Great Lakes Water Authority

September 28, 2017

Preface

These Master Specifications and Standard Drawings are designed to be used in accordance with the User Guide, contract documents and drawings found electronically on the GREAT LAKES WATER AUTHORITY (GLWA) website, http://www.GLWA.org. The current, official version of the Master Specifications, any Supplemental Specifications, and all previous editions can also be found in electronic form on the website.

Printing of the Master Specifications from the website is allowed, however, Reproduction for non-GLWA uses is strictly prohibited. The electronic version is also fully searchable for utilization on GLWA projects.

GLWA Consultants, contractors and any other parties working on GLWA projects shall use the Master Specifications in conjunction with the GLWA User Guide and FormSpec. The Master Specifications are not designed to address all situations. The Master Specifications are intended to focus on standard applications for the design and construction of water, storm, and wastewater systems. GLWA Standard Drawings, schedules and other contract drawings can also be used to detail project specific information.

The Master Specifications should not be modified. Instead, Provisional Specifications should be created in accordance with the User Guide to address limitations, differing details, and additional, specialized specifications. GLWA may also provide—at the discretion of the Master Specifications Oversight Committee—Supplemental Specifications as modifications to the Master Specifications as found on the GLWA website. This allows the Master Specifications to be used by reference.

INDEX

DIVISION 1 – GENERAL REQUIREMENTS

SECTION 01010

ADMINISTRATIVE PROVISIONS

PART 1 - GENERAL

1.1 SCOPE. This section details general Contract Administrative Provisions applicable to all Work to be performed and is intended to be used in conjunction with all aspects of the Contract Documents. Even if not specifically stated, all work associated with Master Specification Sections, unless otherwise clarified or stated, shall also comply with Division 01 Master Specification Section references. Where conflicts develop in specification sections, the more stringent requirement shall govern.

This section includes the following Articles:

Contract Drawings.

Alternatives.

Allowances.

Coordination.

Control Surveys.

Property and Survey Monuments.

Cleanliness of the Work and Streets.

Regulatory Requirements.

Safety Precautions.

Licenses, Permits, and Inspections.

Additional Engineering Services.

Cooperation.

Protection of Property.

Fire Protection.

Chemicals.

Existing Utilities and Structures.

Alteration of Existing Water Mains and Services.

Easement and/or Right-of-Way Across Private Property.

Claims by One Contractor Arising from Alleged Damage by Another Contractor.

Historical Specimens.

Abbreviations.

References.

1.2 CONTRACT DRAWINGS. Resource drawings are available for the Contractor to use. Arrange with DWSD Document Control to receive copies of existing drawings within the limit of the Work. DWSD does not accept responsibility for the accuracy of the drawings.

1.3 ALTERNATIVES. Contract Drawings indicate the extent and general arrangement of the Work. If any departures from the Contract Drawings are deemed necessary by the Contractor to accommodate the material and equipment the Contractor proposes to furnish, details of such departures and reasons thereof shall be submitted as soon as is practicable to the Engineer for approval. No such departures shall be made without the prior written approval of the Engineer. Approved changes shall be made without additional cost to the Owner for this Work or related Work under other Contracts of the project. If a credit is involved, it shall be negotiated with the Owner.

The specific equipment proposed for use by each Contractor on the project may require changes in structures, auxiliary equipment, piping, electrical, mechanical, controls, materials, or other Work to provide a complete and satisfactory operating installation. The Contractor, with proposed changes, shall submit to the Engineer for approval, all necessary drawings and details showing such changes to verify conformance with the overall project, both structural and architectural requirements, and overall operating performance. The bid price shall include all costs in connection with the preparation of new drawings, details, and all changes to construction work to accommodate the proposed equipment, including increases in the costs of other contracts.

Reasonable costs incurred by DWSD as a result of requests for approval of changes in the design initiated by the Contractor, shall be subtracted from the Contract Price regardless of whether the request is denied, granted, or modified.

1.4 ALLOWANCES.

1.4.01 Scope. In General, Cash and Provisionary Allowances are to be incorporated in the Work as defined in the Article 4 of the General Conditions (Exhibit C) of the Agreement. Specifically defined Allowances to be incorporated are listed in the Bid form and described in Specification Section 01025 Article 1.4 UNIT PRICE AND ALLOWANCE ITEMS.

1.4.02 Cash and Provisionary Allowance. It is understood that the Contractor has included in the Contract Price all allowances so named in the Contract Documents.

1.4.03 Measurement and Payment. Measurement and payment for any cash allowance shall be in accordance with the provisions of Article 4.7 ALLOWANCES of the General Conditions (Exhibit C) of the Agreement.

Payment for the cost of any cash allowance shall be in accordance with the Schedule of Values and, if appropriate, in accordance with the change order.

Upon final payment, or other appropriate time, the Contract Price shall be adjusted as required and an appropriate Change Order(s) issued.

Any cash allowance monies remaining after completion of the Work will be credited to DWSD.

1.5 COORDINATION.

1.5.01 Contract Documents. The Work to be performed under a particular specification section is not necessarily restricted to that of any one particular trade. Any item mentioned under any heading must be supplied, even though it is not called for again under the heading for the respective Work.

1.5.02 Existing Facilities. The Contractor shall not disrupt existing facility operations unless otherwise allowed in the Contract Documents. The Contractor shall prepare a construction traffic ingress/egress plan that separates construction activity access from DWSD operations activity.

All proposed interruptions or tie-ins to existing facilities or utilities or other activities affecting the Department's operations shall be scheduled. If shutdown or partial shutdown of an existing utility is required, requests must be submitted for shutdown in writing to the Engineer at least 15 days in advance, unless otherwise specified. A request for shutdown is required for public utilities as well as private utilities.

The Contractor must cooperate with the Owner in scheduling construction activities to minimize any conflicts with the construction activities of other Contractors on the site, and to enable the Owner to maximize the utilization and the occupancy of the site for his normal, as well as special, maintenance and operation activities.

The Engineer shall approve the scheduling of all such activities.

1.6 CONTROL SURVEYS. The City, through the Engineer, will establish for the Contractor's use, suitable points, marks, and benches at such locations and intervals as the Engineer deems reasonably necessary to determine the general location, alignment, elevation, and grade of the Work. The Contractor shall not proceed until a timely request to the Engineer for these control surveys has been made.

Provide reasonable and necessary opportunities to place and remove alignment points, furnish such materials, and give such assistance including clearing and grubbing, as may be required by the Engineer for his survey operations. If it is found necessary to carry on those operations on Sundays, legal holidays, or at other times when the Contractor's Work is not in progress, the Contractor shall furnish all necessary service and assistance. No compensation will be paid for any of the work, materials, or delay occasioned by giving lines and grades, or making other necessary measurements, or inspections.

Carefully preserve all bench marks, reference points and stakes as established by the Engineer. In case of destruction, the City shall charge the Contractor for the resulting restoration expenses. The Contractor shall be responsible for any mistakes and delays that may be caused by their loss or disturbance.

From the control points, marks and benches established by the Engineer and from information shown on the Drawings, make all additional measurements, and establish such additional points, lines and grades necessary for performance of the Work.

The Contractor shall employ a competent Civil Engineer registered within the State of Michigan as a Professional Engineer or Professional Land Surveyor. The Contractor shall require said Engineer to establish all lines, elevations, and reference marks needed by the Contractor during the progress of the Work, and from time to time, verify such marks by instrument or other appropriate means.

The Engineer shall have the right, at any time, to determine the correctness and completeness of the measurements taken, or points, lines, and grades established by the Contractor. Unacceptable or incorrect construction resulting from errors in measurements, points, lines, or grades made or established by the Contractor shall be corrected or replaced by construction that is strictly in accordance with the Contract requirements at the Contractor's expense. While the Engineer may draw the Contractor's attention to errors or incompleteness in the Contractor's measurements, points, lines, or grades, no omission on the part of the Engineer to point out such errors or incompleteness shall give the Contractor any right to claims against the City or shall in any way relieve the Contractor of his responsibilities in accordance with the terms of this Contract.

The Contractor shall make, check, and be responsible for all measurements and dimensions necessary for the proper construction of, and the prevention of, errors in the Work.

All details of survey stations, bearings, or similar survey designations are applicable only for the location of work to be performed under this Contract. It is understood that the designations are only approximate. No changes of such designation caused by the developments of construction shall be made the basis of claims for payment other than provided for in the Contract.

1.7 PROPERTY AND SURVEY MONUMENTS. Before any monuments or stakes marking the boundaries of property along or near the Work are removed or disturbed, the Contractor shall notify the Engineer in sufficient time so that they can be properly located and reset.

All precautions shall be taken to avoid disturbance of permanent survey monuments of any governmental authority, and when any of these are disturbed or destroyed, the Contractor shall restore them to the satisfaction of such authority, and shall pay all costs incurred by such authority in connection therewith.

1.8 CLEANLINESS OF THE WORK AND STREETS. The Contractor shall control dust to meet the requirements of the jurisdictional authorities. Control measures shall include, but are not limited to, sprinkling, applying calcium chloride, wheel washing, street sweeping, street washing, and load covering.

Trucks hauling loose materials to or from the site shall be tightly covered and their loads shall be trimmed to prevent spillage on the public streets or roads. This requirement likewise applies to suppliers making deliveries to the site. The Contractor shall promptly clean streets, or roads, dirtied by any cause arising from the operations or that of the subcontractors or supplier(s). Should the Contractor fail to maintain proper street or road cleanliness, the Owner will take the necessary steps to perform such cleaning and will charge the Contractor for all costs accordingly.

1.9 REGULATORY REQUIREMENTS. The requirements of this Article shall be made a part of any sub-contracts entered into.

All rules, regulations, orders, and permits, of any governmental agency applicable to the Work under this Contract shall be met. It is the Contractor's responsibility to be informed of all applicable governmental rules, regulations, orders, and permits. The Contractor shall cooperate with the Engineer to promptly furnish any information required by such agencies.

Final payment will not be made under the terms of this Contract until written approval of the final conditions of the Work is obtained by the Contractor from all public authorities or agencies having jurisdiction over any portion of the Work included in the Contract.

1.10 SAFETY PRECAUTIONS. In addition to the Contractor’s responsibilities outlined in the General Conditions section, the Contractor shall be responsible for the following actions:

The Contractor shall comply with such safety regulations as may be prescribed by the Engineer, Owner, or local authorities having jurisdiction and shall, when so directed, properly correct any unsafe conditions created by, or unsafe practices on the part of, employees or subcontractors. In the event of the Contractor's failure to comply, the Engineer or Owner may take the necessary measures to correct the conditions or practices, and all costs thereof will be charged to the Contractor, and will be deducted from any monies due the Contractor. Failure of the Engineer to direct the correction of unsafe conditions or practices shall not relieve the Contractor of his responsibility hereunder.

The Contractor shall erect barriers, guard rails, screens, sheathing, bracing, covers, nets, shields, and false-work of non-combustible materials as determined by Engineer to keep a separation between the Contractor’s Work and the Owner’s operations, as needed for the safety of the Work and the Owner’s employees.

The Contractor shall provide adequate shielding to prevent high temperature particles and sparks (resulting from, but not limited to, welding, metal cutting, and grinding), other building debris, spilled sludge, or other materials (resulting form construction, operation, or maintenance activities) from falling upon or reaching workers, the Owner’s workers, or others within the area.

Where project involves confined spaces, Contractor shall take measures as necessary to fully protect employees working in confined spaces to include provision of any necessary protective equipment, forced ventilation, and testing in full compliance with Master Specification Section 01040, Control of Work.

Adequate ventilation shall be provided to keep any noxious fumes, smoke or dust away from the Contractor’s or Owner’s workers or others within the area.

1.11 LICENSES, PERMITS, AND INSPECTIONS. All necessary licenses and permits including the building permit required for the Work, shall be secured at no cost to the Owner. Permits issued by DWSD will be furnished without charge. Permits applied for by the DWSD are described in Article 4.0 of Section 00210, Information for Bidders

The Contractor shall obtain, keep current and pay all necessary fees for any necessary construction permits from those authorities, agencies or municipalities having jurisdiction over land areas, water areas, utilities, or structures which are located within the contract limits and which will be occupied, encountered, used, or temporarily interrupted by the Contractor's operations unless otherwise stated. When construction permits are accompanied by regulations or requirements issued by a particular authority, agency or municipality, it shall be the Contractor's responsibility to familiarize himself and comply with such regulations or requirements as they apply to operations on this project. The Owner shall obtain all water tap permits from the City of Detroit, Water and Sewerage Department.

The Contractor shall apply for inspection of the Work to any and all local, state, or national authorities having jurisdiction, and shall deliver to the Engineer all required certificates of approval of such authorities.

All costs, including fees, inspection charges, temporary improvements and the restoration of existing improvements (e.g. sidewalks, pavements, soil erosion and sedimentation control, landscaping, etc.) shall be paid and provided to the satisfaction of the authority having jurisdiction and shall be included in the contract price.

1.12 ADDITIONAL ENGINEERING SERVICES. If the Engineer is required to provide additional engineering services as a result of substitution of materials or equipment submitted as "or equal" by the Contractor, or changes made by the Contractor in dimension, weight, and power requirements of the equipment and accessories furnished, or if the Engineer is required to examine and evaluate any changes proposed by the Contractor for the Contractor’s convenience, then the Engineer's charges in connection with such additional services shall be charged to the Contractor by the Owner and paid by the Contractor.

Structural design shown on the Contract Drawings is based on maximum weights for major items of equipment, as indicated on the Contract Drawings as specified. If the equipment furnished exceeds the weights of said equipment, the Contractor shall assume the responsibility for all costs of the redesign and for any construction changes required to accommodate the equipment furnished, including the Engineer's expense in connection therewith.

In the event that the Engineer is required to provide additional engineering services as a result of the Contractor's errors, omissions or failure to conform to the requirements of the Contract Documents, or if the Engineer is required to examine and evaluate any changes proposed by the Contractor solely for the convenience of the Contractor, then the Engineer's charges in connection with such additional services shall be charged to the Contractor by the Owner and paid by Contractor.

1.13 COOPERATION. The Contractor shall allow the Owner (or agents), and other project Contractors (or agents), to enter the work area for the purpose of constructing, operating, maintaining, removing, repairing, altering or replacing such pipes, sewers, conduits, manholes, wires, poles, or other structures and appliances as may be required. The Contractor shall cooperate with all the aforesaid parties and shall allow reasonable provisions for the prosecution of any other work by the

Owner, or others, to be done in connection with Work, or in connection with the normal use of the facilities.

Each Contractor shall cooperate fully with the Owner, the Engineer, and all other Contractors employed in the Work, to effect proper coordination and progress to complete the project on schedule and in proper sequence. Insofar as possible, decisions of all kinds required from the Engineer shall be anticipated by the Contractor to provide ample time for inspection, or the preparation of instructions.

Each Contractor shall assume full responsibility for the coordination and integration of all parts of his Work with that of other Contractors. Each Contractor's Superintendent shall coordinate all Work with other Contractors. Each Contractor shall layout his own Work in accordance with the Contract Drawings, specifications and instructions of the latest issue, and with due regard to the Work of other Contractors.

Periodic coordinating conferences shall be held per the section on Project Meetings of the Contract Documents.

1.14 PROTECTION OF PROPERTY. In the event of any claims for damage or alleged damage to property as a result of Work under this Contract, the Contractor shall be responsible for all costs in connection with the settlement of or defense against, such claims. Prior to the commencement of Work in the vicinity of property adjacent to the Work site, the Contractor, at his own expense, shall take such surveys as may be necessary to establish the existing condition of the property.

Before final payment can be made, the Contractor shall furnish satisfactory evidence that all claims for damages have been legally settled or sufficient funds to cover such claims have been placed in escrow, or that an adequate bond to cover such claims has been obtained to secure payment with interest.

In the event that any Contractor has trespassed upon private property in the prosecution of the Work of this contract, the Owner may withhold payment for the value of such Work in or on the property, but in any case no less than a sum of $500.00 for each property trespassed, until the Contractor has secured a release from the property owner upon whose property the trespass was committed.

Contractor shall be responsible for the protection of his own storage area.

1.15 FIRE PROTECTION. All Contractors shall take all necessary precautions to prevent fires, and shall provide adequate equipment for extinguishing fires. No burning of trash or debris will be permitted.

When fire or explosive hazards are created in the vicinity of the Work as a result of the locations of fuel tanks, or similar hazardous utilities or devices, the Contractor shall immediately alert the local Fire Marshal, the Engineer, and the Owner. The

Contractor shall exercise all safety precautions, and shall comply with all instructions issued by the Fire Marshal and will cooperate with the Owner to prevent the occurrence of a fire or an explosion.

1.16 CHEMICALS. All chemicals used during the construction or furnished for the project operation, whether herbicide, pesticide, disinfectant, polymer, or reactant of other classification, must show approval of the EPA, USDA or both. Use of all such chemicals and disposal of residues shall be in strict conformance with all applicable law, rules, and regulations. All chemicals, and the use of chemicals, shall comply with the City of Detroit, "Right to Know Rules" and the DWSD Safety Office.

1.17 EXISTING UTILITIES AND STRUCTURES. The term existing utilities shall be deemed to refer to publicly-owned and privately-owned utilities such as electric power, reservoirs, conduits, and lighting, telephone, water, gas, drains, storm drains, process lines, sanitary sewers, raceway, and all appurtenant structures.

Where existing utilities and structures are indicated on the Contract Drawings, it shall be understood that all of the existing utilities and structures affecting the work may not be shown, and that the locations of those shown are approximate only. It shall be the responsibility of the Contractor to ascertain the actual extent and exact location of existing utilities and structures. In every instance, the Contractor shall notify the proper authority having jurisdiction and obtain all necessary directions and approvals before performing any Work in the vicinity of existing utilities.

Prior to beginning any excavation Work, the Contractor shall, through field investigations, determine any conflicts between existing utilities and new utilities, or other Work to be constructed under this project. This determination shall be based on the actual locations, elevations and slopes, of existing utilities as determined in the field investigations, locations, elevation, and slope of new utilities, if any, as shown on the Contract Drawings. If an interference exists, the Contractor shall bring it to the attention of the Engineer as soon as possible. If the Engineer agrees that an interference exists, he shall modify the design as required, including relocating existing utilities. The Contractor shall make arrangements with the respective utility Owners for the relocation of the utilities. Additional costs to the Contractor for this change shall be processed through a change order as detailed elsewhere in the Contract Documents. In the event the Contractor fails to bring a potential conflict or interference to the attention of the Engineer prior to beginning excavation work, the conflict or interference shall be corrected by the Contractor, as directed by the Engineer, at no additional expense to the Owner.

The Work shall be carried out in a manner to prevent disruption of existing services and to avoid damage to the existing utilities. Temporary connections shall be provided, as required, to insure there is no interruption of existing services. Any damage resulting from the Work of this Contract shall be promptly repaired by the Contractor at his own expense in a manner approved by the Engineer and to the requirements of any authority having jurisdiction. Where it is required by the authority having jurisdiction that they perform their own repairs or have them done by others, the Contractor shall be responsible for all costs thereof.

Where excavations by the Contractor require any utility lines or appurtenant structures to be temporarily supported and otherwise protected during the construction work, such support and protection shall be provided by the Contractor. All such work shall be performed in a manner satisfactory to the Engineer and the respective authority having jurisdiction over such work. In the event the Contractor fails to provide proper support or protection to any existing utility, the Engineer may, at his discretion, have the respective authority provide such support or protection as may be necessary to insure the safety of such utility, and the costs of such measures shall be paid by the Contractor.

1.18 ALTERATIONS OF EXISTING WATER MAINS AND SERVICES. The cutting, reconstructing, or relocating of any existing water mains or water service connections, necessitated to permit construction of the Work under this Contract, shall be performed by the Contractor in accordance with the authority having jurisdiction. The cost of all Work and material, including inspection, permits and penalties, shall be included in the Contract price.

The Contractor shall negotiate with the authorities having jurisdiction regarding the operating of all valves in any existing water mains.

If the Contractor finds it necessary to shut off any existing water mains in service, the Contractor shall ascertain, from the authorities having jurisdiction, the shut-off times considered appropriate for shut off, prior to shutting off the valve.

The Contractor shall receive no extra payment for the times such shutoffs and alterations have to be made or due to delays incurred in conjunction with these alterations.

1.19 EASEMENT AND/OR RIGHT-OF-WAY ACROSS PRIVATE PROPERTY. When working in easements or rights-of-way, the Contractor shall comply with the specific requirements shown on the Contract Drawings at their appropriate locations and/or as specified in these Specifications. In addition to those specific requirements, the Contractor shall comply with, but is not limited to, the following:

> The Contractor shall strip and separately stockpile (in the area where sufficient room permits) the topsoil required to be removed from each individual parcel to accommodate the Work. This topsoil shall be redistributed (or replaced) over the entire disturbed area and seeded unless otherwise directed by the Engineer. In areas where erosion may occur, sodding and pegging shall be required unless otherwise directed by the Engineer.
>
> Excess excavated material from the easement shall be placed and graded on the Owner's property to the satisfaction of the Owner and/or as directed by

the Engineer. It shall not be removed from Owner's property without permission.

If there is a surplus of, or if the Owner does not desire the excess excavated material, it shall be removed as directed by the Engineer at no cost to the Owner.

Any damage caused by the Contractor's operation to the property in/or adjacent to the easement shall be either satisfactorily restored or payment made therefore at no additional cost to Owner.

Remove only those trees necessary to facilitate construction. All others shall be protected from damage during construction. Stumps and brush from trees cut down shall be removed from the property and disposed of as direct by the Engineer.

Trees of reasonable size, removed to accommodate construction, shall be cut into fireplace lengths and stored on the property for the Owner (if requested), unless otherwise directed by the Engineer.

In addition to the specific requirements on the Contract Drawing and/or as specified in these Specifications, the Contractor, where required, shall install temporary fences and/or barricades at the work site for the protection of the public and the property Owner (and his interest, such as children, livestock, pets, and automobiles). The type and placement of fences and/or barricades shall be to the satisfaction of the Owner and/or as directed by the Engineer.

Stones or other undesirable material unearthed due to construction operations shall be removed from the property to the satisfaction of the Owner and/or as directed by the Engineer.

Existing structures or facilities such as driveways, private roads, fences, culverts, water reservoir ponds on or near the easement, underground piping, wells, field drains or tiles, and open ditches, shall be restored to a condition that existed prior to construction, and to the satisfaction of the Owner and/or as directed by the Engineer.

Ascertain the location, condition and depth and also protect any well on or near the easement, which in any way may be affected by construction operations. The Contractor shall be responsible for any and all resulting damages, claims, actions or causes of action arising therefrom. In the event a well is damaged or ceases to function because of the construction operations, a source of water sufficient for the use of the well owner shall be provided by the Contractor at no additional cost. This source of water is to be supplied until such time as the well is restored to its original condition.

Conform to all requirements stated in the Contract Documents with regard to restoration work in private easements including those requirements stated above and those shown on the Drawings at no additional cost.

Complete all restoration work as soon as possible so as to cause a minimum of interference with the normal usage of the land by the Owner and for the control of soil erosion. The restoration or reconstruction of drainage structures, water reservoirs, wells and other facilities, shall be performed as soon as is practical, and in co-operation and compliance with the Owner and/or local agency having jurisdiction over, and/or as directed by the Engineer.

1.20 CLAIMS BY ONE CONTRACTOR FROM DAMAGE BY ANOTHER CONTRACTOR. Each Contractor, in signing his Contract, agrees that if another Contractor working on this project makes a claim against the Owner for money damages due to loss of time, non-payment, or other reasons caused or occasioned by the method of operation or lack of progress of the Contractor, and the allegations are substantiated in the opinion of the Owner, the Owner may assess in turn such money damages and withhold from progress payment against the offending Contractor.

1.21 HISTORICAL SPECIMENS. Any and all specimens of historical or scientific value or interest encountered in the Work shall be preserved and delivered to the Engineer.

1.22 ABBREVIATIONS. The following listed group of letters or abbreviations, wherever they appear in the Contract, shall mean and be interpreted as indicated below ("." May or may not appear in abbreviation):

A.A.S.H.T.O	American Association of State Highway and Transportation Officials.
A.C.I.	American Concrete Institute.
A.E.I.C.	Association of Edison Illuminating Companies.
A.F.B.M.A.	Anti-Friction Bearing Manufacturer Association.
A.G.A.	American Gas Association.
A.G.M.A.	American Gear Manufacturers Association.
A.H.D.G.A.	American Hot Dip Galvanizers Association.
A.M.C.A.	Air Moving and Conditioning Association.
A.I.S.C.	American Institute of Steel Construction.

A.I.S.I.	American Iron and Steel Institute.
A.N.S.I.	American National Standards Institute.
A.P.I.	American Petroleum Institute.
A.R.E.A.	American Railway Engineering Association
A.S.C.E.	American Society of Civil Engineers.
A.S.H.R.A.E.	American Society of Heating, Refrigeration and Air Conditioning Engineers.
A.S.M.E.	American Society of Mechanical Engineers.
A.S.P.E.	American Society of Plumbing Engineers.
A.S.T.M.	American Society for Testing and Materials.
A.W.G.	American Wire Gauge.
A.W.P.A.	American Wood Preservers' Association.
A.W.S.	American Welding Society.
A.W.W.A.	American Water Works Association.
B.O.C.A.	Building Officials and Code Administrators.
C.E.M.A.	Conveyor Equipment Manufacturers Association.
C.S.	Commercial Standards.
C.R.S.I	Concrete Reinforcing Steel Institute.
D.E.Co.	Detroit Edison Company.
D.O.H.	Department of Health
D.P.W.	Department of Public Works - City of Detroit.
D.W.S.D.	Detroit Water & Sewerage Department.
E.J.C.D.C.	Engineer’s Joint Contract Documents Committee, American Consulting Engineers Council, 1050 15th

	Street, N.W. Washington, D.C. 20005.
E.P.A.	Environmental Protection Agency.
E.P.M.D.	Environmental Protection & Maintenance Department of the City of Detroit.
F.C.I.	Fluid Control Institute.
Fed. Spec.	Federal Specification, issued by the Federal Supply Service, General Services Administration, U.S. Government.
F.M.	Factory Mutual System (FM), 1151 Boston-Providence Turnpike, Norwood, MA 02062.
I.B.R.	Institute of Boiler and Radiator Manufacturers.
I.E.E.E.	Institute of Electrical and Electronics Engineers.
I.P.C.E.A.	Insulated Power Cable Engineers Association.
I.R.I.	Industrial Risk Insurers.
I.S.A.	Instrument Society of America.
I.S.O.	International Standard Organization.
J.I.C.	Joint Industry Conference Standards.
M.D.E.Q.	Michigan Department of Environmental Quality (State of Michigan).
M.D.O.H.	Michigan Department of Health.
M.D.O.T.	Michigan Department of Transportation.
M.I.O.S.H.A.	Michigan Occupational Safety and Health Act.
M.S.S.	Manufacturers Standardized Society (MSS).
N.B.F.U.	National Board of Fire Underwriters.
N.B.S.	National Bureau of Standards.
N.C.P.I.	National Clay Pipe Institute.

N.C.P.W.B.	National Certified Pipe Welding Bureau.
N.E.B.B.	National Environmental Balancing Bureau.
N.E.C.	National Electrical Code.
N.E.M.A.	National Electrical Manufacturers Association.
N.F.P.A.	National Fire Protection Association.
N.L.G.I.	National Lubrication Grease Institute.
N.P.D.E.S.	National Pollutant Discharge Elimination Systems.
N.P.T.	National Pipe Thread.
N.S.C.	National Safety Council.
N.S.F.	National Sanitation Foundation.
O.S.H.A.	Occupational Safety and Health Administration.
O.S.Y.	Outside Screw and Yoke.
P.D.I.	Plumbing and Drainage Institute.
P.S.	Pump Station.
S.D.I.	Steel Deck Institute.
S.J.I.	Steel Joist Institute.
S.M.A.C.N.A.	Sheet Metal and Air Conditioning Contractors National Association, Inc.
S.S.P.C.	Steel Structure Painting Council.
Ten State Standards	Great Lake Upper Mississippi River Board of State Public Health and Environmental Managers.
U.L.	Underwriters' Laboratories.
U.S.E.P.A.	U.S. Environmental Protection Agency.
U.S.S.G.	United States Standard Gage.

W.C.A.P.C.P.	Wayne County Air Pollution Program.
W.C.D.E.	Wayne County Department of Environment.
W.O.G.	Water, Oil, and Gas.
W.S.P.	Working Steam Pressure.
W.W.T.P.	Wastewater Treatment Plant.

1.23 REFERENCES.

1.23.01 Specifications by Reference. Where reference is made in the Specifications section to specifications or standards of any technical society, professional association, or governmental agency, it is understood and agreed that such specifications or standards are as much a part of the Specifications Section as though fully repeated therein.

1.23.02 Materials by Reference. A material included in more than one Section of the Specification will, in general, be specified in detail in only one of the Sections.

In other Sections, the material is specified by reference to the Section containing the specifications for the same material, and such Specifications shall be considered as much a part of the other Sections as if they were therein repeated in full.

1.24 VARIOUS ABBREVIATIONS.

The miscellaneous abbreviations herein, together with others in general use, are applicable to these Master Standard Specifications and to project Plans or other Contract Documents.

ABAND	Abandoned
AC	Asphalt Concrete
ACWS	Asphalt concrete wearing surface
ALT	Alternate
Amp	Ampere(s)
APA	Authorized Public Agency
Atm	Atmosphere(s)

Avg	Average
AWG	American Wire Gage (nonferrous wire)
AMER STD	American Standard
Amp	Ampere(s)
Ann	Annual
APA	Authorized Public Agency
B/B	Back to Back
B/W	Back of walk
BC	Beginning of curve
BDRY	Boundary
BF	Bottom of footing
BH	Brinell Hardness
BHP	Brake horsepower
BM	Bench mark
BOD	Biochemical oxygen demand
Btu	British thermal unit(s)
BVC	Beginning of vertical curve
C	Celsius (centigrade)
C to C	Center to Center
C&G	Curb and gutter
C/C	Center to center
CAB	Crushed aggregate base
CAL	Calorie(s)
CAP	Corrugated Aluminum pipe

CB	Catch Basin
CBOD	Carbonaceous biochemical oxygen demand
CBP	Catch Basin Connection Pipe
Cc	Cubic centimeter(s)
CCTV	Closed Circuit TV
CFD	Cubic feet per day
CFH	Cubic feet per hour
CFM	Cubic feet per minute
CFR	Code of Federal Regulations
CFS	Cubic feet per second
CFT	Cubic foot
CI	Cast Iron Pipe
CIA	Construction Influence Area
CIP	Compacted in Place
CL	Clearance, center line
CLF	Chain link fence
CM	Centimeter(s)
CML	Cement mortar-lined
CO	Cleanout (Sewer)
COD	Chemical oxygen demand
COL	Column
CONC	Concrete
CONN	Connection
CONST	Construct, Construction

COORD	Coordinate
CPM	Critical Path Method
CP	Constant pressure
CSDS	DWSD Control System Design Standards
CSP	Corrugated steel pipe
CTV	Cable TV
CU	Cubic
CU FT	Cubic foot (feet)
CU IN	Cubic inch(es)
cu yd	Cubic yard(s)
CV	Check valve
C	Coefficient, valve flow
CYD	Cubic yard
DB	Decibels
DBA	Decibels (A scale)
DBL	Double
DBT	Dry-bulb temperature
DC	Direct current
DCB	Detailed Cost Breakdown
DEG	degree(s)
DIA	Diameter
DI	Ductile iron
DL	Dead load
DO	Dissolved oxygen

DP	Pressure drop or difference
DPT	Dew point temperature
DS	Dissolved solids
DT	Drain Tile
DWG	Drawing
DWSD	Detroit Water & Sewerage Department
DWY	Driveway
DWY APPR	Driveway approach
E/P	Edge of pavement
EA	Each
Eat	Entering air temperature
EC	End of curve
EDR	Equivalent direct radiation
EF	Each face
EFF	Efficiency
EG	Edge of gutter
EGL	Energy grade line
El	Elevation
ELC	Electronic lighting conduit
ENGR	Engineer, Engineering
ESMT	Easement
ETB	Emulsion-treated base
EVC	End of vertical curve
Ewt	Entering water temperature

EX ROW	Existing Right of Way
EXC	Excavation
EXP JT	Expansion joint
EXST	Existing
F	Fahrenheit
F TO F	Face to face
F&C	Frame and cover
F&I	Furnish and install
F/C	Face of Curb
FA	Face area
FAB	Fabricate
FAS	Flashing arrow sign
FBM	Board Foot
FC	Foot-candle
FD	Floor drain
FDN	Foundation
FG	Finished grade
FH	Fire hydrant
FL	Flow line
FM	Factory Mutual System
FO	Fiber Optics Cable
FPD	Feet per day
FPH	Feet per hour
FPM	Feet per minute

FPS	Feet per second
FREQ	Frequency
FS	Federal Specification
FSS	Federal Specifications and Standards
FT	Foot (feet)
FTG	Footing
FT-LB	Food-pound
ft-lb/min	Foot-pounds per minute
FT-LB/SEC	Foot-pounds per second
FW	Face of wall
G	gram(s)
GA	Gauge
GAL	Gallons
GALV	Galvanized
GC-MS	Gas chromatography and mass spectrometry
GIP	Galvanized iron pipe
GM/CC	Grams per cubic centimeter
GPD	Gallons per day
GPD/CU FT	Gallons per day per cubic foot
GPD/SQ FT	Gallons per day per square feet
GPH	Gallons per hour
GPM	Gallons per minute
GPS	Global Positioning System
GPS	Gallons per second

GR	Grade
GR	Grain(s)
GRTG	Grating
GSP	Galvanized steel pipe
H	High or height
HGL	Hydraulic grade line
HORIZ	Horizontal
HP	Horsepower
HP-HR	Horsepower-hour
HR	Hour(s)
HYDR	Hydraulic
Hz	Hertz
ID	Inside diameter
In	Inch(es)
INCL	Including
INSP	Inspection
INV	Invert
IPS	Inches per second
JT	Joint
JTU	Jackson turbidity unit(s)
K	Kelvin
KA	Kilo - amperes
Kg	Kilogram(s)
Km	Kilometer(s)

KV	Kilovolt(s)
KVA	Kilovolt-ampere(s)
KVAR	Kilovar (kilovolt-amperes reactive)
KWH	Kilowatt-hour(s)
L	Liter(s)
LAB	Laboratory
LAT	Lateral
LB	Pound(s)
LBS/DAY	Pounds per day
LBS/DAY/CU FT	Pounds per day per cubic foot
LBS/DAY/SQ FT	Pounds per day per square foot
LFT	Linear foot
LL	Live load
LONG	Longitudinal
LP	Lamp post
LSUM	Lump sum
M	Meter(s)
Ma	Milliampere(s)
MAINT	Maintenance
MAX	Maximum
MBH	Thousand Btu per hour
MCF	Thousand cubic feet
MCL	Michigan Compiled Laws

MEAS	Measure
mg	Milligram(s)
MG	Million gallons
mg/L	Milligrams per liter
MGD	Million gallons per day
MH	Manhole, maintenance hole
MIL	Military Specification
Min	Minute(s)
MISC	Miscellaneous
ML	Milliliter(s)
MLSS	Mixed liquor suspended solids
MMUTCD	Michigan Manual of Uniform Traffic Control Devices
MM	Millimeter(s)
MOD	Modified, modify
MON	Monument
MPH	Miles per hour
MS	Millisecond(s)
MSA	Michigan Statutes Annotated (number always follows)
MTM	Michigan Test Method
MULT	Multiple
MV	Millivolt(s)
MVA	Megavolt-ampere(s)
NBS	National Bureau of Standards
NC	Noise criteria

NPSH	Net positive suction head
NRC	Noise reduction coefficient
NTU	Nephelometric turbidity unit
OA	Outside air
OBS	Obsolete
OC	On center
OD	Outside diameter
OE	Outer edge
OPP	Opposite
ORIG	Original
OZ	Ounce(s)
PB	Pull box
PC	Point of curvature
PCF	Pounds per cubic foot
PCF/HR	Pounds per cubic foot per hour
PCT	Percent
PE	Polyethylene
PF	Power factor
PH	Hydrogen ion concentration
PI	Point of intersection
PL	Property line
PPB	Parts per billion
PPM	Parts per million
PSF	Pounds per square foot

PSF/HR	Pounds per square foot per hour
PSI	Pounds per square inch
PSI	Pounds per square inch
PSIA	Pounds per square inch absolute
PSIG	Pounds per square inch gauge
PVC	Polyvinyl chloride
PVMT	Pavement
PVT R/W	Private right-of-way
Q	Rate of flow in cubic feet per second
Qt	Quart(s)
QUAD	Quadrangle, Quadrant
R	Radius
R&O	Rock and oil
RA	Recycling agent
RAC	Recycled asphalt concrete
RAP	Reclaimed asphalt pavement
RBAC	Rubberized asphalt concrete
RC	Reinforced concrete
RCP	Reinforced concrete pipe
RCV	Remote control valve
REF	Reference
REINF	Reinforced or reinforcement
RES	Reservoir
RES	Resistance

REV	Revolution(s)
RH	Relative humidity
RMS	Root mean squared
ROW	Right-of-way
RPM	Revolutions per minute
RPS	Revolutions per second
RR	Railroad
S	Slope
SA	Supply air
SC	Shading coefficient
SCCP	Steel cylinder concrete pipe
SD	Storm drain
SDI	Sludge density index
SEC	Section
SF	Safety factor
SFT	Square foot
SG	Specific gravity
SV	Specific volume
SPEC	Specifications
SQ	Square
SQ CM	Square centimeter(s)
SFT	Square foot (feet)
SQM	Square meter(s)
SYD	Square yard(s)

SS	Sanitary sewer
ST HWY	State highway
STA	Station
STD	Standard
STR	Straight
STR GR	Straight grade
STRUC	Structural/Structure
SW	Sidewalk
SWD	Sidewalk drain
SYD	Square yard
TAN	Tangent
TD	Temperature difference
TDH	Total dynamic head
TDS	Total dissolved solids
TE	Temperature entering
T	Temperature
TL	Temperature leaving
TLV	Threshold limit value
TOD	Total oxygen demand
TONS	Tons of refrigeration
TOPO	Topography
TP	Total pressure
TRANS	Transition
TRQ	Torque

TS	Traffic signal or transition structure
TS	Total solids
TSC	Traffic signal conduit
TSS	Traffic signal standard
TYP	Typical
VA	Volts-ampere(s)
VAC	Vacuum
VAR	Varies, Variable
VB	Valve block
VC	Vertical curve
VERT	Vertical
VFT	Vertical foot
VOC	Volatile organic chemical
V	Volume
VP	Pressure, dynamic (velocity)
VS	Volatile solids
VSS	Volatile suspended solids
W	Watt(s)
WATCH	Work Area Traffic Control Handbook
WB	Wet-bulb
WBT	Wet bulb temperature
WCAPCP	Wayne County Air Pollution Program
WCDE	Wayne County Department of the Environment
WHD	Watt-hour demand

WHDM	Watt-hour demand meter
WI	Wrought iron
Wk	Week(s)
WM	Water meter
WT	Weight
XCONN	Cross connection
XSEC	Cross section
Yd	Yard(s)
YR	Year(s)

1.25 UNITS OF MEASURE.

1.25.01 General. U.S. Standard Measures, also called U.S. Customary System is the principal measurement system in these specifications and shall be used for construction, unless otherwise stated in the Contract Documents.

Reference is also made to ASTM E 380 for definitions of various units of the SI system and a more extensive set of conversion factors.

1.25.02 Units of Measure and Their Abbreviations.

U.S. Customary Unit (Abbreviations)	Equal To	SI Unit (Abbreviations)
1 mil (=0.001 in)		25.4 micrometer (mm)
1 inch (in)		25.4 millimeter (mm)
1 inch (in)		2.54 centimeter (cm)
1 foot (ft)		0.3048 meter (m)
1 yard (yd)		0.9144 meter (m)
1 mile (mi)		1.6093 kilometer (km)
1 square foot (ft^2)		0.0929 square meter (m^2)
1 square yard (yd^2)		0.8361 square meter (m^2)
1 cubic foot (ft^3)		0.0283 cubic meter (m^3)
1 cubic yard (yd^3)		0.7646 cubic meter (m^3)
1 acre		0.4047 hectare (ha)
1 U.S. gallon (gal)		3.7854 Liter (L)
1 fluid ounce (fl. oz.)		29.5735 milliliter (mL)
1 pound mass (lb) (avoirdupois)		0.4536 kilogram (kg)
1 ounce mass (oz)		28.3495 kilogram (kg)
1 Ton (= 2000 lb avoirdupois)		0.9072 Tonne (= 1000 kg)

1 Poise	0.1 pascal · second (Pa · s)
1 centistoke (cs)	1 square mm per second (mm^2/s)
1 pound force (lbf)	4.4482 Newton (N)
1 pound per square inch (psi)	6.8948 Kilopascal (kPa)
1 pound force per foot (lbf/ft)	1.4594 Newton per meter (N/m)
1 foot-pound force (ft-lbf)	1.3558 Joules (J)
1 foot-pound force per second ([ft-lbf]/s)	1.3558 Watt (W)
1 part per million (ppm)	1 milligram/liter (mg/L)
1 horsepower (550 ft x 1bf/s)	745.7 Watts
1 Million Gallons per Day (MGD)	1.5472 ft^3/sec
1 MGD	0.0438 m^3/sec

1.25.03 Temperature Units and Abbreviations.

Degree Fahrenheit (°F):	Degree Celsius (°C):
°F = (1.8 x °C) + 32	°C = (°F – 32)/1.8

1.25.04 SI Units (abbreviation) Commonly Used in Both Systems.

1 Ampere (A)
1 Volt (V)
1 Candela (cd)
1 Lumen (lm)
1 second (s)

1.25.05 Common Metric Prefixes.

kilo (k)	10^3
centi (c)	10^{-2}
milli (m)	10^{-3}
micro (µ)	10^{-6}
nano (n)	10^{-9}
pico (p)	10^{-12}

1.26 DEFINITIONS.

Addendum – Written or graphic instrument issued prior to the opening of Bids which clarifies, corrects, or changes the bidding or Contract Documents. The term Addendum shall include bulletins and all other types of written notices issued to potential bidders prior to opening of Bids.

Agency – The legal entity for which the Work is being performed.

Base Course – The layer or layers of specified material of planned thickness placed on a subbase or subgrade to support a surface course.

Backfill – Material used to fill an excavation.

Backflow Preventer – Valve within piping system to keep flow moving in one direction.

Benchmark – A fixed, solid reference point with a precisely determined, published elevation.

Catch Basin – A structure designed to collect surface water and transfer it to a storm or combined sewer.

Change Order – A written order to the Contractor signed by the Agency directing an addition, deletion, or revision in the Work, or an adjustment in the Contract Price or the Contract time issued after the effective date of the Contract. A Change Order may or may not also be singed by the Contractor.

Code – The terms *Government Code, Labor Code*, etc., refer to codes of the State of Michigan.

Contract – The written agreement between the Agency and the Contractor covering the Work.

Contract Documents – Including but not limited to; Contract Addenda (which pertain to the contract documents), Notice Inviting Bids, Instructions to Bidders; Bid (including documentation accompanying Bid and any post-bid documentation submitted prior to Notice of Award) when attached as an exhibit to Contract, Bonds, general conditions, permits from other agencies, Special Provisions, Plans, Standard Plans, Details, Schedules, Master Specifications, Reference Specifications, Provisional Specifications, Supplemental Specifications and all Modifications issued after execution of Contract.

Contractor – The individual, partnership, corporation, joint venture, or other legal entity having a Contract with the Agency to perform the Work. In the case of work being done under permit issued by the Agency, the permittee shall be construed to be the Contractor. The term “prime contractor” shall mean Contractor.

Contracting Officer – The Contracting Officer shall be as defined in the Agreement, Exhibit G, Glossary

Contract Unit Price – The amount stated in the Bid for a single unit of an item of work.

Cross-Section – A profile of the ground, etc., taken at right angles to a reference line.

Crown – The uppermost point on a road, sewer, culvert or pipe cross-section.

Culvert – A structure designed to provide an opening under a road etc., usually for the transportation of water.

Cut – In construction, the excavation of material; also the measurement down from a grade mark.

Days – Days shall mean consecutive calendar’s days unless otherwise specified.

Easement – An interest or right held by one person or party in land owned by another person, whereby the first person is accorded partial use of such land for a specific purpose. An easement restricts but does not abridge the rights of the fee owner to the use and enjoyment of the easement holder’s rights.

Encroachment – Any structure illegally erected within or overhanging the R.O.W. and attached to the land i.e., a fence, building or parking lot.

Engineer – The term Engineer in the Contract Documents, Division 01 through 17, shall be synonymous with Contracting Officer as defined in the Agreement, Exhibit G, Glossary, unless stated otherwise
Engineering Survey – Preliminary and layout surveys used for construction.

Fill – Material used to raise the construction level; also, the measurement up from a grade mark.

Footing – The part of the structure which is placed in or on the ground, upon which the main structure rests.

Foundation – The portion of a structure resting upon a footing and providing support for walls and other structural components.

Geotextile – Flexible, permeable fabrics consisting of synthetic fibers or yarns oriented into a dimensionally stable network. Uses include, but are not limited to, as a blanket for filtration applications, liner, separator and for stabilization of subgrade and subbase materials.

Grading Permit – The right to enter upon a specific area of land for the purpose of grading, including the right to grade and/or alter the underlying lands, which right will expire at the completion of the construction of the described project, or upon a specified date.

House Connection Sewer – A sewer, within a public street or right-of-way, proposed to connect any parcel, lot, or part of a lot with a mainline sewer.

House Sewer – A sewer, wholly within private property, proposed to connect any building to a house connection sewer.

Invert – The lowest interior elevation of a pipe, sewer or culvert.

Luminaire – The lamp housing include the optical and socket assemblies (and ballast if so specified).

Luminaire Arm – The structural member, bracket, or mast arm, which, mounted on the standard, supports the luminaire.

Manhole – A structure which provides access to underground services such as sewer, water, phone etc.

Modification – Includes Change Orders and Supplemental Agreements. A Modification may only be issued after the effective date of the Contract.

Monument – A permanent reference point for horizontal and vertical positioning.

Person – Any individual, firm, association, partnership, corporation, trust, joint venture, or other legal entity.

Plans – The drawings, profiles, cross sections, working drawings, and supplemental drawings, or reproductions thereof, approved by the Engineer, which show the location, character, dimensions, or details of the Work.

Pre-engineering Survey – A preliminary survey which forms the basis for engineering design.

Private Contract – Work subject to Agency inspection, control, and approval, involving private funds, not administered by the Agency.

Property Survey – A survey to retrace or establish property lines or to establish the location of buildings within property limits.

Provisional Specifications – Specifications issued separate from DWSD Master Specifications that alter the Master Specifications for specific project requirements. DWSD Master Specifications are available on DWSD's official website located at http://www.dwsd.org/cust/master_spec.html

Reference Specifications and Drawings – Those bulletins, standards, rules, methods of analysis or test, codes, drawings, and specifications of other agencies, engineering societies, or industrial associations referred to in the Contract Documents. These refer to the latest edition, including amendments in effect and published at the time of advertising the project or issuing the permit, unless specifically referred to by edition, volume, or date.

Retaining Wall – A wall built to hold back an embankment.

Right of way (R.O.W.) – The entire area legally reserved for the construction, operation and maintenance of the roadway and the improvement of the roadside and/or utilities.

Roadside – That portion of the R.O.W. outside of the roadway.

Roadway – That portion of the R.O.W. reserved for vehicular use, limited by the outside edges of embankment or cut slopes and including ditches, channels and/or other structures required to facilitate drainage.

Service Connection – Service connections are all or any portion of the conduit, cable, or duct, including meter, between a utility distribution line and an individual consumer.

Setback Line – A line established by zoning ordinance, deed restriction or custom regulating the distance from the R.O.W. line of a street or highway to the point where improvements may be constructed.

Sewer – A system comprising inlets, conduits, manholes and other appurtenances to collect storm runoff from rainfall, sewage and/or fluid industrial wastes and convey these to a point of discharge.

Sidewalk – That portion of the roadway primarily constructed for pedestrian use.

Slope Stakes – Stakes placed to locate the top or bottom of a slope; also may correspond to the limits of construction when referring to roadway construction.

Special Provisions – Any provisions that supplement or modify the Standard Specifications applicable to an individual project. An Addendum is a Special Provision.

Specifications – Standard Specifications, Reference Specifications, Special Provisions, and specifications in Supplemental Agreements between the Contractor and the Board. A general term applied to all written directions, provisions and requirements concerning the performance of the work.

Standard – The shaft or pole used to support street lighting luminaire, traffic signal heads, mast arms, etc.

Standard Plans – Details of standard structures, devices, or instructions referred to on the Plans or in Specifications by title or number.

Standard Specifications – All requirements and provisions contained in this document.

State – State of Michigan.

Station – 1) A point on a baseline that is a specified distance from the point of commencement; 2) A DWSD pumping station.

Street – Any road, highway, parkway, freeway, alley, walk, or access.

Subbase – A free draining granular material, placed on the subgrade and on which the base and surfacing materials are placed.

Subgrade – That part of the finished surface of the graded earth on which the subbase, road surface and shoulders are placed.

Supervision – Supervision, where used to indicate supervision by the Engineer, shall mean the performance of obligations, and the exercise of rights, specifically imposed upon and granted to the Agency in becoming a party to the Contract. Except as specifically stated herein, supervision by the Agency shall not mean active and direct superintendence of details of the Work.

Supplemental Specifications – Specifications issued separate from DWSD Master Specifications for specific project requirements that include information not included in DWSD Master Specifications.

Title – The evidence of a person’s right to the property or the right itself.

Traffic Control Devices – Signs, signals, lighting devices, barricades, delineators, pavement markings, traffic regulators and all other equipment for protecting and regulating traffic in accordance with the MMUTCD.

Tonne – Also referred to as “metric ton”. Represents a unit of measure in the International System of Units equal to 1,000 kilograms.

Utility – Tracks, overhead or underground wires, pipeline, conduits, ducts, or structures, sewers, or storm drains owned, operated, or maintained in or across a public right of way or private easement.

Work – That which is proposed as defined by the Contract Documents to be constructed or done under the Contract or permit, including the furnishing of all labor, materials, equipment, and services.

Work Order – A written order by the Engineer or Agency requiring performance by the Contractor.

SECTION 01020

DOCUMENTATION STANDARDS

PART 1 - GENERAL

1.1 SCOPE. This section defines the content and format for the project documentation. It also includes reference governing standards for the documentation and for performance of the Work. The project documentation will be for DWSD's internal use for operation, facility activation, installation and testing, personnel training and verification of Contractor's performance and compliance with the Contractual requirements.

1.2 GENERAL.

1.2.01 Governing Standards. The following references are provided for use by the Contractor and all subcontractors. It is not all inclusive.

American Concrete Institute (ACI)

Association of Edison Illuminating Companies (AEIC)

American Institute of Steel Construction (AISC)

American Iron and Steel Institute (AISI)

American National Standards Institute (ANSI), 1430 Broadway, New York, NY 10018

American Petroleum Institute (API), Publications and Distribution Section, 1220 L. Street Northwest, Washington, D.C. 20005

American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE), 1791 Tullie Circle, N.E., Atlanta, GA 30329

American Society of Mechanical Engineers (ASME), 345 East 47th Street, New York, NY 10017

American Society for Testing and Materials (ASTM), 1916 Race Street, Philadelphia, PA 19103

American Welding Society (AWS)

American Water Works Association (AWWA), 666 West Quincy Avenue, Denver, CO 80235

Anti-Friction Bearing Manufacturers Association (AFBMA)

Building Officials and Code Administration (BOCA)

City of Detroit Building Code

City of Detroit Ordinances and Executive Orders

Conveyor Equipment Manufacturers Association (CEMA)

DWSD Control System Design Standards (CSDS)

Detroit Edison Company (DECO)

Engineer's Joint Contract Documents Committee (EJCDC), American Consulting Engineers Council, 1050 15th Street, NW, Washington, D.C. 20005

Factory Mutual System (FM), 1151 Boston-Providence Turnpike, Norwood, MA 02062

Federal Specification (FS), General Services Administration, Specification and Consumer Information Distribution Section, (WFSIS), Washington Navy Yard, Building 197, Washington, D.C. 20407

Great Lakes Upper Mississippi River Board of State Public Health and Environmental Managers, 1997 (Ten State Standards)

Institute of Electrical and Electronics Engineers (IEEE), 345 East 47th Street, New York, NY 10017

Instrument Society of America (ISA), 67 Alexander Drive, P.O. Box 12277, Research Triangle Park, NC 27709

Insulated Power Cable Engineers Association (IPCEA)

Underwriters' Laboratories, Inc. (UL), 333 Pfingston Road, Northbrook, IL 60062

The U.S. Environmental Protection Agency (USEPA)

Wayne County Air Pollution Program (WCAPCP)

Wayne County Department of Environment (WCDE)

1.3 QUALITY ASSURANCE. For products or workmanship specified by association, trade, or Federal Standards, comply with the requirements of the standard, except when more rigid requirements are specified or are required by applicable codes.

When required by an individual Specification section, obtain copies of standards, provide a copy to the Engineer, and maintain a copy at the job site throughout the submittals, planning, and execution phases of the specific Work, until Substantial Completion.

When required to verify material and equipment, the Contractor must submit copies of all standards to the Engineer. DWSD Engineering maintains full sets of current ASTM, AWWA, and NFPA standards.

1.4 DOCUMENTATION PREPARATION.

1.4.01 New Drawings. For all new drawings, the Contractor shall utilize the latest. Version of AutoCAD.
1.4.02 Drawing Categories. During the period of Contract performance, the Contractor shall prepare and submit to DWSD for review and acceptance, drawing categories as follows:

General

Architectural

Structural

Mechanical

Electrical

Instrumentation

1.4.03 Revisions. Prior to issue of the final drawings, letters or numbers (e.g., Revision A, Revision B) shall identify revisions. Revisions of drawings shall be indicated by changing revision letters in the title block, entering new revision letters, and specifying revisions in the revision column.

1.4.04 Symbols. Symbols used in documents and drawings shall conform to DWSD's standards or be extracted from a standard reference source accepted in writing by the Engineer such as the list specified below:

Institute of Electrical and Electronics Engineers

National Electrical Manufacturers Association

ISA-S5.1 - Instrumentation Symbols and Identifications

ISA-S5.3 - Graphic Symbols for Distributed Control/Shared Display Instrumentation, Logic and Computer Systems

ISA-S5.5 - Graphic Symbols for Process Displays

ISA-S5.4 - Instrument Loop Diagrams

Each drawing shall use symbols from only one standard reference source. The Contractor shall furnish a symbol list with explanations that includes all nonstandard symbols used on the drawings.

1.4.05 Drafting Media. Drafting media for the final drawings shall be both magnetic media and 4 Mil (0.00762. cm) thickness mylar, double matte, drafting film. Drawings shall be drawn with undiluted permanent drafting ink.

1.4.06 Lettering Standards. Lettering shall be minimum 0.125 inch (0.3175 cm) height. All lettering shall be Simplex Regular 12 Point for general notes and dimensions, Simplex Regular 18 Points for Subtitles, Simplex Regular 24 Point for General Titles, and Simplex Slant 12 Point for all general revisions and as-builts.

1.4.07 Drawing Size. Unless otherwise agreed by DWSD, drawings shall be D-size (24 x 36 inches) (60.96 x 91.44 cm).

1.4.08 Format. Each drawing prepared by the Contractor and submitted for review shall have the following format:

Large Drawings 24 x 36 inches (60.96 cm x 91.44 cm) shall have on the bottom 2 inches (5.08 cm) on the 36 inch (91.44 cm) side the following information:

1st Box	Revision/ Check	A chart to track names and dates of revisions and checks by individuals. Identify "DESCRIPTION", "CHK'D" and "APRVD. DATE".
2nd Box	Author Identification	5 rows with "DESIGNED BY:", "DRAWN BY:", "CHECKED BY:", "PROJ. MGR:" with CAD DISK file information placed at bottom of box.
3rd Box	Seal	Location for professional seal.
4th Box	Project Title	Title of Project with scale and date placed at bottom of box.
5th Box	DWSD & Consultant	List "CITY OF DETROIT" "WATER AND SEWERAGE DEPARTMENT" and "PLAN PREPARED BY" (Consultant name and address). Also include any site positioning information below this box.
6th Box	Project Identification	List Permit Numbers, Contract Numbers, File Numbers and/or Drawing Numbers (Shop drawing or other).

Small Drawings 8.5 x 11 inches (21.59 cm x 27.94 cm) shall have on the bottom 1.5 inches (3.81 cm) on the 8.5 inch (21.59 cm) side the following information:

1st Box	Revision/ Check	A chart to track names and dates of revisions and checks by individuals. Identify "DESCRIPTION", "CHK'D" and "APRVD. DATE".
2nd Box	Author Identification	Place this box below the 1st box and provide "DRAWN BY:", "CHECKED BY:" and "APPROVED:" Also place "PLAN PREPARED BY"

		(Consultant name and address) at bottom of this box.
3rd Box	Project Title	Place at bottom middle of page the Title of Project with scale and date placed at bottom of box.
4th Box	DWSD	Place box on far right of page and include "CITY OF DETROIT" "WATER AND SEWERAGE DEPARTMENT" Provide the "Sheet" Number for individual detail and the "DWG No." to equal the drawing number of the total project drawings.

1.4.09 Layout. Drawings shall be arranged to be easily readable. Drawings shall not be crowded or cluttered. Notes shall be located as far toward the right-hand border of the drawing as possible. Circuitry shall be presented on the drawing with a minimum of crossed or offset lines. Electrical connection drawings for panels shall be drawn to reflect the actual physical wiring of the panels.

1.4.10 Line Work. The Contractor shall use DWSD's drafting standards for preparing drawings for this contract. Use the following line work when drafting drawings:

Minimum 0.01 inch (0.25 mm) for the use of Dimension Lines, Leader Lines, and background

Minimum 0.03 inch (0.76 mm) for the use in the primary object of the drawing

Maximum 0.07 inch (1.78 mm) for the use of diagrammatic drafting.

1.4.11 Existing Drawings. The Contractor may provide copies of existing drawings to any of the Contractor's designers, subconsultants, sub-contractors, or vendors. However, copies of existing drawings shall comply with standards for new drawings as defined above.

PART 2 - PRODUCTS

2.1 STANDARD SYMBOL MANUAL. The Contractor shall submit to the Engineer, five original copies of the Standard Symbol manual to be used on the Drawings.

PART 3 - EXECUTION

3.1 DRAWING GENERATION. All drawings shall be generated using a personal computer and plotter as defined in Part 1 above.

3.2 REVIEW AND ACCEPTANCE OF DOCUMENTATION.

3.2.01 Responsibilities. Acceptance of the Contractor's documentation by DWSD shall not relieve the Contractor of the responsibility to meet all of the requirements of the Contract or of the responsibilities for correction of the documents furnished by the Contractor.

End of Section

SECTION 01025

MEASUREMENT AND PAYMENT

PART 1 – GENERAL

1.1 SCOPE. The items listed below beginning with Article 1.3 refer to and are the same pay items listed in the Bid Form. They constitute all of the pay items for the completion of the Work.

Where the price for an Item is stipulated in the BID FORM, Bidders shall use that price in computing the Total Bid Price.

1.2 RELATED PROVISIONS.

1.2.01 Payments and Completion; Article 9 of General Conditions (Exhibit C) of the Agreement

1.2.02 Changes in the Work. Article 12 of General Conditions (Exhibit C) of the Agreement.

1.3 LUMP SUM BID ITEMS.

1.3.01 Bid Item 6.1.1. The lump sum price for Bid Item 6.1.1 shall constitute full compensation for all the work as specified and shown in the Bidding Documents, except that work included for payment under Item Nos. 6.1.2 and other items listed under 1.4 UNIT PRICE AND ALLOWANCE ITEMS Below.

1.3.02 Bid Item 6.1.2. The lump sum price for Bid Item 6.1.2 shall constitute full compensation for Contractor's mobilization onto and demobilization off the project site for the construction of all Work elements of the project.

1.4 UNIT PRICE AND ALLOWANCE ITEMS.

1.4.01 Cash Allowance: Cash Allowance as shown in the Bid Form, if any, for specific items of work will be paid for the actual invoiced amount and shall not include any cost for Contractor support, coordination, preparation of submittals or contractor's overhead and profit.

No portion of the allowance will be used to correct Contractor's errors or omissions. At the end of the Contract, all remaining monies on the allowance shall be deducted from the Contract via a change order.

1.4.02 Provisionary Allowance: The provisionary allowance as shown in the Bid Form, if any, for unforeseen conditions or for any specific items shall be reserved for such use by the Owner to cover unanticipated costs or for other specific items. Provisionary allowance items are for the sole use of the OWNER. Work under the Provisionary Allowance Items will be done via Construction Change Directive issued by the Contracting Officer.

Payment for Work authorized under Provisionary Allowance will be full compensation for providing all Work authorized by the Owner, complete as specified or directed by the Engineer/Contracting Officer. Work authorized under the provisionary allowance may be included in subsequent Application(s) for Payment, as applicable, following authorization and performance of the Work.

At the end of the Contract, all remaining unused monies from the provisionary allowance shall be deducted from the Contract via a change order.

1.4.03 Unit Price Items: Bidders are required to develop the costs for various types of unit price items listed in the Bid Form and must agree to the use of this price in determining the final cost for this work based on the actual quantities.

The quantities to be paid for under unit price items shall be the actual quantities furnished and installed as specified and shown. The unit price for the specific item shall constitute full compensation for furnishing all labor, tools, materials and equipment, and installing the item complete, including cleaning as applicable, removal and disposal of unsound and deteriorated materials, surface preparation, repair and finishes, and clean-up, complete, as indicated and as specified.

All unused unit price items shall be deleted and the full amount shall be credited back to DWSD via Change Order.

SECTION 01030

SUMMARY OF WORK

PART 1 - GENERAL

1.1 SCOPE. The contract documents include the following:

Contract
FORMSPEC
Master Specifications
Provision Specifications (Issued as separate document)
Supplemental Specifications
Design Drawings

It is the intent of the Contract Documents to provide the Owner with complete operable systems, sub-systems, and other items of Work.

The Contractor shall furnish all labor, superintendents, materials, equipment, tools, services, and incidentals to complete the Work required by these Specifications and as shown on the Drawings.

The Contractor shall perform the Work complete, in place and ready for continuous service, and shall include repairs, testing, training, permits, cleanup, and replacement or restoration required as a result of damages caused during this construction.

Any part of any item of the Work that is reasonably implied, or normally required to place each piece of the Work in satisfactory operating condition, shall be performed by the Contractor and the expense thereof shall be included in the total contract price bid for the Work. All miscellaneous appurtenances and other items of work that are incidental to meeting the intent of these Specifications shall be considered as having been included in the applicable lump sum or unit price bid for the Work even though these appurtenances and items may not specifically called for in the specifications.

1.2 WORK BY OWNER. Work to be performed by the Owner has been indicated on the documents. The Contractor shall coordinate operations with the Owner’s Contact personnel and other contractors, at no additional cost to the Owner.

1.3 DESIGN ENGINEER. The Design Engineer has developed FORMSPEC Section 00300, Bid Form, Article 6, “Bid Schedule” and a Provisional Specification supplementing Master Specification Section 01030 - Summary of Work to clearly define scope of work for each bid item and identify what is included and excluded.

1.4 OWNER SUPPLIED PRODUCTS. Certain items, as indicated on the Contract Documents, shall be provided by the Owner.

1.4.01 Owner Responsibilities. Provide Shop Drawings, Product Data, and Samples to Contractor to support construction and installation of Owner-supplied products.

The Contract Documents identify if Owner or Contractor will arrange and pay for delivery of materials to site. On delivery, Owner shall be given opportunity by Contractor to inspect products jointly with Contractor. Claims may be charged to the Contractor responsible or other transporter for the damage. Damaged, defective, or deficient items shall be replaced by Contractor or other responsible party as promptly as possible which shall be determined by Engineer.

1.4.02 Contractor's Responsibilities. Review Shop Drawings, Product Data, and Samples to include returned information with comments.

Receive and unload Owner or Contractor supplied products at site, and inspect for completeness or damage jointly with Engineer.

Handle, store, install and finish products.

Repair or replace items damaged after receipt.

1.5 CONTRACTOR'S USE OF SITE AND PREMISES. Refer to Article 4 of the General Conditions (Exhibit C) of Agreement and Master Specification Section 01110, Construction Facilities and Identification for general requirements regarding Contractor's use of site and premises.

The Contractor shall provide a completely equipped first aid kit at the site of each location where the Work is progressing. The Contractor shall designate a responsible member of the organization for administering first aid at all times while the Work is in progress.

Contractor shall maintain the flow in all existing sanitary and storm sewers during construction. Sewer systems experience surcharge conditions during wet weather events. No additional compensation will be considered by Owner for bypass pumping. Payment for said costs is to be included in the unit price for the Work required.

1.6 WORK SEQUENCE. Work shall be performed in accordance with project specification approved by Owner.

1.7 WORK TO CONFORM. During its progress and on its completion, the Work shall conform truly to the lines, levels, and grades indicated on the Drawings or given by the

Engineer, and shall be built in a thoroughly substantial and workmanlike manner, in strict accordance with the Drawings, Specifications, and other Contract Documents. Written directions will be provided on a basis to be determined, by the Engineer.

1.8 OWNER OCCUPANCY. Cooperation with the Owner is mandatory to minimize a conflict. Facilitate Owner's operations during transition to Owner occupancy.

PART 2 - PRODUCTS

End of Section

SECTION 01040

CONTROL OF WORK

PART 1 - GENERAL

1.1 SCOPE. This section describes the requirements for Control of Work in addition to the requirements for Control of Work described in the General Conditions (Exhibit C) of the Agreement..

1.2 GENERAL.

1.2.01 Coordination. The Contractor shall furnish personnel, equipment and construction aids that will be efficient, appropriate, and sufficient to secure a satisfactory quality of work and a rate of progress that will ensure the completion of the Work within the time stipulated in the Contract Documents. Contractor shall coordinate with 'Miss Dig' and other Agencies having jurisdiction over property or structures in and around the construction area.

If at any time, Contractor's resources appear to the Engineer to be inefficient, inappropriate, or insufficient to achieve the required quality or rate of progress of the Work, the Engineer may direct the Contractor to increase the efficiency, change the character, or increase the number of personnel and equipment, and the Contractor shall comply. Failure of the Engineer to give such a direction shall in no way relieve the Contractor of its obligations to secure the required quality or rate of progress of Work.

1.2.02 Hours of Work. The Contractor may normally prosecute the Work during the daylight hours of any weekday, providing that the operations are conducted as to not create a public nuisance or disturb the peace. However, should the Contractor be stopped, by order of a public authority, from working at times that are contrary to or in violation of any law, ordinance, permit, or license, the Contractor shall not be entitled to an extension of time due to such stoppages.

At the beginning of Work on this Contract, the Contractor shall notify the Engineer in writing, of the days and hours that will constitute a normal workweek. Whenever the Contractor intends to depart from the specified workweek, the Contractor shall notify the Engineer at least 24 hours in advance in writing of the change so that the Engineer may make the necessary arrangements to have required inspectors assigned to the Work. Failure of the Contractor to give such advance notice may cause the Engineer to require removal or uncovering of the work performed during such time without the Engineer's knowledge.
If an emergency arises that would require work to be performed outside of the normal working hours of the specified workweek to save or protect life or property, the requirements of the 24-hour notification would be waived. The Contractor shall notify

the Engineer as soon as the Contractor determines that an emergency exists that necessitates a change in or extension of the normal hours of work. However, the Contractor's determination of the existence of an emergency is subject to review and revision by the Engineer.

The normal workweek schedule and/or daily hours of work shall be altered at the Engineer's direction, when, in his judgment, such alteration is necessary to maintain the required progress of the Work.

1.2.03 Shutdowns

A shutdown shall be defined as a portion of the normal operation of a unit or conduit that has to be suspended or taken out of service in order to perform the specified Work. For each shutdown, Contractor shall compile an inventory of labor and materials required to perform tasks, an estimate of the time required, including time for the Owner to take down and start up the unit or conduit, and a written description of steps required to complete all tasks. The inventory, the estimate, and written procedures shall be submitted to the Engineer for review 30 calendar days prior to the proposed start date of the shutdown. Contractor shall also request, in writing from the Engineer, approval for each shutdown a minimum of 14 calendar days prior to the proposed shutdown date. No shutdown shall be initiated until the inventory of materials and labor is verified by the Engineer on site prior to the proposed start date.

The Work required herein and any other Work required by the Engineer which may interrupt the normal operations shall be accomplished at such times that will be convenient to the Owner. The Contractor shall note that shutdowns may be during the nighttime hours or during weekend hours. The Contractor shall include in its bid price all overtime and/or premium time required for performing any work associated with these shutdowns.

Contractor shall also have on hand and located in close proximity to the Work area, all tools, equipment, spare parts and materials, both temporary and permanent, necessary to complete each Work category without interruptions. Adequate numbers of personnel shall be scheduled for each shutdown, so that the Work shall be accomplished within the specified time frame. The Engineer shall be satisfied that Contractor has complied with these requirements, to the fullest extent possible, before shutdowns will be authorized.

If Contractor's procedures cause an unscheduled shutdown of the facilities, Contractor shall perform the Work as necessary to immediately re-establish satisfactory operation. Contractor shall notify the Engineer, in writing, immediately of any unscheduled shutdown. Contractor shall permit Owner's personnel to work with Contractor's personnel, as required, to maintain the facilities in continuous satisfactory operation. Unscheduled shutdowns or interruptions of continued safe and satisfactory operation of the facilities that result in fines levied by regulatory agencies shall be the responsibility of Contractor if it is demonstrated that Contractor was negligent in the Work or did not exercise proper precautions in the conduct of the Work.

Shutdowns of Electrical and Control Systems: Contractor and the Owner shall each lock out and tag circuit breakers and switches operated by the Owner and shall check cables and wires to be sure that they are de-energized to ground potential before Work begins. Upon completion of the Work, Contractor shall remove the locks and tags and notify the Engineer that the facilities are available for use. The Owner will then remove its locks and place facilities back into use. The Contractor shall supply its own locks. Locks shall be checked at the beginning of each shift. Contractor shall comply with the Owner's Lockout/Tagout procedure. Shutdowns for any electrical wiring or I&C cables shall be coordinated with the Owner.

1.2.04 <u>General Requirements</u>

The Contractor shall:

Develop a program, in cooperation with the Engineer to provide for the construction and putting into service the new work in the most orderly manner possible and in coordination with continued operations of the facilities and all ongoing construction projects at the time of construction of this project;

Adhere to such program except as deviations therefrom are expressly permitted by the Engineer;

Plan all work of connecting with, cutting into, and reconstructing existing pipes or structures so as not to interfere with the operation and maintenance of the existing facilities. Schedule work that will impact operation of existing facilities for the shortest possible time and when the demands on the facilities best permit such interference, even though it may be necessary to work outside of normal working hours to meet these requirements;

Dewater process and utility pipelines back to nearest closed valve at the beginning of each piping shutdown.

Provide all appropriate means and methods to ensure that water services in the areas/facilities associated with this project are maintained uninterrupted during construction;

Make minor modifications in such work relating to existing structures as may be necessary, without additional compensation;

Before starting any work which will interfere with the operation of the existing facilities, do all possible preparatory work and shall see that all tools, materials, and equipment to be installed are made ready and at hand;

Conduct construction operations in most orderly manners such that these operations (a) interfere as little as possible with the operations of the existing facilities and other ongoing construction contracts, and (b) does not damage existing equipment, structures, etc. or cause disruption to the operations of the existing facilities;

Make no claim for additional compensation by reason of delay or inconvenience in adapting his operations to the need for continuous operations of the existing facilities; and

Do not begin any portion of Work that will interference with continued operations of the facilities until such schedule is accepted and approved by the Engineer.

1.3 PRIVATE LAND. The Contractor shall not enter or occupy private land outside of the designated construction area or property limits, except as specified in the Contract Documents.

1.4 PLANNED CONSTRUCTION LOCATIONS. The work shall be installed substantially as indicated on the Drawings, but the Engineer reserves the right to make such modifications in locations as may be found desirable to avoid interference with planned or existing structures or for other reasons.

Where pipe fittings or other items are noted on the Drawings, such notation is for the Contractor's convenience and does not relieve him from installing different or additional items where required.

1.5 OPEN EXCAVATIONS. Contractor shall adequately safeguard all open excavations by providing temporary barricades, caution signs, lights, and other means to prevent accidents to persons or damage to property. The Contractor shall, at its own expense, provide suitable and safe bridges and other crossings for accommodating travel by pedestrians and workmen. Bridges provided for access during construction shall be removed when no longer required. The length of an open trench will be controlled by the particular surrounding conditions, but shall always be confined to the limits prescribed by the Engineer. If the excavation becomes a hazard, or if it excessively restricts traffic at any point, the Engineer may require special construction procedures such as limiting the length of the open trench, prohibiting stacking excavated material in the street, and requiring that the trench not remain open overnight.

The Contractor shall take precautions to prevent injury to personnel due to open trenches. All trenches, excavated materials, equipment, or other obstacles that could be dangerous to the public, shall be well lit at night.

1.6 TEST PITS. Test pits for the purpose of locating underground pipelines or structures in advance of the construction shall be excavated and backfilled in accordance with specifications and drawings by the Contractor at the direction of the Engineer. Test pits shall be backfilled immediately after their purpose has been satisfied and the surface shall be restored and maintained in a manner satisfactory to the Engineer.

1.7 COOPERATION WITHIN THIS CONTRACT. All firms or persons authorized to perform any Work under this Contract shall cooperate with the Contractor and its subcontractors or trades, and shall assist in incorporating the work of other trades where necessary or required.

Cutting, patching, drilling, and fitting shall be carried out where required by the trade or subcontractors having jurisdiction, unless otherwise indicated herein or directed by the Engineer.

The Contractor shall phase the Work so that all chases or openings for the installation of its own or any other Contractor's or subcontractor’s work are available to prevent delays. The Contractor shall see that all sleeves or forms are delivered to the work area and properly set in ample time to prevent delays. The Contractor shall see that all such chases, openings, and sleeves are located accurately and are of proper size and shape. The Contractor shall consult with the Engineer and any Contractors and subcontractors related to this Work.

In case of failure to leave or cut all such openings or have all such sleeves provided and set in the proper time, the Contractor shall cut them or set them afterwards at the Contractor’s expense. In so doing, the Contractor shall confine the cutting to the smallest extent possible consistent with the Work to be done. In no case shall piers or structural members be cut without the written consent of the Engineer.

The Contractor shall carefully fit around, close up, repair, patch, and point around the Work specified herein to the satisfaction of the Engineer.

All of the Work shall be done by careful workers competent to do such work and with the proper small hand tools. Power tools shall not be used except where, in the opinion of the Engineer, the type of tool proposed can be used without damage to any Work or structures and without inconvenience or interference to the operation of any facilities. The Engineer's concurrence with the type of tools shall not in any way relieve or diminish the responsibility of the Contractor for such damage, inconvenience, or interference resulting from the use of such tools.

The Contractor shall not alter or permit any of its subcontractors to alter the Work of any other Contractor or subcontractors working on said job, except with written consent of the Contractor or subcontractors whose Work is to be altered or with the written consent of the Engineer. All cutting, patching, or repairing made necessary by the negligence, carelessness, or incompetence of the Contractor or any of its subcontractors, shall be the responsibility of the Contractor and shall be done by or at the expense of the Contractor.

1.8 OPENINGS, CHASES, SLEEVES AND INSERTS. Where pipes or conduits are to pass through slabs or walls, or where equipment frames or supports are to be installed as an integral part of an opening, the sleeves, opening forms or frames shall be furnished by the installer of the pipes, conduits, or equipment, and shall be placed by the Concrete Contractor. Where hanger inserts and similar items are to be installed as an integral part of a slab or wall, they shall be furnished by the installer of the pipe or other equipment requiring the hanger, and shall be placed by the Concrete Contractor.

When requested by the Concrete Contractor, Contractors installing pipes, conduits, ducts, or equipment in openings or chases in slabs and walls, shall furnish all necessary information, instructions, and materials for accurate installation of the required openings, chases, sleeves, frames, and inserts in concrete. When the required openings, chases, sleeves, frames, and inserts are secured in position, just prior to construction of the surrounding slab or wall, the Contractor for whom the items are installed shall field verify that the numbers, locations, and settings are correct. The Concrete Contractor shall schedule the operations to provide a reasonable opportunity and time interval for such inspection.

Any cost resulting from the correction of defective, ill-timed, or incorrectly located Work, or for subsequent Work which becomes necessary because of omitted openings, chases, sleeves, frames, and inserts, shall be borne by the responsible Contractor. To this end, no Contractor shall arbitrarily cut, drill, alter, damage, or otherwise endanger the work or another Contractor. The nature and extent of any corrective or additional Work shall be subject to the approval of the Engineer following consultation with the Contractors involved.

1.9 PROTECTION OF CONSTRUCTION AND EQUIPMENT. All newly constructed Work shall be carefully protected from damage in accordance with Contract Documents. No wheeling or walking or placing of heavy loads is allowed and the Contractor, at its own expense, shall reconstruct any portions damaged.

All structures shall be protected in a manner approved by the Engineer. If, in the final inspection of the Work, any defects, faults, or omissions are found, the Contractor shall cause the same to be repaired or removed and replaced by proper materials and workmanship without extra compensation for the materials and labor required. The Contractor shall be fully responsible for the satisfactory maintenance and repair of the construction and other Work undertaken herein, for the warranty period described in the Contract Document, or until the end of the maintenance period, whichever is longer.

The Contractor shall take all necessary precautions to prevent damage to any part of the Work due to water pressure during and after construction until such Work is accepted by the Engineer.

1.10 PRECAUTIONS DURING ADVERSE WEATHER. The Contractor shall take all necessary precautions during and against the possibility of adverse weather, so that the Work may be done properly and satisfactory in all respects. When required, protection shall be provided by use of tarpaulins, wood and building-paper shelters, or other suitable means.

During cold weather, materials shall be preheated, if required, and the materials and adjacent structure into which they are to be incorporated shall be made and kept sufficiently warm so that a proper bond will occur, and proper curing, aging, or drying will result. Protected spaces shall be artificially heated by suitable means resulting in a moist or a dry atmosphere according to the particular requirements of the Work being protected. Ingredients for concrete and mortar shall be sufficiently heated so that the mixture will be warm throughout when used. The Contractor shall provide suitable means of protection to prevent freezing below slabs and any other Concrete Work to frost heave. This shall include all existing and new facilities.

1.11 CONFINED SPACE ENTRY. Applicable confined space entry procedures shall be followed.

At the preconstruction meeting, the Contractor shall submit to the Engineer a copy of their safety program for confined space entry in accordance with current OSHA and MIOSHA requirements. Prior to entry into any confined space, the Contractor shall submit to the Engineer a copy of their “daily” entry permit in accordance with current OSHA and MIOSHA requirements.

Contractor shall perform all work in accordance with the latest edition of Construction Safety Standards as adopted by the Michigan Department of Labor Construction Safety Standards for Occupational Health.

Contractor shall perform all work in accordance with the latest edition of Michigan Department of Environmental Quality, Occupational Health Standard for Construction.

Contractor shall comply with the latest edition of the requirements, specifications and standards as provided for under the Michigan Occupational Safety and Health Act., as amended, and in force at the date thereof and all other applicable Owner, Federal, State and Local requirements, ordinances, statutes and laws.

PART 2 – PRODUCTS

2.1 MATERIALS. Contractor shall provide materials for construction aids. They may be new or used, provided that they are suitable for the intended purpose and do not violate requirements of applicable codes and standards. Maintain facilities and equipment in first-class condition.

2.2 CONSTRUCTION AIDS. Contractor shall provide construction aids and equipment necessary to facilitate the execution of the Work, such as scaffolds, staging, ladders, stairs, ramps, runways, platforms, railings, hoists, cranes, chutes, and other such facilities and equipment. Refer to respective sections for particular requirements for each trade.

When permanent stair framing is in place, provide temporary treads, platforms, and railings for use by construction personnel.

PART 3 - EXECUTION

3.1 PREPARATION. Contractor shall consult with the Engineer, review site conditions and factors that will affect construction procedures, and identify necessary construction aids. Determine if adjacent properties and public facilities will be affected by execution of the Work and develop strategies to address impacts.

3.2 INSTALLATION. Contractor shall install construction aids, where required, and use in accordance with OSHA/MIOSHA requirements and regulations. Relocate construction aids, as construction progresses, if storage or Work requirements change, or to accommodate legitimate requirements of the Engineer, Owner, or other Contractors employed at the site.

3.3 REMOVAL. Completely remove temporary materials, equipment, and services when construction needs can be met by the use of permanent construction and at the completion of the Work. Remove foundations and underground construction aids. Grade areas of the site affected by temporary installations to required elevations and slopes, and clear fire area.

Clean and repair any damage caused by installation or use of temporary facilities. Restore permanent facilities used for temporary purposes to original condition unless otherwise specified.

End of Section

SECTION 01050

PROGRESS SCHEDULES AND PAYMENT SUBMITTALS

PART 1 - GENERAL

1.1 SCOPE. This section adds to and builds upon Article 9: PAYMENTS AND COMPLETION of General Conditions (Exhibit C) of the Agreement. This section also builds upon FORMSPEC 01310, "Progress Schedule (CPM Standard Form)".

1.2 GENERAL.

1.2.01 Progress Schedules. Every 30 days, the contractor shall prepare a package of documents known as the Progress Schedule Submittal. The Progress Schedule package includes three main components, namely Revision, Payment, and Proposal Submittals that are comprised of additional sub-components as listed below.

In many cases, the products in the different submittals duplicate each other. This allows each submittal to be coordinated and evaluated independently of the others. Also, please note that not all submittals are submitted each month.

Revision Submittals – May revise the Record Schedule (Submit every three Months)

Detailed Cost Breakdown

Activity Reports

Schedule of Values

Logic Diagrams

Short Term Schedule

Payment Submittals – Initiates payment to Contractor (Submit Monthly)

Pay Application

Detailed Cost Breakdown

Activity Reports

Schedule of Values

Short Term Schedule

Proposal Submittal – Supports Proposals or Claims for Changes in Contract (Submit one month before Revision Proposal is due or more often as needed)

Detailed Cost Breakdown

Activity Reports

Schedule of Values

Logic Diagram Plots

The activity reports are based on the CPM Progress Schedule and discuss progress by CPM Activity. CPM Schedule requirements are detailed in FORMSPEC Section 01310, "Progress Schedule (CPM Standard Form)."

1.2.02 Initial Progress Schedule (Rev 0). The initial Progress Schedule is known as Rev 0 and, once the documents are reviewed and accepted by the Engineer, becomes the Record Schedule. Any additional modifications to the contract dates, scope, or costs are managed through approval of subsequent Progress Schedule submittals by the Owner.

The Detailed Cost Breakdown is managed initially as a separate submittal from the Rev 0 Submittal and is due 10 days after the Notice to Proceed is issued. However, it becomes part of the Progress Schedule and should be resubmitted with the Rev 0 Submittal which is due five days after the second Progress Payment period closes. The Rev 0 Submittal shall include:

Narrative detailing Contractor's Site Management Plan, Construction Equipment Usage, and Labor Buildup over first three months

Critical Path Method (CPM) Progress Schedule

Detailed Cost Breakout

Schedule of Values

Short-Term Schedules

Logic Diagrams

Resource Plots

1.2.03 Initial Interim Progress Schedule (Interim Rev 0). As an option, if the complete Rev 0 can not be prepared, the Engineer can authorize the submittal of an Interim Rev 0 that includes a Progress Schedule Submittal covering just the first 3 months of the project. If this approach is used, the Interim Rev 0 is due 10 days after the Notice to Proceed is issued.

1.2.04 Payment Submittals. The Contractor shall submit Payment Submittals monthly to the Engineer in accordance with the Agreement Between Owner and Contractor. The Engineer shall establish schedule and cutoff dates for Progress Payment periods.

Payment Submittals shall be typed on Application for Payment forms provided by the Owner, with itemized data typed on 8 1/2-inch x 11-inch (216mm x 279mm), or 8 1/2-inch x 14-inch (216mm x 356mm) white paper sheets.

Provide format, schedules, line items and values as accepted by the Engineer in the Schedule of Valves. Fill in the required information, including that for Change Orders executed prior to date of submittal of application. Fill in summary of dollar values to agree with respective totals indicated on continuation sheets. Execute certification with signature of a responsible officer of Contract firm.

On continuation sheets, fill in total list of all scheduled component items of work, with item number and scheduled dollar value for each item. Fill in dollar value in each column for each scheduled line item when work has been performed or products stored. Round off values to nearest dollar, or as specified for Schedule of Values. List each Change Order executed prior to date of submission at the end of the continuation sheets. List Change Order by number and description as for an original component item of work.

To receive approval for payment on component material stored on site, submit copies of the original paid invoices with the application for payment.

Contractor is to submit a Surety Acknowledgement of Payment Requests letter showing amount of progress payment which the Contractor is requesting and unconditional partial waiver of liens from major subcontractors and vendors through last Progress Payment issued to Contractor.

The first three Payments Submittals shall be based on the DCB and Rev 0 Submittal or Interim Rev 0 Submittal.

1.2.05 Progress Payments. Payment Submittals shall be submitted to the Engineer and a Progress Meeting held within five days after the end of each 30-day Progress Payment period. Progress Payments are initiated by the Engineer based on the Contractor’s Payment Submittal (as modified at the Progress Meeting review). The

Owner will process the final Progress Payment for payment to the Contractor within approximately 30 days of receipt from Engineer.

No Progress Payment will be finalized by the Engineer until he reviews and approves the DCB.

1.2.04 Substantiation of Progress. Payment Submittals shall reflect progress against the Record Schedule (or Rev. 0 Submittal for the first three Payment Submittals). Refer to the Section on Progress Schedule for more information.

The Contractor is to maintain an updated set of Drawings to be used as record Drawings. As a prerequisite for monthly progress payments, the Contractor is to exhibit the updated record Drawings for review by the Owner and the Engineer.

1.2.05 Final Payment. Fill in application form as specified for progress payments. Use continuation sheet for presenting the final statement of accounting as specified in section on Contract Closeout and Cleaning.

1.2.06 Progress Meetings. Progress meetings shall be held with the Engineer and Owner monthly within five working days after the scheduled payment cut-off-date. One of the primary purposes of these meetings is to evaluate actual Work progress in relation to the Progress Schedule and the Contractor's Payment Submittals.

PART 2 - PRODUCTS

End of Section

SECTION 01055

EQUIPMENT RENTAL RATES

PART 1 - GENERAL

1.1 SCOPE. This section describes provisions and general procedures related to determining rates associated with idle equipment or machinery and other contingencies regarding equipment rental rates.

1.1.01 General Conditions of the Contract and Master Specification Section 01180, Equipment, Materials, Parts, and Tools pertain to this Work.

1.1.02 When it is mutually agreed that work has been added to or deleted from the Contract, or the Contractor experiences a compensable delay, it is agreed that the rental rates for equipment or machinery shall be determined as described below.

1.2 GENERAL PROCEDURES. The current edition of the publication entitled, "Rental Rate Blue Book for Construction Equipment" (Blue Book) shall be used to establish the rental rates for each piece of rented machinery or equipment. Dataquest, a company of the Dun and Bradstreet Corporation, 1290 Ridder Park Drive, San Jose, California 95131, publishes the book.

1.2.01 Where leased or rented equipment or machinery is entailed, the rate used to compute payment shall be the actual lease-rental rate or the Blue Book rental rate, whichever is less. The Contractor shall document lease-rental terms. The current edition of the publication entitled, "Contractor's Equipment Cost Guide" shall be used to establish the rental rates for each piece of machinery or equipment owned by the Contractor or a related firm.

1.2.02 In all cases, the equipment rental rates are exclusive of the operator's wages and fringe benefits, but shall include all Owner-related costs defined in the Blue Book. These costs include: purchase price; depreciation; overhead costs such as interest on investments, insurance, property taxes, storage, licensing and record keeping costs; and an allowance for overhaul costs to keep equipment in good operating condition throughout its economic life.

1.2.03 The rental rates allowed herein include the costs of insurance covering the usual insurable risks, including fire and theft. Owner will not be liable for any losses that can be covered by the Contractor's required insurance or for deductible amounts.

1.2.04 The Contractor shall furnish appropriate documentation to the Engineer listing the equipment description, number of actual hours worked each day, total time units, rental rates, and extension (rate times time-units worked) for each unit of equipment engaged. The Contractor's documentation should fully describe each unit of equipment (rating, type of engine, optional equipment, size, manufacturer, model number, type of fuel, horsepower, etc.).

1.2.05 Reimbursement for equipment rental shall cease when the Work Involved is completed.

1.2.06 No rental reimbursement by Owner shall be considered for existing equipment at the site doing Contract Work and not utilized on the extra work.

1.2.07 No rental equipment shall be considered for tools valued at less than $1000, such as hammers, saws, drills, grinders, etc.

1.3 RATE DETERMINATION. For equipment or machinery located at the Work site for Contract Work, but intermittently used to perform extra Work, the hourly rental rate applicable shall be determined by dividing the monthly rental rate by 176. To this base rate shall be added the corresponding monthly-hourly rental rate for any attached equipment (as provided for in the Blue Book Introduction). The sum of these rental rates shall be multiplied by the Area Adjustment Percentage (as defined in the Blue Book Introduction). To that figure shall be added the Estimated Operating Cost per hour (as defined in Article 1.07 of this section). The final sum shall be the Hourly Equipment Rental Rate, exclusive of operator's wages and fringe benefits.

1.3.01 Existing equipment or machinery at the site for Contract Work shall be used for extra work whenever possible.

1.3.02 For equipment or machinery brought to the site specifically to be used on extra work, the hourly rental rate shall be determined basically as defined in Paragraph A above; however, application of these rates shall be determined as follows:

If used on extra work 30 days or more, use the monthly rate;

If used on extra work one week or more, but less than 30 days, use the weekly rate;

If used on extra work less than 7 days, use the daily rate.

1.3.03 Working periods for these calculations shall be considered to be a regular single shift of 8 hours per day, 40 hours per week, 176 hours per month.

1.3.04 Where equipment or machinery is utilized through working periods in excess of the time per period defined in Paragraph D above, the equipment or machinery will be considered as being utilized on overtime. The overtime rate shall be 50 percent of the applicable rental rate. A second or third shift operation shall be considered overtime, unless the equipment or machinery is used only on the additional shift.

1.3.05 Where equipment or machinery is utilized on a monthly or weekly basis and its use is extended only partially into the next period, the base rate shall not increase for the partial period.

1.4 IDLE EQUIPMENT OR MACHINERY. In the event that existing equipment or machinery is idled due to the failure of Owner to properly provide for the Contractor to proceed with the Work in accordance with the Contract, payment may be allowed on a rental basis for the idled equipment. Only existing equipment or machinery idled directly by the extra work shall be eligible for rental reimbursement. For this idled operable equipment or machinery, the Contractor shall receive half the adjusted hourly rental rate, excluding operating cost. Payment will be limited to 8 hours in any one day, 40 hours in any one week, and 176 hours in any one-month.

1.4.01 No payment for idled equipment or machinery shall be made if:

The Contractor suspends the work or removes equipment, machinery, and personnel from the Work that, in the opinion of the Engineer, is necessary for the prosecution of the Work;

The Contractor brings equipment or machinery to the site that is not used and/or required for the Work as determined by the Engineer. Equipment or machinery for standby purposes for which the Contractor wants reimbursement must have the approval of the Engineer prior to delivery to the site;

The Contractor brings equipment or machinery on site before it is required for the Work as determined by the Engineer; or

The Contractor leaves equipment or machinery on site after it is no longer required for the Work as determined by the Engineer.

1.5 OTHER CONTINGENCIES. The following shall apply to all equipment or machinery usage on extra work:

1.5.01 The Estimated Operating Cost per hour includes the following expenses:

All costs for labor and parts for major and minor maintenance, repair and servicing, including but not limited to, repairing, and/or replacing small components such as pumps, carburetors, injectors, motors, gaskets, worn lines, etc.; and

All costs for parts, material, and supplies for operating expendables. This includes fuel, lubrications, filters, oil, grease, and ground engaging components, including tires, pads, blades, bucket teeth, etc.

1.5.02 Owner shall not pay rental reimbursement for transportation vehicles used by officers of the contracting company and their employees to arrive at or depart from the Work site.

End of Section

SECTION 01060

QUALITY CONTROL

PART 1 – GENERAL

1.1 SCOPE. This section defines minimum requirements for the Quality Control (QC) program to be provided by the Contractor. The deliverable documents are defined, along with the method of execution of the QC program.

The Contractor shall schedule and administer a QC program to ensure an acceptable level of quality for all products and services provided, as evidenced by:

> Engineering design performed under subcontractor agreements with the Contractor.
>
> Firm procedures for transmission of data and information to DWSD and subcontractor, and ensuring the subcontractor's compliance therewith.
>
> Adequate testing and verification to ensure uniform product or services conforming to the design requirements.
>
> Total program surveillance and verification of physical conformance and configuration accountability.

The Contractor's QC program shall meet all requirements herein, as well as ISO Standards 9000 and 9001.

The QC program shall apply to all Work provided under this Contract, including components, equipment, systems, services, software, and construction.

Separate payment will not be made for providing and maintaining an effective QC program, and all costs associated therewith shall be included in the applicable unit prices or lump-sum prices contained in the Contract Price Breakdown.

1.2 GENERAL.

1.2.01 Coordination. After the pre-construction conference, before start of Work, and prior to acceptance by the Engineer of the QC Plan, the Contractor shall meet with the Engineer and discuss the Contractor's QC system. The QC Plan shall be submitted for review a minimum of 14 calendar days prior to the QC Plan coordination meeting.

During the meeting, a mutual understanding of the system details shall be developed, including the forms that will be used to record QC operations, control activities, testing, and administration of the system for both on-site and off-site Work. The interrelationship between the Contractor's management and control and the Owner's control specifications will be defined.

Minutes of the meeting shall be prepared by the Engineer and signed by both the Contractor and the Engineer. The minutes shall become a part of the Contract file. There may be occasions when subsequent conferences shall be called by either party to reconfirm mutual understandings, address deficiencies in the QC system or procedures, and determine corrective actions required by the Contractor.

1.2.02 Governing Standards.

ASTM (American Society for Testing and Materials) D3740 – Practice for Minimum Requirements for Agencies Engaged in the Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction.

ASTM E329 – Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction.

ISO Standard 9000

ISO Standard 9001

1.3 SUBMITTALS. The QC organization shall be responsible for certifying that all submittals are in compliance with the contract requirements.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

3.1 PLAN. The Contractor shall prepare and furnish a QC Plan for review by the Engineer, not later than 30 calendar days after receipt of Notice to Proceed. The plan shall identify personnel, procedures, controls, instructions, tests, records, and forms to be used. The Engineer will consider an interim plan for the first 30 calendar days of operation. Work will be permitted to begin only after acceptance of the QC Plan or an interim plan applicable to the particular phase of Work to be started. Work outside of the phase of Work included in an accepted interim plan will not be permitted to begin until the QC Plan or another interim QC plan containing the additional phases of Work to be started is approved.

The QC Plan shall include, as a minimum, the following to cover all design and construction operations, both on-site and off-site, including Work by designers, consultants, subcontractors, fabricators, suppliers, and purchasing agents:

A description of the QC organization, including a chart showing lines of authority and acknowledgment that the QC staff shall implement the three phase control system discussed below for all aspects of the Work specified. The staff shall include a QC Officer who shall report to the project manager or executive.

The name, qualifications (in resume format), duties, responsibilities, and authorities of each person assigned a QC function shall be provided to the Engineer.

A copy of the letter to the QC Officer signed by an authorized official of the firm which describes the responsibilities and delegates sufficient authorities to adequately perform the functions of the QC Officer, including authority to stop Work which is not in compliance with the Contract. The QC Officer shall issue letters of direction to all other various QC representatives outlining duties, authorities, and responsibilities. Copies of these letters will also be furnished to the Engineer.

Procedures for scheduling, reviewing, certifying, and managing submittals, including those of designers, subconsultants, subcontractors, off-site fabricators, suppliers, and purchasing agents. These procedures shall be in accordance with section on Project Submittals.

Control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, phase of Work to be tested, test frequency, and person responsible for each test.

Procedures for tracking preparatory, initial, and follow-up control stages and control, verification, and acceptance tests including documentation shall also be furnished to the Engineer.

Procedures for tracking construction deficiencies from identification through acceptable corrective action. These procedures will establish verification that identified deficiencies have been corrected.

Reporting procedures, including proposed reporting formats.

A list of the definable phases of Work. A definable phase of Work is a task, which is separate and distinct from other tasks and has separate control requirements. It could be identified by different trades or disciplines, or it could be Work by the same trade in a different environment. Although each section of the specifications may generally be considered as a definable phase of Work, there are frequently more than one definable phase under a particular section. This list will be agreed upon with the Engineer.

Acceptance of the Contractor's QC Plan is required prior to the start of Work. Acceptance is conditional and will be predicated on satisfactory performance throughout the Work. The Engineer reserves the right to require the Contractor to make changes in its QC Plan and operations including removal of personnel, as necessary, to obtain the quality specified.

After acceptance of the QC Plan, the Contractor shall notify the Engineer in writing of any proposed change. Proposed changes are subject to acceptance by the Engineer.

3.2 ORGANIZATION. The requirements for the QC organization are a QC Officer and sufficient number of additional qualified personnel to ensure contract compliance. The Contractor shall provide a QC organization which shall be physically available at all times during progress of the Work and with complete authority to take any action necessary to ensure compliance with the Contract. All QC staff members shall be subject to acceptance by the Engineer.

The Contractor shall identify as QC Officer an individual within its organization who shall be responsible for overall management of QC and have the authority to act in all QC matters for the Contractor. The QC Officer shall be a licensed professional engineer or capable of obtaining such license within one year, and have a minimum of 5 years construction experience on construction similar to this Contract. This QC Officer shall be physically available at all times during the execution of Work and shall be an employee of the Contractor. An alternate for the QC Officer will be identified in the plan to serve in the event of the QC Officer's absence. The requirements for the alternate will be the same as for the designated QC Officer.

In addition to QC personnel specified elsewhere in the Contract, the Contractor shall provide as part of the QC organization specialized personnel to assist the QC Officer for the following areas: electrical, mechanical, process, civil, environmental, architectural, and a materials technician. These individuals shall be employed by the Contractor; be responsible to the QC Officer; be physically present during the execution of Work on their areas of responsibility; have the necessary education and experience in accordance with the experience matrix listed herein. These individuals may perform other non-conflicting duties but must be allowed sufficient time to perform their assigned QC duties as described in the QC Plan. Except for the materials technician, each of these individuals shall have a four year college degree from an accredited program in their respective disciplines, and five years of experience in their respective disciplines. The materials technician shall have a minimum of two years of experience.

The Contractor shall maintain its QC staff at full strength at all times. When it is necessary to make changes to the QC staff, the Contractor shall revise the QC Plan to reflect the changes and submit the changes to the Engineer for acceptance.

3.3 IMPLEMENTATION. The QC Plan calls for at least three distinct phases of control to be conducted by the QC Officer for each definable phase of Work.

3.3.01 Preparatory Phase. This phase shall be performed prior to beginning each definable phase of Work, after all required plans, documents and materials are accepted. This phase shall include:

A review of each paragraph of the applicable contract documents.

A review of the contract drawings and construction documents.

A check to assure that all materials and/or equipment have been tested, submitted, and approved.

Review of provisions that have been made to provide required control inspection and testing.

Examination of the Work area to assure that all required preliminary Work has been completed and is in compliance with the Contract.

A physical examination of required materials, equipment, and sample Work to assure that they are on hand, conform to approved shop drawings or submitted data, and are properly stored.

A review of the appropriate activity hazard analysis to assure safety requirements are met.

Discussion of procedures for controlling quality of the Work including repetitive deficiencies. Document construction tolerances and Workmanship standards for that phase of Work.

A check to ensure that the portion of the plan for the Work to be performed has been accepted by the Engineer.

Discussion of the initial control phase.

The Engineer shall be notified at least 48 hours in advance of beginning the preparatory control phase. This phase shall include a meeting conducted by the QC Officer and attended by the superintendent, other QC personnel (as applicable), and the foreman responsible for the Work phase. The results of the preparatory phase actions shall be documented by separate minutes prepared by the QC Officer and attached to the daily QC report. The Contractor shall instruct applicable Workers as to the acceptable level of Workmanship required in order to meet contract specifications.

3.3.02 Initial Phase. This phase shall be accomplished shortly after construction is underway for a definable phase of Work. The following shall be accomplished:

A check of Work underway to ensure that it is in full compliance with contract requirements. Review minutes of the preparatory meeting.

Verify adequacy of controls to ensure full contract compliance. Verify required control inspection and testing.

Establish level of Workmanship and verify that it meets minimum acceptable Workmanship standards. Compare with required samples as appropriate.

Resolve all differences.

Check safety to include compliance with and upgrading of the safety plan and activity hazard analysis. Review the activity hazard analysis with each Worker.

The Engineer shall be notified at least 48 hours in advance of beginning the initial phase. Separate minutes of this phase shall be prepared by the QC Officer and attached to the daily QC report. Exact location of initial phase shall be indicated for future reference and comparison with follow-up phases.

The initial phase should be repeated for each new crew to Work on-site, or any time acceptable specified quality standards are not being met.

3.3.03 Follow-up Phase. Daily checks shall be performed on an ongoing basis to assure control activities, including control testing, are providing continued compliance with contract requirements, until completion of the particular phase of Work. The checks shall be made a matter of record in the QC documentation. Final follow-up checks shall be conducted and all deficiencies corrected prior to the start of following Work phases which may be affected by the deficient Work. The Contractor shall not build upon or conceal non-conforming Work.

The Preparatory and Initial Phases shall be re-accomplished as necessary for a phase of Work if the quality becomes unacceptable, the applicable QC staff, on-site production supervision or Work crew changes, Work is resumed after a substantial period of inactivity, or other problems develop.

3.4 TESTS. The Contractor shall perform specified or required tests to verify that control measures are adequate to provide a product which conforms to contract requirements. Upon request, the Contractor shall furnish to the Engineer duplicate samples of test specimens for possible testing by the Engineer. Testing includes operation and acceptance tests when specified. The Contractor shall procure the services of a testing laboratory or establish a testing laboratory at the project site, which is acceptable to the Engineer. The Contractor shall perform the following activities and record and provide the following data:

Verify that testing procedures comply with Contract requirements.

Verify that facilities and testing equipment are available and comply with testing standards.

Check test instrument calibration data against certified standards.

Verify that recording forms and test identification control number system, including all of the test documentation requirements, have been prepared.

Record results of all tests taken, both passing and failing tests, on the QC report for the date taken. Specification paragraph reference, location where tests were taken, and the sequential control number identifying the test will be given. If acceptable to the Engineer, actual test reports may be submitted later with a reference to the test number and date taken. An information copy of tests performed by an off-site or commercial test facility will be provided directly to the Engineer.

Failure to submit timely test reports as stated may result in nonpayment for or rejection of related Work performed.

Materials and equipment used in the performance of Work under this Contract are subject to inspection and testing by the Contractor at the point of manufacture or fabrication. If Work done away from the construction site is to be inspected on behalf of DWSD during its fabrication, manufacture, testing, or before shipment, the Contractor shall give notice to the Engineer of the place and time where such fabrication, manufacture, testing, or shipping is to be done. Such notice shall be in writing and delivered to the Engineer 30 days in advance so that the necessary arrangements for the inspection can be made.

Standard specifications for quality and Workmanship are indicated in the Contract Documents and Construction Documents. The Engineer may require the Contractor to provide statements or certificates from the manufacturers and fabricators that the materials and equipment provided by them are manufactured or fabricated in full accordance with the standard specifications for quality and Workmanship indicated in the Contract Documents and Construction Documents.

All costs for testing and providing statements and certificates shall be the sole obligation of the Contractor, and no extra charge to DWSD shall be allowed on account of such testing and certification.

3.4.01 Testing Laboratories. Laboratories utilized for testing soils, concrete, asphalt, and steel shall meet criteria detailed in ASTM D3740 and ASTM E329.

3.4.02 On-Site Laboratory. The Owner reserves the right to utilize the Contractor's control testing laboratory and equipment to make assurance tests and to check the Contractor's testing procedures, techniques, and test results at no additional cost to the Owner.

3.4.03 Transportation of Samples for Testing. Costs incidental to the transportation of samples or materials will be borne by the Contractor. Samples of materials for test verification and acceptance testing by the Engineer shall be delivered to the Engineer.

3.4.04 Independent Testing Laboratories. In addition to testing performed by the Contractor, the Engineer may retain the services of an Independent Testing Laboratory (ITL) to perform additional testing, and may at any time elect to have materials and equipment tested for conformity with the Contract Documents.

The Contractor shall cooperate with the Engineer and the Laboratory to facilitate the execution of its required services.

Employment of the ITL shall in no way relieve Contractor's obligations to perform testing, QC, and all other aspects of the Work of the Contract.

ITL’s are not authorized to release, revoke, alter or enlarge on requirements of Contract Documents; approve or accept any portion of the Work; or perform any duties of the Contractor.

3.4.05 Contractor’s Responsibilities in Support of ITL's. Contractor shall cooperate with ITL personnel and provide access to Work or Manufacturer's operations.

Contractor shall secure and deliver to the ITL, adequate quantities of representative samples of proposed materials that require testing.

Contractor shall provide to the ITL, the preliminary design mix proposed to be used for concrete and other materials that require control by a testing laboratory.

Contractor shall furnish incidental labor and facilities to provide access to Work-to-be-tested; obtain and handle samples at the Project site or at the source of the product to be tested; facilitate inspections and tests; and store and cure samples.

Contractor shall notify the Engineer sufficiently in advance of operations to allow for ITL assignment of personnel and scheduling of tests. When tests or inspections cannot be performed due to inadequate notice, Contractor shall reimburse DWSD for ITL personnel and travel expenses incurred due to Contractor's negligence.

The Contractor is deemed to have included in its bid price sufficient monies for furnishing incidental labor, equipment, materials and facilities necessary to support all ITL services.

If the tests and any subsequent re-tests indicate the material or equipment fail to meet the requirements of the Contract Documents, the Contractor shall be liable to DWSD for the ITL costs as well as the cost to remove and replace or repair the substandard materials or equipment.

3.5 COMPLETION INSPECTION.

3.5.01 Final Completion Punch List. Near the completion of all Work, or any portion of Work for which a separate final completion is specified, the QC Officer shall conduct an inspection of the Work and develop a "punch list" of items which do not conform to the approved drawings and specifications. Such a list of deficiencies shall be included in the QC documentation below, and shall include the estimated date by which the deficiencies will be corrected. The QC Officer or staff shall make a second inspection to ascertain that all deficiencies have been corrected. Once this is accomplished the Contractor shall notify the Engineer that the facility is ready for the Engineer’s final inspection.

3.5.02 Final Inspection and Acceptance. The Contractor's QC Officer and the Engineer will be in attendance at this inspection. Additional Engineer personnel may also be in attendance. The final acceptance inspection shall be formally scheduled by the Engineer when all punch list deficiencies have been corrected. Notice shall be given to the Engineer at least 14 days prior to the final inspection and must include the Contractor's assurance that all punch list items will be complete and acceptable by the date scheduled for the final inspection. Failure of the Contractor to have all Contract Work, or any portion of Work for which a separate final completion is specified, completed for this inspection, shall be cause for noncertification of final payment by the Engineer.

3.6 DOCUMENTATION. The Contractor shall maintain current records providing factual evidence that required QC activities and tests have been performed. These records shall include the Work of designers, subconsultants, subcontractors, and suppliers and shall be on an acceptable form that includes, as a minimum, the following information as applicable:

Contractor, designer, consultant, subcontractor and their area of responsibility.

Operating plant/equipment with hours worked, idle, or down for repair.

Work performed each day, giving location, description, and by whom. Identify each phase of Work performed each day by activity number. Indicate the trades and number of personnel working on the project; weather conditions encountered; and any delays encountered.

Test and control activities performed with results and references to specifications/drawings requirements. The control phase should be identified (Preparatory, Initial, Follow-up). List deficiencies noted along with corrective action.

Quantity of materials received at the site with statement as to acceptability, storage, and reference to specifications and drawings requirements.

Submittals reviewed, with contract reference, by whom, and action taken.

Off-site surveillance activities, including actions taken.

Job safety evaluations stating what was checked, results, and instructions or corrective actions.

Instructions given and received and conflicts in plans and specifications.

Contractor's verification statement.

These records shall cover both conforming and deficient features and shall include a statement that equipment and materials incorporated in the Work and Workmanship comply with the contract.

The original and one copy of these records in report form shall be furnished to the Engineer daily within one Work day after the date(s) covered by the report. During periods when no work is being performed, a report shall be prepared and submitted for every seven days that no Work occurs on the last day of each no Work period. All calendar days shall be accounted for throughout the life of the contract. The first report following a day of no Work shall be for that day only. Reports shall be signed and dated by the QC Officer. The report from the QC Officer shall include copies of test reports and copies of reports prepared by all subordinate QC personnel.

Contractor shall provide copies of all QC reports, results and records as requested by the Engineer.

A complete set of indexed QC reports shall be provided to the Engineer within 60 days after Certification of Substantial Completion is submitted and all reports shall be filed in cabinets in ascending order. Three complete sets of indexed QC reports shall be submitted to the Engineer within 60 days.

3.7 NOTIFICATION OF NONCOMPLIANCE. The Engineer will notify the Contractor of any detected noncompliance with these requirements. The Contractor shall take immediate corrective action after receipt of such notice. Such notice, when delivered to the Contractor, shall be deemed sufficient for the purpose of notification. If the Contractor fails or refuses to comply promptly, the Engineer may issue an order stopping all or part of the Work until satisfactory corrective action has been taken. No part of the time lost due to such stop orders shall be made the subject of claim for extension of time or for excess costs or damages by the Contractor.

End of Section

SECTION 01070

PROJECT COORDINATION AND MEETINGS

PART 1 - GENERAL

1.1 SCOPE. This section specifies the requirements of the Contractor to coordinate Work with other construction projects at other DWSD facilities, and with all other jurisdictional authorities involved in the Work as applicable. The Contractor shall also coordinate work with DWSD operation and maintenance activities at the site.

Certain meetings are also defined in this section that need to be held on a recurring basis to track progress, resolve problems, and coordinate work.

1.2 GENERAL.

1.2.01 Coordination. The Contractor shall cooperate with DWSD and Engineer in allocation of mobilization areas onsite for field offices and sheds, access, traffic, storage areas and parking facilities.

Comply with the Engineer's procedures for inter and intra-project communications to include submittals, reports, records, schedules, coordination drawings, recommendations, and resolution of ambiguities/conflicts.

Coordinate field engineering and layout work under instructions of Engineer.

Coordinate scheduling, submittals and work of the various sections of Contract Documents to insure orderly sequence of development, design, and installation of construction activities.

Coordinate sequence of Work to accommodate DWSD or Owner occupancy as specified in General Conditions.

In addition to Progress Meetings, hold pre-construction conferences and Coordination Meetings with personnel and sub-contractors to assure coordination of Work. The Engineer shall be informed of such and shall be allowed to attend.

Coordinate the work of various sections having interdependent responsibilities for installing equipment, connecting equipment, and placing such equipment in service.

Coordinate use of project space and sequence of civil, architectural, mechanical, structural, instrumentation, systems and electrical installation work. Follow available physical space during routings for pipes, ducts, and conduits. Runs shall be parallel with lines of building. Utilize space efficiently to maximize accessibility for other installations, maintenance, and repairs.

Coordinate substantial work completions, including corresponding field performance certification testings, cleanings and other elements of such work in preparation for acceptance.

After DWSD occupancy of premises, coordinate work in existing facilities to minimize disruption of DWSD's operations. Coordinate access to site for correction of defective work.

1.3 PROJECT MEETINGS. Project meetings shall be held as specified herein to review project progress, to ensure correct interpretation of these documents, and to maintain general coordination of DWSD's personnel to Contractor's project personnel. The agenda will serve to indicate which project members should be present at each meeting.

1.3.01 Preconstruction Conference. Following Contract award, the Engineer will schedule a preconstruction conference.

Attendees shall include the Owner or his representative, Engineer or his representatives, Design Consultant(s), Inspectors, Contractor, Superintendent, subcontractors, suppliers, utilities, and others as appropriate.

The suggested Agenda should address the following issues at a minimum:

Letters for Notice to Proceed, Designated Engineer by DWSD, and Field Engineer/Representative.

Distribution and discussion of major subcontractors and suppliers (furnish list).

Projected construction schedules including mobilization and detailed schedule for first two weeks.

Regulatory requirements affecting the Project.

Critical work sequencing and related concerns.

Major equipment deliveries and priorities.

Designation of personnel responsible for project coordination.
Procedures for and processing of field decision, proposal requests, submittals, change orders, and applications for payment.

Adequacy for distribution of Contract documents.

Questions regarding Contract documents.

Procedures for maintaining record documents, samples and manuals.

Use of premises for office, work and storage areas, and Owner’s requirements.

Construction facilities, control and construction aids.

Temporary utilities.

Security and housekeeping procedures.

Check of required bond and insurance certifications.

Liquidated damages.

Request for a monthly job meeting for all involved.

Equal opportunity requirements.

Procedures for laboratory testing of material requirements.

Inventory of material stores on site provisions.

Posting of Government funding sign.

Owner’s requirements for occupancy.

Requirements for start-up of equipment.

Inspection, acceptance and warranties of equipment put into service during construction period.

Project close-out requirements.

Safety and first-aid procedures.

Any other appropriate items or subjects that require the attention and attendance of the Contractor and major subcontractor prior to commencing construction.

1.3.02 Progress Meetings. The Engineer will schedule and administer monthly progress meetings throughout progress of the Work within five working days after the scheduled payment cut-off date. More frequent progress meeting may be required

should the contractor fall behind schedule. The Engineer will prepare agenda, preside at the meeting, record minutes, distribute notice of each meeting to participants, four working days in advance of meeting date and deliver copies of the minutes to participants after the meeting.
Meetings shall be held at the Contractor's field office. The contractor shall provide adequate facility to accommodate a minimum of fifteen (15) people.

Attendance for the Progress Meetings shall include the Contractor, project superintendent, subconsultants, sub-contractors, suppliers, Engineer, job site inspectors, and professional consultants as appropriate.

Suggested Agenda:

Review and approval of minutes of previous meeting.

Discuss safety, problems, conflicts, and comments.

Review of work progress since previous meeting.

Discuss field observations, problems and conflicts.

Discuss problems which impede construction schedule.

Review of off-site fabrication and delivery schedules.

Discuss corrective measures and procedures to regain project schedule.

Discuss revisions to construction schedule.

Discuss progress and schedule during succeeding work period.

Coordinate schedules.

Review submittal schedules, expedite as required.

Discuss maintenance of quality standards.

Discuss pending changes and substitutions.

Review proposed changes for effect on construction schedule, completion date, and other contracts.

Discuss other business.

Discuss construction schedule and CPM network.

Discuss critical/long lead items.

The contractor shall be prepared for progress meetings and ready to discuss pertinent topics such as current agenda items, previous meeting minutes, materials deliveries, equipment, and work progress.

The Contractor shall provide a current submittal log at each progress meeting in accordance with Section Project Submittals.

The Contractor shall prepare and submit a 3 week look-ahead schedule in bar chart format for each progress meeting. The look-ahead schedule shall address specific construction activities planned for the succeeding three week period with emphasis on operations involving tie-ins to existing facilities, interference with plant operations and coordination with other construction contracts.

The Contractor shall prepare a brief written narrative report relating to the status of construction, submittals, approvals and procurement. This report shall indicate areas where any problems exist or are anticipated, and shall prescribe action required by the Owner, Engineer, or Contractor.

1.3.03 Coordination Meetings. The Engineer will schedule and administer coordination meetings as needed whenever the workload or progress of the work requires additional coordination effort.

The Engineer will prepare the agenda, preside at the meeting, record minutes and distribute copies after the meeting to participants.

Attendees shall include the Contractor, project superintendent, consultants, subcontractors, suppliers; Engineer, Engineer’s representatives and consultants as appropriate.

The Engineer will determine the agenda for each coordination meeting on a case by case basis. Typical issues that may be included are:

Approval of minutes of previous Project Coordination Meetings.

Resolution of problems that impede planned progress.

Review the interpretation of the Contract Documents to ensure correct compliance.

Review change order status.

Review progress payments.

Review Project Schedule for completed and upcoming milestones.

Review cost impact of potential contract changes.

Review meeting minutes from Progress Review Meetings.

Review program management and implementation.

1.3.04 Coordination Drawings. Provide information required by the Engineer for preparation of coordination drawings.

1.3.05 Pre-Installation Conferences. Contractor shall convene pre-installation conferences at work sites prior to commencing new phases of the Work. Attendance is required from entities directly affecting, or affected by Work. Notify Engineer five working days in advance of meeting date. Prepare agenda, preside at conference, record minutes, and distribute copies within one week after conference to participants, with two copies to Engineer. Review conditions of installation, preparation and installation procedures, and coordination with related Work.

1.4 SUBMITTALS. Submit requests for interpretation of Contract Documents in a timely fashion to ensure no disruptions with the Work as scheduled. Obtain instructions through the Engineer to resolve all queries.

Comply with DWSD's instructions for completion of items of Work found incomplete in the Engineer's final inspection.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

Not used.

End of Section

SECTION 01080

PROJECT SUBMITTALS

PART 1 - GENERAL

1.1 SCOPE. The Contractor shall prepare and manage submittals in accordance with this section and Article 4.8 – “Shop Drawings, Product Data and Samples” of the General Conditions (Exhibit C) of the Agreement.

1.2 GENERAL.

1.2.01 Overview. Submittals are required documents or products that must be submitted to the Engineer for review by the Contractor before construction or a facet of construction, equipment installation, or related activity can proceed.

Submittals fall into two main categories. The first category consists of administrative plans that show how the Contractor will manage various aspects of the construction process. These submittals are submitted early in the process before construction has progressed very far. The second category consists of technical submittals that include shop drawings, product data, certifications, samples, test reports, and mock-ups. Technical submittals provide detailed information on the actual construction of the project or installation of specific equipment.

The Contractor shall not proceed with the fabrication, procurement of equipment, procurement of materials, or facility modifications, until submittals have been reviewed and approved by Engineer. The Contractor shall be responsible for and bear all cost of damages which may result from ordering any materials or proceeding with any part of work prior to the completion of the review of necessary submittals by the Engineer.

The Engineer's approval will be for the purpose of minimizing changes and project delays in the field, and shall in no way relieve the Contractor of full responsibility for providing a complete, safe, reliable, operating and fully coordinated project (system/ equipment/facilities) which is in compliance with these contractual documents.

1.3 SUBMITTALS.

1.3.01 Administrative Submittals. The Contractor shall submit to the Engineer the applicable administrative documents listed below:

Certifications

Project Management Plan
Project Control Reports

Subcontractor Consent Requests

Progress Schedule

Schedule of Values and Detailed Cost Breakdown

Training Plan

Safety Plan

Confined Space Entry Plan

Progress Payment Requests

Cost Forecasts

Bonds

Insurance Policies

Quality Control Plan

Test and Inspection Reports

Minutes of Design Review Meetings

Daily Field Inspection Reports

Construction Photographs

Affidavits of compliance with City of Detroit withholding tax requirements.

These documents are described in more detail in the General Conditions and other Division 1 Specifications.

1.3.02 Product Information and Performance Data. The Contractor shall submit product documentation to Engineer. The information shall cover all items as called for in the Contract Documents. The submittal information shall show the standard and optional product features, as well as all performance data and specifications. Drawing and schedule submittals shall be checked and coordinated with the work of all trades involved before they are submitted for review by the Engineer. All submittals shall bear the Contractor's stamp and approval as evidence of such checking and coordination. Submittals without this stamp of approval shall be returned to the Contractor for resubmission. Approval of the Contractor's documents by Engineer shall not relieve the Contractor of the responsibility to meet all the requirements of the Contract Documents.

1.3.03 Software and Firmware Submittal. The Contractor shall submit complete documentation on the operation and use of all software and firmware contained in equipment furnished under this Contract. All software and firmware shall be supported by the Contractor for at least five (5) years after Engineer acceptance of all work. The Contractor shall also submit licensing in the name of the Engineer (City of Detroit, Water and Sewerage Department) for all purchased software packages and all software and firmware developed for the Engineer. The Contractor shall submit source code, documentation, editor and warranty for all developed software.

1.3.04 Preliminary Submittal List. Within thirty (30) calendar days after Notice to Start Work, the Contractor shall submit to the Engineer a complete list of preliminary submittal data for this contract. Included in this list shall be the names of all proposed manufacturers furnishing specified items. Review of this list by the Engineer shall in no way, express or implied, relieve the Contractor from submitting complete Shop Drawings in accordance with the Specifications. This procedure is only required to expedite review of Shop Drawings.

1.4 REQUIREMENTS AND FORMAT OF SUBMITTALS.

1.4.01 Drawing Format and Media. Refer to Master Specification Section 01020, Documentation Standards for drawing format and media.

1.4.02 Shop Drawings. Shop drawings shall convey, or be accompanied by, calculations or other sufficient information to completely explain the structure, machine, or system. Prior to commencing such work, shop drawings must have been reviewed without specific exception by the Engineer. Review will be for general conformance and will not relieve the Contractor in any way from his responsibility with regard to the fulfillment of the terms of the Contract. All risks of error are assumed by the Contractor.

Submit a minimum of 10 hard copies plus the number of copies required by the Contractor and one electronic copy of each shop drawing to DWSD/Owner's Representative for review and approval. Detailed calculations for the shop drawings shall be stamped by a registered Professional engineer in the State of Michigan

1.4.03 Working Drawings. When used in the Contract Documents, the term "Working Drawings" shall be considered to mean the Contractor's plans for construction activities. Construction activities include but are not limited to temporary structures, support of open cut excavation, support of utilities, ground water control systems, forming underpinning and for such other work as may be required for construction but does not become an integral part of the Project.

Working drawings shall be signed and sealed by a Registered Professional Engineer, currently licensed to practice in the State of Michigan. The drawings shall convey, or be accompanied by, calculations or other sufficient information to completely explain the structure, machine, or system described and its intended manner of use. Prior to commencing such work, working drawings must have been reviewed without specific exception by the Engineer. Review will be for general conformance and will not relieve the Contractor in any way from his responsibility with regard to the fulfillment of the terms of the Contract. All risks of error are assumed by the Contractor.

Submit a minimum of 5 copies to DWSD or Engineer, and 6 copies plus the number of copies required by the Contractor to the Owner's Representative of each shop drawing for review and approval.

1.4.04 Product Data. Product data shall include all catalog cuts, performance curves, test reports, equipment lists, material lists, diagrams, pictures, and descriptive material. All product data shall be submitted on either 8.5 x 11 inch (216 mm x 279 mm) or folded 11 x 17 inch (279 mm x 432 mm) size paper of 20 lb. weight. The product information shall cover but is not limited to all items including mechanical devices, mounting components, wiring, terminal strips, connectors, accessories, and spare parts. The submittal information shall show standard and optional product features, as well as performance data and specifications. The product information described in Subsection 1.4.12 below shall be marked on all product data sheets. Do not submit general catalogs; only items to be installed or delivered.

Submit a minimum of 5 copies to DWSD or Engineer, and 6 copies plus the number of copies required by the Contractor to the Reviewer of each product information data sheet for review and approval.

1.4.05 Samples. The Contractor shall furnish, for approval of the Engineer, any samples required by the Contract Documents or requested by the Engineer. Samples shall be delivered to the Engineer as specified or directed.

All samples shall be of sufficient size and quantity to clearly illustrate the functional characteristics of the product, with integrally related parts and attached devices. The samples shall show the full range of colors, textures and patterns.

A minimum of 2 samples to DWSD and 2 sample to the Reviewer/Engineer of each sample product submitted for review and approval. All samples shall be marked with required submittal information, as required in Article 1.4.12 below. The materials or equipment of which samples are required shall not be used in the work until approved by the Engineer.

1.4.06 Color, Texture and Pattern Charts. The Contractor shall submit color texture, or pattern charts of all required finishes.

A minimum of two (2) charts to DWSD or Engineer, and two (2) charts to the Reviewer of each product chart submitted for review and approval.

1.4.07 Final Record (As-Built) Drawings. The Contractor shall submit the Final As-Built Drawing Package to the Engineer for review and approval 60 days after project elements or system acceptance by the Engineer. The Final As-Built Package shall contain two (2) reproducible mylars and six (6) black lines on 20 lb. bond paper. Refer to Master Specifications Section 01190, Contract Closeout and Cleanout for additional information. The as-builts need to be sized D drawings and in electronic format.

1.4.08 Operation & Maintenance Manual. The Contractor shall submit to Engineer, for approval, manufacturer's installation, operation, lubrication, maintenance & training manuals for all equipment installed or delivered under contract.

1.4.09 Manufacturer Instructions. Submit the manufacturer's instructions for storage, installation, adjustment, etc. as required elsewhere in the Specifications for the individual items.

1.4.10 Equipment Listing. Submit an equipment listing including each specified item, the manufacturer's name and model No., and any additional information regarding options, ratings, sizes, etc. Organize the list in order of specification section.

1.4.11 Certified Tests. Submit certified results of the tests, specified elsewhere, on the individual items/systems.

1.4.12 Submittal Information Requirements. When used in the Contract Documents, the term "Submittal Information" shall be considered to mean the following information:

Contract Name.

Contract Number.

Plant, Station or Location Name.

Location within facility.

Date Submitted.

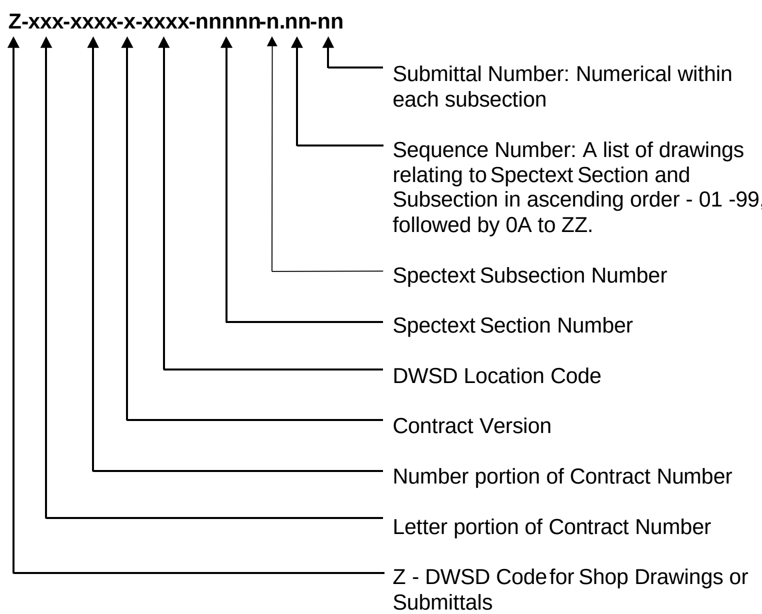
Spectext Section and Subsection Number.

DWSD Z-file Number.

The Contractor shall mark submittal information on all drawings in the area provided in the left half of the 6 inch x 3 inch (15.2 cm x 7.6 cm) block.

The Contractor shall mark all product data and manufacturer's literature with the submittal information, and note what item is being furnished. The Contractor shall mark what option and supplies are being furnished with each item. At least one original manufacturer’s product data sheet must be submitted, the balance can be copies. Do not submit manufacturer's general catalogs, submit only items being installed or delivered. When manuals are being submitted, the Contractor shall mark submittal information on both the cover and title page. If the manual being submitted contains more than just one item, each item must be marked, and only the contract name and number shall be marked on the cover title page.

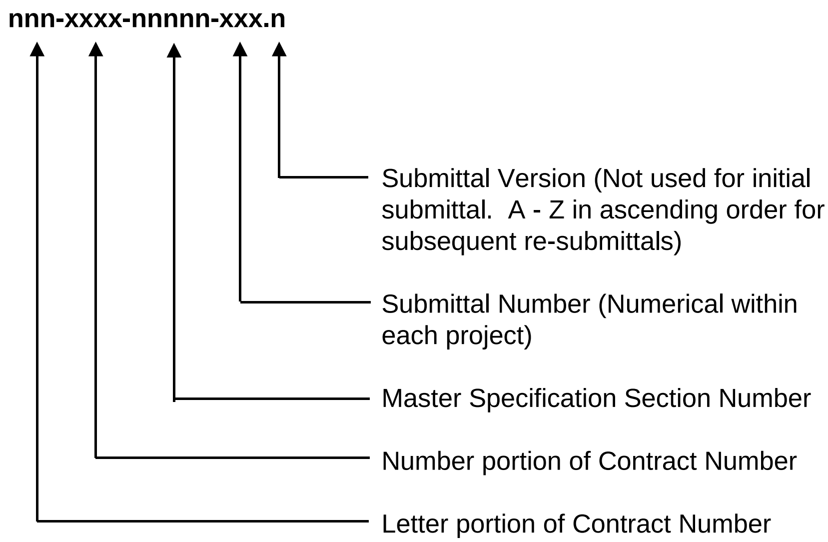
1.4.13 <u>DWSD Z-file Format</u>. DWSD Z-File format shall be identified on each submittal by Contractor to DWSD for review.



<u>Example</u>: Z-WWO-0533-0-S001-15100-2.03-06

This is the information required for gate valves submitted as specified on page 15100-3 of Contract No. 533. The last two digits (06) represent the sixth submittal for that subsection to be submitted.

1.4.14 <u>Streamlined DWSD Submittal Format</u>. With the approval of the Engineer, the Contractor shall use the following streamlined format to identify and track submittals. The submittal identification must be included on all submittals provided by the Contractor to the Engineer for review.



Example: WWO-0533-15104-018

This is the information required for resilient-seated gate valves submitted as Submittal No. 18 under Contract No. WWO 533. The gate valves submitted are specified under Master Specification Section 15104. This is the first submittal so no alphanumeric suffix is shown. If the Engineer requires the submittal to be amended and resubmitted, the Contractor will resubmit as WWO-0533-15104-018.A.

1.4.15 Submittal Quality: All submittals shall be submitted in a readable and legible quality. Any submittal which the Engineer considers not of acceptable quality will be returned to the Contractor for replacement without review.

Facsimile (fax) transmittals or copies of fax transmittals are not acceptable as submittals.

Xerographic copies must be of good quality (3rd generation copy shall be clear and legible) and at least one copy of manufacturer’s original product data sheets must be included with each submittal. All copies shall be on 20 lb (9.1 kg) white bond paper.

1.5 SCHEDULES. The Contractor shall prepare and maintain all schedules required by the Contract Documents and submit schedules for review and approval in appropriate format.

1.5.01 Construction Progress Schedules. The Contractor shall submit a construction progress schedule with separate items for each operation, identifying the first day of work.

A complete sequence of construction, identifying work of separate stages and other logical groups together shall be shown on the schedule.

The Contractor shall submit a projected percentage of completion for each item of work at the time each progress payment is submitted.

The Contractor submittal dates shall be marked on all shop drawings, product data, samples, schedules, and shall include projected product delivery dates.

The Contractor shall submit for approval a network analysis system using critical path method, as outlined in AGC publication "The Use of CPM in Construction - A manual for General Contractors".

1.5.02 Schedule of Equipment. On approved software application, the Contractor shall submit on both paper and disk a schedule of all major components and subsystems installed or delivered under this contract. The schedule shall be compiled with approved software application and shall include the name of the item, manufacturer, a model number, serial numbers, location, and function. The Contractor shall submit the schedule to the Engineer for approval, and final copy shall be submitted with the project record documents and software.

1.5.03 Schedule of Valves. On approved software application, the Contractor shall submit on both paper and disk a schedule of all valves installed or serviced under this contract. The schedule shall be compiled with an approved software application and shall include manufacturer, model, type, pressure rating, location, and type of operator.

1.5.04 Schedule of Instruments. On approved software application, the Contractor shall submit on both paper and disk a schedule of all instruments installed, serviced, modified or replaced under this contract. The schedule shall be compiled with an approved software application and shall include manufacturer, model, type, instrument range, location, and function.

1.6 SPECIFIC SUBMITTAL REQUIREMENTS BY DIVISION. The Contractor shall submit for review and approval all specified product data sheets, catalog cuts, manufacturers' manuals, and all other items which would affect the performance or operation of the equipment or system.

1.6.01 Process Instrumentation and Control Submittals. The Contractor shall submit all process instrumentation and control data to ensure contractual compliance with the requirements of the contract. The submittals shall include support system testing, installation instructions, integration, and system acceptance testing, beginning with the factory acceptance and continuing through the final system acceptance.

Instrument Loop Diagrams: The Contractor shall provide diagrams for all discrete loops, with special emphasis on device elements and their functions to provide understanding of the operation, maintenance, and troubleshooting.

Connection Diagrams: The Contractor shall provide connection diagrams showing component arrangement and internal wiring between devices.

Interconnection Diagrams: Interconnection diagrams shall be provided by the Contractor for all field wiring and wire codes.

Process and Instrumentation Diagrams: The Contractor shall provide diagrams showing all existing and new instrumentation.

Ladder Diagrams: The Contractor shall provide ladder logic diagrams for all logic control circuits.

Panel Detail Drawings: The Contractor shall provide detailed drawings for all panels provided. These drawings shall include all panel mounting devices, and all interior equipment and wiring.

Instrumentation Schedules: The Contractor shall submit instrument schedules for all instruments.

Product Data: The Contractor shall submit the following instrumentation and control product data.

Material Data Sheets.

Instrument Data.

Component Fabrication Drawings.

Test Procedures.

Test Reports.

Operation and Maintenance Manuals.

Final and As-Built Documentation: The Contractor shall submit for review and approval, all final revisions of documentation under this contract.

Test and Acceptance Documentation: The Contractor shall submit for review and approval, the Test and Acceptance Documentation.

Training Documentation: The Contractor shall submit for review and approval, all Training Documentation, consisting of all outlines for training classes and complete training manuals for all levels and types of personnel requiring training. All training manuals and documentation shall become part of the O & M Manuals, as specified in section on Training and Operations & Maintenance Manuals.

Interface Information. The Contractor shall submit an interface table, which describes all external interfaces to and between the Contractor's equipment. Include facilities, communication protocols, voltages, impedances, polarities and existing equipment.

1.6.02 Architectural and Civil Submittals. This section specifies general procedural requirements for contractual submittals for the following architectural and civil schedules, drawings, product data, samples and manufacturer's certificates.

Architectural Drawings: The Contractor shall provide architectural layouts and plans, with special emphasis on elements and their functions, to provide better understanding of the operation and maintenance of the system. The drawings shall include site plan, floor plans, elevations, sections and details.

Structural Drawings: The Contractor shall provide structural and miscellaneous metal drawings showing foundations, mounting components, fasteners, arrangements, and structural details.

Product Data: The Contractor shall submit product data for all architectural, structural, options and other data. Contractor shall provide supplemental manufacturer's standard data for information unique to the work and installation. The submittals shall reflect all items delivered or installed under this contract.

Samples: The Contractor shall provide to the Engineer all samples required under this specification including color charts and product samples.

1.6.03 Mechanical and Electrical Submittals. This section specifies general procedural requirements for contractual submittals for the following mechanical and electrical submittals. Include product data, performance data, control diagrams and other mechanical submittals.

Floor Layout Drawings: The Contractor shall submit floor layout drawings for all mechanical equipment, piping and electrical equipment. Include location dimensions for all connections, oil supply, electrical, power, controls and status connections. The base dimensions and weights shall also be provided.

Composite Assembly Drawings: The Contractor shall provide composite assembly drawings for all mechanical equipment, piping and electrical equipment. Show locations of all auxiliary equipment, dimensions and weight.

Pipe Layout and Drawings: The Contractor shall submit as follows but not limited to installation drawings for pipes, valves, fittings, sewers, drains, heating ducts, ventilation ducts, electrical, plumbing lines, electrical cable trays, lighting fixture layouts, circuiting, instrumentation, interconnection wiring diagrams, communications, power supply, alarm circuits, etc., under this Contract. The final dimensions may depend upon the dimensions of equipment and valves to be furnished by the Contractor.

Elevations: The Contractor shall provide elevation drawings for all mechanical and electrical equipment including front, rear, and side views. Drawings shall include diagrams for nameplates, control panels, component placement and alignment.

Specification Sheets: The Contractor shall submit specification sheets with performance data and engineering details for all mechanical and electrical units installed under this contract. Specification sheets shall determine adequate compliance with the contractual requirements.

Electrical Interconnection Diagrams: Contractor shall submit electrical interconnection diagrams including motors, control panels, pressure, switches level switches, motor control circuits, motorized actuators, and I/O contractual requirements.

Component Identification: The Contractor shall submit a complete identification list of all mechanical and electrical components, materials, manufacturer, model number, rating and serial number.

Performance Data: The Contractor shall submit complete mechanical and electrical unit/subsystem performance data.

Power and Riser Diagrams: The Contractor shall submit single line power and riser diagrams for all equipment and facilities.

Wiring Diagrams: The Contractor shall submit for review and approval a complete set of wiring diagrams. The drawings shall include elementary control diagrams and separate wiring diagrams for mechanical and electrical units or subsystems. Drawings for the starting and shutdown of equipment, including, controls shall be provided. A comprehensive description of operation shall be provided.

Finish Data: The Contractor shall provide complete surface preparation and finish data for all mechanical and electrical units or subsystems including a complete list of cleaning instructions.

Factory Testing: A detailed description of factory testing procedures, reporting procedures, and criteria for the test shall be provided for all mechanical and electrical equipment as specified in each appropriate specification. After fabrication and testing the results of all tests shall be submitted to Engineer. No shipment of any mechanical and electrical equipment shall be allowed without written permission from the Engineer.

Field Testing and Acceptance: The Contractor shall submit for review and approval detailed descriptions of all site or field testing and acceptance. Include descriptions of procedures, test equipment, reporting procedures and criteria for testing all mechanical and electrical equipment.

Operations and Maintenance Manuals (O & M): The Contractor shall furnish manuals for all mechanical and electrical equipment specified under this contract. Each manual shall include complete sets of drawings, description of equipment, record shop drawings, O & M instructions, parts lists, equipment ratings, valve list, lubrication instructions, description of periodic maintenance required, description of trouble shooting procedures, list of replacement parts and any other additional information which may be needed to operate and maintain the equipment. No equipment system will be approved without prior submittal and approval of O & M Manuals.

1.7 CONTRACTORS REVIEW. Coordinate the timely submittal of all necessary information to keep the project on or ahead of schedule. All drawings, product data, lists, samples, test reports, manuals, and other required information shall be submitted in sufficient time to allow the Engineer twenty (20) to forty five (45) days of review time. The submittal review process includes any necessary correlation and checking of related and interdependent parts of the work. Scheduling of submittals shall allow time for review, correction, resubmittal, and final review prior to the ordering of equipment, fabrication of materials, or actual construction, assembly, or erection. No claim for extra cost, damage, or extension of time shall be made because of a failure to submit said information sufficiently in advance.

Submit information on all portions of the work irrespective of their being specifically mentioned.

Review submittal prior to transmitting to the Engineer. Check the completeness of the information submitted. Verify field measurements, coordination of all component parts of work, conformance of all materials, methods, and equipment to Contract Documents. Stamp, sign, and date acceptable submittals before transmitting to the Engineer.

Do not perform any work covered by submittal(s) prior to approval of all related submittals by the Engineer.

No claim shall be made for costs incurred, damages or extension of time required to modify or replace any equipment, materials, or structures in order to conform to submittals as approved by the Engineer.

No alterations shall be made to drawings previously approved by the Engineer without his written consent.

1.8 RESUBMITTALS. Make resubmittals under the same procedure specified for initial submittals.

Verify that all corrections, equipment/system coordination, and field verifications required by Engineer during the initial review have been made, all additional information requested has been supplied, and any other comments made by the Engineer have been addressed in the resubmittal.

Identify all changes made on the submittal since the previous review. Designate drawings with a revision number; letter and the date revised.

1.9 SCHEDULE OF SUBMITTALS. Prepare a Schedule of Submittals as shown on the following page unless another format is pre-approved by Owner.

Submit all of the indicated shop drawings, product data, manufacturer's instructions, equipment part lists, samples, certified test reports, O&M manuals and other items as required on the schedule or in each detailed Specification Section. The sample Schedule of Submittals on the following page shows a few limited examples of entries in a typical schedule of submittals. The Contractor must review each section of the Contract Documents for all required submittals and identifying them by CSI division in the project Schedule of Submittals. The Contractor shall maintain a schedule of submittals on Owner approved software application. The schedule shall include the Name of Items or Subsections, Size and Type, Manufacturer Name, Part No., Drawing Number, Date Submitted, DWSD Z-file Number, DWSD Approval Date, and Approval Status.

A copy of the schedule of submittals, both on paper and disk, shall be submitted to the Engineer at each monthly progress meeting. Three copies of both paper and Owner approved software data files shall be submitted to the Engineer within 5 working days of Substantial Completion.

Submittal Schedule for Project (List No and Title)
as of (Date)

Section	Submittal Type	Item Description	Submit No	Date Due to Engineer	Date to Engineer	Date from Engineer	Action Taken	Comments
02539		**Sanitary Sewage Systems**						
		Subcontractor: (List Company, Contact, and Phone)						
	Product Data	Pipe						
	Product Data	Manholes						
	Certification	Manufacturer's Certification, Pipe						
	Shop Drawings	Sheeting and Bracing Plan for Jacking Pits						
03300		**Concrete**						
		Subcontractor: (List Company, Contact, and Phone)						
	Product Data	Concrete Design Mix						
	Product Data	Concrete Admixtures						
	Product Data	Grout						
	Product Data	Chemical Hardner						
	Test Report	Aggregate quality and gradation						
	Test Report	All Laboratory Tests						
	Certification	Type and amount of fly ash used						
	Shop Drawings	Concrete slabs or beams exceeding 20 feet span with vertical supports exceeding 6 feet						

General: The Schedule of Submittals is a management tool to make sure that all the issues requiring review of materials, shop drawings, etc. are tracked and managed to ensure the finished product is safe, meets specifications, and fulfills the intent of the project. Subcontractors may want to expand this Schedule to allow tracking to and from subcontractors, etc. This is the minimum information that needs to be submitted to the Engineer initially and at on-going progress meetings.

Submittals Types: Shop Drawings, Product Data, Certifications, Samples, Test Reports, Mock-ups, and Record Drawings.

Item Description: Within each Specification Section, there will be many different materials requiring some sort of submittal. Each material should be listed. Within each submittal type, there may be many subcategories.

Use this area to provide more detail if needed. For example, under product data, for a line item, you may want to list Manufacturer's Installation Instructions.

Submittal Number: Submittal numbers are assigned sequentially beginning with 1 and running as necessary to cover all submittals. If a submittal requires revision and resubmittal, the submittal will use the original submittal number followed by a letter (A,B,C,…). For example, if Submittal No. 347 requires resubmittal, the first revised submittal would be Submittal No. 347A and should be inserted into Submittal Schedule in row directly under Submittal No. 347.

Date Required to Engineer: The Engineer needs 20 to 45 days to review submittals depending on complexity. Different materials have different lead times for ordering. Based on the construction schedule, the specific date a submittal needs to be in to the Engineer to keep on schedule should be identified in this column.

Action Taken: A = Approved, AAN = Approved as Noted, RR = Revise and Resubmit, REJ = Rejected

1.10 SPECIAL TOOLS AND SPARE PARTS. The Contractor shall deliver all special tools and spare parts as required by this contract to the Engineer or as the Engineer directs.

1.11 IDENTIFICATION. Each unit of equipment shall be identified with an equipment item number. A corrosion resistant tag or nameplate, securely affixed in a conspicuous place on each unit shall give the equipment item number, manufacturer's name, size, model or any other information as the manufacturer may consider necessary, or as specified for complete identification. All tag numbers shall be assigned by DWSD.

PART 2 - PRODUCTS

Not Used

PART 3 - EXECUTION

3.1 SUBMITTALS PROCEDURES. All documentation submitted by the Contractor to the Engineer shall be accomplished by a letter of transmittal. The submittal shall be submitted in a sequence that allows the Engineer to have all of the information necessary for checking and approving a particular document at the time of submittal. Each document shall be identified by a document number, DWSD Z-file number, contract number, contract name, location, Spectext section and subsection numbers and submittal date. Where a manual or drawing is revised to reflect a change for any other reason, each such revision shall be shown by a revision number, date and subject placed in a revision block. Indication of official approval by the Contractor's Project Manager shall also be included. To permit rapid location of the revision, additional notation shall be made in the manual opposite the line or area where the change was made, and identified by the corresponding revision number.

3.2 SUBMITTALS APPROVAL. Submittals are reviewed to verify conformance with the contractual requirements and check the accuracy of documentation to prevent costly mistakes and delays to construction. Approval of Contractor's documents by Engineer shall not relieve the Contractor of the responsibility to meet all of the requirements stipulated in the Contract Documents. The Contractor shall have no claim for additional costs or extension of time on account of delays due to revisions of the documents which are necessary for ensuring compliance with the contract.

Approval of documentation shall be the functional level. Any detailed design done prior to approval at the functional level shall be at the Contractor's risk.

Engineer will return documents to Contractor stamped "approved", "approved as noted", "revise and resubmit; or "rejected".

> Approved. The document may proceed with the work covered by the drawings or document.
>
> Approved As Noted. The Contractor may proceed with work after making change marked on returned drawing or documents.
>
> Revise and Resubmit. The Contractor may not proceed with work until drawing or document is resubmitted to the Engineer and returned to the Contractor with approved stamp. Any drawing marked "revise and resubmit" must be resubmitted or letter written explaining why document was not resubmitted.
>
> Rejected. The Contractor must not proceed with any construction relating to any "rejected" document. Any drawing marked "rejected" must have new document resubmitted or letter written explaining why document was not resubmitted.
>
> Returned Unreviewed. When the submittal is incomplete or is not applicable or necessary to the project, the submittal may be returned unreviewed.
>
> Information**.** The documents have been accepted for the record and have not been reviewed as defined above.
>
> Record Print**.** When documents are submitted after construction has been completed to comply with section Contract Closeout.

Only the Engineer shall utilize the color "red” in marking Shop Drawings and Submittal Documents.

The Engineer will review a submittal or resubmittal a maximum of 3 times, after which the cost of review will be borne by the Contractor. The cost of engineering shall be equal to the Engineer's full cost.

No partial submittals will be reviewed. An incomplete submittal or resubmittal will be returned to the Contractor for resubmittal.

When the shop drawings or document have been completed to the satisfaction of the Engineer, the Contractor shall carry out the construction in accordance with such drawings and shall make no further changes except upon written instruction from the Engineer.

3.2.01 Testing of Samples. The Engineer may require laboratory tests on samples submitted or may approve materials on the basis of data submitted with the samples. The Engineer shall determine the testing methods and number of tests.

If tested samples indicate a material does not conform to the Contract requirements, the Contractor will be notified of the rejection and given the basic reasons for such rejection. The Engineer will not furnish copies of all the test data or results.

3.2.02 Approval of Tested Materials. The Engineer's approval will only be general and does not constitute a waiver of the City's right to full compliance with the Contract requirements.

Approved materials shall not be changed in brand, make, or formulation without obtaining a new approval from the Engineer.

The Engineer shall check actual materials delivered to the site as necessary to insure compliance with the Contract requirements. Materials previously given general approval may be rejected for cause.

The Engineer shall have authority to require removal and replacement with proper materials which have been incorporated into the work if the material fails field check tests.

3.3 SUBMITTALS TRACKING. A control procedure shall be established by the Contractor to track submittal approval and revision for all documents and drawings. The Schedule of Submittals should be the foundation for tracking submittals approvals and revisions. The Contractor shall maintain his procedure from Contract award through completion of the final project acceptance, and shall provide the Engineer with six copies of the initial Configuration Control Document updated monthly as appropriate, for document drawing submittals or approval procedures.

3.4 RECORD PRINTS. The Contractor shall submit to the Engineer 3 set of all record prints within 60 days after submitting the "Certificate of Substantial Completion". The record prints or project records shall include catalog cuts, drawings, calculations, test reports, manufacturer's data maintenance manuals, installation instructions and operating manual. All "record prints" shall be delivered to the Engineer in cabinets as specified in 2.01 and shall have the DWSD Z-file number marked on them.

End of Section

SECTION 01090

PREDICTIVE TESTING AND INSPECTION

PART 1 – GENERAL

1.1 SCOPE. This section covers predictive testing and inspection requirements for materials and equipment supplied under this Contract.

1.2 GENERAL. Predictive Testing and Inspection (PT&I) technologies are used as part of a Reliability Centered Maintenance (RCM) process to establish maintenance strategies that optimize facility and equipment operability and efficiency, while minimizing life-cycle costs. The data acquired from PT&I permits an assessment of system/equipment performance degradation from the as-designed and/or required condition. The objectives of PT&I are to determine equipment condition and to develop a trend with which to forecast the most effective time to schedule and perform maintenance. Establishment of baseline data (vibration, thermographic, etc.) required by the equipment specifications shall be compiled, properly documented and submitted with the equipment O&M Manuals by the Contractor.

1.3 SUBMITTALS.

1.3.01 Measurements and Measurement Data. The Contractor shall furnish to the Engineer the following information concerning the equipment used to make the specified measurements:

Test Equipment – list of all test equipment used, including manufacturer, model, number, serial number, calibration date, certificate of calibration and special personnel qualifications required.

Equivalency – If the Contractor uses an equivalent test or procedure to meet the requirements of the Contract Documents the Contractor shall provide to the Engineer proof of equivalency.

1.3.02 Bearing Information. Drawings – The Contractor shall provide to the Engineer section drawings that show the component arrangement for all rotating equipment supplied under the contract. The sectional drawings shall accurately depict the bearing support structural arrangement, be drawn to scale and show the dimensions to the centerline of all rotating shafts.

Bearing Data – The Contractor shall provide to the Engineer the bearing manufacturer and part number for all bearings used in all rotating equipment supplied under this contract. The information shall be included on the sectional drawings for each bearing location.

Operating Data – The required equipment data the Contractor shall provide the Engineer under this contract shall include the operating speed for constant speed units and the normal operating speed range for variable speed equipment.

1.3.03 Gearbox Information. The Contractor shall provide to the Engineer the type and number of teeth on each gear used in the gearbox and the input and output speeds and gear ratios. This information shall be included on the sectional drawings which must be to scale and be specific to gear location.

1.3.04 Pumps. The Contractor shall provide to the Engineer the following information on all pumps supplied under the contract:

Number of pump stages

Number of pump vanes per stage

Number of gear teeth for each pump gear

Type of impeller or gears

Rotating speed

Balance specifications as per ISO G1.0 or API specification

Number of diffuser vanes

Pump nameplate data

Motor nameplate data

1.3.05 Centrifugal Compressors. The Contractor shall provide to the Engineer the following information on all centrifugal compressors supplied under the contract:

Number of compressor sections

Number of blades per section

Number of diffusers

Number of vanes per diffuser

Number of gears and teeth per gear

Number of gear teeth per driven shaft

Rotating speed of each rotor

Compressor nameplate data

Motor nameplate data

1.3.06 Fans or Blowers. The Contractor shall provide to the Engineer the following information on all fans supplied under the contract:

Type of fan or blower

Number of rotating fan blades/vanes

Number of stationary fan blades/vanes

Rotating speed(s)

Fan/blower nameplate data

Motor nameplate data

The Contractor shall provide to the Engineer the following additional information if the fans/air handlers are belt driven:

Number of belts

Belt lengths

Diameter of the drive sheave at the drive pitch line

Diameter of the driven sheave at the drive pitch line

For all fans supplied under the contract, the Contractor shall ensure sufficient access to the fan is present to allow for cleaning and in-place balancing of the fan.

1.3.07 Mixers/Flocculators. The Contractor shall provide to the Engineer the following information on all mixers/flocculators supplied under the contract:

Number of impellers

Type of impeller

Rotating speed

Mixer/flocculator nameplate data

Motor nameplate data

1.3.08 Clarifier Drives. The Contractor shall provide to the Engineer the following information on all clarifier drives supplied under the contract:

Rotating speed

Gear box data as described above

Drive nameplate data

Motor nameplate data

1.3.09 Mechanical Bar Screens. The Contractor shall provide to the Engineer the following information on all mechanical bar screens supplied under the contract:

Mechanism speed

Type of drive

Gear box data as described above

Bar screen nameplate data

Motor nameplate data

1.3.10 Chain and Flight Collectors. The Contractor shall provide to the Engineer the following information on all chain and flight collectors supplied under the contract:

Mechanism speed

Type of drive

Gear box data as described above

Chain and flight collector nameplate data

Motor nameplate data

1.3.11 Conveyors. The Contractor shall provide to the Engineer the following information on all conveyors supplied under the contract:

Belt speed

Conveyor nameplate data

Motor nameplate data

1.3.12 Belt Filter Presses. The Contractor shall provide to the Engineer the following information on all belt filter presses supplied under the contract:

Belt speed

Number of rollers

Belt filter press nameplate data

Motor nameplate data

13.13 Centrifuges. The Contractor shall provide to the Engineer the following information on all centrifuges supplied under the contract:

Rotating speed

Centrifuge nameplate data
Motor nameplate data

1.3.14 Lime Mixing Screw. The Contractor shall provide to the Engineer the following information on all lime mixing screws supplied under the contract:

Rotating speed

Lime mixing screw nameplate data

Motor nameplate data

1.3.15 Motorized Valves and Gates. The Contractor shall provide to the Engineer the following information on all motorized valves and gates supplied under the contract:

Rotating speed

Valve and gate nameplate data

Motor nameplate data

1.3.16 Lubricants. The Contractor shall provide to the Engineer the following information on all lubricants supplied in bulk or contained within equipment supplied under this contract:

Liquid Lubricants

a. Viscosity grade in ISO units as per ASTM tests

b. AGMA and/or SAE classification as applicable

c. Viscosity in Saybolt Universal Seconds (SUS) or centipoises at the standard temperature and at designed normal operating temperature

Grease Lubricants

a. National Lubrication and Grease Institute (NGLI) Number

b. Type of thickener

Hydraulic Fluids

a. Type of hydraulic fluid

b. ASTM test requirement

c. ISO number, if appropriate

d. Viscosity

e. Flash Point
f. Oxidation resistance

g. Pour point

h. Foaming

i. Cleanliness (ISO standard)

j. Four ball wear test

Insulating Fluids (Oil-filled transformers)

a. Type of oil used

b. Dielectric

c. Acidity

d. Specific gravity

e. Power factor

f. Dissolved gas

PART 2 – PRODUCTS

Not Used

PART 3 – EXECUTION

3.1 Vibration Measurements. The vendor shall provide to DWSD the following information for all equipment where vibration testing is specified in the contract:

Narrowband spectral vibration data for all machines as follows:

a. For machines operating at or below 1,800 rpm, the frequency spectrum provided shall be in the range of 0 to 5000 Hz.

b. For machines operating greater than 1,800 rpm, the frequency spectrum shall be in the range of 0 to 10,000 Hz.

c. Two narrowband spectra for each point shall be obtained in the following manner:

- For all machines regardless of operating speed, a 5 to 500 Hz spectrum with 1600 lines of resolution shall be used to analyze balance, alignment and electrical line frequency faults.

Vibration data shall be reported in velocity (inches/second)

Vibration data shall be collected at normal operating load, temperature and speed.
If rolling element bearings are utilized in either the driver or driven component of a unit of equipment (e.g., a pump/motor combination), no discrete bearing frequencies should be detectable.

For belt-driven equipment, belt rotational frequency and harmonics should be undetectable.

If no specific criteria are available, the ISO 3945 acceptance Class A guidelines should be used as the acceptance specification.

3.2 Vibration Transducer Mounting. At the designated measurement positions, suitable surfaces shall be provided such that the mounted transducer will attach securely. Mounting locations shall be positioned on structural members. Installation of sound discs on bolted cover plates or other non-rigid members are not acceptable.

Magnetic Mount – For a magnetic base mounted transducer, the location on the machine's surface at which vibration measurements are to be taken shall be machined (faced) or cast 1.1 x diameter of the mounting surface of the magnet to be set on the surface, flat within 25 um (1 mil), and a minimum surface finish (surface texture of 25 um (1 mil). During measurements, the mounting location shall be clean and free of debris and paint, so that the magnet base can be attached firmly without rocking.

Stud Mounted – For a stud mounted transducer, the machine's surface at which vibration measurements are to be taken shall be machined (faced) with a minimum surface diameter of 1.1 x diameter of the mounting surface of the transducer to be mounted on the surface, flat within 25 um (1 mil), and a minimum surface finish (surface texture) of 25 um (1 mil). The tapped hole shall be M6 x 1H (1/4 x 28), unless otherwise specified, with a minimum depth of at least two threads deeper than the stud. The hole shall be perpendicular to within 1^{o} to the mounting surface.

Adhesive Mounting – Adhesives will lower the accelerometer mounted resonance frequency (usually supplied for stud mounting). If an adhesive is used to attach either the transducer or a magnetic mounting pad, the upper frequency limit of the transducer shall be reduced by 20% of the manufacturer's stated resonance for hard adhesives and by 50% of the manufacturer's stated resonance for soft adhesives. Transducer manufacturer's specifications should be consulted. The machine's surface at which vibration measurements are to be taken shall be machined (faced) with a minimum surface diameter of 1.1 x diameter of the mounting surface of the transducer to be mounted on the surface, flat within 25 um (1 mil). The surface shall be abraded to approximately 25 um (1 mil) to increase adhesion. The adhesive bond layer thickness should be less than 1 mm.

3.3 Vibration Measurement Locations. Centrifugal Pumps, Vertically Mounted – Magnets shall be mounted in the radial direction as close to the bearings as possible. Accelerometers shall be mounted to solid structures and not on drip shields or other flexible structures. Mounting locations shall be in line with each other, perpendicular to the pump discharge and located at the free end, at the coupled end of the motor and pump, and in the axial direction on the pump and motor, if possible.

Centrifugal Pumps, Horizontally Mounted – Magnets shall be mounted in the horizontal and vertical planes radial to the shaft at the free and coupled ends of the motor and pump, as close to the bearing as possible. Accelerometers shall be mounted to solid structures and not on drip shields or other flexible structures. Mounting locations shall be in line with each other, perpendicular to the pump discharge and located at the free and coupled end of the motor and pump, and in the axial direction on the motor and pump, if possible.

Positive Displacement Pumps -Magnets shall be mounted in the horizontal and vertical planes radial to the shaft at the free and coupled ends of the motor and pump, as close to the bearing as possible. Accelerometers shall be mounted to solid structures and not on drip shields or other flexible structures. Mounting locations shall be in line with each other, perpendicular to the pump discharge and located at the free and coupled end of the motor and pump, and in the axial direction on the motor and pump. An exception may be granted if the pump is sump mounted.

Generators – Magnets shall be mounted in the horizontal and vertical planes on the free ends of the motor and generator bearing assemblies. Pedestal bearings between the motor and generator should be monitored in the vertical direction radial to the shaft. Thrust bearings shall be monitored in the axial direction.

Gear Boxes – Magnets shall be mounted radial to the input and output shafts in the horizontal and vertical directions. Additional discs shall be installed in the axial direction as close to the input and output shafts as possible.

Centrifugal Compressors - Magnets shall be mounted radial to the input and output shafts in the horizontal and vertical directions. Additional discs shall be installed in the axial direction as close to the input and output shafts as possible. (Reciprocating air compressors shall only be monitored for balance and alignment problems).

Blowers and Fans – Motors on blowers and fans shall have magnets mounted in the radial and axial directions as previously described. Fan bearings shall be monitored radially in the vertical direction.

Chillers

a. Centrifugal – Magnets shall be mounted in the horizontal and vertical planes radial to the shaft at the free and coupled ends of the motor and compressor as close to the bearings as possible. Accelerometers shall be mounted to solid structures and not on drip shields or other flexible structures. Mounting locations shall be in line with each other, perpendicular to the compressor discharge and located at the free end, at the coupled end of the motor and compressor, and in the axial direction on the compressor and motor.

b. Reciprocating - Magnets shall be mounted radial to the input and output shafts in the horizontal and vertical directions. Additional discs shall be installed in the axial direction as close to the input and output shafts as possible.

3.4 <u>Convention for Identifying Vibration Measurements</u>. Vibration measurement locations documented for certification and acceptance on the equipment layout drawing and on any vibration data submitted shall follow the following conventions:

a. Component Part (shaft, gearbox, roll, etc.): four (4) alphanumeric characters:

- Four user defined alphanumeric characters provide a flexible means to identify specific component parts of a machine for convenience and purposes of automated diagnosis. Examples include individual shafts rotating at different speeds within a complete machine (i.e. SFTC to indicate shaft C), an auxiliary gearbox with multiple shaft speeds that differ from the shaft speeds of the main machine (i.e. AGB6, auxiliary gearbox, position number 6).

b. Location (bearing number designation): three (3) numeric characters:

- A numeric sequence identifying the specific bearing on which a vibration measurement is recorded using three numeric numbers. For purposes of this specification, the numeric sequence starts at the outboard bearing position of the driver machine (motor), which is designated as location 001.

c. Sensor (transducer) Type Code: two (2) letters:

- Sensor type is designated by a two-letter abbreviation according to the following:

AA	Single Axis Accelerometer
AC	Single Axis Accelerometer with internal integration
AT	Triaxial Accelerometer
CT	Current Transformer
DP	Displacement Probe
DR	Displacement Probe used as a Phase Reference
LT	LVDT (Linear Voltage Differential Transformer)
MP	Magnetic Pickup (shaft speed/phase reference)
MI	Microphone
OP	Optical Pickup (shaft speed/phase reference)
PD	Dynamic Pressure
PS	Static Pressure
SG	Strain Gage
TC	Temperature – Thermocouple
TR	Temperature – RDT
TT	Torque Transducer
TO	Torsional Transducer
VP	Velocity Pickup
VT	Voltage
OT	Other

c. Angular Orientation: three digits (000 to 360 degrees):

- Foot-Mounted Equipment – The angular position of a vibration sensor is measured from a zero reference located at 3 o'clock when viewed at position 001, looking into the equipment. The 12 o'clock position on the equipment surface is opposite the equipment mounting plate. The angle increases counterclockwise (regardless of the direction of shaft rotation) in the plane of the shaft rotation from 0o to 360o.

- Flange-Mounted Equipment - The angular position of a vibration sensor is measured from a zero reference located at the point of energy input on the motor, when viewed from position 001 looking into the equipment (in the direction from driver to driven). The angle increases counterclockwise (regardless of the direction of shaft rotation) in the plane of the shaft rotation from 0o to 360o.

d. Sensor Axis Direction (Orientation): one (1) letter:

- A single letter defines the direction of the sensor sensitive axis. This portion of the identification provides unique descriptive information when the sensor sensitive axis does not coincide with the radial defined in the previous section. It is redundant when the sensitive axis coincides with the defined radial.

R – Radial	sensor sensitive axis perpendicular to and passes through the shaft axis
A – Axial	sensor sensitive axis parallel to the shaft axis

T – Tangential sensor sensitive axis perpendicular to a radial in the plane of the shaft rotation
H – Horizontal sensor sensitive axis oriented at 000 or 180 degrees only
V – Vertical sensor sensitive axis oriented at 090 or 270 degrees only.

e. Direction of Motion: one (1) letter:

- The final character in the measurement identification code is either an N (normal) or R (reverse) to identify sensors mounted in opposition where machine motion in one direction results in positive motion in one sensor (N – normal) and negative motion (R – reverse) in the other. Axial sensors mounted in opposite directions at opposing ends of equipment are the primary example. Axial machine motion toward the reference end is normally designated as positive. The axial sensor closest to the reference end of the machine, position 001, will be designated normal (N) when mounted such that the positive motion toward the sensor produces a positive signal output. Likewise, motion toward the reference end will produce a negative signal from the axial sensor at the opposite end, which is then designated R (reverse). The angular orientation defines the direction of motion for radially mounted sensors. Therefore, default of N (normal) should be utilized for sensors mounted radially.

An example measurement identification is: SFTA003AC090RN (shaft A, bearing number 3, single axis accelerometer positioned 90 degrees counterclockwise from zero, mounted radially, normal motion).

3.5 Thermography. The Contractor shall perform thermographic surveys, when specified, as follows:

Electrical – Thermographic surveys shall be performed on all electrical distribution equipment, motor control centers and transformers during the startup phase of the installation, unless specifically waived by the Engineer. Any defects noted by an observable difference in temperature of surveyed components or unexplained temperature rise above ambient shall be corrected by the Contractor at no additional expense to the Owner. The Contractor shall resurvey repaired areas to assure proper corrective action has been taken.

Piping Insulation - Thermographic surveys shall be performed on all insulated piping during the startup phase of the installation, unless specifically waived by the Engineer. Any voids in the piping insulation shall be corrected by the Contractor at no additional expense to the Owner. The Contractor shall resurvey repaired areas to assure proper corrective action has been taken.

Building Envelope – A thermographic survey shall be performed of the building envelope to check for voids in insulation and/or the presence of wetted insulation. In addition, the presence of air gaps in building joints such as seams, door frames, window frames, etc. shall be checked via a thermographic survey using the appropriate procedure specified in the following:

a. ASTM C1060-90 – Thermograhic Inspection of Insulation in Envelope Cavities in Wood Frame Buildings

b. ASTM C1153-90 – Standard Practice for the Location of Wet Insulation in Roofing Systems Using Infrared Imaging

c. ISO 6781 – Thermal Insulation – Qualitative Detection of Thermal Irregularities in Building Envelopes – Infrared Method

d. ASTM E1186-87 –Standard Practices for Air Leakage Site Detection in Buildings

The Contractor shall clearly identify by photographs, scale drawings, and/or by description all voids or gaps noted during the thermographic scan. For areas where the moisture content of the insulation or building envelope is questionable, the Contractor shall use either destructive or non-destructive testing techniques that confirm the amount of moisture. Specific testing procedures shall be proposed by the Contractor and approved by the Engineer.

Boilers, Furnaces, and Ovens – A thermographic survey shall be performed during the startup phase of installation of all boilers, furnaces and ovens as a means of determining voids in insulation or refractory materials. Any voids detected during the survey shall be corrected by the Contractor at no expense to the Owner. The Contractor shall perform a thermographic survey of all repaired areas prior to final acceptance by the Owner.

Motors and Bearings – Thermographic scans should be performed on large units to identify abnormal hot spots on the body that may indicate flaws in the stator winding.

Power transformers - Thermographic scans should be performed to identify abnormal heating at connections, localized heating, temperature variations in cooling fins or tubes and temperature differences between units.

3.6 Airborne Ultrasonics. The Contractor shall perform an airborne ultrasonic survey during the startup phase of the installation where airborne ultrasonic testing is specified in the contract. The Contractor shall survey electrical equipment for indication of arcing or electrical discharge, including corona.

Any defects or exceptions noted by the use of airborne ultrasonics shall be corrected by the Contractor at no additional expense to the Owner. The Contractor shall resurvey repaired areas to assure proper corrective action has been taken.

3.7 Pulse Echo Ultrasonics. Material thickness measurements shall be performed on a representative sample of all material where a thickness is specified in the contract. Thickness measurements shall be performed at the fabricator’s place of business prior to shipment of any material to the project site. Material which does not meet the specified requirements of the contract shall not be shipped without the prior approval of the Engineer.

3.8 Motor Circuit Analysis (Complex Phase Impedance). Upon motor installation, the Contractor shall take and provide to the Engineer the following acceptance/baseline readings and measurements, first for the motor alone, and then for the motor and circuit together:

a. Conductor path resistance

b. Inductive imbalance

c. Capacitance to ground

3.9 Motor Current Spectrum Analysis. With the motor installed and operational, the Contractor shall conduct an acceptance/baseline spectral analysis on the loaded motor at 75% or greater load when specified by the Engineer.

3.10 Insulation Resistance. Upon installation, the Contractor shall take and provide to the Engineer the following acceptance/baseline readings and measurements, first for the motor alone, and then for the motor and circuit together:

a. Polarization index (Motors of 500 HP or more only)

b. Dielectric absorption ration (for all motors)

c. Leakage current at test voltage

3.11 Surge Testing. The Contractor shall perform surge testing of the motor(s) prior to their installation and Owner acceptance. The Contractor shall provide to the Engineer documentation of test results, including test voltage and waveforms.

3.12 Startup Tests. With the motor installed and operational, the Contractor shall collect and provide to the Engineer the following baseline data:
a. Coast-down time
b. Peak starting current

3.13 Maintainability and Ease of Monitoring. The Contractor shall provide for facility and equipment maintainability and ease of monitoring.

3.14 Leveling of Equipment Upon Installation. The Contractor shall level all installed rotating electrical and mechanical machinery. After installation, the equipment shall not exceed a maximum slope of the base and the frame of 0.001 inch per foot. The Contractor shall report to the Engineer the type and accuracy of the instrument used for measuring the level; e.g., a 12-inch machinist's level graduated to 0.0002 inch per foot.

3.15 PT&I Technology Schedule.

a. Equipment Type PT&I Technology

b. Pumps Lubricant analysis
Vibration

c. Compressors Vibration
Lubricant analysis

d. Blowers/Fans Vibration
Lubricant analysis

e. Gearboxes Vibration
Lubricant analysis

f. Boilers, Furnaces Infrared thermography

g. Insulated Piping Infrared thermography
Piping/pressure vessels (thickness) Pulse echo ultrasound

h. Chillers/Refrigeration Infrared thermography
Lubricant analysis
Vibration

i. Electrical switchgear/ Circuit breakers Airborne ultrasound
Infrared thermography
Insulation resistance

j. Motor and motor circuits Insulation resistance
Motor circuit analysis
Motor current spectrum analysis
Startup tests

k. Building envelope Infrared thermography

l. Heat exchangers/condensers Infrared thermography
Airborne ultrasound

m. Electric motors Vibration
Surge testing
Infrared thermography

n. Electrical generators Vibration
Motor circuit analysis
Insulation resistance

o. Transformers Infrared thermography
Oil analysis

	Insulation resistance	
p.	Rotating equipment electrical/ Mechanical	Equipment leveling

End of Section

SECTION 01100

TRAFFIC CONTROL

PART 1 - GENERAL

1.1 SCOPE The Contractor shall develop a Construction Traffic Plan to minimize interference from construction vehicles and equipment on pedestrians and traffic in compliance with local authority having jurisdiction.

1.2 SUBMITTALS. Contractor shall prepare and submit a Construction Traffic Plan detailing the location of construction entrances onto the project site, construction delivery routes, general traffic patterns, and temporary parking areas. The construction Traffic Plan shall detail the types of traffic barricades, controls, signage, and temporary pavements that will be used to maintain safety and minimize interference with non-construction vehicles.

The Construction Traffic Plan shall be submitted and approved by the Engineer before mobilization onto construction site begins.

PART 2 - PRODUCTS

2.1 BARRICADES, ARROW BOARDS, TEMPORARY PAVEMENT MARKINGS, AND TEMPORARY SIGHN. Barricades, Arrow Boards, Temporary Pavement Markings, Temporary Signs, and other traffic control devices shall be in accordance with the current edition of the MDOT Standard Specifications for Construction, and the current edition of the Michigan Manual of Uniform Traffic Control Devices.

PART 3 - EXECUTION

3.1 SITE ACCESS AND PARKING. Construct all weather access road(s) and Parking area(s) within the site to serve the construction area. Access road shall be of a width and load-bearing capacity to provide unimpeded traffic for construction purposes. Access drives and parking areas shall be hard surfaced unless otherwise approved by the Engineer. Provide and maintain access to fire hydrants and control valves at all times.

No highway, street or road shall be blocked to traffic without a Right-of-Way permit issued by the authority having jurisdiction to do so.

Bridges over pipe trenches and/or temporary roadways shall be built and maintained as required by the authority having jurisdiction over the highway, street or road.

Drainage through existing sewers and drains shall be maintained at all times during construction except as expressly provided for in these specifications

Parking control shall be managed according to an approved Construction Traffic Plan. Monitor parking to prevent interference with access by emergency vehicles and to make the best use of limited parking areas. Access to fire hydrants, control structures, existing facilities, and water and gas valves shall not be obstructed. Do not allow parking in non-designated areas by construction personnel.

The Contractor shall maintain driveways a minimum of 15 feet wide between and around combustible materials in storage and mobilization areas.

The Contractor shall maintain traffic areas as free as possible of excavated materials, construction equipment, products, snow, ice, and debris.

The Contractor shall not utilize existing parking facilities for construction personnel or for Contractor's vehicles or equipment, unless written permission from owner of parking facility is obtained.

3.2 TRUCKING ROUTE AND PUBLIC ROAD MAINTENANCE. Prior to the start of construction, the Contractor shall submit for review a schedule and list indicating the streets and roads within the municipality that his equipment will use off the Project site.

The Contractor shall comply with all safety requirements, weight restrictions and speed limits.

All gravel and dirt roads or streets used shall be maintained by grading, placing dust palliatives and maintenance gravel in sufficient quantities to eliminate dust and maintain traffic.

Paved streets shall be maintained in a reasonable state of cleanliness and the Contractor shall remove accumulations of debris, dirt or mud caused by his operations. Removal shall be done in such a manner as to prevent the release of dust. This shall be done at least every day at the close of each day's operation or additionally when requested by the Engineer.

Any roads or streets damaged by the Contractor’s operations shall be repaired or removed and replaced to satisfactions of the agency having jurisdiction at no additional cost to the Project.

The Contractor shall not store any equipment, supplies, construction material or excess excavated material on any roads or streets unless otherwise approved by the Engineer.

3.3 EMERGENCY ACCESS. The Contractor shall at all times provide emergency access to property in the vicinity of the construction for police vehicles, fire equipment, ambulances or other emergency vehicles to protect life, health and property. Any areas damaged by emergency vehicles shall be restored by the Contractor at no additional cost to the Owner.

3.4 PRIVATE OR PUBLIC ROADS, SIDEWALKS, AND PARKING AREAS. Where public roads, driveways, parking areas and sidewalks are encountered throughout the project, the Contractor shall maintain those portions affected by the construction operations in a passable condition until such time as final restoration of these improvements can be made as specified. If, in the opinion of the Engineer, the public safety is in danger or the necessity exists for maintaining traffic, the Engineer may direct that backfilling be completed immediately. In the event that the necessary backfill material and equipment are not available when direction is given for immediate backfill, the trench shall be backfilled with native material to provide for the necessary maintenance of traffic and safety; however, the native material shall be removed within 48 hours and the trench properly backfilled as specified.

Where private roads are encountered throughout the project, the Contractor shall maintain those portions affected by its construction operations in a passable condition. These roads shall be maintained by the use of 21A road maintenance gravel, stone or slag. In the event the original sub-base has been destroyed, the Contractor shall furnish and install 1-inch to 2-inch (25 to 50 mm) aggregate to stabilize the existing sub-base. Upon completion of the construction activities, the Contractor shall shape and re-grade these roads leaving them in a condition as good as or better than original, and adequate for normal travel.

3.5 ROAD CLOSING. No street, road or section thereof shall be closed to through traffic unless otherwise provided for on the Plans, Specifications, or authorized by the agency with jurisdiction over the roads. Prior to closing a street, road, or section thereof, the Contractor shall provide the Engineer with a copy of a detour plan approved by the agency having jurisdiction over the roads.

In the event roads or streets are to be closed, the Contractor shall notify the local fire department, police department, local road authority, ambulance and emergency services, Department of Public Works, public transit authority and public school system daily as to what streets will be partly blocked or closed, the length of time the streets will be blocked or closed and when the streets will be reopened to traffic. The Contractor shall designate one responsible employee to carry out the requirements of this condition.

During the time that the road is closed, the Contractor shall make provision for trash, leaf, and rubbish pickup.

3.6 MAINTAINING TRAFFIC. The Contractor shall provide access for local traffic to property along the Project by means of temporary roads, drives, culverts or other means approved by the Engineer. The Contractor shall grade, add surfacing materials, and dust palliatives to such temporary roads and drives as necessary for the proper maintenance of traffic.

The Contractor shall maintain traffic and parking areas in a sound condition, free of excavated material, construction equipment, construction materials, mud, snow and ice at all times. Repair breaks, potholes, low areas, standing water, and other deficiencies promptly to maintain paving and drainage in original, or specified, conditions.

Where the shoulder is used to maintain traffic, the shoulder shall be graded, surfaced, treated for dust, constructed, or reconstructed, as specified herein or as shown on the Plans. If the construction work is suspended due to weather conditions, winter shut down or for any other reason, sufficient labor, materials and equipment shall be ready for immediate use at all times for the proper maintenance of traffic. Surfacing materials and dust palliatives shall be applied at such times and locations and in such amounts as necessary to safely maintain traffic and as determined by the Engineer.

Where shoulders are low, high, soft or rough, adequate provisions shall be taken to inform and protect the traveling public by means such as construction warning signs, barricades, lighted devices, etc. Such shoulder hazards shall be eliminated as soon as practicable.

The Contractor shall furnish, erect and maintain all signs, barricades, lights, and traffic regulators, in accordance with the requirements of the current "Michigan Manual of Uniform Traffic Control Devices". Furnish all flagmen and watchmen as are necessary to maintain and safeguard traffic along the entire Project. Failure to comply with these requirements may be cause for the Owner to issue a stop Work order, which shall remain in effect until all necessary devices are in place and operational. The issuance of a stop Work order shall not be reason for granting additional compensation or an extension to the Contract Time. Furnishing, installing, and maintaining traffic control devices shall be incidental to the Project unless otherwise provided for in the Proposal.

3.7 WORK WITHIN RAILROAD COMPANY RIGHT OF WAY. The Contractor shall be responsible for complying with the requirements of the Railroad Company for all Work of the Project and/or temporary crossings for trucking routes. Unless otherwise provided by an item of these Specifications, the Contractor shall bear all costs and expenses incidental thereto, including, but not limited to, protection, flagmen, construction engineering inspection by the railroad, and incidental work such as drainage facilities and removal, alteration and replacement of railroad fences.

3.8 EXISTING TRAFFIC SIGNS. No stop sign, traffic control or warning device or sign shall be taken down until the agency having jurisdiction over the roads has been notified and arrangements for the immediate reinstallation has been made. The Contractor shall provide temporary signs, traffic control devices, warning devices, or watchmen continuously from the time the item is removed until it is reinstalled. All signs removed shall be replaced with signs meeting requirements of the agency having jurisdiction over the roads.

3.9 TRAFFIC REGULATION FOR SAFETY. If the Contractor fails to promptly provide or neglects to maintain the traffic and parking areas, or is dilatory in carrying out specific instructions of the Engineer, DWSD may, with or without notice to the Contractor, take such remedial measures deemed necessary and charge the Contractor with any costs incurred. Any such action shall in no way serve to release the Contractor from its general or particular liability for safety.

3.10 REMOVAL. Remove all signs, cones, drums, and barricades when traffic regulation is no longer required. Repair existing roads damaged during construction and remove any temporary pavements prior to final completion. Restore facilities damaged by construction usage to original condition as determined by the Engineer.

End of Section

SECTION 01110

CONSTRUCTION FACILITIES AND IDENTIFICATION

PART 1 – GENERAL

1.1 SCOPE. This section defines the temporary utilities, project control devices, fencing, construction facilities, progress cleaning and signage to be used during the work, and their subsequent removal.

1.2 TEMPORARY UTILITIES.

1.2.01 Temporary Light and Power. The Contractor shall provide all temporary electric service and lighting required during the entire construction period and pay all costs for installing, maintaining and removing temporary service. Include all necessary temporary wiring, panel boards, outlets, switches, lamps, fuses, controls and accessories in accordance with Master Specification Division 16000, Electrical.

Provide a sufficient number of electric outlets located so that 50 foot long extension cords will reach all work requiring light or power. All temporary 120 volt, 15 and 20 amp receptacle outlets shall be GFI protected. All temporary service equipment shall be removed by the electrical subcontractor when so instructed by the general contractor. The general contractor shall be responsible for payment of the electric bill.

The contractor shall provide lighting in the field office of at least 100 foot candles throughout.

1.2.02 Temporary Heating. Each subcontractor shall provide temporary heat as necessary to their work and materials from damaging dampness and freezing. Temperatures shall be maintained as per ASTM requirements. Precautions shall be taken against possible spread of fire and the possible damaging effects to building and equipment from smoke and soot.

1.2.03 Heating and Cooling of Field Office. The contractor shall provide heating and cooling of the field offices sufficient to maintain 68-78 degrees F (20-26 degrees C) and 30% to 50% humidity throughout the year.

1.2.04 Telephone Service. Contractor shall provide, maintain and pay for telephone service to field office and Engineer’s field office starting at time of project mobilization.

Subcontractors shall provide their own telephone service, if needed, on construction site.

1.2.05 Copier and Facsimile Service. Contractor shall provide, maintain and pay for a copier and facsimile service and a dedicated telephone line to field office at time of project mobilization.

Subcontractors shall provide their own copier and facsimile service, if needed, on construction site.

1.2.06 Temporary Water Service. The General Contractor shall pay for all water required during the entire construction period. The site utilities subcontractor shall pay tap fees and shall lay a temporary water line from the source, fit with a hose bib, and shall provide and maintain all valves, connections and hoses.

The General Contractor shall furnish drinking water from an approved source for all persons on the work site. Each subcontractor shall provide containers for their personnel.

If the use period for the temporary water installation includes freezing weather, the site utilities subcontractor shall provide insulation for all exposed temporary service piping to prevent freezing.

1.2.07 Temporary Toilets. The General Contractor shall provide and maintain in a sanitary manner, temporary toilets as necessary for the use of the workmen.

1.3 CONSTRUCTION FACILITIES.

1.3.01 Field Offices. The Contractor shall provide clean, well maintained, temporary field office space and furnishings for the project engineer, superintendent and administration staff on the construction site. In addition, the field offices shall include a separate office for the owner and engineer to use when on-site and a conference room of sufficient size to conduct weekly progress meetings with subcontractors and a monthly progress meeting with the owner.

The Project Engineer, Superintendent, and Owner/Engineer offices shall be a minimum of 120 square feet (11 square meters). All other employees shall have 80 square feet (7.4 square meters) of work space minimum. The conference room shall be sized at 15 square feet (1.4 square feet) per person based on the largest recurring meeting that will be held.

Field offices shall be portable or mobile buildings or buildings constructed with floors raised above ground, securely fixed to foundations with steps and landings at entrance doors. They shall be structurally sound, secure, weather tight enclosures and shall be maintained during progress of work. Remove at completion of work.

Permanent facilities shall not be used for field offices or for storage.

1.3.02 Furnishing. Each workspace shall have a 30”x60” desk, two desk chairs, telephone, file drawer, one fax machine, at least one duplex outlet, and lighting that is functional and in good condition.

The project engineer and superintendent offices shall each have a 36”x42” drafting table, one plan rack (minimum capacity eight plan sets), one first aid kit, and one 10A: 80 – B:C fire extinguisher.

The conference room shall include a conference table and chairs to seat all attendees at recurring meetings.

The contractor shall furnish and maintain bottled water and sanitary facilities for the field office. The contractor shall clean the office at least once per week. The contractor shall provide and pay for all utility service throughout the duration of the Project, including local telephone service and long distance telephone service.

A trailer having equal facilities and floor space may be used in place of the described field office if so desired.

The field office shall be furnished with a minimum of an aggregate surfaced driveway and parking area, for the exclusive use of the engineer, for at least (3) vehicles. Contractor shall maintain parking area including snow removal.

The cost for furnishing and installing the field office, for furnishing utilities and utility service, and for maintenance of the field office and facilities, unless otherwise specified in the proposal, will not be paid for separately but shall be included in the price bid for various items of work under the contract. The field office shall be removed by the contractor upon completion of the contract and shall become his property.

.

1.3.03 Security of Field Office. The field offices shall be locked at night with grills over each window and bars across each door. In addition, a reliable security system shall be installed with detectors at each door and window and a motion detector in each room. The system will be connected by telephone and radio to command post and monitored during all non-working hours. Any alarm shall result in an immediate dispatch to site and investigation. Construction field offices are a highly visible target for theft and vandalism. The Contractor will take whatever measures are necessary to minimize exposure.

1.3.04 Storage Sheds. The Contractor shall provide temporary storage as necessary to house materials provided by the Contractor. The field offices will not be used for storage. The storage sheds will be heated and cooled as necessary to protect the materials stored therein.

1.3.05 Subcontractor Field Offices and Storage. Each subcontractor shall provide their own field offices and storage space as needed to perform their work. They shall not rely on the General Contractor for office space, telephones or storage space. Any utilities needed to support subcontractor office space and storage shall be at their expense.

Prime subcontractors shall furnish storage facilities large enough to hold all materials required on the site at any one time that might be subject to damage or vandalism. The facilities shall be constructed to prevent damage from the elements and so they can be adequately secured. Location on the site shall be as per the General Contractor's instructions. Each subcontractor shall be responsible for the security of his own materials and equipment.

1.3.06 Project Identification and Signage. Advertising signs of any kind shall not be erected or displayed on the site. At the start of the work, the Contractor shall furnish and erect one or more project signs as directed by the Engineer bearing the following information:

> Project number, title and name of Owner as shown on the Contract Document
>
> Names and titles of Authorities
>
> Names and titles of Engineer/Consultant
>
> Name of Contractor and major subcontractors

Job instruction signs, such as 'DANGER", "KEEP OFF", "NO CONTRACT PARKING", etc., shall be furnished, erected and maintained by the Contractor as may be required to conduct the work safely. Such signs shall be neat in appearance, shall be maintained in good condition and shall be promptly removed when they have served their purpose. Erect at appropriate locations to provide required information.

1.4 TEMPORARY CONTROLS.

1.4.01 Fencing. Provide 6 foot (1.8 m) high fence around construction site; equip with vehicular gates with locks. Post and rails shall be roll-formed, open scam, self-draining shapes or standard weight Schedule 40 pipe, all galvanized in accordance with ASTM-F1043 Type A. All fittings shall be pressed steel or malleable iron and shall be hot-dip galvanized conforming to ASTM-A153. The wires shall be minimum 10 gage (.35 cm) galvanized steel. Maximum spacing of line posts to be 10 feet (3.05 m) unless noted on drawing. Fence to follow ground line unless otherwise provided for in this specification. Fencing shall be per Master Specification Section 2820, Chain Link Fences and Gates.

1.4.02 Safe Premises. It shall be the responsibility of each subcontractor to maintain all areas adjacent to the construction site in a manner not to hinder or endanger normal traffic flow, or endanger or damage adjacent property. Streets and sidewalks adjacent to the site shall be kept clean and open for pedestrian and vehicular traffic.

Each subcontractor is to provide scaffolding necessary for all of his work. All scaffolding must be built in accordance with the requirements of Federal, state and local regulations.

Temporary stairs, ladders and ramps shall be provided by each subcontractor for his work in order to safely enable access to all parts of the work by the Engineer, the Owner, the HUD representative and any authorized inspection personnel. All such equipment shall meet all Federal, state and local safety requirements.

1.4.03 Pest/Rodent Control. General Contractor shall provide methods and means to prevent pests and rodents from damaging work or entering facility.

The Contractor shall be responsible to contract for the extermination of all insects, rodents and other pests, if necessary, prior to turning over the project for occupancy.

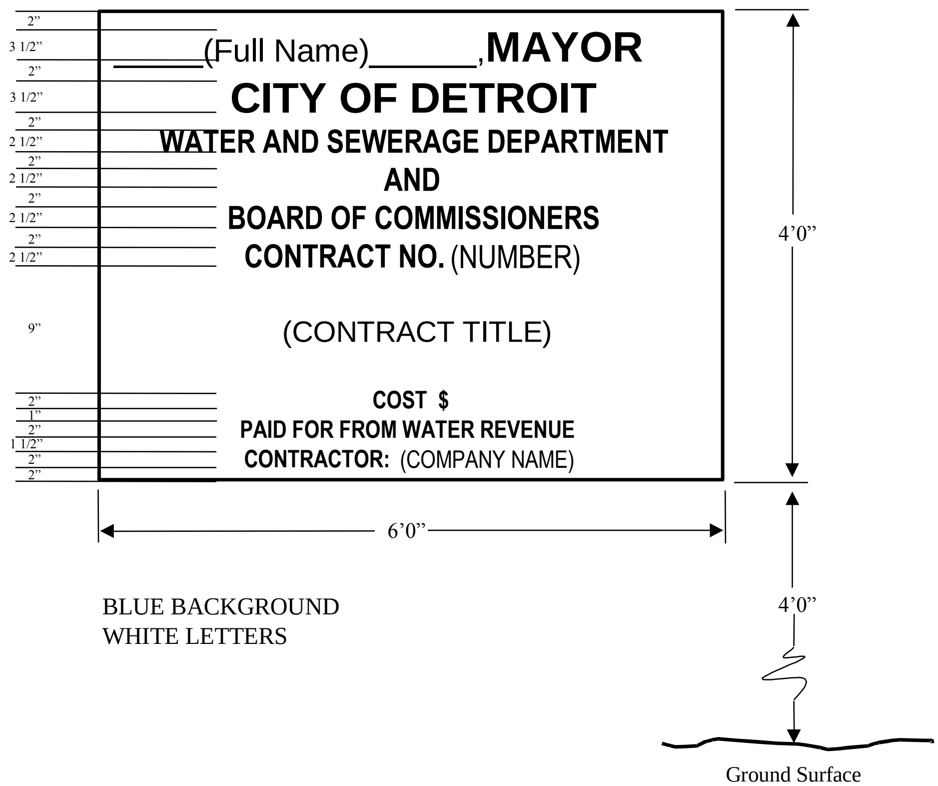
1.5 REMOVAL OF UTILITIES, FACILITIES AND CONTROLS. Remove temporary utilities, equipment, facilities, materials, prior to final inspection. Remove underground installations to a minimum depth of 2 feet (600 mm). Clean and repair damage caused by installation or use of temporary work. Restore and landscape area used during construction to specified condition.

1.6 QUALITY ASSURANCE. Sign painter shall have 5 years documented professional experience in type of work required.

Finishes and painting shall be adequate to resist weathering and fading for scheduled construction period.

PART 2 – PRODUCTS

2.1 PROJECT SIGN. Size of signs and lettering shall be as required by regulatory agencies or as appropriate to usage. See drawing of sign shown below.



Structure and framing may be new or used, wood or metal, in sound condition, structurally adequate to work and suitable for specified finish.

Sign surface shall be exterior plywood with medium density overlay, standard large sizes to minimize joints with sufficient thickness to span framing members, to provide even, smooth surface without waves or buckles.

The entire woodwork of the sign shall be given a priming coat of white exterior paint primer. The sign, including framework, shall be given two (2) coats of white exterior paint.

Project information signs shall be painted signs with painted lettering or standard products and shall be done by a skilled sign painter.

Wrought hardware shall be galvanized.

2.2 MATERIALS. Provide new materials. If acceptable to the Engineer, the Contractor may use undamaged, previously used materials in serviceable condition. Provide materials suitable for use intended.

Lumber, plywood, and plastics shall comply with requirements in Master Specification Division 6, Wood and Plastics:

For job-built temporary offices, shops, and sheds within the construction area, provide UL-labeled, fire-treated lumber and plywood for framing, sheathing, and siding.

For signs and directory boards, provide exterior-type, Grade B-B high-density concrete form overlay plywood of sizes and thickness indicated.

For safety barriers, sidewalk bridges, and similar uses, provide minimum 5/8-inch (16-mm) thick exterior plywood.

Paint shall comply with requirements of Master Specification Section 9900, Painting.

For job-built temporary offices, shops, sheds, fences, and other exposed lumber and plywood, provide exterior-grade acrylic-latex emulsion over exterior primer.

For sign panels and applying graphics, provide exterior-grade alkyd gloss enamel over exterior primer.

For interior walls of temporary offices, provide 2 coats interior latex-flat wall paint.

Provide waterproof, fire-resistant, UL-labeled tarpaulins with flame-spread rating of 15 or less. For temporary enclosures, provide translucent, nylon-reinforced laminated polyethylene or polyvinyl chloride, fire-retardant tarpaulins.

2.3 Equipment. Provide new equipment. If acceptable to the Engineer, the Contractor may use undamaged, previously used equipment in serviceable condition. Provide equipment suitable for use intended.

Provide 3/4-inch (19-mm), heavy-duty, abrasion-resistant, flexible rubber water hoses 100 feet (30 m) long, with pressure rating greater than the maximum pressure of the water distribution system. Provide adjustable shutoff nozzles at hose discharge.

Provide temporary heating/cooling units that have been tested and labeled by UL, FM or another recognized trade association related to the type of fuel being consumed in accordance with Master Specification Division 15000, Mechanical.

Provide self-contained, single-occupant temporary toilet units of the chemical, aerated recalculation, or combustion type. Provide units properly vented and fully enclosed with a glass-fiber-reinforced polyester shell or similar nonabsorbent material.

Provide hand-carried, portable, UL-rated, Class "A" fire extinguishers for temporary offices and similar spaces. In other location, provide hand-carried, portable, UL-rated, Class ABC, dry-chemical extinguishers or a combination of extinguishers of NFPA-recommended classes for the exposures.

Comply with NFPA 10 and NFPA 241 for classification, extinguishing agent, and size required by location and class of fire exposure.

Provide a minimum of two (2) temporary pumps, suitable for the fluid pumped, complete with controls for each temporary bypass and process pumping required to complete the Work in accordance with Master Specification Division 11000, Equipment.

PART 3 – EXECUTION

3.1 INSTALLATION. Use a qualified personnel for installation of temporary facilities. Locate facilities where they will serve the Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required.

Provide each facility ready for use when needed to avoid delay. Maintain and modify as required. Do not remove until facilities are no longer needed or are replaced by authorized use of completed permanent facilities.

3.2 SIGN INSTALLATION Install project identification sign within 30 days after date fixed by Notice to Proceed. Install job construction signs as required and directed by the Engineer.

Erect supports and framing on secure foundation, rigidly braced and framed to resist wind loadings. Install sign surface plumb and level, with butt joints to anchor securely.

Paint all exposed surfaces of sign, supports and framing.

3.3 TEMPORARY UTILITY INSTALLATION. Engage the appropriate local utility company to install temporary service or connect to existing service. Where utility company provides only part of the service, provide the remainder with matching, compatible materials and equipment. Comply with all utility companies' recommendations.

> Arrange with utility company and existing users for a time when service can be interrupted, if necessary, to make connections for temporary services.
>
> Provide adequate capacity at each stage of construction. Prior to temporary utility availability, provide trucked-in services.

Obtain easements to bring temporary utilities to the site where the Owner's easements cannot be used for that purpose.

Cost or use charges for temporary facilities are not chargeable to the Owner or Engineer. Neither the Owner nor Engineer will accept cost or use charges as a basis of claims for Charge Orders.

Install water service and distribution piping of sizes and pressures adequate for construction until permanent water service is in use. Sterilize temporary water piping prior to use.

Provide weatherproof, grounded-temporary electric power service and distribution systems of sufficient size, capacity, and power characteristics during construction period. Include meters, transformers, overload-protected disconnects, automatic ground-fault interrupters, and main distribution switchgear.

Install electric power service underground, except where overhead service must be used. Install wiring overhead and rise vertically where least exposed to damage. Where permitted, wiring circuits not exceeding 125 Volts, ac 20 Ampere rating, and lighting circuits may be nonmetallic sheathed cable where overhead and exposed for surveillance

Provide temporary lighting with local switching. Install and operate temporary lighting that will fulfill security and protection requirements without operating the entire system. Provide temporary lighting that will provide adequate illumination for construction operations and traffic conditions.

Provide temporary heat required by construction activities for curing or drying of completed installations or for protection of installed construction from adverse effects of low temperatures or high humidity. Select safe equipment that will not have a harmful effect on completed installations or elements being installed. Coordinate ventilation requirements to produce the ambient condition required and minimize consumption of energy.

Except where the Owner authorizes use of the permanent system, provide vented, self-contained, LP-gas or fuel-oil heaters with individual space thermostatic control. Use of gasoline-burning space heaters, open flame, or salamander heating units is prohibited.

Provide temporary telephone service throughout the construction period for all personnel engaged in construction activities. Install telephone on a separate line for each temporary office and first-aid station. At each telephone, post a list of important telephone numbers. Provide additional separate telephone lines for the following:

Where an office has more than 2 occupants, install a telephone for each additional occupant or pair of occupants.

Provide a dedicated telephone line for a fax machine in the field office

Provide a separate line for the Owner’s use.

Sanitary facilities shall include temporary toilets, wash facilities, and drinking-water fixtures. Comply with regulations and health codes for the type, number, location, operation, and maintenance of fixtures and facilities. Install where facilities will best serve the Project’s needs. Provide toilet tissue, paper towels, paper cups, and similar disposable materials for each facility. Provide covered waste containers for used material. Use the Owner’s existing toilet facilities will not be permitted. Install self-contained toilet units. Shield toilets to ensure privacy. Use of pit-type privies will not be permitted. Provide separate facilities for male and female personnel.

Install wash facilities supplied with potable water at convenient locations for personnel involved in handling materials that require wash-up for a healthy and sanitary condition. Dispose of drainage properly. Supply cleaning compounds appropriate for each condition. Provide safety showers, eyewash fountains, and similar facilities for convenience, safety, and sanitation of personnel.

Provide drinking-water fountains where indicated, including paper cup supply. Provide containerized, tap-dispenser, bottled-water drinking–water units, including paper supply. Where power is accessible, provide electric water coolers to maintain dispensed water temperature at 45-55 degrees F (7-13 degrees C).

Provide temporary connections to sewers. Filter out excessive amounts of soil, construction debris, chemicals, oils, and similar contaminates. Connect temporary sewers to the municipal system, as directed by Owner. Maintain temporary sewers and drainage facilities in a clean, sanitary condition. Restore normal conditions promptly.

Provide earthen embankments and similar barriers in and around excavations and subgrade construction, sufficient to prevent flooding by runoff of storm water from heavy rains.

3.4 TEMPORARY PAVING. Construct and maintain temporary roads and paving to support the indicated loading adequately and to withstand exposure to traffic during the construction period. Locate temporary paving for roads, storage areas, and parking where the same permanent facilities will be located. Review proposed modifications to permanent paving with the Engineer.

Comply with Master Specification Division 1, Site Construction. Coordinate temporary paving development with subgrade grading, compaction, installation and stabilization of subbase, and installation of base and finish courses of permanent paving. Install temporary paving to minimize the need to rework the installations and to result in permanent roads and paved areas without damage or deterioration when occupied by the Owner. Delay installation of the final course of permanent asphalt concrete paving until immediately before Substantial Completion. Coordinate with weather conditions to avoid unsatisfactory results. Extend temporary paving in and around the construction area as necessary to accommodate delivery and storage of materials, equipment usage, administration, and supervision.

3.5 WASTE CONTROL. Collect waste from construction areas and elsewhere daily. Comply with requirements of NFPA 241 for removal of combustible waste material and debris. Enforce requirements strictly. Do not hold materials more than 7 days during normal weather or 3 days when the temperature is expected to rise about 80 degrees F (27 degrees C). Handle hazardous, dangerous, or unsanitary waste materials separately from other waste by containerizing properly. Dispose of material lawfully.

End of Section

SECTION 01120

SECURITY

PART 1 – GENERAL

1.1 SCOPE. The Contractor shall be responsible for implementing a security program during construction to prevent unauthorized entry into the Work areas; theft of small tools, equipment and materials; and willful destruction of property. The Contractor shall coordinate security activities with DWSD's existing security program.

Where the work to be done is locked at an existing DWSD Facility, the area used by DWSD personnel outside of the construction limits, but within the overall plant grounds, shall be known as the restricted area. Where the work to be done is at a remote location, security will confirm to all portions of this section, except for specific plant security requirements

PART 2 - PRODUCTS

2.1 COMPUTER SECURITY. All personal computer systems shall be secured by cables, locks and pads.

PART 3 - EXECUTION

3.1 PLANT SECURITY. Unless otherwise provided in the Contract Documents or by specific direction and approval by DWSD's Chief of Security, all Contractor, sub-contractor, consultant, vendor, and supplier employees, officers, and agents shall park their vehicles in parking lots inside the fenced perimeter of the construction limits.

The Contractor and employees of the Contractor shall be exclusively responsible for the security, protection, and safety of all equipment, materials, vehicles, and persons located within the construction site fenced area.

All Contractor employees shall carry their hand tools with them and walk through the construction gate. DWSD identification must be shown.

All containers carried on or off the Site are subject to search. Inside the restricted area, employees may walk to their designated Work locations or the Contractor may arrange to transport employees in vehicles that the Contractor may continually keep on the Site.

Those persons who are not DWSD personnel shall have limited access to the restricted area. Persons who enter the DWSD Plant must report directly to and from their destination within the restricted area.

At the time of intended entry to the Plant, the security guard will notify the DWSD Plant employee that the visitor proposes to meet and the security guard will designate the location at which the visitor is to be received. The visitor shall notify DWSD plant employee and security guard prior to departure and obtain any DWSD property-clearance passes that may be required.

All persons and vehicles shall enter and exit the restricted area through the main gate. The Contractor, designer, subconsultant, and sub-contractor shall use no other gates or openings into the restricted area. Prior approval and security arrangements must be made for entry or exit at any location other than the main gates.

Any Contractor, designer, subconsultant, subcontractor, their officers, agents, employees, or other persons entering or exiting through unauthorized openings or found within the restricted area without proof of proper admittance shall be subject to arrest and prosecution for trespassing.

The Chief of Security and authorized agents will provide general security administration, and interpretation of this Section. The Chief of Security will issue any other security directives, orders, or notice that the Chief of Security may consider being necessary and appropriate.

DWSD's applicable executive staff will make any and all final determinations of which vehicles and persons may enter and exit the restricted area.

3.2 CONSTRUCTION SITE SECURITY. Access into and out of the construction work area will be controlled by the Contractor.

Entrance into the construction work area will be through a distinct and separate gate from the plant main gate where applicable. Security at this separate gate will be supplied by the Contractor at all hours that this gate is open. When the gate is secured to the construction work area at DWSD plants with a DWSD security force on duty 24 hours a day, security guards need not be provided by the Contractor.

The construction work area main gates shall use locks to which DWSD plant security has access.

3.3 SECURITY SERVICE. At construction sites without a DWSD security force on site, the Contractor shall, at his own expense, employ a uniformed guard service to provide a watchperson on site during all non-working hours.

3.4 PERSONNEL IDENTIFICATION. DWSD shall issue identification badges to all long term employees of the Contractor and Subcontractor that will be on site.

Contractor and subcontractor employees shall display identification badge at all times while inside the plant perimeter. Failure to do so is grounds for refusing entry at no additional cost to DWSD.

Contractor shall maintain a current list of Contractor and Subcontractor employees with badges and shall submit a copy to owner upon request. Identification badges will be returned at expiration of employee or subcontractor employment on site. Contractor shall be responsible to DWSD for positive control of employee identification badges.

3.5 CONTRACTOR VEHICLES. Contractor's vehicles shall be parked in the areas shown on the Construction Traffic Plan unless it is necessary for designated vehicles to deliver heavy supplies, heavy equipment, or heavy tools to the site.

The Contractor shall register with the security office all vehicles that will be used regularly within the existing plant restricted area. If appropriate, stickers will be issued for such vehicles.

The Contractor shall register with the security office all vehicles that will make deliveries at regular intervals to locations inside the operating plant restricted area. If appropriate, such vehicles will be issued one day passes for a specific destination at the site.

Unless otherwise provided in the Contract Documents or by specific direction and approval by DWSD's Chief of Security, private vehicles shall not be allowed or permitted entry to the restricted operation plant area on a regular basis.

Contractor's general superintendent and management personnel may be issued appropriate passes for a private vehicle to enter the restricted area if such persons can demonstrate a need for such a vehicle to perform their duties.

All vehicles are subject to search upon entry and exit from the restricted area. The Contractor's property must be clearly identified, designated, and declared prior to entry into the restricted area. Written registration of such tools and equipment may be required. Unless proof of ownership and authorization for exit from the restricted area are presented, tools and equipment as well as materials shall not be removed from the restricted area.

Neither extraneous nor unnecessary tools, equipment, or vehicles shall be allowed to enter the restricted area.

3.6 PROPERTY PASSES. Unless otherwise provided in the Contract Documents or unless an authenticated DWSD property-clearance pass is presented to the security guard, tools and equipment as well as materials shall not be removed from the restricted area. An authenticated DWSD property-clearance pass may be secured by Contractor demonstrating that such items were previously registered and have been brought into the restricted area as non-DWSD property that did not thereafter transfer to and became the property of DWSD.

If an authenticated DWSD property-clearance pass is not presented, the security guards will hold and maintain in their physical possession and control all such tools, equipment, or materials until positive identification and approval to remove such items can be established by the Contractor.

The Contractor will be informed by the Engineer of those designated DWSD persons who are authorized to issue and execute property-clearance passes.

End of Section

SECTION 01140

SOIL EROSION AND SEDIMENTATION CONTROL

PART 1 – GENERAL

1.1 SCOPE. This work includes the installation and maintenance of erosion and sedimentation controls required to prevent or minimize soil erosion and sedimentation from impacting the water resources of the State of Michigan and adjacent properties.

1.2 GENERAL.

1.2.01 Coordination. The Contractor shall conduct the work so that all soil, fuels, oils, bituminous materials, chemicals, sanitary sewage, debris and other unsuitable materials, resulting from the construction of the project, are confined within the right-of-way and project limits. These materials shall be properly disposed of to prevent them from leaving the project site and from entering watercourses, rivers, lakes, streams, reservoirs, wetlands or ground water.

1.2.02 Governing Standards.

Act 451 of 1994, Natural Resources and Environmental Protection Act, Part 91, Michigan Soil Erosion and Sedimentation Control (formerly PA 347 of 1972, as amended).

Michigan Department of Transportation (MDOT) Standard Specifications for Construction.

Wayne County Department of Public Services Engineering Division, Erosion and Sedimentation Control Standard Plan, dated April 17,1997.

Wayne County Department of Public Services Engineering Division, Special Provision for Erosion Controls, dated April 24, 1997.

Oakland County Department of Public Works, Erosion Control Manual.

1.3 QAULITY ASSURANCE. Soil Erosion and Sedimentation Control measures shall be installed and maintained in accordance with the requirements of all Federal, State and Local laws and regulations regarding soil erosion and sedimentation control, the Michigan Department of Environmental Quality (MDEQ), has designated the DWSD an Authorized Public Agency (APA) under authority of Act 451, Natural Resources and Environmental Protection Act, Part 91, Michigan Soil Erosion and Sedimentation Control (formerly PA 347 of 1972, as amended). The APA designation allows the DWSD to undertake earth change activities without obtaining an individual soil erosion permit. Failure by the Contractor to install and maintain adequate soil erosion controls may result in project shutdown and/or possible fines from the MDEQ. The Contractor is required to obtain an Act 451, Part 91 permit from the local soil erosion agency, as applicable and all other applicable Federal, State and local permits when working outside of DWSD right-of-way or outside DWSD acquired easement areas. A soil erosion permit is always required when the work disturbs more than 1 acre (4047 m^2) of land or is within 500 feet (152.4 m) of a lake or stream. Local Agency Act 451, Part 91 requirements may be more restrictive.

When conflict exists the more stringent requirement shall govern unless it adversely conflicts with agency having jurisdiction for which Engineer shall make the final determination.

1.4 SUBMITTALS. Even if a soil erosion permit is not required, Act 451, Part 91 requires a Soil Erosion and Sediment Control Plan be prepared as a part of the overall plan that will effectively reduce soil erosion and off-site sedimentation. The soil erosion and sedimentation control plan shall be implemented prior to commencing construction and shall contain at a minimum, the following information:

A map showing the site location, physical limits of each earth change activity, predominant land features including lakes, streams and wetlands, and contour intervals or slope information.

Soils information.

Location of existing and proposed drainage patterns.

Timing and sequence of each proposed earth change.

Description of all temporary and permanent erosion and sedimentation control measures.

A schedule for maintaining all control measures.

Any other information required by the permitting agency.

The Soil Erosion and Sediment Control Plan shall be in accordance with both the MDOT Standard Specifications for Construction and requirements of Agency having jurisdiction.

On projects requiring stream crossing or wetland permits from the MDEQ, the Engineer shall notify the regional MDEQ office of the anticipated construction start date. At project completion, the completion notification card attached to the permit must be submitted to the MDEQ. For projects requiring U.S. Army Corp of

Engineers or U.S. Coast Guard permits, the Engineer shall follow the notification procedures listed on those permits.

Contractor shall be responsible for proper implementation of erosion control measures with regard to construction timing and sequence of operations. Erosion control measures shall be repeated as often as necessary to satisfy permit conditions, Agency having jurisdiction and Engineer's requirements.

PART 2 – PRODUCTS

2.1 MATERIALS. Coarse aggregate shall meet the requirements for 6A aggregate as specified in Section 902 of the 1996 MDOT Standard Specifications for Construction. Additional acceptable materials as specified in the MDOT Standard Specifications include but are not limited to geotextile fabrics, rip-rap boulders, wood stakes, steel stakes, bracing screening, sand bags and standard sized wire bounded straw bales.

2.2 SILT FENCE. Polypropylene geotextile fabric, resistant to common soil chemicals, mildew, and insects; non-biodegradable; in longest lengths possible; meeting the following requirements:

2.2.01 Average Opening Size: 30 U.S. Std. Sieve (600 µm), maximum; ASTM D4751.

2.2.02 Permittivity: 0.05 sec^{-1}, minimum; ASTM D4491.

2.2.03 Ultraviolet Resistance: Retaining at least 70 percent of tensile strength; ASTM D4355 after 500 hours exposure.

2.2.04 Tensile Strength: 100 lb-f (445 N) minimum, in cross-machine direction; 124 lb-f (551 N) minimum in machine direction; ASTM D4632

2.2.05 Elongation: 15 to 30 percent; ASTM D4632.

2.2.06 Tear Strength: 55 lb-f (244 N) minimum; ASTM D4533

Posts shall be 2 by 2-inch (50 mm x 50 mm) cross section hardwood stakes, minimum 3-feet (1.0 m) long.

2.3 DEWATERING DISCHARGE FILTER BAG. UV-stabilized, non-woven geotextile bag to filter sediment from water prior to discharging. Geotextile fabric shall meet the following minimum average roll requirements:

2.3.01 Tensile Strength: 180 lb-f (200 N) minimum; ASTM D4632

2.3.02 Elongation: 50 percent minimum; ASTM D4632

2.3.03 Puncture Strength: 105 lb-f (667 N) minimum; ASTM D4833

2.3.04 Mullen Burst: 350 psi (2413 kPa) minimum; ASTM D3786-87

2.3.05 Trapezoidal Tear: 70 lb-f (310 N) minimum; ASTM D4533

2.3.06 Flow Rate: 80 gal/min/sf. (54 l/s/m^2) Minimum; ASTM D4491

2.3.07 Permittivity: 1.4 sec $^{-1}$ minimum; ASTM D4491

2.3.08 Apparent Opening Size: 100 U.S. Std. Sieve (150 µm) maximum; ASTM D4751

2.3.09 UV-Stability: 70% retained strength; ASTM D4355 after 500 hours.

2.4 TURBIDITY BARRIER. Geotextile fabric curtain suspended from flotation devices at the water surface and held in a vertical position by a ballast chain in the lower hem. Turbidity barrier curtain shall meet the following minimum requirements unless otherwise specified on the plans.

2.4.01 Consist of vinyl laminate on 1000 denier polyester fabric weighing 18 ounce per square yard (610 g/m^2) minimum.

2.4.02 Tensile strength of fabric shall be 220 lbs (100 kg) minimum.

2.4.03 Edges of fabric to be reinforced with minimum 5/8-inch (16 mm) diameter polypropylene rope.

2.4.04 Ballast chain minimum 5/16-inch (8 mm) galvanized steel.

2.4.05 Buoyancy blocks providing buoyancy of 18lbs/l.f (27 kg/m).

2.4.06 Length of curtain (water depth) 5-feet (1.5 m).

2.5 EROSION CONTROL BLANKETS. Machine produced blanket with a consistent thickness of evenly distributed straw or coconut fiber as specified. Unless otherwise specified on the Plans, the erosion control blanket shall have the following minimum properties:

2.5.01 Double net 100% straw blanket

2.5.02 Top and bottom photodegradable polypropylene netting, 1.64 lbs / 1,000 sft. (0.8 kg/ m^2) approximate weight.

2.5.03 100% agricultural straw 0.5 lbs. / sy. (.27 kg/m^2)

2.5.06 Stitch spacing: 1.5 inches (40 mm) on centers

2.5.07 Pegs shall be 6-inch (150 mm) long, hardwood pegs.

2.6 INLET FILTER FABRIC. The filter fabric shall be constructed of 100% continuous polyester needle-punched non-woven engineering fabric and follow the guidelines in the American Society for Testing and Materials (ASTM) D1117-99; Standard Guide for Evaluating Nonwoven Fabrics. The filter fabric shall be fabricated to provide a direct fit with the drainage structure cover. The filter fabric shall have the following minimum physical properties.

2.6.01 Tensile Strength: 80 lb-f (.355 kN) minimum; ASTM D4632

2.6.02 Elongation: 50 percent minimum; ASTM D4632

.6.03 Puncture Strength: 45 lb-f (200 kN) minimum; ASTM D4833

2.6.04 Mullen Burst: 350 psi (2413 kPa) minimum; ASTM D3786-87

2.6.05 Trapezoidal Tear: 70 lb-f (310 N) minimum; ASTM D4533

2.6.06 Flow Rate: 80 gal/min/sf. (54 $l/s/m^2$) Minimum; ASTM D4491

2.6.07 Permittivity: 1.4 sec^{-1} minimum; ASTM D4491

2.6.08 Apparent Opening Size: 100 U.S. Std. Sieve (150 µm) maximum; ASTM D4751

2.6.09 UV-Stability: 70% retained strength; ASTM D4355 after 500 hours.

PART 3 – EXECUTION

3.1 SERVICE CONDITIONS. Construction operations shall be conducted to prevent or minimize erosion and sedimentation. Temporary or permanent erosion and sedimentation controls shall be constructed and maintained as specified by agency having jurisdiction prior to commencing any construction operations including clearing. Grading operations shall be performed as soon as possible after clearing operations. Temporary erosion and sedimentation controls as directed by the Engineer shall be installed to minimize potential problems, to correct conditions which develop during construction, or to stabilize inactive construction areas. The Contractor shall minimize the area of unstabilized land surface over which storm water must flow. Construction shall proceed from lower ground toward higher ground, whenever possible.

Steps shall be taken to minimize erosive loss and resultant offsite sedimentation from stored piles of excavated spoils, topsoil, sand, gravel, and aggregate. Control methods used by the Contractor may include remote storage, covering, temporary stabilization, compacting, diversion ditches, and silt fences, in total in any combination, as may be dictated by the size, type, location, season and anticipated duration of storage.

Soil erosion control techniques such as ground cover in the form of vegetation and seeding, compaction, rip rap, or aggregate cover shall be used as appropriate to control erosion over large surface areas. Soil erosion control techniques such as weirs, check-dams, bank stabilization, sheet pilings, etc. shall be used to minimize soil erosion in streams and small waterways.

Provide suitable sedimentation control measures at affected connections to existing or new storm drains, to minimize deposition of sediment in the storm drains during the construction period. Sedimentation control measures shall be provided prior to any significant clearing, grading or surface disruption of the tributary areas.

Pumped water from well points, dewatering wells, or excavations shall not discharge onto unstabilized areas. Such discharge shall be conveyed by pipe, hose or stabilized channel, to a settling basin or other suitable sedimentation control facility.

3.1.01 <u>Time Limitations</u>. All graded areas shall be brought to final grade as soon as possible. Permanent soil erosion controls and stabilization for all slopes, channels, ditches and other disturbed areas shall be completed within 15 calendar days after final grading as required by law. Permanent restoration of all slopes and ditches within 164 ft. (50 m) of any lake, stream or wetland shall be done within 10 calendar days following final grading. Where it is not possible to permanently stabilize a disturbed area, appropriate temporary erosion and sedimentation controls shall be implemented within 15 calendar days after cessation of grading activity, or as directed, whether or not the area has been brought to final grade. All temporary soil erosion and sedimentation shall control measures be maintained until permanent soil erosion and sedimentation controls are in place and functional.

3.1.02 <u>Area Limitations</u>. The surface area of erodible earth material exposed at any one time will be limited to the minimum amount required for execution of the work. Typically this is the length of water main or sewer line that can be laid and backfilled in one day for cleaning and grading operations, or the minimum area needed to perform general site work activities. The Engineer may reduce or increase the limits of exposed surface area dependent on the Contractor’s capability to keep current the finish grading, top soiling, seeding, mulching, and other temporary or permanent erosion and sedimentation control operations.

When the Contractor has completed the permanent restoration on a cut slope or embankment slope, or portions thereof, the completed slope will be approved by the Engineer.

The Contractor shall not disturb lands and waters outside the grading limits unless such work is found necessary and is approved by the Engineer. Restoration of areas that are disturbed beyond the plan or approved limits will be at the Contractor's expense.

Prior to site disturbance when work is conducted outside the right-of-way, such as borrow operations, at waste or disposal areas, haul roads, storage sites or other types, the Contractor shall obtain and provide the Engineer with copies of any permit required by agency having jurisdiction. These permits shall include, but are not limited to those required under Act 451, Part 91 (Soil Erosion and Sedimentation Control), Part 303 (Wetlands Protection, formerly Act 203), Part 301 (Inland Lakes and Streams, formerly Act 346), Part 31, (Water Resources Protection, Floodplain Regulatory Authority, formerly Act 245 as amended by Act 167), and Part 31 (Water Resources Protection). National Pollutant Discharge Elimination System (NPDES), Federal Section 404 and Clean Water Act, permits may also be required. Temporary and permanent erosion and sedimentation controls shall be provided by the Contractor as specified in the applicable permits.

3.2 CONSTRUCTION OF EROSION AND SEDIMENTATION CONTROLS. Construction of temporary or permanent erosion and sedimentation controls shall meet the requirements as specified on the plans or as directed by Engineer.

If approved by the Engineer, and not prohibited by permit, broken concrete may be used for erosion and sedimentation controls provided all the reinforcing steel has been removed or flush cut. The use of bituminous material for checkdams, weirs or riprap is prohibited.

3.2.01 Filter Bag. This work shall consist of furnishing, placing, and disposing of a minimum 269 ft^2 (25 m^2) filter bag constructed of geotextile blanket. Water pumped from construction operations shall be pumped into and allowed to filter through the filter bag before entering any watercourse. A separate silt fence shall be installed around the filter bag for additional protection in sensitive areas or where the filter bag is not effectively removing the sediment. Water being pumped may be discharged directly into the watercourse provided it remains silt free. The filter bag should be located on level ground above the banks of the stream channel. The location of the filter bag will be approved by the Engineer. The filter bag and its contents shall be properly disposed of by the Contractor.

3.2.02 Silt Fence. This work shall consist of furnishing, erecting, maintaining, removing, and disposing of a silt fence. Silt fencing consists of a post supported geotextile. Installation, including proper entrenching, shall be accomplished as specified or approved according to the manufacturer's published recommended practice. Sections of silt fence shall be overlapped at least 3.3 ft (1 m). In areas where water ponds are located behind the silt fence, a stone filter may be needed to outlet the water and prevent failure.

3.2.03 Sediment Traps and Basins. This work shall consist of excavating, maintaining and filling in if directed, a sediment trap 176 ft^3 (5 m^3) or less in size or a sediment basin greater than 176 ft^3 (5 m^3) as shown on the plans or where directed.

The excavated material shall not be allowed to erode into a lake, watercourse, or wetland. Check dams or weirs that are to be installed at the downstream side of the trap or basin should be installed prior to the excavation of the sediment trap or basin. Sediment traps shall be in place immediately prior to beginning construction or as directed by the Engineer.

3.2.04 Erosion Control Blankets. Shall consist of a machine produced mat of curled wood exterior of 80 percent 6 inch (15.2 cm) or longer fiber length with a consistent width of fiber evenly distributed throughout the mat. A photodegradable netting manufactured from extruded plastic mesh shall be used on the top side of the excelsior erosion control blankets, the blankets shall be smolder resistant with no chemical additives.

3.2.05 Check Dams and Weirs. This work shall consist of installing, maintaining and removing if directed, a check dam or weir across a ditch or watercourse. The cross-section and installation shall be as shown on the plans or as directed. The check dam or weir shall extend at least 16 inch (40.6 cm) up the slope on both sides and shall include a 4 to 5 inch (10.16 to 12.7 cm) lower center channel spillway. Check dams shall be constructed as indicated on plans or immediately after grading in the area is completed. Weirs shall be constructed prior to any construction affecting the waterway is started.

3.2.05 Temporary Channel Liner. This work shall consist of furnishing, installing, maintaining, removing, and disposing of a temporary channel liner. The liner shall be either a plastic sheeting or a Polyvinyl Chloride (PVC) material. The PVC material must be used between November 15 and March 1 or when frozen conditions are expected. The temporary channel liner shall extend over the berm along the top of the temporary channel and be anchored. Sections of temporary channel liner shall be overlapped 20 inches (500 mm) in the downstream direction and have a sufficient quantity of washed 6A stone placed in the overlap area to prevent undermining of the liner.

3.2.06 Stone or Gravel Filter at Inlet. The Stone or Gravel Filter shall be constructed immediately after the backfilling and grading adjacent to the inlet is completed. The number of sides of the filter may vary depending upon the location and type of intake structure.

3.3 MAINTENANCE OF EROSION AND SEDIMENTATION CONTROLS. The Contractor shall maintain all temporary erosion and sedimentation controls during the period that the temporary controls are required and all permanent erosion controls until the contract has been completed and accepted. Such maintenance shall consist of the repair of all damaged areas, replacement of lost facilities and periodic removal of sediment. Sediment traps and basins shall be cleaned out when they are half full or as directed. Sediment or debris shall be removed from in front of silt fence when it has accumulated to one half of the fence height. The removed sediment shall be disposed of according to Subsection 205.03.A.4 of MDOT 1996 Standard Specifications for Construction.

Any accumulation of sediment affecting the efficient operation of the erosion controls should be removed and stockpiled in a stabilized area so as to prevent the material from eroding back into the drainage course.

3.4 REMOVAL OF EROSION AND SEDIMENTATION CONTROL FACILITIES. Temporary erosion and sedimentation controls shall be removed or obliterated when the permanent controls are in place and approved, unless ordered to be left in place by the Engineer. Temporary controls adjacent to lakes, watercourses, or wetlands shall be left in place until the adjacent slopes have turf establishment. Mulch placed for temporary erosion control shall be incorporated into the slope, or removed, prior to placement of topsoil, permanent seeding and fertilizing operations. Care shall be exercised during removal of erosion controls to minimize erosion or sedimentation into watercourses. Any damage caused during the removal operations shall be repaired at the Contractor’s expense.

After the upstream construction is completed and vegetation or a permanent lining has been established in the waterway, the sediment pit shall be filled, the sediment trap removed and the side slope area formerly occupied by the sediment trap sodded or riprapped, as directed by the Engineer.

After vegetation or a permanent lining has been successfully established in the ditches and/or swales, the check dams shall be removed and the area formerly occupied by the check dam shall be sodded as applicable.

After construction is completed and the waterway channel restored, the weirs shall be removed and the area formerly occupied by the weir shall be restored.

After vegetation or a permanent lining has been successfully established in the ditches or swales, the stone or gravel filter at inlet shall be removed and the area formerly occupied by the filter shall be sodded.

Sand filled bags must be disposed of at an upland site or as approved. If approved, stone from stone filled bags may be placed in the bottom of the watercourse if the stream hydraulics are not changed.

End of Section

SECTION 01150

PROJECT RECORD DOCUMENTS AND PHOTOGRAPHS

PART 1 - GENERAL

1.1 SCOPE. This section describes the Contractor's responsibility to provide record documents, construction photographs, and digital video of the Work. This section builds upon the General Conditions (Exhibit C) of the Agreement.

1.1.01 Record Documents. During the construction period, Contractor shall maintain a complete set of project record documents in the project field office for transmittal to Engineer and completion of project. This set is in addition to the construction set used by the Contractor. The record set will not be used for construction. The record documents shall include:

Contract Documents

Construction Documents

Contract Addenda

Change Orders and other Modifications to the Contract

Engineer's Field Orders or Written Instructions

Approved Shop Drawings, Working Drawings and Samples

Field Test Records

Construction Photographs and DVDs

Progress Schedule

1.1.02 Construction Photographs. Provide photographs and DVD's made of the Work from views and at such times as directed by the Engineer.

The photographic and video work shall be done by a responsible commercial photographic studio known to be skilled and regularly engaged in the business of taking commercial photographs.

Electronic "snap-shot" photography shall also be used as necessary to record and facilitate resolution of on-site issues through the transmission of electronic photographs by e-mail from the site to the Designer's and Engineer's offices.

1.2 MAINTENANCE OF RECORD DOCUMENTS AND SAMPLES. Store documents and samples in Contractor's field offices apart from documents used for day-to-day management of construction. Record documents shall not be used for construction purposes.

Provide files and racks for storage of record documents and a locked cabinet or secure storage space for storage of samples. Maintain documents in a clean, dry, legible condition and in good order.

The Contractor shall institute a computerized record control program utilizing, or compatible with, Engineer software.

Documents and samples shall be available at all times for inspection by the Engineer. As a prerequisite for milestone progress payments, the Contractor shall submit the currently updated “Record Documents” for review by the Engineer and Owner.

1.3 PHOTOGRAPHIC REQUIREMENTS. Provide photographs taken at each of the major location of major CPM activities during construction.

Photographs shall be in color. Provide 500 professional photographs taken at various stages of the project as directed by the Engineer unless indicated otherwise. These photographs shall represent a visual history of the Project, from Contract award through occupancy.

Provide scaled, color aerial photographs of the project site; one photograph will be of the project within 60 days after notice to start work; and one photograph shall be within 60 days after project start-up and demolition are completed. The photograph scale shall be 1inch =100 ft (1 cm = 1/100 m). The photograph shall be an aerial composite made up of a sufficient number of segments to ensure that all project structures appear free of distortion.

Provide digital electronic images of all photographs on CDs as well as three prints and negatives of each view. Deliver digital electronic images and prints, to the Engineer.

1.4 RECORDING. Use colored felt tip marking pens for recording information in the color code designated by the Engineer.

Label each document "PROJECT RECORD" in neat large printed letters and all standard document information, Contract name and number, location, specification number or spectext section, etc. Record information concurrently with construction progress. Do not conceal any Work until required information is recorded.

1.4.01 Drawings. Legibly mark the following information onto as-built drawing to record actual construction:

Depths of various elements of foundation in relation to finish first floor drain.

All underground piping with elevations and dimensions. Changes to piping location. Horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements. Actual installed pipe material, class etc.

Location of internal utilities and appurtenances concealed in the construction, referenced to visible and accessible features of the structure.

Field changes.

Changes made by Field Order or by Change Order.

Details not on original contract drawings.

Equipment and piping locations, and relocations.

Major architectural and structural changes including relocation of doors, windows, and etc.

Architectural schedule changes according to Contractor's records and shop drawings.

Transfer all marks to the CAD drawing file and submit a final magnetic media record as well as a final plot on mylar of all updated as-built drawings. In addition, the Contractor shall provide DWSD with ten (10) full size (24"x36") hard copies and ten (10) CDs of the final as-built drawings.

As-built drawings shall be computerized and made available on-line to the control system operators.

1.4.02 Specifications and Addenda. Legibly mark each Section to record the manufacturer, trade name, catalog number, and supplier of each product and item of equipment actually installed, and changes made by Field Order or Change Order.

1.4.03 Shop Drawings. Label shop drawings with "PROJECT RECORD" and rest of information as shown above. Refer to Master Specification Section 01080, Project Submittals for additional information on format.

1.5 SUBMITTAL. On completion of the Work, and prior to final payment by DWSD, the Contractor shall arrange the project records in order to match the Specifications Sections of the Project/Contract, bind them together, index them and deliver them to the Engineer.

The Contractor shall review the records maintained by its sub-contractors for completeness prior to assembly and submittal.

Tracings of all Construction Documents and Shop Drawings made by the Contractor, sub-contractors, and suppliers of materials or equipment shall be corrected to show the Work as actually completed or installed.

Furnish a mylar copy, two xerographic prints, and magnetic media for each corrected and approved drawing.

Accompany each submittal with transmittal letter in duplicate, containing:

Date

Project title and number

Contractor's name and addresses

Title and number of reach record document

Signature of Contractor or its authorized representative

Contract section and subsection numbers

Location

PART 2 - PRODUCTS

2.1 PHOTOGRAPHIC MATERIALS. The film negative shall be not less than 4 x 5 inches (10.16 x 12.7cm).

Each print shall be single weight paper with glossy finish and the overall dimension shall be 7-1/2 x 10 inches (19.05 x 25.4 cm). The print shall be clear, sharp and free of distortion after the enlargement from the negative.

Provide loose-leaf albums for each set of photographs to hold prints with a maximum of 50 leaves per binder. The binder shall be Boorum and Pease No. 352, National No. 75-681, or equal.

Each print shall be protected by a flexible, transparent acetate or plastic sheet protectors with metal reinforced holes which shall fully enclose each print. One edge of each leaf shall be capable of being inserted in the rings of the album. Two extra leaves shall be provided in each binder. Durable blank loose leaf sheets, fitting the album, shall be furnished with each album so the final indexing of all photographs and their description will be recorded and permanently inserted with the photographs. The sheet protector shall be Boorum and Pease model 51780 or equal.

The Contractor shall provide two sets of slides of each view in trays. The slide trays shall be Elmo 4000-1CBK or equal.

All video of the Work shall be provided on digital media such as DVD, in a format acceptable to the Contracting Officer.

Each aerial photographic print shall be double-weight paper with glossy finish and shall have overall dimensions of 36 inches x 58 inches (91.4 cm x 147.3 cm). The Contractor shall provide 24 full size prints (12 prints of the site within 60 days of notice to start and 12 prints of the site within 60 days after plant start-up is completed) and 36 inches x 58 inches (91.4 cm x 147.3 cm) negatives, one for each aerial photograph.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS. Photographs shall be of correct exposure and focus, displaying high resolution and sharpness; maximum depth of field.

3.2 PHOTOGRAPHY VIEWS REQUIRED. Photograph shall be from locations to illustrate condition of construction and state of progress adequately. Prior to the beginning of construction identify and obtain Engineer's approval of a vantage point that will capture the entire construction site. Provide recurring photographs from the location throughout construction. Consult with Engineer each occasion for instruction covering views required.

The Contractor shall provide before and after photographs of each portion of the site. The below ground facilities shall include all equipment, walls, floor, piping, supports and entrance. At major locations, photographs shall include before, during, and after prints and all prints shall be placed in binders in ascending date order to show the Work as it progresses.

3.3 DESCRIPTIVE INFORMATION. Each photograph shall have a permanent title block on the back and shall contain the typed information and arrangement as follows:

> DETROIT WATER AND SEWERAGE DEPARTMENT
> Contract No: (List Contract No)
> (Title of This Contract/Program Element)
> CONTRACTOR: (Name of Contractor)
> DATE: (When photo was taken)
> PHOTO NO: (Consecutive Numbers)
> PHOTO BY: (Firm Name of Photographer)
> LOCATION: (Description of Location and View)

The Contractor shall provide the Engineer with a written description of each photograph and slide. This description shall be included in the binders and copy shall be submitted with negatives and slides. The field engineer or inspector shall approve the description.

3.4 DVD REQUIREMENTS.

3.4.01 Major Locations. The Contractor shall provide color DVD's of the construction site and each major facility and structure adjacent to the construction before construction starts, during construction and when construction has been completed. Approximately every two weeks, 15 minutes of video recording shall be submitted to the Engineer showing Work completed, Work in progress, Work started, and problems which occurred since last taping. The Contractor shall maintain the master DVD of each portion of the facility on Work site. The master DVD is a running chronicle of construction. The Contractor shall "dub" the bi-weekly video recording on to the master DVD. The bi-weekly DVD's shall be submitted to the Engineer within ten (10) working days after video recording and the bi-weekly DVD's may include multiple locations.

All video recording shall be filmed with date and stamp showing on each frame of film. During video recording , the Contractor shall narrate the video explaining what is being shown, the problem that has occurred and what is being done. All master DVD's shall be delivered to the Engineer, within five working days after "Certification of Substantial Completion" is submitted.

3.5 DIGITAL PHOTO DOCUMENTATION.

Catalog and manage Electronic "snap-shots" and images of photographs in a secure digital photo management system capable of being linked to the project schedule and document management database. Add captions, descriptions, and key words. Transfer a copy of all "snap-shots" and photos with their related notes, keywords, captions and activity ID's to the Engineer on a weekly basis. Provide three copies of the digital photo management system with software to the Engineer. Turn over digital camera and master digital photo management software to Owner at final completion

The print shall be clear, sharp and free of distortion after enlargement from the negative. Each photograph shall have a permanent title block in the lower right-hand corner which shall be 2 1/2 inches (6.4 cm) high by 6 inches (15.3 cm) wide and shall contain the "Leroy" template lettered information and arrangement as follows:

DETROIT WATER AND SEWERAGE DEPARTMENT
(Project Title)
(Project Address)
SCALE: 1" = 100'-0" (1 cm = 1/100 m)
PHOTO BY: (Firm Name of Photographer)
DATE: (When photo was taken)

End of Section

SECTION 01160

TRAINING AND OPERATION & MAINTENANCE MANUALS

PART 1 - GENERAL

1.1 SCOPE. This section provides requirements for furnishing Operation and Maintenance (O & M) Manual data with necessary related information and providing associated training.

1.2 GENERAL.

1.2.01 O & M Manual Requirements. Prepare operating and maintenance data as specified in this Section and as referenced in other pertinent sections of the Specifications. The data presented in the O & M Manuals shall be specifically related to equipment, electrical, mechanical, instrumentation, communication, and other systems of this Contract and application.

The Contractor shall furnish all labor, equipment, materials, and all other items to supply and deliver, to the Engineer, O & M Manuals for the Work in accordance with the requirements of this Section. Request and incorporate maintenance and operation data furnished by DWSD.

The costs of the O & M Manuals shall be included in the total Contract Price.

1.2.02 Training Requirements. Instruct and train Owner's personnel in operation and maintenance of equipment and systems supplied and/or installed under this contract.

Incorporate the following operation and maintenance data and training services furnished by suppliers into the training program:

Shop drawings.

Equipment manuals.

Start-up services.

Training as specified in detailed specification sections.

Prepare instructor materials and student notes/guides required for complete factory, field, classroom and hands-on training. Furnish training videotapes for all equipment provided under this contract.

Include in contract price the cost for preparing Training Manuals, conducting classroom instructions, performing field, factory and hands-on training and all other activities required to provide a comprehensive training program as specified herein.

1.3 QUALITY ASSURANCE. Preparation of O & M Manual data and training materials shall be done by personnel:

Trained and experienced in maintenance and operation of equipment and systems installed under this contract.

Familiar with requirements of this Section and training requirements of DWSD.

Skilled as technical writer to the extent required to communicate essential data

Skilled as draftsman competent to prepare required drawings

Furnish resumes, including three outside references for each instructor to be used in the training program.

The Engineer will review the resumes. Based upon a review of resumes and contacts with references, the Engineer will approve, request additional information, or reject proposed instructors for the training program. If the proposed instructor is rejected, the Contractor shall submit a resume and references on an alternate instructor for acceptance by the Engineer.

1.4 MANUAL FORMATS.

1.4.01 O & M Manuals. Where systems are furnished and/or assembled by manufacturers, contractors, or subcontractors, component manuals are required herein. In addition, the Contractor shall provide a Master Index of Component O&M manuals.

The Operation and Maintenance Manuals shall include:

Description of the system components(s), including diagram and exploded views.

Explanation of start-up, shutdown, normal operating and malfunctioning aspects of each component of the system.

Tabulation of a lubrication schedule.

Description of preventive maintenance checking procedures.

Cross-reference to all other individual component manuals.

Storage requirements.

Diagrams and exploded views of equipment and each component of the system.

Installation instructions.

Alignment instructions and tolerances.

Operating instructions.

Troubleshooting instructions.

Maintenance instructions.

Recommended spare parts list and how to obtain same.

Valve and instrument list.

O & M Manuals shall be prepared on 8 1/2 x 11inch (21.6 cm x 27.94 cm) size, 20-lb (9 kg) minimum, white paper for the final submittal. Preliminary copies shall be prepared on colored paper to be distinctive. Text shall be Manufacturer's printed data, or neatly word-processed. Each section shall be separated by indexed tabs.

Drawings shall be in binders with text. Reduce larger drawings and fold to size of text pages but not larger than 11 x 17 inch (27.94 cm x 43.18 cm). All drawings shall be placed at the end of each section and shall be printed on one side only. Sections shall be separated by reinforced, punched binder tabs. Provide a flyleaf for each separate product, or each piece of operational equipment.

Binders shall not be filled to more than 75 percent capacity. When multiple binders are used, arrange the data into related consistent groupings. DWSD will provide sample of required binder. Binders of 1 inch (2.54 cm) thickness are preferred. Binders shall not exceed 2 inches (5.1 cm) in thickness.

Provide word-processed description of product, and major component parts of equipment.

On the cover of each manual, identify each volume with typed or printed title, "OPERATION & MAINTENACE INSTRUCTIONS", listing:

Title of Project and DWSD Contract Number.

Identity of separate structure as applicable.

Identity of general subject matter covered in the manual.

In addition to hard copies, provide two copies of all electronic media. Provide an original word-processed disk of the information to the Engineer and provide the other copy of word processed disk to DWSD Document Control.

All word processing must be done using the latest version of MS Word or word processing software, or as approved by the Owner, that is congruent file format with word processing in Document Control at time of transmittal of documents.

All drawings except control system configuration drawings must be submitted on disk using CAD.

The O & M Manuals shall be computerized and be made available on-line to the control system operators.

1.4.02 Training Manuals. Prepare training packages in form of an instruction manual for use by Owner’s personnel. Submit training packages for approval to the Engineer.

Training Manuals shall be prepared on 8 1/2 x 11 inch (21.6 cm x 27.94 cm) size, 20-lb (9 kg) minimum, white paper. Text shall be Manufacturer's printed data, or neatly word-processed. Each section shall be separated by indexed tabs. Training Manuals shall contain table of contents, pretest, learning objectives, and general operations of specific equipment information.

Drawings shall be in binders with text. Reduce larger drawings and fold to size of text pages but not larger than 11 x 17 inch (27.94 cm x 43.18 cm). All drawings shall be placed at end of each section and shall be printed on one side only. Sections shall be separated by reinforced, punched binder tabs. Provide a flyleaf for each separate product, or each piece of operational equipment.

On each binder cover, identify project and volume titles and general subject matter covered in manual.

Binders shall be commercial quality, three-post binders with durable and cleanable plastic covers. Binders shall include title pockets for holding notes. Binders shall have a maximum post width of 2 inches (5 cm). When multiple binders are used, correlate the information into related consistent groupings.

1.5 TRAINING.

1.5.01 Training Submittals. Submit ten (10) copies of the preliminary draft detailed outline of proposed training program to the Engineer within ninety (90) days after Notice to Start Work.

The outline will be reviewed by the Engineer and Owner’s personnel and comments returned to the Contractor.

A revised training program outline shall be submitted to the Engineer within thirty (30) days after receiving the comments from the Engineer.

After the detailed outline is approved by the Engineer and at least thirty (30) days prior to classroom training, all training manuals shall be submitted and resubmitted (if needed) for DWSD’s review and approval. Copies of approved training manuals shall be provided to all trainees.

Submit the original DVD and two (2) copies of the DVD within 45 days of completion of on-site training. Contractor shall submit information in accordance with Master Specification Section 1080, Project Submittals.

1.5.02 <u>Owner’s Facilities For Training</u>. Where feasible and approved by Engineer. use the Owner’s training facilities for all specified field training programs. Use of the Owner’s facilities shall be coordinated with the Engineer. If Engineer identifies that Contractor’s proposed training facilities are inadequate, Contractor shall coordinate with and provide to Engineer alternate training facilities at no additional cost.

1.5.03 <u>Schedule For Conducting Training</u>. All factory training programs, if required, shall be completed prior to start-up of the Owner’s system and shall use equipment similar and acceptable to the Owner’s equipment.

The training programs shall be conducted before acceptance testing begins or as approved by the Owner.

Up to forty (40) individuals for operating and up to forty (40) individuals for maintenance, unless indicated otherwise, will require training. These individuals shall be trained in small groups Mondays through Fridays, during each shift.

Separate training programs shall be planned and conducted for maintenance of instrumentation, maintenance of process equipment, and operation of process equipment. The training site shall be suitable in all respects for training including seating, lighting, noise, HVAC, and equipment for “hands on” training.
The hands-on training shall be conducted with a maximum of five (5) students per instructor.

1.5.04 <u>Videotaped Training Material</u>. Produce or provide video taped training material, subject to approval of Owner, for all training described below. Furnish videotapes compatible for use with the Owner’s videotaping equipment. Include factory or studio-produced set of materials and/or videotapes of on-site training as appropriate and as acceptable to the Engineer.

Label videotape cassettes with the following information:

Name and number of construction contract.

Name of Contractor.

Subject matter of tape.

Equipment item or system.

Manufacturer of equipment or system.

Date of production of videotape.

Prepare and submit an index of all videotapes, with a numbering system categorized according to subject matter.

All costs associated with production and provision of the videotapes, shall be borne by the Contractor.

1.5.05 Instrumentation Training and Maintenance. Train the Owner’s maintenance personnel to be able to do the following:

Describe the overall function of each instrument and control loop installed under this Contract.

Locate the probable source of a malfunction in the instrumentation equipment and control loops, determine the symptoms of the trouble, establish the probable cause and affect a solution.

Take appropriate preventive and corrective maintenance procedures necessary to keep the instrumentation system in proper operating condition, including calibration and tests.

Course materials to be used for training Owner’s maintenance personnel shall include:

Instrumentation videotapes as described earlier in this Section.

Pertinent portions of the submittals specified in the specifications such as loop diagrams, calibration data and maintenance instructions.

Detailed course outlines and trouble shooting guide for field use. The trouble shooting guides shall include symptoms, probable causes and solutions for cases of trouble described during the training program.

Effectiveness of training maintenance personnel shall be determined through written and in-the-field skills evaluation to the trainees at the completion of each segment of formal instruction and hands-on training. The performance of each of the personnel shall be classified as "satisfactory" (demonstrates basic knowledge and performance of standard maintenance procedures) or "unsatisfactory" (requires more training to demonstrate basic knowledge and performance of standard maintenance procedures). All unsatisfactory evaluations shall include recommendations for corrective action.

The training program shall not include the time required for system start-up instruction or the acceptance test.

1.5.06 Training For Maintenance Of Process Equipment. Train the Owner's maintenance personnel to be able to do the following:

Describe the functions of the process equipment installed under this Contract.

Perform component preventive and corrective maintenance activities required to keep unit equipment in good operating condition.

Locate the probable source of equipment malfunctions, determine the symptoms of the trouble, establish the probable cause, and affect a solution.

Course materials to be used for training Owner's maintenance personnel shall include:

Equipment videotapes as described earlier in this Section.

Pertinent portions of the O & M Manuals as well as alignment tolerances, lubrication schedules, vibration analysis instructions, vibration analysis parameters, and special calibration test and procedures.

Detailed course outlines and troubleshooting guides for each piece of equipment installed under this Contract. The troubleshooting guides shall include symptoms, probable causes, and solutions for all cases of trouble described during the training program.

Method of training maintenance personnel shall include the Contractor using the Owner's equipment to demonstrate troubleshooting, preventive and corrective maintenance procedures.

Effectiveness of training maintenance personnel shall be assessed through written and skills evaluations of each piece of equipment to the trainees. The performance of each trainee shall be classified as "satisfactory" (demonstrates basic performance of standard maintenance procedures) or "unsatisfactory (requires more training to demonstrate basic products). All unsatisfactory evaluations shall include recommendations for corrective action.

The field training program shall not include the time required for system startup instruction or the acceptance test.

1.5.07 Training For Operation Of Process Equipment. Train the Owner's operations personnel by describing the functions of the equipment installed under this Contract. Include how the components of a system are controlled together and what the efforts of the control methods are on the system. Consider both upstream and downstream processes installed under this Contract.

Train personnel to be able to implement start-up and shutdown procedures for each piece of equipment individually, as well as the start-up and shutdown of the systems comprising the equipment. This instruction shall include normal operation, alternative operations, and emergency operations.

Operations personnel should understand the functions of the instrumentation installed under this Contract, describing the individual components and how each component is used in monitoring and/or controlling equipment and/or processes installed under this Contract. They should understand the operating modes possible as a result of the installations made under this Contract.

Operations personnel will be trained to locate the probable source of system inefficiency, determine the symptoms, establish the probable cause, and re-stabilize system efficiency for systems installed under this Contract.

Training shall include taking necessary precautions for safe operation of the equipment, instrumentation, and control system as well as emergency procedures for equipment and systems installed under this Contract.

Course materials to be used for training Owner's operation personnel include:

> Process control videotapes as described earlier in this Section.
>
> Pertinent portions of the O & M Manuals, including start-up procedures, shutdown procedures, descriptions of equipment, instrumentation functions, modes of operations, control and monitoring instructions, trouble-shooting instructions and process control instructions.
>
> Detailed course outlines and operations guides for equipment and processes for field use. The operations guide shall include general, start-up, shutdown, optimization, and emergency operating procedures.

Methods of training Owner's operations personnel shall include a field training program at the Owner's site consisting of classrooms and hands-on training using the Owner’s equipment and systems.

Effectiveness of training operations personnel shall be assessed through written and in-the-field skills evaluation to the trainees. The evaluations shall be designed to determine the trainees’ ability to control the processes, as well as their ability to operate the equipment. The performance of each trainee shall be classified as “satisfactory-operations” (demonstrates basic knowledge and performance of standard operating procedures) or “unsatisfactory-operations’ (demonstrates basic knowledge and performance of process control strategies), or “unsatisfactory-process” (requires more training to demonstrate basic knowledge and performance of process control strategies). All unsatisfactory evaluations shall include recommendations for corrective action.

The field training program shall not include the time required for system start-up instructions or the acceptance test.

1.6 O & M MANUAL CONTENTS BY VOLUME. Neatly word-processed table of contents for each volume, arranged in systematic order, shall include the following:

Contractor, name of responsible principal, address, fax number, and telephone number.

A list of products required to be included, indexed to content of the volume.

For each product list name, address, fax number and telephone number of subcontractor or installer.

Identify area of responsibility of each sub-contractor or installer.

Identify local source of supply for parts and replacement.

Identify each product by product name and other identifying symbols as set forth in Contract Documents.

All sheets, pages, drawings, and etc. shall have ID printed on it including Contract number, volume name, and number and location.

1.6.01 Product Data. Include only those sheets that are pertinent to the specific product. Annotate each sheet to clearly identify specific product or part installed, data references applicable and delete data references not applicable for this installation.

1.6.02 Drawings. Supplement product data with drawings as necessary to illustrate clearly the relations of component parts of equipment, systems, control and flow diagrams. Include DWSD Tag Numbers.

Coordinate drawings with information in Master Specification Section 1150, Project Record Documents and photographs, to assure correct illustration of completed installation.

Project Record Documents shall not be used as maintenance drawings.

1.6.03 Written text to supplement product data for specific installations. Organize in consistent format under separate headings for different procedures. Provide logical sequence of instructions for each procedure. Describe how complete system is to operate.

1.6.04 Warranty, Bond & Service Contracts. Provide copies of pertinent information related to each warranty, bond, and service Contract issued. Provide information sheet for DWSD's personnel that explain proper procedures in event of failure and provides instances that might affect validity of warranties or bonds.

1.6.05 Training Manuals. Training Manuals used in training courses shall become part of the O & M Manual.

1.7 MATERIALS & FINISHES MANUAL. Provide manual that details architectural products, applied materials, and finishes for the project. Include the following information:

Manufacturer's data, giving full information on products.

Catalog number, size, composition.

Color and texture designations.

Information required for re-ordering special-manufactured products.

Instructions for care and maintenance.

Manufacturer's recommendation for types of cleaning agents and methods.

Cautions against cleaning agents and methods that are detrimental to product.

Content, for moisture-protected and weather-exposed products:

Manufacturer's data and applicable standards.

Chemical composition.

Details of installation.

Recommended schedules and instructions for inspection cleaning, maintenance and repair.

Additional requirements for maintenance data as required by other sections of the Specifications.

1.8 COMPONENT SYSTEMS MANUALS. A separate O & M Manual volume is required for each system including electrical, mechanical, instrumentation, communication and other packaged systems as identified by contract documents.

1.8.01 Descriptive Contents. Each manual shall include a table identifying each piece of equipment, each associated control or instrument, location of the equipment, location of control or instrument and the function of each equipment, control or instrument. The manual shall detail the following detailed descriptions:

Charts of equipment, systems, component parts, model number, name plate data, assembly drawings, and tag numbers with location and function of each piece of equipment, instrument or valve.

Function, normal operating characteristics, and limiting conditions for both the system, sub-system and the component parts.

Performance curves, engineering data and tests.

Complete nomenclature and commercial number of replaceable parts.

Circuit directories of panel boards, electrical service, controls and communications.

As-installed color-coded wiring diagrams.

Instrument loop diagrams showing the path that a control or instrumentation signal takes from its origin to the action it takes.

An electrical schematic for each item as installed.

A chart listing the controls/instruments in a loop identifying the equipment's abbreviated symbol, a description of the symbol, design criteria, process flow, quantity supplied, and manufacturer's model and serial number.

List of special tools required to service equipment and/or systems including where they are stored.

Original manufacturer's parts list, illustrations, assembly drawings, and diagrams required for maintenance.

Predicted life of parts subject to wear.

Items recommended to be stocked as spare parts.

As-installed control diagrams.

Each Contractor's coordination drawings.

Reference drawing which shows equipment, instrument or valve location.

Manufacturer's model and serial number.

Valve actuator type (manual, hydraulic, electric or pneumatic).

Local services (process water and air, drains, HVAC, natural gas and steam).

1.8.02 Operations Content. The manuals shall detail the following operational descriptions:

Routine, normal, summer, winter, special, abnormal and emergency O & M instructions to include sequences required.

Regulation, control, setting, stopping, shut-down, and emergency instructions.

Disassembly, repair, re-assembly, alignment, adjustment and checking equipment.

Manufacturer's printed operating and maintenance instructions.

List of original manufacturer's spare parts, manufacturer's current prices, and recommended quantities to be maintained in storage.

Procedures to handle potential overloads, power outage, and breakdown.

Identify alarms by equipment location and action to correct.

Equipment safety features, requirements, and potential hazards.

Programming manuals for programmable devices including list of standard programming.

Function, normal operating characteristics, and limiting conditions.

Performance curves, engineering data and tests.

1.8.03 Maintenance Contents. The manuals shall identify the following detailed maintenance and preventative maintenance descriptions:

Type and frequency of preventive maintenance activities required.

Guide to "trouble-shooting", disassembly, repair, and re-assembly.

Alignment, adjusting, and checking.

Servicing and lubrication schedule.

List of lubricants required together with cross-referenced equivalent oils and greases.

Manufacturer's printed operating and maintenance instructions. (This is not to be a generalized catalog of the entire product line.)

List of original manufacturer's spare parts, manufacturer's current prices, and recommended quantities to be maintained in storage.

1.8.04 Miscellaneous Details. The manual shall identify the following miscellaneous details:

DWSD Z file number reference to the part, equipment or system.

Prepare and include additional data when the need for such data becomes apparent during instruction of DWSD's personnel.

Additional Requirements for O & M Data required by sections of Specifications.

1.9 SUBMITTAL SCHEDULE.

1.9.01 Equipment Manuals. Ten (10) copies of the O & M Instruction Manual for each piece of equipment shall be submitted to the Engineer with delivery of the equipment.

1.9.02 System O & M Manuals. Ten (10) copies of the system O & M Manuals, bound and indexed shall be submitted to the Engineer 90 days prior to demonstration tests for review and approval. Systems O & M Manuals shall be complete except for field results and refinements added as result of demonstration and phase-over.

Submit ten (10) hard copies and ten (10) electronic copies (CD’s) in

PDF/CAD/WORD Format of the Final Equipment and Systems O & M Manuals, bound and indexed and submitted to the Engineer prior to the Substantial Completion of New Facilities under this Contract.

1.9.03 Training Manuals: Submit two (2) sets of DVD's of the video recording of the training programs for the O&M staff; two sets of DVD's of the overview training video recording for supervisory staff. Copies of approved training manuals shall be provided to all trainees.

Any modifications required after final O & M submission shall be made to the manuals by issuance of addenda in the form of change pages to the manual. The addenda will identify where the new data is to be inserted, what data is to be removed, new index sheets as necessary, DWSD Z file list of shop drawings and submittals. Contractor shall submit information in accordance with Master Specification Section 1080, Project Submittals.

PART 2 - PRODUCTS

2.1 O & M MANUALS.

2.1.01 Binders. The manuals shall be supplied in binders as described in Paragraph 1.4.

2.1.02 Electronic Version. An electronic version of the word-processed portions of the manuals shall also be provided on owner-approved media. The electronic version manuals must be capable of being read, edited and printed. The format and file size requirements of the O & M Manuals will be as approved by the Owner and suitable for use in the Owner's current on-line O&M Software. Format will be provided to the Contractor upon request.

The on-line O & M Manual shall include text, hyper-text, hyper-graphics, photographs, CAD drawings, scanned images, and video clips.

The Contractor shall research all necessary sources of reference materials and prepare original written text for an informative narrative, describing the function of each facility, system, and component. The narrative portion of the on-line O & M Manual shall be enhanced by linking key words and references in the text to pertinent reference information such as manufacturer's manuals, CAD drawings, photographs, and video clips. Linking, through the use of hyper-text and hyper-graphics, shall connect the parts of the manual through a point-and-click user interface. The on-line computerized O & M Manual shall be developed for use in the owners system. The Contractor shall provide all hardware and software necessary to view and maintain the on-line computerized O & M Manual.

The on-line computerized O & M Manual shall include the following sections:

Introduction of the facility to include all new, rehabilitated, and retained facilities.

Facility-specific narratives include system overview, process operation, design criteria, and standard operating procedures.

System-wide narratives shall include system overview and design criteria.

Standard operating procedures shall address start-up, shutdown, normal and abnormal conditions, troubleshooting, monitoring and reporting requirements, laboratory procedures, and emergency response requirements.

2.2 BACK-UP BATTERY. Back-up batteries shall be supplied for all units requiring back-up batteries with sufficient capacity in accordance with manufacturer requirements. Standby and shelf life of the batteries shall be at least 5 years. Only training personnel shall be allowed to replace and maintain back-up batteries.

PART 3 - EXECUTION

End of Section

SECTION 01170

WARRANTIES AND BONDS

PART I - GENERAL

1.1 SCOPE. This section covers the consolidation and submittal of all specified warranties, bonds, and extended service and maintenance contracts together as one package. This section builds upon Articles 4 and 13 of General Conditions (Exhibit C) of the Agreement.

1.2 SUBMITTALS.

1.2.01 Certifications. Assemble and submit two duplicate sets of all warranties, bonds, and service or maintenance contracts in 3-ring binders. All warranties, bonds, and maintenance or service contracts shall be signed and executed by the responsible contractor, sub-contractor, supplier, and manufacturer.

Submit warranties, bonds, and service/maintenance contracts to Engineer immediately prior to Final Completion. Provide two signed originals of each document.

1.2.02 Format. Prepare duplicate binders. Each binder shall have a detailed Table of Contents neatly typed, following the sequence of the Specifications. Provide complete information for each item as follows:

Product or work item.

Contractor that installed Product or Work Item, with address, telephone, faxes and E-mail address, and the name of responsible principal.

Scope.

Date of beginning of warranty, bond, or service and maintenance contract.

Duration of warranty, bond, or service and maintenance contract.

Provide the following information for use by DWSD personnel:

Proper procedure in case of failure.

Instances that might affect the validity of warranty or bond.
Maintenance or Service Contractor, with address, telephone, faxes and E-mail numbers, and the name of responsible principal.

All warranties, bonds, and service or maintenance contracts shall be on 8-1/2 inch x 11-inch (21.6 x 27.94 cm) paper punched for standard 3-post binder. Fold larger sheets to fit into binders.

Provide commercial quality, 3-post binders, with durable and cleanable plastic covers with maximum post width of two (2) inches (5.08 cm).

Use index tab sheets keyed to the table of contents listing to separate each warranty or bond. Provide full information, using separate typed sheets as necessary.

1.3 WARRANTY. Even if not specifically stated in the Master Specifications, warranties are required for all work. All work specified to be designed or supplied by the Contractor shall be guaranteed to perform as specified. Any service material, equipment required because of the defect, or additional repairs required due to the defect shall be supplied without charge.

All parts of the work or equipment shall be warranted to be free from defects in workmanship, design and materials. In the opinion of the Engineer, if any part of the equipment should fail during the warranty period, it shall be replaced and the unit(s) restored to service at no expense to the Owner. Then, the one-year warrantee period shall begin again for that item after repair of equipment and other parts repaired in system. Repairs shall be performed expeditiously as directed by engineer.

Warranty from the manufacturer shall be provided for all major pieces of equipment supplied under this Contract. The manufacturer's warranty period shall be concurrent with the Contractor's running at a minimum of one (1) year from date of Project Substantial Completion, unless otherwise specified. The Engineer reserves the right to request warranties for equipment not classified as major. The Contractor shall still warrant equipment not considered to be "major" in the Contractor's one-year warranty period even though certificates of warranty may not be required. This warranty from the manufacturer shall not relieve the Contractor of his one-year warranty starting at the time of Project Substantial Completion.

1.3.01 Commencement of Warranty Period. The Contractor shall guarantee all parts of the Contract Work for one year from date of “Project Substantial completion”, unless otherwise specified. The Contractor shall remove and replace, or repair in a manner satisfactory to the Engineer, at no cost to the Owner, all parts of the Work, including equipment, which in the opinion of the Engineer prove defective either in material, workmanship or operation. The Contractor shall supply without charge any service, material or equipment required because of such defect. The Contractor shall also guarantee the design and performance of the Work specified, Work repaired or replaced.

If the Owner chooses to occupy and/or use any completed portion of the Work or piece of equipment prior to “Project Substantial Completion”, the Contractor shall provide extended warranty services for that particular portion of Work or piece of equipment for the duration between the day of occupancy or use by the Owner and Project Substantial Completion. Furthermore, one (1) additional year of warranty for such portion of the Work or piece of equipment shall be provided and shall begin on the date of Project Substantial Completion, unless otherwise specified.

The guarantee of operation, materials, workmanship, design, and performance for all equipment and Work replaced or repaired shall be continued for the remainder of the extended warranty period starting after the date of written acceptance of replacement or repair for that particular portion of the Work or piece of equipment and the Project Substantial Completion plus one (1) additional year of warranty following the Project Substantial Completion, unless otherwise specified..

PART 2 - PRODUCTS

End of Section

SECTION 01180

EQUIPMENT, MATERIALS, PARTS AND TOOLS

PART 1 - GENERAL

1.1 SCOPE. This section includes general provisions applicable to the furnishing and installation of material and equipment and delivery of all spare parts, maintenance items, tools and all other required items under this contract. The Contractor shall provide specific equipment, materials, parts, and tools as referenced in other Master Specification Sections. This section identifies general requirements common to other Master Specification Sections. Where provisions of other sections conflict with those in this section, the more stringent of the requirements shall apply.

Unless otherwise provided for in the technical Master Specification Sections, this Section shall govern the packaging, delivery and acceptance of equipment, materials, spare parts, maintenance items and special tools. The Contractor shall refer and adhere to the applicable requirements of other Master Specification Sections within Division 01, General Requirements as applicable.

1.2 GENERAL.

1.2.01 Coordination. Contractor shall coordinate all details of the equipment with other related parts of the work, including verification that all structures, piping, wiring, and equipment components are compatible. Contractor shall be responsible for all structural and other alterations in the work required to accommodate equipment differing in dimensions or other characteristics from that contemplated in the Contract Drawings or Specifications.

1.2.02 Governing Standards. Where standards, codes or specifications are referred to by full name or abbreviation, the reference is to published standards, codes, specifications, tests or recommended methods of trade, industry or governmental organizations. These standards shall include all of the latest amendments and errata applicable at the time the bids are taken.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer’s Qualifications. Unless specifically named in the technical Master Specification Section, a manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.3.02 General Equipment Stipulations. Material and equipment shall conform to all applicable specifications and standards.

Material and equipment shall comply with size, make, type, and quality specified, or as specifically approved in writing by the Engineer.

Design, fabricate, and assemble in accordance with the best engineering and shop practices.

Manufacture like parts of duplicate units to standard size and gauges, to be interchangeable. Two or more items of the same kind shall be identical, by the same manufacturer.

Equipment capacities, sizes, and dimensions shown or specified shall be met unless variations are specifically approved in writing.

Do not use material or equipment for any purpose other than that for which it is designed or specified.

1.4 SUBMITTALS.

1.4.01 Schedule of Submittals. Within 30 days after the Notice to Proceed, the Contractor shall submit a list containing product data and related information for materials and equipment proposed to be furnished in accordance with Master Specification Section 01080, Project Submittals.

Operation and Maintenance Manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals.

Each equipment item shall be certified "factory tested" prior to shipment to the project site. A report of such tests shall be submitted to the Engineer prior to installation of the item. Certified curves are required for all pumps.

1.4.02 Equipment and Material List. The Contractor shall furnish 10 copies of the ‘Equipment Parts List’ and/or ‘Spare Parts Lists’ to the Engineer. These lists shall give Job Title, Contract number and a numerical list, including quantity and description of all equipment and spare parts to be delivered under the Contract. The Contractor shall supplement the list by written notification referencing ‘Equipment Parts List’ and/or ‘Spare Parts List’, with updated information such as expected date of shipment and delivery. Provide not less than 4 weeks notice so that storage identification number can be assigned by the owner. The Contractor shall list approximate number of containers, their dimensions, and gross weights, and furnish copies of actual invoices for each item to substantiate the delivery cost of each item.

Equipment and spare parts are intended solely for the purpose of replacing equipment and worn parts in due course of time to minimize equipment downtime. If equipment or parts prove inherently defective in operation or workmanship during the period of the Contract and the guarantee period, then spares for such items shall also be suspected of like defects and shall also be replaced by the Contractor. Spare parts are for DWSD's use and are not to be used by the Contractor for achieving compliance with the operational requirements of the Contract.

1.4.03 Special Tools. Manufacturers of equipment and machinery shall furnish 2 sets of any special tools (including grease guns or other lubricating devices) required for normal adjustment, operation, maintenance, and disassembly, together with instructions for their use. The Contractor shall preserve and deliver to DWSD these tools and instructions in good order before completion of the Contract. Tools shall be high-grade, smooth, forged, alloy, tool steel. Grease guns shall be lever-type.

Special tools are considered to be those tools which because of their limited use are not normally available, but which are necessary for the particular equipment. Special tools shall include any type of tool that has been specially made for use on an item of equipment for assembly, disassembly, repair, adjustment or maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices. Special tools shall be delivered at the same time as the equipment to which they pertain. The Contractor shall properly store and safeguard such special tools until completion of the work, at which time they shall be delivered to DWSD.

A separate set of special tools shall be furnished with each separate item of equipment.

As directed, the Contractor shall furnish and erect one or more neat and substantial steel wall cases with flat key locks and clips or hooks to hold each tool in a convenient arrangement.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Packaging. Packaging shall be in accordance with the best practices of the industry for the shipment and long term storage of parts and equipment. A letter from the manufacturer shall be sent, well before shipment, stating his recommended packaging, for approval. This approval shall not relieve the Contractor of full responsibility for proper packaging. Packaging shall be such that no stresses are imposed on the contents. The container and the filler material shall thoroughly insulate the contents against any reasonable shock or other abuses inherent in shipping, handling, and unloading. Packaging shall protect the contents from external dirt, dust and moisture and damage from other causes. Contents susceptible to the effects of atmospheric corrosion shall be protected by means of sealed plastic wraps with desiccant agents, grease coatings or other proper means.

The outside of each shipping container shall have the following information firmly fastened and legibly posted:

Contract No., Contract Title and Specification, Item Number and Storage

Identification Number.

The words “Equipment”, “Spare parts”, “Special Tools”…, etc.

Complete equipment description if a single unit or item. Provide a list of contents (name equipment) and description and number of each spare item in an attached envelope with bill of lading for multiple contents.

Name and address of manufacturer and other unidentifiable information regarding the contents;

Special instructions as to correct lifting, moving and storage of the container and any other precautionary notes.

The gross shipping weight of the container.

1.5.02 Preparation for Shipment. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces which are damaged prior to acceptance of equipment shall be repainted to the satisfaction of the Contractor.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked as identified in the delivery schedule or on the Shop Drawings. Complete packing lists and bills of material shall be included with each shipment.

1.5.03 Transportation and Handling. Arrange deliveries of products in accordance with construction schedules. Coordinate deliveries to avoid conflict with work and conditions at the site.

Deliver products in undamaged condition, in manufacturer's original containers or packaging, with identifying labels intact and legible.

Immediately on delivery, inspect shipments to assure compliance with requirements of Contract Documents and approved submittals. Verify that products are properly protected and undamaged.

Provide equipment and personnel to handle products by methods to prevent soiling or damage to products or packaging.

1.5.04 Delivery and Acceptance. Major deliveries shall be scheduled in advance with the Engineer to allow effective inspection at the time of delivery. All deliveries of equipment and spare parts at the site shall be made in the following sequence:

The carrier shall enter the Site and report to the guard on duty stating his business, the nature of his shipment, and desired destination within the Site.

The carrier shall report to the Contractor’s Superintendent on duty at the Site. Thereafter, the packages shall be delivered, with the Engineer present before unloading, at the site.

The Contractor shall aide the Engineer in his inspection of the container contents and correctly repack the container after inspection according to the instructions of the manufacturer for long term storage.

Equipment and spare parts will only be accepted by the Engineer if:

The Container has no visible signs of extensive damage, mutilation or contamination.

Contents are all present, packed and labeled correctly, are undamaged and properly prepared for long term storage.

Components are packaged to allow ready access for required “in storage” maintenance procedures as noted in the manufacturer’s storage instructions.

Manufacturer’s long term storage instructions and spare units installation of the procedures accompany or have preceded the shipment. This requirement may be waived by the Engineer if no particular care or special instructions are deemed necessary or if such information already appears in the previously approved submittals.

1.5.05 Storage and Protection. The Contractor shall furnish a covered, weather-protected storage structure providing a clean, dry, non-corrosive environment to store items delivered to the sites. Locate on-site storage facilities in areas approved by the Engineer. When adequate storage space is unavailable on the site, the Contractor shall make its own arrangements for storing equipment off-site as required at his own cost. Temporary indoor/outdoor storage may be available to the Contractor at the following DWSD facilities: Central Services Facility (CSF), Water Works Park WTP, and Springwells WTP. The Contractor shall obtain approval in writing from DWSD Facility Manager prior to entering site.

The storage structure shall be properly protected, guarded, and the equipment shall be stored as specified. Storage of equipment shall be in strict accordance with the manufacturer’s "storage instructions" storage procedures include but are not limited to connection of heaters, placing of storage lubricants in equipment, etc. Corroded, damaged, or deteriorated equipment and parts shall be replaced before acceptance of the project. Equipment and materials not properly stored will not be included in a payment estimate.

All materials and equipment shall be handled and stored by the Contractor before, during, and after shipment in a manner to prevent warping, twisting, bending, breaking, chipping, rusting, theft, or damage of any kind to the material or equipment.

Store products with seals and labels intact and legible. Store products subject to damage by the elements in weather-tight enclosures. Maintain temperature and humidity within the ranges required by manufacturer's instructions.

Store fabricated products above the ground, on blocking or skids to prevent soiling or staining. Cover products that are subject to deterioration with impervious sheet coverings, and provide adequate ventilation to avoid condensation.

Pumps, motors, electrical equipment, and all equipment with antifriction or sleeve bearings shall be stored in weathertight structures maintained at a temperature above 60 F (15.5 C). Equipment, controls, and insulation shall be protected against moisture and water damage. All space heaters furnished in equipment shall be connected and operated continuously.

Store loose granular materials in a well-drained area on solid surfaces to prevent mixing with foreign matter.

Cement and sand shall be stored under a roof and off the ground and shall be kept completely dry at all times. All structural and miscellaneous steel and reinforcing steel shall be stored off the ground in a manner to prevent accumulations of dirt, grease, standing water and to minimize rusting. Beams shall be stored with the webs vertical. Pre-cast concrete beams shall be handled and stored in a manner to prevent accumulation of dirt, standing water, staining, chipping, or cracking. Brick, block, and similar masonry products shall be handled and stored in a manner to minimize breakage, chipping, cracking, and spalling.

Contractor shall arrange storage in a manner to provide easy access for inspection and make periodic inspections of stored products to assure that products are maintained under specified conditions, free from damage or deterioration. Contractor shall provide substantial coverings as necessary to protect installed products from traffic damage and subsequent construction operations. Contractor shall remove coverings when no longer needed.

The Contractor shall be responsible for all material, equipment, and supplies sold and delivered to DWSD under this Contract until final inspection of the work and acceptance by DWSD. In the event any materials, equipment, and supplies are lost, stolen, damaged, or destroyed prior to final inspection and acceptance, the

Contractor shall replace same without additional cost to DWSD.

All materials which, in the opinion of the Engineer, have become so damaged as to be unfit for the use intended or specified shall be promptly removed from the site. The Contractor shall receive no compensation for the damaged material or its removal.

Should the Contractor fail to take proper action on storage and handling of equipment supplied under this Contract, within 7 days after written notice to do so has been given, DWSD retains the right to correct all deficiencies identified in written notice and deduct the cost associated with these corrections from the Contract. These costs may be comprised of expenditures for labor, equipment usage, administrative, clerical, engineering, and any other costs associated with making the necessary corrections.

After installation, all equipment shall be adequately protected from further construction activities.

Coated surfaces shall be protected from impact, abrasion, discoloration and other damage. All coated surfaces damaged shall be recoated.

Equipment and materials shall not show any pitting, rust, decay, or other deleterious effects of storage when installed in the Work.

1.5.06 Storage and Handling. Because of the long period allowed for construction, special attention shall be given to the storage and handling of equipment on site. As a minimum, the procedure outlined below shall be followed:

> The Contractor shall furnish details of storage facilities and instructions for storage for approval prior to shipment.
>
> Equipment shall not be shipped until accepted by the Engineer. The intent of this requirement is to reduce on-site storage time prior to installation and/or operation. Under no circumstances shall equipment be delivered to the site more than one month prior to installation without written authorization from the Engineer. Equipment shipped to the site shall be stored in accordance with the requirements of this section. Operation and maintenance data as described in Master Specification Section 01160, Training and Operations & Maintenance Manuals shall be submitted to the Engineer for review prior to shipment of equipment.
>
> All equipment having moving parts such as gears, electric motors, etc., and/or instruments shall be stored in a temperature and humidity controlled building accepted by the Engineer, until such time as the equipment is to be installed. All equipment shall be stored fully lubricated with oil, grease, etc., unless otherwise instructed by the manufacturer.

Manufacturer's storage instructions shall be carefully followed and a written record of this kept by the Contractor.

Moving parts shall be rotated a minimum of once weekly to ensure proper lubrication and to avoid metal-to-metal "welding." Upon installation of the equipment, the Contractor shall start the equipment once weekly for an adequate period of time to ensure that the equipment does not deteriorate from lack of use.

Lubricants shall be changed upon completion of installation and as frequently as required thereafter during the period between installation and acceptance. Mechanical equipment to be used in the work when stored for longer than ninety (90) days shall have the bearings cleaned, flushed and lubricated prior to testing and startup.

Prior to acceptance of the equipment, the Contractor shall have the manufacturer inspect the equipment and certify that its condition has not been detrimentally affected by the long storage period. Such certification shall be deemed to mean that the equipment is judged to be in a condition equal to that of equipment that has been shipped installed, tested, and accepted in a minimum time period. As such, the manufacturer will guarantee the equipment equally in both instances. If such a certification is not given, the equipment shall be judged to be defective. It shall be removed and replaced at the Contractor’s expense.

1.6 WARRANTY. Submit warranties from manufacturer and for other construction as specified in Master Specifications Section 01170, Warranties and Bonds and related technical Sections.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS.

2.1.01 Elevation. The elevation of Detroit is approximately 580 feet (176.8 m) above mean sea level. All equipment furnished for this project shall be designed to meet stipulated conditions and to operate satisfactorily at this general elevation.

2.2 WORKMANSHIP AND ACCEPTANCE OF MATERIALS AND EQUIPMENT. Equipment Supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests, and shall be identified properly by part name, manufacturer, and year manufactured.

Except where otherwise specified, structural and miscellaneous fabricated steel used in equipment shall conform to AISC standards. All structural members shall be designed for shock or vibratory loads. Unless otherwise specified, all steel which will be submerged, all or in part, during normal operation of the equipment shall be at least 1/4 inch (6.4 mm) thick.

Only new materials and equipment shall be incorporated in the work. All materials and equipment furnished by the Contractor shall be subject to the inspection and acceptance of the Engineer. No material shall be delivered to the work if the Engineer objects.

The Contractor shall furnish facilities and labor for handling and inspection of all materials and equipment. When requested by the Engineer, the Contractor shall submit samples of materials for such special tests as may be necessary to demonstrate conformance to the specifications. Such samples shall be furnished, stored, packed, and shipped as directed at the Contractor's expense. Except as otherwise noted, DWSD will make arrangements for and pay for these tests.

The Contractor shall submit data and samples sufficiently early to permit consideration and acceptance before materials are necessary for incorporating in the work. Any delay of acceptance resulting from the Contractor’s failure to submit samples or data promptly shall not be used as a basis of claim against DWSD.

In order to demonstrate the proficiency of workmen or to facilitate the choice among several textures, types, finishes, and surfaces, the Contractor shall provide such samples of workmanship or finish as may be required.

The materials and equipment used on the work shall correspond to the approved samples or other data.

The Contractor shall submit ample evidence that each and every part of the materials, machinery, and equipment to be furnished are of a reliable make and of a type that has been in successful operation within the continental United States. An installation of any experimental or untried type of apparatus, material, or machinery shall not be allowed by the Engineer.

The equipment specified herein shall be carefully designed and installed to ensure that all required functions shall perform adequately within the specified degree of precision. Each unit shall operate with each of the other parts of the equipment to provide a completely integrated system that shall operate to the satisfaction of the Engineer.

All equipment, machinery, parts, and assemblies thereof, entering into the work shall be tested as specified. Unless waived in writing by the Engineer, all field and operating tests shall be made in the presence of the Engineer or its authorized representative. When such a waiver is issued, sworn statements in duplicate of the tests made and the results thereof shall be furnished to the Engineer by the Contractor or manufacturer. Costs of all tests and trials specified shall be borne by the Contractor, unless noted otherwise, and shall be included in the contract price.

The Contractor shall submit copies of welding procedures for all welding. Welders and welding operators shall be in accordance with the qualification requirements of the AWS Code. Welders and welding operators for stainless steel shall pass qualification tests using stainless steel filler metal and procedures developed for stainless steel. Procedures, welder, and operator qualifications shall be certified by an independent testing laboratory retained and paid by the Contractor.

The Contractor shall not start fabrication of the work until the Engineer receives written acceptance of the proof of welding procedures from the Designer for each type of weld.

The Contractor shall submit copies of mill certificates for each type of rolled steel and as required in the specifications. The Contractor shall not start fabrication of the work until the Engineer receives written acceptance of all mill certificates from the Contractor.

2.3 ACCESSORIES.

2.3.01 Safety Guards. All equipment shall be provided with removable safety guards around rotating, reciprocating, or other moving parts.

The safety guards shall conform to MIOSHA requirements.

Safety guards shall be constructed of 12 USS Gage (2.7 mm) or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (1.3 cm) mesh galvanized expanded metal.

All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.3.02 EQUIPMENT BASES. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (15.2 cm) high. Cast iron or welded steel adjust space baseplates shall be provided for pumps, compressors, and other equipment. Each unit and it’s drive assembly shall be supported on a single baseplate of neat design.

All metal surfaces in contact with concrete shall be coated with 12 to 20 dry mils (0.30 - 0.51 mm) of bitumastic paint.

Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection. Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout, unless indicated otherwise.

2.3.03 Anchor Bolts. Anchor bolts shall be provided in accordance with Master Specification Sections 05550, Anchor Bolts and Expansion Bolts. Equipment suppliers shall furnish suitable anchor bolts for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed.

The Contractor shall furnish all other necessary bolts, anchor bolts, nuts, washers, plates, and bolt sleeves.

Anchor bolts shall be at least 3/4 inch (1.9 cm) in diameter unless otherwise specified.

Unless otherwise indicated or specified, anchor bolts for items of equipment mounted on baseplates shall be long enough to permit 1-1/2 inches (3.8 cm) of grout beneath the baseplate and to provide adequate anchorage into structural concrete.

2.3.04 Electric Motors. Unless otherwise specified or permitted, all electric motors furnished and installed by the Contractor shall conform to Master Specification Section 16220, General Purpose Induction Motors-Procurement.

2.3.05 Shop Painting. All steel and iron surfaces shall be protected by suitable coatings applied in the shop in accordance with Master Specification Section 09900, Painting. Surfaces, which will be inaccessible after assembly, shall be protected for the life of the equipment.

Coatings shall be suitable for the environment where the equipment is installed. The manufacturer at the factory shall apply a prime and one finish coat.

The second finish coat shall be applied in the field. Shop applied coatings shall be compatible with field applied coatings.

Paint equipment according to DWSD color code. Color of equipment not listed will be as selected by the Engineer or as noted in the detail Specifications.

2.3.06 Spare Parts. The Contractor shall furnish complete spare parts for equipment. For each spare part, the Contractor shall provide the part name, manufacturer, year manufactured, address and telephone number.

Product data submitted for all items of equipment shall include complete current published parts information. Information shall clearly show the manufacturer's recommended spare parts and should be supplied as a minimum by the Contractor.

2.3.07 Bearings. All bearings, including those provided in gearboxes, drives, and reducers, except those furnished as an integral part of electric motors, shall conform to the requirements specified herein.

All bearings shall be anti-friction type constructed completely of stainless steel material specially selected for the service required. The bearings shall have a B-10 life, without adjustment factors, of 40,000 hours accept as otherwise defined in technical Master Specification Sections.

All bearings shall be equipped with double seals and cap to completely prevent the intrusion of dirt, dust, water, sludge, chemical, etc., from entering the bearing. The seals shall be effective in preventing the entrance of water from a high pressure hose.

All bearings shall be oil or grease lubricated. The use of permanently sealed, grease lubricated bearings will not be acceptable unless specifically called for in the detailed specification for equipment items. A dipstick or a sight glass arranged to permit visual inspection of lubricant level shall be provided on each unit.

Bearing selection shall be based upon the most severe duty of the unit while operating continuously for 24 hours a day, 7 days per week, with an appropriately selected service factor based on the manufacturers published data.

2.3.08 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment by Engineer. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

During start-up and throughout the Maintenance Period, the Contractor shall properly lubricate all equipment furnished under this Contract.

2.3.9 Grease, Oil, and Fuel. All grease, oil, and fuel shall be furnished with the respective equipment.

The Contractor shall be responsible for changing the oil in all drives of mechanical equipment after initial break-in of the equipment, which shall be no greater than 30 days.

During testing and prior to acceptance, the Contractor shall furnish all lubricants necessary for the proper lubrication of all equipment furnished under this Contract.

2.3.10 Concrete Inserts. Concrete inserts for hangers shall be designed to support safely, the maximum load that can be imposed by the hangers used in the inserts. Inserts for hangers shall be of a type which will permit adjustment of the hangers both horizontally (in one plane) and vertically and locking of the hanger head or nut. All inserts shall be galvanized, unless otherwise specified.

2.3.11 Sleeves. Unless otherwise indicated on the drawings or specified, openings for the passage of pipes through floors and walls shall be formed of sleeves of standard-weight, galvanized-steel pipe. The sleeves shall be of ample diameter to pass the pipe and its insulation, if any, and to permit such expansion as may occur. Sleeves shall be of sufficient length to be flush at the walls and the bottom of the slabs and to project 1-inch (2.54 cm) above the finished floor surface. Threaded nipples shall not be used as sleeves.

Sleeves in exterior walls below ground or in walls to have liquids on one or both sides shall have a 2-inch (5.1 cm) annular fin of 1/8-inch (3.2 mm) plate welded with a continuous weld completely around the sleeve at about mid-length. Sleeves shall be galvanized after the fins are attached.

All sleeves shall be set accurately before the concrete is placed, or shall be built-in accurately as the masonry is being built.

2.3.12 Nameplates. With the exceptions mentioned below, each piece of equipment shall be provided with a substantial nameplate of non-corrodible metal, securely fastened in place and clearly and permanently inscribed with the following: manufacturer's name, model, or type designation, serial number, principal rated capacities, electrical, or other power characteristics, and similar information as appropriate. Equipment tag numbers shall be assigned by DWSD.

This requirement shall not apply to standard, manually operated hydrants or to gate, globe, check, and plug valves smaller than 6" in diameter.

Each process valve shall be provided with a substantial tag of non-corrodible metal securely fastened in place and inscribed with an identification number in conformance with the Valve Identification Schedule.

PART 3 - EXECUTION

3.1 MANUFACTURER'S INSTRUCTIONS FOR INSTALLATION. The equipment installation details shall suit the existing and furnished equipment and are subject to Engineer acceptance.

Any changes or revisions made necessary by the type and dimensions of the equipment furnished shall be made at the expense of the Contractor. Contractor shall furnish detailed drawings showing such changes or revision for the acceptance of the Engineer.

All equipment shall be installed according to the submitted manufacturer's instructions. The Contractor shall maintain a complete set of instructions on the site until the completion of all work.

Handle, install, connect, clean, condition, and adjust products in strict accord with such instructions and in conformity with specified requirements. Site conditions or specified requirements conflicting with manufacturer's instructions must be brought to the Engineer 's attention.

Perform work according to manufacturer's instructions. Do not omit any preparatory step or installation procedure unless specifically modified or exempted by Contract Documents.

3.2 INSTALLATION OF EQUIPMENT. Provide competent manufacturers' representatives for all equipment to supervise the installation, adjustment, and testing of the equipment and to instruct DWSD's operating personnel on operation and maintenance.

A certificate from the manufacturer shall be submitted before substantial completion stating that the installation of the equipment is satisfactory, that the unit has been satisfactorily tested, is ready for operation, and that the operating personnel have been suitably instructed in the operation, lubrication, and care of the unit.

The Contractor shall furnish the service of competent manufacturers' representatives for Contractor furnished equipment, when evident malfunction or over-heating makes such services necessary or as determined by the Engineer. All such equipment shall be installed by skilled mechanics and in accordance with the instructions of the manufacturer.

Special care shall be taken to ensure proper alignment of all equipment. Units shall be carefully aligned on their foundations by qualified millwrights after their sole or base plates have been shimmed to true alignment at the anchor bolts. The anchor bolts shall be set in place and the nuts tightened against the shims. After the manufacturer has approved the foundation alignment, the bedplates or wing feet of the equipment shall be securely bolted in place. The alignment of equipment shall be further checked after securing to the foundations, and after confirmation of all alignments, the sole or base plates shall be finally grouted in place. The Contractor shall be responsible for the exact alignment of equipment with associated piping, and under no circumstances, will "pipe springing" be allowed.

All wedges, shims, filling pieces, keys, packing, grout, or other materials necessary to properly align, level, and secure apparatus in place shall be furnished by the Contractor. All parts intended to be plumb or level must be proven exactly so. Any grinding necessary to bring parts to proper alignment after erection shall be done at the expense of the Contractor.

The Contractor shall furnish the necessary materials and construct suitable concrete foundations or pads for all equipment installed, even though such foundations or pads may not be indicated on the drawings. The tops of foundations shall be at such elevations as will permit grouting.

In setting pumps, motors, and other items of equipment customarily grouted, the Contractor shall make an allowance of at least 1-inch (2.5 cm) for grout under the equipment bases. Shims used to level and adjust the bases shall be steel. Shims may be left embedded in the grout, in which case they shall be installed neatly and so as to be as inconspicuous as possible in the completed work. Unless otherwise permitted, all grout shall be a suitable non-shrinking grout per Master Specification Section 03600, Grout.

Where practicable, the grout shall be placed through the grout holes in the base and worked outward and under the edges of the base and across the rough top of the concrete foundation to a peripheral form so constructed as to provide a suitable chamber around the top edge of the finished foundation.

Where such procedure is impracticable, the Engineer shall approve the method of placing grout. After the grout has hardened sufficiently, all forms, hoppers, and excess grout shall be removed, and all exposed grout surfaces shall be patched in an approved manner, if necessary, given burlap-rubbed finish and painted with at least two coats of an acceptable paint.

Before piping or electrical connections are made, verify that equipment is leveled and aligned on bases and foundations per manufacturer's instructions and recommended tolerances. Recheck before start-up. Assure that thrust is balanced, that shaft can be freely rotated by hand and that motor is quiet in operation. After all adjustments are completed, recheck alignment and adjust as necessary. Piping should not place stress on the equipment flanges. Support piping as necessary to meet this requirement, bolt tightly and grout. Final checking and adjustment shall be performed by the manufacturer's representative, a qualified millwright, or machinist. Proof of such qualification shall be provided to the Engineer.

Each pumping unit shall be leveled, plumbed, aligned and wedged into position with connecting piping. Installation procedures shall be as recommended by the pump manufacturer and as required herein.

The pump base shall be grouted after initial fitting and alignment, but before final bolting of connecting piping. After final alignment and bolting, pump connections shall be tested for applied stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to ensure that piping stresses are not transmitted to the pump flanges.

Equipment shall not be installed or operated except by, or with the guidance of, qualified personnel having the knowledge and experience necessary to obtain proper results. When so specified, or when employees of Contractor or its Subcontractors are not qualified, such personnel shall be field representatives of the manufacturer of the equipment or materials being installed.

Qualified field representatives shall be provided by each equipment manufacturer as required to perform all manufacturer's field services called for in the Specifications. Manufacturers' field representatives shall observe, instruct, guide, and direct Contractor's erection or installation procedures, or perform an installation check, as required. Each field representative shall revisit the site as often as necessary to attain installation satisfactory to Engineer.

All equipment installed under this Contract shall be placed into successful operation according to the written instructions of the manufacturer or the instructions of the manufacturer's field representative. All required adjustments, tests, operation checks, and other startup activities shall be provided.

3.3 PROTECTION AGAINST ELECTROLYSIS. Where dissimilar metals are used in conjunction with each other, suitable insulation shall be provided between adjoining surfaces so as to eliminate direct contact and any resultant electrolysis. The insulation shall be bituminous impregnated felt, heavy bituminous coatings, nonmetallic separators or washers; or other acceptable materials.

3.4 TESTS AND TEST REPORTS. When used in the Contract Documents, "Factory/Fabricating Shop Performance, Evaluation, Certification, and/or Acceptance Tests and Test Reports" shall be considered to mean the corresponding manufacturer's, fabricator's and/or other builder's official tests and tests reports of same. Included in these test reports are appropriate substantiating documentation/data detailing the correct and complete manufacture, fabrication, and "shop performance" (to greatest extent normally practicable) of the particular material, equipment, system and/or facilities proposed for eventual delivery. These are subdivided into three (3) significant tests and test report types:

Certification Tests and Test Reports

Factory Tests and Test Reports

Shop Performance/Evaluation Tests and Test Reports

3.4.01 Certification Tests and Test Reports. Standard specifications, code references, etc. for minimum quality and workmanship levels are indicated in the Contract Documents. Contractor shall compile statements, certificates, other substantiating reporting data, and tests or “Construction Test Reports” conducted on previously manufactured materials or equipment identical to that proposed for use.

As a minimum, all Certification Test Reports shall contain an official analysis of sufficient material composition or show evidence of meeting or exceeding the specified material standard(s) referenced, i.e., ASTM, ASME, etc. All reports shall also indicate from whom the material was/will be purchased.

Unless otherwise waived in writing by the Engineer, separate Certification Test Reports shall be submitted on all materials incorporated into the Work of this Contract. Such reports shall be delivered to the Engineer for review as part of the first submission of the technical submittal corresponding to such material or equipment (see Master Specification Section 01080, Project Submittals for compilation and composition requirements for all project submittals).

The Contractor shall pay all costs of certification tests and test reports.

3.4.02 Factory Tests and Test Reports. Additional tests and reports performed on material or equipment by the manufacturer or fabricator to ascertain quality or workmanship are referred to herein as "Factory Tests and Test Reports".

Prior to the delivery of any Factory Test Report, the Contractor shall first submit for review and approval, a detailed description of the proposed testing including reporting procedure and criteria. Such descriptions shall be delivered as part of the first submission of the technical submittal.

Materials and equipment used in the performance of the Work under this Contract are subject to inspection and testing at the point of manufacture or fabrication. If Work is to be inspected on behalf of DWSD during its fabrication or manufacture away from the construction site, the Contractor shall propose in writing to the Engineer at least 30 days in advance the place and time where such test of fabrication or manufacture is to be done. The Engineer shall approve or disapprove the date and notify the Contractor so that the necessary arrangements for the particular factory inspection tests can be made.

Should the Engineer deem the prescribed factory inspection tests of such importance to require the services of an independent testing laboratory or the witnessing by 4 of DWSD’s representatives, the Contractor will be duly notified. Travel costs incurred to the prescribed inspection tests shall be borne by DWSD and the Engineer respectively for their employees. In the event that the factory tests are not successful and must be re-accomplished, the travel costs for additional trips will be reimbursed to the Engineer and DWSD by the Contractor. Costs shall include travel, lodging, meals and all other reasonable travel-related expenses required for such individuals' observations and round-trip travels.

Upon completion of the factory inspection tests and immediately following manufacture or fabrication, the Contractor shall compile a complete Factory Test Report per the approved format above. All such reports shall be delivered to the Engineer for review as part of the technical submittal corresponding to such tested material or equipment (see Master Specification Section 01080, Project Submittals for details on execution and submission requirements for all project submittals).

3.4.03 Shop Performance/Evaluation Tests and Tests Reports. Material and equipment used in the performance of the Work of this Contract are also subject to the evaluation and testing after the complete, full-scale assembly into major equipment and/or systems. Shop Performance/Evaluation Tests, i.e. tests of simulated Startup, steady state, variable loading, and other normal operating conditions, for such assembled equipment/systems shall be accomplished in strict accordance with the standard testing practices specified or otherwise accepted by the Engineer.

Prior to the delivery of any Shop Performance/Evaluation Test Report, the Contractor shall submit for review, a detailed description of the proposed performance/evaluation tests, including anticipated reporting procedures, data reduction, and criteria used. Where appropriate, such descriptions shall be delivered to the Engineer for review as part of a first or subsequent submission of the technical submittal.

Should such performance/evaluation tests be accomplished away from the construction site, the Contractor shall propose in writing to the Engineer at least 30 days in advance the place and time where such test of fabrication or manufacture is to be done. The Engineer shall approve or disapprove the date and notify the Contractor so that the necessary arrangements for the tests can be made.

Travel costs incurred to the prescribed performance/evaluation tests unless otherwise specified in the detailed equipment specifications shall be borne by DWSD and the Engineer respectively for their employees. In the event that the tests are not successful and must be re-accomplished, the travel costs for additional trips will be reimbursed to the Engineer and DWSD by the Contractor. Costs shall include travel, lodging, meals and all other reasonable travel-related expenses required for such individuals' observations and round-trip travels.

The requirements above pertaining to Factory Tests and Test Reports, shall be incorporated herein for shop Performance/Evaluation Tests and Test Reports. Unless factory tests are coincident with shop performance tests and vice versa for the same material or equipment, a minimum of 15 days shall be scheduled between such multiple equipment tests, where extended travel is required.

3.4.04 Cost of Performance Shop Tests. The Contractor shall conduct shop performance full-scale tests at its expense on all equipment as specified. Each piece of equipment shall be tested completely assembled and the shop test performed by the equipment manufacturer until successful tests are achieved.
Travel costs incurred to the prescribed performance tests unless otherwise specified in the detailed equipment specifications shall be borne by DWSD and the Engineer respectively for their employees. In the event that the tests are not successful and must be re-accomplished, the travel costs for additional trips will be reimbursed to the Engineer and DWSD by the Contractor. Costs shall include travel, lodging, meals and all other reasonable travel-related expenses required for such individuals' observations and round-trip travels.

3.5 FIELD TESTING. Field-testing shall be conducted when called for in the technical specification sections and on all completed systems in general.

After completion of the installation, the Contractor, in the presence of the Engineer, under actual operating conditions, shall test the system. Tests shall be performed according to manufacturer's recommendations.

The Contractor shall include with its bid the services of the equipment manufacturer's field service technician for a period necessary to complete the work to the satisfaction of the Engineer and DWSD. This service shall be for the purposes of checkout, initial start-up, certification, and instruction of plant personnel.

The equipment supplier shall furnish gauges, instruments, test equipment and personnel required for testing. Adjust equipment to perform with the least possible noise and vibration consistent with its duty. Allowable vibration amplitude shall be 2.0 mils (0.05 mm) maximum for blowers or any 3600 rpm machinery.

The Contractor shall arrange for a qualified service representative to perform the initial equipment check-out. The Contractor shall make any adjustment/corrections to the equipment installation as required or recommended by the qualified service representative.

After the Engineer has reviewed and accepted the manufacturer’s representatives report, the Contractor shall make arrangements for the field acceptance tests. Qualified manufacturer’s representatives shall be present during the acceptance tests.

The purpose of the acceptance tests is to demonstrate the equipment’s ability to operate without excessive noise, vibration, overheating, or excessive maintenance and to deliver the rated capacity or service under specified conditions. Field conditions shall be the equivalent of anticipated service conditions and accepted by the Engineer prior to testing.

Field tests shall be suited to the equipment being tested. Refer to the appropriate technical Master Specification Section for a list of the items that should be field tested for each type of equipment.

The Contractor shall provide all necessary supervision and labor, materials, tools, test instruments, or other equipment or services required to test, adjust, set, and calibrate the equipment.

The Contractor shall correct or replace promptly defects or defective equipment revealed by or noted during the tests and repeat tests until results acceptable to the Engineer are obtained at no expense to the Owner.

If the Contractor is unable to demonstrate to the satisfaction of the Engineer that the equipment item satisfactorily performs the service required and will operate free from excessive noise, vibration heating or maintenance, the equipment item will be rejected. The Contractor shall then remove and replace the item and repeat all inspection and testing at no cost to the Owner.

All costs associated with the field testing, including providing necessary fluids to pump, shall be paid for by the Contractor. Each field test shall be of suitable duration to demonstrate the units ability to operate satisfactorily over its entire specified operating range.

The Contractor will supply a certificate of installation stating that the equipment is properly installed and adjusted to operate as designed.

Prior to any testing, the Contractor shall submit the test procedures and data sheets for Engineer's review and approval.

A written report covering the technician's findings and installation approval shall be submitted to the Engineer covering all inspections and outlining in detail any deficiencies noted.

Equipment and System Function and Performance Tests shall be conducted by the Equipment Supplier in the presence of the Engineer.

3.6 EQUIPMENT OPERATION TEST. The Engineer will accept an equipment system as finally completed when the system operates for 30 consecutive days as specified without breakdown. In the event of a breakdown or unsatisfactory performance the Contractor shall make all necessary repairs and a new 30 consecutive day period shall commence. All repairs costs during the initial and follow-on 30 day periods shall be borne by the Contractor.

3.7 ACCEPTANCE OF INSTALLATION. The Engineer may accept an equipment system installation as ready for Substantial Completion of New Facilities when:

The Engineer has accepted all factory tests and all other component testing.

The Engineer has accepted all performance shop tests.

All components of the system are fully installed and tested, including without limitation hydrostatic tests, leak tests, continuity tests, insulation resistance tests, phase rotation tests, bump tests, stroke testing, calibration, adjustment for proper operation, and all other component tests as appropriate.

Field start-up activities have been completed and approved by the Engineer.

The certificates in this section have been submitted.

All equipment has met the performance requirements.

The Engineer has accepted integrated system tests and adjustments performed by the Contractor to demonstrate that the system as a whole functions reliably and meets the performance requirements, in manual and automatic modes, without failure, fault, or defect of any component or of the system as a whole.

The demonstration test has been successfully completed in accordance with the requirements herein.

The Engineer has accepted the O&M Manuals.

All required DWSD personnel have been trained.

All other Contract requirements for Substantial Completion have been satisfied.

3.8 BUILDING OPENINGS FOR ADMISSION OF EQUIPMENT. The Contractor, upon review by Owner, shall provide special break-out openings in the all buildings and structures to move in or remove new and existing equipment. Openings shall be constructed free of obstructions and As-Built drawings shall document the location and purpose of opening.

3.9 SERVICES OF MANUFACTURER'S REPRESENTATIVE. The Contractor shall arrange and pay for a qualified service representative from each company manufacturing or supplying certain equipment as listed in this Section (or in the respective technical Master Specification Sections) to perform the duties herein described. The extent of services required shall be as specified in each equipment section, but in no case shall be less than one 8-hour day.

After installation of the listed equipment has been completed and the equipment is presumably ready for operation, but before it is operated by others, the representative shall inspect, operate, test, and adjust the equipment. The inspection shall include, but not be limited to, the following points as applicable:

Soundness (without cracked or otherwise damaged parts).

Completeness in all details, as specified.

Correctness of setting, alignment, and relative arrangement of various parts.

Adequacy and correctness of packing, sealing, and lubricants.

The operation, testing, and adjustment shall be as required to prove that the equipment is left in proper condition for satisfactory operation under the conditions specified.

On completion of its work, the manufacturer's or supplier's representative shall submit in triplicate to the Engineer a complete, signed report of the result of its inspection, operation, adjustments and tests. The report shall include detailed descriptions of the points inspected, tests and adjustment made, quantitative results obtained, if such are specified, and suggestions for precautions to be taken to ensure proper maintenance. The report also shall include a certificate that the equipment conforms to the requirements of the Contract and is ready for permanent operation and that nothing in the installation will render the manufacturer's warranty null and void.

After the Engineer has reviewed the reports from the manufacturer's representatives, the Contractor shall make arrangements to have the manufacturer's representatives present when the field acceptance tests are made.

The Contractor shall arrange for the service of qualified service representatives from the companies manufacturing or supplying all equipment under the Contractor’s contract.

End of Section

SECTION 01190

CONTRACT CLOSEOUT AND CLEANING

PART 1 - GENERAL

1.1 SCOPE. This section covers contract closeout procedures and both ongoing and final cleaning of the Work. This section builds upon General Conditions (Exhibit C) of the Agreement and includes administrative provisions for Substantial Completion and for Final Acceptance.

1.2 GENERAL.

1.2.01 Coordination. Refer to other Master Specification Sections in Division 1 for coordination.

1.3 CLEANING.

1.3.01 Site Cleaning Requirements. Maintain project site free of waste materials, debris, and rubbish and in a clean and orderly condition on a weekly basis throughout duration of Work. If the premises and job site are not maintained properly, the Owner may have accumulations of waste materials or trash removed and charged the Contractor for those costs.

1.3.02 Street Cleaning Requirements. All public or private property streets or roads, occupied or used by the Contractor shall be kept in a neat and orderly condition at all times. When directed by the Engineer, but not less than weekly, the Contractor shall sweep the streets with a sweeper. This requirement shall apply to any streets or roads in the vicinity of the Work which are affected by the Contractor's construction or hauling operations, and as well as to streets or roads in which the Work is located. Should the Contractor neglect his duties in maintaining the proper street or road cleanliness, the City has the authority to take necessary steps to perform such cleaning and will charge the Contractor for those costs.

1.4 RESTORATION REQUIREMENTS. At the completion of his Work, the Contractor shall remove all temporary construction buildings, equipment, tools, surplus or waste materials and rubbish of any sort from public or private premises temporarily occupied in the vicinity of the Work.

Complete all final cleaning and restoration work prior to final inspection, cleaning and disposal operations to comply with codes, ordinances, regulations and environmental protection laws.

Contractor shall restore all property occupied or affected by operations to its original condition as nearly as practicable. Lawn areas may be seeded, unless otherwise noted. Paved areas shall be restored in accordance with Master Specification Sections 02730 through 02900, compatible with the surrounding area, using like materials and workmanship. The final condition of the premises shall be subject to the approval of the Engineer.

1.5 REINSPECTION FEES. Should status of completion of Work require more than one re-inspection by Engineer due to failure of Work to comply with Contractor's claims on initial inspection, DWSD will deduct from final payment to Contractor the amount of Engineer's compensation for additional re-inspection services.

1.6 SUBSTANTIAL COMPLETION. Contract shall follow paragraph 9.7 of the General Conditions (Exhibit C) of the Agreement and other Contract Documents when Contractor considers the Work or designated portion of Work to be substantially complete.

1.7 FINAL COMPLETION. Upon receiving the certificate of substantial completion or partial completion from Engineer, Work shall be complete once all close-out submittals are received and approved by Engineer. When Contractor considers Work, or designated period of Work, is complete, submit written certification indicating that:

Contract Documents have been reviewed.

Work has been completed and inspected for compliance with Contract Documents.

Deficiencies listed with Certificates of Substantial Completion have been corrected

All equipment and systems have been fully tested and are operational.

All required shop drawings, catalog cuts, maintenance manuals, instruction manuals, test reports, samples, operational manuals and other submittals have been submitted and approved by the Engineer.

The Engineer will conduct final inspection of the Work. Should Engineer's final inspection reveal Work incomplete, the Engineer shall promptly notify Contractor in writing listing observed deficiencies. Contractor shall remedy deficiencies and send a second certification of Final Completion.

The Engineer will reinspect the Work. When Engineer finds Work is complete, closeout submittals shall be submitted.

1.8 CLOSE-OUT SUBMITTALS. Contract shall submit the following close-out submittal items:

Certificate of Occupancy.

All required Certificates of Inspection.

Record Documents.

Operation and Maintenance Data.

Warranties and required Bonds.

Spare Parts and Maintenance Materials (At Final Completion only).

Keys and keying schedule.

Consent of Surety to Final Payment.

As-built documents for all items of construction on electronic format.

1.9 APPLICATION FOR FINAL PAYMENT. Contractor shall submit application for final payment in accordance with provisions of General Conditions.

PART 2 - PRODUCTS

2.1 CLEANING. Use only those cleaning materials that will not create hazards to health or property and that will not damage surfaces. Use only those cleaning materials and methods recommended by manufacturer of the surface materials to be cleaned and by cleaning material manufacturer.

PART 3 - EXECUTION

3.1 CLEANING REQUIREMENTS. The Contractor shall be responsible for the general maintenance of the premises and the job site and for the coordination of the clean-up work of all trades.

Open free-fall chutes are not permitted. Terminate closed chutes into appropriate containers with lids.

Remove debris and rubbish from pipe chases, plenums, attics, crawl spaces and other closed or remote spaces, prior to enclosing the space.

Contractor’s equipment, temporary building, and excess materials shall be promptly removed, as they become no longer needed for prosecution of the Work.

3.1.02 Weekly Cleaning Requirements. Perform weekly cleaning to keep the Work, the site and adjacent properties free from accumulations of waste materials, rubbish, and windblown debris resulting from construction operations. Dispose off all materials collected through the cleaning process.

Each week, perform interior cleaning. Clean interior and exterior exposed-to-view surfaces. Remove temporary protection and labels not required to remain. Clean finishes free of dust, stains, films and other foreign substances. Clean transparent and glossy materials to a polished condition; remove foreign substances. Polish reflective surface to clear surfaces. Clean light fixtures and lamps. Vacuum clean carpet and similar soft surfaces. Clean resilient and hard-surface floor as specified. Clean surfaces of equipment; remove excess lubrication. Clean plumbing fixtures, to a sanitary condition.

Provide on-site containers for the collection of waste materials, debris and rubbish. Collect and remove waste materials, debris and rubbish from site at least weekly and dispose of off-site as containers become full.

3.1.03 Daily Cleaning Requirements. Daily, clean locker rooms and lavatory areas. Remove waste from receptacles.

3.1.04 Street Cleaning. When directed by the Engineer, but not less than weekly, the Contractor shall sweep the streets with a sweeper. Waste materials, rubbish and debris shall not be allowed to accumulate. The sweeper shall have a main broom, conveyor, sprinkler system and storage hopper.

3.1.05 Dust Control. Broom and vacuum clean interior areas of the building just prior to the start of painting and finish Work. Continue cleaning these areas to eliminate dust and maintain in satisfactory condition for painting and finishing as directed by the Engineer.

Schedule operations so that dust and other contaminants resulting from cleaning process will not fall on wet or newly-coated surfaces.

3.2 DAMAGED PROPERTY. Restore or replace, when and as directed, any public or private property damaged by Work, equipment, or employees, to a condition at least equal to that existing immediately prior to beginning of operations and to the satisfaction of the owner of the property. To this end, the Contractor shall perform, as required, all necessary highways or driveway, walks and landscaping work. Suitable materials, equipment and methods shall be used for such restoration. The restoration of existing property or structures shall be done as promptly as practicable as work progresses and shall not be left until the end of the Contract period.

3.3 FINAL CLEANING. Clean the entire Work site as specified in Article 3.1 above and as required below. Employ skilled workmen for final cleaning.

Remove grease, mastic, adhesives, dust, dirt, stains, fingerprints, labels, and other foreign materials from sight-exposed interior and exterior surfaces.

Clean out all floor drains in all Work areas to allow full drainage.

Clean permanent filters of ventilating equipment and replace disposable filters when units have been operated during construction; in addition, clean ducts, blowers, and coils when units have been operated without filters during construction.

Remove waste, foreign matter, and debris from roofs, gutters, area ways, and drainage systems.

Remove wastes, debris, and surplus materials from site. Clean grounds; remove stains, spills, and foreign substances from paved areas and sweep clean. Rake clean other exterior surfaces.

Where material or debris has washed or flowed into or been placed in existing watercourses, ditches, gutters, drains, pipes, structures, as the result of Work done under this Contract, or elsewhere during the course of the Contractor's operations, such material or debris shall be entirely removed and satisfactorily disposed of during the progress of the Work, and the ditches, channels, drains, pipes, structures and Work, etc., shall, upon completion of the Work, be left in a clean and neat condition.

Prior to final completion, or Owner occupancy, conduct an inspection of sight-exposed interior and exterior surfaces and all Work areas to verify that the entire Work is clean.

The Contractor shall thoroughly clean all materials and equipment installed by him and his subcontractors and on completion of the work shall deliver it undamaged and in fresh and new-appearing condition. All mechanical equipment shall be left fully charged with lubricant and ready for operation.

Maintain cleaning until Final Completion.

End of Section

SECTION 01200

EQUIPMENT RECORDS

PART 1 – GENERAL

1.1 SCOPE

This section covers the consolidation and submittal of technical documentation for each piece of equipment specified in the Divisions 2 through 17 technical specification sections under this Contract for input this information into Owner's computerized maintenance management and financial systems.

The Contractor shall furnish all labor, equipment, materials, and incidentals required to deliver technical documentation for the Work to the Owner in accordance with the requirements of this section.

1.2 RELATED REQUIREMENTS.

A. Section 01010, Administrative Provisions
B. Section 01020, Documentation Standards
C. Section 01030, Summary of Work
D. Section 01080, Project Submittals
E. Section 01150, Project Record Documents and Photographs
F. Section 01160, Training and Operations & Maintenance Manuals
G. Specification Division 2 through 17 as applicable

1.3 QUALITY ASSURANCE

A. The Contractor shall verify that each submittal under this section meets the Contract requirements.
B. Preparation of equipment records shall be done by personnel that meet the following minimum qualifications:
    1. Are specifically trained and certified by the manufacturer in the operation and maintenance of the equipment that they are preparing equipment records;
    2. Have at least 5 years of experience in the operation and maintenance of the equipment they are preparing the equipment records.

1.4 SUBMITTALS

A. Submit documentation that demonstrates that the personnel responsible for preparing the equipment records for each equipment being provided under this Contract meet the minimum qualifications specified in paragraph 1.3 (QUALITY ASSURANCE) of this section.

1.5 FORM OF TECHNICAL DOCUMENTATION SUBMITTAL

A. Insert materials in commercial quality, 8-1/2 inch x 11-inch, 3-ring, green color binders with hardback cleanable plastic covers and 2-inch maximum ring size. When multiple binders are used, correlate data into related, consistent groupings.

B. On binder covers, identify each volume with typed or printed title, "THE DETROIT WATER & SEWERAGE DEPARTMENT – EQUIPMENT RECORDS", listing:

1. Title of project;
2. Area at site;

C. Provide tabbed fly-leaf for each separate equipment, piece of operating equipment or system, with equipment and component descriptions. Provide a table of contents for each volume (binder) identifying each separate product, piece of operating equipment or system included.

D. Text shall be manufacturer's printed data, or neatly word processed on 20-pound (minimum) paper.

E. Submit certification that all data pertains exactly to the model, size, series, etc. of the products / equipment installed on this job.

F. Electronic files:

1. Provide manufacturer’s documentation in electronic format.
2. All text prepared shall be in MS Word or MS Excel format as provided in the blank forms;
3. All electronic files in their native format must be submitted on CD-ROM disks.

1.6 CONTENTS, EACH VOLUME

A. Neatly word processed table of contents for each volume, arranged in systematic order to include the following:

1. Contractor, name of responsible principal, address, fax number and telephone number;
2. A list of each product required to be included, indexed to content of the volume. Identify each product by name and other identifying symbols as set forth in the Contract Documents;
3. List, with each equipment, names, addresses, and telephone numbers of: subcontractor or installer, local source(s) of supply for parts and replacements; manufacturer.

1.7 RECORDS FOR EQUIPMENT.

A. The equipment records shall include:

1. Completed Record of Equipment Data Sheets (see Appendix A),
2. Completed Equipment (Asset) Nameplate Data Sheets (see Appendix B for examples), (Owner will provide the appropriate Equipment (Asset) Nameplate Data Sheet templates for the equipment, which is listed on the Equipment (Asset) Data Sheets.)
3. Completed Equipment Preventive Maintenance Procedures forms (see Appendix C), (Prior to submitting the initial Equipment Preventive Maintenance Procedures form to the Owner, the Contractor shall meet with the Owner to review the Owner’s requirements when completing the forms.)
4. Completed Warranty Data Sheets (see Appendix D),
5. Completed Request to Add a Stock Items and Spare Parts Form (see Appendix E),
6. Completed GIS maps, and specifications (see Appendix F),
7. Completed streamlined Reliability Centered Maintenance analysis for all major equipment. (see Appendix G)
8. Mechanical installer information,
9. Electrical installer information (including instrument & controls supplier information), and
10. All corrective and preventive maintenance records as performed by the Contractor from startup through acceptance of the equipment.

B. Any submittals in which this has not been done will be returned immediately without further review.

1.8 SUBMITTAL SCHEDULE.

A. Submit 5 bound copies of the equipment records and 2 CDs with electronic files to the Engineer for approval 40 days before substantial completion. One copy with review comments will be returned.

B. Submit 5 bound copies of the final documentation and 2 CDs with electronic files to the Engineer for approval 20 days before substantial completion.

SECTION 01310 PROGRESS SCHEDULE

TABLE OF CONTENTS

PART 1 — GENERAL

1.01 REQUIREMENTS

A. The **Contractor's** approach to prosecution of the Work shall be disclosed to the **Contracting Officer** by submission of computerized, cost-and-resource loaded CPM Progress Schedules as required in this Section. These requirements are in addition to, and not in limitation of, those imposed elsewhere in the Specifications.

B. A *pay Activity*, as opposed to a *CPM Activity*, is an Activity used to simplify cost-loading of the Progress Schedule. When used, pay Activities shall be loaded with the cost of Work that is included, at no cost, in related (generally, concurrent) CPM Activities. Pay Activities shall not control the rate of progress; however, their start and finish dates shall be consistent with those of their related CPM Activities to ensure accurate Early Date and Late Date payment plots. Other defined terms used in this Section have specific intent and meanings assigned in the Glossary. References to CPM (Critical Path Method) shall be CPM standards consistent with this Section.

C. The General Conditions address actions to be taken if the **Contractor** fails, refuses or neglects to provide the required Progress Schedule information on a timely basis.

1.02 QUALITY ASSURANCE

A. The **Contractor** may self-perform the Work covered by this Section or employ a Subcontractor, subject to the **Contracting Officer's** consent, as provided in the General Conditions. Employment of a scheduling Subcontractor shall not in any way alter or reduce the **Contractor's** obligations under the Contract Documents.

B. In preparing Progress Schedules, it is the **Contractor's** responsibility to (a) request interpretations from the **Contracting Officer**, as warranted, (b) point out to the **Contracting Officer**, by specific, separate notation, any aspects of the Progress Schedule that may reflect variations from the Contract Documents, and (c) work with Sub-contractors and Suppliers in finalizing Activities and logic ties.

1.03 PROGRESS SCHEDULE SUBMITTALS

A. The Progress Schedule shall consist of the following Progress Schedule Submittals: (a) Revision Submittals, which may revise the Record Schedule, (b) Payment Submittals, which shall be required for Progress payments, and (c) Proposal Submittals, which shall support proposals or claims for changes in Contract Price or Contract Time, schedule recovery plans and other **Contractor**-initiated Progress Schedule adjustments.

B. A Progress Schedule Submittals shall include a disk with the **Contractor's** files, a narrative and six (6) copies of the following reports, schedules and plots, all in formats, sorts and sequences acceptable to the **Contracting Officer**: (a) Revision Submittals - Detailed Cost Breakdown, Activity reports, Schedule of Values, logic diagrams and resource plots; (b) Payment Submittals - Detailed Cost Breakdown, Activity reports, Schedule of Values and Short Term Schedule; and (c) Proposal Submittals - Detailed Cost Breakdown, Activity reports, Schedule of Values and logic diagram plots.

C. The **Contractor** shall uniquely identify each Progress Schedule Submittal. Resubmissions shall be identified by reusing the corresponding Submittal number and the letter A, B, etc., and shall fully address all the **Contracting Officer's** comments and objections.

D. No Progress Schedule review by the **Contracting Officer** shall relieve the **Contractor** from the responsibility to: (a) comply with the Contract Times and any sequences of Work indicated in or required by the Contract Documents, and (b) complete omitted Work within the Contract Times. Nor will any such Progress Schedule review by the **Contracting Officer** lead to approval of, or consent to, any variation from the Contract Documents, except as the **Contracting Officer** may otherwise approve or consent to individual variations by means of specific, separate notations in writing.

1.04 SUBSTITUTES; ALLOWANCES

A. Progress Schedule Rev. 0 Submittals shall be based solely on the furnishing of named or specified materials/equipment nominated in Section 00450, and the means and methods indicated in or required by the Contract Documents at Bid opening, and shall exclude substitutions - even if the **Contractor** intends to pursue substitutions under the provisions of the Contract Documents. Since the **Contracting Officer's** determination on substitutions may not be made until after the *As-Planned* Schedule is established, the **Contractor** shall plan substitutions accordingly.

B. The **Contractor** shall cause Work covered by Allowances and contingent Unit Price Work to be done within the Contract Times. The Progress Schedule shall incorporate the **Contractor's** best estimate of Activities and logic ties required by all cash allowances and by any Work authorized under any contingent Unit Price Work item.

C. The **Contractor** shall schedule all requisite tasks of the **DWSD** and **Engineer** and all interfaces between the Work and the work of others within the limits of the Contract Times. The Progress Schedule shall incorporate all related Activities and logic ties based on the information given in the Contract Documents, and if not given, as indicated by the **Contracting Officer** in writing.

1.05 DELAY PROVISIONS

A. The **Contractor** shall promptly take appropriate action to recover schedule whenever the **Contractor** anticipates, or any Progress Schedule Submittal demonstrates, and required CPM Activity to slip, due to acts or omissions within the control of the **Contractor**, by fifteen (15) or more days beyond any Target Time or Contract Time. If the **Contractor** is not responsible for such schedule slippage, the **Contractor** shall give prompt written notice of a delay justifying a Contract Time extension, and follow such notice by taking prompt appropriate action nonetheless, if so directed by the **Contracting Officer**.

1. If schedule recovery is required, the **Contractor** shall enclose with the next Payment Submittal a schedule recovery plan consisting of (a) a narrative describing the cause of schedule slippage and the actions taken to recover schedule within the shortest reasonable time, and (b) a Proposal Schedule with the corresponding revisions in Activities and logic ties and other adjustments. Appropriate schedule recovery actions may include, assignment of additional labor, Subcontractors or construction equipment; Work during other than normal working hours; resequencing of the Work; expediting of Submittals and deliveries; and any combination of any of these or other similar actions. Activity shortening and overlapping shall be explained as to their basis (and be supported by increases in resources).

2. If the **Contractor** believes that an increase in Contract Time is justified, any such extension in Contract Time and associated increase in Contract Price will not be evaluated, unless the following requisites are met: (a) the **Contractor**, using the procedures in this Section, demonstrates that conditions justifying extensions in Contract Time or increases in Contract Price, or both, have arisen, and (b) the **Contractor's** analysis is verifiable by an independent, objective evaluation by the **Contracting Officer**, using the electronic files and data furnished by the **Contractor**.

B. The **Contractor's** failure, refusal or neglect to take appropriate schedule recovery action or, in the alternative, give written notice of a delay, and, in either case, to follow up with a timely Proposal Schedule shall be reasonable evidence that the **Contractor** is not prosecuting the Work with due diligence. Any such **Contractor** failure, refusal or neglect shall give sufficient basis to the **DWSD**, with the **Engineer's** advice, to elect any of the following: (a) demand adequate, written assurance of due performance, as provided in the General Conditions, (b) withhold liquidated damages, and (c) in the **DWSD's** sole discretion, direct alternate schedule recovery actions.

C. Once the *As-Planned* Schedule is established, the **Contracting Officer** will select "Targets" (as defined in the Glossary). Targets will be assigned "Target Times" using the Late Dates in the Rev. 0 Record Schedule (*As-Planned* Schedule). As the Record Schedule is revised, Target Times shall be revised to reflect the Late Dates. Target Times shall be interim, **Contractor**-imposed deadlines; however, Target Times shall not be Contract Times.

D. In the event the **Contracting Officer** is unable to return any Progress Schedule Revision as "Resubmittal Not Required", both the **Contracting Officer** and **Contractor** shall be required to use the Rev. 0 Record Schedule and Rev. 0 Target Times, and not any disputed Record Schedule, to resolve issues affecting Contract Time and Contract Price, as follows: (a) The *As-Planned* Schedule will be updated through several Progress Payment closing dates, and (b) actual dates for the Targets shall be compared with the Rev. 0 Target Times, and any slippage, by trade or equivalent Contract phase, shall be correspondingly explained.

1. Any such updating of the *As-Planned* Schedule through a closing date (a) shall purposely exclude all **Contractor**-initiated revisions affecting Work after the closing date, even if such revisions were incorporated into any Revision Submittal (as permitted under paragraph 3.03C), but (b) shall include adjustments in Activities and logic tie changes covering changes and delays that were consented to by the **DWSD** before the closing date. Adjustments in Activities and logic ties for **Contractor**-initiated revisions (including schedule recovery plans) shall be incorporated only in the update for the period when the Work reflected by those **Contractor**-initiated revisions actually took place.

1.06 PROGRESS SCHEDULE SOFTWARE

A. The Progress Schedule software shall be current version of Primavera Project Planner[7] or equivalent software that runs on IBM PC compatible equipment and is capable of: (a) processing and plotting the required Progress Schedule information, and (b) creating data bases accessible by other software.

1.07 MEASUREMENT AND PAYMENTS

A. The **Contractor** represents to have included in the Contract Price all costs for Work under this Section. Payments for Work performed under this Section will be made as part of those payments made on in-progress and completed Detailed Cost Breakdown pay items, or using the Earned Values for Progress Schedule Submittal pay items, if any such pay items are established.

PART 2 — PRODUCTS

2.01 PROGRESS SCHEDULE; NARRATIVE

A. The Progress Schedule shall detail CPM Activities and logic ties to the extent required to show the **Contractor's** overall approach to the Work. Activity breakdown shall be responsive to the intent of paragraphs 2.01.B through 2.02.E and the purpose of the Progress Schedule stated in the General Conditions.

B. The Progress Schedule shall clearly define the prosecution of the Work from Date of Commencement of the Contract Time to final completion by using separate CPM Activities for, but not limited to: construction/installation; permitting (by the **Contractor** and **DWSD**); Submittal preparation; Submittal review and return; Submittal resubmissions and Submittal rereviews, as advisable; deliveries to the site or storage; **DWSD**-furnished items; interfaces with other work (other contractors, public utilities, etc.); testing and Punch List; **DWSD** training; and start-up.

C. CPM Activity durations shall equate to the days required to complete the associated Work. Activities shall not combine: (a) separate items of Unit Price or lump sum Work; (b) distinct classes of Work (e.g., CSI Divisions or equivalent); (c) Work in separate areas, structures or facilities and, if requested by the **Contracting Officer**, Work in separate locations or elevations within an area, structure or facility; or (d) rough-in and finish Work.

D. Installation CPM Activities shall last from fifteen (15) to forty-five (45) days, unless a shorter duration results from the rules in paragraph 2.01.C. Unless longer review times are specified in other Specifications, Submittal review CPM Activities also shall last from fifteen (15) to forty-five (45) days as determined by the **Contracting Officer**. Submittal, delivery and start-up CPM Activities may combine materials and equipment in the same class of Work, based on the detail of related installation CPM Activities.

E. Activities shall be assigned consistent descriptions, codes, and sort codes. Sort code schemes shall: be subject to the **Contracting Officer's** prior consent; indicate whether the **Contractor** (or a Subcontractor or Supplier), **Engineer** or **DWSD** is the lead; distinguish CPM Activities from pay Activities; and group Activities by unit price, area, change, Submittals, deliveries and other such schemes. Constraint dates shall be explained as to basis.

F. A narrative shall list the CPM Activities on each Critical Path and compare Early and Late Dates for CPM Activities designating Contract Times and Target Times. For Payment Submittals, a narrative also shall recap progress and days gained or lost vs. the current Record Schedule, describe changes in resources to be used on remaining Work and identify delays, their extent and causes. For Revision Submittals, the narrative also shall itemize changes in Activities, logic ties and DCB pay items by each change, recovery plan and **Contractor**-initiated revision.

2.02 REPORTS; SCHEDULES; PLOTS

A. Activity reports shall include CPM Activity code, description, duration, calendar, Early and Late Dates (calendar dates), Total Float, labor man-hours and sort codes. The Late Finish Date (or the Early Start Date) of any CPM Activity highlighting a Contract Time (or commencement of all or any part of the Work) shall equal the corresponding Contract Time (or Contract date). In addition, for precedence-based Progress Schedules, Activity reports shall show, for each CPM Activity, all preceding and succeeding logic ties (lead/lag and lead times) or attach a separate report combining such Activity and logic tie data.

B. The Detailed Cost Breakdown (DCB) shall divide the Work into pay items by significant Sections of the Specifications within areas, structures and facilities, or vice versa. If requested by the **Contracting Officer** in writing, there shall be separate DCB reports for self-performed Work and the Work of each Subcontractor.

1. The Schedule of Values (SOV) shall subdivide the DCB into CPM and pay Activities, sequenced by Activity codes, and shall tabulate for each Activity: code, description, Values for labor, Subcontract and/or materials and equipment costs; Activity Values; percent complete; and Earned Values. Delivery and Submittal review Activities, where appropriate, shall be cost-loaded if the **Contractor** intends to request payment for stored materials and for approved equipment Shop Drawings, respectively.

2. Pay Activities or the features of the software shall be used to ensure that any total CPM Activity Value or, if appropriate, that any Activity labor, Subcontract, etc. Values roll up to only one DCB pay item. Once the Rev. 0 DCB and SOV are approved, the **Contractor** shall not modify any DCB pay item or Activity Value, unless otherwise authorized by the **Contracting Officer** in writing.

C. Short-term Schedules shall subdivide CPM Activities into detailed tasks and cover the prior two (2) weeks and the next four (4) weeks. Each installation task shall be cross-referenced to a CPM Activity and shall not combine the Work for more than one crew. Submittals shall segregate preparation from review and shall not combine items furnished by separate Suppliers.

D. Logic diagrams shall be arrow or precedence and, once the **Contracting Officer** has designated time-scales, shall be plotted on a time-scaled calendar, on 24" x 36" sheets. Logic diagrams shall identify the Contract Times and Critical Path(s). CPM Activities shall be shown on the Early Dates, and Total Floats shall be noted beside the CPM Activities. Logic connectors, whether on the same sheet or not, shall identify predecessors and successors.

E. Resource plots shall graph monthly (or weekly, if chosen by the **Contracting Officer**) and cumulative payments and manpower, using current Early Dates and Late Dates and, when requested by the **Contracting Officer**, comparing *As-Planned* Schedule and current Early Dates. The specific trades shall be chosen by the **Contracting Officer**.

PART 3 — EXECUTION

3.01 TOLERANCES

A. If the Early Dates in any Progress Schedule Payment Submittal forecast any slippage in the Contract Times, the

Contractor shall indicate such overrun(s) by reporting negative Total Floats.

B. A Proposal Schedule with negative Total Float or Contract Float over fifteen (15) days will be returned without review, unless the **Contractor** has notified the **DWSD** in writing of delays justifying Contract Time extensions and the Proposal Submittal does reflect the **Contractor's** position on the issues, or unless the **Contracting Officer**, in its sole discretion, elects to otherwise do a review.

C. Total Float and Contract Float in an early completion Revision Submittal or Proposal Submittal shall be determined based on the definitions given in the Glossary, regardless of the float values calculated in any such Progress Schedule Submittal.

3.02 SOFTWARE SUBMITTAL

A. At the pre-construction conference, the **Contractor** shall inform the **DWSD** of the software the **Contractor** will employ to comply with the requirements of this Section.

B. If the **Contractor** selects software not in use by the **DWSD**, the **Contractor**, at no increase in Contract Price, shall (a) furnish a fully-licensed copy to the **DWSD** for the **DWSD** and **Engineer's** use, (b) provide the **DWSD** and **Engineer** with sufficient classroom training, at the site, in the use of the software (as recommended by the software Supplier) and (c) furnish to the **DWSD** all software upgrades/updates acquired from the software vendor during the period allowed for completion of the Work and that are used by the **Contractor** on the Work.

3.03 REVISION SUBMITTALS

A. The first Revision Submittal shall consist of the Detailed Cost Breakdown (DCB) and an Interim Rev. 0 Submittal or the complete Rev. 0 Submittal, if proposed by the **Contractor** and consented to by the **Contracting Officer**. If the Interim Rev. 0 Submittal procedure is enforced, the Interim Rev. 0 Submittal shall be due within ten (10) days after receipt of the Notice to Proceed, and shall consist of the first three (3) months of the forthcoming Rev. 0 Submittal, with the balance of the Work using summary CPM Activities as required to demonstrate compliance with the Contract Times. No Progress Payment shall be finalized until the **Contracting Officer** approves the DCB and returns to the **Contractor** the Interim Rev. 0 Submittal as "Resubmittal Not Required".

1. In addition to the requirements in paragraph 2.02A, the narrative shall detail: (a) the **Contractor's** plan for management of the site (e.g., laydown, staging, traffic, parking, etc.), (b) the use of construction equipment, (c) the buildup of labor in the first three (3) months, and (d) any delays occurring since Contract Award and the potential schedule effect of pending changes.

2. A Payment Submittal progressing the Interim Rev. 0 Submittal shall be due within five (5) days after the closing date of the first three (3) Progress Payments. Progress data and the calculations of Earned Values for DCB pay items and Activities shall comply with the requirements of paragraph 3.04.A-B.

B. The Rev.0 Submittal, representing the first complete Progress Schedule Submittal, shall be due within five (5) days after the closing of the second Progress Payment, or the first one, if the Interim Rev. 0 Submittal is by-passed. The Rev. 0 Submittal shall reflect the Work as awarded, and shall not include any delays, Change Orders, Construction Change Directives or substitutions. The narrative shall itemize shifts, non-Business Days and any multiple calendars applied to the CPM Activities. If the interim Rev. 0 Submittal is by-passed, the narrative also shall comport with the requirements of paragraph 3.03.A.1 and the first three (3) Progress payments shall rely on the DCB and Rev. 0 Submittal.

1. Once the Rev. 0, or Rev. 0A, etc. Progress Schedule is returned to the **Contractor** as "Resubmittal Not Required," with or without comments or objections noted, it shall become the Rev. 0 Record Schedule, or *As-Planned* Schedule, and be used for Payment Submittals until the Record Schedule is revised.

2. The Rev. 0 SOV shall be required for the third Progress Payment, or ten (10) days after establishment of the *As-Planned* Schedule, whichever comes sooner. Except as provided in paragraph 3.03.A.2, or as otherwise determined by the **Contracting Officer**, no Progress Payment shall be finalized until the **Contracting Officer** approves the Rev. 0 SOV and returns to the **Contractor** the Rev. 0 Submittal as "Resubmittal Not Required".

3. Both the DCB and SOV may include separate pay items for mobilization/demobilization, O&M manuals, **DWSD** training, Punch List Work, start-up, etc., if the Contract Documents permit such approach. If the **DWSD** allows Progress Payments to include sums for approved equipment Shop Drawings, the SOV may assign Values to the corresponding Submittal review Activities if: (a) the equipment requires Shop Drawings of significant up-front Contracting Officering and more than ninety (90) days in fabrication, (b) the Activity Value is less than fifteen percent (15%) of the delivered price of the equipment, and (c) such payment will pass in its entirety to the Supplier furnishing the equipment.

C. The Rev. 1 Submittal shall be due three (3) months after establishment of the *As-Planned* Schedule. Subsequent Revision Submittals shall be due every three (3) months after that. Except as recognized in paragraph 3.03.C.2, a Revision Submittal shall be intended to document those agreement reached between the **DWSD** and **Contractor** concerning the Progress schedule by incorporating, in the most recent Payment Submittal, revisions in Activities, logic ties, and so forth, consented to by the **DWSD** upon completion of the **Contracting Officer's** review of the preceding Proposal Submittals. Activity reports, Schedule of Values and logic diagrams shall group revisions in Activities, logic ties, etc. by Change Order, Change Authorization, delay, schedule recovery plan and **Contractor**-initiated revisions.

1. A Revision Submittal returned by the **Contracting Officer** as "Resubmittal Not Required," with or without comments or

objections noted, shall become the Record Schedule to be used by the **Contractor** for subsequent Payment Submittals and Proposal Submittals, and shall be referred to by its Revision number.

2. In the event the **Contracting Officer** is unable to return any Revision Submittal as "Resubmittal Not Required", with or without comments or objections noted, the evolution of the Record Schedule shall cease, however, the **Contractor** shall nonetheless continue to delivery *disputed* Revision, Payment and Proposal Submittals reflecting the **Contractor's** positions on the issues as well as the **Contractor's** approach for Work remaining.

D. The Record Schedule shall reflect the agreements reached between the **DWSD** and **Contractor** concerning the Progress Schedule. Therefore, the current version of Record Schedule shall be used by the **DWSD** and **Contractor** to monitor progress against Contract Times and resolve issues affecting Contract Price and Contract Time and the assessment of liquidated damages, unless the **Contracting Officer** is unable to return any Revision Submittal as "Resubmittal Not Required", in which case the *As-Planned* Schedule shall be used by the **DWSD** and **Contractor**.

3.04 PAYMENT SUBMITTALS

A. Payment Submittals progressing the current version of the Record Schedule shall be due within five (5) days after the closing date of each Progress Payment. The first such Payment Submittal shall be required for the fourth Progress Payment, whether the *As-Planned* Schedule has been established or not.

1. Record Schedules in Payment Submittals shall reflect progress up to the closing date, forecasted finish for in-progress CPM Activities and re-forecasted Early Dates for CPM Activities due to start in the next month, but shall no other adjustments whatsoever in Activities, logic ties or restraint dates.

2. Progress up to the cut-off date shall be limited to changes in logic ties (to reflect out-of-sequence progress) and as-built dates for completed and in-progress CPM Activities using Submittal logs, daily field reports and other pertinent documents. As-built data shall include actual start dates (discounting premature, non-representative starts), remaining duration, Earned Values, actual finish dates (when a CPM Activity was completed and dependent Work could proceed), delays and other significant events experienced since the previous Payment Submittal.

B. For Earned Value for any Activity involving lump sum Work shall equal the product of percent complete, as determined by the **Contracting Officer**, and Activity Value. The Earned Value for any Activity involving Unit Price Work shall equal the product of the actual quantity completed, as determined by the **Contracting Officer**, and the corresponding unit price. Percent complete and Earned Value for each DCB pay item shall be derived from the Earned Values of related CPM Activities and pay Activities.

C. At least one month before a Revision Submittal is due, or more frequently if required, a Payment Submittal shall attach a Proposal Submittal developed using duplicate electronic disk files of the Payment Submittal. A Proposal Schedule shall group affected and added Activities by: (a) each proposal or claim for changes in Contract Time or Contract Price, (b) each schedule recovery plan, and (c) each **Contractor**-initiated revisions. Except as stated by the **Contracting Officer** in writing, the **Contracting Officer's** review of any Proposal Schedules shall not be construed as pre-acceptance of any proposed Activities, logic ties or impacts.

1. For changes in Contract Price or Contract Time, Proposal Schedules shall (a) add all proposed Activities and logic ties required to reflect the changes and delays being negotiated as to responsibility and extent, (b) detail all impacts on pre-existing Activities, logic ties and DCB pay items, and (c) attach separate logic diagrams with the added and pre-existing CPM Activities and logic ties reflecting such changes and delays.

2. Concerning **Contractor**-initiated revisions, Proposal Schedules shall reflect all adjustments made to: (a) CPM Activities and logic ties necessary to recover schedule and reflect the current approach for Work remaining, and (b) DCB pay items and Activity Values required to ensure consistent DCB and SOV cost-loading.

3. Except as otherwise being negotiated, Proposal Schedules shall show how the **Contractor's** approach to prosecution of Work remaining complies with the Contract Times and those sequences of Work contained in the Contract Documents.

D. Each Payment Submittal narrative shall certify that the **Contractor** has not been delayed, as of the cut-off date, by any acts or omissions of the **DWSD** or **Engineer**, except as otherwise specifically stated. Any refusal to so comply shall be resolved as set forth in the General Conditions.

SECTION 01320

MAINTENANCE OF PLANT OPERATIONS

PART I – GENERAL

1.1 SCOPE. This Section describes the requirements for maintenance of plant operations during the construction period.

1.2 GENERAL REQUIREMENTS. The work must be performed in such a manner that continuous, uninterrupted operation of all essential services and facilities are maintained operational throughout the construction period. Work under this Contract shall be so scheduled and conducted by the CONTRACTOR such that work will not impede any treatment process, create potential hazards to operating equipment or personnel, reduce the quality of treatment operations and the plant effluent or cause odor or other nuisance. In performing the work shown or as specified, the CONTRACTOR shall plan and schedule work to meet the plant operating requirements and additional constraints outlined in this Section.

The CONTRACTOR has the option of providing additional temporary facilities that can eliminate a constraint, provided it is done without additional cost to the OWNER, provided that all requirements of these specifications are fulfilled and prior approval from the ENGINEER is obtained. Work not specifically covered in this specification section or not subject to other operating requirements and construction constraints outlined within the applicable specification section(s) shall be performed any time during the contract period. All references to days in this Section are to be construed as consecutive calendar days.

Construction sequences presented in this section outline the intent of the OWNER with respect to the general progress of work. Sequences and construction activities noted are not intended to be comprehensive or all-inclusive. Many other construction activities and work components, although not specifically noted, are integral-parts of the work included in the Contract Documents and must be both scheduled and completed. The ENGINEER will consider sequences other than those specified provided they afford equivalent continuity of wastewater treatment and plant operations. Alternatives to the specified approaches and duration limits are possible; however, deviating from the specified sequences or duration limits will require development of a formal proposal which can be reviewed by the ENGINEER and OWNER. Development and submission of an alternative approach or duration limit does not constitute approval by the ENGINEER and OWNER. The CONTRACTOR must be prepared to execute the Work in concert with the manner and sequences specified herein.

It is the intent of this Section to keep the areas of work in continuous operation by the OWNER to provide pumping and handling of wastewater and its residuals.

The CONTRACTOR shall not shut off or disconnect any operating system of the plant. The OWNER shall execute all plant equipment shutdowns.

For brevity, the CONTRACTOR is advised that this Section of the specifications contains several references to equipment, piping, material, and appurtenances to be removed or reinstalled. The CONTRACTOR shall refer to Specification Section 02050, Demolition and the Contract Drawings for additional details of equipment, piping, material and appurtenances to be demolished and removed from the site by the CONTRACTOR.

1.3 RELATED WORK.

Section 01030, Summary of Work.

Section 01040, Control of Work.

Section 01070, Project Coordination and Meetings.

Section 01310 Progress Schedule.

Section 02050, Demolition.

Section 01180, Equipment, Materials, Parts, and Tools.

Section 01160, Training and O&M Manuals.

1.4 GENERAL CONSTRAINTS. In PART 3: EXECUTION of this Section, the sequence and shutdown of plant systems and process units that are to be taken out of service and demolished or rehabilitated are presented. The CONTRACTOR shall not interrupt the operational status of new or existing units other than the designated units. The ENGINEER may only accept completed work after the specified testing and training has been completed to the satisfaction of the OWNER.

The following constraints shall be applied to all equipment, treatment units and appurtenant utility systems on the plant site.

1.4.01 Access to Plant Site. The CONTRACTOR shall utilize only designated access roads for site access. Any perimeter fence removed, damaged or modified by the CONTRACTOR must be replaced, repaired or returned to permanent status immediately. Temporary security fencing similar to the type and configuration of the permanent fencing may be installed and maintained by the CONTRACTOR with prior authorization from the ENGINEER. All temporary fencing shall be returned to permanent status prior to 95% project completion of the CONTRACTOR'S schedule.

1.4.02 Internal Roads Access. Vehicular access to all treatment units and buildings must be maintained at all times, except when otherwise permitted. All construction traffic on internal roads shall be approved by the ENGINEER and shall not prevent the OWNER'S personnel from gaining access to their work areas.

1.4.03 Access. The OWNER'S and ENGINEER'S personnel must have safe access to all areas that remain in operation throughout the construction period.

The OWNER will remove, as necessary, piping, boxes, pumps, hardware, and other plant property stored in work areas to permit the CONTRACTOR access to the work area. The CONTRACTOR shall make requests for the removal of such material to the ENGINEER and OWNER 30 days in advance of commencing work in that area.

1.4.04 Potable and Secondary Water Systems. The existing potable water (PW) and secondary water (SW) systems shall be kept in operation at all times.

1.4.05 Plumbing Facilities. Except as otherwise permitted, all building plumbing systems such as roof and floor drains, sump pumps, and other systems shall remain in operation at all times.

1.4.06 Building Heating and Ventilating. Operation of building heating and ventilating systems shall be maintained in all structures. Where necessary, the CONTRACTOR shall make provisions to install temporary heating and ventilation systems for structures in which operation of existing or new heating and/or ventilation systems must be interrupted. The ambient temperatures in all interior plant areas shall be maintained at a minimum of 55 degrees F. Minimum ventilation rates shall be equal to the existing rates or, in the case of new structures, the permanent ventilation rate.

1.4.07 Electric Power, Light and Communication Systems. Electric power, lighting service and communication systems shall be maintained in uninterrupted operation in all areas that remain in operation.

Temporary electrical installations for the purpose of maintaining plant operations shall conform to the material and installation requirements of Division 16 of the specifications. Requests for variances from these requirements shall be submitted to the ENGINEER in writing for review and approval.

1.4.08 Sump Pumps and Sumps. All existing sumps and drainage areas where provided for the CONTRACTOR'S use shall be maintained in a satisfactory operating condition with either existing pumps or temporary pumps. If used for the catchment and/or conveyance of drainage, flushing, sludge or other waste liquids during pipe draining, wash down, cleaning, demolition or construction work, sumps will be immediately and thoroughly cleaned by the CONTRACTOR following termination of work in that area. Any failure of a sump pump or plugging of a line during the CONTRACTOR'S use or for a period of five (5) days following its use will be the responsibility of the CONTRACTOR to immediately clean, repair or replace the affected unit to satisfactory condition as determined by the ENGINEER.

1.4.09 Seal and Service Water Piping. Service and seal water and the necessary connections to existing equipment shall be maintained during construction at all times. Work shall not affect existing service and seal water flow, pressure and quantity.

1.4.10 Draining Process Tanks, Pipes and Conduits. The OWNER will drain all Process Tanks, Pipes and Conduits to the extent possible using existing plant drainage facilities. Drainage may be considered successful by the OWNER when 80% or greater of the contents have been removed. Where necessary, due to OWNER'S facilities being unable to drain the contents of pipes, tanks and conduits, the CONTRACTOR shall be responsible for providing temporary drainage equipment.

The CONTRACTOR shall be responsible for dwatering, removal of the contnents , wash down and cleaning as necessary for the performance of his work. A source of secondary water (SW) will be designated when requested by the CONTRACTOR for the purposes of wash down and/or flushing. Uncontrolled or unattended use of SW will not be permitted. During draining, wash down or any cleaning activities by the CONTRACTOR, and if required, the OWNER retains the right to temporarily suspend any water use and draining operations that negatively impact plant operations.

If a drain is not available on the pipe or section of pipe to be drained, then the CONTRACTOR shall install a wet tap using a tapping saddle and valve. No uncontrolled spillage of a pipe's contents shall be allowed and all contents shall be conveyed to an acceptable drainage point by hoses or conduits.

The CONTRACTOR shall immediately wash down any spillage and floor drains. Sumps and sump pump discharge piping shall be flushed clean to prevent clogging and septic odors.

1.4.11 Temporary Partitions and Enclosures. The CONTRACTOR shall furnish and install temporary partitions, and enclosures as required to protect existing equipment and facilities from ongoing construction activities. Temporary partitions shall be installed at all exterior wall penetrations made in existing buildings where equipment or louvers have not yet been installed.

1.4.12 Shutdowns. Any and all shutdowns are to comply with the appropriate "DWSD Standard Equipment Shutdown Request (ESR)" form completed and approved. The CONTRACTOR shall submit the completed forms and any required additional information to the ENGINEER 30 days in advance of the anticipated shutdown.

Following approval of the CONTRACTOR'S shutdown request and at the appointed time, the OWNER shall cause the work to be shutdown, and shall isolate and drain the work to the extent outlined in subsections 1.4.10. The CONTRATOR shall complete the draining, flushing and cleaning as required prior to commencing the work.

a. Shutdown shall be defined to indicate that the normal operation of a plant system or unit process has to be suspended or taken out of service in order to perform the specified work. For each shutdown, the CONTRACTOR shall submit the ESR form, compile an inventory of labor and materials required to perform the tasks, an estimate of the time required and a written description of the steps required to complete the tasks. The ESR form, inventory, time estimate and written procedure shall be submitted to the ENGINEER for review thirty (30) calendar days prior to the start date of the shutdown. The ENGINEER shall submit the request to the OWNER in writing twenty-one (21) days in advance of each planned shutdown. The request shall be reviewed by the OWNER and returned approved or otherwise five (5) calendar days prior to the proposed shutdown date. No shutdown shall be initiated until the ESR form is approved and the ENGINEER has verified that the materials and labor listed are on site at least seven (7) days prior to the proposed start date. The ENGINEER may choose to waive the on-site verification of materials and labor on a case-by-case basis.

b. The work specified herein and any other work required by the OWNER, which may interrupt the normal plant operations, shall be accomplished at such times that will be convenient to the OWNER. Shutdowns may have to be scheduled on off-shifts, weekends and holidays as required.

c. The CONTRACTOR shall also have on hand, located in close proximity to the work area(s), all tools, equipment and materials, both temporary and permanent, necessary to complete each work task, without interruption prior to commencing work. Prefabrication of all piping and other assemblies shall be completed to the greatest degree possible, prior to any shutdowns.

The ENGINEER must be satisfied that the CONTRACTOR has complied with these requirements, to the fullest extent possible, before any shutdowns will be authorized.

1.4.13 Shutdown of Electrical Systems. Shutdown of an electrical system or component requires the CONTRACTOR to submit the appropriate "DWSD Standard Equipment Shutdown Request (ESR)" form. The CONTRACTOR shall submit the completed forms and additional information as required to the ENGINEER 30 days in advance of the anticipated shutdown. The ESR form will delineate the task(s) to be performed, its duration, the areas and service affected, and additional information of relative to alternative power provisions as required. The plan will be submitted to the OWNER for approval 21 days in advance of the anticipated shutdown. Refer to 1.4.12, Shutdowns and the referenced Detroit Wastewater Treatment Plant (DWWTP) procedure. No electrical shutdown activity will be permitted until the ENGINEER and OWNER has provided official authorization to proceed. Following approval and at the CONTRACTOR'S request, the OWNER shall shutdown an existing electric system. The CONTRACTOR shall be responsible for following and implementing the appropriate lock out and tag out procedures for systems de-energized by the OWNER, and shall check cables and wires to be sure that they are de-energized before work begins. Upon completion of the work that necessitated the shutdown, the CONTRACTOR shall remove the locks and advise the ENGINEER that the facilities are available for use.

1.4.14 Overtime. Overtime work by the CONTRACTOR necessary to comply with the requirements of the Contract Documents shall be considered as normal procedure under this Contract, and the CONTRACTOR shall make no claims for extra compensation as a result thereof. The CONTRACTOR shall be prepared to work around-the-clock, weekends and holidays and supply multiple work crews as necessary to complete the work including testing and acceptance as specified, within the specified time frame.

1.4.15 Weather Constrained. Weather conditions as defined below produce increased hydraulic and solids loading to the treatment facility and processes. Initiation of a work item that constrains the process or facility from adequately processing these loadings may cause system imbalance and impact the treated effluent. Weather constrained shall be defined as follows:

a. Weather conditions that produce additional volumes of screenings and grit that must be removed from the treatment system as defined by the OWNER.

When an item is identified as weather constrained, it cannot be initiated if the above conditions apply without prior approval of the ENGINEER.

During times of inclement weather, the CONTRACTOR shall take all necessary steps to ensure an environment acceptable to performing work to include, but not necessarily limited to painting, welding, sandblasting, grouting, finish work, electrical work or other.

1.4.16 Coordination With Utility Companies. The CONTRACTOR shall notify the ENGINEER and request of the appropriate Utility Company to coordinate the relocation, shut off, (re-) energizing of existing or installation of new service as shown on the Drawings, specified herein or as required for the performance of work. The CONTRACTOR submit the appropriate “DWSD Standard Equipment Shutdown Request (ESR)" form. The CONTRACTOR shall submit the completed forms and additional information as required to the ENGINEER 30 days in advance of the anticipated shutdown. The ESR form will delineate the task(s) to be performed, its duration, the areas and service(s) affected, and additional information relative to alternative utility provisions as required. The plan will be submitted to the OWNER for approval 21 days in advance of the anticipated shutdown. Refer to 1.4.12, Shutdowns and the referenced DWWTP procedure. No shutdown activity will be permitted until the ENGINEER and OWNER have provided official authorization to proceed in addition to the proper authorization of the affected Utility.

1.4.17 Illumination.

Construction areas, roadways, offices, shops, corridors, process areas, storage areas, etc. shall be lighted in conformance with OSHA (Electrical, Construction Part 1926) to not less than the minimum illumination intensities (foot candles) listed in Table D.3 of said standard while any work is in progress.

1.5 SEQUENCE OF CONSTRUCTION AND OPERATION. In order to maintain continuous plant operation during construction, a phased removal and construction sequence shall be required as described herein. Specific constraints are outlined for each item. These steps and constraints are intended to provide a required sequence and timing for specific activities related to that particular item. Contract drawings shall take precedence in their interpretation.

1.5.01 Sequence. The work is presented in a logical sequence and does not preclude the CONTRACTOR from advocating changes and/or revisions to the sequence that shall accomplish the work in a similar manner.

The work defined herein shall be incorporated by the CONTRACTOR into the CPM Schedule and updated regularly per the Division 1 Specifications.

While all work within the project scope shall be clearly identified within the schedule, work requiring a system, subsystem, or component shutdown shall be preceded by no less than a 30-day notice to the ENGINEER that the shutdown is planned to occur. The CONTRACTOR is to submit the appropriate "DWSD Standard Equipment Shutdown Request (ESR)" form. Refer to sections 1.4.12 and 1.4.13 for appropriate DWSD shutdown procedure. No shutdown activity will be permitted until the ENGINEER and OWNER have provided official authorization to proceed and the CONTRACTOR is found to be in compliance with the specifications.

The ENGINEER may request additional information relative to the shutdown request, to include a detailed Work Plan for accomplishing the work during the shutdown. The ENGINEER and OWNER as part of the ESR form submittal process shall review this Work Plan. A coordination meeting may be required to ensure that all issues surrounding the accomplishment of the work during the shutdown are addressed and properly accommodated. The meeting will be held no less than seven (7) days prior to the planned work, and shall be attended by the CONTRACTOR, ENGINEER, and OWNER. At this meeting, the CONTRACTOR shall be prepared to review in detail the plan for accomplishing the work and shutdown. The Work Plan shall include, at a minimum:

1. Start time and planned duration of the work.

2. Valves, breakers, circuits and temporary facilities that need to be secured in order to isolate the work to include timing and/or sequencing.

3. Safety Plan.

4. Procedures to drain, flush and clean the work items.

5. CONTRACTOR personnel required to effectively complete the work including supervisory personnel.

6. Tools, equipment and materials to be on hand during the work, including quantities of each.

7. Detailed sequences of work activities to effectively monitor, control, and complete the specific work.

8. Any preparatory work that could / should / must be accomplished prior to initiating the interconnection work.

9. Other work or contracts that are known to be occurring simultaneously and within the vicinity as the proposed work.

10. Or other items pertinent to the shutdown and accomplishment of work that the CONTRACTOR, ENGINEER, or OWNER deem necessary or appropriate to incorporate into the plan.

All materials needed to effectively complete the work shall be procured and on site prior to initiating the shutdown. Where prefabrication and staging of work materials are required by the specifications, the ENGINEER shall review and confirm with the CONTRACTOR that all needed materials are staged at the specific work site no less than 24 hours prior to initiating the shutdown and work. Failure to have all materials properly staged will constitute failure by the CONTRACTOR to be prepared to effectively complete the work, and the work will be canceled and rescheduled via the process described herein.

1.5.02 Tasks. The individual tasks, their steps and constraints are detailed in PART 3, EXECUTION of the section and indexed below:

PART 2 – PRODUCTS

None This Section.

PART 3 – EXECUTION

3.1 SEQUENCING AND OPERATIONS.

3.1.01 General: All equipment shall be tested and shall be in operating condition before the final tie-ins connecting the new equipment to the existing facility are made.

During the course of the work, the shutdown of any services shall be limited to the minimum duration possible and after close coordination with the Owner. However, if requested by the Owner, the Contractor shall ensure the means and methods to provide temporary services in lieu of the services that will be interupted by the construction activities.

3.1.02 Construction Sequence: The construction sequence is intended only to outline critical work items in order to maintain the continuous operation of the wastewater plant. Refer to the plans and specifications for other required work in these areas. Liquidated damages shall be applied if the work is not completed by the specified milestone dates.

INDEX

DIVISION 2 - SITE CONSTRUCTION

SECTION 02012

SOIL BORINGS AND TESTING

PART 1 - GENERAL

1.1 SCOPE. This section outlines the standard for conducting geo-technical soil boring investigations and performing laboratory testing on soil samples collected at various locations as indicated on project contract drawings.

1.2 GENERAL. The purpose of the soil boring investigation is to obtain necessary information to determine basic engineering properties of soils. A series of test borings and laboratory tests are performed on the soil samples obtained through the field investigations.

The results of these investigations are presented for the Contractor's information and may be used at his discretion. The Contractor shall assume all risks and responsibilities pertaining to subsurface conditions and shall complete the work under whatever subsurface conditions at no additional cost to the City.

1.2.01 Coordination. The Contractor may make additional soil investigations if considered necessary through coordination with the Engineer. Costs to be borne by the Contractor.

1.2.02 Governing Standards.

ASTM C117 - Test Method for Materials Finer Than 75-m (No. 200) Sieve in Mineral Aggregates by Washing.

ASTM C136 - Test Method for Sieve Analysis of Fine and Coarse Aggregates.

ASTM C702 - Practice for Reducing Field Samples of Aggregate to Testing Size.

ASTM D420 - Guide to Site Characterization for Engineering, Design and Construction Purposes.

ASTM D421 - Practice for Dry Preparation of Soil Samples for Particle-Size Analysis and Determination of Soil Constants.

ASTM D422 - Test Method for Particle-Size Analysis of Soils.

ASTM D653 - Terminology Relating to Soil, Rock, and Contained Fluids.

ASTM D1140 - Test Method for Amount of Material in Soils Finer than the No. 200 (75-m) Sieve.

ASTM D1452 - Standard Practice for Soil Investigation and Sampling by Auger Borings.

ASTM D1586 - Standard Test Method for Penetration Test and Split-Barrel Sampling of Soils.

ASTM D2216 - Test Method for Laboratory Determination of Water (Moisture) Content of Soil and Rock.

ASTM D2217 - Practice for Wet Preparation of Soil Samples for Particle-Size Analysis and Determination of Soil Constants.

ASTM D2487 – Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System).

ASTM D2488 – Practice for Description and Identification of Soils (Visual-Manual Procedure).

ASTM D4220 – Practices for Preserving and Transporting Soil Samples.

ASTM D4318 - Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.

ASTM D4427 - Classification of Peat Samples by Laboratory Testing.

ASTM D6066 – Practice for Determining the Normalized Penetration Resistance Testing of Sands for Evaluation of Liquefaction Potential.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. A project specific number of test borings are drilled on the site at various locations identified in contract drawings. The boring locations were approved by Engineer. The test borings were drilled with truck mounted equipment or manually obtained from various elevations below grade.

Drilling methods and standard penetration tests are performed in accordance with the current ASTM D-1452 and D-1586 procedures. These procedures specify that a standard 2-inch (50 mm) O.D. split-barrel sampler be driven by a 140-pound (63.5 kg) hammer with free fall of 30 inches (76.2 cm). The number of hammer blows required to drive the split-barrel sampler through three successive 6-inch (15.2 cm) increments is recorded on the test boring logs in contract documents. The first 6-inch (15.2 cm) increment is use for setting the sampler firmly in the soil and the sum of the hammer blows for the second and third increments is referred to as the "Standard Penetration Index" (N). From the standard penetration test a soil sample is recovered and placed in a container which is sealed to prevent moisture losses during transportation to the laboratory. Standard penetration tests are usually made at depths of 2-1/2 (0.8 m), 5 (1.5 m), 7-1/2 (2.3 m) and 10 feet (3.0 m) and at 5-foot (1.5 m) depth intervals thereafter. These parameters may vary per project conditions.

2.2 LIMITING REQUIREMENTS. Soil test boring samples shall be available for examination anytime during duration of existing project.

2.3 SHOP TESTING.

2.3.01 Laboratory Testing. Testing shall consist of determining the unconfined compressive strength, the natural bulk density, the natural moisture content and other characteristics of the soil samples. In unconfined compression tests, the compressive strength of the soil shall be determined by axially loading a soil sample under slow strain rate until failure is obtained.

Testing shall determine the consistency and relative densities of cohesive and granular soils. The Unified Soil Classification System shall be used for classifying material types by particle sizes based on laboratory determination of particle-size characteristics, liquid limit, and plasticity index and shall be used when precise classification is required per ASTM D2487. This standard is limited to naturally occurring soils. The group names and symbols used in this test method may be used as a descriptive system applied to such materials as shale, claystone, shells, crushed rock, or others. This standard is for qualitative application only. When quantitative information is required for detailed designs of important structures, this test method must be supplemented by laboratory tests or other quantitative data to determine performance characteristics under expected field conditions.

PART 3 – EXECUTION

3.2 PREPARATION.

3.2.01 Soil Boring Logs. The soil conditions encountered in the boring shall be recorded on the individual boring logs as defined in the contract documents. Each log shall record the soil types encountered at that location as well as laboratory test data, ground water data, and other pertinent information. Descriptions of the various soil consistencies, relative densities and particle sizes shall be documented as defined in the contract documents. Additional information can be found in ASTM D653.

End of Section

SECTION 02050

DEMOLITION

PART 1 - GENERAL

1.1 SCOPE. Section includes demolition of designated structures, foundations, slabs-on-grade, sidewalks, and roadways; disconnection and demolition or capping of identified utilities; demolition and removal or filling of underground tanks; and cleanup and removal of demolished materials from the site. Section also includes temporary construction to protect adjacent structures and property against damage and soiling, allow building occupancy, and provide safe access around demolition work. Finally, section includes protection of items to remain.

1.2 GENERAL.

1.2.01 Coordination. When unanticipated mechanical, electrical, or structural elements that conflict with the intended function or design are encountered, investigate and measure the nature and extent of the conflict and promptly submit written report to the Engineer.

1.3 QUALITY ASSURANCE. Accomplish demolition without damaging or soiling existing structures, equipment, and appurtenances that are to remain.

1.3.01 Contractors Qualifications. Contractor shall have a minimum of 5 years experience in construction and similar demolition work.

1.3.02 Hazardous Materials. Certain materials, in areas where the work takes place, may be classified as hazardous to health, the environment and safety by agency regulation or code; regulating the handling, removal, storage and disposal of these materials. Asbestos and lead based paint are examples of hazardous materials which may be encountered. When authorized, the contractor shall utilize personnel having the requisite qualifications to identify, handle, remove, store and dispose of the hazardous materials. Use acceptable techniques in the removal, storage and disposal of these materials.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit a demolition plan for review, describing proposed sequence, methods, and equipment for demolition and disposal of each item or structure prior to any demolition work commencing. Include dust, noise, and odor control measures. Provide inventories of items to be removed and salvaged and items to be removed by Owner.

Provide photographs or videotape, sufficiently detailed, of existing conditions of adjoining structures and site improvements that might be misconstrued as damage caused by selective demolition operations.

Provide product data for any repair materials to Engineer prior to use.

The Contractor shall submit a plan to the Engineer that describes the hazardous materials work and costs before performing the work.

Contractor's Demolition Plan shall take into account all geotechnical conditions.

1.4.02 Certifications. The Contractor shall submit certified copies of all permits, applications and other documentation required by the regulating agency for performance, to completion, of the hazardous materials work. Submit landfill records indicating receipt and acceptance of wastes by a landfill facility licensed to accept these wastes.

1.4.03 Record Drawings. Locate, identify and mark each disconnected service and utility termination point on the project Record Drawings and As-Built Drawings.

1.5 WARRANTY.

1.5.01 Existing Special Warranty. Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials so as not to void existing warranties.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Owner assumes no responsibility for actual condition of buildings to be selectively demolished.

The Contractor shall provide 72 hours notice to Engineer of any activities that will affect occupants.

The Contractor shall maintain circulation of traffic within area at all times during demolition operations.

2.2 MATERIALS. Use repair materials identical to existing materials. Where identical materials are unavailable or cannot be used for exposed surfaces, use materials that visually match adjacent surfaces to the fullest extent possible and whose installed performance equals or surpasses that of existing materials.

The Contractor shall identify and report, in writing, all hazardous materials identified or brought into Work affected areas that are subject to regulation by federal, state and local law in their handling, storing, removal and disposal. This shall be done before performing the regulated activities.

PART 3 - EXECUTION

3.1 PREPARATION.

3.1.01 Survey Marker Reference Points. Provide three reference points for each survey marker and monument removed, establish by a registered surveyor and record locations and designations of survey markers and monuments prior to removal.

Store removed markers and monuments during demolition work, and replace upon completion of work. Reestablish survey markers and monuments in conformance with recorded reference points. Provide documentation verifying reestablishment of survey markers and monuments, signed by registered surveyor.

3.1.02 Disconnection of Utility Service. Locate, identify and mark each existing service and utility to be disconnected, at the termination points. Arrange with and perform work required by utility companies and municipal departments for discontinuance or interruption of utility services due to demolition work. Obtain permission before abandoning or removing any existing structures, materials, equipment and appurtenances. Verify that services and utilities are disconnected and capped prior to beginning demolition.

3.1.03 Protection. Prior to beginning work, provide suitable protection such that the Work shall not hinder or interfere with use of adjacent building spaces in any way, for any purpose. Passageways to, from, and between building spaces adjacent to the Work shall be maintained free and clear of obstruction and safe for normal occupancy and intended use at all times. Cap or plug pipes and other conduits abandoned due to demolition as indicated on drawings or as specified.

3.2 PERFORMANCE. Carefully remove materials to be reused and salvaged. Such materials shall be suitably cleaned and dismantled, moved to designated storage areas, protected from weathering, staining, construction damage, theft and vandalism, and arranged to facilitate inspection. Carefully handle, assemble and reinstall materials to be reused, in undamaged and usable condition. Delmer material to be salvaged to the Owner as directed by Engineer.

Repair or remove items that are damaged. Repair and installation of damaged items shall be at no additional compensation and to condition at least equal to that, which existed prior to start of work. Replace materials that are damaged by the Work with suitable equivalent new materials.

3.2.01 Demolition. Execute the Work in a careful, orderly manner. Provide and maintain barriers, dust screens, ventilation, and warning lights as may be necessary to protect persons and property. Perform the Work with care, using tools and methods that will not transfer any heavy shocks to adjacent structures. Prevent conditions, obstructions, contamination, vibrations or disturbances that are hazardous. Conduct the Work in a manner giving prime consideration to, but not necessarily limited by:

Protection of the public, the Owners property, the Work, and of the existing adjacent structures.

Protection from adverse weather.

Control and prevention of unwanted sounds (noise), shocks, and vibration, dirt and dust.

Provision and maintenance of safe and orderly ingress, access and egress to, within and from the Work.

Coordination and cooperation with the Owner through the Engineer.

Remove from the project site and legally dispose of the removed materials not reused and salvaged.

3.2.02 Debris Removal. Remove from the project site and legally dispose of all debris resulting from the Work. Debris shall not be accumulated.

Maintain the work areas free of debris and swept broom clean at all times.

Provide and maintain readily accessible debris containers, appropriate and suitable for the type of refuse and local work conditions, and as designated and approved by the Engineer.

Clean each active work area no less than once each workday. Empty each debris container and remove all debris from each active work area no less than once each workday, and more often as necessary to prevent obvious accumulation and hazardous conditions.

3.2.03 Salvage.

A. Materials, equipment and appurtenances removed, that are not designated for relocation, shall become the property of Contractor and shall be hauled from site and disposed of at no additional cost to the Owner.

B. Material salvaged from this work shall not be reused, except, where reuse is specifically indicated in the Contract Documents, or when the equipment is to be turned over to the Owner for reuse.

C. Store equipment to be salvaged for relocation where directed by Engineer, and protect from the elements and damage during work. Other materials, equipment and appurtenances removed and designated for salvage by the Owner shall also be stored where directed by the Engineer.

3.2.04 Hazardous Materials. The Contractor shall execute the hazardous materials work in compliance with the laws and regulations governing the work. The Contractor shall be fully responsible for this work.

End of Section

SECTION 02080

ASBESTOS REMOVAL

PART 1 - GENERAL

1.1 SCOPE. The work covered by this section includes the handling of primarily nonfriable materials containing asbestos which are encountered during removal and demolition operations and the incidental procedures and equipment required to protect workers and occupants of the building or area, or both, from contact with airborne asbestos fibers. The work also includes the disposal of the removed asbestos containing materials.

1.1.01 Description of Work. The work specified herein shall be the removal of asbestos containing materials by competent persons trained, knowledgeable and qualified in the techniques of abatement, handling and disposal of asbestos-containing and asbestos-contaminated areas, who comply with all applicable Federal, State, and Local regulations and are capable of and willing to perform the work of this Contract.

The Contractor shall supply all labor, materials, services, insurance, permits and equipment necessary to carry out the work in accordance with all applicable Federal, State, and Local regulations and these specifications.

The Contractor is responsible for restoring the work area and auxiliary areas utilized during the abatement to conditions equal to or better than original. Any damage caused during the performance of abatement activities shall be repaired by the Contractor (e.g. paint peeled off by barrier tape, nail holes, water damage, broken glass) at no additional expense to the Owner.

1.2 GENERAL.

1.2.01 Coordination. Prior to commencement of work, the Contractor shall send written notification in accordance with 40 CFR Part 61.146 of Subpart M, to the appropriate State or Federal Air Pollution Control Agency responsible for the enforcement of the National Emission Standard for Asbestos at least 10 days prior to the commencement of any on-site project activity. Provide a copy of the notice to the Engineer.

Submit proof that required permits, site location and arrangements for transport and disposal of asbestos containing waste materials have been made. Obtain and submit a copy of handling procedures and list of protective equipment utilized for asbestos disposal at the Landfill, signed by the Landfill Owner. (Required for all abatement projects.) DWSD will assign an Asbestos Removal Coordinator for the project. Coordinate all abatement work and related activities with the Coordinator.

1.2.02 Governing Standards. All work under this contract shall be done in strict accordance with all applicable Federal, State, and Local regulations, standards and codes governing asbestos abatement and trade work done in conjunction with the abatement.

OSHA (Occupational Safety and Health Administration) - Title 29 Code of Federal Regulations Section 1910.1001 – General Industry Standard for Asbestos.

OSHA – Title 29 Code of Federal Regulations Section 1910.134 – General Industry Standard for Respiratory Protection.

OSHA – Title 29 Code of Federal Regulations Section 1926 Construction Industry.

OSHA – Title 29 Code of Federal Regulations Section 1910.1020 Access to Employees Exposure and Medical Records.

OSHA – Title 29 Code of Federal Regulations Section 1910.1200 Hazard Communication.

EPA – Title 40 Code of Federal Regulations Part 61 Subparts A and M (Revised Subpart B) – National Emission Standard for Asbestos.

EPA 560/S-83-002 – Guidance for Controlling Friable Asbestos – Containing Materials in Buildings.

The most recent edition of any relevant regulation, standard, document or code shall be in effect. Where conflict among the requirements or with these specifications exists, the most stringent requirements shall be utilized.

Copies of all standards, regulations, codes and other applicable documents, including this specification and those listed as specific requirements shall be available at the work site in the clean change area of the worker decontamination system.

1.2.03 Site Security. Work area is to be restricted only to authorized, trained and protected personnel, including the Engineer or designated representative, employees, Contractor's employees, subcontractor employees, Owner employees and representatives, State and Local inspectors and any other designated individuals. A list of authorized personnel shall be established prior to job start and posted in the clean room of the work decontamination.

Entry into the work area by unauthorized individuals shall be reported immediately by the Contractor.

A logbook shall be maintained in the clean room area of the worker decontamination system. Anyone who enters the work area must record name, affiliation, time in, and time out for each entry.

Access to the work area shall be through a single worker decontamination system located at worksite. All other means of access (doors, windows, hallways, etc.) shall be blocked or locked so as to prevent entry to or exit from the work area. The only exceptions for this rule are the waste pass-out airlock, which shall be sealed except during the removal of containerized asbestos.

1.3 QUALITY ASSURANCE.

1.3.01 Contractors Qualifications. The Contractor shall submit a notarized statement, signed by an officer of the company, containing a record of any citations issued by Federal, State, or Local regulatory agencies relating to asbestos abatement activity. Include projects, dates, and resolutions.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings for layouts and construction of decontamination enclosure system and barriers for isolation of the work area as detailed in this specification and required by applicable regulations.

Inspect the premises wherein all abatement and abatement related activities will occur and submit a signed statement, verifying building and fixture condition prior to the commencement of work.

1.4.02 Certifications. Submit manufacturer's certification that high-efficiency particulate air (HEPA) filter vacuum, negative pressure ventilation units and other local exhaust ventilation equipment conform to ANSI Z9.2-79.

When rental equipment is to be used in abatement areas or to transport asbestos contaminated waste, a written notification concerning intended use of the rental equipment must be provided to the rental agency. Submit a copy of this notification.

Document NIOSH approvals for all respiratory protective devices utilized on site. Include manufacturer certification of HEPA filtration capabilities for all cartridges and filters.

Submit documentation that the Contractor's employees, including foremen, supervisors and any other company personnel or agents who may be exposed to airborne asbestos fibers or who may be responsible for any aspects of abatement activities, have received adequate training that includes, at a minimum, training described in paragraph 3.1.08 of this specification.

Submit documentation from a physician that all employees or agents who may be exposed to airborne asbestos in excess of background level have been provided with an opportunity to be medically monitored to determine whether they are physically capable of working while wearing the respirator required without suffering adverse health effects. In addition, document that personnel have received medical monitoring as required in OSHA 29 CFR 1910.1001 (j). The Contractor must be aware of and provide information to the examining physician about unusual conditions in the workplace environment (e.g. high temperatures, humidity, chemical contaminants) that may impact on the employee's ability to perform work activities.

Submit documentation of respirator fit testing for all Contractor employees and agents who must enter the work area. This fit-testing shall be in accordance with qualitative procedures as detailed in OSHA Lead Standard 29 CFR 1910.1025 Appendix D Qualitative Fit Test Protocol or be quantitative in nature.

1.4.03 Test Reports. During abatement activities, the Contractor shall submit weekly job progress reports detailing abatement activities. Include review of progress with respect to previously established milestones and schedules, major problems and action taken, injury reports, equipment breakdown and bulk material and air sampling results conducted by Contractor's Air Sampling Professional.

Submit per-abatement air sampling results. Include location of samples, name of Air Sampling Professional, equipment, and methods utilized for sampling and analysis.

Submit copies of all transport manifests, trip ticket and disposal receipts for all asbestos waste materials removed from the work area during the abatement process.

Provide copies of the weekly reports to the DWSD Asbestos Removal Coordinator and verify with Coordinator areas that require abatement work to be performed.

Submit daily, copies or work site entry logbooks with information on worker and visitor access.

Submit logs documenting filter changes on respirators, HEPA vacuums, negative pressure ventilation units, and other engineering controls.

Submit results of bulk material analysis and air sampling data collected during the course of the abatement including OSHA compliance air monitoring results.

Submit results of materials testing conducted during the abatement for purposes of utilization during abatement activities (e.g. testing of encapsulates for depth of penetration, testing of substitute materials for adherence to encapsulated surfaces). Post in the clean room area of the worker decontamination enclosure a list containing the names, addresses, and telephone numbers of the Contractor, the Engineer, the Asbestos Project Officer, the General Superintendent, the Air Sampling Professionals, the testing laboratory and any other personnel who may be required to assist during abatement activities (e.g. Safety Officer, Building Maintenance Supervisor, Energy Conservation Officer).

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver all materials in the original packages, containers or bundles bearing the name of the manufacturer and the brand name (where applicable).

Store all materials subject to damage off the ground, away from wet or damp surfaces and under cover sufficient enough to prevent damage or contamination. Replacement materials shall be stored outside of the work area until abatement is completed.

Damaged, deteriorating or previously used materials shall not be used and shall be removed from the work site and disposed of properly.

PART 2 - PRODUCTS

2.1 MATERIALS. Polyethylene sheeting for walls and stationary objects shall be a minimum of 4-mil (0.1 mm) thick. For floors and all other uses, sheeting of at least 6-mil (0.2 mm) thickness shall be used in widths selected to minimize the frequency of joints.

Method of attachment may include any combination of duct tape or other waterproof tape, furring strips, spray glue, staples, nails, screws or other effective procedures capable of sealing adjacent sheets of polyethylene and capable of sealing polyethylene to dissimilar finished or unfinished surfaces under both wet and dry conditions (including the use of amended water).

Polyethylene sheeting utilized for worker decontamination enclosure shall be opaque white or black in color.

Disposal bags shall be of 6-mil (0.2 mm) polyethylene, per-printed with labels as required by EPA regulation 40 CFR 61.152 (b) (i) (iv) or OSHA requirement 29 CFR 19100.1001 (g) (2) (ii).

Disposal drums shall be metal or fiberboard with locking ring tops.

2.1.01 Removal. Surfactant (wetting agent) shall be a 50/50 mixture of polyoxyethylene ether and polyoxyethylene ester, or equivalent, mixed in a proportion of 1 fluid ounce to 5 gallons (1.56 ml to 1 liter) of water or as specified by manufacturer. (An equivalent Surfactant shall be understood to mean a material with a surface tension of 29 dynes/cm as tested in its properly mixed concentration, using ASTM method D1331-56-"Surface and Interfacial Tension of Solutions of Surface Active Agents.") Where work area temperature may cause freezing of the amended water solution, the addition of ethylene glycol in amounts sufficient to prevent freezing is permitted.

2.1.02 Enclosure. The enclosures shall be constructed of materials such that when the enclosure is completed there is limited potential for impact damage to the enclosure and no potential for fiber release.

2.2 EQUIPMENT.

2.2.01 General. A sufficient quantity of negative pressure ventilation units equipped with HEPA filtration and operated in accordance with ANSI 29.2-79 (local exhaust ventilation requirements) and EPA 560/5-83-002 Guidance for Controlling Friable Asbestos-Containing Materials in Buildings, Appendix F: Recommended Specifications and Operating Procedures for the Use of Negative Pressure Systems for Asbestos Abatement shall be utilized so as to provide one workplace air change every 15 minutes.

To calculate total air flow requirement:

Total ft^3/min (m^3/min) = Vol. of work area (in ft^3/m^3)/ 15 min

To calculate the number of units needed for the abatement:

Number of units needed = [Total ft^3 (m^3)/min]/[Capacity of unit in ft^3 (m^3)/min]

If air supplied respirators are utilized, estimate the volume of supplied air and add to workplace air volume when calculating ventilation requirements. For small enclosures and glove bags, a HEPA filtered vacuum system may be utilized to provide negative air pressure.

Type "C" air supplied respirators in positive pressure or pressure demand mode with full facepieces and HEPA filtered disconnect protection are recommended by the U.S. EPA for all full shift abatement work until the successful completion of final clearance of air monitoring. Powered air purifying respirators equipped with HEPA filters and full facepieces or respirators with a higher National Institute of Occupational Safety and Health (NIOSH) assigned protection factor may be used for inspection or repair work of less than 1 hour duration per day. A sufficient supply of charged replacement batteries and filters and a flow test meter shall be available in the clean change area for use with powered air purifying respirators. Air purifying respirators with dual high-efficiency (HEPA) filters may be utilized during work area preparation activities. Spectacle kits and eyeglasses must be provided for employees who wear glasses and who must wear full facepiece respirators. Respirators shall be provided that have been tested and approved by the NIOSH for use in asbestos.

Compressed air systems shall be designed to provide air volumes and pressures to accommodate respirator manufacturer's specifications. The compressed air systems shall have adequate capacity to allow escape of all respirator wearers from contaminated areas in the event of compressor failure. Compressors must meet the requirements of 29 CFR 1910.134 (d). Compressors must have an in-line carbon monoxide monitor and period, inspection of the carbon monitor must be evidenced. Documentation of adequacy of compressed air systems/respiratory protection system must be retained on site. This documentation will include a list of compatible components with the maximum number and type of respirators that may be used with the system. Periodic testing of compressed air shall insure that systems provide air of sufficient quality (Grade D breathing air as described in Compressed Gas Association Commodity Specifications G-7.1).

Full body disposable protective clothing, including head, body and foot coverings consisting of material not penetrable by asbestos fibers (Tyvek R or equivalent) shall be provided to all workers and authorized visitors in sizes adequate to accommodate movement with out tearing.

Additional safety equipment (e.g. hard hats) meeting the requirements of ANSI standard Z89.1-1981, eye protection meeting the requirements of ANSI Standard Z87.1-1979, safety shoes meeting the requirements of ANSI Standard Z41.1-1967, disposable PVC gloves), as necessary, shall be provided to workers and authorized visitors.

Non-skid footwear shall be provided to all abatement workers. Disposable clothing shall be adequately sealed to the footwear to prevent contamination.

If launderable clothing is to be worn underneath disposable protective clothing, it shall be provided by the Contractor to all abatement workers. (It is recommended that launderable clothing be a unique, specific color to enable it to be distinguished from general purpose blue, gray or black coveralls that are commonly worn.) Laundering must occur in accordance with 29 CFR 1910.1001 (d) (4) (iii) however, a sufficient supply of disposable mops, rags and sponges for work area decontamination shall be available.

2.2.02 Removal. A sufficient supply of scaffolds, ladders, lifts and hand tools (e.g. scrapers, wired cutters, brushes, utility knives, wire saws, etc.) shall be provided as needed.

Sprayers with pumps capable of providing 500 psi (3447.4 kPa) at the nozzle for spraying amended water.

Rubber dust pans and rubber squeegees shall be provided for cleanup.

Brushes utilized for removing loose asbestos containing material shall have nylon or fiber bristles, not metal.

A sufficient supply of HEPA filtered vacuum systems shall be available during cleanup.

2.2.03 Enclosure. Hand tools equipped with HEPA filtered local exhaust ventilation shall be utilized during the installation of enclosures and supports if there is any need to disturb asbestos containing materials during this process. (As an alternative, asbestos material may be partially removed following proper removal procedures prior to the installation of supports and enclosures.

2.3 SUBSTITUTIONS.

2.3.01 Approval Required. The Contract is based on the materials, equipment and method described in the Contract Documents.

The Contractor will consider proposals for substitutions of materials, equipment and methods only when such proposals are accompanied by full and complete technical data and all other information required by the Contractor to evaluate the proposed substitution.

Do not substitute materials, equipment or methods unless such substitution has been specifically approved for this work by the Engineer.

PART 3 - EXECUTION

3.1 PREPARATION.

3.1.01 Abatement Notification. Prior to commencement of work, the Engineer shall notify occupants of work areas that may be disrupted by the abatement of project dates and requirements for relocation. Arrangements must be made prior to start, for relocation of desks, files, equipment and personal possessions to avoid unauthorized access into the work area.

Notification of all building occupants and users is recommended in order to prevent unnecessary or unauthorized access to the contaminated work area.

Refer to Paragraph 1.2.01 of this section for government agency requirements.

Document that Owner's employees or designated representatives who will be required to enter work area during abatement have received training equal to that detailed in paragraph on training. (This training may be provided by the Contractor.)

Provide to the Contractor information concerning access, shutdown and protection requirements of certain equipment and systems in the work area.

3.1.02 Work Areas. Post caution signs meeting the specifications of OSHA 29 CFR 1910.1001 (g) (1) (ii) at any location and approaches to a location where airborne concentrations of asbestos may exceed ambient background levels. Signs shall be posted at a distance sufficiently far enough away from the work area to permit an employee to read the sign and take the necessary protective measures to avoid exposure. Additional signs may need to be posted following construction of workplace enclosure barriers.

Shut down and lock out electric power to all work areas. Provide temporary power and lighting. Insure safe installation (including ground faulting) of temporary power sources and equipment by compliance with all applicable electrical code requirements and OSHA requirements for temporary electrical systems. All costs for electrical systems shall be paid for by the Contractor.

Shut down and lock out all heating, cooling and air conditioning system (HVAC) components that are in, supply or pass through the work area.

Interiors of existing duct work may require decontamination. This may be done during the pre-cleaning phase of operations before the duct work is sealed off or during the final cleaning phase prior to reengagement of the system. Appropriate equipment and control measures shall be utilized to prevent contamination of building spaces during this operation. Adequate cleaning of duct work may sometimes be accomplished by drawing high volumes of air through the system using the HEPA filtered negative pressure ventilation units.

Investigate the work area and agree on preabatement condition with Engineer. Seal all intake and exhaust vents in the work area with tape and 6-mil (0.2 mm) polyethylene. Also seal any seams in system components that pass through the work area. Remove all HVAC system filters and place in label 6-mil polyethylene bags for staging and eventual disposal as asbestos contaminated waste.

The Contractor shall provide sanitary facilities for abatement personnel outside of the enclosed work area and maintain them in a clean and sanitary condition throughout the project.

The Owner will provide water for construction purposes. Contractor shall connect to existing plumbing system.

Preclean all movable objects within the work area using a HEPA filtered vacuum and/or wet cleaning methods as appropriate. After cleaning, these objects shall be removed from the work area and carefully stored in an uncontaminated location.

Preclean all fixed objects in the work area using HEPA filtered vacuums and/or wet cleaning techniques as appropriate. Careful attention must be paid to machinery behind grills or gratings where access may be difficult but contamination may be significant. Also pay particular attention to wall, floor and ceiling penetrations behind fixed items. After precleaning, enclose fixed objects in 4-mil (0.1 mm) polyethylene sheeting and seal securely in place with tape. These shall be designated and enclosures constructed with access flaps sealed with waterproof tape.

Preclean all surfaces in the work area using HEPA filtered vacuums and/or wet cleaning methods as appropriate. Do not use any methods that would raise dust such as dry sweeping or vacuuming with equipment not equipped with HEPA filters. Do not disturb asbestos containing materials during the precleaning phase.

Seal off all windows, doorways, elevator openings, corridor entrances, drains, ducts, grills, grates, diffuses, skylights and any other openings between the work area and uncontaminated areas outside of the work area (including the outside of the building, tunnels and crawl spaces) with 4-mil (0.1 mm) polyethylene sheeting and tape (isolating work area from occupied areas).

Cover floors in the work area with polyethylene sheeting.

Floor shall be covered with 2 layers of 6-mil (0.2 mm) minimum sheeting. Additional layers of sheeting may be utilized as drop cloths to aid in cleanup of bulk materials.

Plastic shall be sized to minimize seams. If the floor area necessitates seams, those on successive layers of sheeting shall be staggered to reduce the potential for water to penetrate to the flooring material. A distance of at least 6 feet (1.83 m) between seams is sufficient. Do not locate any seams at wall/floor joints.

Floor sheeting shall extend at least 12 inches (30.48 cm) up the sidewalls of the work area.

Sheeting shall be installed in a fashion so as to prevent slippage between successive layers of material. (Vinyl sheeting may be used for improved traction on floors.)

Cover walls in the work area with polyethylene sheeting. Walls that are non-porous and will not be damaged by water, surfactant, encapsulation do not necessarily need protection. They can be decontaminated using HEPA vacuums and wet cleaning techniques. Walls with mortar joints (e.g. tile) are considered porous. In addition, opening through these walls to uncontaminated areas of the building must be sealed.

Walls shall be covered with 2 layers of 4-mil (0.1 mm) polyethylene sheeting. Plastic shall be sized to minimize seams. Seams shall be staggered and separated by a distance of a least 6 feet (1.83 m).

Wall sheeting shall overlap floor sheeting by at least 12 inches (30.48 cm) beyond the wall/floor joint to provide a better seal against water damage and for negative pressure.

Wall sheeting shall be secured adequately to prevent it from falling away from the walls. This will require additional support/attachment when negative pressure ventilation systems are utilized.

3.1.03 Worker Decontamination Enclosure Systems. Worker decontamination enclosure systems shall be provided at all locations where workers will enter or exit the work area. One system at a single location for each contained work area is preferred. These systems may consist of existing rooms outside of the work area, if the layout is appropriate, that can be enclosed in plastic sheeting and are accessible from the work area. When this situation does not exist, enclosure systems may be constructed out of metal, wood or plastic support as appropriate.

Plans for construction, including materials layout, shall be submitted as shop drawings prior to work initiation. Worker decontamination enclosure systems constructed at the work site shall utilize 6-mil (0.2 mm) opaque black or white polyethylene sheeting or other acceptable materials for privacy. Detailed descriptions of portable, pre-fabricated units, if used, must be submitted. Plans must include floor plan with dimensions, material, size, thickness, plumbing and electrical utilities.

The worker decontamination enclosure system shall consist of at least a clean room, a shower room, and an equipment room, each separated from each other and from the work area by airlocks.

Entry to and exit from all airlocks and decontamination enclosure system chambers shall be through curtained doorways consisting of 2 sheets of overlapping polyethylene sheeting. One sheet shall be secured at the top and left side, the other sheet at the top and right side. Both sheets shall have weights attached to the bottom to insure that they hang straight and maintain a seal over the doorway when not in use. Doorway designs, providing equivalent protection may be utilized.

Access between any 2 rooms in the decontamination enclosure system shall be through an airlock with at least 3 feet (91.44 cm) separating each curtained doorway.

Pathways into (from clean to contaminated) and out from (contaminated to clean) the work area shall be clearly designated.

Clean room shall be sized to adequately accommodate the work crew. Benches shall be provided as well as hooks for hanging up street clothes. (Lockers may be provided for valuables, however, workers may be requested to secure valuables in their cars.) Shelves for storing respirators shall also be provided in this area. Clean work clothes, clean disposable clothing, replacement filters for respirators, towels and other necessary items shall be provided in adequate supply at the clean room. A location for posting shall also be provided in this area. Whenever possible, a lockable door shall be used to permit access into the clean room from outside the work area. Lighting, heat and electricity shall be provided as necessary for comfort. This space shall not be used for storage of tools, equipment or materials (except as specifically designated) or as office space.

Shower room shall contain 1 or more showers as necessary to adequately accommodate workers. Each shower head shall be supplied with hot and cold water adjustable at the tap. The shower enclosure shall be constructed to ensure against leakage of any kind. An adequate supply of soap, shampoo and towels shall be supplied by the Contractor and available at all times. Shower water shall be drained, collected, and filtered through a system with at least 0.5-1.0 micron particle size collection capability. A system containing a series of several filters with progressively smaller pore sizes is recommended to avoid rapid clogging of filtration by particles.

The equipment room shall be used for storage of decontaminated equipment and tools. At the end of a shift, all equipment and tools shall be decontaminated using a HEPA filtered vacuum and/or wet cleaning techniques as appropriate. Other equipment, tools and materials, which may be required during the abatement, may also be stored in the equipment room. These items include replacement filters for HEPA vacuums and negative pressure ventilation equipment, spare tools, and containers of surfactant. Replacement filters are to be kept in sealed containers until they are required for use. A walk-off pan (a small children's swimming pool or equivalent filled with water) shall be located in the work area just outside the equipment room. Workers shall use the walk-off pan to clean off foot coverings after leaving the work area and to prevent excessive contamination of the worker decontamination enclosure system. A drum shall be located in the equipment room for collection of disposable clothing. Drums shall be lined with a label 6-mil (0.2 mm) polyethylene bags. Contaminated footwear (e.g. rubber boots or other reusable footwear) shall be stored in this area for reuse the following work day.

The waste container pass-out airlock shall be constructed at some location away from the worker decontamination enclosure system. Wherever possible, this shall be located where there is direct access from the work area to the outside of the building.

This airlock system shall consist of an airlock, a container staging area, and another airlock with access to outside the work area.

The waste container pass-out airlock shall be constructed in similar fashion as the worker decontamination enclosure system using similar materials and airlock and curtain doorway designs.

This airlock system shall not be used to enter or exit the worksite.

Emergency exits shall be established and clearly marked with duct tape arrows or other effective designations to permit easy location from anywhere within the work area. They shall be secured to prevent access from uncontaminated areas and still permit emergency exiting. These exits shall be properly sealed with polyethylene sheeting, which can be cut to permit egress if needed. These exits may be the worker decontamination enclosure, the waste pass-out airlock and/or other alternative exits satisfactory to fire officials.

3.1.04 Isolation of the Work Area from Occupied Areas of the Building. The contaminated work area shall be separated from uncontaminated, occupied areas of the building by the construction of airtight barriers.

Walls shall be constructed of wood or metal framing to support barriers in all openings larger than 4' X 8' (1.22 m x 2.44 m). A sheathing material (plywood, drywall) of at least 3/8" (9.5 mm) thickness shall be applied to work side of barrier. Cover both sides of partition with double layer of 6-mil (0.2 mm) polyethylene sheeting with staggered joints and seal in place. Caulk edges of partition at floor, ceiling, walls and fixtures to form an airtight seal.

3.1.05 Maintenance of Workplace Barriers and Worker Decontamination Enclosure Systems. Following completion of the construction of all polyethylene barriers and decontamination system enclosures, allow over night settling to insure that barriers will remain intact and secured to walls and fixtures before beginning actual abatement activities.

All polyethylene barriers inside the workplace, in the worker decontamination enclosure system, in the waste container pass-out airlock and at partitions constructed to isolate the work area from occupied areas shall be inspected at least twice daily, prior to the start of each day's abatement activities and following the completion of the day's abatement activities. Document inspections and observations in the daily project log. Damage and defects in the enclosure system are to be repaired immediately upon discovery. Use smoke tubes to test the effectiveness of the barrier system when directed.

At any time during the abatement activities after barriers have been erected, if visible material is observed outside of the work area or if damage occurs to barriers, work shall immediately stop, repairs be made to barriers, and debris/residue cleaned up using appropriate HEPA vacuuming and wet mopping procedures.

If air samples collected outside of the work area during abatement activities indicate airborne fiber concentrations greater than 0.16 f/in^3 (0.01 f/cm^3) or pre-measured background levels (whichever is lower), work shall immediately stop for inspection and repair of barriers. Cleanup of surfaces outside of the work area using HEPA vacuums or wet cleaning techniques may be necessary.

Install and initiate operation of negative pressure ventilation equipment as needed to provide one air change in the work area every 15 minutes. Openings made in the enclosure system to accommodate these units shall be made air tight with tape and/or caulking as needed. If more than one unit is installed, they should be turned on one at a time, checking the integrity of wall barriers for secure attachment and need for additional reinforcement. Insure that adequate power supply is available to satisfy the requirements of the ventilating units. Negative pressure ventilation units shall be exhausted to the outside of the building whenever feasible. They shall not be exhausted into occupied areas of the building. Twelve inch (30.48 cm) extension ducting shall be used to reach from work area to the outside when required. Careful installation, air monitoring and daily inspections shall be done to insure that the ducting does not release fibers into uncontaminated building areas.

Once constructed and reinforced as necessary, with negative pressure ventilation units in operation as required, test enclosure for leakage utilizing smoke tubes, repair or reconstruct as needed.

Clearly identify and maintain emergency and fire exits from the work area.

Remove, clean and enclose in polyethylene the ceiling mounted objects such as lights and others items that may interfere with the abatement process and were not previously cleaned and sealed off. Utilize localized spraying of amended water and/or HEPA vacuums to reduce fiber dispersal during the removal of these fixtures.

3.1.06 <u>Commencement of Work</u>. Work shall not begin until the following actions occur:

Enclosure systems have been constructed and tested.

Negative pressure ventilation systems are functioning adequately.

All pre-abatement submissions, notifications, posting and permits have been provided to the Engineer.

All equipment for abatement, clean-up and disposal are on hand.

All worker training (and certification) is completed.

3.1.07 Personnel Entry/Exit/Procedure. All workers and authorized personnel shall enter the work area through the worker decontamination enclosure system. All personnel who enter the work area must sign the entry log located in the clean room, upon entry and exit.

All personnel, before entering the work area, shall read and be familiar with all posted regulations, personal protection requirements (including workplace entry and exit procedures) and emergency procedures. A sign-off sheet shall be used to acknowledge that these have been reviewed and understood by all personnel prior to entry.

All personnel shall proceed first to the clean room, remove all street clothes and put on appropriate respiratory protection (as deemed adequate for the job conditions) and launderable and/or disposal coverall, head covering and foot covering. Hard hats, eye protection and gloves shall also be utilized if required. Clean respirators and protective clothing shall be provided and utilized by each person for each separate entry into the work area.

Personnel wearing designated personal protective equipment shall proceed from the clean room through the shower room and equipment room to the main work area.

Before leaving the work area, all personnel shall remove gross contamination from the outside of respirators and protective clothing by brushing or/wet wiping procedures. (Small HEPA vacuums with brush attachments may be utilized for this purpose, however, larger machines may tear the suits.) Each person shall clean bottoms of protective footwear in the walk-off pan just prior to entering the equipment room.

Personnel shall proceed to equipment room where they remove all protective equipment except respirators. Deposit disposable (and launderable) clothing into appropriately labeled containers for disposal (and laundering).

Reusable, contaminated footwear shall be stored in the equipment room when not in use in the work area. Upon completion of abatement it shall be disposed of as asbestos contaminated waste. (Rubber boots may be decontaminated at the completion of the abatement for reuse.)

Still wearing respirators, personnel shall proceed to the shower area, clean the outside of the respirators and the exposed face area under running water prior to removal of respirator and shower and shampoo to remove residual asbestos contamination. Various types of respirators will require slight modification of these procedures. An airline respirator with HEPA filtered disconnect protection may be disconnected in the equipment room and placed into the shower. A powered air-purifying respirator facepiece will have to be disconnected from the filter/power pack assembly, which is not waterproof, upon entering the shower. Cartridges must be replaced for each new entry into the work area.

After showering and drying off, proceed to the clean room and don clean disposable (and/or launderable) clothing if there will be later re-entry into the work area or street clothes if it is the end of the work shift.

These procedures shall be posted in the clean room and equipment room.

3.1.08 Waste Container Pass-Out Procedures. Asbestos contaminated waste that has been containerized shall be transported out of the work area through the waste container passout airlock (or through the worker decontamination enclosure if a separate airlock has not be constructed).

Waste pass-out procedures shall utilize 2 teams of workers, an "inside" team and an "outside" team.

The inside team wearing appropriate protective clothing and respirators for inside the work area shall clean the outside, including bottoms, of properly labeled containers (bags, drums, or wrapped components) using HEPA vacuums and wet wiping techniques and transport them into the waste container pass-out airlock. No worker from the inside team shall further exit the work area through this airlock.

The outside team, wearing a different color protective clothing and appropriately assigned respirators, shall enter the airlock from outside the work area, enclose the drums in clean, labeled, 6-mil (0.2 mm) polyethylene bags and remove them from the airlock to the outside. No worker from the outside team shall further enter the work area through this airlock.

The exit from this airlock shall be secured to prevent unauthorized entry.

3.1.09 Training. Prior to commencement of abatement activities, all personnel who will be required to enter the work area or handle containerized asbestos containing materials must have received adequate training in accordance with this section. Special on-site training on equipment and procedures unique to this job site shall be performed as required. Training in emergency response and evacuation procedures shall be provided.

Training shall be provided by the Contractor to all employees or agents who may be required to disturb asbestos contaminated materials for abatement and auxiliary purposes and to all supervisory personnel who may be involved in planning, execution or inspection of abatement projects.

Training shall provide, at a minimum, information on the following topics:

The health hazards of asbestos including the nature of various asbestos related diseases, routes of exposure, known dose-response relationships, the synergistic relationship between asbestos exposure and cigarette smoking, latency periods for disease and health basis for standards.

The physical characteristics of asbestos including fiber size, aerodynamic properties, physical appearance and uses.

Employee personal protective equipment including the types and characteristics of respirator classes, limitations of respirator classes, limitations of respirators, proper selection, inspection, donning, use, maintenance and storage of respirators, field testing and face-piece-to face seal (positive and negative pressure fitting tests), qualitative and quantitative fit testing procedures, variations between laboratory and field fit factors, factors that affect respirator fit (e.g. facial hair), selection and use of disposable clothing, use and handling of launderable clothing, non-skid shoes, gloves, eye protection and hard hats.

Medical monitoring requirements for workers including required and recommended tests, reasons for medical monitoring and employee access to records.

Air monitoring procedures and requirements for workers including description of equipment and procedures, reasons for monitoring, types of samples and current standards with recommended changes.

Work practices for asbestos abatement including purpose, proper construction and maintenance of air-tight plastic barriers, job set-up of airlocks, worker decontamination systems and waste transfer airlocks, posting of warning signs, engineering controls electrical and ventilation system lockout, proper working techniques, waste clean-up, storage and disposal procedures.

Personal hygiene including entry and exit procedures for the work area, use of showers and prohibition of eating, drinking, smoking and chewing in the work area.

Special safety hazards that may be encountered including electrical hazards, air contaminants (CO, wetting agents, encapsulant, materials from Owner's operation), fire and explosion hazards, scaffold and ladder hazard, slippery surfaces, confined spaces, heat stress and noise.

Workshops affording both supervisory personnel and abatement workers the opportunity to see (and experience) the construction of containment barriers and decontamination facilities.

Supervisory personnel shall, in addition, receive training or contract specifications, liability insurance and bonding, legal considerations related to abatement, establishing respiratory protection medical surveillance programs, EPA, OSHA (and State) record keeping requirements, and other topics as requested by the Engineer.

Training shall be provided by individuals qualified by virtue of experience and education to discuss the topic within 12 months prior to the initiation of abatement activities. Contractor must document training by providing date of training, training entity, course outline, names, and qualifications of trainers.

3.1.10 Respiratory Protection. Respiratory protection shall be provided to workers in accordance with the submitted written respiratory protection program, which includes all items in OSHA 29 ACFR 1910.134 (b) (1-11). This program shall be posted in the clean room of the worker decontamination enclosure system.

Workers shall be provided with personally issued, individually identified (marked with waterproof designations), respirators.

The Contractor (in conjunction with an industrial hygienist) shall determine the level of respiratory protection required for asbestos activities, select an appropriate respirator type, and shall notify the Engineer of their selection. The U.S. EPA recommends that Type "C" air-supplied respirators in positive pressure or pressure demand mode with full facepieces and HEPA filtered disconnect protection be provided to all full shift asbestos abatement workers. Powered air purifying respirators equipped with HEPA filtration and full facepieces may be utilized for inspection or repair work of less than 1 hour duration.

3.1.11 Implementation Suggestions. The use of engineering controls such as negative pressure ventilation units and HEPA vacuums and good work practices such as the wetting of asbestos containing material prior to abatement (when applicable), misting the work area to help fibers settle out, removal in small sections, use of glove bags and proper clean-up and containerization all help to reduce airborne fiber levels in the work area. A properly designed air monitoring program, implemented by a qualified air sampling professional and analytical laboratory, may support the use of respiratory protective devices that provide a lower factor of protection to the workers than air supplied respirators, for some abatement activities. Safety problems associated with the use of airline systems and time and financial constraints may be reduced through the use of alternative types of respiratory protection. It is imperative, however, that adequate air monitoring of fiber levels and a well designed respiratory protection program (in accordance with 29 CFR

1910.134) be implemented. Key points of the respirator program include proper selection of respirator type and size, training of personnel in the proper inspection, donning, use, cleaning and maintenance procedures for the respirator selected including their use limitations and a good fitting and fit testing program to provide proper protection. Single use disposable respirators are not to be used during any asbestos abatement activities. Negative-pressure dual cartridge respirators shall be equipped with high efficiency filters and exhalation and inhalation valves to permit the performance of positive and negative pressure fit checks.

3.1.12 Fit Testing. Workers must perform positive and negative air pressure fit tests each time a respirator is put on, whenever the respirator design so permits. Powered air-purifying respirators shall be tested for adequate flow as specified by the manufacturer.

Workers shall be given a qualitative fit test in accordance with procedures detailed in the OSHA Lead Standard (29 CFR 1910.1025, Appendix D, Qualitative Fit Test Protocols) for all respirators to be used on this abatement project. An appropriately administered quantitative fit test may be submitted for the qualitative fit test.

Documentation of adequate respirator fit must be provided to the Contractor.

No one wearing a beard shall be permitted to don a respirator and enter the work area.

Additional respirators (minimum of 2 of each type) and training on their donning and use must be available at the work site for authorized visitors who may be required to enter the work area.

3.1.13 Protective Clothing. Disposable clothing including head, foot and full body protection shall be provided in sufficient quantities and adequate sizes for all workers and authorized visitors. Hard hats, protective eye wear, gloves, rubber boots and/or other footwear shall be provided as required for workers and authorized visitors. Safety shoes may be required for some activities.

3.2 PERFORMANCE.

3.2.01 Removal Procedures. Clean and isolate the work area in accordance with work area preparation section.

Wet all asbestos containing material with an amended water solution using equipment capable of providing a fine spray mist, in order to reduce airborne fiber concentrations when the material is disturbed. Saturate the material to the substrate, however, do not allow excessive water to accumulate in the work area. Keep all removed material wet enough to prevent fiber release until it can be containerized for disposal. If work area temperatures are below 32 degrees "F" (0 degrees C) and amended water is subject to freezing, dry removal permits and procedures must be utilized. Maintain a high humidity in the work area by misting or spraying to assist in fiber settling and reduce airborne concentrations. Wetting procedures are not equally effective on all types of asbestos containing materials, but shall none-the-less be used in all cases.

Saturated asbestos containing material shall be removed in manageable sections. Removed material should be containerized before moving to a new location for continuance of work. Surrounding areas shall be periodically sprayed and maintained in a wet condition until visible material is cleaned up.

Material removed from building structures or components shall not be dropped or thrown to the floor. Material should be removed as intact sections or components whenever possible and carefully lowered to the floor.

Containers (6-mil (0.2 mm) polyethylene bags or drums) shall be sealed when full. (Wet material can be exceedingly heavy. Double bagging of waste material usually is necessary. A determination of need for single or double bags must be made early in the abatement process and the Contractor notified.) Bags shall not be over filled. They should be securely sealed to prevent accidental opening and leakage by typing tops of bags in an overhand knot or by taping in gooseneck fashion. Do not seal bags with wire or cord. (Bags may be placed in drums for staging and transportation to landfill. Bags shall be decontaminated on exterior surfaces by wet cleaning and HEPA vacuuming before being placed in clean drums and sealed with locking ring tops.)

Large components removed intact may be wrapped in 2 layers of 6-mil (0.2 mm) polyethylene sheeting secured with tape for transport to the landfill.

Asbestos containing waste with sharp edged components (e.g. nails, screws, metal latch, tin sheeting) will tear the polyethylene bags and sheeting and shall be placed into drums for disposal.

After completion of all stripping work, surfaces from which asbestos containing materials have been removed shall be wet brushed and sponged or cleaned by some equivalent method to remove all visible residue.

Clean up shall proceed in accordance with clean up section.

After the work area has been rendered free of visible residues, a thin coat of a satisfactory encapsulating agent shall be applied to all surfaces in the work area including structural members, building components and plastic sheeting on walls, floors and covering non-removable items, to seal in non-visible residue. (Note: [1] High temperature components such as boilers and pipes may not permit the application of some encapsulant. [2] If insulation or acoustical materials are to be reapplied to the abated area, be certain that the encapsulant selected will permit good adhesion to the substrate. A small area should be tested before application.)

Special circumstances (e.g. live electrical equipment, high amosite content of material, materials previously coated with an encapsulant or paint) may prohibit the adequate use of wet methods to reduce fiber concentrations. For these situations, a dry removal may be required. Obtain special permits, different from those mentioned herein from the NESHAP enforcement agency.

3.2.02 Enclosure Procedures. Clean and isolate the work area.

Spray areas that will be disturbed during the installation of hangers or other support/framing materials for the enclosure with water containing the specified surfactant. Keep these areas damp to reduce airborne fiber concentrations.

Remove loose or hanging asbestos containing materials in accordance with the requirements.

After installation of hangers and other fixing devices and before installation of enclosure, repair damaged areas of fireproofing/thermal insulation materials as required using a non-asbestos containing replacement material in accordance with manufacturer's recommendations.

Specify enclosure procedures and include the following requirements:

> Use hand tools equipped with HEPA filtered local exhaust ventilation to drill, cut into or otherwise disturb asbestos containing materials during the installation of support systems for the enclosures. (Alternatively, these areas of material could be removed prior to installation of supports.)
>
> Use materials that are impact resistant and that will provide an air tight barrier once construction is complete.
>
> Lower utilities as necessary and reinstall in a manner, which permits proper utilization and does not disturb the integrity of the enclosures. Utility maintenance should not require the enclose to be opened or disturbed. (If it does, an alternative abatement strategy is indicated.)
>
> Enclosed asbestos containing materials shall be designated appropriately (Specify format--sign, label, color code and frequency/location of indicators) in order to warn building maintenance personnel in the event that they are required to disturb the enclosure.

3.2.03 Clean-Up Procedures. Remove and containerize all visible accumulations of asbestos containing material and asbestos contaminated debris utilizing rubber dust pans and rubber squeegees to move material around. Do not use metal shovels to pick up or move accumulated waste. Special care shall be taken to minimize damage to floor sheeting.

Wet clean all surfaces in the work area using rags, mops and sponges as appropriate. (Note: Some HEPA vacuums might not be wet-dry vacuums. To pick up excess water and gross wet debris, a wet-dry shop vacuum may be used. This will be contaminated and require cleaning prior to removal from the work area.)

Remove the cleaned outer layer of plastic sheeting from walls and floors. Windows, doors, HVAC system vents and all other openings shall remain sealed. The negative pressure ventilation units shall remain in continuous operation. Decontamination enclosure systems shall remain in place and be utilized.

After cleaning the work area, wait at least 24 hours to allow fibers to settle and HEPA vacuum and wet clean all objects and surfaces in the work area again.

Remove all containerized waste from the work area and waste container pass-out airlock. Decontaminate all tools and equipment and remove at the appropriate time in the cleaning sequence. Inspect the work area for visible residue. If any accumulation of residue is observed, it will be assumed to be asbestos and the 24 hour settling period/cleaning cycle repeated.

The work area shall be cleaned until it is in compliance with State and Local requirements and any more stringent criteria agreed upon by the Contractor and the Engineer prior to initiation of abatement activities (criteria should be in the form of visual inspections and airborne fiber concentrations). Additional cleaning cycles shall be provided, as necessary, at no cost to the Owner until these criteria have been met.

Following the satisfactory completion of clearance air monitoring, remaining barriers may be removed and properly disposed of. A final visual inspection by the Engineer shall insure that no contamination remains in the work area. Unsatisfactory conditions may require additional cleaning and air monitoring.

3.2.04 Disposal Procedures. As the work progresses, to prevent exceeding available storage capacity on site, sealed and labeled containers of asbestos containing waste shall be removed and transported to the prearranged disposal location.

Disposal must occur at an authorized site in accordance with regulatory requirements of NESHAP and applicable State and Local guidelines and regulations.

All dump receipts, trip tickets, and transportation manifests or other documentation of disposal shall be delivered to the Contractor for his records. A recommended record keeping format utilizes a chain of custody form which includes the names and addresses of the Owner, Contractor, pickup site, and disposal site, the estimated quantity of the asbestos waste and the type of containers used. The form should be signed by the Owner, the Contractor, and the Disposal Site Operator, as the responsibility for the material changes hands. If a separate hauler is employed, his name, address, telephone number and signature should also appear on the form.

3.2.05 Transportation of Landfill. Once drums, bags and wrapped components have been removed from the work area, they shall be loaded into an enclosed truck for transportation.

When moving containers, utilize hand trucks, carts and proper lifting techniques to avoid back injuries. Trucks with lift gates are helpful for raising drums during trucks' loading.

The enclosed cargo area of the truck shall be free of debris and lined with 6-mil polyethylene sheeting to prevent contamination from leaking or spilled containers. Floor sheeting shall be installed first and extended up the sidewalls. Wall sheeting shall be overlapped and taped into place.

Drums shall be placed on level surfaces in the cargo area and packed tightly together to prevent shifting and tipping. Large structural components shall be secured to prevent shifting and bags placed on top. Do not throw containers into truck cargo area.

Personnel loading asbestos containing waste shall be protected by disposable clothing including head, body and foot protection and at a minimum, half-facepiece, air-purifying, dual cartridge respirators equipped with high efficiency filters.

Any debris or residue observed on containers or surfaces outside of the work area resulting from clean-up or disposal activities shall be immediately cleaned-up using HEPA filtered vacuum equipment and/or wet methods as appropriate.

Large metal dumpsters are sometimes used for asbestos waste disposal. These should have doors or tops that can be closed and locked to prevent vandalism or other disturbance of the bagged asbestos debris and wind dispersion of asbestos fibers. Unbagged material shall not be placed in these containers, nor shall be used for non-asbestos waste. Bags shall be placed, not thrown, into these containers to avoid splitting.

3.2.06 Disposal at the Landfill. Upon reaching the landfill, trucks are to approach the dump location as closely as possible for unloading of the asbestos containing waste.

Bags, drums and components shall be inspected as they are off-loaded at the disposal site. Material in damaged containers shall be repacked in empty drums or bags as necessary.

Waste containers shall be placed on the ground at the disposal site, not pushed or thrown out of trucks (weight of wet material could rupture containers).

Personnel off-loading containers at the disposal site shall wear protective equipment consisting of disposable head, body and foot protection and, at a minimum, half-facepiece, air-purifying, dual cartridge respirators equipped with high efficiency filters.

Following the removal of all containerized waste, the truck cargo area shall be decontaminated using HEPA vacuums and/or wet methods to meet the no visible residue criteria. Polyethylene sheeting shall be removed and discarded along with contaminated cleaning materials and protective clothing in bags or drums at the disposal site.

If landfill personnel have not been provided with personal protective equipment for the compaction operation by the landfill operator, Contractor shall supply protective clothing and respiratory protection for the duration of this operation

3.2.07 Reestablishment of the Work Area. Reestablishment of the work area shall only occur following the completion of clean-up procedures and after clearance air monitoring has been performed and documented to the satisfaction of the Engineer.

Polyethylene barriers shall be removed from walls and floors at this time, maintaining decontamination enclosure systems and barriers over doors, windows, etc. as required.

The Contractor and Engineer shall visually inspect the work area for any remaining visible residue. Evidence of contamination will necessitate additional cleaning.

Additional air monitoring shall be performed if additional clean-up is necessary.

Following satisfactory clearance of the work area, remaining polyethylene barriers may be removed and disposed of as asbestos contaminated waste.

At the discretion of the Contractor, mandatory requirements for personal protective equipment may be waived following the removal of all barriers.

Resecure mounted objects removed from their former positions during area preparation activities.

Relocate objects that were removed to temporary locations back to their original positions.

Reestablish HVAC, mechanical and electrical systems in proper working order. Remove contaminated HVAC system filters and dispose of as asbestos contaminated waste. Decontaminate filter assembly using HEPA vacuums and wet cleaning techniques. Install new filters in HVAC systems. Dispose of old filters.

Repair all areas of damage that occurred as a result of abatement activities.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Testing. Following the completion of clean-up operations, the Contractor shall notify the Engineer that the work area is ready for clearance air monitoring.

The Contractor shall then arrange for an Air Monitoring Professional to sample the air in the work area for airborne fiber concentrations.

The use of Transmission Electron Microscopy (TEM) is highly recommended for clearance air monitoring. Availability of this analytical service may be limited, however, and turn around time for sample analysis may be significantly longer than the NIOSH methods. The air sampling shall otherwise be conducted using sampling pumps calibrated at a flow rate of at least 2 and not more than 0.14 cu. ft. (4 liters) per minute using collection media and procedures in accordance with NIOSH Standard Analytical Method P&CAM 239 or 7400, as available. Air volumes shall be sufficient to provide reliable results down to a concentration of 0.01 fibers per cubic centimeter of air (f/cc) or lower. Minimum air volumes of 105.9 cu. ft. (3000 liters) shall be collected for P&CAM and 35.3 cu. ft. (1000 liters) for method 7400. Volume requirements for electron microscope methods should be discussed with the analytical laboratory.)

The number of samples that are required and the specific locations where they shall be taken should be established by the Contractor in conjunction with an industrial hygienist and the Engineer notified before abatement activity begins.

Aggressive sampling shall be performed with portable fans circulating air in the work area to simulate actual use conditions. Negative pressure ventilation units shall not be utilized for this purpose.

All samples at all locations shall indicate concentrations of airborne fibers less than 0.16 f/in^3 (0.01 f/cm^3) for release of the work area.

Areas exceeding this level shall be recleaned and retested until satisfactory levels are obtained.

3.3.02 Implementation Suggestions. The following is excerpted from A Review of the Scientific Basis for EPA: School Asbestos Hazard Program with Recommendations to State Health Officials. Published by the Centers for Disease Control in October, 1984.)

When air samples are collected after an asbestos abatement, the "action level" should conform with a policy of lowest feasible level. The concept of an environmental "action level" is not the same as that of a permissible exposure limit that is precisely monitored for compliance with regulatory standards. As used here it is consistent with a policy of recommending that asbestos exposures be reduced to the lowest feasible level. It is readily measured by the NIOSH #7400 for asbestos in air; and it should be helpful to those who must make risk management decisions when the general public is potentially exposed to asbestos.

An "action level" of 0.16 f/in^3 (0.01 f/cm^3) may be useful as a guideline for monitoring a building with potentially hazardous asbestos surfaces, as part of a comprehensive program or during abatement work, maintenance, etc. It is not recommended "occupancy" or "safe" level.

Using the NIOSH Method #7400 including modified rules for counting only fibers with aspect ratios of 5:1 or more in a 35.3 cu. ft. (1,000 liter) air sample will permit detection and quantification of about 0.16 f/in^3 (0.01 f/cm^3) if a coefficient of variation of 25% is considered acceptable for risk-management decisions. This variability is reasonable, since the conversion factor used to convert mass concentration to fiber concentrations in environmental risk assessment has such a large uncertainty factor.

3.3.03 Medical Monitoring. Medical monitoring must be provided by the Contractor to any employee or agent that may be exposed to asbestos in excess of background levels during any phase of the abatement project. (Due to the synergistic effects between smoking and asbestos exposure, it is highly recommended that only non-smokers be employed in positions which may require them to enter asbestos contaminated atmospheres.)

Medical monitoring shall include at a minimum:

A work/medical history to elicit symptomatology of respiratory disease.

A chest x-ray (posterior-anterior, 14 x 13 inches (35.6 x 33.0 cm)) evaluated by a Certified B-reader.

A pulmonary function test, including forced vital capacity (FVC) and forced expiratory volume at one second (FEV)1, administered and interpreted by a Certified Pulmonary Specialist.

Employees shall be given an opportunity to be evaluated by a physician to determine their capability to work safely while breathing through the added resistance of a respirator.

Examining physicians shall be aware of the nature of respiratory protective devices and their contributions to breathing resistance. They shall also be informed of the specific types of respirators the employees shall be required to wear and the work he will be required to perform, as well as special workplace conditions such as high temperatures, high humidity, and chemical contaminants to which he may be exposed.

3.3.04 Asbestos Project Manager. The Asbestos Project Manager shall be the Contractor or a designated representative paid by the Contractor. Also known as a Competent Person this person could be an administrator, architect, engineer, industrial hygienist or other individual[s] certified by the State of Michigan for safe methods of asbestos removal.

The Asbestos Project Manager shall be able to demonstrate through special education, training, skills, knowledge or experience satisfactory to the Engineer to indicate the ability to carry out the following activities as required:

Assist in decision making regarding selection of procedures.

Enforce contract specifications.

Tour work area with the sub-contractors and agree on pre-abatement conditions of the work area.

Inspect and sign off on barriers and decontamination enclosure systems.

Observe activities at all times during the course of abatement.

Meet with the sub-contractors daily to review work progress and solve problems or adjust procedures as appropriate.

Perform bulk material or air sampling and all workplace inspection and clearance inspections for the Owner.

Report on abatement to the Engineer.

Request, review and maintain Contractor submittals.

Provide training and/or respirator fit testing to personnel.

The Asbestos Project Manager shall have the authority to stop any job activities if they are not being performed in accordance with applicable regulations or guidelines or the requirements of this specification. These will be reported to the Engineer with description of activity, reason for stopping it and alternatives for correcting the problem.

The Asbestos Project Manager shall be covered by adequate liability insurance to protect against errors and omission in the performance of support activities.

3.3.05 Air Sampling Professional (ASP). The Air Sampling Professional shall conduct all air sampling in accordance with the NIOSH Standard Analytical Method for Asbestos in Air P&CAM 239 and/or Method 7400 or other acceptable methods as otherwise agreed upon.

The following schedule shall be utilized for air sampling during the project (in addition to OSHA compliance monitoring):

Pre-abatement sampling: A sufficient number of air samples shall be collected prior to the start of abatement activities in order to determine prevalent airborne concentrations. Samples should be taken both inside and outside of the work area and buildings to establish existing levels under normal activity conditions.

Sampling during the abatement project: The following schedule of samples shall be required on a daily basis, once abatement activities begin and are recommended minimums. The size of the abatement activity will impact on the number of samples necessary to adequately monitor the Contractor's activities. Decisions on the number of samples should be made with the advice of the Air Sampling Professional:

Two Area Samples (inside the work area).

Two Personal Samples (inside the work area).

Two Area Samples (outside the work area in uncontaminated areas of the building.

One of these shall be at the entrance to the worker decontamination enclosure.)

One Area Sample (outside the building).

One Area Sample (at the exhaust of negative pressure ventilation equipment). Samples shall be collected at a sampling rate of 0.07 cu. ft./min. (2 liters/min). A minimum acceptable air volume is 17.0 cu. ft. (480 liters).

Post-Abatement (clearance) air sampling shall be conducted following the cleaning phase of work, once the no visible residue criterion has been met. A sufficient number of samples shall be collected aggressively (with portable fans circulating air in the work area to simulate actual use conditions) to determine post-abatement air concentrations. For an adequate volume of air concentration it is required that an adequate volume of air provides, accuracy to 0.16 fibers/in^3 (0.01 fibers/cm^3)

The Air Sampling Professional shall be experienced and knowledgeable about the methods for asbestos air sampling and be able to select representative numbers and locations of samples.

The Air Sampling Professional shall have adequate liability insurance to protect against errors and omissions in the performance of support activities.

3.3.06 Laboratory Services. Laboratory utilized for analyzing air samples by NIOSH shall be satisfactory participants in the NIOSH Proficiency Analytical Testing (PAT) program asbestos analysis.

Laboratories used for bulk material identification shall be satisfactory participants in the EPA quality assurance program for bulk asbestos analysis.

The period of time permitted between the collection of air samples and the availability of results shall be less than twenty-four (24) hours for samples collecting during abatement activities. Time tables for results of pre-abatement and clearance air samples shall be established with the Engineer. On-site analytical capabilities are preferred for immediate results of sampling. This provides the Engineer with a timely review of Contractor performance and a more rapid awareness of hazardous exposure conditions which can be corrected. This service may not be readily available, however, real-time monitoring instruments provide some support in this matter as long as their limitations are clearly understood and the Contractor and Engineer agree in advance on how the results are to be used. These devices which do not meet current OSHA monitoring requirements should not be used for sampling during the abatement project.

End of Section

SECTION 02084

MODIFICATIONS TO EXISTING STRUCTURES, PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 SCOPE. This section includes all work necessary to modify, alter or abandon existing building components, drainage structures, miscellaneous chambers and facilities, piping, equipment and associated appurtenances.

Furnish all materials, labor and equipment, as required for the work as shown and as specified herein.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C33 - Concrete Aggregates

ASTM C150 - Portland Cement

MDOT Standard Specifications for Construction, Current Edition

Detroit City Engineering Division Standard Specifications for Paving and Related Construction, October 1999

1.3 QUALITY ASSURANCE. Accomplish modifications of existing construction, utilities, and appurtenances without damaging integrity of existing structures, equipment, and appurtenances that are to remain.

The Contractor shall assume full responsibility for any and all damages resulting from his work. Repair or replace items that are damaged at no additional compensation and to condition at least equal to that which existed prior to start of work.

Provide protection of persons and property throughout progress of work. Proceed in such a manner as to minimize spread of dust and flying particles and to provide safe working conditions for personnel.

Obtain permission from Engineer before abandoning or removing any existing structures, materials, equipment and appurtenances.

Arrange with and perform work required by utility companies and municipal departments for discontinuance or interruption of utility services due to work.

Perform all operations in accordance with applicable regulations of the City of Detroit, State of Michigan Department of Health, State of Michigan OSHA, and Federal Government.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit a detailed plan for all of the work required, describing proposed sequence, methods, and equipment for modifying, altering or abandoning of each building, structure or piping and equipment prior to any work commencing. Provide mix designs for all cementitious materials.

1.4.02 Samples. Provide samples of all materials.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Protect adjacent structures, utilities, equipment, and property during execution of the work. Costs associated with replacing damaged elements and items shall be borne by the Contractor.

Where work occurs in a confined space, the Contractor shall monitor the atmosphere in accordance with federal, state and local ordinances, rules and regulations. Provide equipment for dewatering work spaces.

All work done in street and road right of ways in Detroit shall comply with the current City Engineering Division specifications for Paving and Related Construction and the MDOT Standard Specification for Construction.

2.2 MATERIALS.

2.2.01 Cement Stabilized Fly Ash. Filling voids in abandoned large sewers or tunnels: Cement stabilized fly ash shall generally be used.

At the option of the contractor, the cement stabilized fly ash mixture filling may include aggregate. Cement content shall be 2 percent by weight.

2.2.02 Bulkheads. Bulkheads shall be vented and designed to retain the full fluid head of cement stabilized fly ash and/or other materials acting on the bulkhead. If bulkheads are to remain in place, biodegradable material such as wood will not be permitted. Vent holes shall be filled after entire stretch of tunnel, sewer, conduit or structures have been filled. Brick bulkheads, as required, shall be built of common brick.

The surface of contact of the sewer wall with the bulkhead shall be roughened by bush-hammering or chiseling and then cleaned just prior to the bulkhead construction. Such bulkheads shall be vertical, of the thickness shown on the Plans, with alternate header and stretcher courses laid in mortar in the manner specified for “Manholes”. The joints shall be 5/8 inch (16 mm) thick and finished flush.

Removal of bulkheads shall be done in a careful manner that will avoid damage to the sewer. The surface of contact of the sewer wall with the bulkhead shall be cleaned of all brick and mortar and the wall surface left as smooth as possible without mortar patching. The materials from the removed bulkhead shall be promptly removed from the sewer and not left to accumulate.

PART 3 - EXECUTION

3.1 PREPARATION. Dewater work areas subject to standing or flowing water. Remove all standing or flowing water within structures being backfilled.

Provide, erect, and maintain temporary safeguards, including warning signs and lights, barricades, and similar measures, for protection of the public, Owner, Contractor’s employees and existing improvements to remain.

Erect and maintain weatherproof enclosures for exterior openings. Erect and maintain temporary partitions to prevent spread of dust, odors, and noise to permit continued Owner occupancy. Prevent movement of structures, piping, and appurtenances. Provide temporary bracing and shoring as required.

Notify affected utility companies before starting work and comply with their requirements. Cap or plug pipes and other conduits abandoned due to demolition as indicated on Drawings or as specified. Mark location and termination of utilities.

Blasting will not be permitted. Demolition work shall be performed in accordance with all applicable laws and ordinances. Saw cut existing sewers at all connections so that the edges are straight and not ragged. Plug all leaks within the structures being backfilled prior to backfilling.

3.2 INSTALLATION.

3.2.01 Sewer and Structure Tap. Where connections are to be made from the side into an existing 4 feet (1.2 m) or larger sewer or to structures, an opening shall be cut or chipped in the sewer or structure sufficiently large to permit 3 inches (7.5 cm) of non-shrink mortar to be placed around the entering pipe. The mortar shall be used for setting the pipe, and the mortar shall be pointed up smooth and flush with the inner wall of the sewer or structure.

The pipe passing through sewer or structure walls shall be cut at the end to conform to the shape of and be flush with the inside wall. The pipe entering a sewer shall point downstream, as shown on the Drawings. On the outside of the sewer or structure wall, the entering pipe shall be encased in 6 inches (15.0 cm) of Grade “A” concrete for a minimum length of 12 inches (30.0 cm). In addition, Grade “C” or Grade “A” concrete shall be placed as a bedding to undisturbed earth.

Where connections are made from the side into a sewer 18 inches (45.0 cm) or smaller, if the outside diameter of the tap is greater than one-half the diameter of the sewer being tapped, a wye shall be sprung into the existing line and the entire wye encased with 6 inches (15.0 cm) of concrete beyond the joint at each end where it joins the existing sewer.

Saddles encased in concrete shall be used on all other connections. The concrete must extend over the top of the pipe and down to the spring line on the opposite side.

While making the tap, care shall be taken to prevent concrete or debris from entering the existing sewer or structure. Any concrete or debris that does fall into the existing sewer or structure shall be removed.

3.2.02 Sewer Manhole Adjustment And Cone Reconstruction. Existing manholes that are to remain shall have their tops adjusted to the new required grades and cross-sections.

The existing frame and cover shall be carefully removed and the upper portion of the existing manhole structure raised or lowered as required. The frame and cover shall then be set on the adjusted structure to fit the required new grade and cross section. All work in connection therewith shall be done according to the applicable provisions for new manholes. Where pavements are called for to be removed and manholes remaining in service are to be adjusted, a 5 foot by 5 foot by 6 inches (1.5 meter x 1.5 meter x 15.0 cm) Grade “A” concrete slab shall be constructed around the manhole.

Existing sewer manhole frames or covers, or both, which are warped, broken, or any non-standard casting or concrete, as determined by the Engineer, shall be furnished and installed by the Contractor.

3.2.03 Water Gate Manhole And Stop Box Adjustment. The tops of existing water gate manholes and stop boxes shall be adjusted to the new required grades and cross-sections in the same manner as specified for sewer manholes.
Should existing castings require replacement, such castings shall be exchanged, at no cost, by the Contractor for new castings at the D.W.S.D. Central Service Facilities – Materials Management, 6425 Huber Street, between the hours of 8:00 a.m. and 4:30 p.m., Monday through Friday. The Engineer shall furnish a written order authorizing the casting exchange.

3.2.04 Sewer Manhole Abandonment. Existing sewer manholes, when so indicated on the Plans, shall be abandoned. The casting shall first be removed, the manhole cone demolished and removed, the sewer inlets and outlets plugged with concrete, and the manhole backfilled in the same manner as specified for a sewer trench, or the manhole completely filled with Grade “C” concrete.

Any sewers that are to remain in use shall have a connecting pipe placed between inlet and outlet, properly connected. During this construction, satisfactory bypass service shall be maintained.

All salvageable castings shall become the property of the Contractor and shall be promptly removed from the job site.

3.2.05 Catch Basin Adjustment. Existing catch basins that are to remain shall have their tops adjusted, when so indicated on the Plans, to the new required grades and cross sections.

For catch basins that are within the paved area, the standard flat grade and frame shall be used.

For catch basins that are outside the paved area, the standard flat grate or dome grate with appropriate frame, or pyramid cover, shall be used, as directed by the Engineer.

New castings shall be furnished and installed for all adjusted catch basins except when salvage castings are available and their use authorized by the Engineer.

When the existing catch basin is a 12 inch (30.0 m), L-type, without trap, the entire catch basin shall be removed and replaced with a new standard catch basin. Should field conditions prevent replacement, the construction shall be as directed by the Engineer, with payment being made as extra work.

Where pavements are called for to be removed and catch basins remaining in service are to be adjusted, a 5 foot by 5 foot by 6 inches (1.5 meter by 1.5 meter by 15.0 cm) Grade “A” concrete slab shall be constructed around the catch basin.

3.2.06 Catch Basin Abandonment. Existing catch basins, when so indicated on the Plans, shall be abandoned. The catch basin shall be removed, the sewer outlet plugged with concrete, and the resulting hole backfilled as specified for a sewer trench, or the catch basin filled completely with Grade “C” concrete.

When special abandonment is called for in the Proposal and at locations shown on the Plans, the catch basin line shall be plugged at the lateral sewer as detailed on the Standard Plans. This special abandonment shall be used in site clearance and urban areas where the lateral sewer is remaining in service. The catch basin shall be either removed, the sewer outlet plugged with concrete, and the resulting hole backfilled as specified for a sewer trench, or the catch basin completely filled with Grade “C” concrete as directed by the Engineer.

Existing castings shall be considered as salvaged castings.

Salvaged castings not suitable for use and not required for catch basins to be adjusted in the same contract, shall become the Contractor’s property and shall be promptly removed from the job site.

3.2.07 Backfilling Abandoned Sewers. The backfill material for abandoned sewers shall be Grade “C” concrete or grout composed of two parts sand to one part cement or variations thereof as may be approved by the Engineer.

Backfill concrete shall be deposited through drop pipes placed over the abandoned sewer and at locations approved by the Engineer.

Drop-pipe holes shall be spaced at intervals that will ensure the proper and complete filling of the sewer.

All drop holes shall be sleeved for their entire length with a metal casing. The casing shall extend completely through the wall of the sewer.

The drop-pipe shall be fitted with suitable and sufficient baffles to ensure the re-mixing of the concrete rather than a separation of the materials.

The size of the drop-pipe shall be adequate for the placing of the concrete mix.

When the drop holes are no longer needed and the Engineer orders their abandonment, the castings shall be removed so that adjacent structures, utilities, and pavement will not be damaged. The hole shall then be filled with a three (3) bag concrete mix to within 5 feet (1.5 meters) of the surface. The upper portion of the hole shall be filled with compacted sand or sand-gravel and the surface replaced in kind to that originally found to the satisfaction of the Engineer.

Grout shall be placed under a pressure adequate to fill completely the abandoned portion of the sewer. However, grout pressures shall not be so high as to cause leakage from the sewer and the filling of adjacent sewers, utilities and basements.

3.2.08 Salvaged Castings. The metal frames, covers, and grates on existing manholes and catch basins that are to be reused shall be carefully removed to prevent damage.

Any reusable casting damaged by the Contractor shall be replaced with a new casting without additional cost to the City.

All salvaged castings that are not to be used on the work shall become the property of the Contractor and shall be promptly removed from the job site.

3.2.09 Public Lighting Department (P.L.D.) Manhole and Handhole Adjustment. The tops of existing P.L.D. manholes and handholes shall be adjusted to the new required grades and cross-sections as specified for sewer manholes.

If adjusting the frame and cover to the proposed grade requires adjustment of the manhole or handhole roof, the Contractor shall notify the P.L.D. The work involved in the adjustment of the roof of the structure and the adjustment of the frame and cover to the new pavement surface will be performed by the P.L.D. at no cost to the Contractor.

Should existing castings require replacement, such castings shall be exchanged, at no cost, by the Contractor for new castings at the P.L.D. Warehouse, at 9449 Grinnell Street, between the hours of 8:30 a.m. and 4:00 p.m., Monday through Friday. The Engineer shall furnish a written order authorizing the exchange of castings.

3.2.10 Force Main Abandonment. Submit plan for abandonment of Force Main. Abandon Force Main and related structures as detailed on the drawings.

3.2.11 Salvage. Materials equipment and appurtenances scheduled for salvage and delivery to DWSD shall be carefully removed and delivered to DWSD in accordance with the schedule listed in the drawings.

Materials, equipment and appurtenances removed, that are not designed for relocation, or salvage and delivery to DWSD become property of Contractor and shall be hauled from site and disposed of at no additional compensation.

1.4 DEFINITIONS.

Lead-Containing Paint: Paint containing a minimum of 1.0 mg/cm2 (milligram per square centimeters) lead or containing 0.5 percent lead by weight as determined by on-site testing of the coating with a portable X-ray fluorescence (XRF) detector, or through laboratory testing in accordance with ASTM D3335.

1.4.01 Hazardous Waste: Lead paint debris is classified as hazardous due to the characteristic of toxicity, if after testing by Toxicity Characteristic Leaching Procedures

(TCLP), the leachate contains any of the elements in the concentrations listed below (or greater):

Arsenic	5 ppm
Barium	100 ppm
Cadmium	1 ppm
Chromium	5 ppm
Lead	5 ppm
Mercury	0.2 ppm
Selenium	1 ppm
Silver	5 ppm

Note: Other Elements can cause a material to be hazardous as defined in 40 CFR 261 and must be taken into consideration. The list above includes only those elements typically associated with paint solids. If chemical strippers are used, the debris may be hazardous waste, due to corrositivity, if the pH is less than or equal to 2 or greater than or equal to 12.5.

Generator: The facility Owner or Operator or person who first creates or produces the hazardous waste.

Large Quantity Generator: Generates over 2,200 pounds (1,000 kilograms) of hazardous waste or 2.2 pounds of acutely hazardous waste per month or stores more than 13,200 pounds (6,000 kilograms) of waste or more than 2.2 pounds of acutely hazardous waste at the site at any one time.

Small Quantity Generator: Generates more than 220 pounds (100 kilograms), but less than 2,200 pounds (1000 kilograms) of hazardous waste per month and accumulates less than 13,200 pounds (6,000 kilograms) at any one time.

Conditionally Exempt Small Quantity Generator: Generates less than 220 pounds (100 kilograms) of hazardous waste per month, and accumulates no more than 2,200 pounds (1,000 kilograms) of hazardous waste at any time.

Containment and Ventilation Systems: Includes the containment structure (i.e. containment walls, floor, supporting structure, entryways); ventilation system (i.e. and input and exhaust); and dust collection.

Milligram (mg): A milligram is 1/1,000 of a gram.

Microgram (ug): A microgram is 1/1,000,000 or a gram of 1/1,000 of a milligram.

1.5 SUBMITTALS.

1.5.01 Lead Abatement Work Plan: A minimum of 30 days prior to beginning work provide a written plan for the methods to be employed for surface preparation, containment and ventilation, and collection of debris. When designing the system, the Contractor shall recognize the load bearing capacity and integrity of the structure to be abated. The Contractor shall have the containment and ventilation plan reviewed by a Professional Engineer and submit drawings for review. In addition the Work Plan shall contain the following:

Name and address of licensed abatement contractor to undertake the Work.

Site specific Health and Safety Plan.

Site specific Lead Abatement Plan, including quantities to be removed, and abatement contractor’s policies and procedures relating to lead abatement work.

Employee Training Accreditations/Certifications and Physician Clearances, including accreditation certificate from the State of Michigan of Abatement Contractor’s Project Designer.

Lead Abatement License.

Documentation of Respiratory Equipment Fit Tests.

Manufacturer’s information for materials and equipment to be utilized in the work, including Material Safety Data Sheets (MSDS).

Documentation of abatement contractor’s insurance (certificates).

Credentials of independent, third party consultant who will provide testing and clean-up inspection services as specified herein.

Programs for the Protection of the Ambient Air and Water: Submit written testing and evaluation that will be used to confirm that the work does not violate Federal, State and Local regulations. Refer to Item 1.07 for acceptance criteria.

1.5.02 Ambient Air Quality: Submit a written program for air monitoring at the project site to confirm that fugitive dust emissions do not exceed specified criteria. The following shall be addressed:

Particulate Matter: Monitor emissions of particulate matter equal to or greater than 10 micrometers (PM 10) in aerodynamic size in accordance with 40 DFR 50. Include the type and number of samplers to be used, their proposed locations, provisions for background monitoring, and the duration of testing.

Visible Emissions: Submit a written plan for the observations that will be made to verify that the visible emissions criteria of this specification are not exceeded.

Total Suspended Particulate (TSP) Lead: Submit a program for the analysis of airborne lead emissions in accordance with 40 CFR 50. Include the type and number of samplers to be used, their proposed locations, provisions for background monitoring and duration of testing.

Lead Emissions Using Personal Monitors: Submit a program that identifies the proposed monitoring sites for the use of personal monitors in accordance with NIOSH Method 7082. The duration of monitoring, provisions for background monitoring, laboratory qualifications, and evaluation procedures to be employed shall be included.

1.5.03 Water Analysis: Submit a written program for verification of the following:

National Pollutant Discharge Elimination system (NPDES) Permit: If waste water will be discharged to sewers or surface water, obtain an NPDES permit for the work in accordance with 40 CFR 122, and that its requirements will be strictly followed.

Reportable Releases: Prepare a program for reporting releases of lead into the water in accordance with 40 CFR 117.

Water and Sediment Analysis: Outline the sampling and testing protocol proposed for the pre-job and post-job analysis of lead in the water and sediment, and provide the qualifications of testing laboratory to be used.

1.5.04 Handling, Disposal and Analysis of Debris Criteria: Submit the following:

Handling and Site Storage: A written plan that addresses the handling and site storage of lead-containing debris in accordance with the requirements of 40 CFR 262 and 40 CFR 265. The Contractor shall confirm that an EPA identification number shall be obtained if one has not already been assigned to the facility, that proper manifesting of the waste shall be addressed, and that all site storage limitations, including the time of storage, container requirements, contingency plan, and personnel training, shall be observed.

Sampling and Testing of Debris: Written procedures that will be followed for the sampling and testing of debris to determine if it is hazardous waste. The sampling procedure shall be in accordance with the requirements of SW 846, with the testing accomplished by TCLP, defined in Appendix II of 40 CFR 261. The program shall include the name of the testing laboratory to be utilized.

Transportation: Written confirmation that proper transportation of the debris shall be accomplished in accordance with the requirements of 40 CFR 263. The name of the transporter shall be included.

Disposal: Written confirmation that the debris will be treated and disposed of in accordance with the requirements of 40 CFR 264 and 40 CFR 268. The program shall provide assurance that the debris is handled properly from cradle to grave, and include the necessary notifications and certifications on shipments, provide the name of the disposal facility, and include a schedule for the submittal of the completed manifests.

Clearance Testing: The Contractor will provide written programs for the decontamination for reusable items prior to removal from the project site, or for the proper testing and disposal of the materials if decontamination is not possible or desirable.

The submitted Work Plan shall address the criteria outlined in items 1.06, 1.07, 108 and 1.09.

1.5.05 <u>Prior to commencing abatement work in any area or sub-area, if the removal will not be prosecuted continuously, the Contractor shall provide ten (10) days notice. The notice shall include the following information</u>:

Construction contract number and title.

Name of general contractor, general contractor’s superintendent and on-site telephone number.

Name of abatement contractor, abatement contractor’s superintendent and on-site telephone number.

Exact location of abatement work and estimated quantities involved.

Estimated dates and times of commencement and completion.

Date of submittal of Abatement Work Plan.

Copies of any updated notifications to regulatory agencies.

1.5.06 <u>The following shall be submitted on a weekly basis while abatement work is in process</u>:

Updates of Respiratory Fit Tests, if applicable.

Monitoring equipment calibration logs.

Daily logs of work completed.

Daily logs of employees conducting the abatement.

Environmental monitoring results.

Disposal manifests, if removed material is characterized as a hazardous waste and disposal occurs within the reporting period. The name, address and identification number of the licensed transporter/disposer shall be provided.

1.5.07 The following shall be provided prior to re-occupancy of an abated area:

Certification of Visual Inspection and Authorization for Re-Occupancy as provided by an independent, third party consultant (see Items 3.05 and 3.06).

Upon completion of the abatement submit the abatement project records specified in Item 1.10.

1.6 CRITERIA FOR CONTAINMENT SYSTEMS.

Design a containment system for the work area to control environmental emissions according to the criteria listed in Item 1.07 and control working environment within containment according to the criteria listed in Item 1.08.

Thoroughly examine the structure to be prepared to verify its ability to support a containment system, including the wind loads, if any that can be imparted by such a system. Submit containment drawings in accordance with the requirements of Item 1.05.

1.7 CRITERIA FOR CONTROL OF ENVIRONMENTAL EMISSIONS.

1.7.01 Ambient Air Quality – Particulate Matter and Visible Emissions: Monitor and control ambient air particle matter and visible emissions in accordance with the following criteria:

Ambient Air Quality for Particulate Matter (40 CFR 50): Emissions in excess of 150 ug/m3 of PM 10 over a 24-hour period shall be cause for shut down of the project, until corrections to the containment are made to comply with this level. Use high volume air samplers in accordance with 40 CFR 50 to monitor for this level. Prior to project startup, perform a minimum of three days baseline monitoring to determine pre-existing conditions.

Ambient Air Quality – Visible Emissions: Visible emissions shall be used as a criterion for project shut down until corrections to the containment are made. Visible emissions shall be determined in accordance with 40 CFR 60. As determined by SSPC Guide 61, visible emission in excess of 20 percent capacity for any 3-minute period in 60 minutes, shall be cause for shut down of the project until corrections to the containment are made to comply with this level.

Ambient Air Quality – Lead Emissions: Monitor and control ambient airborne lead concentration to conform to the EPA Limit of 1.5 μg/m3 average over a 90 day period. Emissions of lead in excess of 15 μg/m3 over an eight hour period shall be cause for shut down of the project until corrections are made to comply with this level. Airborne lead monitoring shall be accomplished using high volume air samplers in accordance with 40 CFR 50. (Refer to Item 1.05 A.2.a.)

1.7.02 Ambient Air Quality for Lead – Personal Air Monitoring to Establish Regulated Areas:

Establish a regulated area surrounding activities where lead exposures exceed the OSHA Personal Exposure Level (PEL) (refer to Item 1.08). This includes the paint removal area, dust collection equipment, abrasive recycling equipment, and locations where lead-containing debris is handled or transferred to storage containers.

Demarcate the regulated area by use of ropes, tape, walls, or other similar means, and post appropriate warning signs. Limit access to these areas to those persons properly trained and protected.

Water Quality: Do not allow the release of lead into bodies of water or storm sewers. Stop work if spills or emissions are observed entering into bodies of water, or are found in areas where storm water run-off could carry the debris into bodies of water or storm sewers.

NPDES Permit: If waste water is discharged to storm sewers or surface water, an NPDES permit shall be obtained in accordance with the requirements of 40 CFR 122. The requirements of the permit shall be strictly followed.

The Contractor is advised that certain discharges of lead compounds into water are a violation of the Clean Water Act. More specifically, 40 CFR 117.3 establishes reportable quantities of hazardous substances released in a 24-hour period, and 40 CFR 117.21 requires immediate notification of the release of a reportable quantity to the appropriate agency (in Michigan, the Michigan Department of Natural Resources). Examples of reportable quantities of lead compounds include: lead arsenate > 1 lb., lead sulfate > 10 lb., lead acetate > 10 lb., lead stearate > 10 lb.

Provide protection at drains to prevent paint debris from entering the storm sewer system.

1.8 CRITERIA FOR CONTROLS OVER WORKER PROTECTION.

Submit written program for worker protection consistent with OSHA lead standard for construction (29 CFR 1926.62)

1.8.01 In addition to the requirements of the OSHA lead standard for construction, the written program shall apply:

Name the individuals responsible for implementing the various requirements of the written program.

Specify that analysis of air monitoring filters shall be performed by an American Industrial Hygiene Association (AIHA) accredited laboratory.

Require that blood level testing shall be conducted by an OSHA-approved laboratory.

Include the name, address, and telephone number of the hospital to which injured workers will be taken, and a map showing the route to be traveled.

Include the telephone number of the ambulance service to be used.

Include the emergency telephone numbers of the local police and fire departments.

Include specifications for the construction of a work area containment. The containment shall be designed to contain debris generated by the removal process applied (such as dust, waste paint, waste abrasive, and water), in accordance with Item 1.06. Information on the design of containment can be found in Appendix F of OSHA Asbestos Standards for the Construction Industry, 29 CFR 1926.58, and Chapter 6 of the "Industrial Lead Paint Removal Handbook".

Identify the location at which Material Safety Data Sheets (MSDS) will be maintained and identify the individual responsible for compliance with the OSHA hazard communication standard (29 CFR 1910.1200).

1.8.02 Include the following minimum emergency response requirements:
The site Health and Safety (H&S) coordinator (or site superintendent if no H&S coordinator is designated) shall assure someone trained in first aid and cardiopulmonary resuscitation (CPR) is present during normal working hours. The site H&S coordinator shall assure that a first aid kit and appropriate fire extinguishers are available at the site and shall inform site workers of their location. The H&S coordinator shall contact the medical facility identified in Item 1.08 to determine if it has facilities to accept workers contaminated with debris present at the site.

In the event of a worker injury, the responding worker shall inform the site H&S coordinator. The site first-aider shall perform first aid. If the worker should be taken to a medical facility, the designated first-aider shall decide whether to decontaminate the worker beforehand, or transport the worker without being clean.

In the event of a fire, the site H&S coordinator shall determine whether conditions warrant assistance from the fire or police department and shall call for assistance. In the absence of the H&S coordinator, the site superintendent shall make the determination.

18.03 Criteria for Handling of Hazardous Waste and Reporting Releases.

The Owner is considered to be the generator of the waste for this project. The contractor is responsible for implementing the following:

1.8.04 Sampling and testing of debris:

Representative samples of the debris shall be tested by TCLP according to method EPS SW-846 to determine if it is hazardous in accordance with Appendix II of 40 CFR 261.

In the case of wet methods of preparation, the use of chemical strippers, or containerized hygiene water, all liquids and sludge shall be tested, including pH to determine corrositivity, if appropriate.

1.8.05 Hazardous waste: If the tests of the sampled debris indicate the waste to be hazardous, the following requirements apply:

Site Storage and Handling: Store and handle the on-site hazardous waste debris in accordance with the requirements of 40 CFR 262 and 40 CFR 265, with special attention given to proper labeling, time of storage, amount of material stored at any one time, use of proper containers, and personnel training. Confirm that an EPA identification number will be obtained, if one has not already been assigned to the facility. Do not place paint debris on the unprotected ground. Adequately shield paint debris to prevent dispersion of the debris by wind or rain water. Provide preparedness, prevention, and contingency plans (PPCP) in accordance with 40 CFR 265 Subpart C and Subpart D for the steps to be taken in the event of an unplanned release or emergency. Evidence of improper storage shall be cause for immediate shutdown of the project until corrective action is taken.

Transportation and Disposal of Debris: Arrange to have the debris transported from the site in accordance with the requirements of 40 and 40 CFR 268. Use only licensed transporters and disposal facilities. Provide signed manifests to verify that all steps of the handling and disposal process have been completed properly.

Clearance Testing: Thoroughly vacuum, wash, or otherwise decontaminate reusable items prior to removal from the project site. Items include, but are not limited to, equipment, containment materials, ground covers, scaffolding, and change and shower facilities. If adequate cleaning is not possible, the materials shall be treated as waste and tested and disposed of properly.

CERCLA Release – The Contractor is advised that the discharge of one or more pounds of lead waste or dust (4 mils or less in diameter) into the atmosphere or water within a 24-hour period is considered a reportable release in accordance with 40 CFR 300 and 40 CFR 302.

1.9 RECORD KEEPING AND ABATEMENT MANAGEMENT.

1.9.01 Document and maintain records of the abatement process. Submit the records upon completion of the abatement of an area, and prior to final payment. The records for each abated area shall clearly describe in non-technical language where the lead was found, and how it was abated. At a minimum, the records shall also include the following:

Complete identification of area(s) receiving abatement.

Results of testing.

General description of abatement methods.

Results of abatement clearance inspections and tests.

Chronology of project-specific abatement from beginning of planning through final clearance testing.

Pertinent Federal, State, and Local requirements under which abatement was undertaken.

Final medical monitoring results.

Drawings clearly showing the location, extent and quantity of lead-based paint removal.

Any outstanding disposal manifests.

Third Party Inspection and Testing

1.9.02 The Contractor shall arrange and pay all associated costs for the services of an independent, third-party consultant who will perform the following activities:

Perform environmental monitoring to review compliance with the intent of the specification.

Perform a preliminary visual inspection as specified in Item 3.04 D.3.

Perform final inspections and clearance testing as specified in Items 3.05 and 3.06.

The third-party consultant shall have all appropriate certifications for providing the required testing and inspection services.

PART 2 - PRODUCTS

2.1 EQUIPMENT.

HEPA vacuums: HEPA (High Efficiency Particle Air) vacuums differ from conventional vacuums in that they contain high-efficiency filters that trap extremely small, micron-sized particles. These filters can filter out particles of 0.3 microns or greater (from a body of air) at 99.97 percent efficiency or greater. Lead dust tends to break down into extremely fine, micron-sized particles. Vacuuming by conventional means is unacceptable at any time, especially in lead-paint abatement final cleanup, because much of the fine lead dust will simply be exhausted back into the environment. Consequently, the use of a HEPA vacuum is required.

Related attachments: As necessary for the conditions encountered, and including items such as brushes of various sizes, crevice tools, and angular tools.

Other equipment, including personal safety equipment, as necessary to comply with the requirements of this specification.

2.2 MATERIALS.

High-phosphate detergent: Detergents with a high-phosphate content [containing at least 5 percent tri-sodium phosphate (TSP)].

Related cleaning supplies: As necessary to accommodate the conditions encountered, and including such items as wringer buckets, mops, squeegee sponge mops, variously sized hand sponges, and rags.

Polyethylene sheeting: 4-mil and 6-mil thickness.

Polyethylene spray: Product approved for intended use by the manufacturer.

Miscellaneous materials such as storage drums, framing lumber, masking adhesive tapes, spray glues, stapling devices, as necessary to meet the requirements of this specification.

PART 3 - EXECUTION

3.1 SITE PREPARATION: PRIOR TO WORK START.

3.1.01 Post warning signs at all entrances and exits to work areas. The warning signs shall read as follows:

“CAUTION LEAD HAZARD

DO NOT ENTER WORK AREA UNLESS AUTHORIZED”

Ensure that heat, electricity, and water are available in the areas to be abated. Ensure that there are no existing water leaks of any type (including from such sources as roofs, windows, or plumbing related components).

Correct other conditions that can impede abatement or cause the abatement to fail.

Initiate containment procedures to protect surfaces and contain and control lead dust debris as specified in Item 3.02.

3.2 CONTAINMENT.

If the abatement plan necessitates the breaking or disturbing of leaded surfaces or other dust generating procedures, and therefore the generation of lead dust, provide containment procedures in accordance with the criteria in Items 1.06 and 1.07 and as indicated below. If abatement does not break or disturb lead-painted surfaces, provide containment measures only as necessary to protect surfaces from damage.

3.2.01 The following materials may be used for containment:

Polyethylene (plastic) sheets at least 6 mils thick;

Heavy duty tape (e.g., duct tape) to fasten plastic sheets;

Staple gun with heavy duty staples for fastening plastic sheets.

3.2.02 Alternate products include:

Polyethylene spray instead of plastic sheeting (the dry film can be removed later by peeling);

Spray glue in aerosol can for fastening plastic sheets.

3.3 CONTROLLING OFF-SITE DISPERSAL.

3.3.01 Limiting access: Prior to satisfactory clearance testing, limit access to the abatement work areas to the following:

Contractor and designated employees;

State, County or Local enforcement officials, or their designees;

Inspectors with a security interest in the building; and,

Federal, State or Local officials, or their designee, engaged in research on lead.

3.3.02 Limiting Tracking of Dust and Debris:

Persons entering a work area during a lead abatement project involving breaking or disturbing lead-painted surfaces shall wear disposable shoe covers. The shoe covers shall be removed upon leaving the work area and placed with abatement waste.

Persons entering a work area during lead paint removal activity (e.g., by heat gun, scraping, HEPA sander, or chemical) or during replacement and during the cleanup process shall also wear appropriate respirator protection. Worker protection shall be in accordance with Item 1.08.

Program of On-Going Cleanup: Implement a program of on-going cleanup in the lead abatement work area. The frequency and intensity of cleaning will be the greatest with on-site paint removal methods, and methods that create a lot of construction debris. On-going cleanup shall include the regular cleaning of all tools, equipment, and worker protection gear to minimize worker exposure, and the risk of transferring lead to other job sites.

3.4 CLEANUP.

3.4.01 General:

Perform cleanup activities as previously specified and as indicated in this item.

Coordinate abatement activities to ensure proper conformance to the project cleanup requirements.

3.4.02 Cleanup Methods and Procedures: The following two basic cleaning methods shall be used to clean the surfaces of the galleries at the conclusion of the active lead based paint abatement activities:

3.4.03 Dry cleaning method, using HEPA vacuums:

Operation instructions: Operate the HEPA vacuum in accordance with the requirements and recommendations of the vacuum manufacturer. If possible, arrange training sessions with the manufacturer’s representative.

Special attachments needed: Ensure that a variety of vacuum attachments (such as brushes of various sizes, crevice tools, and angular tools) are available to accommodate the conditions encountered. Ensure that the attachments are properly used.

3.4.04 HEPA vacuuming procedures: Include all rooms of the property in this HEPA process, except for rooms that were found free of lead paint and lead dust before the abatement process began, and were never entered during the process:

Thoroughly and completely vacuum all abated surfaces in the abatement area. These surfaces include, but are not limited to: ceilings, walls, floors, pipes and fixtures of any kind (light, electrical).

Thoroughly and completely vacuum all unabated surfaces exposed to lead dust generated by the abatement process.

Start vacuuming at the ceilings and work down to the floors. Pay particular care to rough or porous surfaces, such as weathered or worn surfaces and masonry surfaces, particularly concrete, where lead dust tends to tenaciously adhere.

Maintenance of the HEPA vacuum: Properly maintain HEPA vacuums in accordance with the vacuum manufacturer's instructions.

Use extreme caution when opening the HEPA vacuum for filter replacement or debris removal, due to the high potential for accidental release of accumulated lead dust into the environment. This can occur if the vacuum's seal has been broken and the vacuum's bag is disturbed.

Operators shall wear a full set of protective clothing and equipment, including appropriate respirators, when performing these maintenance functions.

3.4.05 Wet cleaning method, using a high phosphate detergent wash:

Manufacturer's instructions: Carefully follow the specific manufacturer's instructions for the proper use of the product, especially the dilution ratio recommended. Wear waterproof gloves when handling the detergent wash to prevent skin irritation.

Cleaning equipment: Ensure that a variety of cleaning equipment is available (such as wringer buckets, mops, squeegee sponge mops, variously sized hand sponges, and rags) to accommodate the conditions encountered. Ensure that the cleaning equipment is properly used.

3.4.06 Wet cleaning procedures:

After the HEPA vacuuming, thoroughly and completely wash all surfaces in the abatement area with the high phosphate solution. These surfaces include, but are not limited to: ceilings, walls, floors, doors and fixtures of any kind (light, electrical).

Thoroughly and completely wash all unabated surfaces exposed to lead dust generated by the abatement process.

Begin the washing activities at the ceilings and work down to the floor.

Change cleaning mixture regularly: To avoid re-contaminating the area by using overly dirty water, users should carefully follow the surface area limits provided by the manufacturer and change the cleaning mixture accordingly. In cases where the manufacturer does not indicate surface area limits, the cleaning mixture should be changed at least after each room has been washed. Each time the cleaning mixture is changed, users must ensure that the dirty water does not recontaminate the environment.

3.4.07 Special Procedures During Abatement:

Daily cleanup: Perform the following cleanup activities daily. Handle, store, and dispose of debris in accordance with Items 1.09 and 1.10.

Small debris: Spray the affected surfaces with a fine mist of water, to keep surface dust from becoming airborne. Place the swept debris in double 4-mil or single 6-mil plastic bags, properly seal the bags, and move them to the designated trash storage area. Do not overload trash bags to ensure that no ruptures or punctures occur during handling and transport.

During daily cleanup activities, workers shall wear protective clothing and equipment. Also, during daily cleanup activities, abatement workers shall inspect for areas of the plastic requiring repair. Holes and rips found shall be patched with 6-mil plastic and duct tape immediately after cleaning.

3.4.08 Special Procedures After Abatement:

Preliminary final cleanup: Prior to final cleanup and painting or sealing of the abated surfaces, remove and properly dispose of the plastic sheeting used for containment.

Begin removals with the upper-level plastic. Spray or mist the plastic with water to hold down dust and then fold the plastic in upon itself to trap any dust residue inside.

Before removal of floor plastic, spray the plastic and sweep as indicated in Item 3.04C. Fold the plastic carefully from the corners/ends to the middle to trap any remaining lead dust. Place the plastic into double 4-mil or single 6-mil plastic bags, properly seal the bags, and remove the bags from the premises.

As with daily cleanups, this plastic removal process requires the use of protective equipment, especially appropriate respirators.

Do not remove plastic sheets used to isolate contaminated rooms from non-contaminated rooms at this time. These sheets shall remain in place until after the preliminary final cleanup is complete and then carefully removed as described above.

3.4.09 After the plastic has been removed from the contaminated area, perform the following cleanup activities:

HEPA vacuum the entire area as specified in Item 3.04 B.1. Start with the galleries farthest from the entrance to avoid re-tracking dust through the already-cleaned area. In each gallery, begin vacuuming at the ceilings and proceed down the walls, making sure every surface is treated, including, but are not limited to: ceilings, walls, floors, pipes and fixtures of any kind (light, electrical).

Wash down the entire affected area with a high phosphate detergent as specified in Item 3.04 B.2.

HEPA-vacuum the affected area again, as specified in Item 3.04 B.1.

Cleaning of workers, tools, equipment and vehicles:

Personal hygiene: Workers shall carefully follow the personal hygiene procedures of 29 CFR 1926.62.

Supplies: Regularly replace consumable/disposable supplies, such as mop heads, sponges, and rags, at least at the end of each abatement project or monthly, whichever comes first. Treat soiled items as contaminated debris.

Equipment: Clean durable equipment, such as power and hand tools, generators, and vehicles, at least at the end of each abatement project or monthly, whichever comes first. This cleaning shall consist of a thorough HEPA vacuuming and washing with a high phosphate solution.

Preliminary visual inspection:

After the preliminary final cleanup effort is completed, the independent, third-party consultant shall visually inspect the entire affected area to ensure that all surfaces requiring abatement have been addressed, and all visible dust and debris have been removed. If the results of the visual inspection are unsatisfactory, affected surfaces shall be re-abated and/or re-cleaned, in accordance with the inspector’s instructions, at the Contractor’s expense, until satisfactory results are achieved.

3.4.10 Final cleanup: After painting/sealing is complete, perform the following final cleanup activities in the entire affected area:

HEPA-vacuum the area as specified in Item 3.04 B.1.

Wash down the area with a high phosphate detergent as specified in Item 3.04 B.2.

HEPA-vacuum again as specified in Item 3.04 B.1.

3.4.11 Final inspection:

3.4.12 After the final cleanup is complete, the independent, third-party consultant shall perform a final inspection to:

Verify that the abatement work is in compliance with the specifications.

Detect the presence of lead dust.

The Owner’s Environmental Consultant will perform both a visual inspection and clearance testing of lead levels in surface dust as specified in Items 3.05 and 3.06.

3.5 POST-ABATEMENT VISUAL INSPECTION.

The independent, third-party consultant shall confirm job completeness by determining whether all surfaces have been abated according to the approved abatement plan. Special attention will be given to areas where lead paint has been removed adjacent to paint that is intact (for example, where paint has been removed from a door frame but non-lead paint is left on the baseboard). Ensure that paint at this joint is sound. The independent consultant shall verify that all abated surfaces and floors have been repainted or otherwise sealed.

The independent, third-party consultant shall determine whether the area has been adequately cleaned by observing all surfaces for dust and debris.

3.6 TESTING ASSOCIATED WITH THE CLEARANCE PROCESS.

Upon completion of final cleanup and post-abatement visual inspection, the independent, third-party consultant shall test remaining surface dust to verify that only acceptable levels of lead dust remain before returning the area to active operation. This surface dust testing process is referred to as clearance criteria.

Surface dust sampling and testing shall be performed no sooner than 24 hours after completion of post-abatement cleanup activities, to allow any airborne lead dust present to settle

The surface wipe sampling method will be used for surface dust sampling. This method uses commercial wipes moistened with a non-alcohol wetting agent. Surface dust sampling will not be performed if there is a visible accumulation of dust or debris. In this case, surface wipe sampling will be deferred until the contractor completes a thorough cleanup.

Upon determination that lead dust is within acceptable levels the independent third-party consultant shall issue an “Authorization for Re-Occupancy” and “Certification of Visual Inspection”.

3.7 WASTE DISPOSAL – GENERAL.

Prior to the start of abatement operations, determine which waste materials may be hazardous. Keep hazardous waste segregated from solid waste, so that proper disposal of the waste material can be achieved.

Do not leave waste on the property in an unsecured area. Do not dump waste by the roadside, or in a nearby unauthorized dumpster. Do not burn or incinerate waste, due to the danger from lead fumes.

Do not flush lead-contaminated wash water into storm drains or sanitary sewers without permission of local authorities.

3.8 SOLID WASTE (NON-HAZARDOUS) DISPOSAL:

Dispose of solid waste which has been evaluated and determined not to be hazardous in a State approved landfill. Wrap large debris in 6-mil plastic, seal with tape, and move to the trash storage area.

Transport the waste to the disposal facility in covered vehicles. Do not use residential or commercial trash collection services without approval of State and local authorities. Covered dumpster services are acceptable, if the service company is informed of the presence of lead, and that appropriate disposal methods are used.

3.9 HAZARDOUS WASTE DISPOSAL.

Dispose of hazardous waste at a hazardous waste disposal facility, usually called a treatment storage and disposal facility (TSD). A TSD shall have an EPA ID number and authorization (either a permit or “interim status”) to operate. It is the responsibility of the abatement contractor to ensure that the TSD meets all legal requirements. The TSD can advise on appropriate packaging of waste, restrictions on disposal (e.g., liquids in landfills), and technical issues, such as methods for removing liquids from wastes.

Transporters shall have an EPA ID Number and must meet U.S. Department of Transportation (DOT) requirements for shipping containers. A good transporter will be able to advise the abatement Contractor on bagging and special handling of hazardous wastes.

Take special care when removing hazardous waste from the abatement site, in order to avoid environmental contamination or injury to workers or residents. While in the work area, the exterior of the filled waste containers shall be HEPA vacuumed and wet-wiped to remove residual contamination. If plastic bags are used, they shall be bagged again as they come out of the work area. Remove waste from work areas at times when employee use of hallways and stairwells is low. The path from the work area to the truck or dumpster shall be planned in advance to minimize contacts with employees.

Containers shall be moved and packed into the truck with care. When possible, use hand trucks, dollies, or pull cars, along with ramps or trucks with lift gates. These procedures will help minimize container breakage and consequent exposure of residents or employees to hazardous waste.

Submit signed manifests to verify that all steps of the handling and disposal process have been completed properly.

End of section

SECTION 02100

SITE CLEARING

PART 1 – GENERAL

1.1 SCOPE. Section includes removal of surface debris; removal of paving, curbs; removal of trees, shrubs, and other plant life; removal of underground storage tanks if encountered; removal of abandoned utilities; and topsoil excavation and removal of existing fencing.

1.2 GENERAL.

1.2.01 Definitions.

Site clearing includes clearing site, loading and removing waste materials from site, and applying herbicide to designated plant life. The removal of trees with diameter of less than 8 inches (20.3 cm) as measured at a point 4 ½ feet (1.4 m) above the base of the tree at the ground line will be included in the payment for site clearing.

Tree and stump removal includes removal, disposal, backfilling with approved materials and applying herbicides as needed.

Trees having major limbs lower than 4 ½ feet (1.4 m) from the ground will be measured at the smallest diameter below such limbs.

Fence removal includes removing and disposing of the fence materials and gates and backfilling the post holes as required.

Pavement removal includes full depth removal of bituminous, concrete, bituminous over concrete at or any other pavement materials, sawcutting and disposal of removed material. Pavement removal shall be measured by the square yard.

Curb and curb gutter removal includes sawcutting, removal and disposal of removed material.

Sidewalk removal includes sawcutting, removal and disposal of removed material.

PART 2 – PRODUCTS

2.1 MATERIALS.

2.1.01 Herbicide. Use Banvel CST or an equal approved by the Engineer.

2.1.02 Fill Material. Granular Material Class III as per current edition of MDOT Standard Specifications for Construction.

PART 3 – EXECUTION

3.1 PREPARATION. Verify that existing plant life designated to remain is tagged or identified. Identify a waste area for placing removed materials.

3.1.01 Protection. For protection of underground utilities and according to Public Act 53, 1974, the Contractor shall dial Miss Dig 1-800-482-7171 a minimum of three full working days, excluding Saturdays, Sundays, and holidays, before beginning each excavation in areas where public utilities have not been previously located. Utility members will also be routinely notified. This does not relieve the Contractor of the responsibility of notifying utility owners who may not be a part of the Miss Dig alert system.

Protect trees, plant growth and features designated to remain as final landscaping. Protect benchmarks, survey control points and existing structures from damage or displacement.

3.1.02 Clearing. Clear areas required for access to site and execution of work. Remove trees and shrubs within construction areas as directed by the Engineer. Remove stumps, and roots. Where stumps may not be removed to avoid damages to existing utilities, apply herbicide to remaining stumps to inhibit growth.
Clear undergrowth and deadwood without disturbing subsoil.

3.1.03 Removal. Remove debris, and extracted plant life from site. Remove payment, driveways, curb, gutters, sidewalk, to and existing joint or sawed joint. Bituminous and concrete shall be sawed to full depth. Adjacent cut soils or base materials removed when removing concrete shall be replaced with a similar material acceptable at the Contractor’s expense.

Removed materials shall become the property of the Contractor unless otherwise shown on the plans or in the proposal. Materials reserved for use by the Owner shall be removed without damage and delivered to a location directed by the Engineer. Materials not incorporated into the new work, which become the property of the

Contractor, shall be properly disposed of before acceptance of the project. Salvaged materials meeting specification requirements may be used in the new work, if approved.

For all material placed outside of the right-of-way, the Contractor shall furnish the Engineer written permission from the property owner of the disposal site. Disposal will not be permitted in a wetland or flood plain unless permits are obtained from the appropriate regulatory agencies.

3.1.04 Topsoil Excavation. Excavate topsoil from entire site without mixing with foreign materials for use in finish grading. Do not excavate wet topsoil. Stockpile in area designated on site to depth not exceeding 6 feet (1.8 m) and protect from erosion. Material shall be stockpiled on impervious material and covered over with the same material until disposal. Remove excess topsoil not intended for reuse from site as directed by the Engineer.

End of Section

SECTION 02140

DEWATERING

PART 1 - GENERAL

1.1 SCOPE. This section includes all dewatering or groundwater control work complete with design, construction and operation and abandonment of dewatering or groundwater control systems, protection of personnel and structures, and environmental protection and restoration.

1.2 GENERAL.

1.2.01 Coordination. Perform dewatering work as necessary to lower and control groundwater levels and hydrostatic pressures to permit excavation and construction to be performed in near-dry conditions. Control of surface and subsurface water, ice and snow are part of dewatering requirements.

Where applicable, the Contractor shall obtain and pay for all permits and inspections for dewatering construction in accordance with the provisions of Part 91 PA 451, State of Michigan, and all local government agencies having jurisdiction. No additional claim for compensation shall be allowed because of the Contractor's failure to obtain or pay for such permits and inspections.

1.2.02 Governing Standards. All dewatering systems design and construction shall conform to the provisions of the "Soil Erosion and Sedimentation Control Act of the State of Michigan, Part 91 of Act 451; PA of Michigan."

Dewatering operations shall conform to the requirements of all federal, state, and local agencies having jurisdiction.

1.3 QUALITY ASSURANCE. Contractor shall be responsible for the complete design of all structures and methods proposed for dewatering the project site, including the implementation of all materials, tools and equipment proposed for use in the Work. Temporary wiring with the dewatering shall comply with applicable portions of the National Electrical Code.

1.4 SUBMITTALS. Submit proposed dewatering plan and methods, including all proposed equipment to be used. Identify any scheduling or sequencing requirements.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Control of groundwater shall be accomplished in a manner that will preserve the strength of the foundation soils, will not cause instability of the excavated slopes, and will not result in damage to existing structures. Where necessary to this purpose, the water will be lowered in advance of excavation by wells, well points, or similar methods. Open pumping will not be permitted if it results in boils, loss of fines, softening of the subgrade, or slope in stability. Wells and well points will be installed with suitable screens and filters so that pumping of fines does not occur. Discharge will be arranged to facilitate sampling by the Engineer.

Take all steps necessary, during the Work of this Section, to protect surrounding property and adjacent buildings, private water supplies, roads, drains, sewers, structures, and appurtenances. Adequate measures shall be taken to protect such property and construction from the effects of the dewatering operations.

PART 3 - EXECUTION

3.1 INSPECTION. Prior to beginning any work, Contractor shall verify in the field the location, type and capacity of all existing drainage facilities and conditions which will affect the Work of this Section. No allowances shall be made for conditions found during the progress of the dewatering operations because of the Contractor's failure to verify such conditions.

The Contractor shall make field verification of all existing structures and utilities at the site of the Work which are scheduled to remain and which may be affected by the Work of this Section. The Contractor shall be responsible for any damage to existing structures and/or utilities caused because of his Work and shall repair such damage at his expense to the satisfaction of the Engineer.

3.2 PREPARATION. The Contractor shall review the soil report prior to bidding this project and shall consider this in the design of their dewatering or groundwater control systems.

3.3 INSTALLATION. Provide an adequate system to lower and control groundwater in order to permit excavation, construction of structures, and placement of fill materials under dry conditions. Install sufficient dewatering equipment to pre-drain water-bearing strata above and below bottom of structure foundations, drains, sewers, and other excavations. The excavations shall be kept dry until exterior walls have been completed and until the structures have been backfilled. Drainage ditches shall not be placed within the area to be occupied by any structure except where permitted by Engineer. When such ditches are placed beneath the structures, they shall be backfilled with Class C (3000 psi) concrete.

Reduce hydrostatic head in water-bearing strata below structure foundations, drains, sewers and other excavations to extent that water level and piezometric water levels in construction areas are below prevailing excavation surface.

Prior to excavation below groundwater level, place system into operation to lower water levels as required and operate it continuously 24 hours a day, 7 days a week until drains, sewers and structures have been constructed, including placement of fill materials, and until dewatering is no longer required.

Dispose of water removed from excavations in a manner to avoid endangering public health, property, and portions of work under construction or completed. Dispose of water in a manner to avoid inconvenience to others engaged in work about the site. Provide sumps, sedimentation tanks, and other flow control devices as required by governing authorities.

Provide standby equipment on site, installed and available for immediate operation if required to maintain dewatering on a continuous basis in an event any part of system becomes inadequate or fails. If dewatering requirements are not satisfied due to inadequacy or failure of dewatering system, perform work as may be required to restore damaged structures and foundation soil at no additional expense to the owner.

3.4 PERFORMANCE. The Contractor shall maintain all finished excavation work free of water during the preparation of the subgrade and until the completion of the work. No ground or surface water shall be discharged into any existing sanitary sewer. No unit of work shall be constructed under water except as otherwise directed by the Engineer. Provide and maintain adequate dewatering equipment to remove and dispose of all surface or groundwater entering excavations, trenches or other parts of the work. Each excavation shall be kept dry during subgrade preparation and continually thereafter until the construction is complete. All excavations which extend down to or below the static groundwater elevation shall be dewatered by lowering and maintaining the groundwater level beneath such excavations at distance of not less than 12 inches below the bottom of the excavation or as directed by the Engineer. Drainage system methods shall not cause any damage to wells or adjacent property. All outlet drainage piping and conduit shall be kept clean and free from sediment. The Contractor shall be held responsible for the condition of all pipes, conduits and structures, which he may use for drainage.

Sumps and pump wells used as a part of the dewatering system shall be strongly sheathed and braced to protect the construction while in use. Tops of well casings must be covered to prevent animals and debris from entering and shall be 2 to 3 feet (61 to 91.5 cm) above ground. Sumps and wells, when abandoned, shall be backfilled and compacted to the satisfaction of the Engineer.

Methods used in drilling wells associated with dewatering or groundwater control systems shall be the responsibility of the Contractor and shall be acceptable to the Engineer. Drilling methods shall insure proper placement of well materials and shall not involve displacement of earth formations. Drilling shall be done with equipment of proper type and in good condition, acceptable to the Engineer.

Equipment for pumping and pumping methods associated with dewatering or groundwater control systems shall be the responsibility of the Contractor and shall be acceptable to the Engineer. The Contractor shall construct or furnish adequate discharge piping to conduct and dispose of the water so as to prevent damage to existing structures or property. Pumping equipment shall be of proper type and size for the work and in good condition and shall be acceptable to the Engineer. Provide all anchors and supports for pumping equipment.

Upon completion of dewatering work for the Project, abandon and/or fill all holes, trenches, ditches and other earth excavations created by the work of this Section and not scheduled to remain. Do all filling, backfilling and grading to restore excavations and earth banks to the lines and levels indicated on the Plans and as directed by the Engineer. All earth fills shall be compacted to a density equal to that of the surrounding undisturbed earth.

End of Section

SECTION 02145

SLUDGE REMOVAL

PART 1 - GENERAL

1.1 SCOPE. The Contractor shall furnish all labor, supervision, materials, tools, equipment and incidentals specified and required to clean walls, floors, ceilings, and columns of wet wells. Contractor shall clean, transport and dispose material at a city approved disposal facility. Contractor will not be permitted to discharge grit into any part of the pumping station.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

3.1 WET WELL CLEANING. Cleaning of wet well shall include the removal of slime, sludge, and any organic material from the walls, floors, ceilings and columns of wet wells after each well has been dewatered. Additionally, Contractor shall thoroughly clean pump suction bells under this contract to remove all debris and deposits to render the site clean.

Cleaning of the dewatered wet well shall be conducted by workmen experienced in such work and all necessary equipment shall be provided. Cleaning methods shall be approved by Engineer. Contractor should anticipate the dewatered wet wells will contain grit as well as sludge.

Contractor shall furnish and install all temporary pumps, fittings, and hosing necessary to supply adequate water pressure to completely clean all internal surfaces of the dewatered wet wells and the pump suction bells. All necessary electrical connections and wiring to bring power to any cleaning equipment shall be provided by the Contractor

Contractor shall not discharge any wash water that contains grit to any sewer. Contractor may be permitted to discharge wash water to the sewer if he can prove to the satisfaction of the Engineer that such discharge is grit free. Contractor shall furnish all necessary grit removal facilities to accomplish such grit free discharge, as required.

Contractor shall provide adequate lighting, ventilation and safety equipment as required and shall comply with all applicable confined space entry regulations whenever workmen are to enter the wet well in connection with this work.

3.2 REMOVAL OF WET WELL CONTENTS. Contractor shall furnish all necessary equipment, pumps, piping, hosing, and any additional items required to completely remove all grit, sludge, and other material from the dewatered wet well. All sludge/grit removal operations shall be conducted which strict observance of governing regulation, and with approval of Engineer. Upon completion of the work, Engineer will conduct suitable test to determine whether the work has been performed properly and that all contents have been removed from the wet wells.

3.3 SLUDGE TRANSPORTATION. The Contractor shall furnish suitable means for the transportation of sludge and grit to an MDEQ approved location for disposal. Sludge transportation shall be undertaken by the Contractor in strict accordance with all the local ordinances and state and federal regulations and guidelines, in an environmentally safe, nuisance free manner. Contractor shall haul sludge in approved trucks registered for waste hauling. For the protection of the Owner, copies of such licenses and registration numbers shall be furnished to the Engineer prior to the undertaking of any work at the site.

3.4 SLUDGE/GRIT DISPOSAL. Contractor's method of disposal shall fully comply with all local ordinances, state and federal regulations and shall meet the Engineer approval before execution by the Contractor. Before commencing any work, the Contractor shall inform the Engineer in writing as to the method of sludge/grit disposal and shall provide written documentation to the Engineer that Contractor has secured access to a specific legal disposal site and that disposal at the site is not in violation of any federal, state, or local requirements. Contractor shall be responsible for testing material in compliance with the laws and regulations governing the work. Contractor shall be responsible for all costs related to the testing of material.

3.5 CLEANUP AND RESTORATION. Any sludge or grit which is spilled by the Contractor shall be cleaned up immediately. Contractor shall ensure that no area, including that in the immediate vicinity of the work, is permitted to become fouled, odorous or unsightly, due to cleaning of the wet wells. Contractor shall cease work upon receiving notice from Engineer until the problem is corrected.

3.6 INSPECTION. Contractor shall submit written request to Engineer for inspection of cleaned facility in accordance with Master Specifications Section 01190, Contract Closeout and Cleaning. Contractor shall remedy deficiencies as requested by Engineer.

End of Section

SECTION 02211

EXCAVATING, FILLING AND GRADING

PART 1 - GENERAL

1.1 SCOPE. This section covers general earthwork activity and shall include the necessary clearing, grubbing, and preparation of the site; removal and disposal of all debris; excavation and trenching as required; the handling, storage, transportation, and disposal of all excess excavated material; all necessary sheeting, shoring, and protection work; preparation of subgrades; pumping and dewatering as necessary or required; protection of adjacent property; backfilling; pipe embedment; construction of fills and embankments; surfacing and grading; and other appurtenant work.

1.2 GENERAL. With reference to the terms and conditions of the construction standards for excavations set forth in the OSHA "Safety and Health Regulations for Construction", Chapter XVII of Title 29, CFR, Part 1926, the Contractor shall employ a competent person and, when necessary, a registered professional engineer, to act upon all pertinent matters of the work of this section.

Backfilling and construction of fills and embankments during freezing weather shall not be done except by permission of the Engineer. No backfill, fill, or embankment materials shall be installed on frozen surfaces, nor shall frozen materials, snow, or ice be placed in any backfill, fill, or embankment.

With reference to geotechnical instrumentation; the Contractor must coordinate installation of all instrumentation for construction activities with the Engineer and all instruments are to be installed in sufficient time prior to a construction activity to take baseline readings.

Conform to applicable state and local codes for disposal of excavated materials judged not suitable for backfill. Obtain disposal permit from local enforcing agency. Obtain permission to use any storm sewers, drains, or ditches for dewatering purposes. Ensure Soil Erosion and Sedimentation Control Program is followed.

1.3 QUALITY ASSURANCE. The Contractor shall utilize the services of a registered professional engineer, experienced in the design and analysis of all aspects of below grade construction, for the determination and control of the Contractor’s means and methods of performing the work. Such means and methods shall be approved by the Engineer in advance of their use.

However, the approval by the Engineer shall not release the Contractor from liability for injury to persons, damage to property, or poor workmanship.

Use AASHTO T-180 Modified Method C, AASHTO T-99 “One Point Test”, or the Cone Density Method developed by MDOT to determine maximum unit weight.

Do work in accordance with the U.S. Department of Labor Safety and Health Regulations for construction promulgated under the Occupational Safety Act of 1970 (PL 91-596) and under Section 107 of the Contract Work Hours and Safety Standards Act (PL 91-54).

For geotechnical instrumentation the quality assurance refers that:

> The Contractor shall retain a qualified survey firm with a minimum of five years experience. The surveyor supplied by the survey firm shall be a licensed surveyor in the State of Michigan with a minimum of four years of experience in similar work. The surveyor’s experience shall have included determination of horizontal displacement to the accuracy specified hereinafter.
>
> The geotechnical engineering firm retained by the Contractor as a specialty subcontractor, assigned to install and monitor instrumentation must have at least five years of experience in installation and monitoring of the types of instruments specified herein.
>
> The geotechnical instrumentation specialty subcontractor shall provide a qualified Geotechnical Instrumentation Engineer who is a registered Professional Engineer in the State of Michigan who has a minimum of a Masters degree in geotechnical engineering, and who has at least five years of experience in installation and monitoring of the types of instruments specified herein.

1.4 SUBMITTALS.

1.4.01 Drawings and Data Submit detailed sequenced pre-excavation, excavation and backfilling plans for all work. Prepare and submit a Certificate of Design for each temporary sheeting system not detailed on the Drawings. Submit design calculations and necessary Drawings for shaft bracing, ground water control, ventilation requirements and geotechnical concerns.

Submit product data on geotextile separator and filter fabric.

1.4.02 Certifications. For dewatering systems, submit a Certificate of Design, support data, and detailed plans indicating proposed type and location of dewatering system, type and location of geotechnical instrumentation and point of disposal of pumped water.

Submit Certificate of Design for each temporary earth retention system not detailed on the drawings. Design of all temporary earth retention systems shall be by a Registered Professional Engineer in Michigan.

1.4.03 Samples. Provide 0.5 cubic foot (0.014 cubic meter) samples of all proposed materials in sealed plastic buckets taken furnished material.

1.4.04 Test Reports. Submit field density test reports. Submit gradation test for all furnished material.

1.4.05 Record Drawings. Record location of underground utilities and other construction on project record drawings.

1.4.06 Geotechnical Submittals. Provide a geotechnical instrumentation monitoring plan for protection of existing surface and underground facilities and utilities. Indicate all planned measures to monitor and control soil movements, water, vibrations or any other conditions that could potentially endanger existing facilities. Indicate planned location of instruments, parameter to be monitored by each instrument at each location, reading frequency, action levels for each instrument, outline of remedial action, and procedures for ensuring reading correctness. Manufacturer's product data shall be identified on all instruments.

Procedures for all instruments specified herein, for factory calibration, acceptance tests, installation, field calibration, collection of initial data, collection of subsequent data, date reduction, processing of plotting and reporting, protection from damage, and maintenance, together with all required field and office forms.

Within two days of receipt of each instrument at the site, submit to Engineer a copy of factory calibration.

Prior to installing each instrument, submit to Engineer the planned location for that instrument.

Within five days of installing each instrument, submit to Engineer asbuilt location as specified, and installation record sheet.

Within 24 hours of reading an instrument, submit to Engineer plotted data. When readings indicate soil or structure movement the Engineer shall be notified immediately.

For Geotechnical instrumentation, the manufacturer of each instrument shall provide an instruction manual that shall include:

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Provide and maintain barricades, warning lights, warning signs, and other protection required by applicable laws for safety of persons and property.

Protect benchmarks, adjacent structure, utilities, and property during construction operations. Protect excavations by shoring, bracing, sheet piling, underpinning, or other methods required to prevent earth movement. Costs associated with replacing damaged elements and items shall be borne by the Contractor.

Notify Engineer of unexpected subsurface conditions, provide adequate safety measure and discontinue affected work in area until notified to resume work.

2.2 MATERIAL.

2.2.01 Filter Fabric. Filter fabric shall be a nonwoven fabric consisting of only continuous chains of polymeric filaments or yarns of polyester formed into a stable network by needle punching. The fabric shall be inert to commonly encountered chemicals; shall be resistant to mildew, rot, ultraviolet light, insects, and rodents; and shall have the following properties:

Property	Test Method	Unit	Minimum Average Roll Value (weakest principal direction)
Fabric Weight	ASTM D3776	oz/yd^2	5.7
Grab Strength	ASTM D4632	lb	155
Grab Elongation	ASTM D4632	percent	60
Apparent Opening Size	CW-02215	U.S. Standard Sieve Size	70

The filter fabric shall be provided in rolls wrapped with protective covering to protect the fabric from mud, dirt, dust, and debris.

2.2.02 Geotextile Separator. Geotextile with Grab Tensile Elongation at – Break less than 50 percent shall meet the requirements in the column for woven geotextiles. Geotextiles with Grab Tensile Elongation-at-Break equal to or greater than 50 percent shall meet the requirements of column for non-woven geotextiles below.

Property/Test Method	Woven	Non-Woven
ASTM D4632 Grab Tensile Strength, lb.	270 min	200 min
ASTM D4553 Trapezoid Tear Strength, lb.	100 min	75 min

ASTM D4833 Puncture Strength, lb.	100 min	75 min
ASTM D4751 Apparent Opening size, inch	8 x 10^{-3}	8 x 10^{-3}
ASTM D4491 Permittivity, Sec-1	0.05 min	0.5 min

2.2.03 Polyethylene Film. Polyethylene film shall be Product Standard PS17.

2.2.04 Granular Fills. Granular fill material shall be crushed rock or gravel; shall be free from dust, clay, and trash; and shall be graded 1-1/2 inch (3.8 cm) to No. 4 as defined in ASTM C33. Refer to the Drawings for locations of specific fill materials to be placed.

2.2.05 Bank-run Gravel. Division 9, current MDOT Standard Specifications for Construction. Granular Material for Fill, Class I or such other sizes as may be approved. Fill may be approved excavated material or can be obtained from approved natural deposits and unprocessed except for the removal of unacceptable material and stones larger than the maximum size permitted. Material shall be free from vegetation and substantially free from loam and other organic matter, clay, other fine or harmful substances, frost snow, ice, and aggregations of frozen soil particles. Compact thoroughly by means of suitable power-driven tampers or other power-driven equipment to density indicated on the Drawings.

2.2.06 Class II Granular Material. Division 9, current MDOT Standard Specifications for Construction. Approved sand, gravel, crushed stone, blast-furnace slag or combination thereof, with 100% passing 3 inch (7.6 cm) sieve, 60 to 100% passing 1 inch (2.5 cm) sieve, 0 to 30% passing No. 100 sieve, and loss by washing not to exceed 7%, per MDOT Standard Specifications 8.02.06 for Granular Material Class II.

2.2.07 Select Borrow. Division 9, current MDOT Standard Specifications for Construction. Granular Material for Fill, Class III or such other sizes as may be approved. Maximum stone size 6 inch (15.2 cm) and material well-graded throughout entire size range. Borrow free from roots, leaves, and other organic materials. Borrow also free of ice or frost and no aggregations of frozen soil particles. Moisture content of borrow within plus or minus 3 percent optimum moisture content at the borrow source. Compact thoroughly by means of suitable power-driven tampers or other power-driven equipment to the density indicated on the Drawings.

2.2.08 Sand. Division 9, current MDOT Standard Specifications for Construction , type 2NS sand or such other sizes as may be approved by the Engineer.

2.2.09 Aggregate Base Material. Division 9, current MDOT Standard Specifications for Construction. Aggregate base for aggregate surfaced or paved surfaces, Michigan Department of Transportation series 21AA or such other sizes as may be approved by the Engineer.

2.2.10 Graded Gravel. Gravel for compacted trench backfill shall conform to the following gradation:

Sieve Size	Percent Passing by Weight
1 inch (2.5 cm)	100
¾ inch (1.9 cm)	85 – 100
3/8 inch (1.0 cm)	50 – 80
No. 4	35 – 60
No. 40	15 – 30
No. 200	5 – 10

The gravel mixture shall contain no clay lumps or organic matter. The fraction passing the No. 4 sieve shall have a liquid limit not greater than 25 and a plasticity index not greater than 5. An alternative material may be used if approved by the Engineer.

2.2.11 Select Excavated Material. Select excavated material shall be of a type, which can be compacted to the density specified. Such material shall be free from rubbish or debris, frozen lumps, boulders, or concrete fragments, sod, organic material, tree roots, stumps, branches or other timber. Select excavated material considered suitable for backfill shall be sand, sand-gravel mixture, clean clay, or a combination thereof.

Generally, blue clay, foundry sand, organic material and slag shall not be considered a suitable backfill material.

2.2.12 Earthfills, Embankments, Engineered Fill And Structure Backfill. Only the soils comprising the ASTM D2487 classifications GW, GP, GM, GC, SW, SP, SM, SC, CL and ML and having a plasticity index of less than 25 shall be used for earthfills, embankments, engineered fills and structure backfill. The material shall be free from rocks or stones larger than the specified size, brush, stumps, logs, roots, debris and other organic or deleterious materials.

2.2.13 Lean Concrete. Lean concrete shall be a mixture of Portland cement, aggregate and water, having a minimum compressive strength of 1500 psi (10,342.5 kPa) at 28 days.

Two initial gradation tests for each type of embedment, fill, embankment, engineered fill, aggregate base, structure and trench backfill material and one additional gradation test for each additional 1000 tons (909,091 kg) of each material.

2.2.14 Tests. All tests to ensure that embedment, fills and embankments, engineered fill, structure and trench backfill materials, and other fills and their placement comply with specified requirements shall be made by an independent testing laboratory at the expense of the Contractor. The following tests will be required as directed by Engineer:

Two moisture-density (Proctor) tests in accordance with AASHTO T-180 modified Method C, the MDOT cone density method or AASHTO T-99 "one-point" test as appropriate for each type of embedment, fill, aggregate base, embankment, engineered fill, structure and trench backfill material proposed, except for granular embedment material.

For pipelines, in-place field density tests at average intervals of 1,000 feet (304.8 meter) along the trench.

For area fills and embankments an in-place field density test for each 500 cubic yards (383 cu meters) of material placed.

For engineered fill and structure backfill, in-place field density and moisture tests for each 300 cubic yards (229.4 cu m) of material placed.

PART 3 - EXECUTION

3.1 INSPECTION. Locate off-site stockpile areas for suitable excavated material and borrow. Do not stockpile excavated material or borrow on site without approval of Engineer. Select disposal areas for unsuitable excavated material and dispose of in accordance with local laws and ordinances.

Carry out program of pre-excavation, excavation, dewatering, sheeting, and bracing in such manner as to eliminate undermining or disturbing buried utilities, conduits, foundations of existing structures, or of work previously completed under this contract.

Excavate to widths that give suitable room for building structures or laying and jointing piping; furnish and place all sheeting, bracing, and supports; do all pumping, and draining and render bottom of excavations firm and dry and acceptable in all respects.

Make excavations and construct embankments and backfill excavations to the lines and grades indicated on the Drawings and compact to the specified density or as indicated on the Drawings.

Provide suitable and safe bridges and other crossings where required for accommodation of travel, and to provide access to existing facilities during construction, and remove said structures thereafter.

3.2 PREPARATION. Establish the extent of excavation by area and elevation; designate and identify datum elevation. Identify, flag and stake known underground, surface and aerial utilities. Set out all required lines and levels.

All sites to be occupied by permanent construction or embankments shall be cleared of all logs, trees, roots, brush, tree trimmings, snags, bark, and other objectionable materials and debris. Cut trees, stumps, and stubs to be cleared, except where clearing done by machinery, as close to ground surface as practicable, but no more than 6 inch (15.2 cm) above ground surface for small trees and 12 inches (30.5 cm) for larger trees.

Remove existing signs, posts, catch basin frames and grates, and manhole frames and covers, within construction path unless directed otherwise. Store at site designated by Engineer.

The Contractor shall prevent any damage to pipes, conduits, wires, cables and structures above or below ground. No land monuments or property markers shall be damaged or removed without the prior authorization of the Engineer.

All holes remaining in the project area after the completion of clearing and grubbing operations shall have the sides broken down or leveled if necessary to flatten out the slopes. Holes, depressions, ruts and other imperfections shall be refilled with acceptable material and compacted in layers to the density specified under Earthfills and Embankments. The same procedure shall apply to all holes remaining in excavation areas where the depth of the holes exceeds the depth of the required excavation.

Subgrades for fills and embankments shall be cleaned and stripped of all surface vegetation, sod, and organic topsoil. Remove stumps, roots larger than 3 inch (7.6 cm) in diameter to a depth of 12 inch (30.5 cm), and roots larger than 1/2 inch (1.3 cm) in diameter to a depth of 6 inch (15.cm). Measured depths from existing ground surface or proposed finished grade, whichever is lower. Proof roll or compact subgrade to density requirements for backfill material. All waste materials shall be removed from the site and disposed of in accordance with all applicable laws, ordinances, rules and regulations by and at the expense of the Contractor. Burning of materials at the site will not be permitted. Taking loam from site is not permitted.

3.3 PERFORMANCE.

3.3.01 Stripping. Remove heavy growth of grass, sod, decayed vegetation and other unsuitable material from the areas to be stripped.

3.3.02 Conservation of Topsoil. Topsoil to a depth of 6 inches (15.2 cm) within the areas to be stripped shall be removed and stockpiled in a convenient area as approved. Topsoil stripped and stockpiled shall be without admixture of subsoil, free of plants and their roots, stones and other undesirable material. Topsoil suitable for Lawns shall be stored separately from other excavated materials.

3.3.03 Excavation. Excavations shall provide adequate working space and clearances for the work to be performed therein and for installation and removal of concrete forms. In no case shall excavation faces be undercut for extended footings.

Carry out no dewatering and no pre-excavation or excavation below the existing ground-surface until geotechnical instrumentation has been installed and base line data obtained.

Excavate all materials encountered and existing below grade obstructions as required to allow construction of the proposed building structures, utilities and site work as shown on Drawings and as hereinafter specified. Remove any rocks or boulders encountered less than 1/2 cubic yard (0.4 cu m) in volume.

Excavate to levels shown for footings, pile caps and grade beams. Excavate to 3 inches (5.1 – 7.6 cm) below bottom of slabs for mud mat unless otherwise indicated. Excavate as required to provide working clearance and to allow adequate inspection for structures. Excavate to subgrades specified herein below outside of building. Excavate in a manner, which minimizes the disturbance of the pre-excavation slopes.

Cut out soft areas of subgrade not readily capable of compaction. Backfill with approved fill materials and compact to density equal to requirements for subsequent backfill material.

Make no excavations to the full depth indicated when freezing temperature may be expected, unless the footings or slabs can be placed on non-frozen soil after the excavation has been completed. Protect the bottom of excavation from frost if placement of concrete is delayed. Should protection fail, remove frozen materials and replace with concrete or bank-run gravel, as directed, at no additional cost to Owner.

Where excavations may expose existing foundations to potential frost heave, provide adequate protection to prevent freezing below foundations.

Provide all measures necessary to ensure the safety of workers and of the existing facilities at all times during construction and in accordance with applicable City, State and Federal regulations.

There may be pipes, drains, and other utilities in certain locations. These have been indicated on the Drawings to the extent known, however the completeness or accuracy of the information given is not guaranteed.

3.3.04 Classification Of Excavated Materials. No classification of excavated materials will be made. Excavation and trenching work shall include the removal and subsequent handling of all materials excavated or otherwise removed in performance of the work, regardless of the type, character, composition, or condition thereof.

3.3.05 Preservation Of Trees. No trees shall be removed outside excavated or filled areas, unless their removal is authorized by the Owner. The Contractor shall be responsible for damages, outside these areas. Trees left standing shall be adequately protected from permanent damage by construction operations.

Protection for trees and shrubs shall include fences and boards lashed to trees to prevent damage by construction operations. No trees and shrubs shall be trimmed without prior permission of the Engineer. No material that needs to be stockpiled shall be placed against any trees. Only those trees and shrubs shall be removed which are in actual interference with excavation or grading work under this Contract and such removal shall be subject to approval by the Engineer. However, the Engineer reserves the right to order additional trees and shrubs removed at no additional cost to the Owner if such, in his opinion, are too close to the work to be maintained or have become damaged due to the Contractor's operations.

3.3.06 Protection Of Existing Structures. Support and protect from damage all existing pipes, poles, wires, fences, pavement, curbing, walkways, property line markers, bench marks, monuments and other structures, not indicated for relocation which the Engineer decides must be preserved in place without being temporarily or permanently relocated. Should such items be damaged, restore without compensation therefore, to at least as good condition as that in which they were found immediately before the work was begun.

3.3.07 Relocation And Replacement Of Existing Structures. Whenever the Contractor encounters certain unforeseen or unknown conditions pertaining to existing structures and is so ordered in writing, he shall do the whole or such portions of the work as he may be directed, to change the location of, remove and later restore, or replace such structures, or to assist the Owner thereof in so doing.

Use care to avoid damage to materials when removing existing pipes or other structures.

The structures to which the provisions of the preceding two paragraphs apply include pipes, wires, and other structures which meet all of the following:

Are not indicated on the Drawings or otherwise provided for.

Encroach upon or are encountered near and substantially parallel to the edge of the excavation.

In the opinion of the Engineer will impede progress to such an extent that satisfactory construction cannot proceed until they have been changed in location, removed (to be later restored), or replaced.

Remove fences that interfere with the Contractor's operations, and (unless otherwise specified) later restore them to at least as good condition as that in which they were found immediately before the work was begun, without additional expense to the Owner. Contractor shall restore fences promptly and shall not leave restoration until the end of the construction period.

3.3.08 Care And Restoration Of Property. Do not use or operate tractors, bulldozers, or other power-operated equipment on paved surfaces when treads or wheels of which are so shaped as to cut or otherwise injure such surfaces.

Restore all surfaces which have been injured by the Contractor's operations, to a condition at least equal to that in which they were found immediately before work commenced. Use suitable materials and methods for such restoration.

Contractor shall restore existing property or structures promptly and shall not wait until the end of the construction period.

3.3.09 Unauthorized Excavation. Except where otherwise authorized, indicated, or specified, all materials excavated below the bottom of concrete walls, footings, slabs on grade, and foundations shall be replaced, by and at the expense of the Contractor, with lean concrete. Unauthorized excavation in other locations shall be filled with approved fill materials and compacted to the specified density for that type of fill.

3.3.10 Dust Control. During progress of work, conduct operations and maintain area of activities, including sweeping and sprinkling of streets at least once in the morning and once in the afternoon or more if necessary, so as to minimize the creation and dispersion of dust. Furnish and spread calcium chloride material, as directed, if Engineer decides that it is necessary to use calcium chloride for more effective dust control.

3.3.11 Blasting. Blasting or other use of explosives for excavation will not be permitted.

3.3.12 Dewatering. Dewatering equipment shall be provided to remove and dispose of all surface water and groundwater entering excavations, trenches, or other parts of the work. Provide and maintain ample means and devices (including spare units kept ready for immediate use in case of breakdowns) to intercept and/or remove promptly and dispose properly of all water entering trenches and other excavations.

Coordinate construction operations to minimize duration and extent of dewatering required.

Provide all equipment, tools, materials and labor required for dewatering operations for temporary control of artesian water in the underlying bedrock. Dewatering may be required in conjunction with grouting or other suitable methods necessary to seal leakage of artesian water. Leakage of artesian water may occur if rock grouting does not completely seal the rock or in the event that piles or sheeting penetrate the hardpan sufficiently to cause leakage.

Each excavation shall be kept dry during subgrade preparation and continually thereafter until the structure to be built, or the pipe to be installed therein, is completed to the extent that no damage from hydrostatic pressure, flotation, or other cause will result.

All excavations for concrete structures or trenches which extend down to or below groundwater shall be dewatered by lowering and keeping the groundwater level beneath such excavations 2 feet (61.0 cm) or more below the bottom of the excavation.

Modify dewatering operation if geotechnical instrumentation indicates movement of structures, sheeting or embankments.

Surface water shall be diverted or otherwise prevented from entering excavations or trenches to the greatest extent possible without causing damage to adjacent property.

The Contractor shall be responsible for the condition of any pipe or conduit which he may use for drainage purposes, and all such pipe or conduit shall be left clean and free of sediment.

3.3.13 Sheeting Shoring. Except where banks are cut back on a stable slope, excavations for structures and trenches shall be supported as necessary to prevent caving or sliding.

Provide shoring, including steel sheet piling, soldier beams and wood lagging or other protective measures, as may be necessary to protect adjacent structures, facilities and utilities. Contractor shall be responsible for the adequacy of the design installation and effectiveness of shoring and other protective methods utilized and repair damage resulting from failure to take adequate measures for protection of persons and adjacent property (including but not limited to land, structures, facilities, pavements, utilities and grades). Remove shoring when no longer required.
Prior to installation, make every effort to determine the presence of existing underground conditions not indicated. If unknown services or obstructions are discovered the contractor shall notify the Engineer before proceeding.

Trench sheeting may be removed only if the pipe strength is sufficient to carry trench loads based on trench width to the back of sheeting. Trench sheeting shall not be pulled after backfilling. With the concurrence of the Engineer, sheeting shall be left permanently in the trench when placing gravity sewers, force mains, water distribution mains, or transmission lines. Where trench sheeting is left in place, such sheeting shall not be braced against the pipe, but shall be supported in a manner which will preclude concentrated loads or horizontal thrusts on the pipe. Cross braces installed above the pipe to support sheeting may be removed after pipe embedment has been completed.

If Engineer of the opinion that at any point the shoring, bracing or excavation support systems are inadequate or unsuited for the purpose, resubmission of design calculations and working drawings for that point may be ordered, taking into consideration the observed field conditions. If the new calculations show the need for additional shoring and bracing, it should be installed immediately.

Steel sheet piling shall be furnished, installed, and left in place as required to limit the extent of excavations for the deeper structures and necessary backfill under adjacent shallower structures, and to protect adjacent structures and facilities from damage due to excavation and subsequent construction.

Drive sheeting ahead of excavation to avoid loss of material from behind sheeting. Avoid trimming behind face where sheeting will be driven, if excavating below sheeting. Prevent voids outside of sheeting. Immediately fill any voids that develop with sand, and compact.

Cut off sheeting and bracing at specified elevations, as directed by Engineer, or as indicated on the Drawings. Sheeting and bracing shall not be left in place in such a way as to endanger construction or other structures. Immediately backfill all voids left or caused by withdrawal of sheeting. Use suitable materials and compacting methods.

3.3.14 Stabilization. Subgrades for concrete structures and trench bottoms shall be firm, dense, and thoroughly compacted and consolidated; shall be free from mud and muck; and shall be sufficiently stable to remain firm and intact under the feet of the workers.

3.3.15 Compaction Equipment. Provide sufficient equipment units of suitable types to spread, level, and compact fills promptly upon delivery of materials.

Contractor may use any compaction equipment or device which he finds convenient or economical, but the Engineer retains the right to disapprove equipment which, in his opinion, is of inadequate capacity or unsuited to character of material being compacted.

3.3.16 Structure Foundation Preparation. Excavation: Excavation below proposed non-pile-supported concrete structures shall consist of removing all existing fill to the level of natural soils. Excavation shall be performed using methods and equipment that prevent disturbance of the bearing materials. Should bearing materials become disturbed due to excavation operations, they shall be recompacted, removed or stabilized to produce a firm, dense and thoroughly compacted and consolidated subgrade.

Excavations of unsuitable materials shall extend beyond the edge of the footing a distance equal to the depth of overexcavation below the bottom of the footing. In no case, however, shall proposed excavations undermine existing foundations. Foundations and slabs of existing structures shall be positively supported by means suitable to prevent damage to structures.

Subgrade Preparation: Subgrades below footings and slabs shall be compacted to at least 95 percent of the maximum dry density and moisture conditioned to between minus two (-2) and plus two (+2) percent relative to the optimum moisture content or as indicated on the Drawings.

Replacement Materials: Materials used to replace existing fills shall meet the quality and classification of engineered fill. Engineered fill shall be placed and compacted as specified for fills and embankments.

3.3.17 Construction Requirements. Subgrades and fills shall be periodically wetted to prevent desiccation. Should soils become desiccated, they shall be removed and replaced; soaked or; scarified, moisture conditioned and recompacted as specified herein to provide a subgrade within the specified moisture and compaction limits. Any soft areas which develop due to excessive moisture increase shall be dried out or removed prior to placing additional lifts or concrete.

3.3.18 Earthfills And Embankments. Fills and embankments shall be constructed to the lines and grades indicated on the drawings. To the maximum extent available, excess suitable material obtained from structure and trench excavation shall be used for the construction of fills and embankments. Additional material shall be provided as required.

All material placed in fills and embankments shall be free from rocks or stones larger than 6 inches (15.2 cm) in their greatest dimension, brush, stumps, logs, roots, debris, and other organic or deleterious materials. No rocks or stones shall be placed in the upper 18 inches (45.7 cm) of any fill or embankment. Rocks or stones within the allowable size limit may be incorporated in the remainder of fills and embankments, provided they are distributed so that they do not interfere with proper compaction.

Subgrade Preparation: After preparation of the fill or embankment site, the subgrade shall be leveled and rolled so that surface materials of the subgrade will be as compact and well bonded with the first layer of the fill or embankment as specified for subsequent layers.

Placement and Compaction: All fill and embankment materials shall be placed in approximately horizontal layers not to exceed 8 inches (20.3 cm) in uncompacted thickness. Material deposited in piles or windrows by excavating and hauling equipment shall be spread and leveled before compaction.

Each layer of material shall have the best practicable moisture content for satisfactory compaction. The material in each layer shall be wetted or dried as required and thoroughly mixed to ensure uniform moisture content and adequate compaction. Each layer shall be thoroughly compacted to 95 percent of maximum density at a moisture content in the range of 2 percent below to 2 percent above the optimum moisture content, or as indicated on the Drawings. If the material fails to meet the density specified, compaction methods shall be altered.

Wherever a trench is to pass through a fill or embankment, the fill or embankment material shall be placed and compacted to an elevation not less than 12 inches (30.5 cm) above the top of pipe elevation before the trench is excavated.

Earthfills and Embankments Over Reservoir or Basin Roof Slabs: Earthfills and embankments over reservoir or basin roof slabs shall be placed and compacted by using methods that will not damage or overload the structure; compaction in addition to that attained by placement operations will not be required. Rubber-tired equipment shall be used insofar as possible. Individual items of equipment operated on reservoir or basin roof slabs shall not have loaded weight in excess of 14,000 pounds (6342 kg) and shall be so operated that no impact loads are imposed on the structure. Fill material shall not be piled on the roof slab to a depth greater than 12 inches (30.5 cm) above finished grade elevation. Fill construction shall begin at the walls, and construction equipment shall operate on a layer of fill material at least 12 inches (30.5 cm) deep. Special care shall be taken to avoid damaging or disturbing any roofing membrane, tile drains, or granular fill material.

3.3.19 Granular Fills. Granular fills shall be provided where indicated on the drawings. Granular fills shall be placed on suitably prepared subgrades and compacted by vibration. Granular fills shall be compacted to not less than 95 percent of maximum density as determined by the MDOT cone density method or as indicated on the Drawings.

Where granular fills are to be covered with concrete, the top surface shall be graded to the required subgrade and covered with polyethylene film as specified in Master Specification Section 02750, Concrete Pavement.

3.3.20 Roadway Excavation. Excavation for roadways, drives, and parking areas shall conform to the lines, grades, cross sections, and dimensions indicated on the drawings and shall include the excavation of all unsuitable material from the subgrade. Provide and maintain, at all times during construction, adequate means and devices which will promptly remove and dispose of all water from any source entering any area of the work. Dewater by means which will ensure dry work areas and preservation of the final lines and grades. After shaping to line, grade, and cross section, the subgrade shall be compacted to a depth of at least 6 inches (15.2 cm) to 95 percent of maximum density at a moisture content in the range of 2 percent below to 2 percent above the optimum moisture content, or as indicated on the Drawings. This operation shall include any reshaping and wetting or drying required to obtain proper compaction. All soft or otherwise unsuitable material shall be removed and replaced with suitable material. Excavated material unsuitable for reuse shall be disposed of by the Contractor offsite. After removal of unsuitable material, where possible, 6 inch (15.2 cm) perforated underdrain pipe shall be placed from the low point of excavated area to a natural drainage course, ditch or storm sewer structure. The excavated area shall then be backfilled with an approved porous material. Where an outlet for underdrain pipe is not available and the surrounding earth is impervious, the backfill shall be made with clay free from silt and topsoil.

3.3.21 Trench Work. No more trench shall be opened in advance of pipe laying than is necessary to expedite the work. One block or 400 feet (121.9 m), whichever is the shorter, shall be the maximum length of open trench on any line under construction. Except where tunneling is indicated on the drawings, is specified, or is permitted by the Engineer, all trench excavation shall be open cut from the surface.

The alignment and grade or elevation of each pipeline shall be fixed and determined from offset stakes. Vertical and horizontal alignment of pipes, and the maximum joint deflection used in connection therewith, shall be in conformity with requirements of Master Specification Section 02620, Water Main Services.

Where pipe grades or elevations are not definitely fixed by the contract drawings, trenches shall be excavated to a depth sufficient to provide a minimum depth of backfill cover over the top of the pipe of 5 feet (1.5 m). Greater pipe cover depths may be necessary on vertical curves or to provide adequate clearance beneath existing pipes, conduits, drains, drainage structures, or other obstructions encountered at normal pipe grades. Measurement of pipe cover depth shall be made vertically from the outside top of pipe to finished ground or pavement surface elevation, except where future surface elevations are indicated on the drawings.

Trenches shall be excavated to a width which will provide adequate working space and sidewall clearances for proper pipe installation, jointing, and embedment. Minimum trench widths shall be as follows:

MINIMUM TRENCH WIDTHS

Nominal Pipe Size (inches)	Minimum Trench Width (inches)	Minimum Sidewall Clearance (inches)
Less than 27	Pipe OD plus 24	12
27 through 60	Pipe OD plus Nominal pipe size	ID/2
Greater than 60	Pipe OD plus 70	30
OD = Outside diameter (or span) of conduit. ID = Inside diameter (or span) of conduit.		

Specified minimum sidewall clearances are not minimum average clearances but are minimum clear distances, which will be required to the trench excavation or the trench protective system.

Bell holes shall provide adequate clearance for tools and methods used in installing pipe. No part of any bell or coupling shall be in contact with the trench bottom, trench walls, or granular embedment when the pipe is jointed.

Cutting trench banks on slopes to reduce earth load to prevent sliding and caving shall be used only in areas where the increased trench width will not interfere with surface features or encroach on right-of-way limits.

Where, for any reason, the width of the lower portion of the trench, as excavated at any point, exceeds the maximum permitted in the foregoing table, pipe of adequate strength, special pipe embedment, or concrete arch encasement, as required by loading conditions and with the concurrence of the Engineer, shall be furnished and installed by and at the expense of the Contractor.

Whenever unsuitable or unstable soil conditions are encountered, trenches shall be excavated below grade to undisturbed and the trench bottom shall be brought to grade with suitable material.

3.3.22 Mechanical Excavation. The use of mechanical equipment will not be permitted in locations where its operation would cause damage to trees, buildings, culverts, or other existing property, utilities, or structures above or below ground. In all such locations, hand excavating methods shall be used.

Where determination of the exact location of pipe or other underground structure is necessary for doing the work properly, the Contractor may be required to excavate test pits to determine such locations. When such test pits may be properly considered as incidental to other excavation, the Contractor will receive no additional compensation, the work being understood to be included as a part of the excavation.

Mechanical equipment used for trench excavation shall be of a type, design, and construction, and shall be so operated, that the rough trench excavation bottom elevation can be controlled, and that trench alignment is such that pipe, when accurately laid to specified alignment, will be centered in the trench with adequate sidewall clearance. Undercutting the trench sidewall to obtain sidewall clearance will not be permitted.

3.3.23 Pavement Cutting. Cuts in pavements shall be no larger than necessary to provide adequate working space for proper installation of pipe and appurtenances. Cutting shall be by saw cutting in a manner which will provide a clean, flat edge along each side of the trench and along the perimeter of cuts for structures.

Pavement over trenches excavated for pipelines shall be removed so that a shoulder not less than 6 inches (15.2 cm) in width at any point is left between the cut edge of the pavement and the top edge of the trench. Trench width at the bottom shall not be greater than at the top and no undercutting will be permitted. Pavement cuts shall be made to and between straight or accurately marked curved lines which, unless otherwise required, shall be parallel to the center line of the trench.

Pavement removal for connections to existing lines or structures shall not exceed the extent necessary for the installation.

Pavement shall be removed and restored between existing construction or contraction joints, located at or outside the limits of excavation at intersecting streets or roads, except as otherwise shown or specified.

Where the trench parallels the length of concrete walks, and the trench location is all or partially under the walk, the entire walk shall be removed and replaced. Where the trench crosses drives, walks, curbs, or other surface construction, the surface construction shall be removed and subsequently replaced between existing joints or between saw cuts as specified for pavement.

Contractor shall excavate below the underside of the pipe, except where otherwise required, to provide for the installation of granular embedment.

3.3.24 Pipe Embedment. Embedment materials both below and above the bottom of the pipe, classes of embedment to be used, and placement and compaction of embedment materials shall conform to the requirements indicated on the Drawings and to the following supplementary requirements.

Embedment material shall contain no cinders, clay lumps, or other material which may cause pipe corrosion. Embedment below the bottom of the pipe to just above the top of pipe shall conform to the applicable class below:

> Class A Arch Encasement – Is not required unless improper trenching or unexpected trench conditions require its use as determined by Engineer.
>
> Class B Bedding –Shall be used for all steel, pretensioned concrete, profile wall HDPE, PVC, ABS, FRP, and vitrified clay pipelines, and for all other pipelines not otherwise specified.
>
> Class C Bedding – Shall be used for all reinforced concrete, prestressed concrete, and ductile iron pipelines.

Embedment for Ductile Iron, Steel, FRP, and PVC Pipelines: Granular embedment for ductile iron, coal tar coated steel, FRP, and PVC pipelines shall be pea gravel or crushed rock with rounded or subrounded particles; crushed rock with sharp edges which could cause significant scratching or abrasion of the pipe or damage to the polyethylene tube protection shall not be used. Inundated sand may be used for granular embedment in locations where the use of water will cause no damage to adjacent property and where it can be placed and properly compacted without damage to the pipe.

Placement and Compaction: Granular embedment material shall be spread and the surface graded to provide a uniform and continuous support beneath the pipe at all points between bell holes or pipe joints. It will be permissible to slightly disturb the finished subgrade surface by withdrawal of pipe slings or other lifting tackle.

After each pipe has been graded, aligned, and placed in final position on the bedding material, and shoved home, sufficient pipe embedment material shall be deposited and compacted under and around each side of the pipe and back of the bell or end thereof to hold the pipe in proper position and alignment during subsequent pipe jointing and embedment operations.

Embedment material shall be deposited and compacted uniformly and simultaneously on each side of the pipe to prevent lateral displacement.

Class C embedment shall be compacted to the top of the pipe in all areas where compacted backfill is specified.

Each lift of granular embedment material shall be vibrated with a mechanical probe type vibrator during placement to ensure that all spaces beneath the pipe are filled. Each lift of embedment material shall be compacted with a platform type vibrating compactor to at least 95 percent of maximum density or as indicated on the Drawings.

Groundwater Barrier: Continuity of embedment material shall be interrupted by low permeability groundwater barriers to impede passage of water through the embedment. Groundwater barriers for sewer lines that contain manholes with cast-in-place bases shall be compacted soil around each manhole, meeting soil classification GC, SC, CL, or ML-CL, compacted to 95 percent of maximum density. Material may be finely divided, suitable job excavated material, free from stones, organic matter, and debris.

Groundwater barriers for sewer lines that contain manholes with precast (developed) bases and for all other pipelines shall be three layers of 6 mil polyethylene film, extending the full depth and width of granular material, and spaced not more than 400 feet (121.9 m) apart.

3.3.25 Trench Backfill. All trench backfill above pipe embedment shall conform to the following requirements.

A layer of backfill material not more than 8 inches (20.3 cm) deep may be placed over concrete arch encasement or concrete reaction blocking after the concrete has reached its initial set, to aid curing. No additional backfill shall be placed over arch encasement or blocking until the concrete has been in place for at least 3 days.

Compacted Trench Backfill: Will be required for the full depth of the trench. Backfill and compact trenches only after pipe or other appurtenances have been inspected, tested and locations of pipes and appurtenances have been recorded.

The top portion of backfill beneath established lawn areas shall be finished with at least 4 inches (10.2 cm) of topsoil corresponding to, or better than, that underlying adjoining lawn areas.

With exception of beneath pavements and roadways, at the option of the Contractor, compacted trench backfill may be suitable job excavated material or graded gravel, as described below.

Job Excavated Material: May be used for compacted backfill when the job excavated material is finely divided and free from debris, organic material, cinders, any corrosive material, and stones larger than 3 inches (7.6 cm) in greatest dimension. Masses of moist, stiff clay shall not be used. Job excavated materials shall be placed in uniform layers not exceeding 8 inches (20.3 cm) in uncompacted thickness. Each layer of material shall have the best possible moisture content for satisfactory compaction. The material in each layer shall be wetted or dried as required and thoroughly mixed to ensure uniform moisture content and adequate compaction. Increased layer thickness may be permitted for noncohesive material if the Contractor demonstrates to the satisfaction of the Engineer that the specified compacted density will be obtained. The method of compaction and the equipment used shall be appropriate for the material to be compacted and shall not transmit damaging shocks to the pipe. Job excavated material shall meet the requirements specified for engineered fill and shall be compacted to 95 percent of maximum density at near the optimum moisture content, or as indicated on the Drawings.

Where conduits are placed within the zone of influence of proposed or existing roadways and pavements, compacted trench backfill shall consist of graded gravel or other material approved by the Engineer.

Graded Gravel: Gravel backfill shall be deposited in uniform layers not exceeding 12 inches (30.5 cm) in uncompacted thickness. The backfill shall be compacted with a suitable vibratory roller or platform vibrator to at least 95 percent of maximum density, or as indicated on the Drawings.

3.3.26 Structure Backfill. The quality and moisture content of materials for backfill around and outside of structures shall conform to the requirements for materials used for earthfills and embankments. Before backfilling against walls, the permanent structures (including basement floor slabs) must be completed and the concrete shall have attained its 28-day design strength required to resist backfill pressures without damage. Temporary bracing will not be permitted except by written permission from the Engineer. When filling on both sides of a wall or pier, place fill simultaneously on each side. Correct any damage to the structure caused by backfilling operations at no cost to Owner. Backfill materials shall be deposited in layers not to exceed 8 inches (20.3 cm) in uncompacted thickness and shall be compacted to at least 95 percent of maximum density at a moisture content in the range of 2 percent below to 2 percent above the optimum moisture content, or as indicated on the Drawings. Compaction of structure backfill by rolling will be permitted, provided the desired compaction is obtained and damage to the structure is prevented. No backfill shall be deposited or compacted in water.

Structure Backfill placed adjacent to foundation walls shall be placed within a zone defined by a line starting at the base of the wall and sloping upward at a ratio of 1 horizontal to 1 vertical.

Particular care shall be taken to compact structure backfill which will be beneath pipes, drives, roads, parking areas, walks, curbs, gutters, or other surface construction or structures. In addition, wherever a trench is to pass through structure backfill, the structure backfill shall be placed and compacted to an elevation not less than 12 inches (30.5 cm) above the top of pipe elevation before the trench is excavated. Compacted areas, in each case, shall be adequate to support the item to be constructed or placed thereon.

3.3.27 Drainage Maintenance. Trenches across roadways, driveways, walks, or other traffic ways adjacent to drainage ditches or watercourses shall not be backfilled prior to completion of backfilling the trench on the upstream side of the traffic way, to prevent impounding water after the pipe has been laid. Bridges and other temporary structures required to maintain traffic across such unfilled trenches shall be constructed and maintained by the Contractor. Backfilling shall be done so that water will not accumulate in unfilled or partially filled trenches. All material deposited in roadway ditches or other watercourses crossed by the line of trench shall be removed immediately after backfilling is completed, and the original section, grades, and contours of ditches or watercourses shall be restored. Surface drainage shall not be obstructed longer than necessary.

3.3.28 Protection Of Trench Backfill In Drainage Courses. Where trenches are constructed in ditches or other watercourses, backfill shall be protected from surface erosion. Where the grade of the ditch exceeds 1 percent, ditch checks shall be installed. Unless otherwise indicated on the drawings, ditch checks shall be concrete. Ditch checks shall extend at least 2 feet (61 cm) below the original ditch or watercourse bottom for the full bottom width and at least 18 inches (45.7 cm) into the side slopes, and shall be at least 12 inches (30.5 cm) thick.

3.3.29 Final Grading and Placement of Topsoil. After other outside work has been finished, and backfilling and embankments completed and settled, all areas that are to be graded shall be brought to grade at the indicated elevations, slopes, and contours. All cuts, fills, embankments, and other areas which have been disturbed or damaged by construction operations shall be surfaced with topsoil to a depth of at least 4 inches (10.2 cm). Topsoil shall be of a quality at least equal to the existing topsoil in adjacent areas, free from trash, stones, and debris, and well suited to support plant growth.

Use of graders or other power equipment will be permitted for final grading and dressing of slopes, provided the result is uniform and equivalent to manual methods. All surfaces shall be graded to secure effective drainage. Unless otherwise indicated, a slope of at least 1 percent shall be provided.

Final grades and surfaces shall be smooth, even, and free from clods and stones, weeds, brush, and other debris.

3.3.30 Disposal Of Excess Excavated Materials. Insofar as needed, suitable excavated materials shall be used in fills and embankments.

All unused suitable excess excavated materials, together with all debris, stones, logs, stumps, roots, and other unsuitable materials, shall be removed from the site and disposed of by, and at the expense of, the Contractor.

3.3.31 Resodding. All established lawn areas cut by the line of trench or damaged during the work shall be resodded, after completion of construction, to the complete satisfaction of the Engineer. All sod used shall be the same type as removed or damaged, shall be best quality, and, when placed, shall be live fresh growing grass with at least 1-1/2 inches (3.8 cm) of soil adhering to the roots.

All sod shall be procured from areas where soil is fertile and contains a high percentage of loamy topsoil and from areas that have been grazed or mowed sufficiently to form a dense turf.

Sod shall be transplanted within 24 hours from the time it is harvested, unless stacked at its destination in a suitable manner. All sod in stacks shall be kept moist and protected from exposure to the sun and from freezing. In no event shall more than 1 week elapse between cutting and planting.

Before placing sod, all shaping and dressing of the areas shall have been completed. After shaping and dressing, commercial fertilizer of a type acceptable to the Engineer shall be applied uniformly in the manner and amounts recommended by the manufacturer, and harrowed lightly. Sodding shall follow immediately.

All sodding shall be done during the period from March 15 to October 1, unless written permission is given by the Engineer to extend the planting season.

3.3.32 Settlement. The Contractor shall be responsible for all settlement of backfill, fills, and embankments which may occur within the correction period stipulated in the General Conditions.

The Contractor shall make, or cause to be made, all repairs or replacements made necessary by settlement within 30 days after notice from the Engineer.

3.4 FIELD QUALITY CONTROL. All fill materials will be subject to quality control testing. A qualified laboratory will be selected and paid by the Contractor to perform tests on materials. Test results and laboratory recommendations will be made available to Engineer and Contractor.

Provide samples of each fill material from the proposed source of supply. Allow sufficient time for testing and evaluation of results before material is needed (a minimum of two weeks). Submit samples from alternate source if required.

Engineer will be sole and final judge of suitability of all material.

The laboratory will determine maximum dry density at optimum water content in accordance with AASHTO T-180 Modified Method C (for density) and AASHTO T-99 (for optimum moisture) or AASHTO T-99 “One-Point” Test as applicable for the materials to be used.

Tests of material as delivered may be made from time to time. Materials in question may not be used pending test results. Remove rejected materials and replace with new approved material.

End of Section

SECTION 02221

TRENCHING, BACKFILLING AND COMPACTING

PART 1 - GENERAL

1.1 SCOPE. Section includes excavating, backfilling and compacting trenches for utilities and appurtenances.

1.2 GENERAL. Furnish all labor, materials, equipment and incidentals required to perform all trenching, backfilling and compacting specified. Perform prompt cleanup, removal, as well as safe and proper disposal of all waste material resulting from the work herein. Perform prompt and proper removal, salvage, protection, storage and turnover to the Engineer, when requested, of all surplus useable material resulting from the work herein. Remove and restore sidewalks, curbs, driveways and roadways in the trench path.

1.2.01 Governing Standards. Do Work in accordance with the Michigan Department of Energy, Labor and Economic Growth Construction Standards Part 9:"Excavation, Trenching, and Shoring".

The MDOT Standard Specifications.

1.3 QUALITY ASSURANCE.

1.3.01 Tolerances. Cut out soft areas of subgrade not capable of compaction in place. Backfill with sand and compact to 95 percent of maximum density or as shown on the Drawings.

1.4 SUBMITTALS. Submit samples of all proposed materials. Provide accurate record in formation for completed construction.

PART 2 – PRODUCTS

2.1 MATERIALS. Granular backfill material shall be crushed rock, sand or gravel; shall be free from dust, clay, and trash; and shall be graded 1 ½ inch (3.9 cm) to No. 4 as defined in ASTM C33. Refer to the drawings for locations of specific backfill materials to be placed.

2.1.01 Bank-Run Gravel. Use Michigan Department of Transportation (MDOT) Granular Material for Fill, Class I or such other sizes as may be approved. Fill may be approved excavated material or can be obtained from approved natural deposits and unprocessed except for the removal of unacceptable material and stones larger than the maximum size permitted. Material shall be free from vegetation and substantially free from loam and other organic matter, clay, other fine or harmful substances, frost, snow, ice, and aggregations of frozen soil particles. Compact thoroughly by means of suitable power-driven tampers or other power-driven equipment to density indicated on the Drawings.

2.1.02 Class II Granular Material. Approved sand, gravel, crushed stone, blast-furnace slag or combination thereof, with 100 percent passing 3 inch (7.6 cm) sieve, 60 to 100 percent passing 1 inch (2.5 cm) sieve, 0 to 30 percent passing No. 100 sieve, and loss by washing not to exceed 7 percent, per MDOT Standard Specifications for Granular Materials for Fill and Subbase.

2.1.03 Select Borrow. Use MDOT Granular Material for Fill, Class III or such other sizes as may be approved. Maximum stone size is 6 inch (15.2 cm) and material shall be well-graded throughout entire size range. Borrow free from roots, leaves, and other organic materials. Borrow shall also be free of ice or frost and no aggregations of frozen soils particles. Moisture content of borrow shall be within plus or minus 3 percent optimum moisture content at the borrow source. Compact thoroughly by means of suitable power-driven tampers or other power-driven equipment to the density indicated on the Drawings.

2.1.04 Aggregate Base Material. Aggregate base for aggregate surfaced or paved surfaces shall meet MDOT Standard Specification for 21AA or such other sizes as may be approved.

2.1.05 Graded Gravel. Gravel for compacted trench backfill shall conform to the following gradation:

Sieve Size	Percent Passing by Weight
1 inch (2.5 cm)	100
¾ inch (1.9 cm)	85 – 100
3/8 inch (9.5 mm)	50 – 80
No. 4	35 – 60
No. 40	15 – 30
No. 200	5 – 10

The gravel moisture shall contain no clay lumps or organic matter. The fraction passing the No. 4 sieve shall have a liquid limit not greater than 25 and a plasticity index not greater than 5. An alternate material may be used if approved by the Engineer.

2.1.06 Select Excavated Material. Select excavated material shall be of a type, which can be compacted to the density specified. Such material shall be free from rubbish or debris, frozen lumps, boulders, or concrete fragments, sod, organic material, tree roots, stumps, branches or other timber. Select excavated material considered suitable for backfill shall be sand, sand-gravel mixture, clean clay, or a combination thereof.

Generally, blue clay, foundry sand, organic material, and slag shall not be considered a suitable backfill material. Material used for backfill that cannot be compacted to the degree specified shall be removed, and replaced with suitable material. Legally dispose of any material removed.

2.1.07 Sand. Clean yellow sand Type 2NS in accordance to the Aggregation section of the current MDOT Standard Specifications for Construction.

2.1.08 Concrete. Conforming to cast-in-place concrete requirements with a compressive strength of 3000 psi (20,684.3 kPa).

2.1.09 Lean Concrete. Lean concrete shall be a mixture of Portland cement, aggregate and water, having a minimum compressive strength of 1500 psi (10,342.5 kPa) at 28 days.

PART 3 - EXECUTION

3.1 PREPARATION. Identify required lines, levels, contours, and datum locations. Protect plant life, lawns, and other features remaining as a portion of final landscaping. Protect bench marks, existing structures, sidewalks, paving, and curbs from excavating equipment and vehicular traffic. Maintain and protect above and below grade utilities, which are to remain

Notify the Engineer a minimum of 30 working days prior to the work where survey monuments will be disturbed so they may be referenced, then relocated. Provide the referencing and the relocation. The referencing and relocation shall be provided in accordance with the requirements and directions of the authority and agency having jurisdiction.

3.2 PERFORMANCE.

3.2.01 Excavation. Remove all materials of whatever nature necessary to install the required utilities and appurtenances; paving will be cut accurately to correct lines. Paving maybe sawcut where practical. Suitable protection and dewatering will be provided to maintain trenching and excavation dry and safe throughout the construction operations. The Contractor will see that traffic is not obstructed during excavation, trenching, backfilling and compacting operations. The trenches will be sufficiently wide to enable installation and inspection of pipes. Bell and spigot pipe joints will be hand trimmed and loose matter will be removed.

Remove lumped sub soil, boulders and rocks up to ½ cu yd (0.4 cu m) from excavated area and correct with compacted backfill as specified or authorized excavation or replace with lean concrete as directed.

3.2.02 Trenching. Excavation shall be dug so that the pipe can be placed and jointed properly as applicable. The trench shall be made so that the proposed utility pipe can be laid to the alignment and depth as shown on the Drawings. The excavation shall not be more than two feet wider at the bottom than the outside diameter of the pipe or structure. If there is no interference with construction, or adjacent property, and if soil permits, the Contractor at his own expense shall be permitted to slope the side walls of the excavation starting at a point 2 feet (61.0 cm) above the top of pipe.

The trench shall be excavated to the depth required so as to provide a uniform and continuous bearing and support for the pipe or structure on bedding materials at every point between joints, except where pipe slings or other lifting tackle are withdrawn.

Where excavation exposes subsurface materials at the bottom of the trench that are in a loose or soft state, the Contractor shall be advised to excavate to a depth where suitable material is encountered, as directed by the Engineer.

Where the bottom of the trench has been excavated by mistake to a greater depth than required, the Contractor shall refill this area using approved material. No additional compensation shall be given to the Contractor. Refilling with earth to bring the bottom of the trench to the proper grade will not be permitted.

Excavation within 2 feet (61.0 cm) of existing utilities shall be governed by specifications of the Owner of the respective utility. The Contractor shall obtain these specifications and follow the same at no extra cost.

3.2.03 Trenching in Advance of Pipe Laying. No more trench shall be opened per sequence phase than is indicated in the Drawings until concrete is placed over previous opened trench areas. All trench excavation shall be open cut from the surface.

3.2.04 Alignment, Depth, and Width. Trench excavation shall follow the alignment of the proposed utilities and appurtenances.
The Contractor shall be responsible for making careful and accurate measurements and for constructing all work to the lines and grades as shown on the Drawings.

As an alternative means of establishing alignment and grade, a "Laser-Beam" instrument may be utilized with a competent operator.

3.2.05 Location of Pipe Lines. The location and approximate depths of the proposed pipe lines are shown on the Drawings. The Engineer reserves the right to make changes in lines, grades, and depths of pipelines and manholes when such changes are necessary. Excavation and trenching shall be adequately shored and braced. Adjoining ground shall be prevented from sliding or settlement. Existing improvements of any kind shall be fully protected from damage.

Contractor shall bear all responsibility and expenses for any damage and injury, and effect all necessary repairs or reconstruction. Comply with all applicable requirements of the Michigan Department of Energy, Labor and Economic Growth Construction Standards.

Concrete sidewalks within excavation and trenching areas, or within 4 feet (1.2 m) and approximately parallel to excavation and trenching areas, or within other boundaries established by the local jurisdiction, shall be removed, disposed and replaced.

3.2.06 Utilities. Explore, determine and provide the exact locations of all underground utilities and structures sufficiently in advance of excavation to allow adjustment of alignment and elevation.

Provide for having all underground utilities located by the appropriate and responsible utility companies or other agencies in advance of excavation.

Coordinate this activity outside of Owner’s facilities by calling MISS DIG, at 1-800-482-7171 at least three working days in advance of excavation.

Provide adjustments of conduit and/or cable alignment and elevation where the exploratory work indicates the need.

Excavation around utilities and other work under or adjacent to utilities shall not interfere with their safe operation and use. Probe carefully to determine the exact location of utility, and hand excavate where necessary to avoid damage.

In the event of damage incurred during construction to such utilities, structures or property, immediately notify the Engineer, owners and other appropriate authorities, and provide immediate suitable and satisfactory repairs.

Provide all direct and related utility costs and services to protect, maintain and/or relocate utilities within the areas and encroachment limits of the excavation and trenching, including all the work to re-lay utilities to new and/or existing grade lines. Also provide all direct and related utility costs and services to support utilities within or near by the areas and encroachment limits of the excavation and trenching, including utilities that do not require re-laying or altering.

3.2.07 <u>Sheeting and Bracing</u>. Sheeting and bracing of all excavations shall conform to the latest statures of the State of Michigan governing safety of workers in the construction industry. When necessary, in the opinion of the Engineer or Contractor, adequate sheeting and bracing shall be installed to prevent ground movement that may cause damage or settlement to adjacent structures, pipelines and utilities. Any damage due to settlement because of failure to use sheeting or because of inadequate bracing, or through negligence or fault of the Contractor in any other manner, shall be resized at the Contractor's expense.

Sides of trenches in unsuitable, loose or soft material, 5 feet (1.5 m) or more in depth, shall be shored, sheeted, braced, sloped, or otherwise supported by means of sufficient strength to protect employees working within them.

Sheeting requirements: Where excavations are made with vertical sides which require supporting, the sheeting and bracing shall be of sufficient strength to sustain the sides of the excavations and to prevent movement which could in any way injure the work, or adjacent structures, or diminish the working space sufficiently to delay the work. Special precautions shall be taken where there is additional pressure due to the presence of other structures.

It shall be the Contractor's responsibility to select sheeting and bracing of sufficient dimensions and strength to adequately support the sides of trenches and excavations. The Contractor shall submit details of the sheeting and bracing he proposes to use to the Engineer for review.

Timber sheeting shall conform in quality to select structural Douglas Fir lumber and shall be sound, live timber, free from sap, large checks, shakes, loose or decayed knots, worm holes, and other imperfections which may impair its strength or durability.

In wet excavation, grooved sheeting shall be used to prevent passage of soil. Any voids between sheeting and face of excavation shall be filled with suitable material rammed in place.
Sheeting and bracing shall be removed before the completion of the work, unless otherwise directed in writing by the Engineer. Sheeting which is left in place shall be cut off eighteen 18 inches (45.7 cm) below the original ground surface or as directed by the Engineer. Untreated wood will not be allowed to be left in place.

3.2.08 <u>Bedding and Compaction</u>. For proper bedding bring backfill up evenly on both sides of pipe or conduit to a height of 4 inches (10.2 cm) above the top of pipe or conduit. Thoroughly compact before additional fill is placed. Provide a minimum of 4-inches backfill between pipe or conduits and the bottom and sides of the trench. Bedding backfill shall be sand or as indicated on the Drawings.

Compact bedding by impact, vibration, or a combination of these methods. Bedding compaction methods and equipment are subject to the approval of the Engineer.

3.2.09 Backfill and Compaction Above Bedding. Backfill trenches to contours and elevations with unfrozen fill materials. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces. Employ a placement method that does not disturb or damage utilities in trench.

Backfill shall be graded gravel Class I or Class II granular fill for area within influence of paved areas or as indicated on the Drawings or approved by the Engineer. Backfill shall be Class III or select excavated material for areas not within influence of paved areas or as indicated on the Drawings.

Maintain sufficient moisture content of fill materials to attain required compaction density. Maximum lift shall be 8 inches (20.3 cm) as it is placed before compaction. Compact backfill above bedding to 95 percent of maximum density under pavement, sidewalks, curbs, gravel roads, and the influence of pavement. Under green areas such as lawns, parks, and fields, compact backfill above bedding to 90 percent of maximum density, or as reflected on the drawings. Compaction means, methods and equipment shall be satisfactory and suitable for the applications, and shall be approved by the Engineer.

3.2.10 Protection. Reshape and re-compact fills subjected to vehicular traffic during construction.

3.2.11 Cleaning. Dispose of all excess material used for trenching, backfilling, and compacting for the installation of electrical conduits and appurtenances at an approved offsite location, complying with all applicable codes and regulations.

3.3 FIELD QUALITY CONTROL. Compaction testing will be performed by an independent testing agency at the expense of the Contractor in accordance with the MDOT Standard Specifications, current edition.

3.3.01 Field Testing. If tests indicate work does not meet specified requirements, remove work, replace, compact, and retest.

End of Section

SECTION 02231

REMOVING/ABANDONING UTILITIES AND STRUCTURES

PART 1 - GENERAL

1.1 SCOPE. This work consists of removing, or abandoning, in whole or in part, sanitary and storm drainage structures, culverts, sanitary and storm sewers, fire hydrants, gate wells and water mains and other public or private utilities as required. Contractor shall coordinate with the appropriate public utility companies when removal of their appurtenances are required. Salvaging, storing, and disposing of removed materials, and the backfilling and compacting of the excavated sites is also included.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Concrete. Grade 30 P as per MDOT Standard Specifications for Construction.

2.1.02 Grout. A mixture of two parts sand to our part connector or similarly approved material.

2.1.03 Aggregate. 21AA as per MDOT Standard Specifications for Construction.

2.1.04 Caps. Mechanical Joint Caps conform to ANSI/AWWA/C110/A21.10 and be 350 psi (2413.16 kPa) pressure rated.

2.1.05 Restraint. The restraint shall be the series 1100 Megalug restraint as manufactured by EBBA Iron, Inc. or approved equal.

PART 3 - EXECUTION

3.1 SEWER/CULVERT REMOVAL AND ABANDONMENT. When removing or abandoning a sanitary or a storm drainage structure, any live sewers connected to them shall be rebuilt and properly reconnected through the removal area. Services shall be maintained during these construction operations using bypass pumping.

If the plans call for abandoning a sanitary or a storm drainage structure, the existing frames, covers and grates shall be carefully removed to prevent damage and the structure broken down to 3 feet (91.4 cm) below the pavement subgrade or at least 3 feet (91.4 cm) below the final ground elevation outside the pavement area.

Existing castings shall be considered as salvaged castings. Salvaged castings not suitable for use and not required for structures to be adjusted, shall become the Contractor's property and shall be promptly removed from the job site.

When special catch basin abandonment is called for in the Proposal and at locations shown on the Plans, the catch basin line shall be plugged at the lateral sewer as detailed on the Standard Plans. This special abandonment shall be used in site clearance and urban areas where the lateral sewer is remaining in service.

All pipe culverts specified to be removed, including all end treatments shall be completely removed.

Where existing culvert pipe is to be extended or the existing end treatment is to be replaced, only such portions of the existing culvert pipe shall be removed as to provide a proper connection to the new work. Care shall be taken to not damage any portion of the remaining culvert pipe.

All pipe culverts to be abandoned shall be bulkheaded as specified herein or by other approved methods. If the culvert is not in suitable condition for abandonment, in the judgment of the Engineer, alternate methods will be determined.

Culvert pipe designated to be abandoned, with top elevation within 6 feet (18.3 m) of the top of the pavement, shall be reviewed for removal.

3.1.01 Disposing of Materials. All excavated materials, together with all debris, stones, logs, stumps, roots, and other unsuitable materials, shall be removed from the site and disposed of by, and at the expense of, the Contractor.

3.1.02 Backfilling. Backfill the excavated areas with Aggregate 21AA. Backfilling shall be placed and compacted according to MDOT Controlled Density Method at least to 95 percent maximum weight.

All sewers (storm, sanitary, or combined) or parts thereof which are specified to be removed, or that interfere with the new construction, shall be removed.

Where existing sewers are to be extended or otherwise incorporated into the new work, only such part of the existing sewer shall be removed as to provide a proper connection to the new work. The connecting edges shall be cut, chipped, and trimmed to the required lines and grades without weakening or damaging the parts of the sewer to be retained.

3.1.03 Backfilling Abandoned Sewers. All sewers to be abandoned shall be bulkheaded with Grade 30 P concrete or with brick block masonry. A bulkhead shall be constructed from the inner wall of the drainage structure a minimum of 2 foot (61.0 cm) into the pipe or other method. If the sewer is not in suitable condition for abandonment, in the judgment of the Engineer, an alternate treatment will be determined.

An alternate procedure for backfilling abandoned sewers is to fill the sewer with grade 30M concrete or with grout composed of 2 parts sand to 1 part cement or variations thereof as may be approved by the contracting officer.

Backfill concrete shall be deposited through drop pipes placed over the abandoned sewer and at locations approved by the Engineer. Drop-pipe holes shall be spaced at intervals that will ensure the proper and complete filling of the sewer. All drop holes shall be sleeved for their entire length with a metal casing. The casing shall extend completely through the wall of the sewer. The drop-pipe shall be fitted with suitable and sufficient baffles to ensure the re-mixing of the concrete rather than a separation of the materials. The size of the drop-pipe shall be adequate for the placing of the concrete mix.

When the drop holes are no longer needed and the Engineer orders their abandonment, the castings shall be removed so that adjacent structures, utilities, and pavement will not be damaged. The hole shall then be filled with a 1500 psi concrete mix to within 5 feet (1.5 m) of the surface. The upper portion of the hole shall be filled with compacted sand or sand-gravel and the surface replaced in kind to that originally found to the satisfaction of the Engineer.

Grout shall be placed under a pressure adequate to fill completely the abandoned portion of the sewer. However, grout pressures shall not be so high as to cause leakage from the sewer and the filling of adjacent sewers, utilities and basements.

All sewers designated to be abandoned, with top elevation within 5 feet (1.5 m) of the pavement, shall be reviewed for removal.

3.2 Water Main and Appurtenances Removal. When removing or abandoning a water main, or appurtenances any live water connections to them shall be rebuilt and properly reconnected through the removal area. Services shall be maintained during these construction operations. Refer to the drawings for extent of removal and abandonment of water mains and appurtenances.

3.2.01 Disposing of Materials. All excavated materials, together with all debris, stones, logs, stumps, roots, and other unsuitable materials, shall be removed from the site and disposed of by, and at the expense of, the Contractor.

3.2.02 Backfilling. Backfill the excavated areas with Aggregate 21AA. Backfilling shall be placed and compacted according to MDOT controlled Density Method at least to 95 percent maximum weight.

Refer to the Drawings for details regarding removal and abandonment of other utilities and services.

End of Section

SECTION 02233

ADJUSTING AND RECONSTRUCTING STRUCTURES

PART 1 - GENERAL

1.1 SCOPE. This work consists of reconstructing all or portions of existing drainage and other structures and removing existing structure frames and covers and resetting them at the proposed elevations.

1.2 GENERAL.

1.2.01 Governing Standards.

Detroit City Engineering Division Standard Specifications for Paving and Related Construction, October 1999.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All work performed in the City of Detroit street and road right of ways shall comply with the City Engineering Division Standard Specifications for Paving and Related Construction.

2.2 MATERIALS. Concrete shall be Grade 30M as per 1990 MDOT Standard Specifications for Construction.

Aggregate shall be Series 21AA as per 1990 MDOT Standard Specifications for Construction.

Reinforcing Steel shall be Grade 60 steel bars as per 1990 MDOT Standard Specifications for Construction.

Concrete Masonry Unit bricks and blocks shall be as per 1990 MDOT Standard Specifications for Construction.

PART 3 - EXECUTION

3.1 INSTALLATION. Existing structures that are to remain shall have their tops adjusted to the new grades and cross-sections. Final adjustment of existing structures in bituminous surfaced areas shall be prior to placing the top course.

Adjusting covers shall only apply where the elevation of the cover is not changed more than 6 inches (15.2 cm) up or down. The contractor shall remove the frame and cover and reset the castings to the required elevation by supporting them on a metal ring adjustor, or a concrete collar, or on masonry in a full mortar bed. Adjusted covers shall be held firmly in place.

The adjacent pavement, curb, or curb and gutter shall be replaced to the required elevations.

3.1.02 Salvaged Castings. The metal frames, covers, and grates on existing structures that are to be reused shall be carefully removed to prevent damage.

Any reusable casting damaged by the Contractor shall be replaced with a new casting without additional cost to the City.

All salvaged castings that are not to be used on the work shall become the property of the Contractor and shall be promptly removed from the job site.

3.1.03 Structure Reconstruction. The existing frame and cover shall be carefully removed and the upper portion of the existing manhole structure raised or lowered as required. The frame and cover shall then be set on the adjusted structure to fit the required new grade and cross section.

Existing water gate and stop boxes, catch basin, and manhole frames or covers, or both, which require replacement or are non-standard castings, shall be furnished and installed by the Contractor. If the Engineer approves, replacement castings for standard units may be exchanged by the contractor for new castings at the DWSD Central Service Facilities – Materials Management, 6425 Huber, between the hours of 8:00 a.m. and 4:30 p.m., Monday through Friday. The Engineer shall furnish a written order authorizing the exchange of castings.

3.1.04 Water Gate Manhole and Stop Box Adjustment. The tops of existing water gate manholes and stop boxes shall be adjusted to the new required grades and cross-sections in the same manner as specified for drainage structures.

3.1.05 Manhole and Handhole Adjustment. The tops of existing P.L.D. manholes and handholes shall be adjusted to the new required grades and cross-sections as specified for sewer manholes.

If adjusting the frame and cover to the proposed grade requires adjustment of the manhole or handhole roof, the Contractor shall notify the P.L.D. The work involved in the adjustment of the roof of the structure and the adjustment of the frame and cover to the new surface will be performed by the Public Lighting Department at no cost to the Contractor.

Should existing castings require replacement, the Contractor shall furnish new castings. If the Engineer approves existing castings, the castings may be exchanged by the Contractor for new castings at the P.L.D. Warehouse, at 9449 Grinnell, between the hours of 8:30 a.m. and 4:00 p.m., Monday through Friday. The Engineer shall furnish a written order authorizing the exchange of castings.

End of Section

SECTION 02236

PIPE BORING AND JACKING

PART 1 - GENERAL

1.1 SCOPE. This section includes all labor, materials, tools and equipment required to complete pipe boring and jacking work. Boring and jacking consists of pushing a pipe through the earth. This method may also include pushing a pipe through the earth while a boring auger rotates within the pipe to remove the soil.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society of Testing Materials) A53 – Pipe, Steel, Black and Hot-Dipped, Zinc Coated Welded and Seamless.

ASTM A139 Specification for Electric-Fusion (Arc)-Welded Steel Pipe (Sizes 4 inches and over).

ASTM C76 – Reinforced Concrete Culvert, Storm Drain and Sewer Pipe

AWWA (American Water Works Association) C200 - Standard for Steel Water Pipe 6 inches and larger.

AWWA C203, Standard for Coal-Tar Protective Coatings and Linings for Steel Water Pipelines-Enamel and Tape-Hot Applied.

AWWA C206, Standard for Field Welding of Steel Water Pipe.

AWPA (American Wood Preserver's Association) – Manual of Recommended Practice.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Contractor shall have minimum of 5 years documented experience in installations of similar size and character. Submit specific information and data demonstrating successful performance of similar jacking operations in similar situations and subsurface conditions.

1.3.02 Tolerances. Maximum deviation from established line and grade shall be 2 inches (5.1 cm) with a maximum allowable return of 2 inches (5.1 cm) per 100 feet (30.5 m). Maintain a minimum distance from the top of paved surfaces to the top of the installation.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Provide data for materials, equipment, and methods proposed for jacking and boring work. Submit shop drawings showing details of jacking pit, head, frame, reaction block, arrangement of jacks, receiving pit, sheeting for pits and trenches, location of pits, casing pipe and carrier pipe installation. Include plans and description of the boring arrangement at the head of the casing.

1.4.02 Certification. Furnish certificate of design and design calculations that show that all products and pipe boring and jacking details meet the requirements set forth on the Drawings and Specifications.

PART 2 – PRODUCTS

2.1 MATERIALS.

2.1.01 Casing Pipe. Steel pipe shall conform to AWWA C200, Grade B, with a minimum yield strength of 35,000 psi (241.3 MPa) with a nominal diameter and thickness as indicated. Longitudinal and girth seams shall be welded in accordance with ASTM A139. Pipe ends shall be beveled for field butt welded joints in accordance with AWWA C200. Length shall be as indicated.

2.1.02 Carrier Pipe. Steel pipe shall conform to ASTM A53, Type E or S, Grade B or ASTM A139, Grade B. Concrete pipe shall conform to ASTM C76, Class as indicated on the Drawings. Alternate carrier pipe must be approved by the Engineer.

2.1.03 Grout. Grout shall be a Portland cement, fly ash and water mixture. Bentonite will be added in some cases as specified. In certain conditions, a cement, sand and water mixture may be used with approval from the Engineer.

Water shall be of potable quality.

Cement shall be ASTM C150 Type I. Furnish cement used for grouting in 94 pound (42.7 kg) moisture resistant bags. Store cement bags in a waterproof temporary structure at the site of the work.

Bentonite shall be commercially processed, powdered montmorillonite clay meeting the requirements of the American Petroleum Institute Specification 13A.

Grout Fluidizers, accelerators or other admixtures shall not be used without a written request of the Engineer.

Fly Ash shall be ASTM C618 Type F. Furnish fly ash for grouting in 70 pounds (31.8 kg) moisture resistant bags. Store fly ash bags in a waterproof temporary structure at the site of the work.

Grout shall be a 3:1 mix by volume of water to cementitious material or 22.5 gallons (85.2 L) of water per 96 pounds (43.6 kg) of cement/fly ash. The cement/fly ash ratio may vary from 1:1 to 1:3 depending on the stiffness required. Bentonite shall not be added without a written request of the Engineer. The Contractor may revise the grout mix in the field according to specified site conditions with approval from the Engineer.

2.1.04 BLOCKING AND WEDGING. Wood blocking shall be pressure treated with creosote to a retention of at least 10 pounds (4.6 kg) per cubic foot (0.028 cu m) in accordance with American Wood Preserver's Association, "Manual of Recommended Practice." Creosote oil shall be Class 1 oil in accordance with Federal Specification TT-C650 C for creosote, coal tar solution. Fillet leading and trailing edges of blocks to ease sliding.

PART 3 – EXECUTION

3.1 PREPARATION. Prior to start of work, assemble all materials, equipment and tools necessary to conduct jacking and boring work continuously until completed.

Blasting is not permitted within limits of jacking and boring. Rocks shall be removed by hand held equipment.

3.2 INSTALLATION.

3.2.01 Boring and Jacking of Casing Pipe. Proposed methods shall be evaluated on a case-by-case basis by the Engineer prior to construction. Water or air jetting; and air rams, missiles or hole hogs are not recommended methods. Generally, boring and jacking consists of pushing the pipe into the fill with a boring auger rotating within the pipe to remove the soil. When augers, or similar devices, are used for pipe emplacement, the front of the pipe shall be provided with mechanical arrangements or devices that will positively prevent the auger and cutting head from leading the pipe so that here will be no unsupported excavation ahead of the pipe.

The auger and cutting head arrangement shall be removable from within the pipe in the event an obstruction is encountered. The over-cut by the cutting head shall not exceed the outside diameter of the pipe by more than one-half inch. The face of the cutting head shall be arranged to provide reasonable obstruction to the free flow of soft or poor material.

The approach trench shall be large enough to accommodate at least one section of pipe, jacks, and blocking. Two rails or sills shall be laid in the bottom of the trench to keep the pipe at the established line and grade. When jacking pipe under railroad tracks, sheeting and bracing plans of jacking pits shall be submitted for approval of the railroad company through the Engineer. Excavation of the jacking pipe shall not be started until such approval has been received.

The use of water or other liquids to facilitate casing emplacement and spoil removal is prohibited.

Any method which employs simultaneous boring and jacking which does not utilize the method described above WILL NOT BE PERMITTED.

Bored or jacked installations shall have a bored hole essentially the same as the outside diameter of the pipe. If voids should develop or if the bored hole diameter is greater than the outside diameter of the pipe by more than approximately 1 inch (2.5 cm), grouting or other methods approved by the Engineer shall be employed to fill such voids.

Grouting shall be completed immediately upon completing the bore. Bracing shall be immediately strengthened at the first notice of any earth movement. If the access pit becomes unsafe, the access pit shall be stabilized immediately and all voids filled as approved by the Engineer.

Pressure grouting of the soils or freezing of the soils before jacking and boring as required at the direction of the Engineer to stabilize the soils, control water, prevent loss of material and prevent settlement or displacement of embankment. Grout shall be cement, chemical or other special injection material selected to accomplish the necessary stabilization.

The materials to be used and the method of injection shall be prepared by a Professional Engineer registered in the State of Michigan, or by an experienced and qualified company specializing in this work and submitted for approval to the Engineer before the start of work. Proof of experience and competency shall accompany the submission.

When water is known or expected to be encountered, pumps of sufficient capacity to handle the flow shall be maintained at the site and, upon approval of the Engineer they shall be in constantly attended operation on a 24 hour basis until, in the sole judgment of the Engineer their operation can be safely halted. When dewatering, close observation shall be maintained to detect any settlement of adjacent roadways, embankments and adjacent facilities.

If during installation an obstruction is encountered which prevents installation of the pipe in accordance with this specification, the pipe shall be abandoned in place and immediately filled with flowable fill. A new installation procedure and revised plans must be submitted for approval before work can resume.

3.2.02 Sheeting and Bracing. Provide sheeting and bracing when any excavation is located within the influence area of a paved area. Support shall be required at the front face of all access pits in bore and jack operations to prevent loss of material during construction.

3.2.03 Casting Pipe. Full-circle butt welded joints shall be in accordance with AWWA C206. Field welded joints shall be coated and lined with coal tar enamel in accordance with AWWA C203. Invert of casing pipe shall be lubricated to ease carrier pipe insertion.

3.2.04 Casing Pipe End Seals. Casings for carrier pipes of flammable and hazardous substances shall be suitably sealed to the outside of the carrier pipe. Details of the end seals shall be shown on the plans.

Casings for carrier pipes on non-flammable substances shall have both ends of the casing blocked up in such a way as to prevent the entrance of foreign material.

3.2.05 Carrier Pipe. Install true to line and grade as indicated and as specified. Exercise care to prevent damage to casing pipe and carrier pipe.

The Contractor shall use temporary spacers when installing the carrier pipe to maintain interior joint annular spacing as recommend by the pipe manufacturer.

3.2.06 Grout. The Contractor shall fill the annular space between the carrier pipe and casing with Portland cement grout as specified herein.

The grout shall be injected under pressure in one operation. Wood blocking or other means of support for the carrier pipe shall be provided to prevent floating.

3.2.07 Backfilling and Restoration. Access pits and excavations shall be backfilled with approved suitable material.

The disturbed surface area shall be top-soiled, seeded, fertilized, mulched, and anchored. Refer to the section on Landscaping if applicable. If final restoration is not completed within 5 days after completion of the bore and jack operation, temporary erosion control measures shall be required as directed by the Engineer.

Upon completion of work, the Contractor shall remove and properly dispose of all excess materials and equipment.

End of Section

SECTION 02316

ROCK REMOVAL

PART 1 - GENERAL

1.1 SCOPE. This section includes removal of rock encountered during excavation, including explosives, tools, and equipment necessary to assist in rock removal.

1.2 GENERAL.

1.2.01 Governing Standards. NFPA 495 (National Fire Protection Association) - Code for Manufacture, Transportation, Storage, and Use of Explosive Materials. MIOSHA Part 27 – Blasting and Use of Explosives.

1.2.02 Definitions. Rock is defined as a solid material which does not soften when wet and which cannot be excavated without continuous drilling, sawing, blasting, or continuous use of a ripper or other special equipment. Boulders of 1/2 cubic yard (0.4 cu m) or more in volume are also included as rock.

1.2.03 Permits. Before using explosives Contractor shall secure all required permits from the authorities having jurisdiction.

1.3 QUALITY ASSURANCE.

1.3.01 Contractors Qualifications. Seismic survey firm shall be a licensed company specializing in seismic surveys with 5 years documented experience.

Explosives firm shall be a company specializing in explosives for disintegration of rock, with 5 years documented experience.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate the proposed method of removal including blasting, delay pattern, explosive types, type of blasting mat or cover, and intended rock removal method.

1.4.02 Survey Report. Submit survey report on conditions of buildings near locations of rock removal.

1.5 DELIVERY, STORAGE, AND HANDLING. The Contractor shall store and handle all explosives and accessories as accordance with federal, state, and local laws, regulations, and ordinances and manufactures instructions.

All explosives shall be stored in approved structures and detonators shall be stored separation.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Conduct survey with the Engineer and document conditions of buildings near locations of rock removal prior to blasting and photograph existing conditions identifying existing irregularities.

Advise owners of adjacent buildings or structures in writing prior to executing seismographic survey. Explain planned blasting and seismic operations.

Obtain a seismic survey prior to rock excavation to determine maximum charges that can be used at different locations in area of excavation without damaging adjacent properties or other work.

2.2 MATERIALS.

2.2.01 Explosives. Type recommended by explosive firm following seismic survey and required by authorities having jurisdiction.

2.2.02 Delay Device. Type recommended by explosives firm.

2.2.03 Blast Mat Materials. Type recommended by explosives firm.

PART 3 - EXECUTION

3.1 EXAMINATION. Verify site conditions and note subsurface irregularities affecting work of this section.

3.2 PREPARATION. Identify required lines, levels, contours, and datum.

3.3 REMOVAL.

3.3.01 Mechanical Method. Excavate and remove rock by mechanical method. Drill holes and use expansive tools, wedges or mechanical disintegration compound to fracture rock. Cut away rock at bottom of excavation to form level bearing. Remove shaled layers to provide sound and unshattered base for foundations. In utility trenches, excavate to 6 inches below invert. Remove excavated materials from site. Correct unauthorized rock removal as directed by Engineer.

3.3.02 Rock Removal by Explosive Methods. If rock is uncovered requiring the explosives method for rock disintegration, notify the Engineer. The Contractor shall not use any explosives without the Engineer’s approval. Provide seismographic monitoring during progress of blasting operations. Remove rock as recommended by the explosive firm. Remove excavated material from site. Correct unauthorized rock removal as directed by the Engineer.

3.4 FIELD QUALITY CONTROL. Provide for visual inspection of foundation bearing surfaces and cavities formed by removed rock.

End of Section

SECTION 02321

FLOWABLE FILL

PART 1 - GENERAL

1.1 SCOPE. This section includes the furnishing and installation of flowable fill in areas indicated on the drawings and as specified and approved by the Engineer.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C150 (American Society for Testing and Materials) – Portland Cement.

ASTM C260 – Air – Entraining Admixtures for Concrete.

ASTM C618 – Coal Fly Ash and Raw or Calcined Natural Pozzolan for use as a Mineral Admixture in Concrete.

ASTM C989 – Ground Grannulated Blast – Furnace Slag for in Concrete and Mortars.

MDOT (Michigan Department of Transportation) Current Standard Specification for Construction.

1.3 SUBMITTALS. Submit a test report of specified flowable fill material properties.

1.3.01 Test Reports. Submit a flowable fill mix design and trial batch report to the Engineer minimum of 7 days prior to placement. The mix design shall show source and type or class of materials and batch proportions.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. The compressive strength of the flowable fill mixture will not be less than 50 psi (344.7 kPa) at 3 days, nor less than 75 psi (517.11 kPa) and will not exceed 150 psi (1,034.22 kPa) at 28 days.

If an air entraining admixture or performance enhancing admixture is used, then the air content of the flowable fill will not exceed 35 percent of the Flowable Fill volume.

2.2 MATERIALS.

2.2.01 Flowable Fill. Flowable fill shall consist of variable quantities of Type I Portland Cement, granular material or fine aggregate, fly ash and water mixed together and utilized as a controlled density fill. Optional materials, including ground grannulated blast furnace slag, air-entraining admixture and performance enhancing admixture, if required will be indicated on the Drawings or specified by the Engineer.

2.2.02 Granular Material. Granular material shall meet current MDOT Standard Specifications for Construction for Class II requirements except that 100% percent shall pass the 1/2 inch (13 mm) sieve. Fine aggregate shall conform to the requirements of MDOT Type ANS material.

2.2.03 Fly Ash. Fly ash shall meet requirements of ASTM C618 Class F with no limit on the loss of ignition.

2.2.04 Ground Grannulated Blast Furnace Slag. Ground blast furnace slag shall conform to ASTM C989, Grade 100. It shall be used only as a blending material with Type I or Type IA Portland Cement.

2.2.05 Air-Entraining Admixture. Air-entraining admixture used for flowable fill shall conform to ASTM C260.

2.2.06 Performance Enhancing Admixtures. Performance enhancing admixtures are stable high air generators that produce a low water content flowable fill. Performance enhancing admixtures are used to improve flowability, lower densities, eliminate segregation and settlement, and control strength development. If used, the performance enhancing admixture must be included in the mix design and trial batch, and must be used according to the Manufacturer's recommendation.

2.2.07. Mixture. The flowable fill mix proportions shall consist of the following or an approved alternate mix may be provided.

Material	Pounds/Cubic Yard (kg/cu m)
Portland Cement (Type I)	50 (22.68)
Granular Material	3400 (1542.24)
Fly Ash (Class F)	200 (90.72)
Water	Sufficient water to provide the desired flowability (approx. 40 gal (151.42 l))

The mix proportions may be adjusted by the Engineer.

PART 3 - EXECUTION

3.1 PREPARATION. Prior to placement of flowable fill, inspect areas around structures, trenches, and other excavated areas to be filled and ensure that large foreign objects have been removed. The temperature of the flowable fill mix, as it is manufactured and delivered, shall be at least 50º F (10 degrees C). The flowable fill mix shall be transported to the point of placement in a revolving drum mixer or agitator.

3.2 INSTALLATION. Place flowable fill in a manner similar to that for concrete but that adheres to the general requirements for backfilling, according to Section 2.09 of the current MDOT Standard Specifications for Construction, or as approved by the Engineer.

Twenty-four hours will elapse from start to start of each subsequent placement. No placement of flowable fill will be allowed if the anticipated air temperature will be 35° F (17° C) or less in the 24 hour period following proposed placement.

The batching equipment will have devices designed to measure the specified quantities of each component material, and mixing will be of sufficient duration to insure uniform consistency of the mixture. No water will be added to the flowable fill mixture after batching. Water content will be maintained such that compressive strengths are achieved leveling when placed.

During placement operations around manholes and in utility trenches, care shall be used to avoid dislocating any pipes due to fluid pressure from the flowable fill by even placing of the material. Any pipes within the backfill area should be considered for securing to avoid buoyant effect of flowable fill.

When flowable fill is used in pavement cuts, the fill shall be placed to the top of pavement. After setting, the flowable fill is to be removed to the bottom of a concrete pavement patch or to the top of the bituminous base course.

End of Section

SECTION 02342

SOIL STABILIZATION

PART 1 - GENERAL

1.1 SCOPE. This section includes all work necessary to treat existing site subsoil for physical stability and slope protection specified herein and as indicated on the drawings.

Soil stabilization consists of excavating, treatment, and placement of soil cement or lime treated subsoil mix and also placing riprap and rock lining.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C150 – Portland Cement.

ASTM C977 – Quicklime and Hydrated Lime for Soil Stabilization.

ASTM D698 – Test Method for Moisture Density Relations of Soils and Soil-Aggregate Mixtures, using 5.5 lb. (2.5 kg) Rammer and 12 inch (30.5 cm) drop.

ASTM D1633 – Test Method for Compressive Strength of Molded Soil – Cement Cylinders.

AASHTO M216 (American Association of State Highway and Transportation Officials) – Lime for Soil Stabilization.

NLA (National Lime Association) Bulletin 326 – Lime Stabilization Construction Manual.

1.3 QUALITY ASSURANCE. Perform lime stabilization work in accordance with NLA Bulletin 326. Alternatively perform soil stabilization work in accordance with Michigan Department of Transportation (MDOT) Standard Plans and Specifications or as indicated on the drawings.

1.3.01 TOLERANCES. Top surfaces of fill shall be plus or minus 1 inch (2.5 cm) from required elevations.

1.4 SUBMITTALS.

1.4.01 Product Data. Submit mix design and materials mix ratio that will achieve specified requirements.

1.4.02 Samples. Submit sample of each type of fill in air-tight containers to testing laboratory.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Riprap. Provide riprap and heavy riprap in accordance with MDOT Standard Specifications for construction as indicated on the drawings.

2.1.02 Soil Mix Materials. Reuse existing subsoil material combined with ASTM C150 Normal Type I Portland Cement, unless indicated otherwise.

2.1.03 Soil Cement or Lime/Soil Mix. Mix materials in accordance with MDOT Standard Plans and Specifications or as indicated on the drawings. Add water to the mix to achieve a homogeneous damp mixture without lumping, yet not creating a wet plastic consistency. Mix materials in accordance with MDOT Standard Plans and Specifications or as indicated in the drawings.

2.1.04 Curing Seal. Shall be asphalt emulsion primer.

2.1.05 Geotextile Fabric. Shall be non woven polypropylene manufactured by TC Mirafi, Tensar Earth Technologies, Inc., or an approved equal.

2.1.06 Membrane Curing Compound. Compound shall conform to requirements of ASTM C309, Type I, Class B Vehicle with no discoloration properties.

2.1.07 Equipment. Capable of excavating subsoil, mixing and placing materials, wetting, consolidating, and compacting materials.

PART 3 - EXECUTION

3.1 INSPECTION. Do not place materials over frozen or spongy subgrade surfaces.

3.2 PREPARATION. Coordinate requirements with piling operations, if applicable.

3.3 PERFORMANCE.

3.3.01 Excavation. Protect adjacent structures from damage by this work. Excavate subsoil to a depth sufficient to accommodate soil stabilization, and construction operations. Proof roll subgrade to identify soft areas; excavate those areas. Do not excavate within normal 45 degree bearing splay of any foundation.

Remove lumped subsoil, boulders, and rock up to 1/3 cubic yard (0.25 cu m) measured by volume. Larger material will be removed under Master Specification Section 02211 or as directed by the Engineer. Notify Engineer of unexpected subsurface conditions. Discontinue affected work in area until notified to resume work.

Stockpile excavated material in area designated on site; remove excess material not being reused from site.

3.3.02 Soil Treatment and Backfilling. Place geotextile fabric over subsoil surface, lap edges and ends.

Site mix subsoil, backfill and compact. Blend treated subsoil mix to achieve mix formulation and required stabilization.

For lime treated stabilization mixes, mix and wait 16 hours minimum and no more than 72 hours maximum before placing. Place mix material in continuous layers not exceeding 12 inches (30.5 cm) depth.

Maintain optimum moisture content of mix materials to attain required stabilization. If more than one layer, maintain lower layer at optimum moisture until next layer is placed.

For soil cement mixes, place mixed materials within 2.5 hours of adding water to mix. Do not exceed 30 minutes in placing adjacent mixed material. Commence compaction of mix no later than 60 minutes after placement. Compact mix to ASTM D1633 for soil cement mixes and to ASTM 0698 for lime treated mixes.

Slope grade away from building minimum 2 inches (5.1 cm) in 10 feet (3.1 m) unless noted otherwise. Shape to required line, grade, and cross section. Make grade changes gradual. Blend slopes into level areas. At end of day, terminate completed work by forming a straight and vertical construction joint.

Replace damaged fill with new mix to full depth of original mix. Remove surplus mix materials from site.

3.3.03 Curing. Immediately following compaction of mix, seal top surface with curing seal or as indicated on drawings. Do not permit traffic for 72 hours after sealing top surface.

3.3.04 Riprap Replacement. Place geotextile fabric over substrate, lap edges and ends a minimum of 2 feet (61.0 cm) with the upgrade section overlapping the downgrade section. Place riprap at culvert pipe ends, at embankment slopes, and wherever indicated on the drawings.

Plain Riprap: The bank of which plain riprap is to be placed shall be trimmed to a uniform slope as shown on the plans. The riprap shall commence in a trench below the toe of the slope, as shown on the plans, and shall progress upward, with each stone firmly bedded into the slope and against the adjoining stones. The stones shall be laid perpendicular to the slope with the surfaces in contact and with well broken joints. The riprap shall be thoroughly compacted as the construction progresses, and the finished surface of the riprap shall present an even, tight surface. The thickness of the riprap other than precast concrete blocks, shall not be less than 8 inches (20.3 cm), measured perpendicular to the slope. Individual stones shall be laid with their 8-inch (20.3 cm) minimum dimension perpendicular to the plane of the surface to be riprapped.

Grouted Riprap: The stones shall be laid as specified for plain riprap. The spaces between the stones shall be filled with MDOT type R-3 or equal. Mortar shall be placed from bottom to top and sufficient mortar shall be used and worked with suitable tools to completely fill all voids, except that the face surface of the stone shall be left exposed. Any excess mortar shall be removed with a stiff brush.

Grouted riprap shall be cured and protected for a minimum of 4 days by being kept continuously wet or by the application of transparent membrane curing compound.

Heavy Riprap: The bank of which the heavy riprap is to be placed shall be trimmed to a uniform slope as shown on the plans. Heavy riprap shall be constructed in accordance with the requirements for plain riprap except that the thickness of the riprap, other than precast concrete blocks, shall be not less than 16 inches (40.6 cm) measured perpendicular to the slope. Individual stones shall be laid with their 16 inch (40.6 cm) minimum dimension perpendicular to the plane of the surface to be riprapped. When broken pavement is used, it shall be laid in 2 layers with staggered joints and all voids filled to the satisfaction of the Engineer.

3.4 FIELD QUALITY CONTROL. Testing will be performed by an independent testing laboratory paid for by the Contractor. Compression test and analysis of hardened fill material will be performed in accordance with ASTM D1633.

If tests indicate that work does not meet specified requirements, remove work, replace and retest at no cost to Owner.

End of Section

SECTION 02461

STEEL SHEET PILING

PART 1 - GENERAL

1.1 SCOPE. Furnish all labor, materials and equipment to install steel sheet piling where required and where shown on the drawings.

Extent of the steel sheet piling includes, but is not limited to, the following:

Steel sheet piling necessary to protect existing structures, earth, roads, walkways, utilities, and other improvements against loss of ground or caving embankments without producing damage to the adjacent building structures, roads, and/or utilities.

Maintenance of the steel sheet piling and support systems.

Removal and/or relocation of bracing as required.

The configurations of the steel sheet piling may include but are not limited to the following:

Steel sheet piling with walers and struts

Tied-back steel sheet piling

Cantilevered steel sheet piling

A portion of the sheeting may be required to hold back Soil and Water from entering the excavation. As such, the contractor shall be prepared to address all leaking and water inflow through the sheeting interlocks. In any case, the steel sheeting must conform to the minimum requirements indicated on the contract drawings.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM A36: Specification for Structural Steel

ASTM A328: Specification for Steel Sheet Piling

ASTM A572: Specification for High Strength Steel Sheet Piling

ASTM A307: Specification for Steel Bolts and Nuts

AWS: Structural Welding Code

1.3 SUBMITTALS. In accordance with the procedures and requirements set forth in the General Conditions and Division 1, the Contractor shall submit the following:

Two (2) copies of mill test reports certifying that materials meet ASTM requirements.

Photographs of existing structures adjacent to work area.

Survey of existing structures adjacent to work area.

Sample driving record forms.

Schedule of Procedures and Operations.

Details of pile driving equipment.

Shop Drawings.

Each submittal shall be identified by the Specification Section Number.

Each submittal shall be complete in all respects, incorporating all information and data listed herein and all additional information required for evaluation of the proposed materials compliance with the Documents.

Schedule of Procedures and Operations:

Before commencing any steel sheet pile installation, the Contractor shall submit to the Engineer for approval, a schedule of the procedures he intends to use. The schedule shall show in detail, his proposed method, sequence and timing of all steel sheet piling driving operations, catalog data and manufacturer's specification for all hammers and anvils to be used, method of lifting, handling, driving and cutting off of steel sheet piles. The submission of Contractor's details and other information to the Engineer shall not relieve the Contractor of any part of his responsibility for the successful completion of the work.

Shop Drawings shall include but not be limited to:

Layout drawings indicating all structural shapes, sizes and dimensions.

Details of all bracing.

PART 2 - PRODUCTS

2.1 MATERIALS. Steel Sheet Piling shall be hot rolled and shall conform to the requirements of ASTM A328. Sheet piles shall be new and shall be of the continuous interlock type of the section, length and weight shown on the Drawings.

Walers, braces, structures, tie-rod assemblies, plates and similar members shall conform to the requirements of ASTM A36.

Bolts, nuts and washers shall conform to the requirements of ASTM A307.

2.2 FABRICATION. Steel sheet piling shall be so fabricated that when driven in place, it will form a continuously interlocked wall for each structure to the extent required. Steel sheet piling shall be fabricated in one continuous length.

Walers and braces may be prefabricated or fabricated in place. All welding shall conform to the requirements of AWS D1.1-80.

PART 3 - EXECUTION

3.1 INSTALLATION. Steel sheet piling shall be carefully located and driven in a plumb position, to the required tip elevations, each sheet pile interlocking with the adjacent sheet pile so as to form a single continuous wall. Sheet piles shall be driven by approved methods in such a manner as not to subject the sheet piles to serious injury and to insure continuous interlocking throughout the length of the sheet piles. Pile hammers shall be maintained in proper alignment during driving operations. A suitable guide system shall be used to permit the sheet piling to be driven plumb and on-line. Any obstructions encountered in driving the steel sheet piling shall be removed or otherwise disposed of so as to permit the proper installation of the sheet piling. Any sheet piling, which at any time becomes damaged, displaced, separated from adjacent sheets or otherwise injured, shall be withdrawn and replaced with new sheet piling at the expense of the Contractor.

Equipment: The Contractor shall provide and maintain in good operating condition, all equipment necessary for the proper and efficient handling and installation of the sheet piles. The Contractor shall have all major equipment items available for inspection by the Engineer. Any deficiencies in quality, quantity or type of equipment shall be corrected prior to commencing work and such correction shall be a required condition to properly fulfill the Contract. This inspection and subsequent approval shall in no way relieve the Contractor from his obligation to provide all equipment required to properly perform the work.

Hammers: Pile hammers shall be steam, diesel, or air driven impact hammers or vibratory type hammers. Hammers shall be maintained in good operating condition and shall be operated at the manufacturer's rated number of blows per minute. The lower end of the hammer shall be fitted with an anvil base that is built to fit the top of the steel sheet piling and to hold the sheet piling under the center of the hammer during driving.

Driving Records: Steel sheet piling shall be driven only in the presence of the Engineer. The Contractor shall provide a qualified individual to compile and turn over to the Engineer a daily record of driving data. The complete record of each day's activity shall include the number of sheet installed, the length of each, equipment and personnel utilized, and general remarks regarding the day's activity.

Accuracy of Driving: Piles shall be driven to a tolerance of not more than 1/8 inch per foot for the vertical.

Leave sheeting in place where shown on the drawings or as directed by the Engineer. Cut off sheeting left in place a minimum of three feet below finished grades.

3.2 MONITORING. Before starting work, the Contractor shall check and verify governing dimensions and elevations. In company with the Engineer, he shall jointly survey the condition of adjoining structures. He shall take photographs, as directed by the Engineer, recording any prior settlement of cracking of structures, pavements, and other improvements. He shall prepare a list of such damages, verified by dated photographs, and signed by the Contractor and the Engineer participating in the investigation.

The Contractor shall survey adjacent structures and improvements, establishing exact elevations at fixed points to act as bench marks. He shall clearly identify bench marks and record existing elevations. Datum level used to establish bench mark elevations shall be located at a sufficient distance so as not to be affected by movement resulting from excavation or construction operations.

During excavation, the Contractor shall resurvey bench marks weekly, employing a licensed Land Surveyor or registered Professional Engineer. He shall maintain an accurate log of surveyed elevations for comparison with original elevations. He shall promptly notify the Engineer if changes occur or if cracks, sags or other damage is evident.

Vibrations from pile driving operations shall be limited to a measured 1 inch per second peak particle velocity at any adjacent structure. If recorded vibrations exceed the above limit, the contractor shall modify driving operations to reduce vibrations to below the above limit.

3.3 TESTING. All inspection and testing of welds shall be performed in accordance with the provisions of AWS D1.1-810. Welders shall be qualified in accordance with the requirements of AWS D1.1-80.

End of Section

SECTION 02462

STEEL H PILES

PART 1 - GENERAL

1.1 SCOPE. Section includes rolled steel H-section piles. Also covered are pile driving and pile load tests. Structural steel is covered separately.

1.2 GENERAL.

1.2.01 Coordination. Convene a pre-installation meeting a minimum of one week prior to commencing pile-related work.

Follow the Geotechnical Investigation Report recommendations for pile driving.

1.2.02 Governing Standards.

ASTM A6 – General Requirements for Rolled Steel Bars, Plates, Shapes, and Sheet Piling.

ASTM A36 - Carbon Structural Steel.

ASTM A572 Grade 50 – Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.

AWS D1.1 (American Welding Society) – Structural Welding Code - Steel.

AWS D1.5 (American Welding Society) - Bridge Welding Code.

SSPC SP-5 (Steel Structures Painting Council) – White Metal Blast Cleaning.

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Welders employed on the job, must have certification verifying AWS qualification within the previous 12 months.

1.3.02 Contractor’s Qualifications. Company specializing in performing work of this section with minimum 5 years documented experience.

1.3.03 Tolerances.

Maximum Variation From Vertical For Plumb Piles: 1 in 48.

Maximum Variation From Required Angle For Batter Piles: 1 in 24.

Maximum Variation From Pile Cut-off Elevation: 4 inches (10.2 cm).

Maximum Out-of-Position: 2 inches (5.1 cm).

After splicing, the alignment of the centerline of the undriven portion of the pile shall not deviate from the alignment of the centerline of the driven portion of the pile by more than 3/8 inch (1.0 cm) in 40 feet (12.2 m).

After installation, the horizontal deviation of the centerline of the pile at the pile top from the alignment of the centerline of the pile shown on the Drawings shall not be greater or less than an amount equal to two percent of the length over which the alignment is being measured.

Piles at cut-off elevation shall not deviate laterally from required location by more than the tolerance shown on the Drawings. Piles shall not be pulled into location by more than amount shown on Drawings.

1.3.04 Testing Qualifications. Monitor test pile placement under direct supervision of Professional Engineer experienced in design of this Work and licensed in the State of Michigan.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate details and schedule of pile installation sequence. Identify recommended pile length and shapes to suit design loads.

Complete information and data pertaining to the pile driving equipment, including certification of the hammer and details of the capblock and driving head, shall be submitted to the Engineer for review before any driving is done.

Submit details of collars, tips, splices, cushion blocks and welding details.

1.4.02 Certifications. Provide manufacturer's mill certificate that certifies that steel piles meet or exceed specified requirements.

1.4.03 Test Reports. Wave Analysis test results shall be submitted to the Engineer in all required stages, including hammer selection, indicator pile testing program and production piling as required.

1.4.04 Record Drawings. Accurately record the sizes, lengths, and locations of piles, date of driving, pile hammer used, sequence of driving; number of blows per foot (20.5 cm) for entire length of piles and provide a measured set for last 10 blows;

identify piles requiring drilling and their hole diameters, final base and top elevations, and the driving force of each hammer blow.

In addition to the above, pile driving records indicating data recorded as specified herein shall be submitted no later than 2 days after the pile has been completed including final cut-off operations, survey and documentation.

Select pile components not otherwise specified under direct supervision of a professional engineer experienced in design of this work and licensed at the place where the project is located.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Do not drive piles until excavation or filling in the area they are to occupy has been completed to the design grades shown on the Drawings. Do not drive piles until mud-line is clear of debris or other material that may interfere with pile driving. Do not drive piles until the Engineer has approved sequence of driving for all piles. Protect existing structures, including overhead and buried utility lines.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Drive piles to refusal in or on the underlying hard pan. Piles properly driven to refusal in or on the underlying hard pan can develop a compressive capacity equivalent to the maximum allowable stress in the pile.

2.3 MATERIALS. Piles shall comply with ASTM A6, ASTM A36; for structural steel, rolled H sections, with a minimum 36 ksi (248.2 MPa) yield strength; sizes and lengths as indicated on plans. Comply with ASTM A572 Grade 50, for high strength steel rolled H-sections, sizes and lengths as indicated on plans. Use points and driving caps to suit pile shape.

The Contractor shall provide all driving and inspection equipment necessary to determine whether the pile has been started in its planned location, is vertical or at the prescribed batter, and is within allowable tolerance for position after driving.

PART 3 - EXECUTION

3.1 PREPARATION. Obtain prior approval of hammer type to be used. Use driving method, which will not cause damage to nearby structures. Notify adjacent and affected land owners and building occupants with notice before proceeding with the work. Protect structures near the work from damage. Prepare to place piles from excavated working elevation.

3.2 INSTALLATION. Use rigid frame, fixed lead type driving equipment capable of supporting pile firmly in vertical position or to required batter.

Protect pile head during driving, using an approved cap-block cushion consisting of alternate plates of phenolic laminate and aluminum designed to prevent damage to the piles while also transmitting the right amount of energy to the pile top as required, with full bearing on pile butt for even distribution of hammer blow.

Deliver hammer blows to central axis of pile.

If driving is interrupted before refusal, drive an additional 12 inches (30.5 cm) before resuming recording of performance data.

Re-drive piles which have lifted due to driving adjacent piles, or by soil uplift.

Do not damage piles during driving operations.

Cut off tops of piles to elevations indicated and prepare pile top to receive pile caps.

3.2.01 Pile Driving. Driving operations shall be performed only in the presence of the Engineer. The piles must be driven to refusal in competent bedrock. Refusal is defined as 5 hammer blows required to advance the pile ¼ inches or less. The pile driving hammer must have a minimum rated energy of 13,000 foot-pounds per blow. It is recommended that the pile tip be reinforced using an Associated Pile & Fitting Corporation Hard Bite HP77600 Point or equivalent to prevent twisting, buckling, or tearing of the web from the flange.

Top of pile shall be normal to the driving force. Maintain accurate alignment of the pile, hammer and leads to minimize bowing of pile during impact of the hammer ram.

Where groups of piles are required, drive the center pile of the group first and then drive the remaining piles in the group progressing outward from the center.

Drive piles to the minimum tip penetration(s) and to the required driving resistance. Take corrective action, if required, to prevent observable impact bowing of pile at final driving resistance.

When resistance to driving makes it impossible to advance the pile to the required minimum tip penetration, spud, jet, jet and drive, or use such other means as necessary to permit advancement to required minimum tip penetration and then drive to the required resistance. Jetting will be permitted when within the limits specified. If jetting is performed, immediately adjacent piles shall be redriven to the driving resistance required.

Pre-drilling or pre-augering a hole of maximum diameter 2 inches (5.1 cm) smaller than the pile flange dimension may be used to advance the pile to a penetration no deeper than the required minimum tip penetration, providing the pile is driven to the required driving resistance. In granular soils below the ground water level, stabilize the hole by use of drilling fluids.

3.2.02 Pile Hammer. Use a pile hammer complying with the requirements shown on the Drawings. Hammers shall be subject to prior approval by the Engineer. Keep hammer in good mechanical condition and operate it at the speed and pressure recommended by the manufacturer.

During pile driving operations, the Engineer may make occasional measurements of the velocity of the hammer ram using a Hammer Performance Analyzer (radar gun device), as manufactured by Pile Dynamics, Inc., Cleveland, Ohio, or approved equal, to be furnished by the Owner. If the energy per blow computed on the basis of the measured ram velocity at impact is less than 80 percent of the rated energy per blow as specified by the manufacturer of the pile hammer, the Contractor shall make all necessary repairs so as to improve the energy output to a value of at least 80 percent of the rated energy per blow, or, alternatively, the Contractor shall replace the pile hammer.

3.2.03 Welding and Splicing. Perform all welding in accordance with requirements for shielded metal arc welding of AWS D1.1 for buildings or AWS D1.5 for bridges and other structures. Only use welders qualified by tests prescribed in AWS D1.1 or AWS D1.5, as applicable.

Reinforce pile tips, if and when necessary.

Unless stricter requirements are shown on the drawings, splice sections of pile with complete penetration butt weld of flanges and web, provided however, during actual pile installation only, use of the Splicer Sleeve No. BP-3000 as manufactured by Associated Pile and Fitting Corporation, Clifton, New Jersey, with flanges welded with full penetration groove welds, is permitted. Use an approved jig or alignment device during welding to maintain the required straightness of pile specified elsewhere in this section. For splices made during pile installation, rigid frame pile leads may be used as a jig. Notwithstanding the above, only approved butt weld splices shall be permitted within 20 feet (6.1 m) from pile cut-off elevation or design grade, whichever is lower.

The number, type and location of splices shall comply with the following limitations:

No more than three splices per pile over 100 feet (30.5 m) long.

No more than two splices per pile up to 100 feet (30.5 m) long.

No splice closer than 25 feet (7.6 m) from the tip.

3.4 FIELD QUALITY CONTROL. Unacceptable piles include piles that fail tests, piles that are placed out of position, piles that are below cut-off elevations, or piles that are damaged. Provide additional piles or replace piles to conform to specified requirements. The bearing value shall be determined by pile penetration method in accordance with Section 5.02 of the MDOT 1990 Standard Specifications for Construction.

End of Section

SECTION 02530

SANITARY SEWERS

PART 1 - GENERAL

1.1 SCOPE. Section includes sanitary sewerage drainage piping, fittings, manholes, manhole covers and frames, accessories and bedding, sewer leads, cleanout and connection of building sanitary drainage system to municipal sewers.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM A53 – Pipe, Steel, Black and Hot-Dipped Zinc-Coated, Welded and Seamless.

ANSI/ASTM C76 - Concrete Culvert, Storm Drain, and Sewer Pipe.

ANSI/ASTM C443 - Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.

ASTM D2680 - Acrylonitrile - Butadiene - Styrene (ABS) and Poly (Vinyl Chloride) (PVC) Composite.

ASTM D3262 - “Fiberglass” (Glass-Fiber-Reinforced Thermosettting-Resin) Sewer Pipe.

ASTM F1803 - Poly (Vinyl Chloride) (PVC) Closed Profile Gravity Pipe and Fittings Based on Controlled Inside Diameter.

ASTM F949 - Poly (Vinyl Chloride) (PVC) Corrugated Sewer Pipe With a Smooth Interior and Fittings.

MDOT Standard Specifications for Construction, Current Edition.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. All sewer pipe provided for this project shall be manufactured by a pipe manufacturer with a minimum of 5 years history producing the product. Verification of such experience is required with the submittal of the Proposal.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit product data indicating pipe, pipe accessories, and manholes.

Submit manufacturer's installation instructions and indicate special procedures required to install Products specified. Submit sheeting and bracing plans for the jacking pits. Submit construction procedures and necessary details for jacking.

1.4.02 Certifications. Submit manufacturer's certification that products meet or exceed ASTM requirements. Submit two copies of certification to the Engineer.

1.4.03 Record Drawings. Submit record documents that record location of pipe runs, connections, manholes, and invert elevations. Identify locations of and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Manufacturers shall be as shown below based on type of pipe being installed.

Pipe Type	Recommended Manufacturers
Reinforced Concrete Pipe	Premarc, Copipe, National Concrete Products or approved equal
PVC and ABS Truss & Solid Wall Pipe	Lamson, Contech or approved equal
Fiberglass Mortar Pipe	Hobas or approved equal

2.2 MATERIALS.

2.2.01 Pipe. Sewer lines and laterals from 4 to 6 inches (10.2 to 15.2 cm) in diameter shall be solid wall ABS or PVC pipe complying with ASTM D2751 (ABS pipe) or ASTM D3034 (PVC pipe).

Sewer lines 8 to 15 inches (20.3 to 28.1 cm) in diameter shall be ABS or PVC truss pipe complying with ASTM D2680. PVC truss pipe joints shall be push-on type with rubber gasket. ABS truss pipe joints shall be of the chemically welded type with a solid ABS coupling. Joints shall provide a watertight seal and shall be made in strict accordance with the manufacturer’s recommendation.

Sewer lines larger than 15 inches (28.1 cm) in diameter shall be reinforced concrete pipe conforming to ASTM C76 or PVC large diameter pipe conforming to ASTM

F949 or ASTM F1803. Reinforced concrete pipe shall have modified grooved tongue joints with rubber gaskets that shall conform to ASTM C443. Pipe tongue shall not be out of round by more than plus or minus 1/16 inch (1.6 mm) and rubber gaskets shall be fabricated from a high grade rubber-like compound having a minimum tensile strength of 1200 psi (8,273.7 kPa) and a 7-day water absorption by weight not to exceed 5 percent.. PVC large diameter profile pipe shall be manufactured in accordance with ASTM F949 or ASTM F1803. Joints shall be the bell and spigot type.

Fiberglass mortar pipe, where used, shall conform to ASTM D3262. Steel for steel casing pipe shall be Type E or S, Grade B in conformance with ASTM A53.

2.2.02 Pipe Accessories. Fittings shall be of the same material as pipe molded or formed to suit pipe size and end design, in required tee and wyes.

2.2.03 Joint Compound. Joint compounds used to seal concrete reinforced sewer pipe shall be of a flexible Type I (Asbestos free) in compliance with ASTM D4586. Acceptable manufacturers include Sealtight or equal. Do not use cement grout.

2.2.04 Precast Manholes. Manholes shall be pre-cast concrete or fiberglass with rubber boot connections to sewer lines. Refer to Specification Section 02600 – Manholes.

PART 3 EXECUTION

3.1 INSPECTION. Verify that trench cut is ready to receive work and excavations, dimensions, and elevations are as indicated on Drawings.

3.2 PREPARATION. Correct over-excavation with sand. Remove large stones or other hard matter which could damage pipe or impede consistent backfilling or compaction.

3.3 INSTALLATION. Install pipe, fittings, and accessories in accordance with ASTM C12. Seal joints watertight. Lay pipe to slope gradients noted on Drawings. Install bedding at sides and over top of pipe as shown on the Drawings. Do not displace or damage pipe when compacting.

Reinforced concrete pipe joints shall be sealed with a flexible joint compound prior to backfill.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. Compaction testing shall be performed in accordance with Section 5.13 of the MDOT Standard Specifications for Construction.

3.4.02 Exfiltration Method Procedures. The section of sewer to be tested shall be sealed by inserting inflatable rubber bags in the pipes or by other means approved by the Engineer, and then water shall be introduced into a manhole until the section is completely filled. The Contractor shall fill the pipe to the test level prior to the time of exfiltration testing to permit normal absorption into the pipe walls.

Throughout the test period of at least 1 hour, the water level in the upper manhole shall be maintained at least 24 inches (61 cm) above the crown of the upper end of the pipe or at least 24 inches (61 cm) above the ground water table, which ever is higher. The length of pipe tested shall be limited so that the pressure on the center line of the lower end of the section tested shall not exceed 6 feet (1.8 m) of water column.

Exfiltration leakage shall not exceed 200 gallons per inch of pipe diameter per mile per day (185.2 l/cm/km/day) of sewer pipe, including manholes in the test section.

3.4.03 Infiltration Method Procedures. The section of sewer to be tested shall have been trench backfilled and the tests conducted by including infiltration conditions by jetting the sewer trench for a sufficient length of time to insure that the water level in the trench is minimum of 24 inches (61 cm) over the crown of the sewer pipe at the upper end of the pipe. The test must be performed before existing sewers are connected and before sewage flow is allowed in the sewers.

Infiltration flow shall be measured by a 90 degrees V notch weir with free fall discharge or other means acceptable to the Engineer. Infiltration leakage shall not exceed 200 gallons per inch of pipe diameter per mile per day (185.2 l/cm/km/day) of sewer pipe, including manholes in the test section.

3.4.04 Air Testing Method Procedures. The section of sewer to be tested shall have been trench backfilled and cleared. Pneumatic plugs (having a sealing length equal to or greater than the diameter of the pipe to be tested) placed in both ends of the pipe to be tested shall be inflated to 25 psi (172.4 kPa). The sealed sewer pipe shall then be pressurized to 4 psi (27.6 kPa) above the average backpressure of ground water over the sewer pipe and the air pressure allowed to stabilize for at least 2 minutes.

After the stabilization period, the line shall be pressurized to 3.5 psi (24.1 kPa) and the time in minutes measured for pressure to drop to 2.5 psi (17.2 kPa). If ground water is present, the air pressure within shall be increased to 3.5 psi (24.1 kPa) above the level of ground water and the drop of 1 psi (6.9 kPa) of air pressure measured in minutes.

Air testing techniques shall be in accordance with the latest ASTM standard practice for testing sewer lines by low-pressure air test method for the appropriate pipe material.

Air leakage test results shall equal or exceed the times allowed based on sewer pipe diameter and length as specified in the Low Pressure Air Test Tables for concrete pipe sewer per ASTM C924 and plastic gravity sewer per ASTM F1417.

3.4.05 Inspection. Request inspection prior to placing bedding.

End of Section

SECTION 02533

PIPE CLEANING AND TELEVISING

PART 1 – GENERAL

1.1 SUMMARY. Section includes the extent of cleaning and inspection work by closed circuit television of sewers or underground pipe systems.

1.2 SUBMITTALS. Submit in accordance with Specification Section 01080, Project Submittals covering the items included under this Section.

Owner Coordination: The Contractor shall coordinate pipe cleaning and televising work with DWSD SWWTP operations. The Contractor shall submit a coordination plan indicating related segments that will be affected by the Work. Provide schedule and detailed sequence of cleaning and televising work. Indicate impact of work on DWSD operations.

Inspection Report: After completion of Work under this Section, Contractor shall furnish to Engineer ten copies of a complete bound report of the television inspection and photographs taken during the televising of the pipe system. The report shall include written logs of each section of pipe televised, giving specific details as to service connections, broken, or crushed pipe, defective joints, misalignment in line and grade, water infiltration, root growth, and any other points of interest noted during the inspection. The television inspection DVD(s) shall be given to Engineer as part of the inspection report or as they are completed, upon request of Engineer. All DVD’s shall be labeled to describe the reaches of pipe contained in the recording, including manhole numbers or access locations, if available.

The inspection report shall be prepared and submitted in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.3 QUALITY ASSURANCE. Qualifications: Firms regularly engaged in the cleaning and televising of pipe systems for not less than five years. Firms shall submit references at the request of Engineer.

PART 2 - PRODUCTS

2.1 EQUIPMENT.

2.1.01 Cleaning Equipment. The equipment used for pipe cleaning shall be capable of removing all dirt, grease, rocks, roots, and other deleterious materials. The equipment selected by Contractor shall not damage the pipe system.

Equipment may include high-velocity water jetting equipment, vacuum machines, hydraulically propelled equipment, or mechanically powered equipment. Roots, large debris, and heavier deposits shall be removed with appropriate equipment.

If a rodding unit is used, it shall be able to pull brushes, swabs, and other cleaning equipment as well as the television camera. The rodding unit shall have a footage meter attached so that the location of the cleaning tools and/or television camera will be known at all times.

Necessary pulleys and supports shall be installed so as not to restrict the cleaning operation or damage existing equipment, structures, or materials. Where bucket machines and buckets are to be used, caution should be taken that a proper sized flexible cable be used so that cable breakage will not occur.

Cleaning equipment capable of cleaning lengths up to 1,000 feet shall be provided. Equipment must be able to clean the length with vehicular access to one location only.

2.1.02 Televising Equipment. The television camera used for the inspection shall be one specifically designed and constructed for inspection of pipe systems and shall be capable of operating under 100 percent humidity conditions.

The camera shall be of panning, rotating, tilting, and capable of viewing into lateral connections. Lighting for the camera shall be suitable to allow a clear picture of the entire periphery of the pipe.

All television inspection shall be recorded on DVD, which shall be turned over to Engineer. The recording must be made on a continuous running DVD on which sound and video information can be recorded. The DVD must contain a continuous record of the pipe section from access to access. The speed and electronics of the DVD shall be equal to that which can be played back on a standardized DVD player. The recording shall be made on a slow play format.

PART 3 - EXECUTION

3.1 PREPARATION. Cleaning Precautions: During pipe cleaning operations, satisfactory precautions shall be taken in the use of cleaning equipment.

When hydraulically propelled cleaning tools or tools that retard the flow in the pipe line are used, precautions shall be taken to ensure that the water pressure created does not damage or cause flooding. It is the sole responsibility of Contractor to avoid, clean or repair any damages which result from back-flushing the pipe.

When possible, the flows in the pipe shall be utilized to provide the necessary pressure for hydraulic cleaning devices. When additional water from fire hydrants or hose bibs is necessary to avoid delay in normal work procedures, the water shall be conserved and not used unnecessarily. Use of hydrants shall be approved by Engineer prior to utilization. No fire hydrants shall be obstructed in case of a fire in the area served by the hydrant.

3.2 PIPE CLEANING

3.2.01 General. Pipe cleaning shall include all Work required to clean pipes for inspection by closed circuit television. Work included in cleaning of pipes shall include providing necessary equipment and personnel for dislodging material from the pipe, removal of the debris from the system, and the transport and disposal of debris removed. Engineer will not provide a disposal site.

3.2.02 Removal and Disposal of Debris. All sludge, dirt, sand, rocks, grease, roots, and other solid or semisolid material resulting from the cleaning operation shall be removed at the downstream access of the section being cleaned. Contractor shall be responsible for proper and legal disposal of all debris resulting from the cleaning operation.

3.2.03 Acceptance of Pipe Cleaning. Acceptance of pipe line cleaning shall be made upon the successful completion of the television inspection and shall be to the satisfaction of Engineer. If the television inspection shows the cleaning to be unsatisfactory, Contractor shall be required to re-clean and re-inspect the pipe line, until the cleaning is shown to be satisfactory.

3.3 TELEVISION INSPECTION.

3.3.01 General. Under this Work, Contractor shall furnish all materials, labor, equipment, and all else necessary for performing a television inspection of the pipe.

The view seen by the television camera shall be transmitted to a monitor. The stationing of the television camera shall be continuously displayed on the television monitor while the pipe line is inspected. Engineer shall have access to view the television screen at all times.

3.3.02 Televising Procedure. The camera shall be moved through the line in either direction at a moderate rate, stopping when necessary to allow examination and documentation of all points of infiltration, cracked, or crushed pipe, defective joints, misalignment of line and grade, service lateral connections, or other points of interest noted during the inspection.

3.4 FIELD QUALITY CONTROL. Television Inspection Reporting: Two sets of printed records shall be kept by Contractor and will clearly show the location in relation to an adjacent access of each point of significance observed during the inspection. One set of this information shall be turned over to Engineer upon the completion of the inspection of each line. Contractor shall hold the second copy of the information until completion of Project, at which time it shall be neatly assembled and turned over to Engineer.

End of Section

SECTION 02600

MANHOLES

PART 1 - GENERAL

1.1 SCOPE. This section includes all manholes for sewers including entrance manholes, blow off wells, air release manholes, standard sewer manholes, drop manholes and interceptor sewer manholes. Emphasis is on the use of pre-cast concrete manholes.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society of Testing and Materials) A48 - Specification for Gray Iron Casting.

ASTM C32 - Specification for Sewer and Manhole Brick (Made for Clay or Shale).

ASTM C33 – Specification for Concrete Aggregates.

ASTM C150 - Specification for Portland Cement.

ASTM C207 – Specification for Hydrated Lime for Masonry Purposes.

ASTM C443 - Specification for Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.

ASTM C478 – Specification for Precast Reinforced Concrete Manhole Sections.

ASTM C923 - Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures and pipes.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit shop drawings and product data on precast manholes, wells and pits along with related piping and accessories. Provide Manufacturer's written instruction for installing resilient connector.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Precast Concrete Manholes. Manholes shall be leak-tight and shall be constructed of precast units as shown on the Drawings according to ASTM C478.

Base shall be precast concrete or cast-in place. Tops shall be accurately shaped by ring forms to suit riser sections. Walls barrels and cones shall be precast concrete or cast-in place.

Top of Cone shall be reinforced concrete grading rings (preferred) or brickwork for adjusting frame to match finished surface (not to exceed 11 in. (27.9 cm)).

Manhole diameter shall be as indicated on the drawings.

Precast manhole sections shall comply with ASTM C478-85a with the following modifications:

Wall thickness shall be as indicated on drawings.

Cement shall comply with ASTM C150, Type II.

Joints between sections shall be rubber gaskets as per ASTM C443.

Steps shall be set accurately as indicated and specified

Cones and Conical Transitions shall be similar in design and construction to riser sections and as indicated. Flat Club tops as indicated.

During manufacture cast and build, resilient connectors for pipe connections, and holes for future pipe connections into bases.

Cure precast manhole sections by subjecting to saturated steam at temperature between 100 degrees F and 130 degrees F (38 degrees C and 55^0 C) for 12 hours or more. Cast or drill only 2 lift holes in each section. Mark clearly date of manufacture and name or trademark of manufacturer on insides of walls on all sections. Acceptance shall be on based of material tests and product inspection.

2.2.02 Fiberglass Manholes. Fiberglass reinforced polyester manhole shall be manufactured from commercial grade polyester resin or other suitable polyester or vinyl ester resins, with fiberglass reinforcements. Manhole shall be a one piece unit conforming with ASTM D3753 as manufactured by LFM or approved equal.

Manhole shall have resin fiber-reinforced bottom of 1 ½ inch (3.8 cm) minimum thickness and shall have a minimum 3 inch (7.6 cm) anti-flotation ring.

Manhole shall have 6 inches (15.2 cm) of concrete grade rings or brick between frame and cover and fiberglass structure.

Manholes shall be anchored in accordance with manufacturers recommended method to prevent floating. Concrete anchoring or rock anchors are acceptable.

Fiberglass manholes must have the ability to be height adjustable with the use of a height adjustment ring. Height adjustment can be made as a field operation without the use of uncured resins or fiberglass layups. Fiberglass manholes must maintain all load and soundness characteristics required by ASTM D3753 after height adjustment has occurred.

2.1.03 Portland Cement. Shall be ASTM C150, Type II.

2.1.04 Hydrated Lime. Shall be ASTM C207, Type S.

2.1.05 Sand. Shall be ASTM C33, Fine Aggregate, except all passes No. 8 sieve.

2.1.06 Brick. Shall be ASTM C32, Grade SS, but mean of five tests for absorption not to exceed 8 percent by weight.

2.1.07 Frames and Covers. Manhole cover and frame for all manholes, precast concrete, fiberglass, or cast in place, shall be of cast iron construction as per standard details. As indicated on the Contract Drawings, machine contact surfaces to prevent rocking.

Contractor shall furnish and install Type 304 stainless steel manhole designation tags, bolts, nuts and lock washers for each manhole. A list of the characters on the tags shall be provided by the Engineer. The nuts and bolts shall be counter-sunk to be flush with surrounding material.

2.1.08 Bituminous Waterproofing Material. Acceptable products include:

> No. 46-449 Heavy Duty Black made by Tnemec Company, Inc., North Kansas City, MO.
>
> No. 35-J-lG Hi-Build Bituminous Coating made by Mobil Chemical Company, Edison, NJ.
>
> Bitumastic Super Service Black made by Koppers Company, Inc., Pittsburgh, PA.; or acceptable equivalent.

2.1.09 Plastic Coated Steel Steps. PS2-PFS Manhole Steps made by M.A. Industries, Inc., Peachtree City, GA., or approved equal. Steps should be of type driven into preformed holes or embedded plastic inserts.

All steps shall be capable of resisting a minimum horizontal pull out load of 400 pounds (181.8 kg) and a minimum vertical load of 800 pounds (363.6 kg) without loosening or damaging.

2.1.10 Joints. Install rubber gaskets between precast sections to comply with ASTM C443.

Resilient connectors (rubber boots) between pipes and precast sections shall be per ASTM C923, and conforming to manufacturer's standards. Connectors using castings and bolts with non-resilient bearing are NOT ACCEPTABLE.

Rubber ring waterstops for pipe-to-manhole joints shall be of resilient material that will fit snugly over pipes and held firmly against pipe surface by means of a mechanical take-up device which, when tightened, will compress resilient material or by a stretch fit. Waterstop shall be designed and installed so that leakage between pipe and manhole is minimized. Materials and manufacture of waterstops conform to applicable provisions of the ASTM Standard Specifications for Resilient Connectors Between Reinforced Concrete Manhole Structures and Pipes, Designation C923.

Non-shrink mortar for pipe connections to existing manholes shall be Masterflow 713 Grout made by Master Builders, Cleveland, OH; Five Star Grout made by U.S. Grout Corp., Old Greenwich, CT; Upcon made by Upco Co., Cleveland, OH; or an approved equal.

2.1.11 Mixes. Concrete shall have a minimum 3000 psi (20,689.3 kPa) compressive strength at 28 days or as defined in drawings. See Master Specification Division 3 – Concrete.

Cement Mortar for laying brick and block in manholes shall be mixed in the proportion of 2 parts Portland Cement to 1 part hydrated lime to 9 parts sand. Use sufficient water to form a workable mixture of damp mortar, just short of "balling".

Mortar mixed by hand shall be prepared in a suitable clean, water-tight box. The ingredients, except water, shall be first thoroughly mixed dry until of uniform color; then water shall be added and the mixing continued until mortar is of proper consistency and uniform texture is produced.

No retempered mortar that has been mixed for more than thirty minutes shall be used in the work. No cement mortar shall be mixed when the temperature is below 30 degrees F (-1.1 degrees C), without heating the sand and water.

Mortar for plugging lift holes shall be mixed at 2 parts Portland Cement to 3 parts sand by volume with sufficient water.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 Erection of Precast Sections. Set vertical with sections and steps in alignment. Set bases true to line and elevation. Install rubber gaskets in joints between sections conforming to manufacturer's standard. Plug lifting holes with mortar. Hammer mortar into hole until dense and excess of paste appears, then smooth flush with adjoining surface.

3.1.02 Laying Brickwork and Grading Rings. Moisten bricks, before laying. Moistening of grading rings is NOT PERMITTED. Lay bricks and grading rings in full bed and joint of mortar without subsequent grouting, flushing or filling; bond thoroughly.

3.1.03 Plastering and Curing Brick Masonry. Plaster outside faces with mortar for brick: 1/4" (6mm) to 3/8" (10mm) thick. Moisten brick masonry before application of mortar. Spread and trowel plaster carefully. Check after hardening by tapping for bond and soundness. Remove and replace unbonded and unsound plaster. Protect from too rapid drying by moist burlap or as approved. Protect from weather and frost.

3.1.04 Jointing and Connections. Joints between precast sections, and between pipes and precast sections shall conform to related standards and manufacturer's instruction.

When installing rubber ring water stops for pipe-to-manhole, hold firmly against pipe surface by mechanical take-up device to compress resilient material when tightened. Install to minimize leakage.

Apply non-shrink mortar according to manufacturer's instruction. Close openings for future connection with concrete or brick masonry bulkhead as indicated.

3.1.05 Coating. Give exterior surfaces two heavy coats of bituminous waterproofing material. Apply by brush or spray according to manufacturer's instructions. Special coating requirements are specified in Master Specification Section 09900 - Painting.

3.1.06 Setting Frames and Covers. Set frames with top conforming to finished ground or pavement surface as indicated and directed. Set circular frames concentric with top of concrete or masonry. Set frames in full bed of mortar to fill and make watertight space between masonry top and bottom flange of frame. Place thick ring of mortar extending to outer edge of concrete or masonry, around bottom flange. Finish mortar smoothly and give a slight slope to drain water away from frame. Place concrete collar around frame when placing permanent pavement as indicated. Place covers in frames on completion of work.

Install manhole designation, tags in location recommended by Owner's representative according to manufacture's instructions. Provide secondary manhole designation working on interior face of frame.

3.1.07 Installing Steps. Embed steps in wall during casting. Steps shall be installed in a vertical row on centers.

3.2 FIELD QUALITY CONTROL.

3.2.01 Inspection. Inspect for visible leakage after backfill with ground water at normal level. Locate visible leakage inside manhole and repair leaks.

End of Section

SECTION 02620

WATER MAIN SERVICES

PART 1 - GENERAL

1.1 SCOPE. This Section covers buried piping not otherwise specified as steel or reinforced concrete pressure pipes, fittings, valves, service connections, valve wells, thrust blocks, thrust restraining, polyethylene encasement, appurtenances and accessories complete as shown on the drawings and specified herein and other related sections of these Specifications.
1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified herein, all water main work shall be done according to the applicable portions of the Standard Specifications prepared by: the American National Standards Institute (ANSI), the American Society for Testing and Materials (ASTM), the American Water Works Association (AWWA), the National Sanitation Foundation (NSF), the City of Detroit, Department of Public Works Specifications and Standards, and the Michigan Department of Transportation (MDOT). Particularly, the Contractors attention is directed to the latest editions of the following standards at the time of bid:

ANSI/AWWA C104/A21.4 - American National Standard for Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.

ANSI/AWWA C105/A21.5 - American National Standard for Polyethylene Encasement for Ductile-Iron Pipe Systems.

ANSI/AWWA C110/A21.10 - American National Standard for Ductile-Iron and Gray-Iron Fittings, 3in through 48in for Water and other liquids.

ANSI/AWWA C111/A21.11 - American National Standard for Rubber Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.

ANSI/AWWA C115/A21.15 - American National Standard for Flanged Ductile-Iron or Gray-Iron Threaded Flanges.

ANSI/AWWA C150/A21.50 - American National Standard for Thickness Design of Ductile-Iron Pipe.

ANSI/AWWA C151/A21.51 - American National Standard for Ductile-Iron Pipe, Centrifugally Cast, for Water.

ANSI/AWWA C153/A21.53 - American National Standard for Ductile-Iron Compact Fittings, 3 inches (7.6 cm) through 24 inches ((61.0 cm), and 54 inches (137.2 cm) through 64 inches (162.6 cm) for Water Service.

AWWA C600 AWWA - Standard for Installation of Ductile-Iron Water Mains and Their Appurtenances.

ANSI/AWWA C653. AWWA - Standard for Disinfecting Water Mains.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Contractor shall have 5 years documented experience successfully installing water mains and related valves and equipment with sufficient equipment and crews to install Work without delays.

1.3.02 Tolerances. Water main installation shall be within 0.01 foot of the design elevation unless otherwise authorized in writing by the Engineer.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit product data on all water main pipes, fittings, valves, fire hydrants, service connections, valve wells, mechanical thrust restraints, appurtenances and accessories. Submit shop drawings and calculations for all mechanical thrust restraints, thrust clocks, and manholes, wells, and pits.

1.4.02 Certifications. For all furnished materials, the Contractor shall furnish a sworn statement that the inspection and all tests required have been made and that the results comply with the requirements of the applicable standards. All affidavits of compliance shall be certified by a registered professional Engineer.

1.5 DELIVERY, STORAGE, AND HANDLING PRODUCT.

1.5.01 Delivery of Materials. Pipe, fittings, and accessories shall be handled in a manner that will ensure installation in sound, undamaged condition. Equipment, tools, and methods used in handling and installing pipe and fittings shall not damage the pipe and fittings. Hooks inserted in ends of pipe shall have broad, well-padded contact surfaces. Unpadded hooks, wire brushes, or other abrasive tools shall not be permitted to come into contact with the polyethylene lining.

1.5.02 Handling of Materials. Load and unload piping using suitably approved hoist and skidding. Piping shall not be dropped, bumped or allowed to impact against itself. The Engineer shall reject damaged piping.

Lifting devices shall be suited to the Work and shall protect surfaces from damage.

1.5.03 Storage of Materials. Pipe shall be stored in a manner to minimize infiltration of dirt, debris and other extraneous materials.

Piping materials shall not be stacked higher than 4 feet (1.2 m). Suitable racks, chairs and other supports shall be provided to protect preformed pipe mating surfaces from damage. Store bottom tiers off the ground, alternate tiers and chock tier ends.

Store all hydrants, valves, wells and prefabricated structures off the ground, drained and kept free of water to protect against damage from freezing. Hydrants, valves, wells, their accessories and appurtenances shall be kept in their original containers until ready for installation.

All joints and sealing materials subject to ultra-violet or ozone attack and used in the water main system shall be protected from the sunlight, atmosphere and weather, stored in suitable enclosures until ready for installation.

1.5.04 Damaged Materials. Pipe and fittings in which the lining has been damaged shall be replaced.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS.

2.1.01 Dimensions. Ductile iron pipe shall be designed and manufactured in accordance with the latest revision of ANSI/AWWA C150/A21.50 and ANSI/AWWA C151/A21.51, respectively.

2.1.02 Marking. All manhole covers and valves shall have cast the letters DWSD, the manufacturer's name or mark, the year of the manufacturer and the size. Other markings, in lieu of cast markings, shall be approved by the Engineer.

2.2 ACCEPTABLE MANUFACTURERS.

2.2.01 Pipe, Valves and Fittings. Acceptable manufacturers for ductile iron pipe and appurtenances include Ductile Iron Pipe, U.S. Pipe, American, Clow or approved equal.

2.2.02 Roadway Boxes. Acceptable manufacturers include Traverse City Iron Works (A-295 Three Piece Screw Type); Clow (AF2450), Tyler (Series 6860), East Jordan Iron Works (6860 Series) or approved equal.

2.2.03 Corporation Stops. Acceptable manufacturers include Hays, Crane, Mueller, Ford, or approved equal.

2.2.04 Hydrants. Acceptable manufacturers include East Jordan Iron Works or approved equal.

2.2.05 Service Clamps. Acceptable manufacturers include Mueller or approved equal.

2.2.06 Curb Stops. Acceptable manufacturers include Hays, Ford, Mueller, or approved equal.

2.2.07 Curb Box. Acceptable manufacturers include Mueller or approved equal.

2.2.08 Restrained Mechanical Joints. Acceptable manufacturers include American AMJ coupled Joint and, Griffin MECH-LOK. Field Cut Spigot shall be EBAA Iron Megalug Series 1100. (4 to 20 inch (10.2 – 50.8 cm).

2.3 MATERIALS.

2.3.01 Pipe. Shall be ductile iron pipe, Thickness Class 56 as defined in ANSI/AWWA C150/21.50.

As an alternative with approval of Engineer, DI pipe shall conform to ANSI/AWWA C150/A21.50, American National Standard for the Thickness Design of Ductile Iron Pipe and the National Sanitation Foundation Standard No. 61. The material and properties used shall conform to ANSI/AWWA C151/A21.51, Ductile Iron Centrifugally Cast, for Water or Other Liquids. In addition, the pipe shall be pressure rated in accordance with the ANSI/AWWA standards and meet the minimum pressure classes as follows:

Ductile Iron Pipe, 12 inch Diameter or Smaller	Pressure Class 350
Ductile Iron Pipe, 14 inch Diameter or Greater	Pressure Class 250

2.3.02 Fitting. Shall meet ANSI/AWWA C153/A21.53 except 350 psi (2413 kPa) pressure.

2.3.03 Push-on Joints. Shall meet ANSI/AWWA C111/A21.11. except gaskets shall be neoprene or other synthetic rubber. Natural rubber will not be acceptable.

2.3.04 Restrained Push-on Joints.

4 to 12 inch (10.2 – 30.5 cm)	U.S. Pipe Field Lok Gasket, or American Fast-Grip.
4 to 20 inch (10.2 – 50.8 cm)	EBAA Iron Megalug Series 1700.

4 to 64 inch (10.2 – 162.6 cm)	American "Flex-Ring", “Field Flex-Ring”, or "Lok--Ring"; Clow "Super-Lock"; U.S. Pipe "TR Flex"; or Griffin "Snap-Lok". Sets crews bearing on the pipe wall will not be acceptable.

2.3.05 Flanged Joints. Shall meet ANSI/AWWA C115/A21.15.

2.3.06 Flanges Ductile Iron. Shall meet ANSI/AWWA C115/A21.15.

2.3.07 Bolts. Shall be ASTM A307, chamfered or rounded ends projecting 1/4 to 1/2 inch (6.4 – 12.7 mm) beyond outer face of nut.

2.3.08 Nuts. Shall meet ASTM A307, hexagonal, ANSI/ASME B18.2.2, heavy semi-finished pattern.

2.3.09 Gaskets. Shall be ASTM D1330, Grade I rubber, full face type, 1/8 inch (3.2 mm) thick.

2.3.10 Mechanical Joints. Shall be ANSI/AWWA C115/A21.1, except gaskets shall be neoprene or other synthetic rubber. Natural rubber will not be acceptable.

2.3.11 Restrained Mechanical Joints. Shall be factory prepared.

2.3.12 Wall Castings. Mechanical joint with water stop/thrust collar and tapped holes; single casting or fabricated ductile iron. All holes shall be sized in accordance with the details on the drawings and shall be provided with removable plugs. Plan end and flanged end wall castings where indicated on the Drawings.

2.3.13 Mechanical Joints with Tie Rods. See details on the drawings. Tie Rods shall meet ASTM A307. Steel Pipe shall meet ASTM standard weight. Washers shall meet ANSI B18.22.1 plain steel.

2.3.14 Threaded Connections. Shall comply with ANSI/ASME B1.20.1, NPT. Provide boss or tapping saddle wherever wall thickness minus the foundry tolerance at the tapped connection is less than that required for 4-thread engagement as set forth in Table A.1, Appendix A, of ANSI/AWWA C151/A21.51.

2.3.15 Mechanical Couplings. Couplings shall be Dresser “Style 38”, Smith Blair “441 or 411 Flexible Coupling”, Brico Depend-O-Lok, or Romac “Style 501”; without pipe stop. Gaskets shall be Oil-resistant synthetic rubber.

2.3.16 Grooved Couplings. Grooved pipe ends shall meet dimensions conforming to AWWA C606, Table 5 for rigid joints.

Shouldered pipe ends shall meet dimensions conforming to AWWA C606, Table 4. Flanged and grooved pip w/ couplings will not be permitted for underground use, unless written approval by the engineer is obtained.

2.3.18 Tapping Saddles. Shall be ductile iron, with steel straps and rubber sealing gasket, 250 psi (1723.8 kPa) pressure rating.

2.3.19 Tapping Sleeves. Mechanical joint sleeves shall be furnished complete with valve, stops, caps, plugs and joint accessories as indicated on the Plan. The sleeve shall be of a 2-section type.

2.3.20 Shop Coating and Lining. Cement Mortar Lining shall comply with ANSI/AWWA C104/A21.4.

Universal Primer shall be Ameron "Amercoat 180 Synthetic Resin Coating", Carboline "888 Primer", or Tnemec "Series 37H Chem-Prime H.S."

Asphaltic Coating shall meet Manufacturer's standard.

Liquid Epoxy shall meet NSI/AWWA C210.

Rust-Preventive Compound shall be provided by Houghton "Rust Veto 344".

2.3.21 Polyethylene Tube. Shall be seamless, ANSI/AWWA C105/A21.5

2.3.22 Adhesive Tape. Adhesive tape shall be a general purpose adhesive tape 2 inch (5.1 cm) wide and approximately 10 mils thick, such as Scotchrap No. 50, Polyken No. 900 or Tapecoat CT. Tape used for repair of damage to the polyethylene shall possess a life expectancy equal to that of the polyethylene.

2.4 SHOP COATING AND LINING. The interior of all pipe and fittings for water service shall be cement mortar lined double thickness with asphaltic seal coat according to ANSI/AWWA C104/A21.4.

The exterior surfaces of all pipe and fittings which will be exposed in interior locations shall be primed. Flange faces shall be coated with rust-preventive compound. Exterior surfaces of all other pipe and fittings shall be coated with asphaltic coating.

2.5 STRUCTURES. Material for water main structures shall conform to the following requirements:

Precast Concrete Units shall meet ASTM C478, circular with circular or elliptical reinforcement as detailed. Provide lifting holes in precast units where indicated.

Steps shall be Steel Reinforced Plastic using a suitably approved co-polymer polypropylene conforming to ASTM D2146, Type II, Grade 49108 with 3/8 inch (9.5 mm) minimum diameter deformed reinforcing bar conforming to ASTM A615, Grade 60.

Covers and Frames shall be Class 30, ASTM A48 gray iron castings. The castings shall be nearly made and free from cracks, cold sheets, holes and other defects. Surfaces of castings shall be ground to assure proper fit and to prevent rocking. Units shall be frostproof and shall be provided with tapping screws and anchors.

Bolts, studs, and nuts shall conform to the requirements of AWWA C500 and the ASTM standards. Bronze shall meet ASTM B98. Steel shall meet ASTM A307, Grade B. Cadmium Plating shall meet ASTM A165, Grade N.S. Zinc Coating shall meet ASTM A153 or A164, Type G.S. Tee head bolts and nuts shall be high strength, low alloy steel conforming to ANSI/AWWA C111/A 21.11.

2.6 POLYETHYLENE ENCASEMENT. Polyethylene material, in tube form shall be used to encase ductile iron pipe. Polyethylene encasement materials shall be manufactured in accordance with ASTM Specifications D4976. Polyethylene encasement shall be linear low-density polyethylene Film Group 2, Tensile Strength 3,600 psi (24,822 kPa) and Elongation 800%. Polyethylene tube material shall have a minimum thickness of .008 (8-mils).

Adhesive tape shall be used to repair polyethylene and seal joints.

PART 3 - EXECUTION

3.1 INSPECTION. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation; spigot ends shall be examined with particular care. All defective pipe and fittings shall be removed from the site of the work.

3.1.01 Excavation and Bedding. Prior to the installation of any water main piping or materials, examine all trenches and other excavations for the proper grades, lines, levels and clearances required to receive the new Work. Ascertain that all excavation bottoms, compacted subgrades and pipe bedding are adequate to receive water main materials to be installed. Correct all defects and deficiencies before proceeding with the work. Refer also the Master Specification Section 02711, Excavating, Filling, and Grading.

3.1.02 Existing Water Mains. Expose the existing water main piping and structures to which the new Work is to be connected and provide notification of source. After verification of the vertical and horizontal locations of the existing system, the necessary adjustments required to align the new water main work with the existing system, will be determined.

3.2 PREPARATION. The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter prior to installation. Before jointing, all joint contact surfaces shall be wire brushed if necessary, wiped clean, and kept clean until jointing is completed.

Precautions shall be taken to prevent foreign material from entering the pipe during installation. Debris, tools, clothing, or other objects shall not be placed in or allowed to enter the pipe.

3.2.01 Pipe Ends. Remove all lumps, blisters excess coatings from the socket and plain ends of pipe. Wire brush and wipe clean the outside surfaces of all plain ends and the inside surfaces of all socket ends before installation. Any pipe or fitting which has acquired a coating of mud or other adhesive foreign material shall be scrubbed clean with heavily chlorinated water.

3.2.02 Examination of Materials. All pipe fittings, valves, hydrants, accessories and appurtenances shall be examined carefully for damage and other defects immediately before installation. Defective or damaged materials shall be marked and held for inspection. Damaged materials are subject to rejection.

3.2.03 Pipe Plugs. During and after laying operations, no debris, clothing or other materials shall be placed in the pipe. During the progress of all water main Work, watertight plugs shall be carried along and inserted in the end of each pipe as it is laid to prevent foreign matter or rodents from entering the pipe. This watertight plug shall be fastened in the end of the water main in such a manner as to prevent it from floating or being otherwise displaced whenever construction operations are temporarily halted, such as at noon or at the end of the days Work.

3.3 INSTALLATION.

3.3.01 Cutting Pipe. Cutting shall be done in a neat manner, without damage to the pipe or the lining. Cuts shall be smooth, straight, and at right angles to the pipe axis. After cutting, the ends of the pipe shall be dressed with a file or power grinder to remove all roughness and sharp edges. The cut ends of push-on joint pipe shall be suitably beveled.

All cutting of gray cast iron pipe shall be done with mechanical pipe cutters, except where the use of mechanical cutters would be difficult or impracticable.

Ends of ductile iron pipe shall be cut with a portable guillotine saw, abrasive wheel, saw, milling cutter, or oxyacetylene torch. The use of hydraulic squeeze type cutters will not be permitted. Field-cut holes for saddles shall be cut with mechanical cutters; oxyacetylene cutting will not be permitted.

3.3.02 Pipe Linings and Coatings. When cutting pipe or fittings, care shall be taken to prevent damage to linings and coatings. Damage to linings shall be cause for rejection of the complete Section. Damage to exterior coatings shall be corrected to original Specifications.

3.3.03 Gaskets. Where pipe using a resilient gasket to effect the seal is cut, the cut pipe end shall be tapered at a 30-degree angle with the centerline of the pipe, and ground smooth, on the outside end to remove any sharp edges or burns which might damage the gasket.

3.3.04 Alignment. Piping shall be laid to the lines and grades indicated on the drawings. Pipelines or runs intended to be straight shall be laid straight. Deflections from a straight line or grade shall not exceed the values stipulated in Table 4 or Table 5 of AWWA C600, unless specially designed bells and spigots are provided.

Either shorter pipe sections or fittings shall be installed where required to conform to the alignment or grade indicated on the drawings.

3.3.05 Laying Pipe. Pipe shall be protected from lateral displacement by placing the specified pipe embedment material. Under no circumstances shall pipe be laid in water, and no pipe shall be laid under unsuitable weather or trench conditions.

Whenever pipe laying is stopped, the open end of the pipe shall be sealed with a watertight plug, which will prevent trench water from entering the pipe.

Pipe shall be laid with the bell ends facing the direction of laying, except when reverse laying is specifically authorized by the Engineer.

3.3.06 Field Joints. Joints in buried locations shall be push-on type unless otherwise indicated on the drawings. Bells on wall castings and wall sleeves shall be mechanical joint type, with tapped holes for tie rods or stud bolts. All other joints shall be flanged unless otherwise indicated on the drawings.

Where acceptable, grooved couplings may be used instead of flanges, provided that rigid grooving is used to preclude longitudinal pipe movement and angular deflection at joints. Fittings, valves, and equipment installed using grooved couplings shall be adequately supported and blocked or restrained to prevent rotation.

3.3.07 Mechanical Joints. Mechanical joints shall be carefully assembled in accordance with the manufacturer's recommendations. If effective sealing is not obtained, the joint shall be disassembled, thoroughly cleaned, and reassembled. Bolts shall be uniformly tightened to the torque values listed in Appendix A of ANSI/AWWA C111/A21.11. Over tightening of bolts to compensate for poor installation practice will not be permitted.

The holes in mechanical joints with tie rods shall be carefully aligned to permit installation of the tie rods. In flange and mechanical joint pieces, holes in the mechanical joint bells and the flanges shall straddle the top (or side for vertical piping) center line. The top (or side) center line shall be marked on each flange and mechanical joint piece at the foundry.

3.3.08 Push-On Joints. The pipe manufacturer's instructions and recommendations for proper jointing procedures shall be followed. All joint surfaces shall be lubricated with heavy vegetable soap solution immediately before the joint is completed. Lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean. Each spigot end shall be suitably beveled to facilitate assembly.

Pipe ends for restrained joint pipe shall be prepared in accordance with the pipe manufacturer's recommendations.

Joints shall be made by means of a compression type push-on resilient gasket. Gasket shall be prelubricated before installation using a lubricant recommended by the pipe manufacturer. The seated joint shall be identified by the visible mark on the spigot of the installed pipe section.

When the temperature is above 60-degree F (15.6 degrees C), the spigot end of each cast iron pipe lead shall be forced tightly on the bell of the proceeding pipe.

When the temperature is below 60-degrees F(15.6 degrees C), the pipe shall be laid with the spigot end 1/16 inch (1.6 mm) from the face of the bell of expansion.

3.3.09 Sleeve-Type Coupling. Clean pipe ends for distance of 8 inches (20.3 cm). Use soapy water as gasket lubricant. Slip follower and gasket over each pipe to a distance of 6 inches (91.4 cm) from end and place middle ring on pipe end until centered over joint. Insert other pipe end into middle ring and bring to proper position in relation to pipe laid. Press gaskets and followers into middle ring flares. After bolts are inserted and nuts made fingertight, tighten diametrically opposite nuts by use of torque wrench of size and torque specified below:

TORQUE

Nominal pipe size Inch (cm)	Bolt diameter Inch (mm)	Maximum torque Ft-lbs (N – m)
3-24 (7.6 – 6.10)	5/8 (15.9)	75 (101.7)
30-36 (1/2 in./12.7 mm mid. Ring) (76.2 – 91.4)	5/8 (15.9)	65 (88.1)
30-36 (3/8 in./9.5 mm mid. Ring) (76.2 – 91.4)	5/8 (15.9)	70 (94.9)
30-48 (76.2 – 121.9)	3/4 (19.1)	80 (108.5)
48-72 (121.9 – 182.9)	3/4 (19.1)	90 (122.0)

After assembly and inspection and before backfill, coat exterior surfaces of buried couplings with heavy-bodied bituminous mastic.

3.3.10 Mechanical Couplings. Mechanical couplings shall be carefully installed in accordance with the manufacturer's recommendations. A space of at least 1/4 inch (6.4 mm), but not more than 1 inch (2.5 cm), shall be left between the pipe ends. Pipe and coupling surfaces in contact with gaskets shall be clean and free from dirt and other foreign matter during assembly. All assembly bolts shall be uniformly tightened so that the coupling is free from leaks and all parts of the coupling are square and symmetrical with the pipe. Following installation of the coupling, damaged areas of shop coatings on the pipe and coupling shall be repaired to the satisfaction of the Engineer.

The interior surfaces of the middle rings shall be prepared for coating in accordance with instructions of the coating manufacturer and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining components shall be cleaned and shop primed with universal primer.

3.3.11 Grooved End Joints. Grooved couplings shall be installed in accordance with the coupling manufacturer's recommendations. Completed joints shall be rigid and shall not allow angular deflection or longitudinal movement. Except for closure pieces, field grooving of pipe will not be permitted.

Special care shall be taken when connecting to pumping equipment to avoid transmitting pipe stresses to the pump flanges. Piping shall be permanently supported to obtain accurate matching of piping and abutting pump flanges before bolts are installed in the flanges.

3.3.12 Polyethylene Encasement. Polyethylene encasement shall be installed on pipe and fittings at locations specified on the construction drawings. Although not intended to be a completely air and watertight enclosure, the polyethylene shall provide a continuous barrier between the pipe and the surrounding backfill.

Cut polyethylene tube to a length approximately 2 feet (61.0 cm) longer that the length of the pipe section. Slip the polyethylene around the pipe, centering it to provide a foot (30.5 cm) overlap on each adjacent pipe section, and bunching it accordion fashion until it clears the pipe ends.

After completing the joint, make the overlap. Pull the bunched-up polyethylene from the preceding length of pipe, slip it over the end of new length of pipe, and secure in place with one circumferential turn of tape plus enough overlap to assure firm adhesion. Then slip the end of the polyethylene from the new pipe section over the end of the first wrap until it overlaps the joint at the end of the preceding length of pipe. Tape it in place. Take up the slack width to make a snug, but not tight, fit along the barrel of the pipe, securing the fold with short strips of adhesive tape at intervals of about 3 feet (91.4 cm) along the pipe barrel.

Repair any rips, punctures or other damage to the polyethylene with tape or with short length of polyethylene tube cut open, wrapped around the pipe, and secured with tape. Proceed with installation of the next section of pipe in the same manner.

Alternate Method: Cut polyethylene tube to a length approximately 1 foot (30.5 cm) shorter than the length of the pipe section. Slip polyethylene around the pipe, centering it to provide 6 inch (15.2 cm) of bard pipe at each end. Make polyethylene snug, but not tight; tape down and secure ends as described above.

Before making up a joint, slip a 3 feet (91.4 cm) length of polyethylene tube over the end of the preceding pipe section, bunching it accordion fashion. After completing the joint, pull the 3 feet (91.4 cm) length of polyethylene over the joint, overlapping the polyethylene previously installed on each adjacent section of pipe by at least one foot; make snug, tape down, and secure each end as described above.

Repair any rips, punctures, or other damage to the polyethylene as described above. Proceed with installation of the next section of pipe in the same manner.

Bend, reducers and offsets shall be covered with polyethylene in the same manner as the pipe.

Valves and other odd-shaped pieces which cannot practically be wrapped in a tube, shall be wrapped with a flat sheet obtained by splitting open a length of polyethylene tube. This sheet shall be passed under the valve and brought up around the body of the stem. Seams shall be made by bringing the edges together, folding over twice, and taping down. Slack with and overlaps at joints shall be handled as described above. Tape polyethylene securely in place at valve stem and other penetrations.

3.4 VALVES, HYDRANTS, FITTINGS, & APPURTENANCES INSTALLATION.

3.4.01 Valves. All valves shall be installed to the grade, lines, levels and locations indicated on the Plans.

Valve connections shall be as specified for the piping materials used. Valves shall be set with the stem plumb on permanent, firm foundations as indicated on the Plans.

Where required, valves shall be supported with special supports as indicated on the Plans and as approved by the Engineer. Valves shall be installed so as not to receive support from the connecting pipe. In no case shall valve installation be used to bring misaligned pipe into alignment.

3.4.02 Hydrants. All hydrants shall be installed plumb to the lines, levels, grades, and locations indicated on the Plans. Hydrants shall be set to the established grade, shall have their nozzles parallel to or at right angles to and facing the grade road box.

Where necessary to adjust for proper hydrant grade and location, the Contractor shall install additional fitting and spigot pipe between the water main road box.

The Contractor shall plumb all hydrants at the time they are set with the plumb line or other means acceptable. Upon substantial completion of cleanup, the Contractor shall recheck all hydrants for plumb and grade and shall make all adjustments as directed at this time. The Work of constructing fire hydrants shall not be considered complete until these final adjustments for plumb and grade have been made.

3.4.03 Valves Boxes. Install valve boxes to the grade, lines, levels, and locations indicated on the Plans. Valve boxes shall not transmit shock or stress to the valve and shall be set plumb with covers centered over operating nuts and flush with the indicated surface elevations. Valve boxes that shift or fill during backfilling shall be uncovered and reset.

3.4.04 Corporation Stops. Corporation stops shall be located on water main piping where indicated on the Plans, or as directed by the Engineer. Install a minimum of 2 corporation stops in each valve well.

One-inch tapping outlets shall be installed at approximately 20-foot (6.1 m) intervals along the entire length of the water main. These tapping outlets shall be constructed as detailed on the Plans and shall be positioned 45-degrees off vertical. The location of the tapping outlets shall be marked by means of No. 4 reinforcing rod. The rod shall be placed in a vertical position immediately adjacent to, but not touching, the water main and the top, 6 inches (15.2 cm) below finished grade.

3.4.05 Service Clamps. Where service clamps are to be installed, the entire circumference of the main shall be free of all loose material. Installation of the clamp and tapping of the main shall be in accordance with manufacturers recommendations.

3.4.06 Fittings, Strapping, and Lugged Pipe. Install all fittings to the lines, and levels. Installation of fittings shall be with the type of joint specified for piping. Fittings shall be provided with restraints as specified herein as required for a functional installation.

3.4.07 Fire Hydrant Approaches. Fire hydrant approaches shall consist of culvert pipe with end protection and a gravel approach. The culvert pipe shall be of the size and type shown on the Plans. The culvert pipe shall be installed to the existing or proposed grade of the drain with pipe bedding and backfill from a point 4 inches (10.2 cm) below the pipe to a point 12 inches (30.5 cm) above the top of the pipe, consisting of bank run sand meeting the requirements of MDOT Class II granular material and compacted to 95% of maximum unit weight. Each end of the culvert pipe shall be protected against erosion, as shown on the Plans. The gravel approach shall extend from the edge of the travel portion of the road to the fire hydrant and shall be a minimum of 10 feet (3.1 m) wide. The gravel approach shall consist of a minimum of 6 inches (15.2 cm) of compacted 22A or 23A aggregate, with calcium chloride applied at rate of 6 pounds per ton (3 kg per 1000 kg) of aggregate.

3.4.08 Water Main Structures. Construct water main valve wells and structures to the grades, lines and levels indicated on the Plans and as specified. Structures shall be completed with concrete bases, reinforcing, frames, covers, adjustment rings, etc. as shown and as required for a complete installation. Water main structures shall conform to the dimensions indicated on the Plans and as described below.

3.4.09 Precast Concrete Units. Construct as directed and as approved by the Engineer. Provide mortar joints struck smooth. Provide 2 to 4 courses of 8 inch (20.3 cm) brick at top of structure for future adjustment.

3.4.10 Brick Units. Prior to laying, all brick shall be thoroughly wetted and the surfaces allowed to dry only sufficiently to prevent slippage on the mortar.

Broken or chipped brick shall not be used on the faces of the structure.

Brick shall be laid in neat, even consecutive courses with full and close mortar joints. Courses shall be level throughout, except as shown or otherwise required. Stagger joints in adjoining courses by 1/2 a brick as nearly as practicable. At least 1 course in every 7 shall be stretcher courses with intervening courses laid as headers. Length of brick closure pieces shall be not less than the width of 1 whole brick and, wherever practicable, closures as headers, shall be made from whole brick.

Unless otherwise indicated, joints shall be not more than 2 inch (5.1 cm) thick and shall be of a uniform thickness throughout the structure. Joints shall be provided as required. Exposed surfaces shall be true and smooth. Rake all joints to receive plaster coat.

Prior to applying plaster coat, brick shall be thoroughly wetted with water and the surface allowed to dry sufficiently to effect proper bonding.

3.4.11 Concrete Block. Construct concrete block structures as directed and as approved by the Engineer. The first course of concrete blocks shall be placed on the prepared base or footings in a full bed of mortar. Mortar joints shall be full and close in all courses. Courses shall be level throughout. Stagger joints in adjourning courses by one-half the length of the block as nearly as practicable.

Joints shall be uniform in thickness throughout the structures. Strike all joints and properly point to provide true, smooth surfaces.

3.4.12 Plaster Coat. Cement mortar plaster coat shall be applied to the exterior surface of all gate wells and other water main structures that are not precast as indicated on the Plans. Plaster coat shall be 2 inch (5.1 cm) thick and shall be applied to the outer surfaces of the structures.

3.4.13 Castings. Provide and install to the elevations shown all cast iron covers, frames, adjusting rings, anchors, etc., indicated on the Plans and as required. Castings shall be set in a full bed of cement mortar 2 inch (5.1 cm) thick minimum. Mortar joints shall be struck smooth.

3.4.14 Steps. Install steps for structures of types and in locations indicated on the Plans. Steps shall be installed on 16 inch (40.6 cm) centers minimum.

3.4.15 Tapping Valve Assembly. Install all tapping valve assemblies of sizes and to the lines, elevations, locations and indicated on the Plans. The tapping sleeve shall be assembled around the main, and the tapping performed in strict accordance with the manufacturers recommendations. Tapping shall be accomplished without interruption of service.

3.4.16 Wall Castings. Wall castings shall be provided where ductile iron pipes pass through concrete walls. Alternate allowable wall and floor penetration types are indicated on the Drawings.

Where a flange and mechanical joint piece is to connect to a mechanical joint wall casting, the bolt holes in the bell of the wall casting shall straddle the top (or the side for vertical piping) center line of the casting and shall align with the bolt holes in the flange and mechanical joint piece. The top center line shall be marked on the wall casting at the foundry.

3.4.17 Reducers. Where indicated on the drawings, reducers shall be eccentric pattern, installed with the straight side on top so that air traps are not formed. All other reducers shall be concentric pattern.

3.4.18 Outlets. Where a 12 inch (30.5 cm) or smaller branch outlet is indicated and the diameter of the line pipe is at least twice the diameter of the branch, a tee, a factory welded-on boss, or a tapping saddle will be acceptable.

Gauge connections in ductile iron piping shall conform to Master Specification Section 15130, Indicating Devices

Connection of gauges to 6 inch (15.2 cm) and smaller ductile iron pipe shall be made using a tapping saddle, or a tee complete with blind flange drilled and tapped to accept the gauge piping specified. Connection of gauges to 8 inch (20.3 cm) and larger piping shall be made by means of a factory welded-on boss or a tapping saddle. Drilling and tapping of the pipe wall will also be acceptable, provided that the wall thickness, minus the foundry tolerance, at the point of connection equals or exceeds the wall thickness required for 4-thread engagement in accordance with Table A.1, Appendix A, of ANSI/AWWA C151/A21.51.

3.4.19 Connections with Existing Piping. Connections between new work and existing piping shall be made using fittings suitable for the conditions encountered. Each connection with an existing pipe shall be made at a time and under conditions which will least interfere with service to customers, and as authorized by the Owner. Facilities shall be provided for proper dewatering and for disposal of all water removed from the dewatered lines and excavations without damage to adjacent property.

Special care shall be taken to prevent contamination when dewatering, cutting into, and making connections with existing potable water piping. Trench water, mud, or other contaminating substances shall not be permitted to enter the lines. The interior of all pipe, fittings, and valves installed in such connections shall be thoroughly cleaned and then swabbed with, or dipped in, a 200 mg/L (ppm) chlorine solution.

3.4.20 Concrete Encasement. Concrete encasement shall be installed as indicated on the drawings. Concrete and reinforcing steel shall be as specified in the cast-in-place concrete section. All pipe to be encased shall be suitably supported and blocked in proper position, and shall be anchored to prevent flotation.

3.4.21 Reaction Anchorage And Blocking. All exposed piping with mechanical couplings, push-on or mechanical joints, or similar joints subject to internal pressure shall be blocked, anchored, or harnessed to preclude separation of joints. All push-on and mechanical joint tees, Y-branches, bends deflecting 22-1/2 degrees or more, and plugs which are installed in buried piping (subjected to internal hydrostatic heads in excess of 30 feet (9.14 m)) shall be provided with suitable reaction blocking, anchors, joint harness, or other acceptable means for preventing movement of the pipe caused by internal pressure.

Concrete blocking shall extend from the fitting to solid undisturbed earth and shall be installed so that all joints are accessible for repair. The dimensions of concrete reaction blocking shall be as indicated on the drawings or as directed by the Engineer. If adequate support against undisturbed ground cannot be obtained, metal harness anchorages shall be installed to provide the necessary support. Metal harness anchorages shall consist of steel rods extending across the joint and securely anchored to pipe and fitting, or other adequate anchorage facilities shall be installed to provide the necessary support. If the lack of suitable solid vertical excavation face is due to improper trench excavation, metal harness anchorages shall be furnished and installed by and at the expense of the Contractor.

Reaction blocking, anchorages, or other supports for fittings installed in fills or other unstable ground, installed above grade, or exposed within structures, shall be provided as required by the drawings or as directed by the Engineer.

3.4.22 Leakage. All joints shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of the Contractor.

3.4.23 Outlets. In special cases as approved by Owner, outlets may be used in accordance with Master Specification Section15061, 3.14, Ductile Iron Pipe.

3.5 FIELD QUALITY CONTROL.

3.5.01 Pressure Test. Unless otherwise specified herein, the hydrostatic testing shall be performed according to ANSI/AWWA C-600. After the pipe has been laid and backfilled, the pipes shall be hydrostatically tested for leakage. The Contractor shall furnish the pumps, pipe connections, hydrants, valves temporary plus and bracing and any other necessary apparatus including gages and meters and all personnel necessary for conducting the test. Before applying the test pressure, all air shall be expelled from the pipe. If necessary to accomplish this, taps shall be made at points of higher elevation and afterwards plugged with brass plugs as approved by the Engineer. The test shall be made at a pressure of 150 psi (1,034.2 kPa) gage. The full pressure shall be held for at least 1 hour for piping 12 inch (30.5 cm) inside diameter and under and for 2 hours on piping 12 inch (30.5) inside diameter and larger. Any faulty pipe fitting, gate valves or other accessories which permit leaks during testing shall be replaced by the Contractor with sound material and the test shall be repeated until specified requirements are met. The maximum permissible leakage measured by water meter from the section of main tested under pressure, shall not exceed a rate of 11 U.S. gallons per inch diameter of main per mile of pipe in 24 hours for each section tested. Test sections will normally not exceed 1 mile (1.6 km) and in the event more than 1 mile (1.6 km) of water main is tested, the permissible leakage will remain at the amount determined for 1 mile (1.6 km) of pipe.

3.5.02 Water for Testing. Water for testing shall be obtained from a potable water supply. The Contractor shall provide all water required at his own expense and shall make all necessary arrangements with the authority that controls the source of water. The Contractor shall provide and remove temporary connections between the source water system and the mains constructed under this Contract. All temporary connections between the source of water system and the mains constructed under this Contract shall meet approval of the authority controlling the source water system and Public Health authorities having jurisdiction.

The Contractor shall provide all necessary pumping equipment; piping connections between the piping and the nearest available source of test water; pressure gauges; and other equipment, materials, and facilities necessary for the tests.

All pipe, fittings, valves, pipe joints, and other materials which are found to be defective shall be removed and replaced with new and acceptable materials, and the affected portion of the piping retested by and at the expense of the Contractor.

End of Section

SECTION 02621

COMPRESSION TYPE FIRE HYDRANTS

PART 1 – GENERAL

1.1 SCOPE: This section covers breakable flange double nozzle, compression type fire hydrants. Hydrants shall be of a true compression type, opening against the pressure and closing with the pressure. The hydrants shall be in strict conformity with this specification.

1.2 PATTERNS**:** All necessary patterns required for the manufacture of the hydrants shall be furnished by the manufacturer and shall remain his property.

1.3 GENERAL:

1.3.01 Governing Standards. Unless otherwise specified herein, all water main work shall be done according to the applicable portions of the Standard Specifications prepared by: the American National Standards Institute (ANSI), the American Society for Testing and Materials (ASTM), the American Water Works Association (AWWA), the National Sanitation Foundation (NSF), the City of Detroit, Department of Public Works Specifications and Standards, and the Michigan Department of Transportation (MOOT). Particularly, the Contractors attention is directed to the latest editions of the following standards at the time of bid:

ANSI/AWWA C104/A21.4- American National Standard for Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.

ANSI/AWWA C105/A21.5 - American National Standard for Polyethylene Encasement for Ductile-Iron Pipe Systems.

ANSI/AWWA C110/A21.10– American National Standard for Ductile-Iron nd Gray-Iron Fittings, 3in through 48in for Water and other liquids.

ANSI/AWWA C111/A21.11 -American National Standard for Rubber Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.

ANSI/AWWA C115/A21.15- American National Standard for Flanged Ductile-Iron or Gray-Iron Threaded Flanges.

ANSI/AWWA C150/A21.50- American National Standard for Thickness Design of Ductile-Iron Pipe.

ANSI/AWWA C151/A21.51 -American National Standard for Ductile-Iron Pipe, Centrifugally Cast, for Water.

ANSIIAWWA C153/A21.53- American National Standard for Ductile-Iron Compact Fittings, 3 inches (7.6 cm) through 24 inches ((61.0 cm), and 54 inches (137.2 cm) through 64 inches (162.6 cm) for Water Service.

AWWA C600 AWWA- Standard for Installation of Ductile-Iron Water Mains and Their Appurtenances.

ANSI/AWWA C653. AWWA- Standard for Disinfecting Water Mains.

1.4 QUALITY ASSURANCE.

1.4.01 Contractor Qualifications Contractor shall have 5 years documented experience successfully installing water mains and related valves and equipment with sufficient equipment and crews to install Work without delays.

1.4.02 Tolerances. Water main installation shall be within 0.01 foot of the design elevation unless otherwise authorized in writing by the Engineer.

1.5 SUBMITTALS.

1.5.01 Drawings and Data. Submit product data on all water main pipes, fittings, valves, fire hydrants, service connections, valve wells, mechanical thrust restraints, appurtenances and accessories. Submit shop drawings and calculations for all mechanical thrust restraints, thrust clocks, and manholes, wells, and pits.

1.5.02 Certifications. For all furnished materials, the Contractor shall furnish a sworn statement that the inspection and all tests required have been made and that the results comply with the requirements of the applicable standards. All affidavits of compliance shall be certified by a registered professional Engineer.

1.6 DELIVERY, STORAGE AND HANDLING PRODUCT.

1.6.01 Delivery of Materials. Hydrants, and accessories shall be handled in a manner that will ensure installation in sound, undamaged condition. Equipment, tools, and methods used in handling and installing hydrants shall not damage the hydrants. Hooks inserted in ends of pipe shall have broad, well-padded contact surfaces. Unpadded hooks, wire brushes, or other abrasive tools shall not be permitted to come into contact with the polyethylene lining.

1.6.02 Handling of Materials. Load and unload hydrants using suitably approved hoist and skidding. Hydrants shall not be dropped, bumped or allowed to impact against itself. The Engineer shall reject damaged hydrants. Lifting devices shall be suited to the Work and shall protect surfaces from damage.

1.6.03 Storage of Material. Store all hydrants and accessories off the ground, drained and kept free of water to protect against damage from freezing. Hydrants and appurtenances shall be kept in their original containers until ready for installation.

All joints and sealing materials subject to ultra-violet or ozone attack and used in the water main system shall be protected from the sunlight, atmosphere and weather, stored in suitable enclosures until ready for installation.

1.5.04 Damaged Material Hydrants in which the lining has been damaged shall be replaced.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS

2.1.01 WORKMANSHIP**:** All operations in the manufacture of the hydrants shall be conducted in accordance with the best modern foundry and machine shop practice. All castings shall be "Made in USA", and be sound, clean, smooth, and free from cold shuts, scales, bumps, blisters, sand holes, porous areas and other defects, which make them unfit for their intended use. No plugging, brazing or welding of defects will be allowed.

2.1.02 BRONZE: Bronze for the operating nut shall conform to the current specifications for Manganese Bronze Castings of the American Society of Testing Materials, B 584.

Bronze required in other hydrant parts shall conform to the current Standard Specifications for Composition Brass or Ounce Metal Castings of the American Society of Testing Materials, B 62-09.

2.1.03 DUCTILE IRON: The lower standpipe barrel shall be made of Class 53 Ductile Iron pipe per AWWA C151 with screwed on AWWA C151 ductile iron flanges. Ductile Iron shall conform to ASTM A536. The nozzle section and bonnet shall be made of ductile iron per ASTM 536.

2.1.04 "O" RING SEALS: The material for "O" Ring Seals shall be Buna-N. All pressure connections shall be sealed with "O" rings.

2.1.05 BOLTS AND NUTS: All bolts and nuts shall be 304 stainless steel and in conformity with the current ASTM Designation: A 320. "Alloy Steel Bolting Materials for Low Temperature Service". Bolts included in the accessories packs shall have core blue coating. The nuts shall be hexagonal in shape. Bolt heads shall be American Standard Regular, semi-finished, hexagon; nuts shall be American Standard Regular semi-finished, hexagon.

Bolt and nut threads shall conform to the current Specifications for Screw Threads for Bolts, Nuts, Machine Screws, and Threaded Parts of the American Standards Association, Specification No. B1. I, coarse thread series, Class 2 fit.

2.1.06 OPERATING NUT: The operating nut shall be a one piece design, manufactured of ASTM B-584 bronze. The operating nut shall be affixed to the bonnet by means of an ASTM B-584 bronze hold down nut. The hold down nut shall be threaded into the bonnet in such a manner as to prevent accidental disengagement during the opening cycle of the hydrant. A weather shield or seal shall be incorporated with the hold down nut, for the purpose of protecting the operating mechanism from the elements.
The operations nut shape shall be pentagon shaped with the following dimensions:

a. Taper 1/32 inches
b. Dimension across flats at top -3/4 inches, 1-1/8 inches point to flat
c. Dimension between top and bottom of pentagon nut -1-1/8 inches.

The lubrication system shall be sealed from the waterway and any external contaminants by use of "O" ring pressure seals. Anti-friction washers shall be in place above and below the thrust collar of the operating nut to further minimize operating torque. The grease reservoir shall be factory filled with an FDA approved food grade lubricant. Oil shall not be used.

2.1.07 MAIN VALVE STEM: The main valve stem shall consist of both an upper operating stem and a lower operating stem connected by a steel stem coupling. The safety coupling shall be a one-piece design. Multiple parts and cast iron not allowed. The upper stem threads shall be ACME type with no 60 deg. V threads allowed. Travel stops shall be in the inlet/shoe and are not allowed in the bonnet area. Screws, pins, bolts or fasteners used in conjunction with the stem coupling shall be stainless steel.

Material for both stems shall conform to the Specifications for Cold-Finished Carbon Steel Bars and Shafting of the American Society of Testing Materials, 1 ¼” Steel Bar Stock grade C 1045.

The coupling shall be designed to transmit the torsional strength of the shaft and fail at less than 50% of the stem material's tensile strength.

2.1.08 VALVE DISC: The valve disc shall be of either Synthetic Rubber or SBR Rubber.

Synthetic Rubber Valve Disc
Synthetic rubber valve discs shall be made of synthetic rubber and shall be reinforced with nylon fibers. The material shall be homogenous and not built up of laminated sheets. Synthetic rubber shall be in conformity with the following physical characteristics:

Shore A Durometer:	91 +/-5
Tensile Strength:	3,055 psi
Elongation:	194%

SBR rubber shall be in conformance with

Shore A Durometer:	94 +/-2
Tensile Strength:	3,055 psi
Elongation:	194%

2.1.09 VALVE OPENING: The valve-opening diameter shall not be less than 5 ¼”. The valve opening area shall be not less than 21.6 square inches.

2.1.10 NOZZLES: Hydrants shall have two brass pumper nozzles, spaced 90 degrees apart, with a 3 ¾” inside diameter and the following thread:

6-60 degree"V1'threads per inch -cut off at top 0.010 inches -left at bottom 0.010 inches -Higbee Cut at outer end of thread -O.D. 4.546 inches -R.D. 4.299 inches.

The first 3/16-inch shall have an outside diameter of 4.299 inches with no thread and a 1/32-inch x 45 degree chamfer. Nozzles shall "thread" counterclockwise into hydrant barrel utilizing "O" ring pressure seals. A suitable nozzle lock shall be in place to prevent inadvertent nozzle removal. Wedging devices and/or ductile iron retainer rings to secure nozzles shall not be allowed.

2.1.11 DIRECTION OF OPENING HYDRANT: The direction of opening the hydrant shall be left (counter-clockwise). An arrow shall be cast on the top of the hydrant to indicate the opening direction.

2.1.12 INLET CONNECTION: The inlet/shoe shall be fusion-bonded epoxy coated per ANSI/AWWA C550 and with an NSF61 approved coating having ample blocking pads for sturdy setting. A minimum of six stainless steel bolts and nuts are required to fasten the shoe to the lower barrel.

End connections shall be 6-inch Tyton joint in accordance with ANSI/AWWA C111/A21.11ANSI.

2.1.13 BREAKABLE FLANGE: The flange shall be the traffic safety flange that breaks on impact.

2.2 ACCEPTABLE MANUFACTURERS: East Jordan Iron Works model 5BR250 with Carrol drain assembly and Clow Medallion.

PART 3 – EXECUTION

3.1 INSPECTION:

Fire Hydrants shall be carefully examined for cracks and other defects immediately before installation. All defective hydrants shall be removed from the site of the work.

The DWSD reserves the right to inspect hydrant parts at any time during the process of manufacture. The Engineer of the DWSD herein referred to as the Engineer, or his authorized representative shall have access to all parts of the Manufacturer's plant where any hydrant parts are being manufactured.

Upon request of the Engineer, tension and transverse test specimens shall be made from any melt from which the castings are made, in accordance with the requirements of A.S.T.M. Specification, Designation A 126, the Manufacturer shall certify that all test specimens are made from the same metal and melt as the castings. The expense of laboratory tests shall be borne by the City.

3.2 TESTING:

Upon request, each hydrant shall be tested in the presence of the Engineer to a hydrostatic pressure of 500 psi and shall be subjected to a careful hammer test while under this pressure. Such additional tests shall be made which, in the judgment of the Engineer, are necessary to determine that the hydrants will function in the intended manner. Also upon request, supplier shall furnish flow data indicating friction loss in psi at a flow of 1,000 gpm from the pumper nozzle. Such friction loss shall not exceed 2.5 psi. Also, the DWSD may request the manufacturing "point of origin" for any/or all hydrant parts. All cast components shall be made in the USA.

3.2.1 NOTICE OF TESTING: The Engineer shall be given seven days notice in advance of the above shop tests in order that arrangements may be made for his representative to be present. The Contractor shall complete the entire order prior to notification of testing so that only one inspection trip will be required.

3.3 VALVES. All valves shall be installed to the grade, lines, levels and locations indicated on the Plans.

Valve connections shall be as specified for the piping materials used. Valves shall be set with the stem plumb on permanent, firm foundations as indicated on the Plans.

Where required, valves shall be supported with special supports as indicated on the Plans and as approved by the Engineer. Valves shall be installed so as not to receive support from the connecting pipe. In no case shall valve installation be used to bring misaligned pipe into alignment.

3.4 HYDRANTS. All hydrants shall be installed plumb to the lines, levels, grades, and locations indicated on the Plans. Hydrants shall be set to the established grade, and shall meet the following requirements:

1) Detroit Standard Hydrant Required.
2) Centerline of 4" inch opening of hydrant shall not be less than 19" inches above ground, facing curb line.
3) Hydrant shall not be installed more than 3' feet from curb line.
4) Fire hydrants shall not exceed a distance of 300' feet.
5) Hydrant shall be East Jordan Iron Works, Midwest 6BR and shall conform to AWWA specifications C502.
6) Hydrant shall be Traffic Model with breakable flange and coupling.
7) Hydrant shall have swivel flange to allow bonnet to be turned 360 for ease of facing.
8) Hydrant shall have full 6 ¼” valve opening which closes with the water pressure.
9) Inlet connection to be 6” Tyton Joint.
10) Hose Connections: 2-4” Pumper Nozzles with Detroit Standard Thread.
11) Operating nut to be 1-1/8” P-F pentagon shape, open left.
12) Color: Red No. 1210
13) Bury: 5’6”, or as specified otherwise.
14) Hydrant to be furnished with Carroll Drain.
15) No automatic drain outlet.

Where necessary to adjust for proper hydrant grade and location, the Contractor shall install additional fittings and spigot pipe between the hydrant and the water main road box.

The Contractor shall plumb all hydrants at the time they are set with the plumb line or other means acceptable. Upon substantial completion of cleanup, the Contractor shall recheck all hydrants for plumb and grade and shall make all adjustments as directed at this time. The Work of constructing fire hydrants shall not be considered complete until these final adjustments for plumb and grade have been made.

3.5 VALVES BOXES. Install valve boxes to the grade, lines, levels, and locations indicated on the Plans. Valve boxes shall not transmit shock or stress to the valve and shall be set plumb with covers centered over operating nuts and flush with the indicated surface elevations. Valve boxes that shift or fill during backfilling shall be uncovered and reset.

3.6 Tapping Valve Assembly. Install all tapping valve assemblies of sizes and to the lines, elevations, locations and indicated on the Plans. The tapping sleeve shall be assembled around the main, and the tapping performed in strict accordance with the manufacturer's recommendations. Tapping shall be accomplished without interruption of service.

3.7 FIRE HYDRANT APPROACHES:

Fire hydrant approaches shall consist of culvert pipe with end protection and a gravel approach. The culvert pipe shall be of the size and type shown on the Plans. The culvert pipe shall be installed to the existing or proposed grade of the drain with pipe bedding and backfill from a point 4 inches (10.2 cm) below the pipe to a point 12 inches (30.5 cm) above the top of the pipe, consisting of bank run sand meeting the requirements of MDOT Class II granular material and compacted to 95% of maximum unit weight. Each end of the culvert pipe shall be protected against erosion, as shown on the Plans. The gravel approach shall extend from the edge of the travel portion of the road to the fire hydrant and shall be a minimum of 10 feet (3.1 m) wide. The gravel approach shall consist of a minimum of 6 inches (15.2 cm) of compacted 22A or 23A aggregate, with calcium chloride applied at rate of 6 pounds per ton (3 kg per 1000 kg) of aggregate.

3.8 PAINTING:

All interior and exterior surfaces of lower barrel standpipes shall be thoroughly cleaned and then painted with two coats of coal tar enamel or bituminous paint as approved by the Engineer. The exposed portion of the exterior of the standpipe shall first be painted with one coat of an approved zinc chromate primer. The nozzle section, bonnet, caps, and weather shield shall be painted with TGIC epoxy powder paint system. Color shall be red.

3.9 FIELD QUALITY CONTROL:

3.9.01 Pressure Test: Refer to section 3.5.01 in specification section 02620.

3.9.02 Warranty: All hydrants shall come with a limited 10-year warranty on materials and workmanship.

End of Section

SECTION 02621

HIGH DENSITY POLYETHYLENE (HDPE) PIPE AND FITTINGS

PART 1 – GENERAL

1.1 SECTION DESCRIPTION. This specification governs the material, pipe, fittings, joining methods and general construction practices for High Density Polyethylene (HDPE) piping systems, 4" and smaller, for the transportation of sewage buried below grade as indicated in the Contract Documents.

1.2 REFERENCES.

AWWA C901 Polyethylene (PE) pressure Pipe & Tubing, 1/2 inch through 3 inch for water

AWWA C906 Polyethylene (PE) pressure Pipe & Fittings, 4 inch through 63 inch for water

ASTM D3035 Standard Spec for PE Pipe (DR-PR) Based on Controlled Outside Diameter

ASTM D3261 Butt Heat Fusion PE Fittings for PE Pipe & Tubing

ASTM D3350 Standard Specification for PE Pipe & Fittings Materials

ASTM D1238 Melt Flow Index

ASTM D1505 Density of Plastics

ASTM D2837 Hydrostatic Design Basis

NSF Std.#14 Plastic Piping Components & Related Materials

TR-33/2005 Generic Butt Fusion Joining Procedure for Field Joining of PE Pipe

1.3 GENERAL.

1.3.01 Use

HDPE pipes/fittings shall be allowed for use as wastewater pressure pipe where compatible with the specific conditions of the project. The use of material other than HDPE pipe may be required if it is determined that HDPE pipe is unsuitable for the particular application.

1.3.02 Documentation

Documentation from the resin's manufacturer showing results of the following tests for resin identification:

Melt Flow Index ASTM D1238

Density ASTM D1505

1.3.03 Manufacturer

All HDPE pipe and fittings shall be from a single manufacturer, who is fully experienced, reputable and qualified in the manufacture of the HDPE pipe to be furnished. The pipe shall be designed, constructed and installed in accordance with the best practices and methods and shall comply with these Specifications. Qualified manufacturers shall be: PLEXCO Division of Chevron Chemical Company, DRISCOPIPE as manufactured by Phillips Products Co., Inc., SCLAIRPIPE as manufactured by DuPont of Canada or equal as approved by the Engineer.

1.3.04 Finished Product Evaluation

Production staff shall check each length of pipe produced for the items listed below. The results of all measurements shall be recorded on production sheets, which become part of the manufacturer's permanent records.

Pipe in process shall be checked visually, inside and out for cosmetic defects (grooves, pits, hollows, etc.)

Pipe outside diameter shall be measured using a suitable periphery tape to ensure conformance with ASTM F714 or ASTM D3035, whichever is applicable.

Pipe wall thickness shall be measured at 12 equally spaced locations around the circumference at both ends of the pipe to ensure conformance with ASTM F714 or ASTM D3035, whichever is applicable.

Pipe length shall be measured.

Pipe marking shall be examined and checked for accuracy.

Pipe ends shall be checked to ensure they are cut square and clean.

Subject inside surface to a “reverse bend test” to ensure the pipe is free of oxidation (brittleness).

1.3.05 Stress Regression Testing

The polyethylene pipe manufacturer shall provide certification that stress regression testing has been performed on the specific polyethylene resin being utilized in the manufacture of this product. This stress regression testing shall have been done in accordance with ASTM D2837 and the manufacturer shall provide a product supplying a minimum Hydrostatic Design Basis (HDB) of 800 psi.

1.3.06 Compatibility

Contractor is responsible for compatibility between pipe materials, fittings and appurtenances.

1.3.07 Warranty

The pipe MANUFACTURER shall provide a warranty against manufacturing defects of material and workmanship for a period of ten years after the final acceptance of the project by the OWNER. The MANUFACTURER shall replace at no expense to the OWNER any defective pipe/fitting material including labor within the warranty period.

PART 2 - PRODUCTS

2.1 MATERIALS FOR PIPE SIZES 4-INCH DIAMETER AND LESS.

2.1.01 Materials used for the manufacture of polyethylene pipe and fittings shall be made from a PE 3408 high density polyethylene resin compound meeting cell classification 345464C per ASTM D3350; and meeting Type lll, Class C, Category 5 per ASTM D1248.

2.1.02 High Density Polyethylene (HDPE) pipe shall comply with AWWA Specifications C906.

2.1.03 If rework compounds are required, only those generated in the Manufacturer’s own plant from resin compounds of the same class and type from the same raw material supplier shall be used.

2.1.04 Dimensions and workmanship shall be as specified by ASTM F714. HDPE fittings and transitions shall meet ASTM D3261. HDPE pipe shall have a minimum density of 0.955 grams per cubic centimeter. All HDPE pipe and fittings shall have a Hydrostatic Design Basis (HDB) of 1,600 psi.

2.1.05 HDPE pipe and accessories shall be 160 psi at 73.4 meeting the requirements of Standard Dimension Ration (SDR) 11 as MINIMUM STRENGTH.

2.1.06 The pipe Manufacturer must certify compliance with the above requirements.

2.2 FITTINGS.

2.2.01 All molded fittings and fabricated fittings shall be fully pressure rated to match the pipe SDR pressure rating to which they are made. All fittings shall be molded or fabricated by the manufacturer. No Contractor fabricated fittings shall be used unless approved by the Engineer.

2.2.02 The manufacturer of the HDPE pipe shall supply all HDPE fittings and accessories as well as any adapters and/or specials required to perform the work as shown on the Drawings and specified herein.

2.2.03 All fittings shall be installed using butt-fused fittings, thermo-fused fittings/couplings, or flanged adapters and must be approved by the Engineer. NO size on size wet taps shall be permitted.

2.2.04 All transition from HDPE pipe to steel pipe shall be made per the approval of the Engineer and per the HDPE pipe manufacturer's recommendations and specifications. A molded flange connector adapter within a carbon steel back-up ring assembly shall be used for pipe type transitions.

Transition from HDPE to steel fittings and valves shall be approved by Engineer before installation.

Fittings and transitions shall be as manufactured by Phillips DRISCOPIPE, Inc., 1000 Series Pressure Pope, Chevron chemical company Plexco/Spiralite pipe, or equal.

The pipe supplier must certify compliance with the above requirements.

2.3 PIPE IDENTIFICATION.

2.3.01 The following shall be continuously indent printed on the pipe or spaced at intervals not exceeding 5-feet:

Name and/or trademark of the pipe manufacturer.

Nominal pipe size.

Dimension ratio.

The letters PE followed by the polyethylene grade in accordance with ASTM

D1248 followed by the hydrostatic design basis in 160's of psi, e.g., PE 3408.

Manufacturing standard reference, e.g., ASTM F714 or D-3035, as required.

A production code from which the date and place of manufacture can be determined.

2.3.02 Tracing Wire

All HDPE shall have wire conforming to Copperhead Industries Reinforced #1245 Extra-High Strength Tracer Wire and affixed to the drilling head/reamer.

2.3.03 Marking Tape: Marking tape shall be installed per Engineer approval.

PART 3 - EXECUTION

3.1 JOINING METHOD.

3.1.01 The pipe shall be joined with butt, heat fusion joints as outlined in ASTM D2657 and conform to the Generic Butt Fusion Joining Procedure for Field Joining of Polyethylene Pipe, Technical Report TR-33/2005, published by the Plastic Pipe Institute (PPI). All joints shall be made in strict compliance with the manufacturer's recommendations. A factory qualified joining technician as designated by pipe manufacturer or experienced, trained technician shall perform all heat fusion joints in the presence of the Owner.
3.1.02 Lengths of pipe shall be assembled into suitable installation lengths by the butt-fusion process. All pipes so joined shall be made from the same class and type of raw material made by the same raw material supplier. Pipe shall be furnished in standard laying lengths not to exceed 50 feet and no shorter than 20 feet.

3.1.03 On days butt fusions are to be made, the first fusion shall be a trial fusion in the presence of the owner. The following shall apply:

Heating plate surfaces shall be inspected for cuts and scrapes and shall be free of dirt and residue. Heater surfaces should be between 400°F (minimum) to 450°F (maximum). Measure the temperature @ 12:00, 3:00, 6:00 and 9:00 o'clock positions using a pyrometer of infrared thermometer at locations where the heating plate will contact the pipe/fitting ends. The maximum temperature difference between any two points on a single heating surface must not exceed 24°F. If this temperature is exceeded, the heating plate shall be cleaned per the manufacturer's recommendations.

The fusion or test section shall be cut out after cooling completely for inspection.

The test section shall be 12" or 30 times (minimum) the wall thickness in length and 1" or 1.5 times the wall thickness in width (minimum).

The joint shall be visually inspected as to continuity of "beads" from the melted material, and for assurance of "cold joint" prevention (i.e. – joint shall have visible molded material between walls of pipe). Joint spacing between the walls of the two ends shall be a minimum of 1/16” to a maximum 3/16”.

3.1.04 The polyethylene flange adapters at pipe material transitions shall be backed up by stainless steel flanges conforming to ANSI B16.1 and shaped as necessary to suit the outside dimensions of the pipe. The flange adapter assemblies shall be connected with corrosion resisting bolts and nuts of Type 316 Stainless Steel as specified in ASTM A726 and ASTM A307. All bolts shall be tightened to the manufacturer’s specified torques. Bolts shall be tightened alternatively and evenly. After installation, apply a bitumastic coating to bolts and nuts.

3.2 INSTALLATION.

3.2.01 High Density Polyethylene (HDPE) Pipe shall be installed in accordance with the instruction of the manufacturer, as shown on the Drawings and as specified herein. A factory qualified joining technician as designated by the pipe manufacturer shall perform all heat fusion joints.

3.2.02 HDPE shall be installed by Directional Bore Method as outlined in Section 3.2.17 –Directional Bore Installation.

3.2.03 Care shall be taken in loading, transporting and unloading to prevent damage to the pipe. Pipe or fitting shall not be dropped. All pipe or fitting shall be examined before installation, and no piece shall be installed which is found to be defective. Any damage to the pipe shall be repaired as directed by the Engineer. If any defective pipe is discovered after it has been installed, it shall be removed and replaced with a sound pipe in a satisfactory manner by the Contractor, at his own expense.

3.2.04 Under no circumstances shall the pipe or accessories be dropped into the trench or forced through a directional bore upon “pull-back”.

3.2.05 Care shall be taken during transportation of the pipe such that it will not be cut, kinked or otherwise damaged.

3.2.06 Ropes, fabric or rubber protected slings and straps shall be used when handling pipes. Chains, cables or hooks inserted into the pipe ends shall not be used. Two slings spread apart shall be used for lifting each length of pipe.

3.2.07 Pipes shall be stored on level ground, preferably turf or sand, free of sharp objects, which could damage the pipe. Stacking of the polyethylene pipe shall be limited to a height that will not cause excessive deformation of the bottom layers of pipes under anticipated temperature conditions. Where necessary due to ground conditions, the pipe shall be stored on wooden sleepers, spaced suitably and of such width as not to allow deformation of the pipe at the point of contact with the sleeper or between supports.

3.2.08 Pipe shall be stored on clean level ground to prevent undue scratching or gouging. The handling of the pipe shall be in such a manner that the pipe is not damaged by dragging it over sharp and cutting objects. The maximum allowable depth of cuts, scratches or gouges on the exterior of the pipe is 5 percent of wall thickness. The interior pipe surface shall be free of cuts, gouges or scratches.

3.2.09 Pipe shall be laid to lines and grade shown on the Drawings with bedding and backfill as shown on the Drawings.

3.2.10 When laying is not in progress, including lunchtime, the open ends of the pipe shall be closed by fabricated plugs, or by other approved means.

3.2.11 Sections of pipe with cuts, scratches or gouges exceeding 5 percent of the pipe wall thickness shall be removed completely and the ends of the pipeline rejoined.

3.2.12 The pipe shall be joined by the method of thermal butt fusion, as outlined in PART 3 – Execution, Section 3.1 Joining Method. All joints shall be made in strict compliance with the manufacturer's recommendations.

3.2.13 Mechanical connections of the polyethylene pipe to auxiliary equipment such as valves, pumps and tanks shall be through flanged connections which shall consists of the following:

A polyethylene flange shall be thermally butt-fused to the stub end of the pipe.

A 316 stainless steel back up ring shall mate with a 316 stainless steel flange.

316 stainless steel bolts and nuts shall be used.

3.2.14 Flange connections shall be provided with a full-face neoprene gasket.
3.2.15 All HDPE pipe must be at the temperature of the surrounding soil at the time of backfilling and compaction.

3.2.16 If a defective pipe is discovered after it has been installed, it shall be removed and replaced with a sound pipe in a satisfactory manner at no additional cost to the Owner. All pipe and fittings shall be thoroughly cleaned before installation, shall be kept clean until they are used in the work and when laid, shall conform to the lines and grades required.

3.2.17 Directional Bore Installation:

Refer to Specification 02237 - Horizontal Directional Drilling in its entirety.

3.3 CLEANING.

3.3.01 At the conclusion of the work, thoroughly clean all of the new pipe lines to remove all dirt, stones, pieces of wood or other material which may have entered during the construction period by forcing a cleaning swab through all mains 4” or greater. Flushing velocities shall be a minimum of 2.5 feet per second. All flushing shall be coordinated with the Owner. Debris cleaned from the lines shall be removed from the job site.

3.4 TESTING.

3.4.01 Pressure testing shall be conducted per Manufacturer’s recommendations and as approved by the Engineer.

3.4.02 All HDPE mains shall be field-tested. Contractor shall supply all labor, equipment, material, gages, pumps, meters and incidentals required for testing. Each main shall be pressure tested upon completion of the pipe laying and backfilling operations, including placement of any required temporary roadway surfacing.

3.4.03 All HDPE mains shall be tested at 150 percent of the operating design pressure of the pipe unless otherwise approved by the Engineer.

3.4.04 Pressure testing procedure shall be per Manufacturer’s recommendations or as follows:

Fill line slowly with water. Maintain flow velocity less than 2 feet per second.

Expel air completely from the line during filling and again before applying test pressure. Air shall be expelled by means of taps at points of highest elevation.

Apply initial test pressure and allow to stand without makeup pressure for two to three hours, to allow for diametric expansion or pipe stretching to stabilize.

After this equilibrium period, apply the specified test pressure and turn the pump off. The final test pressure shall be held for one to three hours.

Upon completion of the test, the pressure shall be bled off from a location other than the point where the pressure is monitored. The pressure drop shall be witnessed by the Owner at the point where the pressure is being monitored and shall show on the recorded pressure read-out submitted to the Engineer.

3.4.05 Allowable amount of makeup water for expansion during the pressure test shall conform to Chart 6, Allowance for Expansion Under Test Pressure, Technical Report TR 31/9-79, published by the Plastic Pipe Institute (PPI). If there are no visual leaks or significant pressure drops during the final test period, the installed pipe passes the test.

3.4.06 If any test of pipe laid disclosed leakage significant pressure drop greater than the manufacturer’s recommended loss, the Contractor shall, at his/her own expense, locate and repair the cause of leakage and retest the line. The amount of leakage, which will be permitted, shall be in accordance with AWWA C600 Standards.

3.4.07 All visible leaks are to be repaired regardless of the amount of leakage.
3.4.08 The Contractor must submit his plan for testing to the Engineer for review at least 10 days before starting the test and shall notify the Owner a minimum of 48 hours prior to test.

End of Section

SECTION 02626

STEEL TRANSMISSION PIPE

PART 1 – GENERAL

1.1 SCOPE. This section includes the furnishing and installation of 36 inch steel water pipe with bell and spigot O-ring gasketed joints and internal lap welded restrained joints, conforming to the requirements of the current ANSI/AWWA C200, Standard for "Steel Water Pipe 6-Inch and Larger" and AWWA M11, “A Guide for Design and Installation, except as otherwise hereinafter specified.

1.2 QUALITY ASSURANCE.

1.2.01 SPFA Certification Program. Steel pipes and fittings furnished in this Contract shall be manufactured, fabricated, lined and coated in a plant certified under Steel Plate Fabricators Association (SPFA) Quality Certification or ISO 9001. Steel pipe manufacturer shall have 5 years prior experience manufacturing large diameter pipes and fittings designed for high pressure under similar field conditions as those specified under this Contract. This program shall assure the Engineer that the steel pipe and accessories are produced by a certified fabricator committed to supplying high quality products that meet all the requirements of AWWA Specifications. All specials and fittings shall be fabricated in accordance with the manufacturer's approved shop drawings.

1.2.02 Inspection. All pipes and fittings furnished under this Contract shall be subject to inspection, in the shop, by a representative of the Detroit Water and Sewerage Department (DWSD). The Manufacturer shall notify the Engineer at least ten (10) days in advance of the date when fabrication will start, so that a DWSD representative may be assigned to witness fabrication and tests. DWSD representatives shall be personnel that have direct knowledge of the project. Not more than four (4) DWSD representatives, two (2) from the Design Group will be assigned to the pipe fabrication and a maximum of two (2) shop visits will be required for this Contract. All costs of inspection should be born by owner. We have no control over their arrangements. The DWSD representatives shall have free entry at all times to all parts of the shop where pipe is fabricated. The fabricator shall furnish all materials, tools and equipment required in making all essential tests. The DWSD representatives shall also be provided with a "hard hat", goggles and such other equipment. Such inspection shall not relieve the manufacturer of responsibility to furnish material and perform work in accordance with these Specifications. Material which arrives at the jobsite and does not conform to these Specifications shall be rejected and shall be replaced at no cost to the Owner or repaired to the owner’s satisfaction.

1.2.03 Welding Requirements. All welding shall be done by certified welders who have had adequate experience in the method and materials to be used. All welders shall be certified under the standard qualification procedure of the American Welding Society (AWS Dl.1).

1.2.04 Shop Test on Production Pipe. Each length of pipe shall be tested by the manufacturer in accordance with ANSI/AWWA C200 Standard.

1.3 REPORTS AND SUBMITTALS. The following data shall be submitted to the Engineer for approval prior to start of fabrication: Design calculation on pipe wall thickness and reinforcement, design calculation in restraining or anchoring bends, tees, dead ends, reducers or any fitting where fluid flow would produce a thrust on the pipe that tends to pull the joints apart, assembly drawings showing overall dimensions and location of each piece identified by Mark No. or a tabulated pipe laying schedule indicating location, stationing, elevation, bends including horizontal and vertical deflections, outlets and other key points along the line, all necessary shop drawings showing complete details of all pipe and fittings furnished. A pipe delivery schedule that is compatible with the Contractor's progress schedule, certified welding procedures to be used in fabrication of this material and list of qualified and experienced welders with certification for the above welding procedures.

The following data shall be submitted prior to approval of any progress payments on materials furnished under this Section: Affidavit of Compliance certifying that all pipe, specials and fittings supplied comply with all provisions of this Contract. Certified mill test reports of steel plates or sheets used in fabrication of this material. Certified mill test reports of all steel pipe, and certified records of hydrostatic tests.

1.4 PRODUCT HANDLING.

1.4.01 Prior to shipment. Pipe shall be visually inspected for damage to the coating. When visual inspection shows a portion of the polyethylene tape system has sustained physical damage, the area in question may be subjected to an electrical holiday test as detailed in AWWA C-214. Repair should only be made by a manufacturer's representative. When the area is tested and there are no holes or no tearing of the material (only wrinkling or bruising) then the area shall be noted OK and shipped with no patching required. When the damaged area does show damage to steel from either a visual inspection or from the use of a holiday detector, expose the inner wrap of black polyethylene repair tape and cut back the damaged layers leaving a smooth surface. The area shall then be wiped clean and dry with a rag and a coat of primer shall be applied to the area. When the primer is tacky, apply a patch of polyethylene tape of sufficient size to completely cover the damaged area, plus a minimum lap of 4 inches on sound tape in all directions. A second patch of polyethylene repair tape shall then be put over the first patch once again insuring a minimum overlap of 4 inches beyond the first patch on a clean dry surface. Repair tape and primer shall conform to ANSI/AWWA Standards and the tape shall be 35 mil high tack polyethylene tape compatible with the original tape system.

1.4.02 Storage and Delivery. Pipe shall be stulled as required to maintain roundness of plus or minus 1 percent during shipping and handling. All pipe and in-line fittings shall be clearly marked to correspond to the mark number on the approved laying schedule. Pipe shall be delivered, handled and stored in a careful manner to avoid damage. Pipe shall at all times be secured against sliding, rolling, falling, or any other such movement that may cause damage. Pipe shall be stored at the site in locations where it will not interfere with traffic or entrances to private property. Pipe shall not be stored on public property until permission is obtained from authorities having jurisdiction there over. Pipe shall not be stored on private property without the owner's written permission, evidence of which shall be furnished to the Engineer. In distributing the pipe in the field, each pipe shall be placed as near as possible to the point where it is to be laid and end facing in the proper direction. Coated pipe shall be stored on padded skids, sand or dirt berm, sand bags or other suitable means so that the coating will not be damaged.

1.4.03 Protection. Pipe shall be handled and transported in such a manner as to prevent damage to the pipe and its lining and coating. Padded bunks, nylon belt tied-own straps or padded banding located over stulling shall be used. No repairs shall be made to damaged pipe unless both the method of repair and the workmanship involved are inspected and approved by the Engineer. Pipe shall be transported and handled, utilizing equipment of proper capacity. Nylon or canvas slings shall be used at all times when handling steel water pipes. Pipe shall not be rolled from transport vehicle.

PART 2 – PRODUCTS

2.1 DESIGN. Steel pipe shall be designed in accordance with "AWWA M11 a Guide for Design & Installation". Design requirements for steel water pipes, except as otherwise specified or shown on the drawings are as follows:

Inside diameter of pipe after Lining (in.)	
Design pressure (psi)	100
Min. wall thickness of steel (in.)	AWWA M11 to dictate wall thickness based on performance criteria set forth by the actual project design parameters.
Design earth cover (ft.)	As shown in contract documents or minimum

	of 5 feet whichever is greater
Min. weight of backfill (pcf)	
Highway design live load	H-20
Impact Factor	1.5
E' = Modulus of soil reaction (psi)	Per Table 6-1 in AWWA M_11 Design Guide
Dl = Deflection lag factor	1

The maximum allowable design deflection for all buried pipe shall not exceed 3 percent. Pipe shall be installed to withstand flotation under all conditions. All pipe, fittings and specials shall be designed to withstand the effects of a 10-psi vacuum condition. The steel cylinder thickness of reducing sections shall be the same thickness as that required for the larger end of the reducing section.

2.1.01 Pipe Standards. Pipe shall be furnished in accordance with ANSI/AWWA C200 Standard, Section 2.1 with steel meeting the requirements of ASTM A139, Grade B, C or D; ASTM A1011; ASTM A1018 Grades 35 to 50; ASTM A53, Type E or S. Steel plate shall meet the requirements of ASTM 283, Grade C or D or ASTM A572, Grade 42. Pipes to be installed inside casing pipe or liner plate shall be designed neglecting the casing pipe or liner plate. Rimmed steel shall not be used. The weight, class and casting period of pipe shall be shown on each pipe. Changes in alignment or grade may be made by breaking the joints of the straight pipe or by use of beveled ends. Joint openings shall not exceed that recommended by the manufacturer.

2.2 ACCEPTABLE MANUFACTURERS. Pipe shall be as manufactured by American SpiralWeld Pipe, Northwest Pipe Company, or approved equal.

2.3 FITTINGS. Fittings shall be fabricated in accordance with ANSI/AWWA C200 Standard, Section 4, from pipe conforming to the above Standards. Fittings shall conform to the dimensions of ANSI/AWWA C208 Standard, "Dimensions for Fabricated Steel Water Pipe Fittings" or may be fabricated into standard or special pipe lengths. Fittings fabricated from previously hydrostatically tested straight pipe shall require testing of only those welded seams that were not previously hydrostatically tested in the straight pipe. The testing shall be dye penetrant or magnetic particle. Elbows over 0 thru 22.5 degrees shall be two-piece, over 22.5 thru 45 degrees shall be three-piece, over 45 thru 67.5 degrees shall be four-piece and over 67.5 thru 90 degrees shall be five-piece. Elbows shall have a minimum centerline radius of 2.5 x the pipe outside diameter. All tees, lateral and outlets shall be reinforced in accordance with ASME Pressure Vessel Code, Section VIII, Paragraph G-37 or AWWA M-11 Manual. Location of tees, laterals or outlets shall be a minimum of five (5) feet from the joint of any pipe.

2.4 CEMENT MORTAR LINING. Pipe shall be cement–mortar lined in the shop in accordance with ANSI/AWWA C205 Standard, “Cement-Mortar Protective Lining and Coating for Steel Water Pipe-4 In. and Larger-Shop Applied”. The interior surface of all steel pipe, fittings and specials shall be cleaned to remove loose and foreign matter. The cement mortar lining shall be centrifugally applied as described in ANSI/AWWA C205 Standard, in the shop. Lining of all bends, reducers, fittings and specials shall be in accordance with ANSI/AWWA C205 Standard. For gasketed joint pipe, shop applied internal lining shall be continuous to the end of the pipe on the spigot end and shall be held back on the bell to the point of maximum engagement or further as shown in the joint detail. Cement–mortar lined pipe shall be stulled as required to maintain roundness during shipping and handling and shall have ends capped prior to shipment. The nominal diameter of cement mortar lined pipe shall be the inside diameter after lining. Field application of cement-mortar lining shall be in accordance with ANSI/AWWA C602 Standard, “Cement Mortar Lining of Water Pipelines-4 in. and Larger”.

2.5 TAPE COATING. Pipe shall be coated and wrapped outside with prefabricated multilayer cold applied polyethylene tape coating in accordance with ANSI/AWWA C214 Standard, "Tape Coating Systems for the Exterior of Steel Water Pipelines". The total tape coating thickness of pipe sections shall be 80 mils consisting of primer, 20 mil inner layer for corrosion protection and two 30 mil outer layers for mechanical protection. Fittings shall be coated and wrapped outside with prefabricated multilayer of cold-applied polyethylene tape coating in accordance with ANSI/AWWA C209 Standard, "Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines".

The total thickness of coating for fittings and field joints shall be 70 mils minimum consisting of primer and two wraps of 35 mil tape. Welded joints shall not be shop painted as the paint may contaminate the field weld. For gasketed joint pipe, shop applied outside coating shall be continuous to the end of the pipe on the bell end and shall be held back 4.25 inches on the spigot end. For gasketed joint pipe, the inside of bell and outside of spigot shall be shop-painted with one coat of primer compatible with the field coating materials.

2.5.01 Materials for tape coating system. The primer shall be supplied by the tape systems manufacturer and shall consist of butyl rubber matrix in a solvent which will produce an effective bond between the pipe surface to be protected and the inner wrap tape. Primer shall comply with the code and regulatory requirements regarding safety and environmental protection in effect at the location of use. Coating tapes Inner wrap shall be 20 mils thick dielectric tape having a ratio of 11 mils of pressure sensitive cross-linked butyl rubber adhesive mass bonded to 9 mils of high density polyethylene backing. The middle wrap and the outer wrap shall be colored gray or black. The second and last outer wrap shall be colored white. Minimum overlap shall be 1 inch. The overlap of successive layers shall not coincide with the overlap of the previous layer. Hand-wrapped tape for coating of fittings and field joints shall be 35 to 40 mils thick consisting of a soft cross-linked butyl rubber adhesive mass bonded to a pliable low density polyethylene backing. Shrink sleeves with a minimum thickness of 80 mils may be used in lieu of hand-wrapped tape.

2.6 LAYING LENGTHS. Pipe shall be furnished principally in 40 to 50 foot laying lengths with special lengths, field trim pieces and closure pieces as required by plan and profile for location of elbows, tees, reducers and other in-line fittings. The contractor may request approval from the Engineer if considering using shorter pipe lengths as dictated by the situation, such as machine capacity, OSHA requirements, soil conditions, etc. If 40 to 50 feet laying lengths are used, the Contractor will have to abide by MIOSHA requirements for trench. Pipe lengths for tunnel installation and where pipe is encased in concrete shall be determined by the Contractor for compatibility with construction means and methods. Prior to fabrication, approval shall be obtained from the Engineer and jurisdictional authorities. The pipe fabricator shall prepare a pipe laying schedule showing the location of each piece by Mark No. with station and invert elevation at each bell end.

2.7 GASKETED JOINTS. The standard joint for working pressures up to 250 psi shall be O-ring unless otherwise noted on the plans. O-ring joints shall conform to ANSI/AWWA C200 Standard. The O-ring joints shall consist of a flared bell end formed and sized by forcing the pipe end over a plug die or by expanding on segmented dies. The spigot end groove design to retain the O-ring rubber gasket shall be formed and sized by rolling on male-female dies to match the bell. The difference in diameter between the I.D. of bell and the O.D. of spigot shoulder at point of full engagement with allowable deflection shall be 0.00 to 0.04 inches as measured on the circumference with a diameter tape. The O-ring gasket shall have sufficient volume to approximately fill the area of the groove and shall conform to ANSI/AWWA C200 Standard. The joint shall be suitable for a safe working pressure equal to the class of pipe furnished and shall operate satisfactorily with a deflection, the tangent of which is not to exceed 0.751D where D is the outside diameter of the pipe in inches or with a pull-out of 0.75 inches.

2.8 RESTRAINED JOINTS. Pipe shall be designed to resist thrust forces developed at fittings and deflections resulting from the application of the specified hydrostatic test pressure. When angular deflection is required at restrained joints, special shop fabricated bevel pipe shall be furnished by the manufacturer to accommodate the exact angular deflection using the bevel and the accompanying joint opening. Welded joints shall be designed to resist the full thrust associated with the working and transient pressures. Restrained length shall be based on the allowable dissipation of the thrust as detailed in AWWA M11. Working stresses for design of welded joints to withstand longitudinal forces shall not exceed 50% of the specified minimum yield strength of the material for working pressure and 75% for transient conditions. Joint details proposed for welded section shall be submitted to the Engineer for approval.

2.9 FLANGES. Flanges shall be in accordance with ANSI/AWWA C207 Standard, "Steel Pipe Flanges for Waterworks Service - Size 4 In. Through 144 In.", Class D for working pressures to 175 psi on 4 thru 12 inches diameter and 150 psi on diameters over 12 inches. Flanges shall be in accordance with ANSI/AWWA C207 Standard, Class E for working pressure over 150 psi to 275 psi when mating steel-to-steel, Class F for working pressures to 300 psi (drilling matches ANSI B 16.5 Class 250). All flanges shall have a 250-500 (per C207) micro-inch finish. Shop lining and coating shall be continuous to end of pipe or back of the flange. Flange faces shall be shop coated with a soluble rust preventive compound. Blind flanges shall be equal in thickness to a ring flange of the pressure class. Blind flanges shall be machine faced to match the mating flange. Flanged outlets as detailed in the plans for blow-offs, access manholes and for installation of air and vacuum relief valves, may be utilized as needed as access for workers and material. Flanged outlet shall be capable of withstanding the specified test pressure and the manufacturer shall coordinate dimensions and drilling of flanges furnished with the flanges for valves to be installed. Flanges shall be of the slip-on or welding neck type end to be fitted with slip-on flanges shall have the longitudinal or spiral welds ground flush to accommodate the type of flanges provided.

2.10 BOLTS AND NUTS. The Contractor shall supply all flange bolts, nuts, washers and gaskets for all flanged connections to Owner furnished in-line valves. All flange bolts shall be made of the best quality open hearth or electric furnace stainless steel or zinc plated carbon steel l, having an ultimate tensile strength of at least 60,000 pounds per square inch, yield point of not less than 45,000 pounds per square inch with an elongation of not less than 18 percent in 2 inches. All nuts for flange bolts shall be hexagonal, and material shall be in conformance with the current specifications for "Carbon and Alloy Steel Nuts and Bolts for High Pressure and High Temperature Service", ASTM Specification A194, Grade 1 or ASTM A307. The flange bolts and nuts shall conform to ANSI Standard, B18.2 Heavy Series and shall have U.S.S. right-handed machine-cut threads, conforming to the requirements of ANSI Standard B1.l, "Screw Threads Coarse Thread Series", Class *2* Fit. Flange bolts shall have hot forged hexagonal heads, and the underside of the head shall be at right angles to the axis of the bolt. Bolt heads and nuts shall be hexagonal in shape and in conformance with then dimensions for "Wrench-Head Bolts and Nuts and Wrench Openings". The threads of all bolts and nuts shall be covered with an approved type of graphite coating before installation.

2.11 RUBBER GASKETS (PIPE CONNECTIONS). Rubber compound for gaskets shall conform to the requirements of the ANSI/AWWA C200 Standard.

2.12 GASKETS (FLANGED CONNECTION). Gaskets for all flanged connections shall be full-faced, single piece, 1/16 inch thick, fabricated from non-metallic, non-asbestos fiber gasket material conforming to the current ASTM Designation, F104, and shall have graphite or an approved anti-stick compound on both sides. Gaskets shall be Anchor 443-A or equal with approved anti-stick coating.

2.13 FIELD WELDS. Field welded joints shall meet the requirements of ANSI/AWWA C-206 Standard, "Field Welding of Steel Water Pipe", except as modified herein. All joints to be field welded shall be preheated in accordance with the requirements of Section 5.5, Preheating, Table 1, of ANSI/AWWA C-206 Standard. Welding procedures, materials and equipment to be used shall be submitted in writing to the Engineer for Approval prior to the work. All field welded joints in steel pipe shall be subjected to magnetic particle testing of the entire pipeline as specified. Prior to the start of the work, the contractor shall submit a list of the welders he proposes to employ, for the competency test to meet the required qualifications. All welders shall be certified for circumferential welding.

After the exterior field welded joints of steel pipe and fittings have been inspected and tested, the exterior of those joints shall received a cold applied tape or shrink sleeve coating conforming to the requirements specified herein. As an alternative to exterior welding, an internal weld may be accomplished using the weld-after-backfill method. Most restrained joints will require a single interior or exterior weld but not both. Inspection of the welds by the representative of an independent testing laboratory shall not relieve the Contractor of responsibility for the quality of all welding done or for performing the work as specified herein. All welds containing cracks or showing signs of porosity shall have the defects ground out, repaired and retested. Welded joints will only be used in restraining elbows on each side of the angle point. A distance sufficient to resist the components of thrust shall be calculated. Welded joints shall also be used to resist thrusts caused by closed valves or by changes in direction of pipeline. Welded joints shall be provided to transmit such thrusts over sufficient distance to absorb the force through skin friction provided by the backfill material against the pipe. Accurate computation of thrust and strength of the weld must be made to determine if the weld is sufficiently strong to transmit the force from one pipe section to the next. Where bell and spigot field welded joints are required on the contract drawings such as restrained joints shall provide a minimum 2.25-inch lap with a minimum of a 0.75-inch allowable pull (joint opening) for the required 1.5-inch minimum lap. Shop applied exterior coating shall be held back in accordance with the manufacturer's recommendations. The interior lining shall also be held back if so recommended by the pipe manufacturer. Lap-welded field joints shall be analyzed for proper strength close to valves and at large deflection angles. Adequate ventilation must be provided to insure adequate air exchange when crews are working inside the pipe.

2.14 CONNECTION TO OTHER PIPE MATERIAL. Care must be exercised when connecting dissimilar pipe materials, because of the possibility of galvanic corrosion. When connecting steel pipe to either gray cast or ductile iron pipe, or to concrete embedded steel cylinder pipe, or to copper or galvanized pipe, an approved electrically insulating joint shall be used. The joint insulation shall be accomplished with an insulating gasket with sleeves and washers on a flanged connection or with an insulating sleeve-type flexible coupling.

PART 3 – EXECUTION

3.1 INSPECTION. Inspect each pipe and fittings before lowering the pipe or fitting into the trench. Inspect the interior and exterior protective coating. Repair any damaged areas as previously specified. Repair of any damaged interior and or exterior protective coating shall be carried out by manufacturer's representative or Contractor's representative certified by the manufacturer. Clean ends of pipe thoroughly. Remove foreign material from inside of pipe. Keep inside clean during and after pipe laying. Handle pipe in a manner to avoid any damage to the pipe. Do not drop or roll pipe into trenches under any circumstances.

3.2 LAYING STEEL WATER PIPE. The pipeline trench shall be excavated to allow the specified thickness of selected bedding material. This material shall support the pipe over its entire length with the exception of a bell hole work area near the pipe ends. A variety of methods can be used to place joints together provided the joints and pipes are not damaged. Before the pipe is released from the slings, the entire placement of the gasket shall be checked using a feeler gage. If it is determined that the gasket has disengaged during joint engagement, the pipe shall be pulled apart and the gasket carefully checked and replaced, if necessary. The joint should then be reassembled and checked once again with the feeler gage.

Each length of pipe shall be electrically bonded to the adjacent length of pipe using two #4 copper bonding wires and termite welding cartridges furnished by pipe fabricators or clips welded to the pipe ends that can be shown to provide adequate conductivity. Backfilling operation shall commence as soon as possible to prevent movement of the installed pipe in the bedded trench. At the conclusion of each day's pipe laying, backfill shall be completed to the end of the pipe and a bulkhead installed therein.

3.2.01 Closure Pieces. Where closure pieces are required for steel pipe, the contractor shall be required to make all measurements for the same and shall be responsible for correctness of the steel sections needed to complete the work. Where steel pipe closures are cut with acetylene torches or by a similar method, the burned ends of the cut ends of the pipe shall be grounded and made smooth before completing the joint in an approved manner. Any pipe coating damaged in the cutting of the ends of closure pieces shall be repaired in accordance with ANSI/AWWA C214 Standard, "Tape Coating Systems for the Exterior of Steel Water Pipelines, or to the satisfaction of the Engineer.

3.2.02 Special Requirements. Every precaution shall be taken against flotation of the pipe. All damages from flotation shall be made good by the Contractor at his expense and to the satisfaction of the Engineer. The Contractor shall also take whatever means necessary to prevent pipe flotation where the Drawings require the pipe to be encased in concrete. If, after the pipeline has been installed, it is found that the rubber gasket is or otherwise improperly placed or that the joint is otherwise unsatisfactory, one of the adjacent pipes shall be removed and a closure pipe with new rubber gasket shall be installed. As an alternative, the joint may be welded so that it is watertight. A representative of the pipe manufacturer shall be present initially during construction activities to advise Contractor in the proper handling, storage, and installation of the pipe. The field representative shall instruct the Contractor and Owner's field personnel in the proper installation techniques and use of feeler gage and show these personnel how to accomplish a proper coating repair. The Contractor's field personnel responsible for such coating repair should be certified by the manufacturer.

3.3 HYDROSTATIC TEST. Hydrostatic field testing shall be conducted in accordance with Master Specifications Section 02670.

End of Section

SECTION 02628

PRE-STRESSED CONCRETE PRESSURE PIPE

PART 1 - GENERAL

1.1 SCOPE. This section includes the furnishing, installation and connection pre-stressed concrete cylinder pipe for pipe diameters greater than 24 inches, with rubber and steel joints. Pre-stressed concrete pressure pipe is primarily used in forced water applications, however it is not uncommon to utilize this pipe in surcharged or force-main sewer applications. Reference Master Specification Section 02620 – Water Main Services and Master Specification Section 2530 – Sanitary Sewers as appropriate.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Pipe shall be transported and handled, utilizing equipment of proper capacity.

1.2.02 Governing Standards. Except as modified or supplemented herein, all concrete pressure pipe shall conform to the applicable requirements of the following standards:

ANSI/AWWA Standards	Title
C104	ANSI Standard for Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
C207	Steel Pipe Flanges for Waterworks Service—Sizes 4 In. Through 144 In. (100 mm Through 3,600 mm)
C300-97	Reinforced Concrete Pressure Pipe, Steel-Cylinder Type
C301	Prestressed Concrete Pressure Pipe, Steel-Cylinder Type
C303	Concrete Pressure Pipe, Bar-Wrapped, Steel-Cylinder Type
C304	Standard for Design of Pre-stressed Concrete Cylinder Pipe

Concrete Pressure Pipe (M9)	Operations manual explains selection, installation, testing, and cleaning and lining practices for concrete pressure pipe.

ASTM Standards

A36	Standard Specification for Carbon Structural Steel
A283	Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates
A449 Type I	Standard Specification for Quenched and Tempered Steel Bolts and Studs
A648	Steel Wire, Hard Drawn for Pre-stressing Concrete Pipe
A663	Standard Specification for Steel Bars, Carbon, Merchant Quality, Mechanical Properties
A675, Grade 50	Standard Specification for Steel Bars, Carbon, Hot-Wrought, Special Quality, Mechanical Properties
A1011, SS Grade 33	Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Allow with Improved Formability
B633 Type III	Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel
C94	Standard Specification for Ready-Mixed Concrete
C150	Standard Specifications for Portland Cement
D2240 Method A	Standard Test Method for Rubber Property—Durometer Hardness

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Certified welders who have had adequate experience in the method and materials to be used shall do all welding. All welding operators shall be certified under the standard qualification procedure of the American Welding Society. When required by the Engineer, tests shall be conducted of the welders to determine their ability to produce welds that are in compliance with these specifications. Tests shall be made in accordance with the above named qualification procedure using machines and electrodes similar to those that are to be used on the work and in the presence of the Engineer who shall determine the quality of the work done.

Specimens shall be welded in the same position as the work for which the welder is qualifying. The Engineer may call for additional test plates as the work progresses and may demand the removal from work, under the Contract, of any welder whose work is not satisfactory, regardless of the quality of the test welds. The Contractor shall furnish all materials and bear all expenses of qualifying welders.

In lieu of tests conducted in the presence of the Engineer, the Engineer may require that the certified welders be qualified under said qualification procedure by an approved testing agency.

1.3.02 Contractors Qualifications. Contractor shall have a minimum of 5 years experience installing and connecting pre-stressed concrete cylinder pipe with rubber and steel joints.

1.3.03 Manufacturer. In order to verify that the pipes have been properly steam cured, the pipe manufacturer shall have a properly installed automatic recording device, maintained in good working order, in his curing sheds. This device shall automatically record on a chart room temperature versus time and be available to the Engineer for verification of proper curing procedures.

1.3.04 Manufacturers Field Services. The Contractor shall include in his bid, as a minimum, that the pipe manufacturer's field service representative will be on-site for the following periods:

Initial installation monitoring for a minimum period of two working days.

Provide installation advice during construction for a minimum period of five working days throughout the length of the project.

Witnessing of the pressure testing for a minimum period of one working day.

When requested, a representative of the pipe manufacturer shall be present to instruct the contractor's crew on proper installation of the first five joints and the procedure for checking pipe joints to determine whether the rubber gasket is in its proper position.

1.3.05 Testing. Complete steel plate cylinder shall be tested for water tightness by an approved method such as is specified in AWWA C301.

1.4 SUBMITTALS. Prior to pipe shipment, the Contractor shall obtain from the pipe manufacturer and submit for approval the following:

1.4.01 Affidavits of Compliance. The pipe manufacturer shall furnish an Affidavit of Compliance to the effect that all pipe and fittings supplied by the manufacturer comply with all provisions of this Contract.

1.4.02 Drawings and Data. Pipe design calculations and pertinent design information. Pipe design calculations shall include thrust restraint calculations. Pipe design calculations shall designate whether trench or embankment conditions are assumed. If trench conditions are assumed, manufacturer shall state assumed width of trench and provide an alternate bedding detail to be used during construction if design trench width is exceeded.

All necessary shop drawings showing complete details of all pipe, fittings, and specials to be furnished including but not limited to the following data for each inside pipe diameter (inches):

Design Working Pressure (psi)

Field Testing Pressure (psi)

Design Earth Cover (As shown on plans or 10 feet whichever is greater)

Minimum Weight of Backfill (Lbs./cu. ft.) (120 Lbs./cu. ft minimum)

Minimum Core Thickness (In accordance with AWWA C301) (Inches)

Mortar Coating Thickness over Wire (Inches)

Minimum Thickness for Steel Cylinder (Inches with a Zero Minus tolerance)

Minimum Wire Diameter (Inches)

Design Bedding Angle (for trench installation) (Degrees)

60 degree bedding angle may be used to design pipe for earth loads based on trench width approaching embankment conditions.

P_1 (wire Elastic Limit Pressure)

> 1.7xPw (Design Working Pressure)

A detailed drawing showing the method of securing the ends of the pre-stressing wire to the barrel of the pipe.

Test reports showing the physical properties of the rubber to be used in pipe joint gaskets.

Shop hydraulic test results.

Compression Test Reports, showing strength of concrete at time of wrapping.

1.4.03 Certifications. Design calculations for pipe and fittings shall be signed and sealed by a registered professional engineer licensed in the State of Michigan. This engineer shall be a current employee of the pipe manufacturer and shall have at least 5 years experience with this manufacturer.

Proof that only certified welders shall be employed on the work, furnishing to the Engineer details of the welding procedure, methods, and materials proposed to be used.

Certified mill test reports or plant test reports on each heat from which sheet steel is rolled or pre-stress wire is drawn. Test specimens cut from each shipment of cylinder steel and high tensile wire shall also be made available to the Engineer when requested prior to shipment of these materials to the pipe manufacturer.

1.4.04 Schedules. A tabulated pipe layout schedule. When beveled pipe and/or joint opening is proposed to achieve both vertical and horizontal deflection, the layout schedule shall specify the amount and direction of deflection and rotation required for each occurrence.

The pipe layout schedule shall indicate the trench width, height of cover and design pressure used in the design calculations. An alternate bedding detail, to be used during installation if design trench width is exceeded, shall be made available.

A pipe delivery schedule that is compatible with the Contractor's progress schedule.

1.5 DELIVERY, STORAGE AND HANDLING. Pipe shall be delivered and stored in a careful manner to avoid damage thereto. Pipe shall at all times be secured against sliding, rolling, falling, or any other such movement that may cause damage.

Pipe shall be stored at the site in locations where it will not interfere with traffic, sight distances or entrances to private property. Pipe shall not be stored on public property until permission is obtained from authorities having jurisdiction there over. Pipe shall not be stored on private property without the owner's written permission, evidence of which shall be furnished to the Engineer.

Pipe shall be handled and transported in such a manner as to prevent damage to the pipe and its coating. Any damaged pipe will be rejected and shall be removed from the site at once. Removal of the rejected pipe and its replacement shall be at the Contractor's expense.

No repairs shall be made to damaged pipe unless both the method of repair and the workmanship involved are approved by the Engineer and the pipe manufacturer's field service representative.

Steel cable slings for handling pipe shall have an approved covering to prevent damage to pipe.

Pipe shall not be rolled from transport vehicles.

PART 2 - PRODUCTS

2.1 BASIS OF DESIGN.

2.1.01 Dimensions. Design requirements for pre-stressed concrete pressure pipe should be provided on shop drawings. Refer to paragraph 1.4.02 Drawings and Data, for design data requirements.

Pipe of special lengths, or other approved means of adjusting length of line as laid, shall be provided to the end that each element of the water main shall be placed at the location shown on the drawings.

Unless otherwise shown on the Contract Drawings or otherwise approved, closures shall be the follower ring type. Details of closure sections shall be furnished for approval. Such number of approved closure sections shall be provided as may be required in the course of the work, subject to approval.

JOINT OPENING	SIZE
One Inch	16-Inch through 48-Inch diameter pipe
One & One-half Inches	54-Inch through 72-Inch diameter pipe
Two Inches	78-Inch through 120-Inch diameter pipe

However, the maximum allowable joint opening for installing non- restrained joint pipe in the trench shall be one-half of the above values pipe manufacturer's limit for maintaining a water tight seal. The maximum joint opening to be used on the pipe layout schedule for non-restrained joint pipe shall be 1/4-inch less than the maximum allowed for installing pipe.

Commented [DJD5]: Page: 6
Follower Ring

Commented [DJD6]: Page: 6
Joint Opening

2.1.02 Structural Design. Embedded Cylinder Pipe (ECP) and Lined Cylinder Pipe (LCP) are acceptable design alternatives for the Design Engineer for pipe diameters greater than 24 inches.

Commented [DJD7]: Page: 7
LCP

Maximum Allowable Gross Wrapping Stresses:

Diameter	Class II Wire	Class III Wire
0.192-Inch	166,500 psi	189,000 psi
1/4-Inch	158,200 psi	180,000 psi
5/16-Inch	150,000 psi	165,750 psi

The gross wrapping stress shall not exceed 75 percent of the specified minimum tensile strength of the wire, as required by ASTM Designation A648, Standard Specification for "Steel Wire, Hard Drawn for Prestressing Concrete Pipe."

2.1.03 Outlets. Outlets should be located in the center of the pipe section. The reinforcement wire shall be either wrapped continuously from one side of the opening to the other, avoiding the opening and not cutting the wire, or the wire shall be securely fastened on each side of the outlet by mechanical or other approved means.

Commented [DJD8]: Page: 7
Outlets

2.2 ACCEPTABLE MANUFACTURERS. Pipe shall be made by a manufacturer experienced in producing pipe of the type, size and quality specified herein. The pipe manufacturer shall have produced pipe for at least five years and shall have a successful performance record in the U.S.A on projects of considerable magnitude.

The concrete pressure pipe shall be manufactured by Price Brothers Co., Ameron, Hanson, Vianini or an approved equal meeting the requirements specified herein.

2.3 MATERIALS.

2.3.01 PIPE MATERIALS. Use materials meeting the requirements of ANSI/AWWA C 301 as modified herein.

Cement for concrete core and mortar coating shall conform to the requirements of "Standard Specifications for Portland Cement, " ASTM C150, Type I.

No fly ash or pozzolanic material shall be used in the concrete.

Mix water used for concrete and cement-mortar shall be fresh, clean water meeting the requirements of ASTM C94. Water used for curing pipe shall be fresh, clean water or recycled process water. Water for both uses shall be free from oil, acid, strong alkalis, salts, and vegetable matter.

Sheet steel for cylinders shall meet the requirements of the current specifications for "Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability," ASTM A1011, SS Grade 33.

Wire for circumferential reinforcement shall be as designated in ANSI/AWWA Standard C301.

Steel for joint rings shall meet the requirements of the current Standard ANSI/AWWA C301, except that ASTM A283 and ASTM A1011 steel shall be Grade 33. ASTM A663 and ASTM 675 Grade 50 steel may be used provided the minimum yield stress is 30,000 psi. Joint ring steel other than noted above shall not be used without written prior approval.

No rebound material shall be used in the mortar coating.

2.3.02 SPECIAL PIPE AND FITTINGS. Special pipe and fittings required for bends, tees, reducers, adapters (connections to line valves, etc.) and closures shall be furnished as shown on the Drawings, or as required for complete construction. The details of design shall conform to Section 4, "Fittings and Special Pipe" of ANSI/AWWA C 301 and to Chapter 8 of AWWA M9, except as otherwise specified hereinafter.

Fittings shall be composed of cut and welded steel plate or sheet with concrete or mortar coating on the interior and exterior unless otherwise shown on the drawings or approved.

Fittings shall be strutted until installed unless otherwise reinforced.

The dimensions shown on the drawings are in accordance with available information. Longitudinal pipe dimensions (lay lengths) are subject to change to meet equipment manufacturer's requirements.

Steel plate shall be of an approved thickness determined by the design pressure plus 40 percent surge pressure allowance and by the earth cover as shown on the drawings, using a 10-foot minimum plus equivalent AASHTO H-20 truck live load. Steel plate thickness, based on dead load plus live load shall be such that the predicted vertical deflection of the pipe, as calculated in Chapter 8 of AWWA M9, shall not exceed 2 percent of the inside diameter of the steel plate.

The deflection angle of adjacent sections of steel plate cylinder used for bends shall not exceed 22 1/2 degrees.

Commented [DJD9]: Page: 9
Maximum Miter on Elbow

Inside diameter of cylinder segments in bends shall be sufficient to permit shaping the lining so as to eliminate abrupt deflections in the inner surface of the bend, without reducing the thickness of lining at any point to less than 1 inch (with tolerance of 1/8 inch), and without reducing the inside diameter of the bend to less than that specified for the pipe.

The welds of each complete steel plate fitting shall be tested for water tightness by an approved method prior to mortar lining and coating application.

Steel plate fittings shall be lined and coated with mortar deposited at least 1-inch thick on the surface by an approved method unless otherwise shown on the drawings. Steel plate for fittings and specials shall conform to ASTM A36 or ASTM A283 Grade D.

2.3.03 JOINT RINGS. The steel joint rings with rubber gasket seal for non-restrained joints shall be able to withstand, without leakage, a joint opening of the amount listed in paragraph 2.2.02 Dimensions.

For joint rings on finished 54 inch and larger pipe, the out-of-roundness of either the inside bell ring or outside spigot ring contact surface, measured as the difference between maximum and minimum diameters, shall not exceed 0.5 percent of the nominal diameter of the contact surface or 1/2" whichever is less. For pipe 48 inch and smaller, the joint ring out-of-roundness shall not exceed 0.7 percent of the nominal diameter or 3/16" inch whichever is larger. Flat spots or other irregularities in joint rings shall not deviate from a 3-foot template cut to the nominal diameter of the contact surface by more than 1/8 inch.

The portions of the joint rings that will be exposed on finished pipe and fittings shall be protected from corrosion by an approved metallic coating with a minimum thickness of 0.004 inch, applied by an approved method. The exposed portions of the joint rings may be topcoated with a bitumastic paint meeting the requirements of AWWA C104.

Commented [DJD10]: Page: 9
Paint on Joint Rings

2.3.04 RUBBER GASKETS. Where an 0-ring rubber gasket is required between mating flanges, the finishes shall be as specified in Paragraph 2.9.03 Edge Grinding.

Rubber compound for gaskets shall conform to the requirements of the current ANSI/AWWA Standard C301 except for the following:

Rubber compound shall contain not less than 50 percent, by volume, of virgin natural or synthetic polyisoprene elastomer and the remainder suitable pulverized fillers. The fillers shall be free from any substance likely to have a deleterious affect on the compound. The compound shall contain no elastomer substitute of any kind, rubber that has previously been used, or reclaimed rubber.

Tensile strength of the rubber shall be at least 3000 psi.

Elongation at rupture shall be at least 425 percent.

Specific gravity shall be consistent within plus or minus 0.05 and within the range of 1.02 and 1.19.

Percentage of cold flow shall not exceed 18 percent.

Hardness of the rubber compound shall be 60 with a tolerance of plus or minus 5 as determined with a Shore A durometer, in accordance with ASTM 2240 Method A.

2.3.05 FLANGES. Pipe flange class shall be selected to suite application. Pipe flange steel meeting all requirements of current ANSI/AWWA Standard for "Steel Pipe Flanges" C-207, except where noted otherwise on drawings.

All flanges shall be in accordance with details shown on the drawings.

All flanges shall be rolled or forged steel, in accordance with details shown on the drawings, and shall conform to the requirements of the AWWA Standard C207.

2.3.06 GASKETS FOR FLANGES. Gaskets for flanged connections shall be ring type, 1/8 inch thick, nylon reinforced neoprene in compliance with AWWA C207. Gasket hardness shall be in the range of 75-85 as measured in accordance with ASTM D2240, Method A. Flange gaskets shall be in conformity with sample material approval by the Engineer.

If the Contract Drawings require 0-ring type gasket connections for flanges, they shall conform to the following: 0-ring gaskets for flanged connections shall be made of extruded neoprene rubber having a hardness of 60-70 measured with a Shore, Type A durometer and a cross sectional diameter of 0.275 inches, +0.012, -0.006 inches. The gaskets shall be shop spliced and vulcanized endless to the correct diameter to ensure leak-tight joints.

2.3.07 BOLTS AND NUTS FOR FLANGE JOINTS. The Contractor shall supply all flanged bolts, nuts, washers and gaskets for all flanged connections, including connections to City-furnished valves.

All flange bolts shall conform to ASTM A449 Type 1, with an electrodeposited zinc coating of 0.00015 inch minimum thickness in accordance with ASTM B633 Type III.

All nuts for flange bolts shall be hexagonal, and material shall be in conformance with the current specifications for "Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service or Both, ASTM Specification: A194, Grade ~~1~~ 2H with an electrodeposited zinc coating of 0.00015 inch minimum thickness in accordance with ASTM B633 Type III.

Flange bolts and nuts shall have American National right-handed machine-cut threads, conforming to the requirements of Flange bolts shall have hot forged hexagonal heads, and the underside of the head shall be at right angles to the axis of the bolt. Bolt heads and nuts shall be hexagonal in shape and in conformance with the dimensions for "Wrench-Head Bolts and Nuts and Wrench Openings," ANSI Standard, B18.2. Bolt heads and nuts shall be standard hex dimensions for bolt diameters 1 1/2 inch or smaller and heavy hex for bolt diameters larger than 1 1/2 inch. The threads of all bolts and nuts shall be covered with an approved type of graphite coating before installation.

2.3.08 JOINT LUBRICANT. Joint lubricant for coating the rubber gaskets and the pipe joint rings shall be furnished by the pipe manufacturer, shall meet NSF61 standards, and shall be subject to approval by the Engineer.

2.3.09 JOINT FILLING. Mortar for filling joints shall be Portland cement mortar, mixed in the proportion of 1 part cement to 2 parts sand.

2.3.010 PROTECTIVE COATING. Bitumastic coating complying with AWWA C104.

2.3.011 THRUST RESTRAINTS. Thrust restraint details are to be shown on the contract drawings. Thrust restraint is to be provided by reinforced encasement or thrust block. When limited by space or schedule, thrust restraint by method of restrained joints is an acceptable design alternative. When used, restrained joints must be at all fittings where an unbalanced thrust force will exist in the pressurized line, including elbows, tees, and bulkheads. Restrained distances and steel cylinder thickness requirements to transmit thrust forces shall be calculated by the methods and equations in AWWA M9. Calculations must be submitted as noted in paragraph 1.4.02 Drawings and Data. Restrained joints shall be of the snap ring or harness clamp mechanically restrained type. Evidence of the proposed mechanically restrained joint's strength capability, such as previous or current tests, shall be submitted to the Engineer for approval.

Commented [DJD11]: Page: 11
2nd Restrained Joint reference

2.4 MANUFACTURE AND FABRICATION.

2.4.01 General. All specials and fittings shall be fabricated only according to approved manufacturer's shop drawings.

The City will have the option to inspect pipe fabrication.

Admixtures shall not be used in the concrete pipe core or cement mortar lining or coating without written approval.

Design using multiple layers of circumferential reinforcement wire must comply with AWWA C301 and AWWA C304.

Commented [DJD12]: Page: 12
Double Wrap

Any pipe or fittings supplied from the manufacturer's inventory must comply with this specification unless written permission is granted by the Engineer.

Place concrete in the cores only by methods specified in AWWA C301.

Generally, standard pipe sections shall have a minimum laying length of 20 feet; however, under special circumstances and when approved, the minimum laying length of standard pipe sections may be reduced to 16 feet.

Out-of-roundness, dimensional tolerances and coating tolerances shall be in accordance with the latest ANSI/AWWA C301 Standard, unless otherwise stated in this specification.

2.4.02 Edge Grinding. All flanges shall have a 125 micro-inch machined finish. Flange faces shall be machine finished after flanges have been welded to the pipe in order to provide true faces perpendicular to the axis of the pipe. The machined surfaces shall be finished to a degree of smoothness, which shall not exceed the RMS micro-inch value specified.

If an 0-ring rubber gasket is required between mating flanges, the flange containing the 0-ring groove shall have a 125 RMS micro-inch finish except that all sides of the groove shall have a 63 RMS micro-inch finish. The flange mating with the flange containing the 0-ring groove shall have a 63 RMS micro-inch finished face.

Commented [DJD13]: Page: 12
Special Machine Finish

2.4.03 Shop Painting. After fabrication, each piece of pipe, fitting and special shall be clearly marked by the pipe manufacturer to indicate its design pressure, date the concrete core was poured, date of pre-stressing, design depth of cover and name of manufacturer.

Commented [DJD14]: Page: 13
Stamping and Shop Painting

Specials, fittings, and beveled pipes shall be marked to show proper locations in the pipeline.

All marks on pipe sections, fittings, and specials shall correspond to those shown on the approved layout schedule.

PART 3 - Execution

3.1 INSPECTION. Examine the areas and conditions under which work is to be performed. Correct the conditions that are detrimental to the timely and proper completion of the work. Do not proceed until unsatisfactory conditions have been corrected.

Carefully examine each pipe, prior to placing. Promptly set aside all defective pipe and all damaged pipe. Clearly identify all defects. Do not install defective pipe or damaged pipe. Pipe shall be laid in accordance with the printed instructions of the manufacturer and as specified herein.

3.2 PREPARATION.

3.2.01 Placement. Provide excavating, trenching, and bedding in accordance with the provisions of Master Specification Section 02221, Trenching, Backfilling and Compacting and as specified herein.

Pipe shall be laid on a properly prepared subgrade by entering the spigot ring into the bell of the preceding pipe after proper alignment of the pipe.

Each gasket shall be tested or inspected. For non-testable joints, after the spigot is well entered into the bell ring so that the gasket is fully compressed and brought to its final shape, and before the next pipe is brought fully home, each gasket shall be carefully checked to ensure that it is in the proper position around the full circumference of the pipe. Stops shall be used to prevent the pipe from going home before the gasket is checked. After the gasket is checked, the pipe shall be brought fully home. For testable joints the pipe may be brought home prior to testing the joint. After the joint has been tested and the pipe is brought fully home, the pipe shall be checked for line and grade. Any misalignment shall be corrected by bringing the bell end of the pipe into its proper position. If the subgrade is too low, it shall be brought to the proper grade with a stabilized mixture of sand and cement, consisting of not over 20 parts of sand per part of cement.

Joint opening must be less than distance specified in paragraph 2.2.01 Dimensions of this specification.

3.2.02 Application of Lubricant. Before laying pipe, the bell and spigot rings shall be thoroughly cleaned. The spigot ring shall be coated with the approved lubricant after which the rubber gasket, coated with the lubricant, shall be properly placed in the spigot ring groove and the stretch equalized in the manner recommended by the pipe manufacturer. The bell ring of the preceding pipe shall also be coated with this lubricant before the pipe is guided into place.

Do not lubricate self-lubricating joints.

3.2.03 Gaskets. Installation of the "0" ring gasket shall be as directed by the manufacturer; however, no material shall be placed in the groove that will impede the movement of the gasket after the flanged connection is made.

3.2.04 Joint Filling. The annular spaces between pipe ends, both inside and outside, shall be completely filled with Portland Cement mortar mixed in the proportion of 1 part cement to 2 parts sand; however, the inside of the joints on all pipe 24 inches in diameter and smaller shall not be filled. Prior to backfilling, the outside pipe joint shall be filled with mortar. To ensure complete filling of this joint, the mortar shall be behind poured inside the diaper supplied by the pipe manufacturer, down one side of the pipe until it can be seen rising up on the opposite side, then it shall be filled from either side. The material for and the dimensions of the diaper used for retaining the mortar at the exterior joint shall be subject to approval. The diaper shall encompass the full circumference of the joint.

Mortaring of the inside joint space shall not be done until after backfilling over the joint is complete.

3.2.05 Cold Weather Requirements. In cold weather, precautions shall be taken to prevent the mortar used for filling pipe joints from freezing. Joint rings shall be heated by approved methods and the temperature of the mortar shall not be less than 60°F or more than 120°F when deposited in the joint. Immediately after placing, mortar shall be protected from freezing by placing a minimum thickness of 12 inches of sand around the joint. No pipe shall be laid and no exterior joints shall be poured when the temperature is less than 15°F unless otherwise approved.

3.2.06 Backfilling. Backfilling shall follow closely behind pipe laying unless otherwise permitted. Backfilling shall be completed up to the horizontal diameter of the pipe not more than 2 pipe lengths behind pipe laying and shall be completed to the top of the trench not more than 5 pipe lengths behind pipe laying. Backfilling shall conform to the requirements of the Master Specification Section 02221, Trenching, Backfilling, and Compacting, At the conclusion of each day's pipe laying, backfill shall be completed to the end of the pipe and a bulkhead installed therein.

3.2.07 Curves. Long radius curves, either horizontal or vertical, may be made with standard straight pipe by deflection at each joint provided that the maximum joint opening caused by such deflection shall not exceed that specified herein for pipe laying, or they may be made with straight pipe in which the spigot joint rings are manufactured on a bevel.

3.2.08 Protection. Every precaution shall be taken against flotation of the pipe. All damages from flotation shall be made good by the Contractor at his expense and to the satisfaction of the Engineer. The Contractor is especially cautioned to take whatever means necessary to prevent pipe flotation where the Drawings require the pipe to be concrete encased.

Where the Contract Drawings call for a protective coating to be applied to the exterior wall of the pipe, there shall be applied, as shown on the Drawings, either one or two coats of the coating specified in paragraph 2.3.010 Protective Coating of this specification. The method of application shall be as recommended by the coating manufacturer and as approved by the Engineer. The cost of this coating shall be included in the Contract Price.

If during pipe installation, the Engineer determines that ground conditions warrant the use of a protective coating on the pipe where the Contract Drawings do not call for a protective coating, the Contractor shall make all the necessary arrangements to furnish the pipe with the necessary protection, as specified in this specification.

Caution shall be exercised when handling, delivering, and installing this pipe so that the protective coating is not damaged. Any pipe so damaged shall be replaced or repaired by the Contractor, as directed by the Engineer, at no additional cost to the City.

3.3 FIELD QUALITY CONTROL.

3.3.01 Inspection. The pipe manufacturer shall provide a qualified field service representative, who shall be available to be on the project site within 24 hours notice from the Contractor or the Owner's representative.

The field service representative must have a minimum of 5 years experience as a representative of the pipe manufacturer in the area of providing such services. The individual may be a registered professional engineer possessing a minimum of 2 years experience in the area of manufacture of pipe, sales and service representation in lieu of 5 years of experience as stated above.

The owner's engineer shall have the right of final acceptance of the field service representative based on a resume of the individual indicating the minimum experience required above.

Pipe manufacturer must agree to supply field service assistance to the owner for the next five years at no charge on technical-field support of this pipeline.

If, after the pipeline has been installed, it is found that, at any joint, the rubber gasket is pinched or otherwise improperly placed or that the joint is otherwise unsatisfactory the joint shall be repaired in a manner recommended by the pipe manufacturer and approved by the Engineer. This may involve field welding the leaking joint or removal of one of the adjacent pipes to install shall be removed, and a closure section of pipe with new rubber gaskets.

End of Section

SECTION 02630

STORM DRAINAGE AND PIPE CULVERTS

PART 1 - GENERAL

1.1 SCOPE. Section includes storm drainage pipe, pipe culverts, fittings and accessories, catch basins, manholes, bedding and backfill and all connections to catch basins and manholes. It provides foundation drainage system work for pre-stressed concrete reservoir.

1.2 GENERAL.

1.2.01 Coordination. Coordinate the Work with trenching, paving, and other construction activities in the site.

1.2.02 Governing Standards.

ASTM C76 – Specification for Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.

ASTM C443 – Specification for Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.

MDOT Standard Specifications for Construction.

ASTM C478-97 Standard Specification for Precast Reinforced Concrete Manhole Sections.

Divisions 1 and 2 of the Standard Specifications for Paving and Related Construction of the City of Detroit Department of Public Works – City Engineering Division

ASTM D1557 – Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.

ASTM D 2729 – Specification for Polyvinyl Chloride (PVC) Sewer Pipe and Fittings.

ASTM D 3776 – Test Methods for Mass Per Unit Area of Woven Fabric.

ASTM D 4491 – Test Methods for Water Permeability of Geotextiles by Permittivity.

ASTM D 4533 – Test Method for Trapezoid Tearing Strength of Geotextiles.

ASTM D 4632 – Test Method for Breaking Load and Elongation of Geotextiles.

ASTM D 4751 – Test Method for Determining the Apparent Opening Size of a Geotextile.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit product date for pipe, pipe joints, and accessories. Submit Manufacturer's Installation instructions and special procedures required to install products. Submit Shop Drawings for all precast pipes, manholes and catch basins.

1.3.02 Certifications. Submit Manufacturer's certificate to certify that products meet or exceed specified requirements. Submit 2 copies of the certificates to the Engineer.

Submit Certification, signed by the Contractor and foundation drainage system Installer that installed materials, indicating conformance to the specified requirements and that the system was successfully checked and tested prior to covering with filtering and drainage fill.

1.3.03 Record Drawings. Accurately record actual locations of pipe runs, connections, catch basins, inlets, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.4 DELIVERY, STORAGE AND HANDLING. Comply with precast concrete manufacturer's instructions for unloading, storing and moving precast manholes and drainage structures. Store precast concrete manholes and drainage structures to prevent damage to the Owner's property or other public or private property. Any property so damaged shall be repaired at the Contractor's expense. Clearly mark each precast structure by indentation or waterproof paint to indicate the date of manufacture, manufacturer and identifying symbols and/or numbers shown on the Contract Drawings to indicate its intended use.

Cold Weather Requirements shall comply with ACI 530.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Sewer Pipe Materials. Reinforced concrete pipe shall be ASTM C76, with Wall Type C, bell, and spigot end joints. The joint shall be ASTM C443, rubber compression gasket joint.

2.1.02 Pipe Culvert Materials. Reinforced concrete pipe shall be ASTM C76, with wall type C, bell and spigot end joints. The joint shall be ASTM C443, rubber compression gasket joint.

2.1.03 Manholes. Manhole sections shall be reinforced precast in accordance with ASTM C478 with rubber gaskets in accordance with ASTM C443. Cones shall be eccentric. Frame and Cover shall be cast iron construction, EJIW 1000C cover and 1010Z frame bolted down cover as per standard detail.

2.1.04 Drainage Pipe and Fittings. Furnish drainage pipe complete with bends, reducers, adapters, couplings, collars, cleanouts and joint materials. Use polyvinyl chloride pipe for run-off pipe to the storm drainage system, conforming to ASTM D2729, and perforated polyvinyl chloride pipe, conforming to ASTM D2729.

2.1.05 Subsurface Drainage Materials. Provide perfabricated in-place wall drainage matting conforming to ASTM D3776, ASTM D4636, ASTM D4533, ASTM D4833, ASTM D4751 and ASTM D4491, as part of the overall foundation drainage system.

For drainage core, provide the manufacturer's standard open three-dimensional, nonbiodegradable, plastic Geomatrix material designed to effectively conduct water to the foundation drainage system under maximum soil pressures.

Provide a minimum vertical flow rate of 5 gpm per foot width at 3,600 psf, and provide the manufacturers standard nonwoven geotextile fabric of polypropylene or polyester fibers, or a combination thereof.

2.1.06 Soil Materials.

Impervious Fill: Use clayey gravel and sand mixture compacted to percent of procter meeting the requirements of ASTM D1557.

Gravel Fill: Use evenly graded mixture of natural or crushed gravel or crushed stone, and natural sand with 100 percent passing a ½ inch (1.3 cm) sieve and 0 to 5 percent passing a No. 50 sieve.

Filtering Material: Use an evenly graded mixture of natural or crushed gravel or crushed stone, and natural sand, with 100 percent passing a 1 ½ inch sieve and 0 to 5 percent passing a No. 50 sieve.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that trench cut and excavation base are ready to receive work and excavations, dimensions, and elevations are as indicated on layout drawings.

3.2 PREPARATION. Hand trim excavations to required elevations. Correct over excavation with sand. Remove large stones or other hard matter which could damage piping or impede consistent backfilling or compaction.

3.3 INSTALLATION.

3.3.01 Pipe Installation. Installation shall be in accordance with Master Specification Section 02211, Excavation, Filling and Grading. Lay pipe true to the lines and grade given, bells or grooves, upgrade, ends fully and closely joined, and each section shall have a full, firm bearing throughout its length. Sewer sections showing signs of settlement or poor alignment shall, as directed by the Engineers, taken up and relaid at the Contractor's expense.

Existing live sewers and service leads shall be maintained and carefully protected during the construction of the sewers. Damaged sewer or services leads shall be immediately replaced or replaced as directed by the Engineer. When tapping an existing pipe or structure a minimum opening of the entering pipe outside diameter plus 6 inches (15.2 cm) shall be cut into the receiving structure. A minimum of 3 inches (7.6 cm) mortar layer shall be packed completely around the entering pipe. The entering pipe shall be cut with flush to conform to inner wall of pipe or structure. The entering pipe shall be incased on the outside portion of the connection to provide efficient clearing under the pipe. Damages to existing pipe or structure caused by the contractor during the topping operations shall be required or replaced at the contractor's expense.

3.3.02 Precast Concrete Manhole Installation. Do not displace or damage pipe when compacting. To ensure safety, lift precast structures at the lifting points designated by the manufacturer. Set precast structures so that they firmly and fully bear on crushed stone bedding, compacted as specified accordance on other support system shown on the Contract Drawings. Assemble multi-section structures by lowering each section into the excavation. Lower, set level, and firmly position the base section before placing additional sections.

When lowering manholes and drainage structures into the excavations and joining pipe to the units, take precautions to ensure that the interior of the pipeline and structure remains clean. Ensure joint integrity by removing all foreign materials from joint surfaces and verifying that sealing materials are placed properly. Avoid misalignment by using guide devices affixed to the lower section. Joint sealing materials may be installed at the site or at the manufacturer's plant.

Verify that manholes and drainage structures installed satisfy required alignment and grade. Cut pipe to finish flush with interior of structure. Remove knockouts or cut structure to receive piping so as not to create openings more than that required to receive pipe. Fill annular space with mortar. Shape inverts through manhole as shown on the Contract Drawings.

3.3.03 Foundation Drainage Installation. Install all foundation drainage equipment in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Master Specifications Division 1. Foundation drainage system must be checked and tested prior to covering with filtering and drainage fill

Impervious Fill at Footings: After concrete footings have been cured and forms removed, place impervious fill material on the subgrade adjacent to the bottom of footings. Place and compact impervious fill to the dimensions indicated or, it not indicated, not less than 6 inches (12.2 cm) deep and 12 inches (30.5 cm) wide.

Filtering Material: Place a supporting layer of filtering material over the compacted subgrade where drainage pipe is to be laid, to the depth indicated or, if not indicated, to a compacted depth of not less than 4 inches (10.2 cm).

Laying Drain Pipe: Lay the drain pipe solidly bedded in the filtering material. Provide full bearing for each pipe section throughout its length, to true grades and alignment, and with a continuous slope in direction of flow. Provide collars and couplings as required, Provide recesses in excavation bottoms to receive bells for drain pipe having bell and spigot ends. Lay the pipe with bells facing up slope with spigot and entered fully into the adjacent bell. Seal joints.

Gravel Fill: Place gravel fill over drain lines, after satisfactory testing and covering of drain lines with filtering material. Completely cover drain lines to a width of at least 24 inches (61 cm) on each side and above the top of the pipe. Place fill material in lifts not exceeding 3 inches (7.6 cm) in loose depth and compact each lift as it is placed. Wrap gravel fill material with one layer of synthetic nonwoven drainage fabric (equivalent opening size 70-100), overlapping the edges by at least 4 inches (10.2 cm).

Connect continuous foundation drainage systems to the storm drainage system.

Test or check lines before backfilling to confirm free flow. Remove obstructions, replace damaged components, and retest the system until satisfactory. After testing drain lines, place additional filtering material to a 4 inch (10.2 cm) depth around the sides and top of drains. Coordinate the placement of drainage mats with other foundation drainage materials. Do not use drainage mat as protection board for waterproof membrane unless otherwise approved by the membrane manufacturer. Use adhesives and mechanical fasteners as recommended by the matting manufacturer. Lap edges of fabric and extend the fabric around the foundation drainage pipe in accordance with the mat manufacturer's recommendations. Protect in-place matting during backfill operations in accordance with the matting manufacturer's instruction

Backfill to Grade. Place backfill material over the compacted gravel fill at footing drains, placing material in lifts not exceeding 6 inches (15.2 cm) in loose depth and thoroughly compacting each lift. Carry backfilling to the indicated finish elevations sloping it away from the building perimeter.

3.4 FIELD QUALITY CONTROL. Request inspection prior to placing aggregate cover over pipe. Where required, adjust the top elevation of existing manholes and drainage structures to suit finished grades shown on the Contract Drawing.

Reset existing frames, grates and covers, carefully removed, cleaned of all mortar fragments, to the required elevation in accordance with the requirements specified for installation of castings. Remove the concrete so as not to damage the existing vertical reinforcing bars when removal of an existing concrete wall is required. The vertical bars shall be cleaned of all concrete and bent into the new concrete top slab or spliced to required vertical reinforcement, as shown on the Contract Drawings.

3.5 MAINTENANCE.

3.5.01 Protection. Protect pipe and aggregate cover from damage or displacement until backfilling operation is in progress. Take care not to damage or displace installed pipe and joints during construction of pipe supports, backfilling, testing, and other operations. Where pipe is damaged or displaced, take remedial measures as directed by the Engineer, including but not limited to, retesting of joints, relaying pipe or replacing pipe. Provide remedial measures at no additional cost to the Owner.

End of Section

SECTION 02675

DISINFECTION OF WATER DISTRIBUTION SYSTEM

PART 1 - GENERAL

1.1 SCOPE. This section covers the cleaning and disinfection of new water pipelines and associated appurtenances. Pressure and leakage testing shall be completed before cleaning and disinfection of new water pipes is started.

1.2 GENERAL. The Contractor shall provide the necessary apparatus for making chlorine residual tests by the drop dilution method as set forth in Appendix A of America Waterworks Association (AWWA) C651. Chlorine residual tests will be performed by the Contractor.

The Owner will perform bacteriological tests on the water lines after the disinfection is completed. Should the bacteriological tests indicate the presence of coliform organisms at any sampling point, the pipe shall be reflushed, resampled, and retested. If check samples show the presence of coliform organisms, then the main shall be rechlorinated until results acceptable to the Engineer are obtained. The Contractor shall be available to assist the Owner as required.

1.2.01 Coordination. The Contractor shall coordinate flushing work with adjacent work as necessary to preclude work interference or duplication of effort and to expedite the overall progress of the work. Water required for flushing, cleaning and disinfection work will be provided by the Owner.

1.2.02 Governing Standards**.** All disinfection work shall conform to the requirements of ANSI/AWWA C651. All disinfection work shall conform to the requirements of the Michigan Department of Environmental Quality. If any State requirements conflict with the provision of this Section, the State requirements shall govern. All Specifications are to be the Current Edition

AWWA (American Water Works Association), B300 – Standard for Hypochlorites.

AWWA B301 – Standard for Liquid Chlorine.

AWWA C600 – Installation of Ductile-Iron Water Mains and Their Appurtenances.

AWWA C651 – Standards for Disinfecting Water Mains.

1.3 QUALITY ASSURANCE. Perform Work in accordance with AWWA C651. All Specifications are to be the Current Edition

1.3.01 Contractor Qualifications. Contractor shall be a water treatment firm specializing in disinfecting potable water systems specified in this section with a minimum of 5 years documented experience.

The testing firm shall be a company specializing in testing potable water systems, certified by the State of Michigan. Submit bacteriologist's signature and authority associated with testing. Maintain one copy of each document on site.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. The Contractor shall submit a detailed cleaning and disinfection plan. The plan shall cover the methods and procedure proposed, proposed chemicals, and treatment levels to include coordination, sequence of operations, equipment to be used, the manner of filling and flushing of lines, and the neutralization and disposal of wasted water.

1.4.02 Certification. Certify that cleanliness of water distribution system meets or exceeds specified requirements.

1.4.03 Test Reports. Indicate results comparative to specified requirements. Submit Disinfection Reports for each disinfection event showing type and form of disinfectant used; date and time of disinfectant injection start and time of completion; test locations; name of person collecting samples; initial and 24 hour disinfectant residuals (quantity in treated water) in ppm for each outlet tested; date and time of flushing start and completion; disinfectant residual after flushing in ppm for each outlet tested.

Bacteriological Reports for each test by the Owner will include data on date issued, project name, and testing laboratory name, address, and telephone number; time and date of water sample collection; name of person collecting samples; test locations; initial and 24 hour disinfectant residuals in ppm for each outlet tested; coliform bacteria test results for each outlet tested; certification that water conforms, or fails to conform, to bacterial standards.

PART 2 – PRODUCTS

2.1 MATERIALS. The Contractor shall provide all necessary piping connections, temporary valves, sampling taps, pumps, disinfectant, neutralization agents, chlorine residual test apparatus, and all other items of equipment or facilities required to complete the cleaning disinfection work. Disinfection chemicals shall comply with AWWA B300, Hypochlorite.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that piping system has been cleaned, inspected, and pressure tested.

Perform disinfecting activity after pressure testing, and coordinate work with related systems as required.

3.2 PERFORMANCE.

3.2.01 Cleaning. All potable water lines installed under this contract, including all associated valves and fittings, shall be flushed or cleaned to the satisfaction of the Engineer.

Small pipelines shall be flushed with water at the maximum velocity, which can be developed, but not less than 2.5 feet (0.75 m) per second, unless otherwise permitted by the Engineer. Flushing shall be accomplished through the installed valves or fittings, or through corporation cocks furnished and installed for that purpose.

Pipelines may be flushed as specified, cleaned with a hose, or by other methods acceptable to the Engineer.

Pumps shall be used if required to obtain the necessary volume or velocity of water. Pumping equipment installed under this contract shall not be used for flushing, nor shall the flushing water be passed through them. Temporary bypass piping at each pump shall be provided.

Whenever practical, tests shall be made on sections between valves or sections not exceeding 2000 feet (600 m) in length. Dead ends, bends by hydrants and other fitting shall have a firm foundation and be securely blocked against the trench walls before testing takes place.

3.2.02 Disinfection Procedure**.** The new water lines shall be disinfected in accordance with AWWA C651 by the continuous feed method, slug method, or the tablet method for at least 24 hours. Unless otherwise permitted, the chlorination agent consisting of liquid chlorine, sodium hypochlorite, or calcium hypochlorite shall be injected into the water line at the supply end of each new line or valve section thereof through a corporation cock installed in the top of the pipe. See Table 1 for the dose of chlorine as stated by AWWA C651.

Table 1: Chlorine required to produce 25-mg/L (ppm) concentration in 100 ft (30.5 m) of pipe by diameter.

Pipe Diameter		100 percent Chlorine		1 percent Chlorine Solution	
Inch	*(mm)*	*lb*	*(g)*	*gal*	*(l)*
4	(100)	.013	(5.9)	.16	(0.6)
6	(150)	.030	(13.6)	.36	(1.4)
8	(200)	.054	(24.5)	.65	(2.5)
10	(250)	.085	(38.6)	1.02	(3.9)
12	(300)	.120	(54.4)	1.44	(5.4)
16	(400)	.217	(98.4)	2.60	(9.8)
60	(1500)	2.827	(1281.6)	36.75	(139.1)
72	(1800)	4.07	(1845.1)	52.93	(200.4)

Admission of disinfectant solution into or the flushing thereof through existing mains shall be held to the minimum possible, and then only after proper and adequate measures have been taken to effectively prevent any such solution from entering other areas of the water system. Existing mains which could have been contaminated during work requiring connections to the new water line, involving either tapping or cutting into operations, shall be flushed and disinfected in accordance with Section 9 of AWWA C651.

During disinfection, all valves and hydrants shall be operated to ensure that all appurtenances are disinfected. Valves shall be manipulated in such a manner that the strong chlorine solution in the line being chlorinated will not flow back into the supply line. Check valves shall be used if required.

Flush circulate and clean new water lines until required cleanliness is achieved in accordance with Section 9 of AWWA C651. All chlorinated water discharged to drainage courses shall be neutralized by dilution or chemical treatment. The chlorine residual of wasted water shall not to exceed 4 mg/l (ppm). The manner, disposal point, and rate of discharge shall be acceptable to the Engineer.

3.2.03 Flushing and Sampling. Upon completion of the retention period required for disinfection, flush the pipeline until the chlorine concentration of water leaving the pipeline is no higher than that generally prevailing in the existing system or is acceptable for domestic use.

Dispose of the chlorinated water in conformance with all Federal, State and Municipal laws, ordinances, rules, and regulations. If there is any possibility that the chlorinated discharge will cause damage to the environment, then a neutralizing chemical shall be applied to the chlorinated water to neutralize thoroughly the chlorine residual remaining in the water.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Testing. After final flushing and before the pipeline is connected to the existing system, or placed in service, the Contractor shall employ an approved independent testing laboratory to sample, test and certify the water for conformance with the purity standards of the City of Detroit, the United States Environmental Protection Agency, and the Federal Clean Water Act Health Standards. The Engineer shall be furnished with a copy of such certification by the testing laboratory, and no installation will be approved without such certification.

The Owner may at its discretion, independently perform bacteriological tests on the water lines and the test results shall be binding on the Contractor.

End of Section

SECTION 02676

LEAKAGE TESTS

PART 1 - GENERAL

1.1 SCOPE

The section includes testing for any signs of leakage in all pipelines and structures required to be watertight. Test all other pipelines with water under 250 psi.

Conduct all tests in a manner to minimize as much as possible any interference with the day-to-day operations of existing facilities or other contractors working on the site.

1.2 GENERAL

1.2.01 Related Sections. Related Work specified in other Sections includes:

Section 02620 – Water Main Services
Section 02617 - Steel Water Pipe
Section 15020 – Miscellaneous Piping and Accessories Installation

1.2.02 Governing Standards. Codes and standards referred to in this Section are:

AWWA C 600 - Installation of Ductile-Iron Water Mains

1.3 QUALITY ASSURANCE

1.3.01 Performance Requirements. Provide written notice when the work is ready for testing, and make the tests as soon thereafter as possible.

Personnel for reading meters, gauges, or other measuring devices, will be furnished.

Furnish all other labor, equipment, air, water and materials, including meters, gauges, isolation valves, piping, fittings, blind flanges, smoke producers, blower, pumps, compressors, fuel, water, bulkheads and accessory equipment.

1.4 SUBMITTALS

Provide all submittals as specified in Division 1.

Prior to placing the piping systems in service submit for review and approval a detailed bound report summarizing the leakage test data, describing the test procedure and showing the calculations on which the leakage test data is based.

PART 2 - PRODUCTS

NOT USED

PART 3 - EXECUTION

3.1 INSPECTION.

Pressure test exposed pipelines for leakage by maintaining the fluid in the pipe at the specified pressure for a period of 60 minutes. Examine all accessible joints during the test. Stop all visible leakage. Test the various pipelines at the test pressures specified.

3.2 VALVES.

Operate valves in the section under test through several complete cycles of closing and opening. In addition, have the test pressure for each valve, when in the closed position, applied to one side of the valve only. Test each end of the valve in this manner.

Test each valve at the same test pressure as that specified for the pipe in which the valve is installed.

Stop all external and internal leakage through the valves.

3.3 REPAIR OF PIPING LEAKS.

3.3.01 Procedures. Repair leaks as follows:

1. Replace broken pipe or joint assemblies found to leak.

2. When leakage occurs in excess of the specified amount, locate and repair defective valves, pipe, cleanouts or joints.

3. If the excess leakage is determined to be caused by defective materials furnished, improper workmanship, or damage to the materials, make the necessary repairs or replacements at no addition to the Contract Price.

4. If defective portions cannot be located, remove and reconstruct as much of the original work as necessary to obtain piping that meets the leakage requirements specified herein and retest, all at no addition to the Contract

Price.

End of Section

SECTION 02730

AGGREGATE BASE AND SURFACE COURSE

PART 1 - GENERAL

1.1 SCOPE. Section includes aggregate base course, aggregate surface course and aggregate shoulder.

1.2 GENERAL.

1.2.01 Governing Standards.

AASHTO (American Association of State Highway and Transportation Officials) M147 – Materials for Aggregate and Soil-aggregate.

AASHTO T180 – Moisture-density Relations of Soils Using a 10 Pound (4.54 kg) Rammer and an 18 inch (45.7 cm) Drop.

ASTM (American Society for Testing Materials) C136 – Test Method for Sieve Analysis of Fine and Coarse Aggregates.

ASTM D1557 – Test method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft – lbf/ft^3 (2,700 kN – m/m^3)).

ASTM D2487 – Classification of Soils for Engineering Purposes (Unified Soil Classification System).

ASTM D2922 – Test Methods for Density of Soil and Soil-aggregate in Place by Nuclear Methods (Shallow Depth).

ASTM D3017 – Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).

ASTM D4318 - Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.

MDOT (Michigan Department of Transportation) Standard Specifications for Construction.

1.3 QUALITY ASSURANCE. Perform work in accordance with current edition of MDOT Standard Specifications for Construction, except where modified herein.

1.4 SUBMITTALS.

1.4.01 Samples. Submit, in air-tight containers, 5 lb (2.27 kg) sample of each type of material to testing laboratory. Wherever materials proposed have MDOT designated classifications, submit a certificate of conformance with applicable MDOT specifications for each type of material to be furnished.

1.4.02 Materials Source. Submit name of imported materials suppliers.

PART 2 – PRODUCTS

2.1 MATERIALS.

2.1.01 Aggregate. The coarse aggregate for base course, surface course, or shoulders, may consist of gravel, stone or slag, generally conforming to MDOT Series 21AA, 22A, and 23A, and as modified below.

Stone material shall be crushed rock, crushed boulders, crushed stone, or crushed gravel, and shall consist of angular fragments of hard, durable particles. When gravel is used in the production of stone, all materials before crushing shall be retained on a sieve ½ inch (1.3 cm) larger than the maximum size permitted in the crushed product. The material shall be 100 percent crushed; that is each particle shall have a minimum of one fractured surface. The aggregate shall be reasonably free of clay lumps and other foreign matter.

Crushed slag shall consist of clean, tough, angular fragments of air cooled blast furnace slag, reasonably uniform in density and quality and reasonably free from glassy pieces, coke, dirt, or other objectionable matter. The slag shall weigh no less than 75 pounds per cubic foot (1201.4 kg per cubic meter) dry rodded.

For aggregate bases to be surfaced with bituminous mixtures, Aggregate 21AA shall be used unless otherwise indicated on the Drawings.

PART 3 – EXECUTION

3.1 INSPECTION. Verify substrate has been inspected, gradients and elevations are correct, and is dry. No aggregate shall be placed until substrate has been approved by Engineer.

3.2 PREPARATION. Correct irregularities in substrate gradient and elevation by scarifying, reshaping, and re-compacting. Unsuitable substrate material shall be excavated to firm soil and replaced with suitable fill when requested by the Engineer. Unless otherwise indicated, suitable fill shall be a type which can be compacted to the density specified, and shall be free from rubbish or debris, vegetable matter, frozen lumps, boulders, large stones, concrete fragments, or other road material, lumber, tree roots, or branches. Blue clay shall not be considered suitable backfill material. Do not place fill on soft, muddy, or frozen surfaces.

3.3 INSTALLATION.

3.3.01 Aggregate Placement. Place aggregate in conformance with Master Specification Section 02730, Base and Surface Aggregation Course and applicable MDOT Standard Specifications for Construction.

3.3.02 Backfill. Excavated earth materials suitable for backfilling behind the aggregate base course, surface course or shoulder shall be deposited and spread in not more than 8 inch (20.3 cm) layers, loose measure, or as directed by the Engineer. Compaction shall be by pneumatic or vibratory type compactors, or other approved methods.

3.3.03 Tolerances. Plus or minus ¾ inch (1.9 cm) from plan dimensions per MDOT Standard Specifications for Construction.

3.4 FIELD QUALITY CONTROL. Compaction testing will be performed in accordance with Section on Roadway Earthwork of the MDOT Standard Specifications for Construction. If tests indicate Work does not meet specified requirements, remove Work, replace and retest.

3.5 MAINTENANCE. Completed aggregate base course, surface course and shoulder shall be maintained with grades in a smooth, compacted condition, substantially true to line, grade and cross-section until surface treatment is applied, or the surface is accepted.

End of Section

SECTION 02740

BITUMINOUS PAVING

PART 1 - GENERAL

1.1 SCOPE. Section includes bituminous concrete paving, wearing, leveling or base course, bituminous curbs, and surface sealer.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C40 (American Society for Testing and Materials) – Test Method for Organic Impurities in Fine Aggregates for Concrete.

ASTM C136 Test Method for Sieve Analysis of Fine and Coarse Aggregates.

ASTM C311 – Test Methods for Sampling and Testing Fly Ash or Natural Pozzolans for Use as a Mineral Admixture in Portland Cement Concrete.

ASTM D88 – Test Method for Saybolt Viscosity.

ASTM D95 – Test Method for Water in Petroleum Products and Bituminous Materials by Distillation.

ASTM D139 – Test method for float test for bituminous materials.

ASTM D244 – Test Methods for Emulsified Asphalts.

ASTM D946 – Penetration-Graded Asphalt Cement for Use in Pavement Construction.

ASTM D692 – Coarse Aggregate for Bituminous Paving Mixtures.

ASTM D1073 – Fine aggregate for bituminous paving mixtures.

ASTM D3381 – Viscosity-Graded Asphalt Cement for Use in Pavement Construction.

AASHTO T2 (American Association of State Highway and Transportation Officials) - Saybolt Viscocity.

AASHTO T10 – Spot Test of Asphaltic Materials.

AASHTO T164 – Quantitative Extraction of Bitumen from Bituminous Paving Mixtures.

1996 MDOT Standard Specifications for Construction.

1999 Standard Specifications for Paving and Related Construction, City of Detroit.

1.3 QUALITY ASSURANCE. Perform work in accordance with 1996 MDOT Standard Specifications for Construction, except as modified herein. Obtain materials from same source throughout.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit product information and mix design.

1.4.02 Certifications. Furnish a copy of certification of analysis by the source of all asphalt and aggregate materials before use.

1.4.03 Test Reports. Tests shall be made on bituminous materials by an independent testing laboratory and results of the test furnished to the Engineer for each 1,000 tons of material delivered or as the Engineer may require. Aggregates, not from an MDOT approved supplier, meeting requirements according to test results by an independent testing laboratory, may be used when approved by the Engineer.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Asphalt Cement. In accordance with MDOT Standard Specifications for Construction Section on Bituminous Pavements and Surface Treatment.

2.1.02 Aggregate for Base Course Mix. In accordance with MDOT Standard Specifications for Construction Section on Bituminous Pavements and Surface Treatment..

2.1.03 Aggregate for Leveling Course Mix. In accordance with MDOT Standard Specifications for Construction Section on Bituminous Pavements and Surface Treatment.

2.1.04 Aggregate for Wearing Course Mix. In accordance with MDOT Standard Specifications for Construction Section on Bituminous Pavements and Surface Treatment.

2.1.05 Bituminous Curb Materials. In accordance with MDOT Standard Specifications for Construction Section on Bituminous.

2.1.06 Fine Aggregate. In accordance with MDOT Standard Specifications for Construction Section on Aggregates.

2.1.07 Mineral Filler. In accordance with MDOT Standard Specifications for Construction Section on Aggregates.

2.1.08 Emulsified Asphalt. Emulsified asphalt for bond or top coat shall form to the specific requirements of MDOT Section on Asphaltic Materials for rapid setting anionic asphalt emulsion “SS-1h”.

2.2 PROPORTIONING.

2.2.01 Asphalt Paving Mix. Provide paving mix for each required layer of pavement and bituminous curb in accordance with the current MDOT Standard Specifications for Construction unless indicated otherwise on the drawings.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that compacted granular base is dry and ready to support paving and imposed loads. Verify gradients and elevations of base are correct.

3.2 PREPARATION.

3.2.01 Cleaning Existing Pavement. Before placing bituminous mixture, the existing pavement surface, joints, and cracks shall be thoroughly cleaned of all dirt and debris by compressed air or by the use of mechanical sweepers or hand brooms to permit examination of the existing surface for defects which need to be corrected.

The Contractor shall not place any resurfacing mixture until the condition of the pavement to be resurfaced has been inspected by the Engineer and approved for resurfacing.

The existing surface, including any repaired area and surface treatment subsequently applied, shall be thoroughly clean at anytime any surface treatment is applied, regardless of any previous cleaning.

3.2.02 Cleaning of Alleys. In addition to the cleaning required for resurfacing above, cleaning of alleys shall also include the removal of any loose refuse and/or garbage from the alley and relocating any trash receptacles that are within the resurfacing area.

Also included is the trimming back of any bushes or tree branches that would impede the asphalting operations.

3.2.03 Conditioning. Conditioning existing pavement includes joint and crack cleanout, jointed crack repair, removing bituminous patches and other work specified herein.

When called for on the plans, or as directed by the Engineer, clean joints and cracks by clean joints and cracks by removing joint sealants to a depth of up to one inch (2.5 cm) from transverse and longitudinal joints and from cracks by mechanical or hand methods.

Repair joints and cracks in accordance with the details shown on the plans.

Remove all “cold patched” areas designated by the Engineer, to the full depth of the bituminous surface. The edges of such areas shall be trimmed to a fairly vertical face and then lightly painted with asphalt emulsion SS1-h. The areas shall be filled with hot binder course mixture brought to a compacted level of the abutting old surface by rolling.

Prior to placing any bituminous concrete surfacing, the existing pavement which is to be used as a base course shall be prepared in accordance with the following procedure: All broken surfacing not bounded to the pavement or to other bituminous surfacing, including badly cracked or patched areas, which in the opinion of the Engineer, may cause instability or bleeding, shall be removed. The edges of such areas shall be trimmed to a fairly vertical face. All random cracks 1 inch (2.54 cm) or more in width shall be cleaned. Deteriorated surface adjacent to any random crack shall be removed. On pavement not previously surfaced, joints and cracks 1 inch (2.54 cm) or more in width shall be cleaned of any filler, sealer or foreign materials to a depth of at least one inch (2.54 cm) below the pavement surface or as directed by the Engineer. The removal of bituminous concrete surface either by the standard or planer method shall be performed as directed by the Engineer.

All underlying loose, deteriorated concrete base shall be removed by thorough sweeping with a power broom, compressed air jet, air hydraulic tools or other means approved by the Engineer. All existing or resulting holes, ruts, cracks, and depressions in the existing concrete pavement or bituminous concrete pavement surface shall be swept or blown clean of dust, dirt or other loose material, and the resulting areas sprayed with bond coat material and completely refilled with bituminous mixture as directed by the Engineer. The mixture shall be thoroughly compacted by mechanical tamping or rolling. All areas cleaned during the day shall be patched and repaired as specified above by the end of the day’s work.
The bituminous mixtures required for filling of holes and areas where deteriorated bituminous material has been removed shall be as directed by the Engineer and will be selected from the mixtures specified in the MDOT Standard Specifications for

Construction Section on Bituminous Pavements and Surface Treatments. The mixture selected by the Engineer will be dependent on the depth and size of the patch and the type of mixture and penetration grade of the asphalt cement required for the project. The patches shall be compacted to the required grade by use of machine vibrator or approved roller.

Place leveling or wedge courses of binder material to bring the existing surface to a uniform contour, where indicated, machine placed and rolled in layers as directed by the Engineer.

3.2.04 Stripping of Existing Asphalt Surface. Where the existing asphalt surface is shattered, broken, or not properly bonded to the concrete base to such an extent that it provides an unsuitable foundation, or it is necessary to remove the old surface to provide a proper grade and crown, it shall be stripped and removed to the extent directed by the Engineer. Any existing bituminous patch which, in the judgement of the Engineer, may cause instability of the final wearing course shall likewise be removed.

The inspector and the Contractor's representative shall measure the pavement stripped, and this shall be summarized on a report, showing the size and location of the various areas. This measurement shall be taken before the application of the resurfacing materials.

In the areas to be stripped, the material shall be loosened with air hammers and the perimeter of the stripped area cleaned and shaped with hand tools.

3.2.05 Strip and Adjust Asphalt Surface. Stripping and adjusting asphalt surface consists of the stripping of the existing asphalt surface to the base pavement, adjusting the existing base pavement so that it serves as a satisfactory foundation for the rebuilt asphalt, and furnishing and applying the bond coat, binder course mixture and the wearing surface mixture.

3.2.06 Concrete Base Removal and Replacement. Loose or disintegrated concrete 9in the exposed pavement base shall be removed to the extent deemed necessary by the Engineer. The means and methods used shall be such as to not damage or loosen adjacent pavement areas. The edges of existing concrete left in place shall be so cut and shaped that proper bond may be obtained between the old and new concrete. The existing concrete shall be properly wetted prior to the placement of the new replacement concrete.

The space left by the removal of the existing concrete shall be filled with Grade A (4000 psi (27,579.2 kPa) concrete, thoroughly compacted and brought up to conform to the required grade and contour of the underside of the new binder course mixture. The poured concrete shall be protected until it has developed sufficient strength to prevent damage from application of the new surfacing materials or other causes.

3.2.07 Fills. Depression or voids in the pavement sub-base and around manholes that are being adjusted shall be filled with Grade C (2000 psi (13,289.6 kPa) concrete or compacted granular material, as directed by the Engineer. Isolated fills requiring less than ½ cubic yard (0.38 cu m) of fill material shall be made without additional cost to the Owner. Fills of ½ cubit yard (0.4 cu m) or more, when required by the Engineer, will be paid for as extra work.

3.2.08 Preparation Of Existing Pavement. Preparation of existing pavement includes butt joint cutting, chipping concrete pavement for joints and resetting frames of manholes, catch basins and boxes.

Connections with the existing surfaces at the beginning and end of resurfacing sections and at intersections with other pavement shall be made by cutting the old pavement surface to give a butt joint to a depth equal to the thickness of the proposed overlay. The old surface shall be cut back not less than 3 feet (91.44 cm) the full width of the joint.

When a butt joint is specified, the existing concrete surface shall be tapered back to a minimum of 30 feet (9 m) or as shown on the plans to a depth of a least 1-1/2 inches (40 mm), for the full width of the joint.

Existing manholes, catch basins, stop boxes, survey control monuments boxes, etc., shall be raised where necessary so that their exposed areas will be flush with the finished new wearing surface. For one-course pavement resurfacing, existing catch basins shall be reset only when so directed by the Engineer. Resetting of manholes, catch basins, and stop boxes shall be done after placing of the binder course.

A sufficient amount of the adjacent existing pavement surface shall first be removed to permit removal of a casting without damage. Any casting damaged by the Contractor in removal or resetting shall be replaced by him with a new casting without additional cost to the Owner. Any existing casting or stop box which is in a damaged condition prior to the Contractor's operations and which, in the judgement of the Engineer, is not suitable for resetting shall be replaced.

Castings shall be supported at the new elevations on collars of Grade A concrete or brick masonry so formed and constructed as to hold the casting firmly and permanently in place, except as follows. Where an existing manhole or catch basin of a type not requiring replacement is securely embedded in the existing pavement and needs only to be raised to the new surface grade, an adaptor shall be used when so directed by the Engineer. Manhole adaptors shall be in accordance with the Standard Plans and catch basin adaptors with the Standard Plans. Stop boxes shall not be raised by means of a metal collar ring.

For a catch basin of an obsolete type, such as the so-called Stuart basin having metal back plate requiring removal and discarding in order to raise the casting proper, the destroyed curb area back of the metal plate shall be replaced with Grade A concrete, finished to conform with the surface of the adjacent curbing.

All holes in the existing pavement around the reset castings shall be filled by using an applicable method as approved by the Engineer.

3.2.09 Rebuilt and Semi-Rebuilt Catch Basin. Catch basins requiring rebuilding, as determined by the Engineer, shall be completely rebuilt in accordance with the Standard Plans.

Catch basins requiring semi-rebuilding only, as determined by the Engineer, shall be rebuilt in accordance with the Standard Plans. Such semi-rebuilding shall consists of rebuilding no more than the top pipe section or 6 to 9 courses of brick.

3.2.10 Abandoned Streetcar Tracks. Existing streetcar tracks shall be removed and the area filled in and covered by resurfacing materials unless otherwise specified.

The track drain frames and covers shall be removed and disposed of by the Contractor. The manhole frames and covers on “dead” manholes shall likewise be removed and disposed of by the Contractor. Care shall be taken to determine if the particular manhole is “dead” or is still in use.

All abandoned manholes and track drains shall be cleaned out, the inlets and outlets plugged with concrete, and the manhole backfilled in the same manner as specified for a sewer trench, or the manhole completely filled with Grade “C” concrete.

3.2.11 Removing Bituminous Surface. This applies to the removal of the bituminous surface, regardless of thickness or width, where it overlies a base course that is to remain in place, and includes the construction of butt joints.

The bituminous surface shall be removed to the depth, width, grade, and cross-section as shown on the plans, or as directed by the Engineer.

Where material is removed below the grade specified due to poor cold-milling practice, the resultant holes or depressions shall be backfilled and compacted. Such work shall be at the expense of the Contractor.

The material which is picked up by sweeping after cold-milling shall not be incorporated in the bituminous mixture nor used as fill.

If the material removed from the pavement is not salvaged for use in recycled mixture for the project, or a subsequent project, the Contractor shall dispose of the material in accordance with Division 1, section on Contract Closeout and Cleaning.

Where it is desirable in the opinion of the Engineer to remove the existing pavement surface to provide a better grade, the existing surface shall be removed by means of a power operated planing machine or grinder capable of removing a layer of material 6 feet (1.8 meters) in width and 2 inches (5.1 cm) in depth.

The equipment shall be capable of accurately establishing profile grades by referencing from either the existing pavement or from an independent grade control, and shall also have an effective means for removing excess material from the surface while preventing any dust resulting from the operation from escaping into the air.

If the grinder cannot remove the material to the curb face, the method of removing the material adjacent to the curb face shall be approved by the Engineer. Any excess bituminous material removed shall be replaced and any damage to the existing curb shall be repaired by the Contractor at no cost to the project. In no case shall the use of a grader, front end loader, or bulldozer, be allowed to clean the remaining material to the curb face.

The bituminous surface shall be removed to a depth of 2 inches (5.1 cm) at the gutter tapering to zero depth at 6 feet (1.8 m), or as shown on the plans as directed by the Engineer. Removal in the vicinity of bridges and/or viaducts shall be uniform 2 inches (5.1 cm) depth from curb to curb commencing approximately100 feet (30 m) from either side of the structure. On streets designated for curb to curb removal, bituminous surface shall be removed to a uniform depth from curb to curb, as directed by the Engineer. The bituminous surface at all intersections shall be removed where necessary to form a smooth transition between abutting existing pavement and the proposed pavement. Excess material resulting from the operation shall be removed immediately as the work progresses and disposed of in an approved manner. Accumulations of material which might interfere with drainage or might constitute a hazard to traffic will not be permitted.

Prior to milling, the Contractor may lower all existing castings of manholes, water gates, stop boxes and other miscellaneous castings in the area of pavement milling. The lowering shall be to the depth of the proposed milling but in no case shall exceed one inch (2.5 cm) more than the depth of the proposed milling.

A sufficient amount of adjacent existing pavement, not to exceed a maximum of 12 inches (30.5 cm) beyond the visible outline of casting, shall first be removed to permit removal of the casting without damage. Any casting damaged by the Contractor in removing pavement or lowering shall be replaced by him with a new casting at no additional cost to the Owner.

The method used by the Contractor to remove the adjacent existing pavement around the castings shall be approved by the Engineer.

Chipping and cleaning around the existing catch basins shall be completed immediately after the milling operation.

All catch basins and manholes within the milling area shall be covered by an acceptable method, prior to the milling operation, to prevent any of the milling material from entering the structures. Any of the milling material that falls into the catch basins or manholes shall be removed by the Contractor without additional cost to the Owner.

All depressions in the existing pavement resulting from the lowering off the castings shall be filled with cold patch material. With the approval of the Engineer, cold patching may be eliminated if the milling operation follows immediately after lowering the castings, in either case, the streets shall be left in a safe condition for traffic.

If the Contractor exercises the option or lowering, castings prior to milling, no additional compensation will be allowed for any of the work or materials used in the lowering of the castings or in adjusting the castings to the finished elevations.

3.2.12 Application. The prepared surface shall be treated with a bituminous bond coat. Apply bond coat to prepared surface in accordance with the MDOT Standard Specifications for Construction at an application not between 0.10 and 0.15 gallons per square yard (0.45 and 0.68 liters per square meter). No bond coat shall be applied on wet or moist base and no pools of bituminous material shall be allowed to remain on the surface. Distributors shall be equipped with approved temperature and volume indicators and quick shut-off spray bars to avoid dripping.

3.3 INSTALLATION.

3.3.01 Bituminous Base Course Placement. The base course shall be constructed only on a clean foundation in accordance with the MDOT Standard Specifications for Construction unless otherwise indicated on the drawing. The mixture shall be delivered and placed at a temperature between 275 degrees F (13.5 degrees C) and 325 degrees F (162.8 degrees C). It shall be dumped into a mechanical spreading machine which shall strike off and screed the mixture in layers not to exceed 3 inches (7.62 cm) or as called for on the drawings. Spreading shall start at the sides and progress to the center in strips of uniform width.

3.3.02 Bituminous Leveling Course Placement. The leveling course shall be constructed only on a clean foundation in accordance with the MDOT Standard Specifications for Construction unless otherwise indicated on the drawing. The mixture shall be delivered and placed at a temperature between 275 degrees F (135 degrees C) and 325 degrees F(162.8 degrees C). It shall be dumped into a mechanical spreading machine which shall strike off and screed the mixture in layers not to exceed 3 inches (7.62 cm) or as called for on the drawings. Spreading shall start at the sides and progress to the center in strips of uniform width.

3.3.03 Bituminous Wearing Course Placement. The wearing course shall be constructed only on a clean foundation after preparation or on completed binder course in accordance with the MDOT Standard Specifications for Construction, unless otherwise indicated on the drawings. It shall be constructed in the same manner as leveling course and the thickness shall be as shown on the drawings.

The wearing surface shall be feathered to provide a transition between existing and new surfaces at all intersections and/or limits of resurfacing projects.

The wearing surface shall have a minimum thickness of 1 ½ inches (3.8 cm). Where the minimum thickness of 1 ½ inches (3.8 cm) cannot be maintained, the existing surface shall be milled to permit the placing of a minimum of 1 ½ inches (3.8 cm) of wearing surface.

3.3.04 Smoothness Requirements. After final rolling, the surface may be tested longitudinally by the Engineer using a straightedge at selected locations. Use MDOT Materials Testing Manual Protocol 722 to determine locations. Variations in the surface shall not exceed the current MDOT Standard Specifications for Construction.

For Bituminous Base Course Mixtures:

Lower Courses: 0.8 inches (20 mm)
Top Course: 0.4 inches (10 mm)

For Leveling and Top Course Mixtures:

Multiple Course Construction:	0.125 inches (3 mm) for top course
	0.25 inches (6 mm) for lower courses
Single Course Construction:	0.25 inches (6 mm)

3.3.05 Bituminous Curb Placement. Bituminous curb shall be placed using a bituminous curbing machine.

3.3.06 Protection. Immediately after placement, protect pavement from mechanical injury for 24 hours.

3.3.07 Backfilling. When the area behind the curb is to be backfilled, the backfilling shall not commence until the mixture has been allowed to cure for approximately 24 hours, unless otherwise approved by the Engineer. The backfill material shall be placed and thoroughly tamped and compacted to the satisfaction of the Engineer, without disturbing the curb, and shall be left in a neat condition.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. Perform field density testing and extract cores for testing in accordance with the MDOT Standard Specifications for Construction.

End of Section

SECTION 02750

CONCRETE PAVEMENT

PART 1 – GENERAL

1.1 SCOPE**.** This work shall consist of furnishing and constructing a jointed Portland cement concrete pavement, alley pavement, concrete base course or concrete shoulder, with or without reinforcement, as shown on the plans or as directed by the Engineer. The work also includes curbs, curb and gutter, and integral curb and sidewalk. This work shall be done in accordance with sections 4.50, 4.52 and 6.09 of the 1990 Michigan Department of Transportation (MDOT) Standard Specifications for Construction, and as specified in the Standards of the County, City or Township having jurisdictional authority, as well as the 1999 Standard Specifications for Paving and Related Construction for the City of Detroit, Department of Public Works, City Engineering Division. The types of concrete paving will be as classified in Section 4.50.02 of the current MDOT Standard Specifications for Construction.

1.2 GENERAL.

1.2.01 Governing Standards.

AASHTO (American Association of State Highway and Transportation Officials) M33 as Revised – Preformed Expansion Joint Filler for Concrete (Bituminous Type).

AASHTO M213 as Revised - Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Types).

AASHTO T26 as Revised - Standard Method of Test for Quality of Water to be Used in Concrete.

AASHTO T96 as Revised - Resistance to Abrasion of Small Size Coarse Aggregate by use of the Los Angeles Machine.

ACI 301 (American Concrete Institute) – Specifications for Structural Concrete for Buildings.

ACI 304 – Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete.

ASTM (American Society for Testing and Methods) A185 – Steel Welded Wire Fabric, Plain for Concrete Reinforcement.

ASTM A497 – Steel Welded Wire Fabric, Deformed for Concrete Reinforcement.

ASTM A615/A615M – Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM C31/C31M – Practice for Making and Curing Concrete Test Specimens in the Field.

ASTM C33 – Concrete Aggregates.

ASTM C39/C39M – Test Method for Compressive Strength of Cylindrical Concrete Specimens.

ASTM C42/C42M – Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete.

ASTM C94/C94M – Ready-Mixed Concrete.

ASTM C136 – Test Method for Sieve Analysis of Fine and Coarse Aggregates.

ASTM C143/C143M – Test Method for Slump of Hydraulic Cement Concrete.

ASTM C150 – Portland Cement.

ASTM C172 – Practice for Sampling Freshly Mixed Concrete.

ASTM C173 – Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method.

ASTM C174/C174M - Test Method for Measuring Thickness of Concrete Elements Using Drilled Concrete Cores.

ASTM C231 – Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.

ASTM C260 – Air-Entraining Admixtures for Concrete.

ASTM C309 – Liquid Membrane – Forming Compounds for Curing Concrete.

ASTM C494 –Chemical Admixtures for Concrete

.

ASTM C595 – Blended Hydraulic Cements.

ASTM C666 – Test Method for Resistance of Concrete to Rapid Freezing and Thawing.

ASTM D98 – Calcium Chloride.

ASTM D1751 – Preformed Expansion Joint Filler for Concrete Paving and Structural Construction.

ASTM D1752 – Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction.

Fed. Spec SS-S-164 Sealing Compound, Hot Poured Type, for Joints in Concrete.

1.3 QUALITY ASSURANCE. Perform work in accordance with 1990 MDOT Standard Specifications for Construction Sections 2.08, 6.09 and 6.11 and as specified in the standards of the County, City and Township having jurisdiction as well as the 1999 Standard Specifications for Paving and Related Construction for the City of Detroit.

Obtain cementitious materials from same source throughout.

1.3.01 Testing. The Contractor shall make cylinders for compressive strength tests as well as slump tests for consistency and tests for air content concurrently at the job site. These tests shall be made for all exposed concrete used in commercial driveways, building construction; concrete paving projects; repairs of public streets, alleys, sidewalks, curbs and driveways; new curbs, sidewalks and driveways; and/or at such locations deemed necessary by the Engineer for quality control of concrete placed on public property.

A minimum of one test for slump and one test for air content shall be taken for each 25 cubic yards (19.1 cu m), or portion thereof, of concrete placed. Should test results so dictate, the Engineer may order additional testing to assure quality concrete. Tests for entrained air and slump of concrete may also be made by the Engineer when concrete is being placed.

Air content tests shall be in accordance with ASTM C231 or C173. The concrete, when deposited in the forms for pavements or curbs, shall contain 6 percent (plus or minus 1 percent) of entrained air.

The consistency of concrete mixes will be determined by the slump cone test as specified in the method of test for slump of Portland Cement Concrete ASTM C143.

The consistency of the concrete shall not exceed the limits listed below:

Concrete for street pavement including base course and curbs shall have a maximum slump of 3 inches (7.6 cm).

Concrete for alley pavement and cubs shall have a maximum slump of 4 inches (10.1 cm).

Concrete for sidewalks and driveway paving shall have a maximum slump of 5 inches (12.7 cm).

For any single batch, slump tests of individual samples taken at approximately the one-quarter and the three-quarter points of the load shall differ by not more than 1 inch (2.5 cm).

Compression test specimens shall be prepared in accordance with ASTM C31 with 1 set of 4 standard cylinders for each compressive-strength test, unless otherwise directed. Mold and store cylinders for laboratory-cured test specimens except when field-cured test specimens are required.

Compressive-strength tests shall follow ASTM C39 with 1 set for each day's pour exceeding 5 cubic yards (3.82 cu m) plus additional sets for each 50 cubic yards (38.2 cu m) more than the first 25 cubic yards (19.1 cu m) of each concrete class placed in any 1 day. Test 1 specimen at 7 days, 2 specimens at 28 days, and hold 1 specimen in reserve for later testing if required.

1.4 SUBMITTALS.

1.4.01 Mix Design. Submit certification that concrete mix conforms to specified MDOT mixes. Submit three copies of the mix design for approval for all non-MDOT concrete mixes.

1.4.02 Product Data. Submit data on joint filler, admixtures, and curing compounds.

1.5 DELIVERY, STORAGE, AND HANDLING. Concrete materials shall be so furnished, handled, and stored as to preclude inclusion of foreign matter and permit easy access for inspection. Storage facilities shall be sufficient and so stocked and maintained as to assure concrete placement at the required rate without damaging delays. Handling methods and storage facilities shall be subject to the approval of the Engineer.

Cement shall be so handled and stored as to be protected from the weather, dampness, and contamination. Cement shall be used in the same relative order as received. Cement salvaged or reclaimed from cleaning sacks, leaking containers, or discarded sacks shall not be used. Any cement which, for any reason, has become partially set, contains lumps of caked cement, or is in any way contaminated shall be rejected and shall be promptly removed from the site.

Aggregates shall be so furnished, handled, and stored as to insure uniformity of the specified grading at the time of batching, and that the moisture content will be reasonably constant for each day's run. Aggregate requiring pre-washing shall not be used until the surplus water has disappeared and the material has a uniform and acceptable water content.

Fine and coarse aggregates, aggregates from different sources, and various classes of coarse aggregates shall be separately stored.

PART 2 – PRODUCTS

2.1 MATERIALS.

2.1.01 General. Concrete shall be composed of a mixture of Portland cement, fine aggregate, coarse aggregate, fly ash, admixtures when specified and water. The materials and methods used shall produce a dense, homogenous impervious, durable and workable concrete of the highest quality and without defects of any kind.

The materials shall meet the requirements specified in the MDOT Standard Specifications for Construction as follows unless otherwise indicated on the drawings

Concrete, 30P, 35P, 35HE	Section 7.01
Mortar and Grout	Section 7.02
Steel Reinforcement	Section 8.05
Joint Materials	Section 8.16
Curing Materials	Section 8.24

For instances where an MDOT mix is not specified, provide concrete as follows unless indicated otherwise on the Drawings: Grade "A" concrete shall be used throughout the work except that Grade "C" concrete may be used for backfills, unless stronger concrete is called for on the plans.

Grade "A" concrete shall have a minimum compressive strength of 4,000 psi (27,579 kPa) at 28 days and shall contain not less than 6 1/2 sacks of cement per cubic yard (8 1/2 sacks of cement per cubic meter) of concrete. Grade "C" concrete shall have not less than 3 sacks of cement per cubic yard (4 sacks of cement per cubic meter) of concrete.

2.1.02 Water. Water used in concrete or mortar mixtures or for curing concrete shall be reasonably clean and free of oil, salt, acid, alkali, sugar, vegetable, or other substances injurious to the finished product. DWSD furnished potable water may be used without testing.

For water requiring testing, the tests will be conducted in accordance with AASHTO T26. Water from sources other than City tap water shall meet the following requirements:

Total solid matter, max	0.03%
Organic matter, max	0.05%
Alkalinity – Acidity	Natural to litmus

Water failing to meet these requirements may be approved for use if, when comparative tests are made between the proposed water and distilled water, using an approved cement, there is no indication of unsoundness, marked change in time of setting, or a reduction of more than 10 percent in mortar compressive strength.

The water intake shall provide for the exclusion of silt, mud, grass, or other foreign materials.

2.1.03 Cement. Cement for pavement, base course, curbs, sidewalk and shoulder, as called for on Plans or as directed by the Engineer shall be “Portland Cement” conforming to the respective requirements of the applicable ASTM specifications listed below. Cement of only one kind and type shall be used throughout the work and it shall be a standard brand of a single producer, unless otherwise specifically authorized by the Engineer.

Portland Cement Types I, IA, III and IIIA shall conform to ASTM C150. The requirements for Gillmore Setting Time Test and compressive strength through the 28 day test shall apply.

Portland Cement Types IS and IS-A Blast-Furnace Slag shall conform to ASTM C595.

2.1.04 Fine Aggregate (Sand). Fine aggregate shall be natural sand consisting of fine granular material resulting from the natural disintegration of rock or manufactured sand or a combination thereof. The sand shall consist of clean, sound, durable particles free from any adherent coating, clay lumps or other deleterious substances, and at the time of use shall be entirely free of frozen material.
Fine aggregate shall conform to the requirements of the current MDOT Standard Specifications for fine aggregates for portland cement concrete, natural sand, Type 2NS.

2.1.05 Coarse Aggregate. Coarse aggregate shall consist of gravel, stone or slag all of which shall conform to the current MDOT Specifications for Type 6AA. Coarse aggregate shall be used in all concrete permanently exposed to the weather.

2.1.06 Admixtures. Admixtures include all materials other than water, aggregates, and Portland Cement that are used in the making of concrete and that are added to the batch immediately before or during the mixing.

Admixtures, other than Air-Entraining admixture conforming to the requirements of ASTM C260, shall not be used in the concrete without the prior written approval of the Engineer.

Admixtures that may be used with written approval of the Engineer are Calcium Chloride per ASTM D98, Type 1 regular flake and water reducing admixtures ASTM C494 Type A and Type D.

2.1.07 Joint Materials. Filler for expansion joints shall be premolded bituminous, ASTM D1751. Filler for contraction joints shall be bituminous joint filler, AASHTO M33. Filler for curb expansion and contraction joints shall be premolded bituminous, ASTM D1751 or AASHTO M213 Type III.

Poured joint filler shall be hot-poured rubber-type compound, Fed. Spec. SS-S-164.

2.1.08 Forms. Pavement and curb forms shall be straight and free from distortion, and of sufficient strength to resist forces applied during the process of placing concrete against them. The forms shall be of an approved section, with a flat surface on top, and shall be of the full depth of the pavement or curb.

Forms for radius corners shall be steel or thin board, accurately formed to true radius, and held by bracing and stakes to maintain a true curve.

2.1.09 Fill Materials. Earth materials excavated under this Contract, to be suitable for backfill behind the curb or integral curb and sidewalk, the filling of low places in a strip 2 feet (61.0 cm) wide and paralleling the constructed curb, and integral curb and sidewalk shall be a type that may be thoroughly compacted by the method specified. Such material, to be useable, shall be free from rubbish or debris, vegetable matter, large stones, concrete fragments or other road material, lumber, tree roots, or branches. In general, select excavated material to be suitable for backfill shall be restricted to sand or crumbly clay, unless indicated otherwise.

2.2 PROPORTIONING.

2.2.01 Design Mixture. The mixing proportions (approximately 1:2:3 mix) and water-cement ratio used shall be such as to produce a dense, homogenous, workable and durable concrete having a minimum compressive strength of 4,000 psi (27,579 kPa) at 28 days, unless indicated otherwise on the Drawings.

The concrete mix design to produce a concrete of the required minimum strength shall be the sole responsibility of the Contractor, except that no less than 6 1/2 sacks of cement per cubic yard (8 1/2 sacks of cement per cubic meter) shall be used and the mixing water shall not be more than 5 1/2 gallons (20.8 liters) per sack of cement, including the surface moisture carried by the aggregates, both fine and coarse. The maximum allowable slump shall be that consistent with the proper placement of the mix, but in no case shall the water content exceed that specified. The Engineer will check the Contractor’s proposed concrete design mix. Mixes which do not produce concrete of required quality shall be adjusted, at the Contractor’s sole expense, until all the requirements of these specifications are complied with.

The Grade of concrete to be used in the various parts of the work shall be as stipulated below, unless otherwise called for on the Plans.

Grade	Use
“A”	Concrete pavement, alley pavement, curbs, commercial drives, pavement base, residential drives, and sidewalks.
“C”	Backfill where called for on plans or as directed by the Engineer.

Grade “A” concrete may be used in the place of Grade “C” concrete, without additional cost to the Owner.

High-Early-Strength Concrete installation and mix design shall be subject to the approval of the Engineer for each location shown on the Plans, or as directed by the Engineer.

PART 3 – EXECUTION

3.1 INSPECTION. Verify compacted subgrade or granular base as applicable is acceptable and ready to support paving, curbs, curb and gutter, integral curb and sidewalk and imposed loads.

Verify gradients and elevations of subgrade or base are correct.

3.2 PREPARATION. Prepare subgrade or base in accordance with Section 2.08 of the MDOT Standard Specifications for construction unless indicated otherwise on the drawings. Replace unsuitable subgrade soils with approved suitable materials. Moisten base to minimize absorption of water from fresh concrete.

Coat surfaces of manhole, catch basin and other metal frames and covers with oil to prevent bond with concrete pavement.

Notify Engineer a minimum of 24 hours prior to commencement of concreting operations.

3.2.01 Forming. Place and secure forms to correct location, dimension, profile, and gradient. Forms shall be adequately staked and braced to resist the pressure of the concrete. All forms shall be thoroughly cleaned and oiled before concrete is placed against them.

Assemble formwork to permit easy stripping and dismantling without damaging concrete.

Place joint filler vertically in position, in straight lines. Secure to formwork during concrete placement.

3.3 INSTALLATION.

3.3.01 Batching, Mixing and Transporting Concrete. Ready-mixed concrete from an approved source shall be used unless on-the-site mixing is authorized by the Engineer. The plant and transportation equipment and the methods used for producing and delivering the ready-mixed concrete shall conform to the current ASTM Standard C94 except as otherwise modified or specified herein.

The plant and transportation equipment of the ready-mix concrete source shall be available for assignment to this work and shall be of adequate size and sufficient capacity to maintain a satisfactory job progress schedule. Concrete materials shall be stocked in such quantities as required to meet maximum demands. Trucks delivering ready-mixed concrete for alley paving shall be equipped with exhaust systems venting upward over the cab.

A “Transit Mix Concrete Producer’s Certificate”, furnished by the City Engineering Department, shall be used in lieu of the certification called for in Section 16 of ASTM C94. Such certificate, completely filled out and signed by an authorized agent of the producer, shall accompany each truck load of ready-mix concrete and be presented to the Engineer or Inspector prior to unloading at the site as a condition for the use of concrete in the work. The person signing shall be one who has previously been officially designated by the producer as authorized agent and whose signature is currently on file with the Engineer of Inspection for the Detroit Water and Sewerage Department.

The Engineer's determination of "Failure to Meet Strength Requirements" of ASTM C94, shall be final and conclusive upon the Contractor. Such determination will be based on tests and other factual data deemed pertinent by the Engineer.

On-the-site batching and mixing equipment and methods, when authorized, shall be such that will produce concrete comparable in all respects to ready-mixed concrete meeting the specified requirements.

3.3.02 Erection. Curbs of all types shall not have reinforcing steel extend through transverse expansion and contraction joints.

3.3.03 Separate Type Curb Construction – Unreinforced and Reinforced Construction. The curbs shall be constructed in conformance with the types and details as specified on the plans. When steel reinforcement is called for on the plans, it shall be properly spaced and held in the correct position during the placing of concrete by the use of devices or methods meeting the approval of the Engineer.

Splicing of steel reinforcement bars shall be accomplished by lapping and securely wiring the bars together. The bars shall be lapped at least 10 inches (25.4 cm), unless otherwise shown on the Plans.

The concrete shall be spaded sufficiently to eliminate all voids and tamped to bring the mortar to the surface.

Joints shall be constructed perpendicular to the surfaces of the structure and shall not vary more than 1/4 inch (6.4 mm) from their designated positions.

Expansion joints in un-reinforced curb shall be 1 inch (2.54 cm) thickness, with curb size premolded bituminous fiber filler, shall be placed through the curb at the end of the street and alley returns at 50 feet (15.2 m) intervals, or at such lesser distances when necessary to retain the 50 foot (15.2 m) interval between existing expansion joints remaining.

Expansion joints in reinforced curb shall be 1 inch (2.54 cm) thickness, with curb size premolded bituminous fiber filler, shall be placed through the curb at the end of street and alley returns and in line with all expansion joints in the abutting pavement.

The curb shall be constructed in uniform sections of a length not longer than 10 feet (3.1 m) except when otherwise shown on the plans. Provide separation joints at 10 foot (3.1 m) intervals between expansion joints. Separation joints shall be formed by a steel template 1/8 inch (3.2 mm) in thickness, of a width equal to the required width of the curb, and depth of at least 2 inches (5.1 cm) greater than the required depth of the curb, set vertically within the forms and at right angles to the curb face. Finding of separate type curb shall be as specified for Reinforced Curb and Gutter.

3.3.04 Reinforced Integral Curb and Gutter Construction. The reinforced integral curb and gutter shall conform to the cross-section shown on the plans. The reinforced integral curb and gutter shall be constructed to the grade shown on the Drawings, unless otherwise directed by the Engineer. Integral curb shall be constructed monolithic with the pavement slab. The curb material shall be placed before the pavement has started its initial set, and shall be of the same mix and be identical to the concrete in the pavement.

The curb and gutter forms shall be substantial and so placed and held as to be unyielding during the placing, compaction, and curing of the concrete.

The concrete shall be carefully placed to avoid segregation and shall be sufficiently spaded or vibrated to eliminate all voids and taped to bring the mortar to the surface.

The longitudinal bars called for on the plans shall be properly spaced and held in correct position during the placing of concrete by use of bar chairs, hangers, or other devices approved by the Engineer. Longitudinal bars shall end 2 inches (5.1 cm) from each expansion or contraction joint.

Splicing of steel reinforcement bars shall be accomplished by lapping and securely wiring the bars together. The bars shall be lapped at least 10 inches (25.4 cm).

Expansion joints of 1/2 inch (1.3 cm) thickness, with curb size premolded bituminous fiber filler shall be placed through the curb at 60 foot (18.1 m) intervals, or at such lesser distances when necessary to retain the 60 foot (18.1 m) intervals between existing expansion joints remaining.

The bottom of the premolded filler shall be set 1 1/2 inches (3.8 cm) below the bottom of the pavement. The joint shall be free from concrete and the end of the joint cleaned of hardened concrete as soon as the forms are removed.

During installation, the joint shall be held in place by an approved installing device which shall be securely staked. The top edge of the filler shall be protected, while the concrete is being placed, by a metal channel cap of at least 10 gage (3.5 mm) thickness material having flanges not less than 1 1/2 inches (3.8 cm) in depth. The channel cap shall be shaped to the contour of the pavement and shall extend over the filler from gutter line to edge of pavement. A premolded filler of the full depth, width, and cross-section of the curbs shall be placed at the channel cap end and shall make a positive separation between curb and gutter sections.

Reinforced integral curb and gutter shall be constructed in uniform sections of a length not longer than 20 feet (6.1 m). Provide separation joints at 20 foot (6.1 m) intervals between expansion joints shall be formed by a steel template, 1/8 inch (3.2 mm) thickness, of a width equal to the required width of the curb and gutter and depth of at least 2 inches (5.1 cm) greater than the required depth of the curb, set vertically within the forms and at right angles to the curb face.

The edges and back top edge of the curb and all transverse joints and planes of weakness shall be rounded with an approved finishing tool having a radius of 1/4 inch (6.4 mm). The face of the curb, at the top of all curb and at the bottom of the integral curb, shall be rounded with approved finishing tools having the radii shown on the plans. When the concrete has set sufficiently to prevent slumping the face form shall be removed and the exposed surfaces of the concrete curb or curb and gutter shall be finished smooth and even by means of a moistened wood float, followed by a light brushing, using either a broom, brush or burlap. The top of curb shall not vary more than 3/16 inch in 10 feet (4.7 mm in 3.1 m) when checked with a 10 foot (3.1 m) straightedge. The balance of the exposed surfaces shall not vary more than 3/8 inch (9.5 mm) from the alignment and typical cross-section.

Water shall not be added to the concrete surface as an aide to finishing, except in isolated instances where a delay in finishing has occurred and evaporation has caused a loss of surface moisture. Water added in these instances shall be minimal and then only when approved by the Engineer.

Honeycombed areas and minor defects shall be filled with mortar, prior to applying membrane curing compound. Use mortar conforming to Type R-2 per Section 7.02.03 of the MDOT Standard Specifications for Construction unless indicated otherwise on the drawings.

3.3.05 Alley Curb Construction. The curbs shall be constructed in conformance with the types and details as specified on the plans. All curbs, including circles at intersections, shall be integral roll curb, unless otherwise specified on the plans or in the proposal for the contract.

The concrete shall be placed and spaded sufficiently to eliminate voids so that the roll curb and slab shall form an integral unit.

Expansion joints in the slab shall be carried through the integral roll curb.

Contraction joints in the integral roll curb shall be placed at all contraction joints in the slab and shall be of the same type of construction.

The edges and back top edge of the curb and all transverse joints and planes of weakness shall be rounded with an approved finishing tool having a radius of 1/4 inch (6.4 mm). The face of the curb, at the top of all curb and at the bottom of the integral curb, shall be rounded with approved finishing tools having the radii shown on the plans. The exposed surfaces of the curb shall be finished smooth and even. Neat cement shall not be used as a dryer to facilitate the finishing of the surface.

3.3.06 Integral Curb and Sidewalk. Integral curb and sidewalk shall conform to the cross-section shown on the plans and shall be constructed in a similar manner to curbs specified herein. Sidewalk portion shall have a broomed finish.

3.3.07 Road Pavement Joints. All transverse joints in the concrete pavement shall extend entirely through the integral curb. The edges of the transverse joint in the curb shall be rounded with an approved finishing tool having a radius of 1/4 inch (6.4 mm).

Joints in the integral curb shall be sealed with Hot-Poured Rubber-Asphalt type compound as specified in Section 8.16 of the MDOT Standard Specifications for Construction.

Transverse contraction joints per MDOT Road Standard Plan No. II-39K shall be placed at the locations shown on the plans and elsewhere at maximum intervals of 25 feet (7.6 m) between expansion joints. The minimum distance between any load transfer joints shall be 12.5 feet (3.8 m).

Expansion joints per MDOT Road Standard Plan No. II-39K, and expansion joints with load transfer assemblies shall be placed at locations shown on the plans and at locations as follows:

At the “spring lines” of street returns.

At the P.C. and P.T. of horizontal curves where the degree of curvature is 2 degrees 30 minutes or more. These joints may be omitted during the period from September 15th to April 15th, as directed by the Engineer.

Where necessary to relieve horizontal pressures at sharp vertical curves where shown on the plans or as directed by the Engineer.

During the period from September 15th to April 15th, expansion joints shall be spaced at maximum intervals of 315 feet (96.0 m), this includes a full-width expansion joint for any portion of multiple-lane pavement placed during this period.

End-of-pour-joints shall be placed at the location of full width pavement and the start of non-reinforced temporary transition tapers as shown in MDOT Road Standard Plan No. II-39K, or as directed by the Engineer.

3.3.08 Alley Pavement Joints. Expansion joints and contraction joints shall be constructed as shown on the plans.

All joints shall be constructed true to line with their face perpendicular to the surface of the pavement. Transverse joints shall be constructed at right angles to the center line of the pavement, unless otherwise required, and shall not vary more than 1/4 inch (6.4 mm) from a true line. Longitudinal joints shall be constructed parallel to the center line of the pavement, unless otherwise required, and shall not vary more than 1/4 inch (6.4 mm) from their true designated position.

The surface of the pavement adjacent to all joints shall be finished to a true surface. The surface across the joint shall be tested with 10 feet (3.1 meter) straightedge as the joints are finished, and any irregularities shall be corrected before the concrete has hardened.

Longitudinal Contraction joints shall be constructed in pavements 17 feet (5.2 m) or greater in width, unless otherwise directed by the Engineer.

Longitudinal Contraction joints shall be constructed 6 inches (15.2 cm) from and parallel to the center line by cutting with a saw, to a minimum depth of 2 inches (5.1 cm) after the concrete has hardened sufficiently to permit sawing without damage to the pavement. The joint shall be cut within 24 hours after the concrete has been poured. The sawed joint shall be immediately flushed out with a jet of water.

Longitudinal Contraction joints shall be constructed 6 inches (15.2 cm) from the alley gutter on the high side of the pavement if the pavement is warped enough to shift the alley gutter from the center line of the pavement.

The concrete saw shall be adequately powered, self-propelled and constructed to cut hardened concrete rapidly with a water cooled diamond edge or abrasive saw blade to a depth of at least 2 1/2 inches (6.4 cm). The minimum width of saw blade shall be 3/16 inch (4.8 mm).

Transverse Contraction joints shall be constructed at locations shown on the plans. The premolded filler shall be placed in the concrete after rough finishing of the slab has been completed. The top edge of the premolded filler shall be placed with the top edge flush with the adjacent concrete surface. Concrete shall not bridge over the top of the premolded filler.

Construction joints shall be key joints, with provision for joint filler as shown on the Plans. Construction joints shall be placed at the ends of all pours and at places where paving operations are stopped for a period of more than 1/2 hour, except where such pours end at expansion joints. Construction joints shall be formed by placing a bulkhead.

Bulkheads for construction joints shall be of lumber not less than 2 inches (5.1 cm) nominal thickness, shaped to conform to the cross-section of the pavement.

One inch (2.5 cm) transverse expansion joints shall be located at all intersections and at locations shown on Plans. 1 1/2 inch (3.8 cm) expansion joints shall also be placed along the edge of pavement abutting building walls or other solid structures.

The bottom of the premolded filler shall be set 1 1/2 inches (3.8 cm) or more below the bottom of the slab. The premolded filler shall be set and held in a vertical position. The joint shall be free from concrete and the end of the joint cleaned of hardened concrete as soon as the forms are removed.

The premolded joint filler shall be furnished in lengths not less than the lane widths being poured, except that lengths greater than 12 feet (3.7 m) will not be required. Where more than one section is allowed and used in a joint, the sections shall be fastened together with a half lap scarf joint securely clipped together. The scarf shall have a minimum length of 3 inches (7.6 cm).

During installation, the joint filler shall be held securely in place. The top edge of the filler shall be protected, while the concrete is being placed.

Transverse expansion joints only shall be sealed.

Joints shall be filled and sealed in accordance with the same requirements as that for road pavement joints.

3.3.09 Concrete Base Course Joints. All joints shall conform to the details and position shown on the plans, with the following exceptions:

> Joints in Unreinforced Concrete Base Course: Sawed transverse contraction joints shall not be required.
>
> Joints in Reinforced Concrete Base Course: A load transfer unit shall not be required for transverse contraction joints. The pavement reinforcement shall be continuous through the joint.
>
> Joint Filler: Joints shall not be filled with poured joint filler. Premolded joint filler shall be placed with its top edge 1/2 inch (1.3 cm) below the pavement surface.

3.3.10 Reinforcement. Pavement reinforcement shall be placed as specified in Section 8.05 of the MDOT Standard Specifications for Construction, except that adjacent sheets or mats shall be lapped approximately 1 foot (30.1 cm) and that pavement reinforcement shall stop 6 inches (15.2 cm) from all expansion or contraction joints.

On the outside of 13.5 foot (4.1 m) lanes, pavement reinforcement for a 12 foot (3.7 m) lane shall be used with no reinforcement for the outside 1.5 feet (45.7 m) of pavement and curb.

Tie-bars shall be epoxy-coated. Damaged areas shall be repaired before placing concrete. Bent tie-bars shall be inspected after straightening, and any damaged epoxy coatings shall be repaired before embedment in concrete.

Expansion-anchored lane-ties shall be of the size and spacing shown on plans. They shall be either the self-drilling flush type, pre-drilled flush type, or the pre-drilled torque type. Expansion-anchored lane-ties shall replace broken bent lane tie-bars in longitudinal bulkhead joints at the Contractor's expense.

Load transfer assemblies used in 13.5 foot (4.1 m) lane widths shall be 11.5 feet (3.5 m) long. They shall be placed in the inside 12 feet (3.6 m) of the outside curb lane.

3.3.11 Placement. The concrete shall be distributed or spread as soon as placed. The concrete shall be deposited on the subgrade in such a manner as to require as little re-handling as possible. Any additional spreading required shall be done by means of shovels. The method and manner of placing shall be such as to avoid segregation and separation of the materials. The concrete shall be distributed to such depth and sufficiently above grade so that when consolidated and finished, the surface shall conform to the required finished grade. The concrete along the faces of the forms and adjacent to joints shall be consolidated and compacted to fill all voids and insure a dense smooth surface.

The depositing and spreading of the concrete shall be continuous, as far as possible, between transverse joints. In the case of a temporary shutdown, the concrete at the unfinished end of the slab shall be covered with wet burlap. In the event of an unavoidable interruption of the work continuing more than ½ hour, a construction joint shall be placed provided the section is 10 feet (3.1 m) or more in length between joints. Sections less than 10 feet (3.1 m) in length shall not be permitted, and if constructed shall be removed.

The entire area of the pavement shall be so consolidated as to ensure a minimum of voids. The concrete shall be struck off with a screed to the cross-section and thickness shown on the plans. The screed shall be set on side forms and upon a temporary center form or guide.

When constructing alley pavement, the temporary center form or guide shall be firmly staked or fastened to the exact line and grade of the alley gutter. This line and grade shall be produced to the center of the alley from the Engineer's stakes set at each grade change; intermediate points shall be accurately set by T-bars or other suitable methods.

Alley pavement edges shall be located in accordance with the plans and additionally warped as is necessary to meet adjacent garage entrances and existing pavements.

In all cases the minimum thickness of the pavement shall be the thickness shown on the plans.

Cement mortar gathered from the surface of the concrete already placed shall not be used for filling boot tracks or stony areas. Such areas shall be dug out, refilled with concrete, and worked smooth.

After striking off, the surface shall be finished to a gritty texture by means of a wooden float. If a metal float is used for final finishing, no more than two passes may be made over the surface.

3.3.12 Texturing of Concrete Pavement. Texturing of Concrete pavement shall be in accordance with Subsection 4.50.14 of the MDOT Standard Specifications for Construction, except as follows:

> As soon as the concrete has set sufficiently to maintain a texture, the concrete surface shall be dragged longitudinally with a stiff fiber artificial grass carpet.
>
> Under unusual conditions, the following texturing method may be utilized, if approved by the Engineer:
>
> As soon as all excess moisture has disappeared and while it is still possible to produce a uniform surface of gritty texture, the pavement surface shall be dragged longitudinally using a Monsanto Astroturf Mat, or approved equal, to a degree of texturing as directed by the Engineer. The astroturf mat shall be suspended from a movable bridge and shall be in full longitudinal contact with the pavement surface for a minimum distance of 3 feet (91.4 cm). This method of texturing shall apply to concrete pavement only, not to concrete base course.

The texturing mat shall be kept free from accumulations of concrete mortar by removing the mat from the movable bridge and flushing the mat with water, or by other means approved by the Engineer. The texturing mat shall be replaced when the mortar accumulations harden and cannot be removed.

3.3.13 Sawing Joints. Joints shall be sawed in accordance with the details shown on the plans and in accordance with Section 4.50.17 of the current MDOT Standard Specifications for Construction.

3.3.14 Texturing (Finishing). When the water sheen has practically disappeared, the pavement surface shall be textured (finished) by use of an approved broom or brush. The texturing operations shall produce uniform corrugations approximately 1/16 inch

(1.6 mm) in depth and approximately at right angles to the centerline of the pavement. Texturing shall be completed before the concrete is in such condition that the surface will be torn or unduly roughened by the operations. The finished surface shall be free from rough or porous areas, irregularities and depressions resulting from texturing operations and shall meet the approval of the Engineer. Brooms or brushes for texturing the pavement surface shall be of such material and design that they will be capable of producing uniform corrugations of the specified depth.

Final surface finishing of concrete base courses shall be as specified above except the pavement shall be rough broom finished.

3.3.15 Alley Pavement Stamp. The Contractor's name and the month, day and year in which the pavement was laid shall be carefully and clearly impressed in the concrete surface of each end slab, as directed by the Engineer.

The stamp or plate used for the marking shall have an approximate maximum outside dimension of 4 x 6 inches (10.2 x 15.2 cm). The Contractor's name and the current year's date shall be in such characters and arrangement that a legible and indelible impression may be made in the concrete.

3.3.16 Form Removal. Pavement forms shall not be removed from freshly placed concrete until it has set for at least 24 hours. After the form pins have been removed, the forms shall be carefully removed so that no damage will be done to the edge of the pavement.

After the forms have been removed, the ends of all concrete joints shall be cleaned and all honeycombed areas pointed. Such honeycombed areas shall be covered with wetted burlap until the pointing has been completed, after which the area shall be cured as specified below.

3.3.17 Patching of Transverse and Longitudinal Joints. The patching of transverse and longitudinal joints shall conform to the specific requirements of the MDOT, Standard Specifications for Construction on concrete pavement construction (Sections 4.50 and 4.52).

3.3.18 Protection. Fresh concrete pavement and integral curb shall be protected from rain and freezing, and the Contractor shall make this possible by keeping available sufficient covering material. The exposed surface of the concrete shall be protected from premature drying for a period of seven days after pouring.

Sufficient barricades and lights shall be provided to prevent traffic upon the concrete pavement for seven (7) days or for three (3) days if high-early strength concrete was used, unless such interval shall be modified when deemed necessary by the Engineer.

3.3.19 Curing. After finishing operations have been completed and immediately after the free water has left the surface, the surface of the slab shall be completely coated and sealed with a uniform layer of membrane curing compound in accordance with Section 4.50.16 of the current MDOT Standard Specifications for Construction and as specified herein. The compound shall be thoroughly stirred to a uniform consistency in the drum just prior to transfer of the compound to the membrane spraying equipment. Curing compound shall not be thinned.

The curing compound shall be applied at a minimum rate of 1 gallon per 200 square feet (1 liter per 4.9 square meters) of surface. For miscellaneous concrete pavement over one lane in width, where a manually operated pressure-type sprayer is used, the compound shall be applied from a foot bridge. If rain falls on the newly coated pavement before the film has dried sufficiently to resist damage, or if the film is damaged in any other way, the Contractor will be required to apply a new coat of material to the affected areas equal in curing value to that specified for the original coat.

Curing of concrete base courses shall be as specified above except that transparent membrane curing compound shall be used.

All traffic, either foot or otherwise, will be considered as injurious to the film of the applied compound. A minimum of foot traffic will be permitted on the dried film as necessary to properly carry on the work, such as sawing joints, provided any damage to the film is immediately repaired by another application of compound. If fixed-forms are removed during the curing period, the entire area of the sides of the slab shall be coated with curing compound immediately after removal of the forms. Approved hand-spray equipment will be permitted for the application of the curing compound on the sides of the slab and for repairing damaged areas.

Failure to provide proper curing will be considered as sufficient cause for immediate suspension of the concreting operations.

When approved by the Engineer, curing compound may be omitted when cold-weather protection is used during the curing period.

3.3.20 Cold-weather Protection. No concrete shall be placed after November 1, and prior to May 1, without specific written authorization of the Engineer. Without exception, all costs associated with placing concrete in cold weather shall be the responsibility of the Contractor.

If the authorization is given to place concrete during this period and the use of high-early strength concrete was not originally specified, the Engineer may require the use of high-early strength concrete at no extra cost. In any case, concrete shall be adequately protected when necessary from cold weather and freezing and precautions taken to prevent any damage to the concrete from low temperatures.

Frozen concrete or concrete otherwise damaged from cold weather shall be removed and replaced with sound concrete at the Contractor's expense. When low air temperatures are probable, a plan and method for protecting the concrete during its early stages shall be adopted, subject to the approval of the Engineer and in conformity with the limiting requirements herein. Only such methods shall be used that will maintain reasonably uniform temperatures and provide proper moisture conditions for curing. All required materials, special equipment and facilities needed to provide the adequate provisions shall be readily available before the low temperature actually occurs.

The subgrade shall not be frozen when pouring concrete. When necessary to excavate below subgrade to remove frozen material, the excavated space below the subgrade shall be refilled with unfrozen crushed stone, gravel or sand, but not with clay or loam. If such suitable materials are not available for backfill, then concrete shall be used for the full depth of the excavation.

Whenever it is anticipated that the air temperature at the point of concrete placement is likely to be 40 degrees F (4.4 degrees C) or lower during the 24-hour period following the pouring, or below 30 degrees F (-1.1 degrees C) during the succeeding seven days, protective measures shall be taken.

At times when prevailing air temperatures will produce concrete of less than 65 degrees F (18.3 degrees C), mixing water shall be heated. Concrete materials entering the mixture shall be free of lumps, frost, snow, or ice. When necessary, the concrete materials shall also be heated so as to produce a concrete having a temperature of not less than 65 degrees F (18.3 degrees C), nor more than 90 degrees F (32.2 degrees C) and as near 70 degrees F (21.1 degrees C) as possible at the time of pouring. The heating of the materials shall be done in a manner and by such methods as will keep the materials clean and free from injurious substances. The heating of the mixing water and aggregates shall be controlled so that there will be no large differences in temperature form batch to batch. The maximum temperature for the heated water and fine aggregate shall not exceed 150 degrees F (65.6 degrees C), and that of the heated coarse aggregate shall not exceed 100 degrees F (37.8 degrees C). Salt or other chemicals shall not be added to prevent freezing.

Calcium chloride shall be added to concrete mixture to accelerate the hardening of the concrete under conditions stipulated below. The calcium chloride shall be added to the concrete mixture only in solution in water and not in dry flake form. The maximum amount of calcium chloride that may be added is 2 percent of the weight of the cement in the batch, or slightly less than 2 pounds (0.9 kilograms) per standard sack of cement.

The solution shall be made up on the basis of 4 pounds of flake calcium chloride in 1 gallon (0.48 kilograms in 1 liter) of hot water of hot water. The solution shall be considered as part of the total allowed concrete mixing water, unless authorized by the Engineer. Thus, if a 1 percent calcium chloride mix is needed, 1 quart (0.95 liters) of the solution is added per bag of cement. If a 2 percent calcium chloride is needed, then 2 quarts (1.9 liters) of solution is added per bag of cement.

Concrete which will be deposited when the predicted air temperature is in a range listed below, shall be prepared in accordance with the provision stipulated for the applicable range.

> 40 degrees to 30 degrees F (4.4 degrees C to –1 degrees C): 1 percent calcium chloride added to concrete mix.
>
> 28 degrees F (-2.2 degrees C) and rising: 1 percent calcium chloride added to concrete mix and heated mixing water used.
>
> 35 degrees F (1.7 degrees C) and rising: Either or both of above requirements may be omitted.
>
> 40 degrees F (4.4 degrees C) or lower before dark: 1 percent calcium chloride added to concrete mix for concrete that will be poured after 1:00 p.m., to accelerate setting to allow completion of finishing operations and covering within daylight hours.

Concrete when being placed shall have a temperature within the range specified. Forms shall be free of ice, snow and frost at the time of pouring concrete and the subgrade shall not be frozen. The poured concrete shall be protected as shown in the tables below:

Table 1 - Minimum Temperatures & Durations for Concrete Curing (Normal Strength)

Section Thickness	Minimum Temperature (°F)	Period of Time (Days) That Minimum Temperature Is Required
Thin	55	2
Moderate	50	2
Massive	45	2

Notes:
1) If concrete has any exposure to freeze-thaw cycle, add 1 day.
2) If concrete is high early strength concrete, subtract 1 day.

Table 2 – Maximum Allowable Rate of Cooling Once Temperature Protection is Removed

Section Thickness	Maximum Allowable Temperature Drop (°F) In Any 1 Hour	Maximum Allowable Temperature Drop (°F) In First 24 Hours
Thin	5	50
Moderate	4	40
Massive	3	30

Marsh hay or straw shall be used for a protective covering unless another equally effective means is approved by the Engineer. Where necessary to maintain the required minimum temperatures, the hay or straw shall be covered with tarpaulins, or other approved materials, securely weighted against displacement by wind.

A high-low thermometer shall be furnished and installed as directed by the Engineer to record the maximum and minimum temperature of the concrete.
Periodic inspections shall be made to assure the protective covering is properly maintained in place. Any concrete damaged by freezing or overheating shall be removed and replaced with sound concrete at the Contractor's expense.

3.3.21 Alley Barricades. Temporary alley barricades shall be constructed and placed as detailed on the drawings.

The Barricades shall be promptly removed and the pavement opened to traffic when so directed by the Engineer, which generally will be upon the expiration of the curing period.

3.3.22 Backfilling. After the concrete has gained sufficient strength, the remaining excavated areas shall be backfilled with approved material, compacted thoroughly, and left in a neat condition. Provide suitable backfill as specified herein if excavated material is insufficient in quantity or unsuitable for backfill.

Compaction shall be to at least 95 percent of the maximum unit weight.

3.3.23 Cleaning. Any concrete spilled on the pavement or structures shall be removed and the pavement or structures thoroughly cleaned before the concrete sets. Spilled concrete shall not be washed into sewers or drains. The site of the work shall be restored to a neat and clean appearance, including the removal of excess earth, material, forms and equipment.

3.4 FIELD QUALITY CONTROL. Before final acceptance of the pavement, cores will be taken from the pavement after placement to determine the compressive strength at 28 days, the thickness of the pavement, and the depth of pavement reinforcement below the pavement surface. The Contractor shall be required to hire a testing laboratory, to perform testing of the installed concrete pavement.

The frequency of coring will be based on pavement units. The width of a unit is a lane. The width of each lane is determined by mandatory and/or optional joints indicated on the cross sections shown on the plans, except that thickened edges of lanes will not be included in the lane widths. The length of a unit will be 250 linear feet (76.2 linear meters) or any fraction thereof.

3.4.01 Coring the Pavement. An initial 6 inch (15.2 cm) core shall be taken from each prescribed unit through the entire thickness of the pavement at such times and locations as directed by the Engineer. The cores shall be drilled and handled in accordance with ASTM C42.

3.4.02 Measuring and Testing the Core. Each core shall be measured for thickness of concrete and depth of steel reinforcement and tested for compressive strength at 28 days after placement.

The measurement for length of core, depth of reinforcement, and the averaging of measurements when more than one core is taken form a unit, will be reported to the nearest 0.1 inch (3 mm) in accordance with the Rounding-Off Method of ASTM E29.

3.4.03 Measurement for Thickness of Pavement. The length of a core for determining pavement thickness shall be determined by average measurements of the core in accordance with AASHTO T148.

When averaging core lengths, measurements which are in excess of specified pavement thickness by more than 0.2 inches (5.1 mm) will be considered as the specified thickness plus 0.2 inch (5.1 mm).

3.4.04 Measurement for Depth of Reinforcement. Measurements for depth of reinforcement will be made from the top surface of the core to the top of the longitudinal bar or wire. If a core does not include a section of pavement reinforcement, an additional core will be taken not less than 10 feet (3.1 m) nor more than 10 feet (3.1 m) ahead of the core. This additional core will be used for the determination of the depth of pavement reinforcement and not for the measurement of pavement thickness.

3.4.05 Determination of Compressive Strength. The compressive strength at 28 days after placing shall be determined according to ASTM C42.
The core shall be classified in accordance with the results or the measurements for concrete thickness, the depth of steel and the compressive strength in accordance with the ranges indicated in Tables I, and II.

The Engineer shall be furnished with a certified report of such measurements and tests. After making such measurements and tests, the cores shall be delivered to the Engineer for further checking and tests.

Table 3 - Classification of Cores for Pavement Deficient in Thickness

Core Type	Deficiency in Thickness Determined by Cores, Inches (mm)
A	0.2 (5 or less)
B	0.3 (6 to 9)
B	0.4 (10 to 12)
B	0.5 (13 to 15)
B	0.6 to 1.0 (16 to 26)
C	1.1 (27) and over

Table 4 - Classification of Cores for Reinforced Concrete Pavement where Reinforcement is out of Tolerance.

Depth Range of Reinforcement, inches (mm)

Core Type	Pavement Thickness		
	7 ½ - 8 ½ (190 – 219) inches (mm)	**8 ½ - 9 ¾ 220 – 249 inches (mm)**	**9 ¾ - 11 250 – 279 inches (mm)**
Z	0 – 1 (0 – 24)	0 – 1 (0 – 24)	0 – 1 (0 – 24)
X	1 – 2 (25 – 49)	1 – 2 (25 – 49)	1 – 2 1/4 (25 – 59)
W	2 – 4 (50 – 99)	2 – 4 ¼ (50 – 110)	2 1/4 – 5 ¼ (60 – 134)
X	4 – 5 (100 – 124)	4 1/4 – 5 1/2 (111 – 139)	5 1/4 – 6 ¼ (135 – 159)
Y	5 – 6 (125 – 152)	5 1/2 - 7 1/4 (140 – 184)	6 1/4 – 8 ¼ (160 – 209)
Z	6 & over (165 & over)	7 1/4 & over (185 & over)	8 1/4 & over (210 & over)

* When a core length measures 1/10 inch (3 mm) or more over the plan thickness, the maximum depth range will be increased by 1/2 of the excess core length over the plan thickness. For each core, the increase will be rounded off to the nearest 1 mm in accordance with rounding-off method of ASTM E29 and then added to the range shown.

3.4.06 Additional Coring Requirements for Pavement Deficiencies. When the initial core from a pavement unit is classified as Type AW, no additional cores will be taken from that pavement unit.

When the initial core from a pavement unit is classified as other than Type AW, additional cores will be taken. The additional cores will be measured only for the defect that required the taking of the additional cores. Additional coring requirements for the various core types will be as follows:

When core measurements indicate the core to be one of Types AX, AY, BW, BX, and BY, two additional cores will be taken within the pavement unit. When the coring is being done on a linear foot (meter) basis, one additional core will be taken not less than 10 feet (3.1 m) nor more than 300 feet (91.4 m) in each direction from the initial core.

If the measurements of the 2 additional cores lie within the Type AW, AX, AY, BW, BX or BY range, no further cores will be taken within this pavement unit. Any adjustment to the contract price will be in accordance with the General Conditions.

When core measurements indicate the core to be one of Types AZ, BZ, CW, CX, CY, and CZ, additional cores will be taken randomly within the pavement unit but spaced at 10 foot (3.1 meter) longitudinal intervals in each direction from the initial C and/or Z core until, in each direction, a core is obtained which is no longer in a C and/or Z range. The second core so obtained which is not in a C and/or Z range will be used only for determining the extent of the area having a deficiency in the C and/or Z range. The procedure to be followed after the first core is obtained will be dependent on the classification of the core, with any adjustment to the contract price in accordance with the General Conditions.

3.4.07 Adjustment for Substandard Concrete. The applicable portions of the contract price as a total shall be decreased for substandard concrete pavement based on Table 3 and 4 above. The amount of adjustment and correction actions required shall be as shown in Table 5 below or as defined by the governing authority for the concrete pavement being poured.

Table 5 - Contract Decreases

If core is classified as shown below	Or classified as shown below,	Then all portions of the contract related to concrete paving as a total shall be reduced by the percent show below.	In addition, the following corrective actions will be taken.
Core Type From Table 3	**Core Type From Table 4**	**Percent Contract Decrease**	**Required Corrective Action**
A	W	0 %	
B		5 %	
C		15 %	
D	X	25 %	
E	Y	50 %	
F	Z	100 %	Remove & Replace

End of Section

SECTION 02755

REMOVAL AND REPLACEMENT OF CURBS AND SIDEWALKS

PART 1 – GENERAL

1.1 SCOPE**.** This section covers removal and replacement of concrete curbs and sidewalks including all necessary incidental work such as grading, subgrade preparation, forms, joints, finishing, and curing.

1.2 GENERAL. At the Contractor's option, concrete curbs may be constructed by conventional forming and placing methods or by means of an acceptable slip form process.

1.2.01 Governing Standards.

AASHTO M33 as Revised, Preformed Expansion Joint Filler for Concrete Bituminous Type).

AASHTO T26 as Revised - Standard Method of Test for Quality of Water to be Used in Concrete.

AASHTO T96 as Revised - Resistance to Abrasion of Small Size Course Aggregate by use of the Los Angeles Machine.

AASHTO M213 as Revised - Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Type).

ASTM (American Society of Testing Materials) A185 – Steel Welded Wire Fabric Plain for Concrete Reinforcement.

ASTM A497 – Welded Steel Wire Fabric Deformed, for Concrete Reinforcement.

ASTM A615/A615M – Deformed and Plain Billet-Steel for Concrete Reinforcement.

ASTM C31/C31M – Practice for Making and Curing Concrete Test Specimens in the Field.

ASTM C33 – Concrete Aggregates.

ASTM C39-C39M – Test Method for Compressive Strength of Cylindrical Concrete Specimens.

ASTM C42/C42M – Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete.

ASTM C94/C94M – Ready-Mixed Concrete.

ASTM C136 – Test Method for Sieve Analysis of Fine and Coarse Aggregates.

ASTM C143/C143M – Test Method for Slump of Hydraulic Cement Concrete.

ASTM C150 – Portland Cement.

ASTM C172 – Practice for Sampling Freshly Mixed Concrete.

ASTM C173 – Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method.

ASTM C174/C174M – Test Method for Measuring Thickness of Concrete Elements Using Drilled Concrete Cores.

ASTM C231 – Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.

ASTM C260 – Air-Entraining Admixtures for Concrete.

ASTM C309 – Liquid Membrane-Forming Compounds for Curing Concrete.

ASTM C494 – Chemical Admixtures for Concrete.

ASTM C595 – Blended Hydraulic Cements.

ASTM C666 – Test Method for Resistance of Concrete to Rapid Freezing and Thawing.

ASTM D98 – Calcium Chloride.

ASTM D1751 – Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction.

ASTM D1752 – Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction.

AASHTO (American Association of State Highway and Transportation Officials) M33 as Revised - Preformed Expansion Joint Filler for Concrete (Bituminous Type).

AASHTO T26 as Revised - Standard Method of Test for Quality of Water to be Used in Concrete.

AASHTO T96 as Revised - Resistance to Abrasion of Small Size Coarse Aggregate by use of the Los Angeles Machine.

AASHTO M213 as Revised - Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Types).

ACI 301 (American Concrete Institute) – Specifications for Structural Concrete for Buildings.

ACI 304 – Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete.

Fed. Spec. SS-S-164 Sealing Compound; Hot Poured Type, for Joints in Concrete.

1.3 QUALITY ASSURANCE. Perform work in accordance with 1990 MDOT (Michigan Department of Transportation) Standard Specifications for Construction sections on Roadway Earthwork; Concrete Curb and Gutter; and Concrete Sidewalk, Sidewalk Ramps, and Steps and 6.11 and as specified in the standards of the County, City or Township having jurisdictional authority as well as the 1999 Standard Specifications for Paving and Related Construction for the City of Detroit. Replacement work shall match the appearance of the original construction.

Obtain cementitious materials form same source throughout.

1.4 SUBMITTALS.

1.4.01 Product Data. Three copies of the mix design shall be submitted to the Engineer. Submit data on joint filler admixtures and curing compounds.

1.4.02 Certification. Submit certification that concrete mix conforms to specified MDOT mixes. Submit mix design for approval for all non-MDOT concrete mixes.

PART 2 – PRODUCTS

2.1 MATERIALS. Concrete shall be composed of a mixture of Portland Cement, fine aggregates, coarse aggregates, fly ash, admixtures, when specified, and water.

2.1.01 Fill Materials. Earth materials excavated under this Contract, to be suitable for backfill behind the curb or integral curb and sidewalk, the filling of low places in a strip 2 feet (61 cm) wide and paralleling the constructed curb, and integral curb and sidewalk, shall be a type that may be thoroughly compacted by the method specified. Such material, to be useable, shall be free from rubbish or debris, vegetable matter, large stones, concrete fragments or other road material, lumber, tree roots, or branches. In general, select excavated material to be suitable for backfill shall be restricted to sand or crumbly clay, unless indicated otherwise on the drawings. Approved offsite fill of similar quality shall be provided when excavated material is of insufficient quantity or unsuitable for use as backfill.

2.1.02 Concrete Materials. The materials shall meet the requirements specified in the MDOT Standard Specifications for Construction.

Concrete, 30P, 35P, 35HE	Section 7.01
Mortar and Grout	Section 7.02
Steel Reinforcement	Section 8.05
Joint Materials	Section 8.16
Curing Materials	Section 8.24

For instances where an MDOT mix is not specified, provide concrete as follows. Grade “A” concrete shall be used throughout the work except that Grade “C” concrete may be used for backfills, unless stronger concrete is called for on the plans.

Grade “A” concrete shall have a minimum compressive strength of 4,000 psi (27.6 kPa) at 28 days and shall contain not less than 6 ½ sacks of cement per cubic yard (8 ½ sacks of cement per cubic meter) of concrete. Grade “C” concrete shall have not less than 3 sacks of cement per cubic yard (4 sacks of cement per cubic meter) of concrete.

2.1.03 Water. Water used in concrete or mortar mixtures or for curing concrete shall be potable or reasonably clean and free of oil, salt, acid, alkali, sugar, vegetable, or other substances injurious to the finished product.

2.1.04 Cement. Cement for use in concrete shall be “Portland Cement” conforming to the respective requirements of the applicable ASTM specification listed below. Cement of only one kind and type shall be used throughout the work and it shall be a standard brand of a single producer, unless otherwise specifically authorized by the Engineer.

Type I, IA, III and IIIA Portland cements shall conform to ASTM C150. The requirements for Gilmore Setting Time Test and compressive strength through the 28-day test shall apply.

2.1.05 Fine Aggregate (Sand). Fine aggregate shall be natural sand consisting of fine granular material resulting from the natural disintegration of rock or manufactured sand or a combination thereof. The sand shall consist of clean, sound, durable particles free from any adherent coating, clay lumps or other deleterious substances, and at the time of use shall be entirely free of frozen material.

Fine aggregate shall conform to the requirements of the current MDOT Standard Specifications for fine aggregates for Portland Cement concrete, natural sand, Type 2NS.

2.1.06 Coarse Aggregate. Coarse aggregate shall consist of gravel, stone, or slag all of which shall conform to the current MDOT Specifications for type 6AA. Coarse aggregate shall be used in all concrete permanently exposed to weather.

2.1.07 Admixtures. Admixtures include all materials other than water, aggregates, and Portland Cement that are used in the making of concrete and that are added to the batch immediately before or during the mixing.

Admixtures, other than Air-Entraining admixture conforming to the requirements of ASTM C260 shall not be used in the concrete without the prior written approval of the Engineer.

Admixtures that may be used with written approval of the Engineer are Calcium Chloride per ASTM D98, Type 1 regular flake and water reducing admixtures ASTM C494, Type A and Type D.

2.1.08 Joint Materials. Filler for expansion joints shall be premolded bituminous, ASTM D1751 unless indicated otherwise on the drawings. Filler for contraction joints shall be bituminous joint filler, AASHTO M33 unless indicated otherwise on the drawings. Filler for curb expansion and contraction joints shall be premolded bituminous, ASTM D1751 or AASHTO M213 Type III unless indicated otherwise on the drawings.

Poured joint filler shall be hot-poured rubber-type compound, Fed Spec. SS-S-164.

2.1.09 Forms. Pavement and curb forms shall be straight and free from distortion, and of sufficient strength to resist forces applied during the process of placing concrete against them. The forms shall be of an approved section, with a flat surface on top, and shall be of the full depth of the pavement or curb.

Forms for radius corners shall be steel or thin board, accurately formed to true radius, and held by bracing and stakes to maintain a true curve.

PART 3 – EXECUTION

3.1 PREPARATION.

3.1.01 Sidewalk Removal. The required removal shall be done in a manner that will avoid damage to property and any existing sidewalks and driveways that are to remain. Where portions of an existing sidewalk or driveway are to remain, the removed portion shall extend to an existing joint or sawed joint as directed by the Engineer. The sawed joint shall be cut full-depth with a power-driven concrete saw.

Earth removal at the edges of the existing sidewalks shall be limited to that reasonably required for the subsequent installation of the concrete forms or rails. Existing sod shall be carefully removed and suitably stored for later replacement. Such work will be considered incidental to the cost of construction.

3.1.02 Subgrade. Subgrade for sidewalks shall be compacted to a density equivalent to the density of the immediately surrounding undisturbed soil for a depth of 6 inches (15.24 cm).

3.1.03 Curb Removal. Existing curbs which are to be removed will be designated in the field by the Engineer. The required removal shall be done in a manner that will avoid damage to property and to any existing sidewalks that are to remain.

Where existing curb is located over a gas service line, the use of a drop-weight type pavement breaker, crane and ball type breaker, hydraulic ram, or breaker called a “Woodpecker” shall not be used for curb removal.

Separate type curb shall be completely removed, including existing concrete backing or fill, unless otherwise directed by the Engineer.

Curb removal for integral curb and sidewalk and modified separate type curb shall be done in accordance with the requirements shown on the standard plans.

Earth removal at the back of and adjacent to existing curbs shall be limited to that reasonably required for the subsequent concrete construction including the necessary form work.

3.1.04 Forms. Forms for curves shall be rigid steel forms except on returns or curved sections. Forms for sidewalks shall be steel, except that wood forms may be used on sharp turns and for special sections when approved by the Engineer. If forms for sidewalks are wood, the least dimension shall be nominally 2 inches (5.1

cm) and lumber shall be free of loose knots and knotholes. All side forms shall have a depth at least equal to the edge thickness of concrete being formed.

All forms shall be in good condition with no more than 1/8 inch (3.2 mm) variation in horizontal and vertical alignment for each 10 feet (3.1 m) in length. Forms shall be set true to line and grade and shall be adequately supported to stay in position while depositing and compacting concrete. Forms shall be designed and constructed so as to permit their removal without damage to concrete. The forms shall be oiled with a light clean paraffin oil which will not stain the concrete.

Slip forms for curbs will be permitted upon approval of the Engineer as to methods and equipment.

3.2 INSTALLATION. Curbs shall be constructed in the locations they are removed due to construction operations and shall match the shape of the curb that was removed and the adjacent construction. Expansion joints shall be placed at intervals not greater than 50 feet (15.24 m), at the beginning and end of all radii, and where the curbs abut structures. Contraction joints shall be provided at intervals not greater than 10 feet (3.1 m) and shall not be less than 2 inches (5.1 cm) deep. Tool marks shall not be left in the exposed portion of curbs.

If slip forming is used, an acceptable slip form curb machine shall be used to place, consolidate, and finish the freshly placed concrete in one complete pass in a manner that will require a minimum of hand finishing to produce a dense and homogenous section in conformance with the details indicated on the drawings. A form shall trail behind the machine for such a distance that no appreciable slumping of the concrete will occur. Final finishing shall be as specified hereinafter.

Concrete sidewalks shall be constructed in the locations they are removed due to construction operations and shall match the general characteristics of the removed and adjacent sections of sidewalk. Sidewalks shall be edged and grooved. Expansion joints shall be placed where sidewalks abut structures and curbs, and at intervals not greater than 50 feet (15.24 m).

3.2.01 Joints. Expansion joints in slip form construction shall be made by removing a portion of the freshly placed concrete, inserting 1/2 inch (1.3 cm) thick joint filler, and replacing hand finished concrete at the joint. Rigid forms shall be placed at these joints and left in place for a length of time sufficient to ensure that no appreciable slumping of the hand placed concrete will occur.

Expansion joints in sidewalks shall be formed 1/2 inch (1.3 cm) thick and shall extend the full depth of the slab. All of the joint except for the top 1/2 inch (1.3 cm) below the surface of the sidewalk slab shall be filled with expansion joint material. Sealer shall be poured into the joint to the level of adjacent concrete surfaces.

Contraction joints in curbs shall be placed every 10 feet (3.1 m) and at tangents to radii sections. Contraction joints in curbs shall be formed by 1/4 inch (6.4 mm) thick templates, cut to the configuration of the curb section to the extent indicated on the drawings. These templates shall be secured so that they do not move during placement and compaction of concrete.

As soon as concrete has sufficiently hardened, templates shall be removed from joints, and edges of the joint shall be rounded with an edging tool of 1/8 inch (3.2 mm) radius.

Contraction joints may also be constructed by sawing through curbs to a depth of not less than 1 1/4 (3.2 cm) inches below the surface and with a width of cut not to exceed 1/4 inch.

Contraction joints in sidewalks shall be located so as to provide square panels with a maximum dimension of 7 feet (2.13 m) or as indicated on the drawings. Joints shall be 1/8 inch wide by 1 inch (2.5 cm) deep and may be formed either by inserting a fiber strip, by tooling, or by cutting with a concrete saw.

3.2.02 <u>Finishing</u>. Each curb shall be tooled to the required radii as soon as possible after the concrete takes its initial set. After the forms and templates are removed, the joints shall be tooled and the surface finished with a wood or cork float to remove all imperfections without additional mortar or drier. In all cases, the resulting surface shall be smooth and of uniform color with all rough spots, projections and form stakes removed. No plastering of the concrete will be allowed. Each finished curb shall have a true surface; shall be free from sags, twists, or warps and shall have a uniform appearance. Final finishing shall be light brooming transverse to the line of the curb.

After concrete in sidewalks has been thoroughly consolidated and leveled, and the initial set has taken place, the surface shall be finished with a wood or cork float and either burlap or broom finish. The top surface of sidewalks shall be uniform in color and edges shall be tooled. Care shall be taken to ensure a straight, neat appearance along edges of the sidewalk and at joints.

3.2.03 <u>Curing</u>. After finishing operations have been completed and immediately after the free water has left the surface, the surface of the slab shall be completely coated and sealed with a uniform layer of membrane curing compound in accordance with section 4.50.16 of the 1990 MDOT Standard Specifications for Construction and as specified herein. The compound shall be thoroughly stirred to a uniform consistency in the drum just prior to transfer of the compound to the membrane spraying equipment. Curing compound shall not be thinned.

The curing compound shall be applied at a minimum rate of 1 gallon per 200 square feet (1 liter per 4.9 square meters) of surface. If rain falls on the newly coated concrete before the film has dried sufficiently to resist damage, or if the film is damaged in any other way, the Contractor will be required to apply a new coat of material to the affected areas equal in curing value to that specified for the original coat.

All traffic, either foot or otherwise, will be considered as injurious to the film of the applied compound. A minimum of foot traffic will be permitted on the dried film as necessary to properly carry on the work, such as sawing joints, provided any damage to the film is immediately repaired by another application of compound.

If fixed-forms are removed during the curing period, the entire area of the sides of the slab shall be coated with curing compound immediately after removal of the forms. Approved hand-spray equipment will be permitted for the application of the curing compound on the sides of the slab and for repairing damaged areas.

Failure to provide proper curing will be considered as sufficient cause for immediate suspension of the concreting operations.

When approved by the Engineer, curing compound may be omitted when cold-weather protection is used during the curing period.

3.2.04 Protection. The Contractor shall protect the concrete work against damage of any kind until it has been accepted by the Engineer. Concrete which has been damaged shall be removed and replaced or repaired by the Contractor to the satisfaction of the Engineer.

3.2.05 Restoration of Asphalt Surfaces. Any asphalt surface damaged during curb replacement work shall be replaced by saw cutting the pavement 1 foot (30.5 cm) from the face of the curb and parallel to it; and stripping the wearing course, and replacing with a wearing course mixture similar to the existing surface course with bond coat on the underlying base or leveling course.

End of Section

SECTION 02760

SIDEWALKS, SIDEWALK RAMPS AND DRIVEWAYS

PART 1 - GENERAL

1.1 SCOPE. This section includes the removal of existing and/or disintegrated concrete sidewalks and/or driveways, disposal of broken concrete and other waste materials, excavation, backfilling, and grading for sidewalks and driveway construction to the established grades and cross-sections, and protection of trees and trimming of tree roots, as required is included herein.

The furnishing, care, storage, and mixture of all materials which are necessary to be incorporated into the concrete, including contraction and expansion material; the furnishing, erection, stripping, care and maintenance of forms; the handling, transportation, and placement of concrete for the proposed sidewalks and driveways; and the protection and care of the partially completed and completed work until final acceptance.

1.2 GENERAL.

1.2.02 Governing Standards.

AASHTO (American Association of State Highway and Transportation Officials) M213, as revised – Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Types).

ADA (American with Disabilities Act) – Standards for Accessible Design.

ASTM (American Society for Testing and Materials) A185 – Steel Welded Wire Fabric, Plain for Concrete Reinforcement.

ASTM A497 – Steel Welded Wire Fabric, Deformed for Concrete Reinforcement.

ASTM A615/A615M – Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM C31/C31M – Practice for Making and Curing Concrete Test Specimens in the Field.

ASTM C33 – Concrete Aggregates.

ASTM C39/C39M – Test Method for Compressive Strength of Cylindrical Concrete Specimens.

ASTM C94/C94M – Ready-Mix Concrete.

ASTM C150 – Portland Cement.
ASTM C172 – Practice for Sampling Freshly Mixed Concrete.

ASTM C173 – Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method.

ASTM C174/C174M – Test Method for Measuring Thickness of Concrete Elements Using Drilled Concrete Cores.

ASTM C260 – Air-Entraining Admixtures for Concrete.

ASTM C309 – Liquid Membrane-Forming Compounds for Curing Concrete.

ASTM C494 – Chemical Admixtures for Concrete.

ASTM C595 – Blended Hydraulic Cements.

ASTM C666 – Test Method for Resistance of Concrete to Rapid Freezing and Thawing.

ASTM D98 – Calcium Chloride.

ASTM D154 – Guide for Testing Varnishes.

ASTM D1751 – Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction.

ASTM D1752 – Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction.

1.3 QUALITY ASSURANCE. Perform work in accordance with MDOT (Michigan Department of Transportation) Standard Specifications for Construction Division of Earthwork and Miscellaneous Construction. Obtain materials from same source throughout period of construction.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit data on joint filler, admixtures, and curing compounds. Three copies of the mix design shall be submitted to the Engineer for review.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Maintain access for pedestrian and vehicular traffic during placement of curbs and sidewalks.

2.2 MATERIALS.

2.2.01 Concrete. Concrete shall be composed of a mixture of Portland Cement, fine and coarse aggregate, water and any admixtures used and blended together to produce a dense homogeneous finished material.

Water used in concrete or mortar mixtures or for curing concrete shall be potable and reasonably free of oil, salt, acid, alkali, sugar, vegetable, or other substance injurious to the finished product.

2.2.02 Cement. Cement for pavement and curb concrete shall be "Portland Cement" conforming to the respective requirements of the applicable ASTM specifications. Cement of only one kind and type shall be used throughout the work and it shall be a standard brand of a single producer, unless otherwise specifically authorized in writing by the Engineer.

Type I, IA, III, and IIIA Portland Cements shall conform to ASTM C150. The requirements for Gillmore Setting Time Test and compressive strength though the 28-day test shall apply.

2.2.03 Fine Aggregate (Sand). Fine aggregate shall be natural sand consisting of fine granular material resulting from the natural disintegration of rock, manufactured sand, or a combination thereof. The sand shall consist of clean, sound, durable particles free from any adherent coating, clay lumps or other deleterious substances, and at the time of use shall be entirely free of frozen material.

Fine aggregate shall conform to the requirements of the current MDOT Specifications for Fine Aggregates for Portland Cement concrete, natural sand, Type 2NS.

Sampling and testing shall be done in accordance with methods and requirements in ASTM C33. Loss by washing shall not exceed 3%.

2.2.04 Coarse Aggregate. Coarse aggregate shall consist of gravel, stone or slag all of which shall conform to the current MDOT Specifications for Type 6AA, except for sampling and testing. Sampling and testing shall be done in accordance with the methods and requirements specified in ASTM C33. MDOT Serial No. 6AA coarse aggregate shall be used in all concrete permanently exposed to the weather.

2.2.05 Admixtures. Admixtures include all materials other than water, aggregates, and Portland cement that are used in the making of concrete and that are added to the batch immediately before or during the mixing.

Admixtures, other than air-entraining admixture conforming to the requirements of ASTM C260, shall not be used in the concrete without the prior written approval of the Contracting Engineer.

Admixtures that may be used with written approval of the Engineer are calcium chloride, ASTM D98, Type 1, regular flake and water reducing admixtures per ASTM C494, Type A and Type D. Neither Type A nor Type D admixtures shall contain calcium chloride.

2.2.06 Steel Reinforcement. Steel reinforcement for use in concrete sidewalks, sidewalk ramps, and driveways, shall conform to the specific requirements of the 1990 MDOT Standard Specifications for Construction on Steel Reinforcement, Section 8.05.

2.2.07 Joint Materials. Joint and joint filler materials for use in concrete pavements shall conform to the specific requirements of the MDOT Standard Specifications for Construction on Joint and Waterproofing Materials, Section 8.16.

2.2.08 Curing Materials. White membrane curing compound for curing concrete shall consist of pigments, a blend of oils and resins, and a volatile solvent and shall conform to the specific requirements of the MDOT Standard Specifications for Construction, Section 8.24 except, nonvolatile matter in the compound shall be not less than 40 percent by weight determined by methods for testing varnishes of ASTM D154. Also, the pigment shall not settle out excessively or cake in the container during storage and shall be capable of being mixed to a smooth, uniform consistency.

When curing compound containing linseed oil is called for in the documents or the proposal, the material shall comply with ASTM C309 or AASHTO M148. Application shall be as per manufacturer's recommendations and as directed by the Engineer.

PART 3 – EXECUTION

3.1 PREPARATION. Finished grades, alignments and contours shall be established, set, achieved and maintained to the satisfaction, and approval of the Engineer, prior to placing concrete.

3.1.01 Sidewalk and Driveway Removal. The required removal shall be done in a manner that will avoid damage to property and any existing sidewalks and driveways that are to remain. Where portions of an existing sidewalk or driveway are to remain, the removed portion shall extend to an existing joint or sawed joint unless otherwise directed by the Engineer. The concrete shall be cut full depth with a concrete saw. Adjacent to structures that are to remain in place, the removal procedures used shall be such that no damage occurs to the structure. In all instances, sufficient removal shall be made to provide for proper grades and connections between the old and new work.

Earth removal at the edges of the existing sidewalks and driveways shall be limited to that reasonably required for the subsequent installation of the concrete forms or rails. Earth which may be removed when removing concrete shall be replaced with a similar material at the contractor's expense. Existing sod shall be carefully removed and suitably stored for later replacement.

The exposed soil shall be prepared as a foundation for the new concrete replacement as specified herein.

3.1.02 Subgrade and Subbase Preparation. Excavation for sidewalk and driveway paving is limited to the width of the sidewalk or driveway plus 6 inches (15.2 cm) allowed on each side for forming. Additional excavation, unless directed by the Engineer, shall be backfilled, compacted, and landscaped at no additional cost. Excavation and shaping shall be to the required line, grade, and cross-section as shown on the drawings, and as indicated by stakes set on the site by the Engineer.

Vegetable matter at the subgrade shall be removed as directed by the Engineer, and the resulting space backfilled with suitable material and compacted in a manner specified herein.

Should the soil at the subgrade be, in the judgement of the Engineer, unsuitable as a foundation for the pavement, the excavation shall be taken down to firm soil as directed by the Engineer. The resulting space shall be backfilled with, and compacted as described above.

Excavation below the subgrade, unless directed by the Engineer, will be deemed unauthorized and the space of such excess excavation shall be backfilled in the same manner as specified above but at no additional cost.

The excavated subgrade area shall be uniformly compacted. A pneumatic or vibratory type mechanical tamper shall be used. The subgrade shall be so tamped as to closely approximate the required grade and cross-section.

Where the subgrade is at the required elevation, not requiring a subbase, the tamped and partially formed subgrade shall be trimmed and smoothed to the grade and cross-section required by the concrete construction, by a suitable method approved by the Engineer.

A subbase, when required, shall be placed on the tamped subgrade, as specified below.

The subgrade, or subbase where used, shall be moist, but not muddy, soft, or frozen, at the time of concrete placement. When necessary, the area shall be uniformly wetted by a method that will prevent forming pools of water.

Immediately prior to concrete placement, the prepared subgrade and subbase when used, shall again be tested for conformity with the required grade and cross-section, using an approved scratch template on the side forms or rails. Material shall be removed, or added and tamped, if and as required, to bring all portions of the exposed surfaces to the required elevations. The surfaces shall again be checked with the template. All loose material which may have fallen on the prepared surfaces shall be carefully removed.

The prepared subgrade and subbase shall be approved by the Engineer before any concrete is placed thereon.

The subbase wherever required on the subgrade shall be composed of MDOT Class II granular, fill material, except as hereinafter specified. The fill material shall be deposited and spread in not more than 8-inch (20.3 cm) layers loose measure, or as otherwise directed by the Engineer. Each layer shall be compacted in a similar manner to that specified above for the subgrade. The subbase shall be brought up to the grade required for the concrete construction. The final surface finish of the subbase shall be as specified above for subgrade.

Where the top of the concrete sidewalk or driveway will be above the original ground, the subbase fill shall be brought up to the top of the concrete and extend out level at least 12 inches (30.5 cm) from the edge of the concrete. From such

outside point, the fill shall extend to natural grade on a maximum slope of 1 ½ horizontal to 1 vertical.

Where necessary to provide for natural surface drainage, and when so directed by the Engineer, subbase shall be composed of MDOT 22A fill material, deposited, spread, and compacted in the same manner as specified for Class II fill material.

3.1.03 Tree Protection. Trees shall be protected from damage by the construction operations. The sidewalk adjacent to a tree shall, where necessary and when directed by the Engineer, be arced to provide an 18 inch (45.7 cm) clearance between the edge of the sidewalk and the tree trunk or root system at ground level. Such arcs shall be as uniform and symmetrical in appearance as is practicable to meet existing conditions.

Tree roots 3 inches (7.6 cm) and larger in diameter within the sidewalk or driveway area shall not be completely severed when they may be trimmed and still not protrude. Smaller roots which would protrude into the new concrete entirely or in part shall be completely removed. Cutting of tree roots 3 inches (7.6 cm) and larger in diameter shall be done under the supervision of the Engineer.

Tree Removal. Trees and stumps shall be removed as specified in the most current edition of MDOT Standard Specifications for Construction.

3.2 INSTALLATION.

3.2.01 Application. All sidewalks, whether repaired, replaced, or entirely new, shall ordinarily be constructed with a cross slope of 3/8 inches each foot (3.1 cm per meter) upward from the top of the pavement curb, or from the established grade therefore, towards the property line. The edge of the sidewalk at the curb side shall not exceed 6 inches (15.2 cm) as a maximum height above the top of the curb or above the established grade of the street. At intersection of streets, junctions with existing work, and other special conditions where it is not practical and reasonable to follow such cross slope, the sidewalks shall be constructed as directed by the Engineer.

Driveways across public property shall be constructed to the grades established by the Engineer. On unpaved streets, the Engineer will establish the line and grade.

All site preparation shall be so performed that the finished concrete sidewalks and driveways will conform to these requirements.

3.2.02 Erection. Concrete forms shall be suitably constructed, placed, positioned, secured and braced to achieve and maintain the established finished grades and contours, and to maintain position of all reinforcing, and expansion joint material, all to the satisfaction and approval of the Engineer.

Steel bar and wire reinforcing with appropriate chairs shall be provided, suitably placed, positioned and secured, all to the satisfaction and approval of the Engineer.

3.2.03 Placement. The base shall be moist and the mixed concrete shall be deposited thereon, to the depth specified on the Plans or in the Proposal, in successive batches and continuous operation without the use of bulkheads between joints. Regardless of the methods of mixing, transporting, placing and working, the concrete when deposited in the forms shall be free from segregation, have a slump of between 3 to 5 inches (7.6 cm to 12.7 cm) and contain not less than 4 percent nor more than 7 percent of entrained air.

The concrete shall be placed and distributed to such depth and sufficiently above grade that when consolidated and finished, the concrete surface will conform to the required finished grade and elevations. All spreading required shall be done with shovels. The concrete shall be thoroughly spaded along the face of the forms and adjacent to joints before finishing operations are started.

The concrete shall be struck off to the required grade and cross-section.

Sidewalk ramp slopes shall be uniform except as necessary for short grade changes.

Where gutters are replaced in conjunction with sidewalk ramps, the gutter shall be constructed to the same dimensions and profile and contain the same reinforcement as the existing gutter, unless otherwise shown on the plans.

3.2.04 Jointing. All concrete sidewalks and driveways shall have expansion joints and contraction joints in accordance with these specifications.

Joints shall be constructed true to line with their faces perpendicular to the surface of the sidewalk and shall not vary more than ¼ inch (6.4 mm) from their designated position.

When the sidewalk is constructed in partial width slabs, transverse joints in the succeeding slab shall be placed in line with the like joints in the adjacent slab. In the case of widening existing sidewalks, transverse joints shall be placed in line with joints in the existing sidewalk.

The concrete at the faces of all joints shall be thoroughly spaded or vibrated and compacted to fill all voids, and the surface shall be finished smooth and substantially true to grade.

Expansion joints shall be placed at right angles to the rail forms and perpendicular to the subgrade, and shall extend from 1 inch (2.5 cm) below the bottom of the pavement to the top of and flush with the finished concrete surface.

When a driveway apron abuts an existing private driveway or a sidewalk abuts a driveway the expansion joint filler shall extend 1 inch (2.5 cm) below the bottom of the thinner pavement.

Sidewalks less than 7 feet (2.1 m) in width shall have transverse expansion joints ½ inch (1.3 cm) in thickness at lot lines, except:

> Where individual lots are 25 feet (7.6 m) or less in width, an expansion joint shall be placed at every two lots on the lot line, and a divider joint shall be placed at the intervening lot line.
>
> Where individual lots are 50 feet (15.2 m) in width, additional expansion joints shall be so spaced so that in no case will joints be more than 50 feet (15.2 m) apart.

Driveways and full-width walks extending more than 7 feet (2.1 m) from the curb to the property or building line, shall have expansion joints 1 inch (2.5 cm) in thickness at both the curb and property or building line, or shall be divided at two or more places by expansion joints where:

The distance exceeds 30 feet (9.1 m).

The joints cannot be placed vertically at the curb or building line.

Driveway aprons shall have expansion or contraction joints so placed that no slab shall have nominal dimension exceeding 15 feet x 15 feet (4.6 m x 4.6 m).

Commercial driveways shall be divided on all sides by 1 inch (2.5 cm) thick expansion joints. Where commercial driveway aprons exceed 20 feet (6.1 m) parallel to the curb construction, contraction joints shall be placed at the center line.

All key flags or property line margin flags, driveways, crosswalks, junction of curb circles, and alley returns shall have 1 inch (2.5 cm) thick expansion joints.

Where hydrants are located within the sidewalk area, a 3 foot (91.4 cm) knockout square, centered on the hydrant, shall be constructed with full depth ½ inch (1.3 cm) expansion paper and 30 pound (13.6 kg) felt paper shall be wrapped around the hydrant at contact with the concrete.

Where utility poles are located within the sidewalk area, full depth, ½ inch (1.3 cm) expansion paper shall be required around the pole and, in addition, at the perimeter of a 3 foot (91.4 cm) knockout square centered on the pole.

Contraction joints shall be placed at intervals of not less than 5 feet (1.5 m) nor more than 7 feet (2.1 m) at right angles to the rail forms and perpendicular to the subgrade, and extending from the surface not less than one half the slab thickness. Walks 4 feet (1.2 m) in width shall have joints placed at intervals of not less than 4 feet (1.2 m) nor more than 7 feet (2.1 m). All walks extending to property or building line shall be a longitudinal joint at the margin line.

Contraction joints may be constructed by the use of either divider plates, premolded joint paper, or a jointer, with 1 1/2 inches (3.81 cm) minimum depth, or by sawing concrete when approved by the Engineer.

Divider plates shall be ¼ inch (6.4 mm) in thickness. Divider plates shall be removed after the concrete has set sufficiently to prevent slumping. After the divider is removed, the open joint shall be finished with a double edger, as specified under "Finishing."

Premolded joint filler paper shall be ¼ inch (6.4 mm) in thickness. The paper shall permanently remain in place. The surface of the concrete shall be finished with an edger on both sides of the paper, as specified under “Finishing.”

Sawed contraction joints may be used in lieu of the above methods upon specific authorization of the Engineer based upon methods and equipment proposed by the Contractor.

3.2.05 Finishing. As soon as free mortar appears on the placed concrete, a straight edge template shall be used as a strike-off across the rail forms to produce a true surface. While the concrete is still plastic, the surface shall be finished with wood or steel floats, bringing the surface to the required grade and cross-section. Care shall be taken not to overwork the concrete and bring an excess of water to the surface. Neat cement shall not be used as a dryer to facilitate finishing the surface.

When the concrete is sufficiently hard, the surface shall be carefully and uniformly scored by brooming with a brush having fine bristles, or by means giving

comparable results when approved by the Engineer. The surface of sidewalk ramps shall be textured with a coarse broom transversely to the ramp slope.

The edges of the concrete areas shall be rounded with approved finished tools having a radius not exceeding ¼ inch (6.4 mm). Such edging shall be carefully done so as to produce an evenly rounded edge, true to both line and grade.

3.2.06 Contractor’s Stamp. The Contractor’s name and the year in which the walk or drive was laid shall be carefully and clearly impressed in the concrete surface of each isolated flag, each flag at the property line, and in each end flag or slab of two or more adjoining flags or slabs. Each individual flag adjacent to a tree, whether arced or not, shall be also marked, as directed by the Engineer.

The stamp or plate used for marking shall have an approximate maximum dimension 4 x 6 inches (10.2 x 15.20 cm), outside dimension. The Contractor’s name and the current year’s date shall be in such characters and arrangement that legible and indelible impressions may be made in the concrete.

3.2.07 Protection of Concrete. The placed concrete shall be protected from damage from all causes. Sufficient covering material shall be kept available to protect the fresh concrete from pitting and washing in case of rain. No one shall be allowed to walk on or otherwise disturb the concrete until it has thoroughly set. Barricades and lights shall be provided to prevent traffic upon the concrete until it sufficient strength to avoid damage.

Barricades and lights shall not be removed from commercial drives until the concrete has developed 7-day strength.

Concrete shall be protected by suitable means from low temperatures and moisture from start of placement until completion of curing or until concrete has attained strength of at least 750 psi (5,171 KPa).

Any settlement, damage, or defects occurring in any portion of the work shall be repaired or that portion of the work replaced, as directed by the Engineer, prior to and as a condition of final acceptance.

3.2.08 Curing Concrete. All exposed concrete surface shall be protected from premature drying. Such surfaces shall be given an application of membrane curing compound immediately after the water sheen, which follows the final finishing, has disappeared. The compound shall be applied to concrete surface that is thoroughly wet but having no free water. The compound shall be applied as a spray at the rate of 1 gallon per 200 square feet (1 liter per 4.9 square meters) of surface. Buildings and property adjacent to the area being sprayed shall be protected from splashing or blowing of the curing compound.

The membrane curing compound shall be white pigmented. Transparent compound may be used at locations approved by the Engineer. Approval to use transparent curing compound shall be requested prior to placement of concrete.

The treated surfaces shall be protected from damage for at least seven days. Any area where the compound film is damaged in any way shall have a new coat of material applied in the same manner and rate as required for the original coat.

End of Section

SECTION 02820

CHAIN LINK FENCES AND GATES

PART 1 - GENERAL

1.1 SCOPE. Section includes all labor, material, and equipment to construct fence framework, fabric, and accessories; excavation for post bases; concrete foundation for posts, and center drop for gates; and manual gates and related hardware.

Fencing shall be provided in the alignment and at the heights indicated on the drawings. Fencing shall have a top rail, bottom tension wire, and three strands of barbed wire projecting outward at the top.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM A53, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

ASTM A121, Standard Specification for Metallic-Coated Carbon Steel Barbed Wire.

ASTM A392, Standard Specification for Zinc-Coated Steel Chain-Link Fence Fabric.

ASTM A824, Metallic Coated Steel Marcelled Tension Wire for Use With Chain Link Fence.

Chain-Link Fence Manufacturers Institute (CLFMI).

AASHTO M181 – Standard Specification for Chain-Link Fence.

Section 6.21 of the 1990 MDOT Standard Specifications for Construction.

1.3 QUALITY ASSURANCE. Supply material in accordance with the Chain Link Fence Manufacturer's Institute – Product Manual. The Engineer may inspect all fencing materials at the place of manufacture.

1.3.01 Contractors Qualification. Company specializing in installation of chain link fencing and gate with minimum 3 years documented experience.

1.3.02 Tolerances. Maximum Variation from Plumb shall be 1/4 inch (0.64 cm). Maximum Offset From True Position shall be 1 inch (2.5 cm). Components shall not infringe adjacent property lines.

If foundation holes are excavated in unstable soil, notify Engineer for determination of suitable construction precautions.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. All shop drawings shall conform to the provisions of Project Submittals. Shop drawings shall include cross sectional dimensions of posts, braces, rails, fittings, accessories and gate frames; design of gates; and details of all gate hardware. Layout drawings to show the spacing of posts and locations of all gates; abrupt changes in grade; and all corner, gate, anchor, end, and pull posts.

Submit data on fabric, posts, accessories, fittings and hardware along with manufacturer installation instructions and requirements.

1.4.02 Samples. Submit samples of all fencing materials to be used, in accordance with the requirements of Project Submittals. Mark or tag each sample.

1.4.03 Test Reports. Submit certified reports indicating results of tests for zinc-coating.

Submit 2 statements, one with Contractor's letterhead, and the other with subcontractor's letterhead, stating the submitted samples comply with the requirements of the Contract Documents.

Submit samples at least 30 days before erection of the fence.

1.4.04 Record Documents. Accurately record actual locations of property perimeter posts relative to property lines and easements on “as-builts” drawings.

1.5 DELIVERY, STORAGE, AND HANDLING. Fence fabric and accessories shall be delivered to the construction site in packed cartons or firmly tied rolls. Each package shall be identified and shall bear the manufacturer’s name. Store fence fabric and accessories in a secure and dry place.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Fence Height shall be 8 feet (2.4 m) or as indicated on Drawings. Line Post Spacing shall be at intervals not exceeding 10 feet (3.1 m).

2.2 MATERIALS. All chain-link fencing shall be galvanized steel. Steel pipe dimensions and weights shall conform to ASTM A53, Schedule 40. Dimensions specified are the nominal pipe sizes. Dimensions and weights specified herein are subject to a tolerance of plus or minus 5 percent.

Ferrous metal fittings, posts, fence, gate framework, and all accessories shall be galvanized with a heavy coating of pure zinc spelter using the hot-dip process. Thinner zinc-coatings and electro-galvanizing are not acceptable. Zinc paint or cold galvanizing compounds shall not be used as a substitute for the specified hot-dipped galvanized finish. The zinc-coating shall be a minimum of 2.0 oz./ sq. ft. (61mg/square cm), except where specified otherwise.

Fabrication and welding shall be done before hot-dip galvanizing. All welding shall conform to American Welding Society standards.

Provide posts with tops of same material, so designed as to fit securely over post and carry top rail or cable; base of top fitting to carry apron around outside of post.

2.2.01 Fence Fabric. Galvanized steel chain-link fabric shall conform to ASTM A392, with Class 2 zinc coating (2.0 oz./sq. ft. (61 mg/square cm) of uncoated wire surface); Fabric shall be woven in 2 inch (5.1 cm) mesh from 9 gage (3.84 mm) wire in an 8 foot (2.4 m) width with knuckled selvage on top and twisted selvage on bottom.

2.2.02 Barbed Wire And Extension Arms. Galvanized steel barbed wire consisting of three strands of twisted 12 gage (2.7 mm) wires with 4 point barbs spaced 3 inches (7.6 cm) apart and conforming to ASTM A121, with Class 2 zinc-coating.

Extension arms shall project outward, from the top of the posts, at a 45 degree angle and shall be capable of withstanding a 200 lb. (90.9 kg) downward pull on the outermost end of the arm, without failure. The upper strand of the barbed wire shall be approximately 12 inches (30.5 cm) out from the fence and 12 inches (30.5 cm) above the top of the fabric. Extension arms shall evenly space the barbed wire and shall be integral with post top weather caps with holes for passage of top rail at intermediate posts.

2.2.03 Tension Wire. Tension wire shall conform to ASTM A824, 7 gage (4.6 mm) coil spring steel wire with galvanized finish having a minimum of 0.80 oz./sq. ft. of uncoated wire surface. of zinc-coating

2.2.04 Tie Wires. Shall be minimum 9 gauge (3.84 mm) aluminum or 11 gauge (3.1 mm) galvanized steel.

2.2.05 Line Posts. Line posts shall be “C” section roll-form from steel conforming to ASTM-A570 grade 50, 1.875 x 1.625” (4.8 cm x 4.1 cm) with minimum bending strength of 274 pounds (124.6 kg) under a 6 foot cantilever load continuous coated 4 ounces (113.6 gm^3) of zinc coated per ASTM-F043 Type A, or 2.375 inches (6.0 cm)

O.D. Standard weight Schedule 40 galvanized pipe with minimum bending strength of 2.34 pounds (1.1 kg) under a 6 foot (1.8 m) cantilever load coated with 1.8 ounces of hot-dipped zinc in accordance with ASTM-F1083.

2.2.06 End, Corner And Pull Posts. End, corner and pull posts shall be 2-7/8 inch (7.3 cm) O.D. steel pipe weighing not less than 5.79 pounds/foot (8.6 kg/m)., 2-1/2 inch (6.4 cm) square steel tube weighing not less than 5.14 pounds/foot (7.7 kg/m) or 3-1/2 by 3-1/2 inch (8.9 x 8.9 cm) roll-formed, steel corner section weighing not less than 5.14 pounds/foot (7.7 kg/m). Terminal posts shall have a minimum bending strength of 443 lbs. (201.4 kg) under a 6 foot (1.8 m) cantilever load.

2.2.07 Top, Bottom, and Brace Rail. Top, bottom, and brace rails shall be roll-formed section of 1.625 inches x 1.25 inches (4.1 cm x 3.2 cm) channel shaped rail with minimum vertical bending strength of 263 pounds on 10 foot (3.1 m) span continuous coated 4 ounces (113.6 gm) of zinc coated per ASTM-F1043 Type A, or 1.66 inch (4.2 cm) O.D., Standard weight Schedule 40 galvanized pipe with minimum vertical bending strength of 235 pounds (106.8 kg) on 10 foot (3.1 m) span coated with 1.8 ounces (51.1 gms) of hot-dipped zinc in accordance with ASTM-F1083. Top, bottom, and rail couplings 6 inches (15.2 cm) minimum in length shall be spaced at maximum 21 feet (6.4 m) centers. Fabric tie wire shall be spaced at 24 feet (7.3 m) maximum centers.

2.2.08 Gates. Gate types, opening widths and directions of operation shall be shown on the Drawings. Gates shall be designed for operation by one person. Gate Fabric shall be the same chain-link fabric as used for the fence. Barbed wire shall include vertical support arms and 3 strand barbed wire as used for the fence.

2.2.09 Swing Gate. Swing gates shall be factory assembled and shall swing 180 degrees.

Gate posts, for gate leaves up to and including 6 feet (1.8 cm) wide, shall be 2-7/8 inch (7.3 cm) O.D. steel pipe weighing not less than 5.79 pounds/foot (8.6 kg/m), or 2-1/2 inch (4 m) square steel tube weighing not less than 5.14 pounds/foot (7.7 kg/m). or 3-1/2 by 3-1/2 inch (8.9 x 8.9 cm) roll-formed, steel corner section weighing not less than 5.14 pounds/foot (7.7 kg/m).

Gate posts, for gate leaves over 6 feet (1.8 m) wide and up to and including 13 feet (4 m) wide, shall be 4 inch (10.2 cm) O.D. steel pipe weighing not less than 9.10 pounds/foot (13.6 kg/m).

Gate leaf framework shall utilize 1-7/8 inch (4.8 cm) O.D. steel pipe weighing 2.72 pounds/foot (4.1 kg/m), minimum.

Gate hinges shall be heavy pattern of adequate strength for gate size, with large bearing surfaces for clamping or bolting in position.

2.2.09 Sliding Gates. Sliding gates shall be factory assembled. Each section of sliding gates shall have equal widths. Gate posts shall be 4 inch (10.2 cm) O.D. galvanized steel pipe weighting 9.10 pounds/foot (13.6 kg/m).

Gate Frames shall be fabricated of galvanized steel pipe and top and bottom members shall be 2 3/8 inch (6.0 cm) O.D. weighting 3.65 pounds/foot (5.4 kg/m). Vertical members shall be 1.9 inch (4.8 cm) O.D. weighting 2.7 pounds/foot (4.1 kg/m). Diagonal members shall be 1.66 inch (4.2 cm) O.D. weighting 2.3 pounds/foot (3.4 kg/m). Joints shall be made either by welding or by heavy fittings.

Rollers for overhead and cantilever sliding gates shall be equipped with bearings. Non-sealed bearings shall be provided with a grease fitting for periodic maintenance. Rollers shall be secured to post or frame without welding.

2.2.10 Cantilever Gates. Each section of double cantilevered gates shall have a 20 foot (6.1 m) width.

Gate posts shall be 4 inch (10.2 cm) O.D. galvanized steel pipe weighing 9.10 pounds/foot (13.6 kg/m).

Gate Frames shall be fabricated of galvanized steel pipe and top and bottom members shall be 2-3/8 inch (6.0 cm) O.D. weighing 3.65 pounds/foot (5.4 kg/m). Vertical members shall be 1.90 inch (4.8 cm) O.D. weighing 2.72 pounds/foot (4.1 kg/m). Diagonal members shall be 1.66 inch (4.2 cm) O.D. weighing 2.27 pounds/foot (3.4 kg/m). Joints shall be made either by welding or by heavy fittings.

Rollers shall be 4 each 4 inch x 2 ½ inch (10.2 x 6.4 cm) cantilever rollers at 18 lbs. (8.2 kg) each.

2.2.11 Gate Hardware. Furnish appropriate hardware for gates including gate stop and drop rod, mechanical keepers, and hardware for padlock as required.

2.2.12 Railings. Railings shall be 1-5/8 inch (4.1 cm) O.D. steel pipe with a minimum weight of 2.27 pounds/foot (3.4 kg/m) or 1-1/4 inch (3.2 cm), 14 gage (19 mm) roll-form section, for top railing and railings for top middle and bottom braces between terminal posts and adjacent line posts.

2.2.13 Truss Braces. Shall be 3/8 inch (1.0 m) diameter steel rod, diagonal truss braces between terminal and adjacent line posts and for gate framework.

2.2.14 Fittings And Post Tops. Heavy-duty malleable iron or pressed steel fittings or suitable to produce strong construction.

2.2.15 Stretcher Bars. Flat steel bars, conforming to ASTM A626, with minimum cross section dimensions of 1/4 inch by 3/4 inch (6.4 mm x 19.1 mm), full height of fabric, secured with bar bands of minimum 11 gage (3.9 mm) sheet steel, spaced approximately 15 inches (38.1 cm) on center and bolted with 3/8 inch (95.3 m) diameter bolts, for attaching fabric to terminal posts.

2.2.16 Latch. Gates shall be provided with suitable latch, accessible from both sides and with provision for padlocking.

2.2.17 Gate Padlocks. Manufactured by Eaton Corp. Lock & Hardware Div., Yale Marketing Dept., Charlotte, NC; P&F Corbin, Div. of Emhart Corp., Berlin, CT; Best Universal Lock Co., Inc., Indianapolis, IN; or acceptable equivalent and furnished with two keys each. Padlock keying shall be coordinated with Engineer.

Padlocks shall have solid brass cases, hardened steel shackles, removable core cylinders, and galvanized steel chains attached to shackle by a clevis.

2.2.18 Concrete. Concrete, for post foundation bases and maintenance strips, shall conform to the requirements specified in Master Specification Section 03300, Cast In Place Concrete. Where indicated on the Drawings, provide an 18" (45.7 cm) wide concrete maintenance strip centered under the fence line.

2.2.19 Privacy Slats. Where indicated on the drawings, provide lock-top, non-winged PVC slats as manufactured by Hoover Fence Co., Newton Falls, and Ohio. The slats shall be installed vertically between the chain-link fence fabric and shall be held in place with a horizontal locking strip. The color of the slats shall be as determined by the Engineer.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Any change in direction, of the fence line, of 30 degrees or more shall be considered a corner. Pull posts shall be used at any abrupt change in grade.

Post foundations shall be concrete cylinders with a minimum diameter of 12 inches (30.5 cm), crowned at grade to shed water, with 36 inches (91.4 cm) minimum depth in ground.

Place posts at each corner, having change of direction, abrupt change in grade, gate, and terminal, in addition to line and pull posts. Set post foundations in full depth of foundation except for 4 inches (10.2 cm) of concrete foundations.

Post spacing shall be uniform with a maximum spacing of 10 feet (3 m) in fences erected along straight lines. All posts shall be placed plumb and centered in concrete foundations.

Excavate post hole footings not smaller than 12 inches (30.5 cm) in diameter and 36 inches (91.4 cm) deep. Crown top of concrete to shed water, and allow to cure not less than 72 hours before proceeding with further work on posts. Embed galvanized steel eye bolts in top of footings, adjacent to posts, to receive bottom tension wire.

Brace end, corner, pull, and gate posts to nearest line post with diagonal or horizontal brace rails used as compression members, and with truss rods with turn-buckles used as tension members. Brace line posts horizontally and truss in both directions as required at approved intervals. The maximum area of unbraced fence shall not exceed 1,500 square feet (54.9 square meters).

Stretch fabric taut and tie to posts, rails, and tension wires with bottom edge following finished grade not more than 2 inches (5.1 cm) above grade. Install fabric on security side of fence and anchor to framework so that fabric remains in tension after pulling force is released. Pull fabric tight so maximum fabric deflection is 2 inches (5.0 cm) when a 30 lb. (14 kg) pull is exerted perpendicular to the center of a panel. Attach fabric to line posts with ties spaced at not more than 24 inch (61.0 cm) intervals. Attach fabric to tension wire with hog ring ties on 21 inch (53.3 cm) centers.

Install three strands of barbed wire on each extension arm of line fence and at the top of each gate. Pull wires taut and fasten at each support.

Install gates plumb, level, and secure for full width of opening and hardware adjusted for smooth operation.

3.1.02 Touch-Up And Repair Work. Remove and replace fencing, which is improperly located or is not true to line, grade and plumb within tolerances as indicated.

End of Section

SECTION 02900

LANDSCAPING

PART 1 - GENERAL

1.1 SCOPE. This section covers placing and grading topsoil, turf establishment, and the installation of trees, shrubs, and ground covers. The Contractor shall provide all materials, labor, and equipment to complete all landscape work in accordance with the drawings and specifications.

1.2 GENERAL. All landscaping and seeded or sodded areas (turf establishment) work shall be performed by a landscape contractor or nursery having demonstrated experience in the installation of plant material on projects of similar size and who employs only experienced personnel who are familiar with the required work and who shall provide adequate supervision by a qualified foreman at all times when the work is in progress.

1.2.02 Finish Grades and Soil Conditions. Shall be subject to approval before commencing work under this section.

1.2.03 Horticultural Standards. All work and material covered by this section shall be in strict accordance with standards of the American Association of Nurserymen as set forth in the latest edition of "American Standard for Nursery Stock".

1.2.04 Certificates of Inspection. All shipments of plant material shall be inspected at the nursery or at the growing site by the authorized Federal and State Agencies. All necessary inspection certificates shall accompany the invoice for each shipment.

Any plant material which indicates signs of insects, their eggs or larvae, and diseases shall be rejected and immediately removed from the project and shall be replaced with proper materials within one working day, weather permitting. Removal and replacement shall be at the expense of the Contractor.

1.3 SUBMITTALS.

1.3.01 Sample. Samples of topsoil, Humus, Peat Moss, Mulch, and Filler Fabric shall be submitted for analysis and testing; they shall be submitted in approved containers, appropriately labeled as to kind of material and its sources.

1.3.02 Test Reports and Certificates. Shall be submitted as specified in Master Specification Section 01080, Project Submittals.

1.3.03 Certification. Certificates of inspection for plant materials and material certificates for landscape materials shall be submitted in Project Submittals section.

1.3.04 Planting Schedule. The proposed planting schedule shall be submitted indicating dates for each type of landscape work during normal seasons for such work in the area of the site. Once accepted, dates shall be revised only if accepted in writing and after documentation of reasons for delays.

1.3.05 Maintenance Instructions. Typewritten instructions shall be submitted which recommend procedures to be established by the Engineer for maintenance of landscape work for one full year. Maintenance procedures shall be performed by the Contractor for recommended procedures.

1.3.06 Landscape Foreman. The Contractor shall submit to the Engineer in writing the name of the landscape foreman to be in attendance at the project site during progress of the work. Should a change in foremanship be necessary during any period in the progress of the work, the Engineer shall be notified promptly and the name of the new foreman submitted.

1.4 SUBSTITUTIONS. If a plant is found not to be available, the Contractor shall notify the Engineer. The Engineer will select a reasonable alternate or inform the Contractor of the availability of the original plant. If a substitution is selected, it shall be of the same size, value, and quality as the original plant.

1.5 WARRANTY.

1.5.01 Guaranteed Period. All seeded and sodded areas and all trees and shrubs shall be subject to one year correction period which shall commence upon the date of Final Acceptance by the Engineer. Any turf, tree, or shrub, planted during this period, which dies or partially dies to the point that the main leader has died back or there is 25 percent or more of the crown dead, shall be replaced at the Contractor's expense. Replacements made under the Contractor's warranty shall be covered by a like warranty for a period of one year after completion of the replacement. Rejection of plants by the Engineer will be final. When notified by the Engineer that certain plants, seeded or sodded areas require replacement, the replacements shall be made within 30 days of notification, providing the 30 day period falls within the planting season.

1.5.02 Replacements. All replacements shall be of the same kind and size as originally planted and shall be made at no extra cost. The Contractor shall repair any damage, including ruts in seeded, sodded, or bed areas incurred in making replacements.

At the direction of the Engineer, replacements may be planted at the start of the next planting and digging season. In such cases, dead trees and shrubs shall be removed within a reasonable time.

1.5.03 Notification. The Engineer will conduct additional inspections, and will notify the Contractor of any plants that die or require replacement during the one-year warranty period. The Contractor shall provide and coordinate planting of replacements.

1.5.04 Final Warranty Inspection. At the conclusion of the warranty period, the Contractor and Engineer shall conduct a final warranty inspection at a time mutually agreeable. It will be the Contractor's responsibility to notify the Engineer in writing requesting the inspection. The Owner will assume full responsibility after Final Warranty Inspection Approval.

1.6 DELIVERY, STORAGE AND HANDLING.

1.6.01 Packaged Materials. Packaged materials shall be delivered in containers showing weight, analysis, and name of manufacturer. Materials shall be protected from deterioration during delivery and while they are stored at the site.

Each plant packed or shipped individually and each bundle of plants, shall bear, intact upon arrival at the job site, a substantial label on which is legibly written or printed the true name in full of the plant and its size or age.

1.6.02 Plant Material. Give the Engineer at least 48 hours notice before making any delivery of plant material or sod. Plants shall be handled with care at all times to avoid damage to the roots and branches. Trees with broken leaders will be rejected. Dumping, dropping, or dragging of plants will not be permitted. Plants shall be protected from sun and wind. Root balls shall be kept damp or wet during the interim period from delivery to planting. When transporting plants to the site, provisions shall be made to protect the material from wind damage by using an anti-desiccant and avoiding high speeds, by transporting in enclosed or partially enclosed vehicles, or by covering with burlap or other suitable material. Plants damaged by wind will be rejected. This applies to trees supplied by hydraulic tree spade, as well as balled and burlapped trees.

Trees and shrubs shall be delivered after preparation for planting has been completed and shall be promptly planted. If planting is delayed more than 6 hours after delivery to the planting area, trees and shrubs shall be set in shade, protected from weather and mechanical damage, and roots shall be kept moist by covering with mulch, burlap, or other acceptable means of retaining moisture.

Container-grown stock shall not be removed from containers until the time of planting.

1.7 PROJECT CONDITIONS

1.7.01 Time of Planting. The Contractor shall perform planting activities only during periods within the planting season when weather and soil conditions are suitable for each species to be planted and in accordance with local accepted practice. Digging and delivery of plant material shall be made in the dormant season, preferably between the following dates:

Deciduous Material	March 1 to May 15, October 1 until ground freezes
Evergreen Material	March 1 to June 1, August 1 to October 1
Ground Covers	April 15 to June 1

Seeding and sodding shall be performed between the dates of May 1 and October 10, provided adverse conditions do not exist.

1.7.02 Soil and Drainage Conditions. The Contractor shall notify the Engineer in writing of all soil or drainage conditions, which the Contractor considers detrimental to growth of plant material. The Contractor shall state conditions and submit a proposal for correcting conditions, if feasible, including change in cost, if any.

If rock, underground construction work, tree roots, or obstructions are encountered in the excavation of plant pits, alternate locations may be selected by the Engineer. Where locations cannot be changed as determined by the Engineer, the cost required to remove the obstructions to a depth of not less than 6 inches (15.2 cm) below the required pit depth shall be submitted. Work will proceed only after acceptance by the Engineer. Fragmented bedrock that can be reasonably removed shall not be considered an obstruction.

1.7.03 Sequencing. Landscape work shall progress as rapidly as portions of the site become available, working within seasonal limitations for each kind of landscape work required. Final grades shall have been established, top soil spread and bound to subgrade, fills and backfills allowed to settle, the irrigation system installed and operational, and any required mechanical compaction completed before commencing work in any area.

Trees and shrubs shall be planted after final grades are established and prior to planting of grass, or placing sod, unless otherwise acceptable to the Engineer. If planting of trees and shrubs occurs after seeding, sprigging, or sodding work, the grass areas shall be protected, and damage to these areas resulting from landscaping operations shall be promptly repaired.

1.7.04 Job Conditions. All existing trees and other plant material to remain shall be clearly designated and marked under the direction of the Engineer and shall be properly protected by means of fencing or by another approved manner. Any existing trees or plant material designated to remain that is subsequently damaged by operations under this Contract shall be replaced with plant material of the same size and kind at the Contractor's expense.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Topsoil. Topsoil for planting operations shall be fertile, friable, natural loam containing a liberal amount of humus, and shall be capable of sustaining vigorous plant growth and shall not be delivered in a frozen state. Topsoil shall be free of subsoil and shall be reasonably free of stone, lumps, clods of hard earth, plants or their roots, stalks, and other extraneous matter. Topsoil shall contain at least five percent (5%) but not more than twenty percent (20%) by weight of organic matter.

If it is necessary to bring topsoil into the site it shall be subject to inspection and approval at the sources of supply or upon delivery.

2.1.02 Fertilizer. Fertilizer shall be pelleted or granular in an analysis of equal parts of available nitrogen, phosphorus and potash such as 12-12-12. Nitrogen shall be a combination of inorganic and slow release or slowly soluble substances. Fertilizers shall be delivered mixed in standard size bags of the manufacturer showing weight, analysis, and the name of the manufacturer. If not used immediately after delivery, it shall be stored in a dry place in such a manner that its effectiveness will not be impaired.

Fertilizer for tree and shrub planting areas shall be Osmocote slow release 13-13-13, or equal.

2.1.03 Mulch. Mulch for application to seed bed areas shall include straw and wood cellulose fiber.

Mulch for planting areas shall be wood chip mulch of a long fibrous nature, 2 inches to 4 inches in length. Material shall be free of all foreign debris including clods, adhering films of dirt, weed seeds, and roots.

Straw mulch shall be baled, dry, unweathered, and shall not contain an excessive amount of seed as determined by the Contractor. Material for anchoring straw shall be as per Division 9 of the MDOT Standard Specifications for Construction.

Wood cellulose fiber mulch for hydromulching shall be equal to "Hydro Mulch" as manufactured by Conwed Corp. of St. Paul, Minnesota.

2.1.04 Manure. Manure shall be well rotted, unleached stable or cattle manure containing not more than 25 percent by volume of straw, sawdust or other bedding materials and containing no chemicals or ingredients harmful to plants.

2.1.05 Guying and Staking Material. Stakes shall be sound hardwood, free of loose knots and holes, and at least 8 feet (2.4 m) long for all deciduous trees. Stakes shall be #5 rebar at least 3 feet (91.4 cm) long for all coniferous trees. Wire for tree bracing and guying shall be 12 gage double-strand, twisted, galvanized steel wire. Hose for covering wire shall be rubber hose of the same color throughout the work.

2.1.06 Seed. Seed shall be certified seed tagged and sealed in accordance with Federal and State seed laws. Samples of all seed used shall have been tested within 9 months prior to seeding by an official seed testing laboratory. Seeding mixtures shall have a maximum weed seed content of 0.5 percent, with no noxious weed seed, and shall be composed of certified seed of the purity, germination, and proportion by weight as indicated below:

Species	Percent Mix
Norlea Perennial Ryegrass	30
Kentucky BlueGrass	30
Creeping Red Fescue	40

Seed shall be furnished in sealed, standard containers with certification label attached. Seed that is wet or moldy or that has been otherwise damaged in transit or storage will not be acceptable.

2.1.07 Sod. Sod shall be nursery grown and composed of the following mixture:

Species	Percent Mix
Perennial Ryegrass	30
Kentucky Bluegrass	30
Creeping Red Fescue	40

Sod shall be machine cut at a uniform soil thickness of 1 - 1 1/2 inches (2.5 – 3.8 cm), plus or minus 1/4 inch (0.6 cm), at the time of cutting. Measurement for thickness shall exclude top growth and thatch.

Individual pieces of sod shall be cut to the supplier's standard width and length. Maximum allowable deviation from standard widths and lengths shall be plus or minus 1/2 inch (1.3 cm) on width and plus or minus 5 percent on length. Broken pads and torn or uneven ends will not be acceptable.

Standard-sized sections of sod shall be strong enough to support their own weight and should retain their size and shape when suspended vertically from a firm grasp on the upper 10 percent of the section.

Sod shall not be harvested or transplanted when moisture content (excessively dry or wet) will adversely affect its survival.

Before stripping, sod shall be mowed uniformly to a height of 1 to 2-1/2 inches (2.5 – 6.4 cm).
Sod shall be relatively free of thatch, up to 1/2 inch (1.3 cm) allowable (uncompressed).

Sod shall be reasonably free of diseases, nematodes, and soil-borne insects.

Sod shall be free of objectionable grassy and broadleaf weeds. Sod shall be considered free of such weeds if less than 5 such plants are found per 100 square feet (9.3 square meters). Sod will not be acceptable if it contains any of the following weeds: quackgrass, Johnson grass, poison ivy, nutsedge, nimblewill, Canada thistle, bindweed, wild garlic, ground ivy, perennial sorrel, bromegrass, bentgrass, and Bermuda grass.

2.1.08 Trees and Shrubs. The proportions and branching of all trees and shrubs shall be in strict accordance with the standards of the American Association of Nurserymen as published in the "American Standard for Nursery Stock", ANSI Z60.1-1981. Trees and shrubs shall have a normal habit of growth and shall be well-branched, vigorous, healthy, and free from insect infestations, insect eggs or larvae, and disease. Trees with weak, thin trunks which are not capable of self-support when planted in the open are not acceptable. Trees with bad crotches, broken or unidentifiable leader, lopsided growth, or weak open structure are not acceptable. All trees and shrubs of any one species shall have the same general form and character. All trees and shrubs shall be nursery grown and true to name. Balled and burlapped plants shall be freshly dug when dormant. Collected plants are not acceptable. Plants from cold storage, from the past season, and heeled-in plants are not acceptable. Balls shall be firm and tightly wrapped. No balled plant shall be planted if the ball is cracked, broken, or mushroomed. The size of the ball shall conform to minimum sizes in ANSI Z60.1.

2.1.09 Water. Water shall be furnished by the Contractor. The Contractor shall also provide all necessary hoses, hose connections, temporary pipe, and other equipment necessary for watering.

2.1.10 Edging. Edging shall be 1/8 inch (0.3 cm) by 6 inch (15.24 cm) by Permaloc aluminum edging, or approved equal.

2.1.11 Selective Pre-emergence Herbicide. Surflan, Devrinol, Betasan, or Dacthal herbicide shall be used.

2.1.12 Weed Barrier and Filter Fabric. DuPont Typar 3201 Filter Fabric shall be used. A full product fact sheet and sample shall be submitted to the Contractor for consideration.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 General. Prior to grading and tilling, vegetation that may interfere with operations shall be mowed, grubbed, and raked. The collected material shall be removed from the site. The surface shall be cleared of stumps, stones larger than 3 inches (7.62 cm), roots, cable, wire, and other materials that might hinder the work for subsequent maintenance.

Locations of underground utilities shall be determined prior to any excavation. Work shall be performed in a manner which will avoid possible damage. Hand excavation will be used as required. Grade stakes shall be maintained until removal is mutually agreed upon by parties concerned.

Landscaping work shall not be started until substantially all earthwork has been completed. Backfills and fills shall be allowed to settle and finish grading completed immediately before the work is started. All surface and subsurface construction debris shall have been removed completely.

3.1.02 Tree and Shrub Location Staking. The Engineer and Contractor will inspect the tree and shrub bed location staking prior to installation. The Engineer reserves the right to move, shift, or adjust any or all of the stakes to better achieve the planting design intentions as shown on the drawings. Planting shall commence only upon approval of this inspection.

3.1.03 Quantity and Quality of Trees and Shrubs. No plant shall be planted until it is inspected and approved by the Engineer. The Engineer may inspect trees and shrubs either at the place of growth or at the site of collection, for compliance with requirements for genus, species, variety, size, and quality. The Engineer retains the right to further inspect trees and shrubs for size and condition of balls and root systems, insects, injuries and latent defects, and to reject unsatisfactory or defective material at any time during progress of work. Rejected trees or shrubs shall be immediately removed from the project site.

3.1.04 Planting Operating. Planting operations shall proceed under a well-organized program and according to accepted nursery practices. Plants shall be planted within three days upon delivery to the site. The Contractor shall be held solely liable for damage to existing utilities and other structures.

3.1.05 Placing Topsoil. Place topsoil in areas where seeding, sodding or planting is required to a nominal depth of 3 inches (7.6 cm) plus or minus 1/2 inch (1.3 cm). Place topsoil during dry weather. Fine grade topsoil to eliminate rough or low areas. Maintain profiles and contour of subgrade. Remove roots, weeds, rocks, and foreign material while spreading. Manually spread topsoil close to plant, building, to prevent damage. Remove surplus subsoil and topsoil from site. Leave stockpile area and site clean and raked, ready to receive landscaping.

3.1.06 Grading. Established grades, as indicated on the drawings, shall be maintained in a true and even condition. Eroded areas and areas having inadequate drainage, as indicated by the ponding of water, shall be filled. Ruts, deep tracks, dead furrows, and ridges shall be eliminated.

3.1.07 Tilling. The area to be seeded or sodded shall be thoroughly tilled to a depth of at least 3 inches by discing, harrowing, or other accepted methods until the soil is well pulverized and smoothed by harrowing, floating, or dragging. After completion of the tilling operation, the surface shall be cleared of all stones, stumps, or other objects larger than 1-1/2 inches (3.8 cm) in thickness or diameter, and of roots, wire, grade stakes, and other objects that might be a hindrance to maintenance operations. Paved areas over which hauling operations are conducted shall be kept clean and dirt that may be brought upon the surface shall be removed promptly.

Any objectionable undulations or irregularities in the surface resulting from tillage or other operations shall be removed before seeding begins. Bed preparation shall be performed only during periods when satisfactory results are likely to be obtained. When results are not satisfactory because of drought, excessive moisture or other causes, the work shall be stopped until such conditions have been corrected to the satisfaction of the Engineer.

All operations shall be done in a direction parallel to proposed contour lines, and not uphill nor downhill.

3.1.08 Fertilizing. Fertilizer shall be applied within 24 hours prior to the tilling operation. The material shall be distributed uniformly over the entire area. Fertilizer shall be applied at a rate to give one and one-half pounds (0.68 kg) of each pure chemical per 1000 square feet (92.9 square meters) such as 12 pounds (5.5 kg) of 12-12-12, or 15 pounds (6.8 kg) of 10-10-10 per 1000 square feet (92.9 square meters). Alternatively, follow recommendations for fertilizer and lime application rates based upon topsoil testing.

3.1.09 Seeding. Seeding equipment calibration tests shall be made to determine the equipment setting required to apply the seed at the specified rates. In unplanted skips and areas noted after germination and growth of the grass, the unplanted areas shall be seeded at no additional cost. The seed box shall be kept at least half full during seeding operations to ensure even distribution of seed over all the areas seeded.

Leguminous seeds shall be inoculated with a standard pure culture of nitrogen fixing bacteria. The culture shall be mixed with sufficient water to distribute it thoroughly. The seed shall be wetted thoroughly with the solution and allowed to dry sufficiently to be in condition for sowing. Inoculated seed shall be sown within 30 hours after the treatment.

All areas shall be seeded with five pounds of seed per 1000 square feet (92.9 square meters).

Seeding and fertilizing shall not be done during periods of severe drought, high winds, excessive moisture, muddy or frozen ground, as determined by the Engineer, because satisfactory results are not likely to be obtained.

Do not seed areas in excess of that which can be mulched on same day.

Provide recommendation for fertilizer and lime application rates for specified seed mix as result of topsoil testing.

Refer to additional requirements of the current edition of MDOT Standard Specifications for Construction.

3.1.10 Covering and Firming. Unless a cultipacker type seeder is used, the seed shall be covered with a shallow-set spike tooth harrow or a chain, plank, or brush drag. The depth of cover shall not exceed 1/4 inch. In small areas, covering may need to be performed by light hand raking. After covering, the areas shall be firmed by rolling or with the use of a cultipacker.

3.1.11 Mulching. Straw mulch shall be spread uniformly in a continuous blanket at 1-1/2 inch depth loose measurement. Mulch shall be spread by hand or by a blower type mulch spreader. All wire from baled mulch shall be collected as it is removed from the bale.

Wood cellulose fiber mulch as specified shall be applied at a rate of one ton (900 kg) per acre (0.4 ha) in areas designated by the Engineer. A 4 foot by eight foot (1.2 x 2.4 m) plywood sheet shall be used along all walks and structures to prevent overspray.

Immediately following spreading, the straw mulch shall be anchored in the soil to a depth of 2 to 3 inches (5.08 to 7.6 cm) by a coulter disc mulch anchor machine designed to force the mulch into the soil surface. The machine shall be weighted and operated in such manner to secure the mulch firmly in the ground to form a soil-binding mulch and prevent loss or bunching of the hay by wind. The coulter shall be at least 10 inches (25.4 cm) in diameter. Mulch shall be secured within 24 hours after seeding. Two or more passes may be required to anchor the mulch to the satisfaction of the Engineer.

3.1.12 Protection. After completion of construction operations, seeded areas shall be protected where necessary against traffic by erecting barricades or placing warning signs in appropriate areas. Such protective devices shall be maintained until final acceptance of the project.

3.1.13 Sodding. Sodding shall be to the complete satisfaction of the Engineer. Areas which do not exhibit an acceptable stand of grass following seeding shall be sodded at the Contractor's expense. All sod used shall be best quality, and, when placed, shall be live fresh growing grass with soil adhering to the roots.

All sod shall be procured from areas where soil is fertile and contains a high percentage of loamy topsoil and from areas that have been grazed or mowed sufficiently to form a dense turf.

Sod shall be transplanted within 24 hours from the time it is harvested, unless stacked at its destination in a suitable manner. All sod in stacks shall be kept moist and protected from exposure to the sun and from freezing. In no event shall more than one week elapse between cutting and planting.

During periods of higher than optimal temperature and after all unevenness in the soil surface has been corrected, the soil shall be lightly moistened immediately prior to laying the sod.

Before placing sod, all shaping and dressing of the areas shall have been completed. After shaping and dressing, commercial fertilizer of a type acceptable to the Engineer shall be applied uniformly in the manner and amounts recommended by the manufacturer, and harrowed lightly. Sodding shall follow immediately.

The first row of sod shall be laid in a straight line, with subsequent rows placed parallel to and tightly against each other. Lateral joints shall be staggered to promote more uniform growth and strength. Care shall be exercised to avoid stretching or overlapping the sod and to ensure that all joints are butted tight in order to prevent voids which would cause air drying of the roots.

The Contractor shall water sod immediately after transplanting to prevent excessive drying. As sodding is completed in any one section, the entire area shall be rolled. It shall then be watered to a sufficient depth to thoroughly wet the underside of the new sod pad and the soil immediately below the sod.

Sod shall be staked on slopes of 3:1 or steeper; however, the Contractor shall be solely responsible for replacing sod displaced by erosion or other causes.

All sodding shall be done during the period from May 1 to October 1, unless written permission is given by the Engineer to extend the planting season.

3.1.14 Planting Trees and Shrubs. Preparing Shrub Beds: Osmocote shall be spread at a rate of 20 pounds (9 kg) per 100 square feet (9.3 square meters). Soil shall be cultivated to a depth of not less than 8 inches (20.3 cm) to incorporate the fertilizer and manure and break up the compacted soil. Grass, weeds, sods, stones larger than 2-1/2 inches (6.4 cm) in any dimension, clay lumps, and other extraneous material shall be removed to the depth of tillage. Beds shall be mulched with wood chips as specified.

Where existing tree roots are encountered, reduce the depth of tillage and soil amendments proportionately as required to avoid root injury.

3.1.15 Preparing Shrub Beds. Trees and shrubs shall be set in the center of pits, plumb and straight and planted in accordance with the details on the drawings. Backfill soil shall be worked around the root ball and water-settled to eliminate air pockets. Any wire or nylon twine tied or wrapped around the base of the plant shall be removed. All plastic wraps shall be removed. For plants supplied in wire baskets, at least the top 10 inches (25.4 cm) of wire shall be cut away and removed from the pit. The surface for a radius of 2 feet (61.0 cm) and depth of 2 to 4 inches (5.1 0 10.1 cm) around the tree shall be loosened and slightly saucered to retain moisture and act as a mulch.

3.1.16 Fertilizing. Osmocote shall be surface broadcasted over the entire pit area at the rate of 1.8 pounds (0.8 kg) per square yard (0.8 square meters) and shall be mixed into the top 6 inches (15.2 cm) of soil. A guaranteed analysis shall be shown on each bag and the content, testable to ten percent (10) nitrogen, six percent (6) available phosphoric acid and four percent (4) total potash. All trees shall have an application of fertilizer after planting at approximately 1 pound (0.5 kg) per inch of caliper. The fertilizer shall be raked into the top surface above the root system of the plant.

3.1.17 Watering. As planting is completed, each tree and shrub shall be watered thoroughly to settle the plants and eliminate air pockets. All plants shall be watered after planting regardless of soil moisture conditions.

3.1.18 Wrapping and Staking. Shade trees shall be wrapped in a spiral manner with the overlap to one-half (1/2) the width of wrapping. The wrapping shall be securely fastened. Wrapping strips shall be 6 to 10 inches (15.2 – 25.4 cm) in width, free from holes and tears. Either burlap or waterproof crepe paper may be used.

All trees between 1-1/2 inch and 4 inches (5.8 and 10.2 cm) in caliper shall be carefully and adequately staked. Supporting stakes shall be of sound wood uniform in size, and not less than two by 2 inches (5.1 x 5.1 cm) in section. Wire used shall be 12 or 14 gauge (2.7 mm or 1.9 mm) pliable galvanized wire. Hose used for covering wire shall be at least 1/2 inch (1.3 cm) fabric rubber hose. Used hose is acceptable if approved prior to installation. The trees shall be protected by passing wire through sections of rubber hose. The wire shall be so looped that it bears only one side of the tree and in no case shall the wire loop around the truck or branches. Maintain stakes to the end of the guarantee period.

Guying and staking shall be performed before backfilling and watering and as indicated on the drawings.

3.1.19 Pruning. After planting, only deadwood, suckers, and broken or badly bruised branches shall be removed. Pruning shall be performed by shortening branches back to the nearest lateral branch or live bud. The leader shall not be cut. Stubs shall not be left. The natural form and balance of the tree or shrub shall be retained. Trees with heavy tops shall have about one-third to one-half (1/3 to 1/2) of the preceding season's growth removed. Care shall be taken in pruning to preserve the natural character of the plant. Dead, broken and badly bruised branches shall be removed with a clean cut. All cut surfaces over 1 inch (2.5 cm) in diameter shall be tree painted.

3.1.20 Weed Barrier. Weed barrier shall be installed under all mulch in locations indicated on the drawings. The weed barrier shall be placed under mulch on a clean weed- and grass-free and uniformly graded surface and cut to fit neatly against adjacent walls, walks, and edgings. Barrier overlaps shall be at least 4 inches (10.2 cm). The mulch shall be placed at a uniform depth of 2 inches (5.1 cm) over the weed barrier. After installation, no weed barrier shall protrude above the mulch or along edges.

3.1.21 Mulching. Shredded bark shall be installed to a uniform depth of not less than 2 inches (5.1 cm) to the outside diameter of the pit for trees and shrubs, and in the limits of shrub beds.

3.1.22 Edging Material. Edging shall be installed around each planting area to separate seeded and sodded areas from mulched areas. Edging shall be installed in accordance with the manufacturer's recommendations.

3.1.23 Pre-Emergence Herbicide. A pre-emergence herbicide shall be applied at the rate recommended by the manufacturer to all shrub beds and within the limits of mulch at the base of the trees.

3.2 CLEAN UP. After completion of the planting operations, the entire site shall be cleared of excess soil and waste material resulting from the Contractor's work including, but not limited to, stones, stumps, roots, brush, wire, grade stakes, and all objects that might be a hindrance to maintenance operations or affect the visual appearance of the site. Soil clods and debris left on the surface shall be removed.

3.3 MAINTENANCE. The Contractor shall maintain all material beginning immediately after the work is started and continuing until final acceptance. The Owner will assume all maintenance work upon final acceptance, including the removal of stakes and guy wires at the proper time.

3.3.01 Watering. Maintenance shall include a thorough initial watering with programmed or hand watering of trees, shrubs, seeded and sodded areas and ground cover beds thereafter when soil moisture is below optimum level for establishment and growth. Watering in seeded areas shall be by fine mist.

3.3.02 Resetting Plants, Stakes and Guys. Settled plants shall be reset to proper grade and position, dead material removed, and guys tightened or repaired within a reasonable time.

3.3.03 Pruning. Pruning will include only work that is necessary to maintain the plants in their normal growth pattern.

3.3.04 Replacing Dead and Partially Dead Plants. Plant replacement shall be made as specified.

The Contractor shall assume responsibility of maintaining work until final acceptance. Minimum of one (1) maintenance trip every two (2) weeks shall be made to the site during the growing season. Notify the Engineer at least 2 work days prior to each maintenance trip.

3.3.05 Maintenance of Grades and Repair of Erosion Damage. Original grades of the grass areas shall be maintained after commencement of planting operations and during the maintenance period. Any damage to the finished surface from construction operations shall be promptly repaired. In the event erosion occurs from either watering operations or rainfall, such damage shall be promptly repaired. Ruts, ridges, tracks, washouts or gullies and other surface irregularities shall be corrected and areas replanted where required.

3.3.06 Maintenance of Lawn Areas. Shall consist of watering, mowing, fertilizing, weed control, re-sodding or re-seeding bare areas if necessary, repair of erosion damage, maintenance of mulch, trimming, edging and any other operation necessary to produce a first quality lawn. The lawn shall be mowed as necessary, keeping the lawn height to a maximum of 3-1/2 inches (8.9 cm) until acceptance. Do not cut more than 1/3 of grass blade at any one mowing. The first mowing shall take place when seedlings are 40 percent higher than desired height. Neatly trim edges and hand clip where necessary and immediately remove clippings after mowing and trimming. Do not let clippings lay in clumps. The Contractor shall provide all maintenance of the lawn areas as described until it has been thoroughly established.

3.3.07 Maintenance of Plantings. Maintenance of plantings shall consist of watering, cultivating, weeding, pruning, fertilizing, keeping plants erect, raising plants which settle below grade, maintaining tree stakes and applying such sprays as are necessary to keep the plantings free of insects and disease.

3.3.08 Maintenance of Mulched Areas. Mulch in seeded areas shall be maintained until covered with growing grass seedlings. Mulch material that has been removed from the site by wind or other causes shall be replaced and secured. Repair work that is required because of faulty operations or negligence on the part of the Contractor shall be performed at no additional cost.

3.3.09 Weeding and/or Weed Killer Application. Shall be scheduled as necessary to keep the seeded and sodded areas and planting area as free of weeds as possible. All shrub and mulched areas around trees shall be weed free at final acceptance. Remedy damage resulting from improper use of herbicides.

3.3.10 Plant Material. Contractor agrees to guarantee all plant material for a period of two years. The Guarantee period shall start at the time of provisional acceptance

of the landscaping and terminate at final warranty inspection acceptance of the landscaping. The guarantee includes furnishing new plants as well as labor and materials for installation of replacements. Plants found to be dead or dying during the maintenance trips will be reported in writing to the Engineer. Replacement planting shall be completed no later than the next planting season with plant material conforming to the original specifications. All areas damaged by replacement operations shall be fully restored by the Contractor. First replacement plants shall be guaranteed one growing season following planting. If the first replacement plant dies, the Contractor shall be responsible for not more than one additional replacement plant per location which will carry no guarantee. Plants planted in the fall or spring will be inspected in September. The Contractor shall not assume responsibility for damage or loss of plant material resulting from natural
causes such as flood, lightning storms, freezing rains, or winds over 60 miles per hour (96.5 km/hr), nor will he be hold responsible for damages resulting from acts of negligence on the part of the Owner or others occupying the site; fires or vandalism during the guarantee period. Any tree replacement planting shall have the same guarantee as that of the original tree planting.

3.4 FINAL ACCEPTANCE. When the work has been completed, the Contractor shall notify the Engineer in writing requesting a final acceptance. At a time mutually agreeable, the Contractor and Engineer will inspect the work and report findings as to acceptability and completeness. Any work remaining to be done shall be subject to another review. The Contractor will be notified in writing by the Engineer of the provisional acceptance of completed portions of the work.

This final acceptance shall serve as the start of the guarantee period.

End of Section

SECTION 02906

PLANTING IRRIGATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Piping.
2. Automatic control valves.
3. Automatic drain valves.
4. Transition fittings.
5. Miscellaneous piping specialties.
6. Sprinklers.
7. Quick couplers.
8. Controllers.
9. Boxes for automatic control valves.

1.3 DEFINITIONS

1.3.01 Circuit Piping: Downstream from control valves to sprinklers, specialties, and drain valves. Piping is under pressure during flow.

1.3.02 Drain Piping: Downstream from circuit-piping drain valves. Piping is not under pressure.

1.3.03 Main Piping: Downstream from point of connection to water distribution piping to, and including, control valves. Piping is under water-distribution-system pressure.

1.3.04 Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

1.4 PERFORMANCE REQUIREMENTS

1.4.01 Irrigation zone control shall be automatic operation with controller and automatic control valves.

1.4.02 Location of Sprinklers and Specialties: Design location is approximate. Make minor adjustments necessary to avoid plantings and obstructions such as signs and light standards. Maintain 100 percent irrigation coverage of areas indicated.

1.4.03 Minimum Working Pressures: The following are minimum pressure requirements for piping, valves, and specialties unless otherwise indicated:

1. Irrigation Main Piping: 200 psig (1380 kPa).
2. Circuit Piping: 150 psig (1035 kPa).

1.5 SUBMITTALS

1.5.01 Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

1.5.02 Wiring Diagrams: For power, signal, and control wiring.

1.5.03 Delegated-Design Submittal: 100 percent coverage irrigation system, including locations of heads pipes, zones, valves, types of heads and available pressure for system.

1.5.04 Coordination Drawings: Irrigation systems, drawn to scale, on which components are shown and coordinated with each other, using input from Installers of the items involved. Also include adjustments necessary to avoid plantings and obstructions such as signs and light standards.

1.5.05 Qualification Data: For qualified Installer.

1.5.06 Zoning Chart: Show each irrigation zone and its control valve.

1.5.07 Controller Timing Schedule: Indicate timing settings for each automatic controller zone.

1.5.08 Field quality-control reports.

1.5.09 Operation and Maintenance Data: For sprinklers controllers and automatic control valves to include in operation and maintenance manuals.

1.6 QUALITY ASSURANCE

1.6.01 Installer Qualifications: An employer of workers that include a certified irrigation designer qualified by The Irrigation Association.

1.6.01 Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.7 DELIVERY, STORAGE, AND HANDLING

1.7.01 Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

1.70.2 Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.8 PROJECT CONDITIONS

1.8.01 Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:

1. Notify Owner’s representative no fewer than two days in advance of proposed interruption of water service.
2. Do not proceed with interruption of water service without Owner's written permission.

1.9 EXTRA MATERIALS

1.9.01 Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Impact Sprinklers: Equal to 95 percent of amount installed for each type and size indicated, but no fewer than 80 units.
2. Spray Sprinklers: Equal to 5 percent of amount installed for each type and size indicated, but no fewer than 4 units.

PART 2 - PRODUCTS

2.1 PIPES, TUBES, AND FITTINGS

2.1.01 Comply with requirements in the piping schedule in this section for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

2.1.02 PVC Pipe: ASTM D 1785, PVC 1120 compound, Schedules 40 and 80.

1. PVC Socket Fittings: ASTM D 2466, Schedule 40.
2. PVC Threaded Fittings: ASTM D 2464, Schedule 80.
3. PVC Socket Unions: Construction similar to MSS SP-107, except both headpiece and tailpiece shall be PVC with socket ends.

2.1.03 PVC Pipe, Pressure Rated: ASTM D 2241, PVC 1120 compound, SDR 21 and SDR 26.

1. PVC Socket Fittings: ASTM D 2467, Schedule 80.
2. PVC Socket Unions: Construction similar to MSS SP-107, except both headpiece and tailpiece shall be PVC with socket or threaded ends.

2.2 PIPING JOINING MATERIALS

2.2.01 Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick unless otherwise indicated; full-face or ring type unless otherwise indicated.

2.2.02 Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

2.2.03 Solvent Cements for Joining PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.

2.2.04 Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

2.3 AUTOMATIC CONTROL VALVES

2.3.01 Plastic, Automatic Control Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
2. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:

   a. Buckner; a division of Storm Manufacturing Group Inc.
   b. Greenlawn Sprinkler Company.
   c. Hit Products Corporation.
   d. Hunter Industries Incorporated.
   e. Rain Bird Corporation.

3. Description: Molded-plastic body, normally closed, diaphragm type with manual-flow adjustment, and operated by 24-V ac solenoid.

2.4 AUTOMATIC DRAIN VALVES

2.4.01 Description: Spring-loaded-ball type of corrosion-resistant construction and designed to open for drainage if line pressure drops below 2-1/2 to 3 psig (17 to 20 kPa).

2.5 TRANSITION FITTINGS

2.5.01 General Requirements: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.

2.5.02 Transition Couplings:

1. Manufacturers: Subject to compliance with requirements, provide products available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Cascade Waterworks Manufacturing.
    b. Dresser, Inc.; DMD Division.
    c. Ford Meter Box Company, Inc. (The).
    d. JCM Industries.
    e. Smith-Blair, Inc; a Sensus company.
    f. Viking Johnson.

2. Description: AWWA C219, metal sleeve-type coupling for underground pressure piping.

2.5.03 Plastic-to-Metal Transition Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Harvel Plastics, Inc.
    b. Spears Manufacturing Company.

2. Description: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-socket[or threaded] end.

2.5.04 Plastic-to-Metal Transition Unions:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    a. Colonial Engineering, Inc.

b. NIBCO INC.
c. Spears Manufacturing Company.

2. Description: MSS SP-107, PVC four-part union. Include one brass[or stainless-steel] threaded end, one solvent-cement-joint[or threaded] plastic end, rubber O-ring, and union nut.

2.6 MISCELLANEOUS PIPING SPECIALTIES

2.6.01 Water Hammer Arresters: ASSE 1010 or PDI WH 201, with bellows or piston-type pressurized cushioning chamber and in sizes complying with PDI WH 201, Sizes A to F.

2.6.02 Pressure Gages: ASME B40.1. Include 4-1/2-inch- (115-mm-) diameter dial, dial range of two times system operating pressure, and bottom outlet.

2.7 SPRINKLERS

2.7.01 General Requirements: Designed for uniform coverage over entire spray area indicated at available water pressure.

2.7.02 Plastic, Pop-up, Gear-Drive Rotary Sprinklers:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Buckner; a division of Storm Manufacturing Group Inc.
b. Champion Irrigation Products.
c. Hunter Industries Incorporated.
g. Rain Bird Corporation.
h. Toro Company (The); Irrigation Division.
i. Weathermatic.

3. Description:

a. Body Material: ABS.
b. Nozzle: ABS.
c. Retraction Spring: Stainless steel.
d. Internal Parts: Corrosion resistant.

4. Capacities and Characteristics:

a. Flow: 3 to 6 gpm.
b. Pop-up Height: 3 to 12 inches above ground to nozzle.
c. Arc circle as indicated.

d. Radius: 40 to 50 feet.

2.7.03 Plastic, Pop-up, Impact-Drive Rotary Sprinklers:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

2. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:

   a. Buckner; a division of Storm Manufacturing Group Inc.
   b. Toro Company (The); Irrigation Division.

3. Description:

   a. Case: ABS.
   b. Pop-up Height: Approximately 3 inches (75 mm).
   c. Sprinkler Construction: ABS and other corrosion-resistant metals.

4. Capacities and Characteristics:

   a. Flow: 3 to 6 gpm.
   b. Pop-up Height: 3 to 12 inches above ground to nozzle.
   c. Arc circle as indicated.
   d. Radius: 40 to 50 feet.

2.8 QUICK COUPLERS

2.8.01 Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Buckner; a division of Storm Manufacturing Group Inc.
4. Hunter Industries Incorporated.
5. Nelson, L. R. Corporation.
6. Rain Bird Corporation.
7. Toro Company (The); Irrigation Division.
8. Weathermatic.

2.8.02 Description: Factory-fabricated, bronze or brass, two-piece assembly. Include coupler water-seal valve; removable upper body with spring-loaded or weighted, rubber-covered cap; hose swivel with ASME B1.20.7, 3/4-11.5NH threads for garden hose on outlet; and operating key.

1. Locking-Top Option: Vandal-resistant locking feature. Include two matching key(s).

2.9 CONTROLLERS

2.9.01 Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Hunter Industries Incorporated.
2. Rain Bird Corporation.
3. Superior Controls Co., Inc.
4. Toro Company (The); Irrigation Division.
5. Weathermatic.

2.9.02 Description:

1. Controller Stations for Automatic Control Valves: Each station is variable from approximately 5 to 60 minutes. Include switch for manual or automatic operation of each station.
2. Exterior Control Enclosures: NEMA 250, Type 4, weatherproof, with locking cover and two matching keys; include provision for grounding.

    a. Body Material: Enameled-steel sheet metal or Molded plastic.
    b. Mounting: Surface type for wall.

3. Interior Control Enclosures: NEMA 250, Type 12, dripproof, with locking cover and two matching keys.

    a. Body Material: [Enameled-steel sheet metal or Molded plastic.
    b. Mounting: Surface type for wall.

4. Control Transformer: 24-V secondary, with primary fuse.
5. Timing Device: Adjustable, 24-hour, 14-day clock, with automatic operations to skip operation any day in timer period, to operate every other day, or to operate two or more times daily.

    a. Manual or Semiautomatic Operation: Allows this mode without disturbing preset automatic operation.
    b. Nickel-Cadmium Battery and Trickle Charger: Automatically powers timing device during power outages.
    c. Surge Protection: Metal-oxide-varistor type on each station and primary power.

6. Moisture Sensor: Adjustable from one to seven days, to shut off water flow during rain.

7. Wiring: UL 493, Type UF multiconductor, with solid-copper conductors; insulated cable; suitable for direct burial.

   a. Feeder-Circuit Cables: No. 12 AWG minimum, between building and controllers.
   b. Low-Voltage, Branch-Circuit Cables: No. 14 AWG minimum, between controllers and automatic control valves; color-coded different from feeder-circuit-cable jacket color; with jackets of different colors for multiple-cable installation in same trench.
   c. Splicing Materials: Manufacturer's packaged kit consisting of insulating, spring-type connector or crimped joint and epoxy resin moisture seal; suitable for direct burial.

8. Concrete Base: Reinforced precast concrete not less than 36 by 24 by 4 inches (900 by 600 by 100 mm) thick, and 6 inches (150 mm) greater in each direction than overall dimensions of controller. Include opening for wiring.

2.10 BOXES FOR AUTOMATIC CONTROL VALVES

2.10.01 Plastic Boxes:

1. Manufacturers: Subject to compliance with requirements, [provide products by one of the following] [available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:

   a. Armorcast Products Company.
   b. Carson Industries LLC.
   c. Nationwide Plastics, Inc.
   d. Oldcastle, Inc.

2. Description: Box and cover, with open bottom and openings for piping; designed for installing flush with grade.

   a. Size: As required for valves and service.
   b. Shape: Rectangular unless indicated otherwise.
   c. Sidewall Material: PE, ABS, or FRP.
   d. Cover Material: PE, ABS, or FRP.

      1) Lettering: "VALVE BOX."

2.10.02 Drainage Backfill: Cleaned gravel or crushed stone, graded from 3/4 inch (19 mm) minimum to 3 inches (75 mm) maximum.

PART 3 - EXECUTION

3.1 EARTHWORK

3.1.01 Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."

3.1.02 Install warning tape directly above pressure piping, below finished grades, except 6 inches (150 mm) below subgrade under pavement and slabs.

3.1.03 Drain Pockets: Excavate to sizes indicated. Backfill with cleaned gravel or crushed stone, graded from (3 inches to12 inches below grade.) Cover gravel or crushed stone with sheet of asphalt-saturated felt and backfill remainder with excavated material.

3.1.04 Provide minimum cover over top of underground piping according to the following:

1. Irrigation Main Piping: Minimum depth of 36 inches (900 mm) below finished grade, or not less than 18 inches (450 mm) below average local frost depth, whichever is deeper.
2. Circuit Piping: 12 inches (300 mm).
3. Drain Piping: 12 inches (300 mm).
4. Sleeves: 24 inches (600 mm).

3.2 PREPARATION

3.2.01 Set stakes to identify locations of proposed irrigation system. Obtain Architect's approval before excavation.

3.3 PIPING INSTALLATION

3.3.01 Location and Arrangement: Drawings indicate location and arrangement of piping systems. Install piping as indicated unless deviations are approved on Coordination Drawings.

3.3.02 Install piping at minimum uniform slope of 0.5 percent down toward drain valves.

3.3.03 Install piping free of sags and bends.

3.3.04 Install groups of pipes parallel to each other, spaced to permit valve servicing.

3.3.05 Install fittings for changes in direction and branch connections.

3.3.06 Install unions adjacent to valves and to final connections to other components with NPS 2 (DN 50) or smaller pipe connection.

3.3.07 Install flanges adjacent to valves and to final connections to other components with NPS 2-1/2 (DN 65) or larger pipe connection.

3.3.08 Install underground thermoplastic piping according to ASTM D 2774 and ASTM F 690.

3.3.09 Install expansion loops in control-valve boxes for plastic piping.

3.3.10 Lay piping on solid subbase, uniformly sloped without humps or depressions.

3.3.11 Install ductile-iron piping according to AWWA C600.

3.3.1 Install PVC piping in dry weather when temperature is above 40 deg F (5 deg C). Allow joints to cure at least 24 hours at temperatures above 40 deg F (5 deg C) before testing.

3.3.12 Install water regulators with shutoff valve and strainer on inlet and pressure gage on outlet. Install shutoff valve on outlet. Install aboveground or in control-valve boxes.

3.3.13 Water Hammer Arresters: Install between connection to building main and circuit valves aboveground or in control-valve boxes.

3.3.14 Install piping in sleeves under parking lots, roadways, and sidewalks.

3.3.14 Install sleeves made of [Schedule 80] PVC pipe and socket fittings, and solvent-cemented joints.

3.3.15 Install transition fittings for plastic-to-metal pipe connections according to the following:

1. Underground Piping:

   a. NPS 1-1/2 (DN 40) and Smaller: Plastic-to-metal transition fittings.
   b. NPS 2 (DN 50) and Larger: AWWA transition couplings.

2. Aboveground Piping:

   a. NPS 2 (DN 50) and Smaller: Plastic-to-metal transition [fittings] [unions].
   b. NPS 2 (DN 50) and Larger: Use dielectric flange kits with one plastic flange.

3.3.16 Install dielectric fittings for dissimilar-metal pipe connections according to the following:

1. Underground Piping:

   a. NPS 2 (DN 50) and Smaller: Dielectric coupling or dielectric nipple.
   b. NPS 2-1/2 (DN 65) and Larger: Prohibited except in control-valve box.

2. Aboveground Piping:

   a. NPS 2 (DN 50) and Smaller: Dielectric union.
   b. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Dielectric flange.
   c. NPS 5 (DN 125) and Larger: Dielectric flange kit.

3. Piping in Control-Valve Boxes:

   a. NPS 2 (DN 50) and Smaller: Dielectric union.
   b. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Dielectric flange.
   c. NPS 5 (DN 125) and Larger: Dielectric flange kit.

3.4 <u>JOINT CONSTRUCTION</u>

3.4.01 Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

3.4.02 Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

3.4.03 Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

3.4.04 Flanged Joints: Select rubber gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.4.05 Copper-Tubing Brazed Joints: Construct joints according to CDA's "Copper Tube Handbook," using copper-phosphorus brazing filler metal.

3.4.06 Copper-Tubing Soldered Joints: Apply ASTM B 813 water-flushable flux to tube end unless otherwise indicated. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy (0.20 percent maximum lead content) complying with ASTM B 32.

3.4.07 PVC Piping Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
2. PVC Pressure Piping: Join schedule number, ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
3. PVC Nonpressure Piping: Join according to ASTM D 2855.

3.5 SPRINKLER INSTALLATION

3.5.01 Install sprinklers after hydrostatic test is completed.

3.5.02 Install sprinklers at manufacturer's recommended heights.

3.5.03 Locate part-circle sprinklers to maintain a minimum distance of 4 inches (100 mm) from walls and 2 inches (50 mm) from other boundaries unless otherwise indicated.

3.6 AUTOMATIC IRRIGATION-CONTROL SYSTEM INSTALLATION

3.6.01 Equipment Mounting: Install interior controllers on wall.

1. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor bolts to elevations required for proper attachment to supported equipment.

3.6.02 Equipment Mounting: Install exterior freestanding controllers on precast concrete bases.

1. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor bolts to elevations required for proper attachment to supported equipment.

3.6.03 Install control cable in same trench as irrigation piping and at least 2 inches (51 mm) below or beside piping. Provide conductors of size not smaller than recommended by controller manufacturer. Install cable in separate sleeve under paved areas.

3.7 CONNECTIONS

3.7.01 Comply with requirements for piping for water supply from exterior water service piping, water meters, protective enclosures, and backflow preventers. Drawings indicate general arrangement of piping, fittings, and specialties.

3.7.02 Install piping adjacent to equipment, valves, and devices to allow service and maintenance.

3.7.03 Connect wiring between controllers and automatic control valves.

3.8 IDENTIFICATION

3.8.01 Identify system components. Comply with requirements for identification as required and approved by owner.

3.8.02 Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplates and signs on each automatic controller.

1. Text: In addition to identifying unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.

3.8.03 Warning Tapes: Arrange for installation of continuous, underground, detectable warning tapes over underground piping during backfilling of trenches.

3.9 FIELD QUALITY CONTROL

3.9.01 Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

3.9.02 Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

3.9.03 Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, operate controllers and automatic control valves to confirm proper system operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.9.04 Any irrigation product will be considered defective if it does not pass tests and inspections.

3.9.05 Prepare test and inspection reports.

3.10 STARTUP SERVICE

3.10.01 Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Verify that controllers are installed and connected according to the Contract Documents.
3. Verify that electrical wiring installation complies with manufacturer's submittal.

3.11 ADJUSTING

3.11.01 Adjust settings of controllers.

3.11.02 Adjust automatic control valves to provide flow rate at rated operating pressure required for each sprinkler circuit.

3.11.03 Adjust sprinklers and devices, except those intended to be mounted aboveground, so they will be flush with, or not more than (1/2 inch above, finish grade.)

3.12 CLEANING

3.12.01 Flush dirt and debris from piping before installing sprinklers and other devices.

3.13 DEMONSTRATION

3.13.01 Train Owner's maintenance personnel to adjust, operate, and maintain automatic control valves and controllers.

3.14 PIPING SCHEDULE

3.14.01 Install components having pressure rating equal to or greater than system operating pressure.

3.14.02 Piping in control-valve boxes and aboveground may be joined with flanges or unions instead of joints indicated.

3.14.03 Underground irrigation main piping, [NPS 4 (DN 100) and smaller, shall be SDR 21, PVC, pressure-rated pipe; Schedule 80, PVC socket fittings; and solvent-cemented joints.

3.14.04 Underground irrigation main piping, [NPS 5 (DN 125) and larger shall be SDR 21, PVC, pressure-rated pipe; Schedule 80, PVC socket fittings; and solvent-cemented joints.

3.14.05 Circuit piping, NPS 2 (DN 50) and smaller, shall be SDR 26, PVC, pressure-rated pipe; Schedule 40, PVC socket fittings; and solvent-cemented joints.

3.14.06 Circuit piping, NPS 2-1/2 to NPS 4 (DN 65 to DN 100), shall be SDR 26, PVC, pressure-rated pipe; Schedule 40, PVC socket fittings; and solvent-cemented joints.

3.14.07 Underground Branches and Offsets at Sprinklers and Devices: Schedule 80, PVC pipe; threaded PVC fittings; and threaded joints.

1. Option: Plastic swing-joint assemblies, with offsets for flexible joints, manufactured for this application.

3.15 VALVE SCHEDULE

3.15.01 Underground, Shutoff-Duty Valves: Use the following:

1. NPS 2 (DN 50) and Smaller: Curb valve, curb-valve casing, and shutoff rod.
2. NPS 3 (DN 80) and Larger: Iron gate valve, resilient seated; iron gate valve casing; and operating wrench(es).

End of Section

INDEX

DIVISION 3 - CONCRETE

SECTION 03100

CONCRETE FORMWORK

PART 1 – GENERAL

1.1 SCOPE. Section includes formwork for cast-in-place concrete, with shoring, bracing and anchorage; openings for other work; complete with furnishing, preparation, installation, coating, protection, adjustment, removal and accessories.

Design, engineer and construct formwork, shoring and bracing to meet design and code requirements, so that resultant concrete conforms to the required shapes, lines and dimensions of the work.

Prompt cleanup, removal, safe and proper disposal of all waste material resulting from the work herein.

Prompt and proper removal, salvage, protection, storage and turnover to the Owner of all surplus useable material resulting from the work herein.

1.2 GENERAL.

1.2.01 Governing Standards.

ACI SP-4, “Formwork for Concrete."

ACI 301, “Specification for Structural Concrete for Buildings.”

ACI 305, “Hot Weather Concreting.”

ACI 306, “Recommended Practice for Cold Weather Concreting.”

ACI 307, “Curing Concrete.”

ACI 317, “Standard Specifications for Tolerances for Concrete Construction and Materials.

ACI 318, “Building Code Requirements for Structural Concrete and Commentary.”

ACI 347, “Recommended Practice for Concrete Formwork.”

ACI 350, “Code Requirements for Environmental Engineering Concrete Structures.”

ACI 605, "Recommended Practice for Hot Weather Concrete."

ACI 614, "Recommended Practice for Measuring, Mixing and Placing Concrete."

ASTM C94, "Ready-Mix Concrete."

1.3 QUALITY ASSURANCE. The formwork shall be designed for the loads, lateral pressure, and allowable stresses outlined in "Recommended Practice for Concrete Formwork" ACI 347 and for design considerations, wind loads, allowable stresses and other applicable requirements of the local building code. The design and construction of the formwork shall be the responsibility of the Contractor.

The formwork shall be true in every respect to produce hardened concrete to the required shape, size, grade and alignment as indicated on the Plan, and of sufficient strength, bracing and rigidity to maintain their position and shape under the loads and operations incidental to placing and curing the concrete, as well as all other forces resulting from the movement of the forms. The forms shall be mortar-tight at the time concrete is placed in them and shall be so constructed that the surfaces of the finished concrete will be reasonably free from ridges, fins, offsets or similar defects. Adequate and suitable means for removing the forms without injury to the surfaces or edges of the finished concrete shall be provided.

1.3.01 Tolerances. Formwork shall be constructed such that the hardened surfaces shall conform to the tolerance limits of ACI 347, except as modified below.

Variation from plumb in lines and surfaces of piers, walls or columns in any ten (10) feet (3.05 m) of length shall not exceed ¼ inch (6.4 mm) with a maximum for entire length of 1 inch (2.54 cm).

Variation from the level or from the grades in any ten (10) feet (3.05 m) of length shall not exceed ¼ inch (6.4 mm) with a maximum for entire length of ¾ inch (1.9 cm).

Variation of distance between walls, columns and beams in any ten (10) feet (3.05 cm) of distance shall not exceed ¼ inch (6.4 mm) with a maximum for entire distance of 1 inch (2.54 cm).

Variation of the linear lines from the established position as indicated on the Plan in any 20 feet (6.1 m) of length shall not exceed ½ inch (1.27 cm) with a maximum for entire length of 1 inch (2.54 cm).

Variation in sizes and locations of sleeves, floor openings, and wall openings shall not exceed minus ¼ inch (6.4 mm) or plus ½ inch (1.27 cm).

Variation in cross-sectional dimensions of columns and beams and thickness of slabs and walls shall not exceed minus ¼ inch (6.4 mm) or plus ½ inch (1.27 cm).

Variation of footing dimensions in Plan shall not exceed minus ½ inch (1.27 cm) or plus 2 inches (5.08 cm).

Thickness shall not exceed minus 5%.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit all formwork and shoring shop drawings and their associated calculations. Indicate the pertinent dimensions, openings, methods of construction, types of connections, materials, joint arrangement and details, ties and shores, location of framing, studding and bracing, and temporary supports. Also show means of leakage prevention for concrete exposed to view in the finished construction. Indicate sequence and timing of erection and stripping, assumed compressive strength at time of stripping, height of lift and height of drop during placement. Vertical, horizontal and special loads shall be in accordance with ACI 347, Section 2.2 and camber diagrams, if applicable. The shop drawings and their associated calculations shall be signed and sealed by an engineer registered in the State of Michigan.

Notes to formwork erector showing size and location of conduits and piping embedded in concrete in accordance with ACI 318, Section 6.3.

Submit data on void form materials (and installation requirements).

1.5 DELIVERY, STORAGE AND HANDLING. Deliver forms and installation instructions in manufacturer's packaging. Store off ground in a ventilated and protected manner to prevent deterioration from moisture.

Store and handle form coating to prevent contamination of coating in accordance with manufacturer's recommendations.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Forms shall be substantial and sufficiently tight to prevent leakage of mortar. Forms shall be braced or tied to maintain the desired position, shape, and alignment during and after concrete placement. Walers, studs, internal ties, and other form supports shall be sized and spaced so that permissible working stresses are not exceeded.

Beams and slabs supported by concrete columns shall be formed so that the column forms may be removed without disturbing the supports for the beams or slabs.

Wherever the top of a wall will be exposed to weathering, the forms on at least one side shall not extend above the top of the wall and shall be brought to true line and grade. At other locations, forms shall be brought to a true line and grade, or a wooden guide strip shall be placed at the proper locations on the forms so that the concrete surface can be finished with a screed or template to the specified elevation, slope or contour. At horizontal construction joints in walls, the forms on one side shall not extend more than 2 feet (60.96 cm) above the joint.
Provide openings in concrete formwork to accommodate work of other trades, sized and located accurately. Securely support items built into forms; provide additional bracing at openings and discontinuities in formwork.

Temporary openings shall be provided at the bottom of the column and wall forms and at other points where necessary to facilitate cleaning and inspection. Close with tight-fitting panels designed to minimize appearance of joints in finished concrete work.

2.1.01 Formwork Design Requirements – General. Produce shop drawings showing details of form type including tunnel and shaft forms, methods of form construction erection, and removal, design computations, location of form joints, form ties, and shoring. Keep a copy of drawings in field office during erection.

Provide and design formwork to support vertical and horizontal loads and lateral pressure resulting from placement and vibration of concrete in accordance with ACI-347.

Provide and design formwork to locate bracing which will maintain form stability, and to comply with the tolerances specified.

Provide and design formwork to anticipate deflection and creep due to weight and pressure of fresh concrete and construction loads. Camper shall be designed into the formwork to compensate for anticipated deflection and creep due to the weight and pressure of the fresh concrete, prestressing loads, and construction loads.

Provide and design form openings to allow placement and consolidation of concrete without segregation. Provide drop chutes or drop pipes to prevent accumulation of hardened concrete on forms and reinforcement above fresh concrete and to prevent concrete segregation.

Provide and design forms to conform to expansion and construction joint locations indicated, and to match architectural lines.

External corners shall be chamfered ¾ -inch unless otherwise noted.

Forms for all exposed surfaces shall be such as to provide an as-cast concrete surface, and equivalent to a rough form finish as specified in Section 10.2.1 of ACI 301.

2.2 ACCEPTABLE MANUFACTURERS. Provided they comply with the contract documents, these manufacturers are acceptable.

Fitzgerald Formliners, 7730 Strathmore Road, Dublin, OH 43016
(614) 798-0354

Alabama Metal Industries Corp., 3245 Fayette Avenue, Birmingham, AL 35208 (205) 787-2611

Molded Fiberglass Construction Products, 1018 W. Sycamore Street, Independence, KS 67301 (316) 331-7366

2.3 MATERIALS

2.3.01 Forms. Forms shall be designed to produce hardened concrete having the shape, lines, and dimensions indicated on the drawings. Forms shall conform to ACI 347 and the following additional requirements.

Prefabricated forms shall be Simplex “Industrial Steel Frame Forms”, Symons “Steel Ply” or Universal “Uni-form”.

Plywood shall be Product Standard PS-1, waterproof, resin-bonded, exterior type Douglas Fir, face adjacent to concrete Grade B or better.

Fiberboard shall be ANSI/AHA A135.4, Class 1, tempered, water-resistant, concrete form hardboard.

Lumber shall be straight of uniform width and thickness, and free from knots, offsets, holes, dents and other surface defects.

Chamfer Strips shall be Clear white pine, surface against concrete planed.

2.3.02 Forms for Smooth Form Finish Concrete. Forms for surfaces which will be exposed to view, when construction is completed, shall be constructed of prefabricated plywood panels, metal panels, fiber-reinforced plastic panels, job-built of plywood or lined with plywood or fiberboard. Forms for exposed surfaces shall be laid out in a regular and uniform pattern with the long dimensions of panels vertical and all joints aligned. The forms shall produce finished surfaces that are free from offsets, ridges, waves, and concave or convex areas, within the tolerances specified herein. Furnish largest practicable sizes to minimize joints and to conform to joint system shown on drawings.

2.3.03 Forms for Rough Form Finish Concrete. Plywood or lined forms will not be required for surfaces which are normally submerged or not ordinarily exposed to view, such as the interior of manholes, basins, and reservoirs. Other types of forming materials, such as steel or unlined wood, may be used where plywood or lined forms are not required and may be used as backing for form linings. Concrete forms are required above all extended footings. Use lumber dressed on two edges and one side for tight fit.

2.3.04 Forms for Cylindrical Columns and Supports: Metal, fiberglass-reinforced plastic or paper or fiber tubes. Construct paper or fiber tubes of laminated plies using water-resistant adhesive with wax-impregnated exterior for weather and moisture protection. Provide units with sufficient wall thickness to resist loads imposed by wet concrete without deformation. Flat segmented forms not more than 24 inches (60.96) wide may be used for forming curved surfaces 25 feet (7.62 m) in diameter or larger.

2.3.05 Forms for Textured Finish Concrete. Use units with face design, size, arrangement and configuration to match Engineer's control sample. Provide solid backing and form supports to stabilize textured form liners.

2.3.06 Earth Forms. Hand trim bottoms and sides of earth forms to profiles required. Remove loose dirt before placing concrete.

2.4 FORM SURFACES.

2.4.01 Lumber. Use straight, uniform width and thickness, free from knots, offsets, holes, dents, warpage and other surface defects.

2.4.02 Plywood. Use product standard psi, waterproof, resin-bonded, exterior-type Douglas Fir, face adjacent to concrete Grade B or better.

2.4.03 Metal. Use smooth metal plate free of surface irregularities.

2.4.04 Chamfer Strips. Use clear white pine, surface against concrete planed, 1 inch (2.54 cm) bevel width or cant strip.

Forms shall be coated in accordance with manufacturer's recommendations before the form or reinforcement is placed in final position. Surplus coating on form surfaces, or any coating on reinforcing steel and construction joints shall be removed before placing concrete.

Commercial formulation form-coating compounds with no more than 350 mg/ltr volatile organic compounds (VOCs) that do not bond with, stain, or adversely affect concrete surfaces, or prevent good bonding with later concrete surface treatments.

Non-staining and non-toxic after 30 days: Burke "Spectrum Release Agent", L&M Chemical "Debond", Master Builders "Pro-Cote", Nox-Crete "Chembetron 103", or Symons "Thrift Kote".

2.5 FORM TIES. Form ties shall be of the removable end, permanently embedded body type, and shall have sufficient strength and rigidity to support and maintain the form in proper position and alignment without the use of auxiliary spreaders. Cones shall be provided on the outer ends of each tie, and the permanently embedded portion shall be at least 1 inch (2.54 cm) back from the concrete face and leave not more than 1 inch (2.54 cm) diameter hole in concrete surface. Form ties for liquid-bearing walls shall be provided with water stop washers located on the permanently embedded portions of the ties at the approximate center of the wall. Permanently embedded portions of form ties without threaded ends shall be constructed so that the removable ends are readily broken off without damage to he concrete. Tie wire shall be mild steel or annealed iron, minimum 16 gage, Dayton "Sure Grip" or Richmond "Snap-Tys" Form Ties, or approved equal.

At locations approved by the Contractor, a through-wall removable tie system approved by the Contractor may be used.

Form ties in exposed surfaces shall be uniformly spaced and aligned in horizontal and vertical rows.

Form ties shall be factory-fabricated, adjustable-length, removable or snapoff metal form ties, designed to prevent form deflection and to prevent spilling concrete upon removal. Provide units which shall leave no metal closer than 1 ½ inches (3.81 cm) to surface.

Provide ties which, when removed, leave holes no larger than 7/8 inch (2.22 cm) or less than ½ inch (1.27 cm) in diameter in concrete surface.

Form ties encased in concrete shall be designed so that after removal of the projecting part, no metal shall be within 1 inch (2.54 cm) of the face of the concrete. That part of the tie to be removed shall be at least ½ inch (1.27 cm) diameter and 1 inch (2.54 cm) long. Form ties in concrete exposed to view shall be the cone-washer type equal to the Richmond "Tyscru". Through-bolts or common wire shall not be used for form ties.

2.6 FABRICATION.

2.6.01 Forms. Use forms that conform to ACI 347. Fabricate with facing materials that produce the specified tolerance requirements of Article 1.02.B of this Section; produce true surfaces, sharp corners and true lines; and are free of offsets, ridges, bulging, waves and concave or convex areas.

2.6.02 Layout. Use regular and uniform pattern; long dimension of panels vertical; joints horizontal, vertical and aligned; form ties uniformly spaced and aligned in horizontal and vertical rows.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Erect, support, brace, and maintain formwork to support vertical, lateral, static, and dynamic loads that might be applied until concrete structure can support such loads. Construct formwork so that concrete members and structures are of correct size, shape, alignment, elevation and position. Maintain formwork construction tolerances and surface irregularities complying with the following ACI 117 limits:

Provide Class A tolerances for concrete surfaces exposed to view.

Provide Class C tolerances for other concrete surfaces.

Construct forms to sizes, shapes, lines, and dimensions shown, and to obtain accurate alignment, location, grades, level and plumb work in finished structures. Provide for openings, offsets, sinkages, keyways, recesses, moldings, rustications, reglets, chamfers, blocking, screeds, bulkheads, anchorages and inserts and other features required in the work. Use selected materials to obtain required finishes. Solidly butt joints and provide backup at joints to prevent cement paste from leaking.

Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush plates or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces where slope is too steep to place concrete with bottom forms only. provide kerfs in wood inserts for forming keyways, reglets, recesses and the like for easy removal.

Provide temporary openings for clean-outs and inspections where interior area of formwork is inaccessible before and during concrete placement. Securely brace temporary openings and set tightly to forms to prevent losing concrete mortar. Locate temporary openings in forms at inconspicuous locations.

Chamfer exposed corners and edges as indicated, using wood, metal, PVC or rubber chamfer strips fabricated to produce uniform smooth lines and tight edge joints.

Edges of all form panels in contact with concrete shall be flush within 1/32 inch (0.8 mm) and forms for plane surfaces shall be such that the concrete will be placed within 1/16 inch (1.6 mm) in 4 feet (1.22 m). Forms shall be tight to prevent the passage of mortar water and grout.

Forms for walls shall have removable panels at the bottom for cleaning, inspection, and scrubbing-in of bonding paste.

Molding or bevels shall be placed to produce ½ inch (1.27 cm) chamfer on all exposed projecting corners, unless otherwise shown on the Drawings. Similar chamfer strips shall be provided at horizontal and vertical extremities of all wall placements to produce "clean" separation between successive placements.

Forms shall be sufficiently rigid to withstand vibration and to prevent displacement of sagging between supports and constructed so the concrete will not be damaged by their removal. The Contractor shall be entirely responsible for their adequacy.

Forms, including new pre-oiled forms, shall be oiled before reinforcement is placed with an approved non-staining oil or liquid form coating not having a paraffin base.

3.1.02 Placement. Forms shall be sufficiently tight to prevent loss of mortar from the concrete, set true to the lines and elevations indicated on the Plans, tied and braced to remain true during and after concrete placement within tolerances of this Section. The Engineer may at any time condemn any section or sections of forms found deficient in any respect, and such form shall be promptly removed and replaced.

No wooden spreaders shall be allowed to remain in the concrete. No metal shall be within 1 inch of any surface.

Place chamfer strips in forms to bevel all corners, edges, joints and other structural elements exposed to view, including use of dummy chamfer and false joints to provide neat and uniform appearance. Exposed corners and edges shall have 1" x 1" (2.54 cm x 2.54 cm) – 45 degrees chamfer, unless otherwise indicated on the Plan.

Provide temporary openings at the base of wall forms and at the other points where necessary to facilitate cleaning and inspection immediately before depositing concrete.

Secure wedges and embedded items into position for final alignment.

Forms for keyways shall be prepared in advance of pouring concrete. Keyway forms in slab edges and vertical wall joints shall be rigidly secured in place before the concrete is poured. Forms for keyways for horizontal joints in walls may be placed at the conclusion of the pour, but proper provision shall be made for obtaining and holding the full depth and form of the keyway.

Provide openings in concrete formwork to accommodate work of other trades. Determine size and location of openings, recesses and chases from trades providing such items. Accurately place and securely support items built into forms.

Thoroughly clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, or other debris just before placing concrete. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.

During cold weather remove ice and snow from within the forms. Do not use deicing salts. Do not use water to clean out forms unless formwork and concrete construction proceed within heated enclosed areas.

Obtain approval before framing openings in structural members, which are not indicated on Drawings.

Install waterstops continuous without displacing reinforcement. Install waterstop a minimum of 2 inches clear of reinforcing steel. Tie through hog rings or grommets to reinforcing steel.

3.1.03 Adjustment of Forms. Positive means of adjustment should be provided to permit realignment or readjustment of shores if excessive settlement occurs.

A pair of wedges may be used at the top or bottom of shores, but not at both ends, to facilitate vertical adjustment, to correct uneven settlements, or to facilitate dismantling of the formwork.

Screw jacks for pipe shores or scaffold-type shoring may be used at both top and bottom so long as they are secured by the shore or scaffold leg against loosening or falling out, to avoid lateral deflections.

During and after concrete placement, but before initial set of the concrete, the elevations, camber and plumbness of formwork systems shall be checked, using telltale devices. Appropriate adjustments shall be promptly made where necessary. If, during construction, any weakness develops and the formwork shows any undue settlement or distortion, the work shall be stopped, the affected construction removed if permanently damaged and the formwork strengthened.

3.1.04 Removal of Forms. Provide commercial formulation form release agent with a maximum of 0.047 oz./gal. (350 mg/ltr) volatile organic compounds (VOCs) that will not bond with, stain or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.

Forms, wedges or shoring shall not be removed or disturbed until the concrete has attained sufficient strength to safely support all superimposed dead, temporary construction and live loads. When forms or shoring are removed, there shall be no excessive deflection or distortion of the concrete. Forms shall be removed in an orderly fashion; with care to avoid surface gorging, corner or edge breakage, or other damage or injury to concrete surface or physical property; and without impact or shock, to permit the concrete to carry its share of the loads gradually and uniformly. Form removal shall not impair the safety and serviceability of the structure or concrete members.

Formwork not supporting weight of concrete, such as sides of beams, walls, columns, and similar parts of the work, may be removed after cumulatively curing at not less than 50 degrees F (10 degrees C) for 24 hours after placing concrete, provided concrete is sufficiently hard to not be damaged by form-removal operations, and provided curing and protection operations are maintained.

Formwork supporting weight of concrete, such as beam soffits, joists, slabs and other structural elements, may not be removed in less than 14 days or until concrete has attained at least 75 percent of design minimum compressive strength at 28 days. Determine potential compressive strength of in-place concrete by testing field-cured specimens representative of concrete location or members.

Form-facing material may be removed 4 days after placement only if shores and other vertical supports have been arranged to permit removal of form-facing material without loosening or disturbing shores and supports.

Forms and shoring in the formwork shall not be removed without the approval of the Engineer. The minimum in-place times are for ordinary conditions and represent cumulative number of days, not necessarily consecutive, after the concrete was placed, during which the temperature of the air surrounding the concrete is above 50 degrees F (10 degrees C). The times may be increased or decreased as directed by the Engineer, dependent on air temperatures, cement type, concrete additives or other conditions of the work in accordance with ACI 347.

Submit calculations based on in-situ concrete strength and modulus at the time of form removal, to demonstrate that the fresh concrete can sustain all construction loads that act upon it without over-stress and excessive deformation.

3.1.05 Reshoring. When removing forms before structural members are strong enough to carry dead load and/or construction loads, reshores shall be installed to assure safe distribution of loading. Reshoring operations shall be planned in advance and shall be subject to the Engineer’s review. During reshoring, no construction loads shall be permitted on the new construction. Reshores shall be placed as soon as practicable after form removal, but in no case later than the end of the working day on which form removal occurs, and shall remain in place until the concrete has acquired the required strength.

3.1.06 Reusing Forms. Clean and repair surfaces of forms to be reused in the work. Split, frayed, delaminated or otherwise damaged form-facing material will not be acceptable for exposed surfaces. Apply new form-coating compound as specified for new formwork.

Forms shall not be reused if there is any evidence of surface wear and tear or defects which would impair the quality of the surface. All surfaces of forms and embedded materials shall be cleaned of any mortar from previous concreting and of all other foreign material or water before coating is placed in them.
When forms are extended for successive concrete placement, thoroughly clean surfaces, remove fins and laitance and tighten forms to close joints. Align and secure joint to avoid offsets. Do not use patched forms for exposed concrete surfaces except as acceptable to Engineer.

End of Section

SECTION 03200

CONCRETE REINFORCEMENT

PART 1 - GENERAL

1.1 SCOPE. This section includes reinforcing steel bars, welded wire fabric and associated accessories for cast-in-place concrete.

1.2 GENERAL

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

ACI SP-66, “ACI Detailing Manual”

ACI -315R “Manual of Engineering and Placing Drawings for Reinforced Concrete Structures”.

ACI 301, “Specifications for Structural Concrete.”

ACI 318, “Building Code Requirements for Reinforced Concrete, and Commentary”

ACI 350, “Environmental Engineering Concrete Structures.”

ASTM (American Society for Testing Materials) A82, “Steel Wire, Plain, for Concrete Reinforcement.”

ASTM A185, “Steel Welded Wire Fabric, Plain, for Concrete Reinforcement.”

ASTM A496, “Steel Wire, Deformed, for Concrete Reinforcement.”

ASTM A497, “Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement.”

ASTM A615/A615M, - “Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.”

ASTM A706/A706M, “Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.”

ASTM A775/A775M, “Epoxy-Coated Reinforcing Steel Bars.”

AWS D1.4, "American Welding Society, Structural Welding Code, Reinforcing Steel."

ASTM D3963/D3963M, "Fabrication and Jobsite Handling of Epoxy-Coated Reinforcing Steel Bars."

1.3 QUALITY ASSURANCE

1.3.01 Codes and Standards: Comply with the CRSI Manual of Standard Practice, except where requirements of the contract documents or of governing codes and governing authorities are more stringent.

1.3.02 Testing Agency Services. Employ, at contractor's expense, an independent testing agency acceptable to the Engineer to perform specified tests, which include the testing of existing reinforcing steel as required, and other services required for quality assurance. Testing agency shall meet ASTM E329 requirements.

1.3.03 Fabrication. Materials for which shop drawings are required are not to be fabricated before approval of the drawings by the Engineer. Tolerances shall conform to ACI SP-66.

All reinforcing steel shall be free from defects and bends not shown on the drawings.

1.3.04 Welding. When welding is indicated, specified, or authorized by Engineer, then reinforcement, procedures, and welding shall conform to requirements of AWS D1.4.

All welding shall be performed by qualified operators, certified within the past 12 months and shall conform to requirements of AWS D1.4.

All bars shall be of the shape, size, class and grade of steel specified and as shown on the Drawings, and each bar shall have at all points a net section not less than that of plain round or square bars of corresponding size.

All reinforcing bars to be bent in the field or in the shop shall be bent cold to the shapes and dimensions shown on the Drawings or as specified herein. Bends shall be made in accordance with the requirements of the current "Manual of Standard Practice for Reinforced Concrete Construction" published by the Concrete Reinforcing Steel Institute.

Steel shall not be bent or straightened in a manner injurious to the material. Bending of reinforcing steel by heating will not be permitted. Bent up bars in beams and slabs shall be bent at an angle of 45 degrees unless otherwise shown on the Drawings.

Steel appreciably reduced in section shall be rejected.

1.3.05 Fabricating and Placing Tolerances. Bars used for concrete reinforcement shall be fabricated in accordance with the fabricating tolerances given in ACI 315. Bars shall be placed to the following tolerances:

Clear distance to formed surfaces	± ¼ inch (6.4 mm)
Minimum spacing between bars	± ¼ inch (6.4 mm)
Top bars in slabs and beams:	
Members 8 inches (20.32 cm) deep or less	± ¼ inch (6.4 mm)
Members more than 8 inches (20.32 cm) but not over 2 feet (60.96 cm) deep	± ½ inch (1.27 cm)
Members more than 2 feet (60.96 cm) deep	± 1 inch (2.54 cm)
Crosswise of members	spaced evenly within 2 inches (5.08 cm)
Lengthwise of members	± 2 inches (5.08 cm)

Bars may be moved as necessary to avoid interference with other reinforcing steel, conduits, or embedded items. If bars are moved more than one bar diameter, or enough to exceed the above tolerances, the resulting arrangement of bars shall be subject to acceptance.

1.4 SUBMITTALS

1.4.01 Drawings and Data. Reinforcing bar schedules and detail shop drawings showing complete details as to size, length, weights, arrangement and bending shall be submitted by the Contractor, a complete schedule of reinforcement chairs, supports, saddles, spacers, and other accessories shall be included as provided in the Specification herein. No reinforcement shall be cut, bent or fabricated before these schedules and/or drawings are approved by the Engineer.

General placement drawings showing the location of pieces detailed shall be submitted with the detail drawings and schedules. Show construction and expansion joints. Show details of bar supports and spacers including types, sizes, spacing, sequence and support bars. Show marking for each reinforcement item.

1.4.02 Certificates. Submit certified mill test reports for each shipment of reinforcement showing that steel complies with applicable specification. Reports shall identify specific lots in shipment and submitted prior to use of reinforcement in work.

Submit chemical composition of reinforcement steel, including ladle analysis to stating percentage of carbon, phosphorous, manganese and sulfur present in steel.

Submit Welder’s certification in accordance with AWS D1.4 prior to welding when welding is indicated, specified or approved by Engineer.

1.5 DELIVERY, STORAGE AND HANDLING. Ship reinforcement and accessories to work site with items of same size and shape fastened in bundles tagged and marked in accordance with the code of standard practice in the current "Manual of Standard Practice for Reinforced Concrete Construction" published by the Concrete Reinforcing Steel Institute. Identify each bundle using wired-on metal identification tags indicating size and mark.

Store reinforcement and accessories above ground on platforms, skids or other supports and protect from weather at all times with suitable coverage. It shall be stored in an orderly manner plainly marked to facilitate inspection and checking. Labor and other assistance shall be furnished to the Engineer as may be required to check the steel as it is being stored or after storage on the site.

Protect reinforcement from rusting, deforming, bending, kinking and other damage.

PART 2 – PRODUCTS

2.1 MATERIALS.

2.1.01 Steel Reinforcing Bars. Newly rolled deformed billet-steel bars for concrete reinforcement shall conform to ASTM A615, Grade 60, unless otherwise indicated. Bar sizes No. 3 (3/8 inch (9.5 mm)) and larger shall be deformed.

When welding of reinforcement is indicated, specified, or approved by the Engineer, reinforcement must be ASTM A706. Welding of epoxy-coated reinforcement is not permitted.

When any portion of a bar requires epoxy coating, the entire bar shall be coated in accordance with ASTM D3963.

Reinforcing shall be mill and cold bent. Conform to dimensions indicated and meet the requirements of ACI SP-66.

Reinforcing steel, post tensioning strands and pre-stressing strands shall be in accordance with MDOT Standard Specification for Construction.

2.1.02 Tie Wire. Tie wire shall be of mild steel or annealed iron, 16 gage (1.6 mm) or heavier.

For epoxy coated reinforcement, use plastic coated wire, and epoxy coated wire or molded plastic clips.

2.1.03 Supports for Reinforcement. Use bolsters, chairs, spacers and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place. Use wire bar-type supports complying with CRSI specifications.

For slabs-on-grade, use supports with sand plates or horizontal runners where base material will not support chair legs.

For exposed to view concrete surfaces where legs of supports are in contact with forms, provide supports with legs that are protected by plastic (CRSI, Class 1) or stainless steel (CRSI, Class 2).

For epoxy coated steel reinforcement, bar chairs shall be plastic coated wire, epoxy coated wire or plastic.

Bar spacers in contact with exposed surfaces shall be plastic protected in conformance with ACI SP-66 (Class 1 - Maximum Protection).

2.1.04 Welded Wire Fabric. Conform to ASTM A185. Gage and spacing shall be as indicated.

2.1.05 Stainless Steel. Conform to Type 316.

2.1.06 Mechanical Couplers. Mechanical couplers shall develop a tensile strength which exceeds 125 percent of the yield strength of the reinforcing bars being spliced at each splice. The reinforcing steel and coupler used shall be compatible for obtaining the required strength of the connection.

Where the type of coupler used is composed of more than one component, all components required for a complete splice shall be supplied.

Hot –forged sleeve type couplers shall not be used. System shall possess a current and valid International Code Council Evaluation Service Report. Acceptable

Manufacturers: Erico Lenton, Form Saver; Dayton Richmond, DB-SAE; or as approved.

2.1.07 Dowel Adhesive System. Where shown on the Drawings, reinforcing bars anchored into hardened concrete with a dowel adhesive system shall use a two-component adhesive mix which shall be injected with a static mixing nozzle following manufacturer’s instructions. The embedment depth of the bar shall be per manufacturer’s recommendations, so as to provide a minimum allowable bond strength that is equal to 125 percent of the yield strength of the bar, unless noted otherwise on the Drawings. The adhesive system shall be “Sikadur Injection Gel” as manufactured by Sika Corporation, “Epcon System” as manufactured by ITW Ramset/Redhead, or “HIT-HY 200 Injection Adhesive Anchor System” as manufactured by Hilti, Inc. Engineer’s approval is required for use of this system in locations other than those shown on the Drawings.

PART 3 - EXECUTION

3.1 PREPARATION. Before placing in form, thoroughly clean reinforcement and accessories free of mortar, oil, dirt, loose mill scale, loose or thick rust, and coatings of any character that would destroy or reduce the bond with the concrete.

3.2 INSTALLATION.

3.2.01 Placement. Accurately place reinforcing bars and secure in position using tie wire with ends pointed away from forms.

Reposition bars as necessary to avoid interference with other reinforcing steel, conduits, or embedded items. If bars are moved more than one bar diameter, the resulting arrangement of bars is subject to acceptance by Engineer. Place required number of bars.

Use precast concrete or metal chairs, bolsters, spacers, anchors, saddles, ties, light structural frames of approved shape and dimensions and other approved devices of sufficient strength to resist crushing under load in accordance with ACI SP-66. Do not use metal chairs which extend to such surfaces as concrete, stones, and brick chips. Do not use wood block supports.

Use precast concrete bar support blocks for foundation mats, base slabs, and slabs on grade.

Placing bars on layers of fresh concrete as the work progresses, and adjusting bars during the placement of concrete is not permitted.

Place bar laps in contact and tie securely, or space transversely apart to permit embedment of entire surface of each bar in concrete. Length of laps for bars shall conform to requirements of ACI 318, except as otherwise indicated.

Reinforcement or other fixed metal items shall not be continuous through expansion joints. Provide reinforcement clearance of two inches from each face of expansion joint.

Do not field bend bars including bars partially embedded in concrete unless indicated or authorized by Engineer. Do not straighten or bend in manner injurious to steel, epoxy-coating or concrete.

Do not place bars that have kinks and bends other than shown on approved shop drawings. Reject and remove such damaged bars and replace at no additional compensation.

Do not use heat to bend or straighten reinforcing steel.

Welding of reinforcing bars shall be permitted where indicated or as otherwise directed by Engineer. Such welding shall be in accordance with AWS D1.4.

Welding reinforcing steel shall be done only by operators certified in accordance with AWS D1.4.

Tack welding to, or of, reinforcement is prohibited.

Paint reinforcement which is to be exposed for more than 90 days with coat of neat cement grout to prevent rust formation.

In case there is a delay in placing concrete after the steel has been placed, the steel shall be reinspected and, when necessary, recleaned prior to placement of the concrete.

The minimum center-to-center distance between parallel bars shall be two and one-half (2 ½) times the diameter of the bars. End-hooked bars shall have a minimum center to center spacing of two (2) times the diameter of the bars. In no case shall the clear spacing between bars be less than one (1) inch (2.54 cm), nor less than one and one-third (1/3) times the maximum size of the coarse aggregate.

Relative to the face of the concrete, unless otherwise shown on the Drawings, reinforcement shall be placed as follows:

For concrete surfaces exposed to sewage or sewage atmosphere, and for concrete poured on earth subgrade, the clear distance from the main steel to surface shall be

3 inches (7.62 cm). The clear distance from the main steel to other surfaces shall be 2 inches (5.08 cm).

Temperature or shrinkage steel, relative to the main or flexure steel, shall be placed away from the concrete surfaces.

The clear distance between reinforcing steel and the face of the concrete shall be maintained at all points in order that the designed strength of the structure shall not be reduced.

All reinforcement shall be supported and fastened together to prevent displacement by construction loads or the placing of concrete beyond the tolerances of Paragraph 1.4.05. Unless otherwise indicated in the project specification, reinforcement supported from the ground shall rest on precast concrete blocks not less than 4 inches square, and having a compressive strength equal to the specified compressive strength of the concrete being placed. Other means of support may be used if acceptable to the Engineer.

Reinforcement supported from formwork shall rest on bar supports and spacers made of concrete, metal, plastic or other acceptable materials. Where the concrete surface will be exposed to the weather in the finished structure, the portions of all accessories within ½ inch (1.27 cm) of the concrete surface shall be non-corrosive or protected against corrosion.

Welded wire fabric designated as load-carrying reinforcement shall be overlapped wherever successive mats or rolls are continuous in such a way that the overlaps shall be at least two full meshes. It shall be supported as required for reinforcing bars.

Welded wire fabric not specifically designated as load-carrying reinforcement shall be overlapped wherever successive mats or rolls are continuous in such a way that the overlap measured between outermost cross wires of each fabric sheet is not less than 2 inches (5.08 cm). The fabric shall extend across supporting beams and walls and to within 4 inches (10.16 cm) of concrete edges. It may extend through contraction joints. It shall be adequately supported during placing of concrete to insure its proper position in the slab either by laying the fabric on a layer of the fresh concrete of the correct depth before placing the upper layer of the slab.

Vertical bars in columns shall be offset at least one bar diameter at lapped splices. To insure proper placement, templates shall be furnished for all column dowels.

All splices not indicated on the contract documents shall be subject to acceptance. Mechanical connections for reinforcing bars may be used subject to acceptance.

Do not field-cut reinforcement without Engineer's permission.

Unless permitted by the Engineer, reinforcement shall not be bent after being embedded in hardened concrete.

Clean reinforcement of loose rust, mill scale, ice, earth, and other materials which affect bond with concrete.

3.2.02 Splicing. Reinforcement shall not be spliced at points other than shown on the Drawings except with the approval of the Engineer. The main or flexural steel shall not be tied together but shall be staggered so that the distance between adjacent bars in one-half the minimum nominal spacing shown on the Drawings or as specified herein.

Provide reinforcement continuous through construction joints except as otherwise indicated. Do not splice reinforcement steel in mats, slabs, beams, girders and walls at points of maximum stress unless otherwise indicated. Lap splice wire-mesh reinforcement at least two full meshes; stagger to avoid continuous laps in either direction and wire securely.

Mechanical splices shall be used only where shown on the Drawings or when approved by the Engineer.

3.2.03 Dowels. Dowels and exposed reinforcing bars intended for bonding with future construction shall be protected from corrosion in a manner approved by the Engineer. All dowels shall be placed before the concrete is placed. The insertion of dowels after the concrete has been placed will not be permitted.

End of Section

SECTION 03250

CONCRETE ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section includes joint fillers, joint sealants, waterstops, slab isolation systems, and miscellaneous embedded items in concrete.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing Materials), D994 - “Performed Expansion Joint Filler for Concrete.”

ASTM D1190, “Concrete Joint Sealer, Hot – Applied Elastic Type.”

ASTM D1751, “Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Non extruding and Resilient Bituminous Types).”

ASTM D1752-84, “Performed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction.”

ASTM 03405, “Joint Sealants, Hot-Applied, for concrete and Asphalt Pavements.”

ASTM 03406, “Joint Sealants, Hot-Applied, Elastomeric – Type for Portland Cement Concrete Pavements.”

Corps. of Engineers Spec. CRD-C572-74, Specification for Polyvinylchloride Waterstop.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit a schedule showing sequence of concrete pouring and indicate locations of proposed construction and expansion joints. This schedule is subject to approval of the Engineer.

1.3.02 Test Reports. Submit certified manufacturer’s affidavits for expansion joint filler, joint sealant, slab isolation systems, and waterstops to verify compliance with the applicable Specifications.

1.4 DELIVERY, STORAGE, AND HANDLING. Deliver concrete accessories in manufacturer's packaging including installation instructions. Store materials in accordance with manufacturer's recommendations.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Joint Filler. Preformed Expansion Joint Filler (Bituminous Type) shall comply with ASTM D994.

Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types) shall comply with ASTM D1751.

Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Concrete shall comply with ASTM D1752.

2.1.02 Joint Sealer. Expansion Joint Seal System shall consist of a pre-molded neoprene profile, installed using the same dimensions as the joint gap, bonded with a two-component epoxy adhesive and pressurized during the adhesive cure time.

The expansion joint sealing system shall be "Hydrozo/Jeene Structural Joint Sealing System" by Hydrozo/Jeene, Inc. or approved equal.

Joint Sealants, Hot-Poured, For Concrete and Asphalt Pavement shall comply with ASTM D3405.

Joint Sealants, Hot-Poured, Elastomeric Type, for Portland Cement Concrete Pavements shall comply with ASTM D3406.

2.1.03 Contraction or Control Joint Inserts. Contraction joint inserts shall be Transverse-Control Joints by Greenstreak Plastic Products or approved equal.

2.1.04 Polyvinyl Chloride (PVC) Waterstops. PVC waterstops for construction joints shall be flat ribbed type, 6 inches wide with a minimum thickness at any point of 3/8 inches.

Waterstops for expansion joints shall be ribbed with a center bulb. They shall be 9 inches wide with a minimum thickness at any point of 3/8 inch unless shown or specified otherwise. The center bulb shall have a minimum outside diameter of 1 inch and a minimum inside diameter of 1/2 inch.

The waterstops shall be manufactured from virgin polyvinyl chloride plastic compound and shall not contain any scrap or reclaimed material or pigment whatsoever. The properties of the polyvinyl chloride compound used, as well as the physical properties of the waterstops, shall exceed the requirements of the U.S. Army Corps of Engineers' Specification CRD-C572. The waterstop material shall have an off-white, milky color.

The required minimum physical characteristics for this material are:

Tensile strength - 1,750 psi (ASTM D-638).

Ultimate elongation - not less than 280% (ASTM D-638).

No reclaimed PVC shall be used for the manufacturing of the waterstops. The Contractor shall furnish certification that the proposed waterstops meet the above requirements.

PVC waterstops shall be as manufactured by Greenstreak Plastics Products or approved equal.

All waterstop intersections, both vertical and horizontal, shall be made from factory fabricated corners and transitions. Only straight butt joint splices shall be made in field.

2.1.05 Bentonite Waterstops. Bentonite waterstops shall be 1-inch side Volclay Waterstop-RX by the American Colloid Company, Swellstop by Greenstreak Plastic Products, or Bluestop by Vinylex Corporation.2.1.06 Expanding Rubber Waterstop. Expanding rubber waterstop shall be Adeka Ultra Seal by Asahi Denka Koygokik, Hydrotite by Greenstreak Plastic Products.

Waterstops shall be a chemically modified natural rubber product with a hydrophilic agent.

2.1.07 Waterstop Adhesive. Adhesive between waterstops and existing concrete shall be 20+F Contact Cement by Miracle Adhesives Corporation, Neoprene Adhesive 77-198 by JGF Adhesives, Sikadur 31 Hi-Mod Gel by Sika Corporation, DP-605 NS Urethane Adhesive by 3M Adhesive Systems.

2.1.08 Expansion Joint Material. Pre-molded expansion joint material shall be non-extruding, and shall be of the following types:

Type I -Sponge rubber, conforming to ASTM D1752, Type I.

2.1.09 Epoxy Bonding Agent. Epoxy bonding agent shall conform to ASTM C881 and shall be Sikadur 32 Hi-Mod, Sika Corporation, Lyndhurst, N.J.; Euco #452 Epoxy System, Euclid Chemical Company, Cleveland, OH.

2.1.10 Epoxy Resign Binder. Epoxy resin binder shall conform to the requirements of ASTM C-881, Type III, Grade 3, Class B and C for epoxy resin binder and shall be Sikadur 23, Low-Mod-Gel, manufactured by the Sika Corporation, Lyndhurst, N.J.

2.1.11 Vapor Barrier. Vapor barrier shall be 8-mil polyethylene, manufactured in accordance with ASTM C171 and shall be placed on top of 4 inches minimum of compacted structural fill stone. A 3 inch minimum layer of sand shall be placed on top of the vapor barrier prior to casting the floor slabs.

2.1.12 Slab Isolation Systems. System shall consist of isolation pads and low density material in roll form designed to safely withstand a minimum imposed live load of 1,500 psf (7.324 kg/m^2) in all areas. Pads shall have satisfactorily passes WMATA Section 3.49, Dynamic Test for Isolator Permanence.

PART 3 – EXECUTION

3.1 INSPECTION. Inspect the locations and surfaces to receive joint filler, joint sealer, waterstops, slab isolation system, or miscellaneous embedded items and correct defects or conflicts which will affect the proper performance of the item to be placed.

3.2 PREPARATION. All accessories to be embedded into concrete shall have contact surfaces free of dirt, curing compound, protrusions of hardened concrete or any other foreign material which would affect bond with concrete.

3.2.01 Sequencing. The Contractor shall sequence installation of miscellaneous embedded items with the work of Master Specification Sections in Division 3, Concrete.

3.2.02 Joint Sealants. Prime surfaces in accordance with manufacturer's recommendations.

3.2.03 PVC Waterstops. PVC waterstops shall be provided in all construction and expansion joints in water bearing structures and at other such locations as required by the Drawings.

Waterstops shall be carefully positioned so that they are embedded to an equal depth in concrete on both sides of the joint. They shall be kept free from oil, grease, mortar or other foreign matter. To ensure proper placement, all waterstops shall be secured in correct position at 12" on center along the length of the waterstop on each side, prior to placing concrete. Such method of support shall be submitted to the Engineer for review and approval.

Splices in PVC waterstops shall be made with a thermostatically controlled heating element. Only straight butt joint splices will be allowed in the field. Factory fabricated corners and transitions shall be used at intersections. Splices shall be made in strict accordance with the manufacturer's recommended instructions and procedures. At least three satisfactory sample splices shall be made on the site. The Engineer may require tests on these splices by an approved laboratory. The splices shall exhibit not less than 80 percent of the strength of the unspliced material.

All splices in waterstops will be subject to rigid review for misalignment, bubbles, inadequate bond, porosity, cracks, offsets, and other defects which would reduce the potential resistance of the material to water pressure at any point. All defective joints shall be replaced with material which will pass said review and all faulty material shall be removed from the site and disposed of by the Contractor at no additional cost to the Owner.

3.2.04 Bentonite, and Expanding Rubber Waterstops. Waterstops shall be installed only where shown on the Drawings.

Waterstops shall be installed in strict accordance with manufacturer's recommendations

3.2.05 Waterstop Adhesive. Adhesive shall be applied to both contact surfaces in strict accordance with manufacturer's recommendations.

Adhesive shall be used where waterstops are attached to existing concrete surfaces.

3.2.06 Installation of Expansion Joint Material and Sealants. Type I, II, or III shall be used in all expansion joints in structures and concrete pavements unless specifically shown otherwise on the Drawings. Type IV shall be used in sidewalk and curbing and other locations specifically shown on the Drawings.

All expansion joints exposed in the finish work, exterior and interior, shall be sealed with the specified joint sealant. Expansion joint material and sealants shall be installed in accordance with manufacturer's recommended procedures and as shown on the Drawings.
Expansion joint material that will be exposed after removal of forms shall be cut and trimmed to ensure a neat appearance and shall completely fill the joint except for the space required for the sealant. The material shall be held securely in place and

no concrete shall be allowed to enter the joint or the space for the sealant and destroy the proper functions of the joint.

A bond breaker shall be used between expansion joint material and sealant. The joint shall be thoroughly clean and free from dirt and debris before the primer and the sealant are applied. Where the finished joint will be visible, masking of the adjoining surfaces shall be carried out to avoid their discoloration. The sealant shall be neatly tooled into place and its finished surfaces shall present a clean and even appearance.
Type 2 joint sealant shall be used in all expansion and contraction joints in concrete, except where Type 1 or Type 7 is required as stated below, and wherever else specified or shown on the Drawings. It shall be furnished in pour grade or gun grade depending on installation requirements. Primers shall be used as required by the manufacturer. The sealant shall be furnished in colors as directed by the Engineer.

Type 1 joint sealant shall be used in all concrete pavements and floors subject to heavy traffic and wherever else specified or shown on the Drawings.

Type 7 joint sealant shall be used for all joints in chlorine contact tanks and wherever specified or shown on the Drawings.

3.2.07 Expansion Joint Seal. The expansion joint seal system shall be installed as shown on the Drawings in strict accordance with the manufacturer's recommendations.

3.2.08 Contraction or Control Joint Inserts. For contraction joints in slabs, inserts shall be floated in fresh concrete during finishing.

For contraction joints in walls, inserts shall be secured in place prior to casting wall.

Inserts shall be installed true to line at the locations of all contraction joints as shown on the Drawings.

Inserts shall extend into concrete sufficient depth as indicated on the Drawings or specified in Section 03290, Joints in Concrete.

Inserts shall not be removed from concrete until concrete has cured sufficiently to prevent chipping or spalling of joint edges due to inadequate concrete strength.

3.2.09 Epoxy Bonding Agent. The Contractor shall use an epoxy bonding agent for bonding fresh concrete to existing concrete as shown on the Drawings.

Bonding surface shall be clean, sound and free of all dust, laitance, grease, form release agents, curing compounds, and any other foreign particles.

Application of bonding agent shall be in strict accordance with manufacturer's recommendations.

Fresh concrete shall not be placed against existing concrete if epoxy bonding agent has lost its tackiness.

3.2.10 Epoxy Resin Binder. Epoxy resin binder shall be used to seal all existing reinforcing steel cut and burned off during demolition operations. Exposed reinforcing steel bars shall be burned back 1/2-inch minimum into existing concrete and the resulting void filled with epoxy resin binder.

3.3 INSTALLATION.

3.3.01 Joint Fillers. Details, including materials and methods of installation of joint fillers shall be as indicated on the Plans and as directed in the field.

3.3.02 Joint Sealants. Joints shall not be sealed when the sealant, air or concrete temperature is less than 40 degrees F (4 degrees C). Bond breaker and backup material shall be installed where required as indicated on the Plans or manufacturer's recommendations.

3.3.03 Waterstops. Shall be maximum practicable length to minimize joints.

Shall be positioned as indicated on the Plans in a manner to permanently retain flexibility.

Splices in running lengths or at intersections shall be performed by heat sealing in accordance with manufacturer's recommendations.

Reform splices with a remolding iron with ribs or corrugations to match the pattern of the waterstops. When cooled and bent by hand in as sharp an angle as possible, the splice shall show no sign of separation.

Provide support and protection of the waterstops during the progress of the work. Any waterstop punctured or damaged shall be replaced or repaired at the Contractor's expense. The concrete shall be thoroughly consolidated in the vicinity of the waterstop. Suitable guards shall be provided to protect exposed projecting edges and ends of partially embedded waterstops from damage when concrete placement has been discontinued.

3.3.04 Slab Isolation Systems. The installation of all slab isolation system materials shall be per manufacturer's specifications and as indicated on the plans.

After installation of the isolation materials and pouring forms, the system shall be protected with two layers of 6 mil (.02 mm) polyethylene film overlapped and taped at all seams. The perimeter and all penetrations shall be caulked with polyurethane sealant after the concrete has been cured.

3.3.05 Miscellaneous Embedded Items. All sleeves, inserts, anchors, and other embedded items required for adjoining Work or for its support shall be placed prior to concreting. Embedded items shall be positioned accurately and supported against displacement. Voids in sleeves, inserts, and anchor slots shall be filled temporarily with readily removable material to prevent the entry of concrete into voids.

End of Section

SECTION 03251

CONSTRUCTION AND EXPANSION JOINTS

PART 1 - GENERAL

1.1 SCOPE. This section includes construction and expansion joint requirements.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C920, "Elastomeric Joint Sealants."

ASTM D994, "Preformed Expansion Joint Filler for Concrete (Bituminous Type)."

ASTM D1751, "Performed Expansion Joint Filler for Concrete Paving and Structural Construction (Non Extruding and Resilient Bituminous Types)."

ASTM D1752, "Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction."

ASTM D2628, "Performed Polychloroprene Elastomeric Joint Seals for Concrete Pavements."

ASTM D2835, "Lubricant for Installation of Performed Compression Seals in Concrete Pavements."

Corps. of Engineers Spec. CRD-C572-74, Specification for Polyvinylchloride Waterstop.

1.3 QUALITY ASSURANCE. Do not add or relocate construction and expansion joints without written approval of Engineer.

Cast slabs and beams monolithically, without horizontal joints unless otherwise indicated.

Do not use horizontal joints in footings and foundation mats unless otherwise indicated.

Provide concrete construction and expansion joints in fills and toppings at the same location as the construction and expansion joints in the supporting concrete.

1.4 SUBMITTALS. Prior to delivery of materials, submit the following for approval:

1.4.01 Drawing and Data. Submit product data for all materials including location where product is to be used. Submit manufacturer's application and installation instructions.

1.4.02 Certifications. Submit certification that materials meet the specifications.

1.4.03 Samples. Submit samples of water stops and joint fillers.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver joint materials in manufacturer's packing including installation instructions. Store materials in accordance with manufacturer's recommendations.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Joint Compounds. Joint compound for joints in horizontal or nearly horizontal surfaces: ASTM C920, Type S or M, Grade P, Class 25, Use T in pedestrian and vehicular traffic areas, and Use NT in non-vehicular areas. Use preformed joint seals where indicated.

Joint compound for joints in walls shall comply with ASTM C920, Type S or M, Grade NS, Class 25. Compounds abutting each other shall be compatible. Compounds in tanks shall be suitable for continuous submergence in liquids.

Preformed Polychloroprene Elastomeric Joint Seal (compression seal): Vulcanized elastomeric compound using polychloroprene as the only base polymer. Use in expansion joints where indicated and conform to ASTM D2628.

Lubricant for installation of Elastomeric Joint Seal shall be single-component polychloroprene compound; ASTM D2835.

2.1.02 Bond Breaker for Joint Compounds. Polyethylene tape, coated paper, metal foil or similar type materials.

2.1.03 Back-Up Material for Joint Compounds. A 100 percent closed-cell material, compressible, non-shrink, non-reactive with joint compound, and non-absorbent. Extruded butyl or polychloroprene foam rubber is acceptable. Material impregnated with oil, bitumen, or similar substances is not acceptable.

Back-up material shall be compatible with joint compound and have same expansion/contraction capability as compound.

2.1.04 Pre-Molded Joint Filler. Unless otherwise specified, pre-molded joint filler shall comply with ASTM D1752, Type I or Type II, ASTM D994, or ASTM D1751.

Furnish joint filler with thickness equivalent to joint width indicated and of suitable length and width.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 Construction Joints. Provide keys for key grooves with width one-third the thickness of the thinner member in which the key is placed and a key depth of 1-1/2 in (3.81 cm), except as otherwise indicated.

Use slightly tapered key groove forms to permit form removal without damage to groove after concrete has cured. Do not remove key groove forms until after concrete has cured.

Center waterstops in construction joints except as otherwise indicated.

The PVC strip shall be embedded one-half its width in the poured concrete at the construction joint. The exposed half width of strip shall be adequately protected against damage and shall be cleaned and repaired, if needed, prior to being embedded in the next adjacent pour. The strip shall be placed and firmly secured in relation to the construction joint and sewer wall or structure as detailed in the Drawings. In lieu of the detail on the Drawings, the strip may be placed and secured at the construction joint in accordance with details submitted by the Contractor and approved by the Engineer.

The bentonite/butyl rubber waterstop shall be installed at the locations as indicated on the Drawings and per the manufacturer's recommendations. In the event that a conflict occurs between the Drawings and the manufacturer's recommendations, bring conflict to Engineer's attention for approval prior to proceeding with installation.
Clean key groove free of latice, curing compound, foreign materials, protrusions of hardened concrete; roughen; and blow out debris and dust with oil-free compressed air.

Continue reinforcement across and perpendicular to construction joints, unless specifically indicated otherwise.

3.1.02 Expansion Joints. Provide expansion joints indicated on drawings. Center waterstops in expansion joints except as otherwise indicated.

3.1.03 Polyvinylchloride Waterstops. The PVC strip shall be constructed as a continuous one-piece waterstop to produce water tightness. Any required splice shall be in strict accordance with the manufacturers recommended method.

Make all splices on a bench following manufacturer's splicing procedures and instructions. Use miter guide and portable power saw to cut spliced ends. Maintain continuity of characteristic features of waterstop cross section (ribs, center bulb, etc.)

Make splices by heat sealing adjacent surfaces using a thermostatically controlled electric heat source in accordance with manufacturer's printed instructions. Reform waterstop at splices using a remolding iron having pattern matching waterstop. After splice has cooled, test by hand bending flat sides of waterstop at splice to sharp bend in both directions. If splice shows any separation or lack of fusion reject splice.

Carefully and correctly position waterstop to form continuous watertight diaphragm in joint to avoid leakage. Support and protect waterstop. Clean waterstop of curing compound, foreign materials, and protrusions of hardened concrete. Replace or repair damaged or punctured waterstop as directed by Engineer.

Consolidate concrete in vicinity of the waterstop during concrete placement.

3.1.04 Premolded-Joint Filler. All joints which are to be sealed shall be formed with filler. Place filler in correct position before concrete is placed against it. Prevent disturbance of or damage to joint filler. Fill expansion joint completely.

Holes or joints in the filler shall be filled with mastic to prevent the passage of mortar or concrete from one side of the joint to the other.

3.1.05 Joint Compound. Clean and dry concrete to be sealed in accordance with manufacturer’s printed instructions. Install back-up and bond breaker materials. Prime concrete, fill joint flush with joint compound of required thickness, tool to concave joint and seal, all in accordance with the joint compound manufacturer’s instructions and ASTM C920. Prevent spilling compound over adjoining surfaces. Use tape adjacent to joint if required. Remove all tape completely from concrete surface. Do not seal when compound, air, or concrete temperature is less than 40° F (4 degrees C).

3.1.06 Preformed Elastomeric Joint Seal. All joint fillers should be removed prior to installation of compression seal. Prior to installation, correct irregularities in the expansion joint face that would prevent contact between the joint seal and the joint face. Lightly sandblast the exposed joint faces until the surfaces are free of dust, dirt, curing compound, joint filler, and any other material that might prevent ready insertion and bonding of the joint seal to the concrete or stainless steel. After final cleaning and immediately prior to joint seal installation, clean the expansion joints until they are completely free of sand and water.

Ensure that the expansion joints are thoroughly clean and dry. Do not install the joint seal if the atmospheric and pavement temperatures are at or below 40° F (4 degrees F).

Lubricate and install the joint seal in accordance with the seal manufacturer’s printed instructions. Ensure that the in-place joint seal is in the upright position and free from twisting, distortion and stretching that exceed five percent. Install the joint seal to a depth of 3/16 inch (4.8 mm), plus or minus 1/16 inch (1.6 mm), from the finished surface. Ensure that butt joints and intersecting splices have full contact. Use adhesive recommended by the seal manufacturer. Remove contaminants, such as dust, grease from the seal.

3.1.07 Bentonite/Butyl Rubber Waterstops. Follow manufacturer’s recommendations for preparation and installation of bentonite/butyl rubber waterstop. Tightly butt coil ends together to form a continuous waterstop – DO NOT OVERLAP COIL ENDS. Place the maximum practical lengths to minimize coil end joints. Where required, cut coils with a sharp knife or utility blade to fit coil ends together. Make horizontal to vertical transitions by abutting coil sections together.

End of Section

SECTION 03300

CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 SCOPE. Provide all labor, equipment, materials and services necessary for the manufacture, transportation, placement, and curing of all plain and reinforced concrete work, as shown on the Drawings or as ordered by the Engineer.

The requirements in this section shall apply to the following types of concrete:

Class A Concrete: Normal weight concrete to be used in all cast in place structures and pavements except where noted otherwise in the Contract Documents.

Class B Concrete: Concrete to be used for curbs, gutters, catch basins, sidewalks, fence and guard post embedment, underground duct bank encasement and all other concrete appurtenant to electrical facilities unless otherwise shown or noted on the Drawings. Concrete to be used for thrust blocks, pipe trench cut-off blocks and cradles, mud-mats, and concrete fills where the preceding items are detailed on the Drawings as unreinforced. Concrete to be used as protective cover for dowels intended for future connection.

1.2 GOVERNING STANDARDS. Without limiting the generality of the Specifications, all work herein shall conform to or exceed the applicable requirements of the following documents. All referenced specification, codes, and standards refer to the most current issue available at the time of Bid.

ACI 214	Recommended Practice for Evaluation of Strength Test Results of Concrete
ACI 301	Specifications for Structural Concrete for Buildings
ACI 304	Guide for Measuring, Mixing, Transporting, and Placing Concrete
ACI 305	Hot Weather Concreting
ACI 306	Cold Weather Concreting
ACI 308	Standard Practice for curing concrete
ACI 309	Recommended Practice for Consolidation of Concrete

ACI 318	Building Code Requirements for Structural Concrete and Commentary
ACI 350	Environmental Engineering Concrete Structures and Commentary (ACI 350R)
ASTM C 31	Standard Methods of Making and Curing Concrete Test Specimens in the Field
ASTM C 33	Standard Specification for Concrete Aggregates
ASTM C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
ASTM C 88	Standard Test Method for Soundness of Aggregates by use of Sodium Sulfate or Magnesium Sulfate
ASTM C 94	Standard Specification for Ready-Mixed Concrete
ASTM C 114	Standard Test Method for Chemical Analysis of Hydraulic Cement
ASTM C 136	Standard Method for Sieve Analysis of Fine and Coarse Aggregate
ASTM C 138	Standard Test Method for Unit Weight, Yield, and Air Content (Gravimetric) of Concrete
ASTM C 143	Standard Test Method for Slump of Portland Cement Concrete
ASTM C 150	Standard Specification for Portland Cement
ASTM C 171	Standard Specifications for Sheet Materials for Curing Concrete
ASTM C 172	Standard Method of Sampling Fresh Concrete
ASTM C 192	Standard Method of Making and Curing Concrete Test Specimens in the Laboratory
ASTM C 231	Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method

ASTM C 260	Standard Specification for Air-Entraining Admixtures for Concrete
ASTM C 309	Standard Specification for Liquid Membrane Forming Compounds for Curing Concrete
ASTM C 494	Standard Specification for Chemical Admixtures For Concrete
ASTM C 595	Standard Specification for Blended Hydraulic Cements
ASTM C 618	Standard Specification for Fly Ash and Raw or Calcined Natural Pozzolan for use as a Mineral Admixture in Portland Cement Concrete
ASTM C 989	Standard Specification for Ground Granulated Blast-Furnace Slag for Use in Concrete and Mortars
ASTM C1260	Standard Test Method for Potential Alkali Activity of Aggregates (Mortar-Bar Method)
MDOT	Michigan Department of Transportation Latest Edition of Standard Specifications for Construction
AASHTO T26	Quality of Water to be used in Concrete

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit the following in accordance with Specifications herein:

Sources of all materials and certifications of compliance with specifications for all materials.

Aggregate test results showing compliance with required standards, i.e., sieve analysis, aggregate soundness tests, etc.

Manufacturer's data on all admixtures stating compliance with required standards.

Concrete mixture designs and test data shall be submitted for review by the Engineer with a written request for approval. No concrete shall be placed until the Contractor has received such approval in writing. Each mixture report shall include:

Slump on which design is based.

Total gallons of water per cubic yard.

Brand, type, composition, and quantity of cement.

Brand, type composition, and quantity of fly ash.

Brand, type, composition, and quantity of microsilica

Specific gravity and gradation of each aggregate.

Ratio of fine to total aggregates.

Weight (surface dry) of each aggregate per cubic yard.

Brand, type, ASTM designation, active chemical ingredients, and quantity of each admixture.

Air content.

Compressive strength based on 7-day and 28-day compression tests.

Time initial set.

Submit reports of the sampling and testing of slump, air content and strength performed.

Submit reports of nondestructive, core and/or liquid retention testing required for acceptance of concrete in place.

Submit Shop Drawings showing the location of all joints. Included shall be a schedule of the concrete pouring. The location of joints and pouring schedule shall be subject to approval by the Engineer.

Delivery Tickets: Furnish to Engineer copies of all delivery tickets for each load of concrete delivered to the site, see Article 3.2.B.6.

1.4 QUALITY ASSURANCE. Tests on materials used in the production of concrete shall be required as specified in PART 2 -- PRODUCTS. These tests shall be performed by an independent testing laboratory approved by the Engineer at no additional cost to the Owner.

Trial concrete mixes shall be tested when required in accordance with Article 3.10 at no additional cost to the Owner.

Field quality control tests, as specified herein, unless otherwise stated, will be performed by a testing laboratory employed by the Contractor. Any individual who samples and tests concrete to determine if the concrete is being produced in accordance with this Specification shall be certified as a Concrete Field Testing Technician, Grade I, in accordance with ACI CP-2. Testing laboratory shall conform to requirements of ASTM C-1077.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Hydraulic Cement.

Portland Cement:

Portland Cement shall be Type II conforming to ASTM C 150. Type I cement may be used provided fly ash is also included in the mix in accordance with Specifications herein.

For concrete mixed with only Portland Cement, the total alkalies in the cement (calculated as the percentage of NA2O plus 0.658 times the percentage of K2O) shall not exceed 0.40% unless aggregates to be used meet the requirements for non-reactivity with alkalies stated in Article 2.4.

For concrete mixed with Portland Cement and an appropriate amount of fly ash, the total alkalies in the Portland Cement (calculated as the percentage of NA2O plus 0.658 times the percentage of K2O) shall not exceed 0.85% unless aggregates to be used meet the requirements for non-reactivity with alkalies stated in Article 2.4.

Different types of cement shall not be mixed nor shall they be used alternately except when authorized in writing by the Engineer. Different brands of cement or the same brand from different mills may be used alternately. A resubmittal will be required if different cements are proposed during the Project.

Cement shall be stored in a suitable weather-tight building so as to prevent deterioration or contamination. Cement which has become caked, partially hydrated, or otherwise damaged will be rejected.

2.1.02 Fly Ash.

.

Fly ash shall meet the requirements of ASTM C 618, except that the loss on ignition shall not exceed 4%. The available alkalis in the fly ash shall not exceed 1.5% as specified in ASTM C 618. Fly ash shall also meet the optional physical requirements for uniformity as shown in ASTM C 618.

Where fly ash is included in the concrete mix to waive the 0.4% alkali requirement of the Portland Cement, the fly ash constituent shall be between 15% and 25% of the total weight of the combined Portland Cement and fly ash. The percentage of fly ash shall be set so that the mean mortar bar expansion of the cement-fly ash mix shall be 0.08% or less when tested at 16 days in accordance with ASTM C 1260. The Portland Cement and aggregates used in the mix for this test shall be the Portland Cement and aggregates submitted for use on the job.

2.1.03 Water. Potable water approved by the State Department of Public Health may be used without testing.

For water requiring testing, the tests shall be conducted in accordance with AASHTO T26 and meet the following requirements:

Total Solid Mater, max. ………… 0.30%

Organic Matter, max. …………… 0.05%

Alkalinity-acidity ……………….. neutral to litmus

2.1.04 Aggregates. All aggregates used in normal weight concrete shall conform to ASTM C 33.

Do not use aggregates containing soluble salts or other substances such as iron sulfides, pyrite, marcasite, ochre, or other materials that can cause stains on exposed concrete surfaces.

General Requirements: Washing will be required to eliminate the dust, clay, or silt coating. Aggregates, which have been washed, shall not be used sooner than 24 hours after washing, unless approved by the Engineer.
Fine Aggregate (Sand) in the various concrete mixes shall consist of natural or manufactured siliceous sand, clean and free from deleterious substances. Fine Aggregate shall be MDOT aggregate 2NS. Fine aggregates shall conform to MDOT Specification 902.09 and the Grading Requirements in Table 902.4.

Coarse Aggregate shall be gravel or crushed rock conforming to MDOT Class 6AA meeting the requirements of MDOT paragraph 902.03 as well as tables 902-1 and 902-2.

Aggregates shall be tested for soundness in accordance with ASTM C 88. The loss resulting after five cycles shall not exceed 10 percent for fine or coarse aggregate when using magnesium sulfate.

When aggregates, which are non-reactive with alkalis, are desired in order to waive the alkali content requirement of cement as stated in herein, the following tests shall be performed:

A petrographic analysis in accordance with ASTM C295 shall be performed to identify the constituents of the fine and coarse aggregate. Aggregates containing more than the following quantities of constituents shall be considered potentially reactive:

a. Optically strained, microfractured, or microcrystalline quartz exceeding 5.0%.

b. Chert or chalcedony exceeding 3.0%.
c. Tridymite or cristobalite exceeding 1.0%.

d. Opal exceeding 0.5%.

e. Natural volcanic glass in volcanic rocks exceeding 3.0%.

Aggregate shall be evaluated by ASTM C-1260 Aggregate sources that exhibit mean mortar bar expansions at 16 days greater than .08% shall be considered potentially reactive. Tests shall be made with cement proposed for use on the job.

Contractor shall submit a new trial mix to the Engineer for approval whenever a different aggregate or gradation is proposed.

No aggregates that have become intermixed prior to proportioning shall be used. Sufficient aggregate shall be available at the site to preclude the possibility of damaging delays while placing the concrete.

2.01.05 Admixtures. Provide admixtures produced by established, reputable manufacturers, and used in compliance with the manufacturer's printed instruction. Do not use admixtures which have not been incorporated and tested in accepted mixes, unless otherwise authorized in writing by the Engineer.

Air Entraining Admixtures: ASTM C 260

Product and Manufacturer: Provide one of the following:

SIKA AER, as manufactured by Sika Corporation.

MB-VR, as manufactured by Master Builders, Inc.

Daravair, as manufactured byt W.R. Grace & Co.-Conn.

Or equal.

Water-Reducing Admixture: ASTM C 494, Type A.

Proportion all Class “A” and Class “B” concrete with non-air entraining, normal-setting, water-reducing, aqueous solution of a modification of the salt of polyhydroxylated organic acids. The admixture shall not contain any lignin, nitrates or chlorides added during manufacturing.

Product and Manufacturer: Provide one of the following:

Eucon WR-75, as manufactured by the Euclid Chemical Company.

Pozzolith, as manufactured by Master Builders Inc.
WRDA-15, as manufactured by W.R. Grace & Co.-Conn.

Or equal.

Do not use calcium chloride or other accelerating mixtures unless specifically permitted by the Engineer for mass concrete.

2.2 CONCRETE MIX DESIGN. The proportions of cement, aggregates, admixtures and water used in the concrete mixes shall be based on the results of field experience or laboratory trial mixes in conformance with Section 5.3. "Proportioning on the Basis of Field Experience and/or Trial Mixtures" of ACI 318. When trial mixes are used they shall also conform to Article 3.1 of this specification section. Field experience records and/or trial mix data used as the basis for the proposed concrete mix design shall be submitted to the Engineer along with the proposed mix.

Class A concrete shall conform to the following requirements. Cementitious materials refer to the total combined weight of all cement, fly ash, and ground granulated blast furnace slag contained in the mix.

Compressive strength (28-Day): 4,500 psi (for concrete mixed with only Portland Cement 4,000 psi (for concrete mixed with Portland Cement and fly ash)

Maximum water/cementitious: 0.45 materials ratio, by weight

Slump range: 4" nominal unless high range water reducing admixture is used.
3" max. before addition of high range water reducing admixture.

8" max. after addition of high range water reducing admixture.

Air Content:

All Class A concrete not otherwise noted: 6% +/- 1.5%

Class A concrete which is to receive a hardened finish (Type G in accordance with Section 03350): 3% Max

Class B concrete need not be air-entrained unless exposed to freeze/thaw cycles or as may be otherwise indicated. The minimum compressive strength (28-day) of these types of concrete shall be 2,500 psi.

PART 3 - EXECUTION

3.1 TRIAL MIX. When field experience records are inadequate to confirm the quality of a proposed concrete mix in accordance with Section 5.3, "Proportioning on the Basis of Field Experience and/or Trial Mixtures" of ACI 318, or when required by the Engineer, an independent testing laboratory designated by the Contractor and acceptable to the Engineer shall test a trial batch of each of the preliminary concrete mixes submitted by the Contractor. The trial batch shall be prepared using the aggregates, cement and admixtures proposed for the project. The trial batch materials shall be of a quantity such that the testing laboratory can obtain enough samples to satisfy requirements stated below. Tests on individual materials stated in PART 2 -- PRODUCTS should already be performed before any trial mix is done. The cost of laboratory trial batch tests for each specified concrete mix will be borne by the Contractor and the Contractor shall furnish and deliver the materials to the testing laboratory at no cost to the Owner.

An independent testing laboratory shall observe the preparation of the trial batch, and they shall prepare a minimum of fifteen (15) standard test cylinders in accordance with ASTM C 31 in addition to conducting slump (ASTM C 143), air content (C 231) and unit weight (C 138) tests. Compressive strength test on the cylinders shall subsequently be performed by the same laboratory in accordance with ASTM C 39 as follows: Test 3 cylinders at age 7 days; test 3 cylinders at age 21 days; test 3 cylinders at age 28 days and test 3 cylinders at 56 days. The cylinders shall be carefully labeled. If the average 28-day compressive strength of the trial mix is less than that specified, or if any single cylinder falls below the required strength by more than 500 psi, the mix shall be corrected, another trial batch prepared, test cylinders taken, and new tests performed as before. Any such additional trial batch testing required shall be performed at no additional cost to the Owner. Adjustments to the mix shall be considered refinements to the mix design and shall not be the basis for extra compensation to the Contractor.

3.2 PRODUCTION OF CONCRETE. All concrete shall be machine mixed. Hand mixing of concrete will not be permitted. The Contractor may supply concrete from a ready mix plant or from a site mixed plant. In selecting the source for concrete production the Contractor shall carefully consider its capability for providing quality concrete at a rate commensurate with the requirements of the placements so that well bonded, homogenous concrete, free of cold joints, is assured.

3.2.01 Ready-Mixed Concrete. At the Contractor's option, ready-mixed concrete may be used meeting the requirements for materials, batching, mixing, transporting, and placing as specified herein and in accordance with ASTM C 94.

Truck mixers shall be equipped with electrically-actuated counters by which the number of revolutions of the drum or blades may be readily verified. The counter shall be of the resettable, recording type, and shall be mounted in the driver's cab. The counters shall be actuated at the time of starting mixers at mixing speeds.

Each batch of concrete shall be mixed in a truck mixer for not less than 70 revolutions of the drum or blades at the rate of rotation designated by the manufacturer of equipment. Additional mixing, if any, shall be at the speed designated by the manufacturer of the equipment as agitating speed. All materials including mixing water shall be in the mixer drum before actuating the revolution counter for determining the number of revolutions of mixing.

Truck mixers and their operation shall be such that the concrete throughout the mixed batch, as discharged, is within acceptable limits of uniformity with respect to consistency, mix and grading. If slump tests taken at approximately the 1/4 and 3/4 points of the load during discharge give slumps differing by more than one inch when the specified slump is 3 inches or less, or if they differ by more than 2 inches when the specified slump is more than 3 inches, the mixer shall not be used on the work unless the causing condition is corrected and satisfactory performance is verified by additional slump tests. All mechanical details of the mixer, shall be checked before a further attempt to use the unit will be permitted.

Ready-mixed concrete shall be delivered to the site for the work and discharge shall be completed before the drum has been revolved 250 revolutions and within the time requirements stated in Article 3.03 of this Section.

Each and every concrete delivery shall be accompanied by a delivery ticket containing at least the following information:

Date and truck number

Ticket number

Mix designation of concrete

Cubic yards of concrete

Cement brand, type and weight in pounds

Weight in pounds of fine aggregate (sand)

Weight in pounds of coarse aggregate (stone)

Air entraining agent, brand, and weight in pounds and ounces

Other admixtures, brand, and weight in pounds and ounces
Water, in gallons, stored in attached tank

Water, in gallons, maximum that can be added without exceeding design water/cement ratio

Water, in gallons, actually used (by truck driver)

Time of loading
Time of delivery to job (by truck driver)

Signatures of inspectors at plant and site

Any truck delivering concrete to the job site, which is not accompanied by a delivery ticket showing the above information will be rejected and such truck shall immediately depart from the job site.

The use of non-agitating equipment for transporting ready-mixed concrete will not be permitted. Combination truck and trailer equipment for transporting ready-mixed concrete will not be permitted. The quality and quantity of materials used in ready-mixed concrete and in batch aggregates shall be subject to continuous inspection at the batching plant by the Engineer.

3.2.02 Site Mixed Concrete. Scales for weighing concrete ingredients shall be accurate when in use within "0.4 percent of their total capacities. Standard test weights shall be available to permit checking scale accuracy.

Operation of batching equipment shall be such that the concrete ingredients are consistently measured within the following tolerances:

Cement, fly ash:	+/- 1 percent
Water:	+/- 1 percent

Aggregates:	+/- 2 percent
Admixtures:	+/- 3 percent

Each batch shall be so charged into the mixer that some water will enter in advance of the cement and aggregates. Water shall continue for a period that may extend to the end of the first 25 percent of the specified mixing time. Controls shall be provided to prevent batched ingredients from entering the mixer before the previous batch has been completely discharged.

The concrete shall be mixed in a batch mixer capable of thoroughly combining the aggregates, cement, and water into a uniform mass within the specified mixing time, and of discharging the concrete without harmful segregation. The mixer shall bear a manufacturer's rating plate indicating the rate capacity and the recommended revolutions per minute and shall be operated in accordance therewith.

Mixers with a rate capacity of 1 cu.yd. or larger shall conform to the requirements of the Plant Mixer Manufacturers' Division of the Concrete Plant Manufacturers' Bureau.

Except as provided below, batches of 1 cu. yd. or less shall be mixed for not less than 1 minute. The mixing time shall be increased 15 seconds for each cubic yard or fraction thereof of additional capacity.

Shorter mixing time may be permitted provided performance tests made in accordance with of ASTM C 94 indicate that the time is sufficient to produce uniform concrete. Re-tempering or re-mixing concrete that has partially set will not be permitted.

Controls shall be provided to insure that the batch cannot be discharged until the required mixing time has elapsed. At least three-quarters of the required mixing time shall take place after the last of the mixing water has been added.

The interior of the mixer shall be free of accumulations that will interfere with mixing action. Mixer blades shall be replaced when they have lost 10 percent of their original height.

Air-entraining admixtures and other chemical admixtures shall be charged into the mixer as solutions and shall be measured by means of an approved mechanical dispensing device. The liquid shall be considered a part of the mixing water. Admixtures that cannot be added in solution may be weighed or may be measured by volume if so recommended by the manufacturer.

If two or more admixtures are used in the concrete, they shall be added separately.

Addition of retarding admixtures shall be completed within 1 minute after addition of water to the cement has been completed, or prior to the beginning of the last three-quarters of the required mixing, whichever occurs first. Retarding admixtures shall not be used unless approved by the Engineer.

Concrete shall be mixed only in quantities for immediate use and within the time and mixing requirements of ASTM C 94. The mixer shall be cleaned each time when not operating for more than 30 minutes.

3.3 CONCRETE PLACEMENT. No concrete shall be placed prior to approval of the concrete mix design. Concrete placement shall conform to the recommendations of ACI 304.

Prior to concrete placement, all reinforcement shall be securely and properly fastened in its correct position. Formwork shall be clean, oiled and form ties at construction joints shall be retightened. All bucks, sleeves, castings, hangers, pipe, conduits, bolts, anchors, wire, and any other fixtures required to the embedded therein shall be in place. Forms for openings to be left in the concrete shall be in place and anchored by the Contractor. All loose debris in bottoms of forms or in keyways shall be removed and all debris, water, snow, ice and foreign matter shall be removed from the space to be occupied by the concrete. The Contractor shall notify the Engineer in advance of placement, allowing sufficient time for a concurrent inspection and for any corrective measures which are subsequently required.
On horizontal joints where concrete is to be placed on hardened concrete, a slush coat of mortar 1/2-inch to 1-inch thick with slump less than 6 inches, made of the same materials as the concrete, but without the coarse aggregate, shall be worked well into the irregularities of the hard surface just ahead of the concrete placement.

All concrete shall be placed during the daylight hours except with the consent of the Engineer. If special permission is obtained to carry on work during the night, adequate lighting must be provided.

When concrete arrives at the site with slump below that suitable for placing, as indicated by the Specifications, water may be added to bring the concrete within the specified slump range provided that the design water-cement ratio is not exceeded. The water shall be incorporated by additional mixing equal to at least half of the total mixing required. Water may be added only to full trucks. On-site tempering shall not relieve the Contractor from furnishing a concrete mix that meets all specified requirements.

Concrete shall be conveyed as rapidly as practicable to the point of deposit by methods which prevent the separation or loss of the ingredients. It shall be so deposited that rehandling will be unnecessary. Discharge of the concrete to its point of deposit shall be completed within 90 minutes after the addition of the cement to the aggregates. In hot weather, or under conditions contributing to quick stiffening of the concrete, the time between the introduction of the cement to the aggregates and discharge shall not exceed the requirements stated herein.

No concrete shall be deposited in any unit until the area has been completely de-watered, and not until after the CONTRACTOR has made satisfactory provisions to eliminate all possibility of water entering or flowing through the concrete while it is being poured or is taking its set.

Before depositing new concrete on or against concrete which has already been cast, it shall be roughened as required by the Engineer and thoroughly cleaned of foreign matter and laitance. It shall be saturated with water, and then cleaned. The saturated surface of the hardened concrete, including vertical and inclined surfaces, shall be slurried with a minimum 2-inch thick coating of concrete grout without coarse aggregate.

Where concrete is conveyed to position by chutes, a practically continuous flow in the chute shall be maintained. The angle and discharge arrangement of the chute shall be such as to prevent segregation of the concrete ingredients. The delivery end of the chute shall be as close as possible to the point of deposit and in no case shall the free pour from the delivery end of the chute exceed five feet.

The interior hopper slope shall be not less than 60 degrees from the horizontal, the minimum dimension of the clear gate opening shall be at least five (5) times the nominal maximum size aggregate and the area of the gate opening shall be not less than two (2) square feet. The maximum dimension shall not be greater than twice the minimum dimension. The bucket gates pneumatically or hydraulically operated except for buckets larger than two, (2) cubic yards shall not be manually operated. The design of the bucket shall provide means for positive regulation of the amount and rate of deposit of concrete in each dumping position.

Conveyors shall be designed and operated to assure a uniform flow of concrete from mixer to final place of deposit without segregation of ingredients or loss of mortar and shall be provided with positive means for preventing segregation of the concrete at the transfer points and the point of placing.

Special care must be exercised to prevent splashing of forms or reinforcement with concrete, and any such splashes or accumulations of hardened or partially hardened concrete on the forms or reinforcement above the general level of the concrete already in place must be removed before the work proceeds. Concrete shall be placed in all forms in such way as to prevent any segregation.

Placing of concrete shall be so regulated that the pressure caused by the wet concrete shall not exceed that used in the design of the forms.

All concrete for walls shall be placed through openings in the form spaced at frequent intervals or through tremies (heavy duct canvas, rubber, etc.), equipped with suitable hopper heads. Tremies shall be of variable lengths so that the free fall shall not exceed five (5) feet and a sufficient number shall be placed in the form to insure the concrete being kept level at all times.

When placing concrete that is to be exposed, sufficient illumination shall be provided in the interior of the forms so that the concrete, at places of deposit, is visible from deck and runways.

Concrete shall be placed so as to thoroughly embed all reinforcement, inserts, and fixtures.

When forms are removed, surfaces shall be even and dense, free from aggregate pockets or honeycomb. To achieve this, concrete shall be consolidated using mechanical vibration, supplemented by forking and spading by hand in the corners and angle of forms and along form surfaces while the concrete is plastic under the vibratory action. Consolidation shall conform to ACI 309. Vibrators shall be used at 18” to 30” intervals in the concrete.

Mechanical vibration shall be applied directly to the concrete, unless otherwise approved by the Engineer. The bottom of vibrators used on floor slabs must not be permitted to ride the form supporting the slab. Vibration shall be applied at the point of deposit and in the area of freshly placed concrete by a vertical penetration of the vibrator. Vibrators shall not be used to move concrete laterally within the forms.

The intensity of vibration shall be sufficient to cause settlement of the concrete into place and to produce monolithic joining with the preceding layer. It shall be of sufficient duration to accomplish thorough compaction and complete embedment of reinforcement and fixtures with a vibrator transmitting not less than 7,000 impulses per minute. Since the duration of vibration per square foot of surface is dependent on the frequency, size of vibrator, and slump of concrete, the length of time must therefore be determined in the field. Vibration, however, shall not be continued in any one location to the extent that pools of grout are formed. All such vibrating, including methods and equipment, shall be subject to review by the Engineer.

Care shall be taken to prevent cold joints when placing concrete in any portion of the work. The concrete placing rate shall be such as to ensure that each layer is placed while the previous layer is soft or plastic, so that the two layers can be made monolithic by penetration of the vibrators. Maximum thickness of concrete layers shall be 18 inches. The surface of the concrete shall be level whenever a run of concrete is stopped.

To prevent featheredges, construction joints that are located at the tops of horizontal lifts near sloping exposed concrete surfaces shall be inclined near the exposed surface, so that the angle between such inclined surface and the exposed concrete surface will be not less than 50°.

In placing unformed concrete on slopes, the concrete shall be placed ahead of a non-vibrated slip-form screed extending approximately 2-1/2 feet back from its leading edge. The method of placement shall provide a uniform finished surface with the deviation from the straight line less than 1/8 inch in any concrete placement. Concrete ahead of the slip-form screed shall be consolidated by internal vibrators so as to ensure complete filling under the slip-form. Prior to placement of concrete on sloped walls or slabs, the Contractor shall submit a plan specifically detailing methods and sequence of placements, proposed concrete screed equipment, location of construction joints and waterstops, and/or any proposed deviations from the aforementioned to the Engineer for review and approval.

Concrete shall not be placed during rains sufficiently heavy or prolonged to wash mortar from coarse aggregate on the forward slopes of the placement. Once placement of concrete has commenced in a block, placement shall not be interrupted by diverting the placing equipment to other uses.

3.4 PLACING UNDERWATER CONCRETE. No concrete shall be placed under flowing water. The concrete shall be placed by gravity flow tremies or pipelines from the mixer. The hopper and tremie pipe shall be a closed system. The bottom of the tremie shall be kept as far as practical below the surface of the placed concrete. The tremie pipe shall be large enough to accommodate the size of aggregate.

The first charge of concrete shall be placed with a sliding plug pushed down the tube ahead of it to prevent mixing of the concrete and water. The tremie pipe shall always penetrate well into the concrete to prevent accidental withdrawal if the pipe is surged to discharge concrete.

The concrete shall be wholly deposited by tremie and the method of deposition shall not be changed part way up to prevent the laitance from being entrapped within the structure. All tremie pipes shall be cleaned after use.

Bottom dump buckets will not be permitted. Still water shall be maintained at the point of deposit and the forms underwater shall be tight. The tremie tube shall be supported to permit free movement of the discharge end over the entire surface of the work and to permit rapid adjustment to the flow of concrete.

The concrete shall be placed full depth in one continuous operation completing the work to grade progressively. The tremie tube shall be kept in the freshly deposited concrete at all times, being withdrawn only at the completion of a pour. After withdrawing the tremie tube it shall be recharged with concrete above water and lowered to the new position where the discharge end can be placed below freshly deposited concrete.

During placing operations, the tremie tube shall be kept full to the bottom of the hopper. When a batch is dumped into the hopper, the flow of concrete shall be induced by raising the discharge end of the tube slightly but not out of the concrete. The tremie tube shall be equipped such that the bottom end will be closed when pipe is not enclosed by concrete.

An approved tremie shall consist of a water tight tube fitted with a valve or other approved device to ensure that the surrounding water is prevented from mixing with the concrete during the initial concrete charge. The base of the tube shall sit on the bottom of the pour while the initial charge is affected. The tube and the hopper shall be completely filled with concrete before the base valve is opened.

The tremie shall be capable of controlled movement at the discharge end in both lateral and vertical directions and shall be capable of rapid lowering at any time to decrease the discharge rate of the concrete. The flow of concrete shall be regulated by adjusting the depth so the discharge end is submerged below the surface of the freshly placed concrete.

The placement of concrete shall be through the use of gravity flow tremies only, concrete pumps will not be permitted. The concrete shall not be subjected to any physical disturbance after placement. Adequate allowance shall be made when concreting to provide for the subsequent removal of the contaminated surface layer. If the finished surface of the concrete rises above the water level, the contaminated concrete may be removed before hardening occurs. When dewatering in completed, structural concrete shall have all unsound or contaminated areas removed.

3.5 PLACING FLOOR SLABS ON GRADE. The subgrade for slabs on ground shall be well drained and of adequate and uniform loadbearing nature. The in place density of the subgrade soils shall be at least the minimum required by the specifications. No foundation, slab, or pavement concrete shall be placed until the depth and character of the foundation soils have been inspected and approved by the Engineer.
The subgrade shall be free of frost before concrete placing begins. If the temperature inside a building where concrete is to be placed is below freezing it shall be raised and maintained above 50°F. long enough to remove all frost from the subgrade.

The subgrade shall be moist at the time of concreting. If necessary, it shall be dampened with water in advance of concreting, but there shall be no free water standing on the subgrade nor any muddy or soft spots when the concrete is placed.

Thirty pound felt paper shall be provided between edges of slab on grade and vertical and horizontal concrete surfaces, unless otherwise indicated on the Drawings.

Contraction joints shall be provided in slabs-on-grade at locations indicated on the Drawings. Contraction joints shall be installed as per Section 03251 - Joints in Concrete.

Floor slabs shall be screeded level or pitched to drain as indicated on the Drawings. Finishes shall conform with requirements of Section 03345 - Concrete Finishes.

3.6 PLACING CONCRETE UNDER PRESSURE (PUMPING). Where concrete is conveyed and placed by mechanically applied pressure, the equipment shall have the capacity for the operation. The operation of the pump shall be such that a continuous stream of concrete without air pockets is produced. To obtain the least line resistance, the layout of the pipeline system shall contain a minimum number of bends with no change in pipe size. If two sizes of pipe must be used, the smaller diameter should be used at the pump end and the larger at the discharge end. When pumping is completed, the concrete remaining in the pipelines, if it is to be used, shall be ejected in such a manner that there will be no contamination of the concrete or separation of the ingredients. Concrete may be conveyed using a pump only when authorized by the ENGINEER.

The maximum size coarse aggregate shall not be reduced to accommodate the pumps. The distance to be pumped shall not exceed limits recommended by the pump manufacturer. The concrete shall be supplied to the pump continuously. When pumping is completed, concrete remaining in the pipeline shall be ejected without contamination of concrete in place. After each operation, equipment shall be thoroughly cleaned, and flushing water shall be wasted outside of the forms.

No aluminum parts shall be in contact with the concrete during the entire placing of concrete under pressure at any time.

Prior to placing concrete under pressure, the Contractor shall submit the concrete mix design together with test results from a recognized testing laboratory proving the proposed mix meets all requirements. In addition, an actual pumping test under field conditions may be required by the ENGINEER prior to acceptance of the mix. This test requires a duplication of anticipated site conditions from beginning to end. The batching and truck mixing shall be the same as will be used; the same pump and operator shall be present and the pipe and pipe layouts will reflect the maximum height and distances contemplated.
If the pumped concrete does not produce satisfactory end results, the Contractor shall discontinue the pumping operation and proceed with the placing of concrete using conventional methods.

The pumping equipment must have two cylinders and be designed to operate with one cylinder only in case the other one is not functioning. In lieu of this requirement, the Contractor may have a standby pump on the site during pumping.

The minimum diameter of the hose (conduits) shall be 4 inches.

Pumping equipment and hoses (conduits) that are not functioning properly shall be replaced.

Concrete samples for quality control in accordance with Article 3.9 and will be taken at the placement (discharge) end of the line.

3.7 ORDER OF PLACING CONCRETE. In order to minimize the effects of shrinkage, the concrete shall be placed in units as bounded by construction joints shown on the Drawings and maximum lengths as indicated on Drawings. Where required on the Drawings and wherever else practical, the placing of such units shall be done in an alternating or checkerboard pattern.

3.8 CONCRETE WORK IN COLD WEATHER. Cold weather concreting procedures shall conform to the requirements of ACI 306.

The Engineer may prohibit the placing of concrete at any time when air temperature is 40°F. or lower. If concrete work is permitted, the concrete shall have a minimum temperature, as placed, of 55°F. for placements less than 12" thick, 50°F. for placements 12" to 36" thick, and 45°F. for placements greater than 36" thick. The temperature of the concrete as placed shall not exceed the aforementioned minimum values by more than 20°F.

All aggregate and water shall be preheated. Precautions shall be taken to avoid the possibility of flash set when aggregate or water are heated to a temperature in excess of 100°. in order to meet concrete temperature requirements. The addition of admixtures to the concrete to prevent freezing is not permitted. All reinforcement, forms, and ground with which the concrete is to come in contact shall be defrosted by an approved method. No concrete shall be placed on frozen ground.

3.9 CONCRETE WORK IN HOT WEATHER. Hot weather concreting procedures shall conform to the requirements of ACI 305.

When air temperatures exceed 85°F., or when extremely dry conditions exist even at lower temperatures, particularly if accompanied by high winds, the Contractor and his concrete supplier shall exercise special and precautionary measures in preparing, delivering, placing, finishing, curing and protecting the concrete mix. The Contractor shall consult with the Engineer regarding such measures prior to each day's placing operation and the Engineer reserves the right to modify the proposed measures consistent with the requirements of this Section of the Specifications. All necessary materials and equipment shall be on hand an in position prior to each placing operation.

Preparatory work at the job site shall include thorough wetting of all forms, reinforcing steel and, in the case of slab pours on ground or subgrade, spraying the ground surface on the preceding evening and again just prior to placing. No standing puddles of water shall be permitted in those areas which are to receive the concrete.

The temperature of the concrete mix when placed shall not exceed 90°F.

Temperature of mixing water and aggregates shall be carefully controlled and monitored at the supplier's plant, with haul distance to the job site being taken into account. Stockpiled aggregates shall, if necessary, be shaded from the sun and sprinkled intermittently with water. If ice is used in the mixing water for cooling purposes, it must be entirely melted prior to addition of the water to the dry mix.

Delivery schedules shall be carefully planned in advance so that concrete is placed as soon as practical after it is properly mixed. For hot weather concrete work (air temperature greater than 85°F), discharge of the concrete to its point of deposit shall be completed within 60 minutes from the time the concrete is batched.

The Contractor shall arrange for an ample work force to be on hand to accomplish transporting, vibrating, finishing, and covering of the fresh concrete as rapidly as possible.

Temperature Limits of Mixture: The temperature of the cement, at the time of delivery to the mixer, shall not exceed 165°F. It may be required that it be stored at CONTRACTOR’s expense until cooled to that temperature.

The temperature limits of aggregates and water entering the mixer shall be as follows:

LIMITS OF TEMPERATURES

	Minimum	Maximum
Water	75°F	140°F
Fine Aggregate	65°F	140°F
Coarse Aggregate	65°F	110°F
Concrete (resulting)	60°F	90°F

3.10 QUALITY CONTROL.

3.10.01 Field Testing of Concrete. The Contractor shall coordinate with the Owner's project representative the on-site scheduling of the testing firm's personnel as required for concrete testing.

Concrete for testing shall be supplied by the Contractor at no additional cost to the Owner. In addition Contractor shall provide assistance to the testing laboratory employed by the Contractor in obtaining samples. The Contractor shall dispose of and clean up all excess material.

Tests shall be made of each batch of concrete delivered, each 50 cubic yards, or whenever consistency appears to vary. The sampling and testing of slump, air content and strength will be performed at no cost to the Owner. Composite samples shall be secured in accordance with the Method of Sampling Fresh Concrete, ASTM C172

3.10.02 Consistency. The consistency of the concrete will be checked by the Engineer by standard slump cone tests. The Contractor shall make any necessary adjustments in the mix as the Engineer may direct and shall upon written order suspend all placing operations in the event the consistency does not meet the intent of the specifications.

Slump tests shall be made in accordance with ASTM C 143. Slump tests will be performed as deemed necessary by the Engineer and each time compressive strength samples are taken.

Concrete with a specified nominal slump shall be placed having a slump of +/-1 inch of the specified slump. Concrete with a specified maximum slump shall be placed having a slump less than the specified slump.

3.10.03 Air Content. Samples of freshly mixed concrete will be tested for entrained air content by the Engineer in accordance with ASTM C 231.

Air content tests will be performed as deemed necessary by the Engineer and each time compressive strength samples are taken.

In the event that test results are outside the limits specified, additional tests will be run. Admixture quantity adjustments shall be made immediately upon discovery of incorrect air entrainment.

3.10.04 Compressive Strength. Samples of freshly mixed concrete will be taken by the independent test laboratory and tested for compressive strength in accordance with ASTM C 172, C 31 and C 39, except as modified herein. Any deviations from the requirements specified shall be recorded in the test report.
In general, one sampling shall be taken for each placement in excess of five (5) cubic yards, with a minimum of one (1) sampling for each day of concrete placement operations, or for each fifty (50) cubic yards of concrete, whichever is greater.

Each sampling shall consist of at least four (4) cylinders. Each cylinder shall be identified by a tag, which shall be hooked or wired to the side of the container. The

Engineer will fill out the required information on the tag, and the Contractor shall satisfy himself that such information shown is correct.

The Contractor shall be required to furnish labor to the independent test laboratory in preparing test cylinders for testing. The Contractor shall provide approved curing boxes for storage of cylinders on site. The insulated curing box shall be of sufficient size and strength to contain all the specimens made in any four consecutive working days and to protect the specimens. The box shall be erected, furnished and maintained by the Contractor. Such box shall be equipped to provide the moisture and to regulate the temperature necessary to maintain the proper curing conditions required by ASTM C 31. Such box shall be located in an area free from vibration such as pile driving and traffic of all kinds. No concrete requiring inspection shall be delivered to the site until such storage curing box has been provided. Specimens shall remain undisturbed in the curing box until ready for delivery to the testing laboratory but not less than sixteen hours.

When transported, the cylinders shall not be thrown, dropped, allowed to roll, or be damaged in any way.

Compression tests shall be performed in accordance with ASTM C 39. One test cylinder will be tested at seven days and two at 28 days. The remaining cylinder will be held to verify test results, if needed.

The acceptance test results shall be the average of the strengths of the two (2) specimens tested at 28 days. If one (1) specimen in a test manifests evidence of improper sampling, molding or testing, it shall be discarded and the strength of the remaining cylinder shall be considered the test result. Should both specimens in a test show any of the above defects, the entire test shall be discarded.

Acceptance of Concrete: The strength level of the concrete will be considered satisfactory so long as the averages of all sets of three (3) consecutive strength test results equal or exceed the specified 28-day strength and no individual strength test result falls below the specified 28-day strength by more than 500 psi. If the strength test is not acceptable, further testing shall be performed to qualify the concrete.

Concrete Temperature: Determine the temperature of concrete sample for each strength test.

3.10.05 Evaluation and Acceptance of Concrete. Evaluation and acceptance of the compressive strength of concrete shall be according to the requirements of ACI 214 and ACI 318.

The strength level of concrete will be considered satisfactory if all of the following conditions are satisfied.

The average of 28-day cylinder tests for any three consecutive samplings shall meet or exceed the strength required for the mix specified (see Article 2.6).

No more than 20 percent of the compressive tests have strengths less than that specified.

No individual compressive strength test results falls below the specified strength by more than 500 psi.

In the event that any of the conditions listed above are not met, the mix proportions shall be corrected for the next concrete placing operation.

In the event that condition 2c is not met, additional tests in accordance with Article 3-9, Paragraph F shall be performed.

When a ratio between 7-day and 28-day strengths has been established by these tests, the 7-day strengths shall subsequently be taken as a preliminary indication of the 28-day strengths. Should the 7-day test strength from any sampling be more than 10% below the established strength, the Contractor shall:

Immediately provide additional periods of curing in the affected area from which the deficient test cylinders were taken.
Maintain or add temporary structural support as required.

Correct the mix for the next concrete placement operation, if required to remedy the situation.

All concrete which fails to meet the ACI requirements and these specifications is subject to removal and replacement at no additional cost to the Owner.

3.10.06 Additional Tests. Additional tests on in-place concrete, when and if order by the Engineer, shall also be provided and paid for by the Contractor.

In the event that the 28-day test cylinders fail to meet the strength requirements as outlined in Article 3-9 Paragraph E, the Contractor shall have concrete core specimens obtained and tested from the affected area immediately.

Three cores shall be taken for each sample in which the strength requirements were not met. Core holes shall be filled with low slump concrete or mortar.

The drilled cores shall be obtained and tested in conformance with ASTM C 42. The tests shall be conducted by an independent testing laboratory to be selected by the Engineer.

The location from which each core is taken shall be approved by the Engineer. Each core specimen shall be located, when possible, so that its axis is perpendicular to the concrete surface and not near formed joints or obvious edges of a unit of deposit.

The core specimens shall be taken, if possible, so that no reinforcing steel is within the confines of the core.

The diameter of core specimens should be at least 3 times the maximum nominal size of the course aggregate used in the concrete, but must be at least 2-inches in diameter.

The length of specimen, when capped, shall be at least twice the diameter of the specimen.

The core specimens shall be taken to the laboratory and when transported, shall not be thrown, dropped, allowed to roll, or damaged in any way.

Two (2) copies of test results shall be mailed directly to the Engineer. The concrete in question will be considered acceptable if the average of the test results on core specimens taken from a given area equal or exceed 85% of the specified 28-day strength and if the lowest core strength is greater than 75% of the specified 28-day strength.

In the event that concrete placed by the Contractor is suspected of not having proper air content, the Contractor shall engage an independent test laboratory to be selected by the Engineer, to obtain and test samples for air content in accordance with ASTM Specification C 457.

3.11 CARE AND REPAIR OF CONCRETE. The Contractor shall protect all concrete against injury or damage from excessive heat, lack of moisture, overstress, or any other cause until final acceptance by the Owner. Particular care shall be taken to prevent the drying of concrete and to avoid roughening or otherwise damaging the surface. Care shall be exercised to avoid jarring forms or placing any strain on the ends of projecting reinforcing bars. Any concrete found to be damaged, or which may have been originally defective, or which becomes defective at any time prior to the final acceptance of the completed work, or which departs from the established line or grade, or which, for any other reason, does not conform to the requirements of the Contract Documents, shall be satisfactorily repaired or removed and replaced with acceptable concrete at no additional cost to the Owner.

Areas of honeycomb shall be chipped back to sound concrete and repaired as directed by the Engineer.

Concrete formwork blowouts or unacceptable deviations in tolerances for formed surfaces due to improperly constructed or misaligned formwork shall be repaired as directed by the Engineer. Bulging or protruding areas, which result from slipping or deflecting forms shall be ground flush or chipped out and redressed as directed by the Engineer.

Areas of concrete in which cracking, spalling, or other signs of deterioration develop prior to final acceptance shall be removed and replaced, or repaired as directed by the Engineer.

Concrete which fails to meet the strength requirements as outlined in Article 3-9 Paragraph E, will be analyzed by the Engineer as to its adequacy based upon loading conditions, resultant stresses and exposure conditions for the particular area of concrete in question. If the concrete in question is found unacceptable based upon this analysis, that portion of the structure shall be strengthened or replaced by the Contractor at no additional cost to the Owner. The method of strengthening or extent of replacement shall be directed by the Engineer.

Testing of Concrete In Place: Additional testing of materials or concrete occasioned by their failure by test or inspection to meet specification requirements shall be at the expense of the Contractor.

Nondestructive Devices: Testing by impact hammer, sonoscope, or other nondestructive device may be permitted by the Engineer to determine relative strengths at various locations in the structure as an aid in evaluating concrete strength in place or for selecting areas to be cored. Such tests, unless properly calibrated and correlated with other test data, shall not be used as a basis for acceptance or rejection.

Two (2) copies of test results shall be mailed directly to the Engineer. The concrete in question will be considered acceptable if the average of the test results on core specimens taken from a given area equal or exceed 85% of the specified 28-day strength and if the lowest core strength and if the lowest core strength is greater than 75% of the specified 28-day strength.

In the event that concrete placed by the Contractor is suspected of not having proper air content, the Contractor shall engage the independent test laboratory to obtain and test samples for air content in accordance with ASTM Specification C 457.

End of Section

SECTION 03345

CONCRETE CURING AND FINISHING

PART 1 - GENERAL

1.1 SCOPE. This section includes procedures, materials, and techniques required to cure and achieve an exposed finish on horizontal, sloped, or vertical concrete surfaces, including final cleaning.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

ACI 301, “Specifications for Structural Concrete for Buildings.”

ACI 302.1, “Guide for Concrete Floor and Slab Construction.”

ACI 308, “Standard Practice for Curing Concrete.”

ASTM C171, “Sheet Materials for Curing Concrete.”

ASTM C309, “Liquid Membrane-Forming Compounds for Curing Concrete.”

ASTM L881, “Epoxy Resin-Base Bonding Systems for Concrete

ASTM D2103, “Polyethylene Film and Sheeting.”

ASTM E1155, “Method for Determining FF (Floor Flatness and Levelness Using the F-Number System).”

ASTM C150, “Portland Cement.”

1.3 QUALITY ASSURANCE. Perform work in accordance ACI 301 and ACI 302.

Comply with air pollution regulations of governing authorities.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit data on curing compounds, curing papers, and slip resistant treatments including compatibilities and limitations.

1.4.02 Samples. Submit samples not less than 12 inch (30.48 cm) by 12 inch (30.48 cm) size of each type of processed concrete finish, indicating materials and methods used to produce finishes. Engineer's review will be for color and texture only.

Prepare sample finishes on mock-up panels erected under Master Specification Section 03300, Cast-in-Place Concrete.

Submit two 5 lb (2.268 kg) plastic bags of each aggregate specified, illustrating size, color and the extremes of color range.

1.4.03 Mock-Up. Apply surface finishes to sample concrete units or project control mock-up panels in presence of Engineer. Provide workmanship and procedures as required to match approved finish samples.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver curing and finishing materials in manufacturer's packaging including application instructions. Store materials in accordance with manufacturer's recommendations.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pre-cure Finishing Aid. BASF MasterKure ER 50, Euclid "Eucbar", L&M Chemical "E-Con", Master Builders "Confilm", or Sika "Sikafilm".

2.1.02 Polyethylene Film. Product Standard PS17, 6 mils or thicker.

2.1.03 Nonslip Aggregate. Fused aluminum oxide grits or crushed emery abrasive aggregates for nonslip finish, certified by manufacturer to be rustproof, nonglazing, and unaffected by freezing, moisture, and cleaning materials; factory-graded and packaged. Aluminum oxide aggregate; L & M Chemical "Grip It" or BASF "Frictex H".

2.1.04 Absorptive Cover. Burlap cloth made from jute or kenaf, weighing approximately 9 ounces per square yard (305 grams per square meter), complying with AASHTO M 182, Class 2.

2.1.05 Moisture-Retaining Cover. Shall comply with ASTM C171. Curing paper, polyethylene film and white burlap-polyethylene sheeting are all acceptable products.

2.1.06 Chemical Hardener. Colorless, aqueous solution of fluosilicates and wetting agents for application to cured concrete for surface densification.

2.1.07 Membrane Curing Compound – Dissipating Type. ASTM C309, Type 1, Class A & B. Use non-yellowing formulation where subject to ultraviolet light. Cured film must start to chemically break down in four to six weeks after application; unit moisture loss 0.113 PSF (0.55 kg/m^2) maximum; Conspec “RX Cure WB”.

2.1.08 Membrane Curing Compound and Floor Sealer. Shall be Fed Spec TT-C-800, Type I, Class 1, minimum 18 percent solids, non-yellowing, unit moisture loss 0.08 PSF (0.390 kg/m^2) maximum; L&M Chemical “Dress & Seal”, BASF “Kure-N-Seal”, Dayton Superior “Cure & Seal”, or “ Euclid “Super Diamond Clear”.

As on alternative, comply with ASTM C1315, Type I, Class A, minimum 25 percent solids, acrylic, nonyellowing, unit moisture loss 0.082 PSF (0.40 kg/m^2) maximum in 72 hours; L&M Chemical “Dress & Seal 30”, Master Builders “Masterkure-N-Seal HS”, BASF “Kure-N-Seal 25 LV”, or Dayton Superior “Cure & Seal 30”.

When using curing and sealing compound and where indicated, provide curing and sealing formulation with long-lasting finish that is resistant to chemicals, oil, grease, deicing salts, and abrasion.

2.1.09 Bonding Compound. Non-redispersable acrylic bonding admixture, ASTM C1059, Type II.

2.1.10 Epoxy Bonding System. ASTM C881; type, grade, and class as required for project conditions.

PART 3 - EXECUTION

3.3 INSTALLATION.

3.1.01 Curing. Protect freshly placed concrete from prematurely drying and excessively cold or hot temperatures. Start curing as soon as free water has disappeared from the concrete surface after placement and finishing. Maintain curing for at least 7 days (10 days for high-early-strength concrete) after placement.

Curing of concrete shall be done by water curing, by membrane curing, by curing compound, or by combination thereof or by other method approved by the Engineer.

Curing of concrete shall be done by methods that will keep the concrete surfaces adequately wet for the specified curing period. Avoid rapid drying at the end of the curing period by slowly reducing the wetting of concrete surface for the next 3 days, after the 7-day (10-day for high-early-strength) specified curing period.

3.1.02 Water Curing. Water saturation of concrete surfaces shall begin as soon as possible after initial set. The rate of water application shall be regulated to provide complete surface coverage with a minimum of runoff. Acceptable methods of water curing are described in ACI 308. The application of water to walls may be interrupted for grout cleaning only over the areas being cleaned at the time, and the concrete surface shall not be permitted to become dry during such interruption.

3.1.03 Membrane Curing. Unless otherwise specified, membrane curing compound may be used instead of water curing on concrete which will not be covered later with topping, mortar, or additional concrete.

Membrane Curing compound shall be sprayed at a coverage rate of no more than 300 square feet per gallon (7.36 square meters per liter). The spray equipment shall have sufficient capacity to continuously spray curing compound at approximately 40 psi (2.81 kg/cm^2) with a suitable nozzle as recommended by the manufacturer. Unformed surfaces shall be covered with curing compound within 30 minutes after final finishing. If forms are removed before the end of the specified curing period, curing compound shall be immediately applied to the formed surfaces.

Where compounds are proposed for use on surfaces to which finishes, coatings, or coverings subsequently will be applied, compound shall possess demonstrated compatibility with finish, coating, or covering.

3.1.04 Curing Compound. Apply at rate stated by manufacturer to conform with moisture-retention requirements specified, using second, immediate application at right angles to first, if necessary, and reapply if damaged by rain.

Use curing compounds only in locations permitted or required, and where use will not interfere with other finish, coatings, or coverings to be applied.

3.1.05 Curing and Sealing Compound. Where indicated, provide curing and sealing formulation with long-lasting finish that is resistant to chemicals, oil, grease, deicing salts, and abrasion.

Apply at rate stated by manufacturer to conform with moisture-retention requirements specified, using second, immediate application at right angles to first, if necessary, and reapply if damaged by rain. Apply additional coat near substantial completion to act as sealer.

3.1.06 Curing and Hardening Compound. Apply one or more applications as recommended by manufacturer to achieve maximum hardness and at rate stated by manufacturer to conform with moisture-retention requirements specified.

Use curing compound only in locations permitted or required. Do not apply to surfaces to receive other finishes, coatings, or covers.

3.1.07 Film Curing. Unless otherwise specified, film curing with polyethylene sheeting may be used instead of water curing on concrete to be covered later with mortar or additional concrete, or which will otherwise not be exposed to view.

Film curing shall begin as soon as possible after initial set of the concrete. The concrete surfaces shall be completely covered with polyethylene sheeting. Sheeting shall overlap the edges of the concrete for proper sealing and anchorage, and joints between sheets shall be sealed. All tears, holes, and other damage shall be promptly repaired. Covering shall be anchored continuously at edges and as necessary to prevent billowing on the surface.

3.1.08 Surface Not in Contact with Forms. Start curing as soon as free water has disappeared, but before surface is dry. Place to protect adjacent concrete edges. Acceptable curing methods include:

Water ponding

Water-saturated sand

Water-fog spray

Saturated burlap. Provide 4 inch (10.16 cm) minimum overlap at joints

3.1.09 Moisture Retaining Cover. Lap not less than 3 inches (7.62 cm) at edges and ends, and seal with waterproof tape or adhesive. Repair holes or tears during curing period with same tape or adhesive. Maintain covering in intimate contact with concrete surface. Extend covering past slab edges at least twice the thickness of slab. Secure to avoid displacement. Do not use plastic sheeting on surfaces which will be exposed to view when in service.

3.1.10 Finishing. Remove and replace defective concrete, which is not properly formed, is out of alignment or level, or displays surface defects, unless Engineer permits patching or other corrective measures. Permission to patch defective concrete is not a waiver of Engineer’s right to require complete removal of defective work if patching does not, in his opinion, satisfactorily restore quality and appearance of surface.

Perform patching, when permitted, in compliance with applicable provisions of “Concrete Work”.

Do not directly apply water to slab surface or dust with cement.

Use hand or powered equipment only as recommended in ACI 302.1 R.

3.1.11 Floating. Screeded surfaces shall be given an initial float finish as soon as the concrete has stiffened sufficiently for proper working. Any piece of coarse aggregate which is disturbed by the float or which causes a surface irregularity shall be removed and replaced with mortar. Initial floating shall produce a surface of uniform texture and appearance, with no unnecessary working of the surface.

Initial floating shall be followed by a second floating at the time of initial set. The second floating shall produce a finish of uniform texture and color, and unless additional finishing is specifically required, shall produce the completed finish for unformed surfaces. Floating shall be done with hand floats or suitable mechanical compactor-floats.

3.1.12 Screeding. Strikeoff to required grade and within surface tolerances indicated. Verify conformance to surface tolerances. Correct deficiencies while concrete is still plastic.

3.1.13 Bull Floating. Immediately following screening bull float or darby float before bleed water appears to eliminate ridges, fill in voids, and embed coarse aggregate. Recheck and correct surface to within tolerances.

Do not perform subsequent finishing until excess moisture or bleed water has disappeared and concrete will support either foot pressure with less than 1/4 inch (6.4 mm) indentation or weight of power floats without damaging flatness.

3.1.14 Final Floating. Float to embed coarse aggregate, to eliminate ridges, to compact concrete, to consolidate mortar at surface, and to achieve uniform, sandy texture. Recheck and correct surface to within tolerances.

3.1.15 Broom Finish. Exterior concrete surfaces and all exterior concrete stair treads shall be given a light broom finish to produce a nonslip surface. Brooming, approximately 1/16 inch (1.6 mm) deep, shall be done after the second floating and at right angles to the normal direction of traffic.

3.1.16 Nonslip Finish. Tread surfaces of all interior concrete and concrete filled pan type stairs shall be surfaced with nonslip aluminum oxide aggregate. Aggregate shall be uniformly graded from 100 percent retained on a No. 50 sieve to 100 percent passing a No. 8 sieve. Aggregate shall be uniformly distributed during steel troweling at the rate of 1/4 pound per square foot (1.22 kg/m^2), in accordance with the manufacturer’s recommendations and as acceptable to the Engineer.

3.1.17 Troweling. Surfaces to receive troweling shall include interior floor surfaces which will be exposed after construction is completed; surfaces to be covered with resilient floor coverings, thinset terrazzo, or seamless floor covering; exposed top surfaces of equipment bases and interior curbs; and other surfaces designated on the drawings shall be steel trowel finished. Surfaces to be covered with Elastomeric deck covering shall be lightly troweled but not burnished. Trowel finishing will not be required for floors which are normally submerged. Troweling shall be performed after the second floating when the surface has hardened sufficiently to prevent an excess of fines being drawn to the surface. Troweling shall produce a dense, smooth, uniform surface free from blemishes and trowel marks.

Trowel immediately following final floating. Apply first troweling with power trowel except in confined areas, and apply subsequent trowelings with hand trowels. Wait between trowlings to allow concrete to harden. Do not overtrowel. Begin final troweling when surface produces a ringing sound as trowel is moved over it. Consolidate concrete surface by final troweling operation. Completed surface shall be free of trowel marks, uniform in texture and appearance, and within surface tolerance specified.

Grind smooth surface defects which would telegraph through final floor covering system.

Finishing Surfaces for Bonding: All surfaces to be covered with concrete or topping shall be float finished. All laitance, surface mortar, and unsound material shall be removed by brushing or air blasting at the time of initial set. Surfaces shall be rough, clean, and sound. Floors and other flat surfaces to receive topping shall be given a broom finish.

Edging: Unless specified to be beveled, exposed edges of floated or troweled surfaces shall be edged with a tool having a 3/4 inch (1.9 cm) corner radius.

Duct Bank Finishing: After screeding and before final floating, a red concrete surface coloring shall be dusted on the fresh concrete surface at the rate recommended by the manufacturer.

3.1.18 Finishing Formed Surfaces. Fins and other concrete surface projections shall be removed from all formed surfaces, except exterior surfaces that will be in contact with earth backfill and are not specified to be dampproofed. A power grinder shall be used, if necessary. Surfaces to be dampproofed shall have fins removed and tie holes filled, but no additional finishing will be required.

3.1.19 Tie Holes. Tie holes in formed surfaces shall be cleaned, wetted, and filled with patching mortar. The patches shall be finished flush and shall match the texture of the adjacent concrete.

3.1.20 Special Surface Treatment. All exterior concrete surfaces which are exposed to view shall be grout cleaned. Grout-cleaned finish shall conform to Paragraph 5.3.3.4.b of ACI 301. Grout cleaning shall not result in an overall plastering of the concrete surfaces, but shall produce a smooth, uniform surface free of marks, voids, surface glaze, and cement dust.

End of Section

SECTION 03371

SHOTCRETE

PART 1 - GENERAL

1.1 SCOPE. Section includes the requirements for materials, proportioning and application of shotcrete – pneumatically applied concrete.

1.2 GENERAL.

1.2.01 Coordination. Coordinate the work with associated items that are placed within shotcrete work. Coordinate with sculpturing rough-in work, coloring/staining requirements, and associated or adjacent materials.

Convene pre-installation meeting minimum one week prior to commencing work of this section.

1.2.02 Governing Standards.

ACI 506.2, "Specification for Materials, Proportioning, and Application of Shotcrete."

ACI 301, "Specification for Structural Concrete for Buildings."

ASTM A185, "Steel Welded Wire Fabric, Plain, for Concrete Reinforcement."

ASTM A497, "Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement."

ASTM C33, "Concrete Aggregates."

ASTM C150, "Portland Cement."

ASTM C260, "Air Entraining Admixtures for Concrete."

ASTM C330, "Lightweight Aggregates for Structural Concrete."

ASTM C494/C494M, "Chemical Admixtures for Concrete."

1.3 QUALITY ASSURANCE. Perform work in accordance with ACI 506.2. Perform work of this section under direct supervision of a professional engineer experienced in design of this work and licensed in the State of Michigan.

1.3.01 Contractors Qualifications. Company specializing in performing the work of this section with minimum five (5) years documented experience.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate formwork, dimensions and thickness, tolerances, and accessories. Submit data on admixtures, mix design and test reports.

1.4.02 Samples. Prepare specimens for examination and testing prior to construction.

1.4.03 Mock-Up. Construct two sample panels, 3 feet (91.44 cm) long by 3 feet wide, to indicate range of special treatment or finish required.

Prior to starting work, also provide mock-ups for evaluation of materials and workmanship. Provide three test panels fabricated by placing shotcrete onto plywood for each mix design being considered, for each shooting position to be encountered. Form panels to same shotcrete thickness as the structure, but not less than 3 inches (7.62 cm).

Repair core holes after testing, in accordance with ACI 506.2. Mock-ups may remain as part of the work.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Maintain material and surrounding air temperature at minimum 50 degrees F (10 degrees C) prior to and during installation, and maintain material at this minimum temperature for 7 days after completion of work. Provide equipment and cover to maintain minimum temperature.

Suspend shotcrete operations during high winds, rainy weather, or near freezing temperatures when work cannot be protected.

2.2 ACCEPTABLE APPLICATORS. Acceptable companies include D.C. Byers Co., Detroit; Mid-American Gunite, Newport, and others as approved.

2.3 MATERIALS.

2.3.01 Cement. Shall be ASTM C150, Type I or Type II.

2.3.02 Aggregate. Shall be normal weight, ASTM C33 3/8 inch (9.5 mm) maximum size.

2.3.03 Admixtures. Shall be chemical types conforming to ASTM C494. Air entraining type conforming to ASTM C260. These admixtures are only used in "wet mix" applications.

2.3.04 Reinforcing Bars. Shall be type and size as specified in Master Specification Section 03200, Concrete Reinforcement.

2.3.05 Reinforcing Mesh. Shall be welded wire fabric, ASTM A185 or ASTM A497, galvanized, epoxy coated.

2.3.06 Water. Shall be clean, potable, and not detrimental to shotcrete.

2.3.07 Curing Compound. Shall not be detrimental to application of subsequent surface finish materials.

2.3.08 Bonding Agent. Shall be compatible with substrate and subsequent materials.

2.3.09 Alignment Wire. Shall be small gage, high strength steel wire.

2.4 PROPORTIONING.

2.4.01 Shotcrete Mix. Provide wet or dry mix design that gives good compaction and low percentage of rebound, is stiff enough not to sag, maximum aggregate size of 3/8 inch (9.5 mm) and air entertainment of 5 percent and has a minimum:

Compressive Strength ASTM C109	4000 psi (281.23 kg/cm^2) @ 28 days
Direct Tensile Bond, ACI 503R	180 psi (12.66 kg/cm2) @ 28 days
Flexural Strength, ASTM C348	1800 psi (126.56 kg/cm2) @ 28 days
Splitting Tensile Strength, ASTM C496	45.70 psi (12.66 kg/cm2) @ 28 days
Slant Shear Bond Strength, ASTM C882	400 psi (28.12 kg/cm2) @ 28 days

Maintain quality control records during production of shotcrete; make records available.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that conditions are acceptable and are ready to receive work.

Verify field measurements are as shown on Drawings. Verify fabricated forms are true to line and dimension, adequately braced against vibration during placement, constructed to permit escape of air during gunning operations, and constructed to minimize rebound during gunning operations.

Ensure correct placement of reinforcement and sufficient clearance exists around reinforcement to permit complete encasement.

Ensure easy access to shotcrete surfaces for screening and finishing, and to permit uninterrupted application.

3.2 PREPARATION. Remove existing unsound concrete from substrate surfaces.

Minimize abrupt changes in thickness of repair. Remove square external corners from substrate by rounding the edges.

Clean surfaces to receive shotcrete. Clean and wet cementitious or absorptive substrate surfaces prior to receiving shotcrete. Keep porous surfaces damp for several hours prior to placement of shotcrete. Apply bonding agent, if required.

Determine operating procedures for placement in close quarters, extended distances, or around unusual obstructions where placement velocities and mix consistency may be adjusted during application.

Protect adjacent surfaces not receiving shotcrete.

3.2.01 Alignment Control. Provide alignment wire to establish thickness and plane of required surfaces. Install alignment wire at corners and offsets not established by forms. Tighten alignment wire true to line. Position adjustment devices to permit additional tightening.

3.3 INSTALLATION. Place reinforcement in accordance with ACI 506.2.

Use mixing and delivery equipment capable of thoroughly mixing aggregate, cement, and water in sufficient quantity to maintain continuous and uniform placement.

Do not apply shotcrete more than 45 minutes after adding Portland cement to the mix.

Do not place shotcrete on surfaces that are frozen, spongy, or where there is free water.

Achieve maximum compaction with minimum rebound.

Build-up to required thickness in multiple passes to achieve layering. Encase reinforcement with the first pass.

Allow each layer to take initial set before applying succeeding layers.

Do not permit applied shotcrete to sag, slough, or displace.

After initial set of final layer, remove excess material outside of forms and alignment lines.

Sandblast to remove laitance. Clean with air/water pressure.

Finish surface of final layer with steel trowel and brush, finish to match existing.

Remove rebound material, which does not fall clear of work. Discard salvaged rebound.

Maintain shotcrete with minimal moisture loss at relatively constant temperature for period necessary for hydration of cement and hardening of shotcrete.

Immediately after placement, protect shotcrete from premature drying, excessively hot or cold temperatures, and mechanical injury.

Maintain surfaces wet for a minimum of 7 days.

Sound test the applied material with hammer for voids. Expose voids and replace with new shotcrete ensuring full bond with adjacent work.

3.3.01 Protection Of Installed Work. Do not permit applied work to damage adjacent surfaces.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. Provide inspection and testing for conformance to design mix. Test samples in accordance with ACI 506.2. To test mock-up panels, drill 3 inch diameter core samples from test panels. Test for strength, water absorption, drying and shrinkage.

Modify mix design as required based on results of testing.

Provide additional test panels, as specified for mock-up, during the course of the work as may be requested by the Engineer.

End of Section

SECTION 03410

PLANT- PRECAST STRUCTURAL CONCRETE

PART 1 – GENERAL

1.1 SCOPE. This section includes plant precast and prestressed concrete members, used as building structural framing members, of standard or custom size; with lifting, supporting, and connection devices; standard or stressing reinforcement, and minor surface finish options.

Section includes columns and bearing saddles; beams, spandrels, girders, purlins; floor, grout packing; connection devices; and lintels.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards.

ACI 301, "Specification for Structural Concrete for Buildings.

ACI 318, "Building Code Requirements for Structural Concrete and Commentary."

ASCE 7-93 (American Society of Civil Engineers), "Minimum Design Loads for Buildings and Other Structures."

ASTM A36 (American Society for Testing and Materials), "Specification for Carbon Structural Steel."

ASTM A82, "Specification for Steel Wire, Pain, for Concrete Reinforcement."

ASTM A123/A123M, "Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and steel Products."

ASTM A153/A153M, "Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware."

ASTM A185, "Specification for Steel Welded Wire Fabric, Plain, for Concrete Reinforcement."

ASTM A416/A416M, "Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete."

ASTM A497, "Steel Welded Wire Fabric, Deformed, for Concrete

Reinforcement."

ASTM A615/A615M, "Deformed and Plain Billet-Steel Bars for Concrete Reinforcement."

ASTM A666, "Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar."

ASTM C33, "Concrete Aggregates."

ASTM C39/C39M, "Test Method for Compressive Strength of Cylindrical Concrete Specimens."

ASTM C88, "Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate."

ASTM C150, "Portland Cement."

ASTM C260, "Air-Entraining Admixtures for Concrete."

ASTM C494/C494M, "Chemical Admixtures for Concrete."

ASTM C979, "Pigments for Integrally Colored Concrete."

ASTM E329, "Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction."

ASTM F593, "Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs."

AWS D1.1 (American Welding Society), "Structural Welding Code – Steel."

AWS D1.4, "Structural Welding Code – Reinforcing Steel."

Michigan Building Code – Latest Edition

Military Specification DOD-P-21035A, "Paint, High Zinc Dust Content, Galvanizing Repair."

PCI MNL-117 (Precast/Prestressses Concrete Institute), "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."

PCI MNL-116, "Manual for Quality Control for Plants and Production of

Precast and Prestressed Concrete Products."

PCI MNL-120, "Design Handbook - Precast and Prestressed Concrete."

PCI MNL-123, "Manual on Design of Connections for Precast Prestressed Concrete."

PCI MNL-124, "PCI Design for Fire Resistance of Precast Prestressed Concrete."

PCI MNL-126, "Manual for the Design of Hollowcore Slabs."

UL (Underwriters Laboratory, Inc.), "Fire Resistive Directory"

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit shop drawings prepared by or under the supervision of a Professional Engineer registered in the State of Michigan experienced in precast work. Do not commence preparation of shop drawings until the structural analysis and design are reviewed by the Contractor.

Shop drawings shall include at least the following:

Unit shapes (elevations and sections), and dimensions.

Finishes.

Reinforcement, joint, and connection details.

Lifting and erection inserts.

Location, dimensional tolerances, and details of anchorage devices that are embedded in or attached to structure or other construction. Furnish template if required for accuracy.

Other items cast into panels.

Handling procedures, plans and/or elevations showing panel location, and sequence of erection for special conditions.

Relationship to adjacent material. Show location of unit by same identification mark placed on panel.

Indicate welded connections by means of standard AWS symbols.

Panel openings intended to be field-cut.

Submit complete design calculations including connections for each type of precast unit. Employ a Professional Engineer experienced in precast/prestressed design and licensed in the State of Michigan to perform calculations. If computerized calculations are performed, submit a sample problem with all manual calculations and the details of the program.

Submit design modifications necessary to meet performance requirements and field coordination. Do not allow variations in details or materials to adversely affect the appearance, durability or strength of units. Maintain general design concept without altering size of members, profiles and alignment. Submit, on request, materials reports, compressive strength tests on concrete and water absorption tests on units.

1.3.02 Samples. Submit samples representative of precast structural concrete panel finished exposed surfaces showing complete range of color, texture, and profiles at panel edges of finished work. The sample's representative size and type is to be determined by Engineer.

1.4 QUALITY ASSURANCE.

1.4.01 Welding Qualifications. Employ welders qualified under AWS D1.1.

1.4.02 Contractor's Qualifications. Employ a fabricator who has a minimum of 5 years previous experience in the fabrication of precast structural concrete. Submit evidence of such experience, including a list of projects for which the work was similar in scope and quality to that specified.

Employ a fabricator who has the production capacity to fabricate the required units without causing delay in the Work and is a "PCI Certified" plant and a participating member of the PCI quality assurance program.

Employ an erector who has a minimum of 5 years previous experience in erection of structural precast concrete units similar to those required on this Project.

1.4.03 Testing. Testing shall be in general compliance with testing provision in PCI MNL-117. Testing agency shall have not less than 2 years experience in performing concrete tests of type specified in this section and capable of performing testing in accordance with ASTM E329.

After samples are accepted for finish, and prior to production, fabricate a full size unit finished to match the approved samples. Do not proceed with product of units until the full size unit has been approved. Approved mockup construction shall represent the standard of workmanship, shall be shipped to the Project site, and may be installed in the work.

1.5 DELIVERY, STORAGE AND HANDLING.

1.5.01 Delivery and Handling. Deliver structural precast concrete units to Project site in such quantities and at such times to assure continuity of erection.

Handle and transport units in a position consistent with their shape and design in order to avoid stress which would cause cracking or damage. Do not place units directly on ground.

Lift or support units only at the points shown on the shop drawings. Lifting or handling devices shall be capable of supporting member in positions anticipated during manufacture, storage, transportation, and erection.

Place non-staining resilient spacers of even thickness between each unit. Support units during shipment on non-staining shock-absorbing material.

1.5.02 Storage at Jobsite. Store and protect units to prevent contact with soil, staining, and physical damage.

Store units, unless otherwise specified, with non-staining, resilient supports located in same positions as when transported.

Store units on firm, level, and smooth surfaces to prevent cracking, distortion, warping or other physical damage.

Place stored units so that identification marks are discernible, and so that product can be inspected.

Mark each member with date of production and final position in structure.

1.6 WARRANTY. Warrant the work for 5 years against defects in materials and workmanship resulting in warping, spalling or disintegration, and against other defects affecting the strength, durability or appearance of the work.

During this period, restore defective work to the standard of the Contract documents, including all materials, labor, refinishing and other costs incidental to the work. Inspect the work within 24 hours after receipt of notice from the Engineer and immediately repair leaks in the work. Restore work found to be defective, as designed in the Contract documents, within 10 days after receipt of notice from the Engineer.

1.7 COORDINATION. Coordinate field cut openings in precast concrete deck with affected section. Field cut openings shall be no larger than 12 inches square or 12 inches diameter. Location to be approved by Engineer and Fabricator. Coordinate and confirm factory-cut openings larger than 12 inches square of 12 inches in diameter. Provide headers as required to accommodate openings.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Take field measurements to verify or supplement dimensions indicated.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Engineer, fabricate and install precast structural units to withstand design loads as indicated and as required by the latest local code. Comply with ACI 318 for structural analysis and design.

2.2.01 Design loads. Applicable Building Code: Michigan Building Code. See Drawings for loading information. Dead loads: Include the weight of all indicated permanent construction. Design of precast concrete deck shall include a collateral dead load of 10 psf. Snow drift loading in accordance with Section 1608 of Michigan Building Code shall be considered. Maximum allowable deflection of roof deck shall comply with ACI 318 Table 9.5(b).

Design members exposed to the weather to provide for movement of components without damage, failure of joint seals, undue stress on fasteners or other detrimental effects, when subject to seasonal or cyclic day/night temperature ranges.

Design system to accommodate construction tolerances, deflection of other building structural members and clearances of intended openings.

Calculate structural properties of framing member in accordance with ACI 301 ANSI/ACI 318.

Maintain indicated dimensions. Deviations will only be permitted after it is proven by structural analysis that larger or different dimensions are required. Changes in dimension and subject to approval.

2.3 MATERIALS.

2.3.01 Forms. Shall be metal, plastic or wood to produce required finish.

2.3.02 Cement. Shall be ASTM C150, Type I or III, for Portland cement

2.3.03 Coloring Agent. Shall meet ASTM C979. A synthetic mineral oxide that is harmless to concrete setting and strength, stable at high temperature, and is not affected by sunlight.

2.3.04 Aggregates. Shall meet ASTM C33. Coarse aggregate shall be class designation 5S, except as follows. Limit for chart shall be 1.0 percent. Maximum weight loss when subjected to 5 cycles of the ASTM C88 magnesium test shall be 9 percent. Supply coarse aggregates from a single (source) for entire Project. Provide aggregate which is clean, hard, strong, durable, and inert, free of staining or deleterious material.

2.3.05 Water. Shall be potable.

2.3.06 Admixtures: Air-entraining agent shall comply with ASTM C260. High range water reducing (superplasticizer), and retarding admixtures shall comply with ASTM C494.

2.3.07 Reinforcement. Bar reinforcement shall comply with ASTM A615, grade 60. Wire reinforcement shall comply with ASTM A82. Welded wire fabric shall comply with ASTM A185 or ASTM A497. Reinforcement and accessories within 1 1/2 inches (3.81 cm) or exterior exposed surfaces shall be galvanized or epoxy coat.

2.3.08 Prestressing Strands. Prestressing strands shall be uncoated 7 wire, stress-relieved, high-strength strands grade 250 or 270K. Comply with ASTM A416/A416M-12a "Standard Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete".

2.3.09 Shear Ties: Shall be No. 16 – 18 gage galvanized metal, 3/4 inch (1.9 cm) wide, flattened and shaped into a channel section, or galvanized commercial truss member with top and bottom chord of double 7 gage wires and web members of single 7 gage wire.

Provide support for reinforcement, including bolsters, chairs, spacers, and fastening devices. For exposed to view concrete surfaces, where legs of supports are in contact with forms, provide legs that are protected by plastic or stainless steel.

2.3.10 Anchorage Devices. Inserts in the unit for anchorage to the structure shall be 3/4 inch Richmond Screw Anchor Co., Inc., "Rocket", malleable iron threaded insert with machine bolt. Steel for clips, angles and plates shall comply with ASTM A36. Steel exposed to the exterior shall be hot-dip galvanized in accordance with ASTM A153 or ASTM A666 stainless steel.

2.3.11 Welded Anchor Studs: Shall comply with AWS D1.1, Section 4 for anchorage devices, including inserts, bolts, nuts, washers, shims, clips, angles and plates, except devices for welded connections: galvanized or cadmium plated.

Slotted inserts in the unit for attachment of wood nailer at parapet, Unistrut Corp. "Type P-3000 with spring loaded nuts" for 1/4 inch (6.4 mm) bolts, with galvanized finish and standard duty concrete inserts.

Inserts embedded in the units for handling and erection shall be galvanized or cadmium-plated and not protruding from the units.

Reglet embedded in units to receive flashing shall be Fry Reglet Corp. “Original Reglet”, or as approved, PVC complete with spacer channel and vinyl rope backup for sealant.

2.3.12 Rigid Insulation. Shall be Dow Chemical Co., “Styrofoam”.

2.3.13 Coatings. Items specified to be galvanized shall be zinc-coated in accordance with ASTM A153 or A123. Refer to Master Specification Section 09900, Painting for painting ferrous metal.

2.3.14 Grout. Shall be high strength, non-shrink grout.

2.3.15 Bolts, Nuts and Washers. Shall be of high strength steel type recommended for structural steel joints.

2.3.16 Prime Paint. Zinc-rich paint shall be ZRC Chemical Products Co., “Z.R.C.” or other acceptable product complying with DOD-P-21035A.

2.3.17 Form Release Agent. Shall be compatible with the sealant for weatherproofing joints and certified as such by the sealant manufacturer.

2.3.18 Bearing Pads. Shall be random, fiber-reinforced elastomeric pad with pre-formed, randomly oriented synthetic fibers set in elastomer. Surface hardness of 70 to 90 Shore A durometer. Neoprene shall have 50 durometer hardness.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Fabricator. Provide precast structural concrete fabricate in general conformance with PCI MNL-117 by Pre-Con Corp., Kalamazoo, Michigan; Concrete Technology, Inc., Springboro, Ohio; Precast Specialties, Ft. Wayne, Indiana; Bluegrass Artcast, Inc., Lexington, Kentucky; or National Precast, Inc., Roseville, Michigan; Hollowcore Midwest LLC, Ohio, Coreslab Structures, Inc., Sidley Precast Company, Inc, or as approved.

2.4.02 Procedures. Fabricate units to match approved mockup construction before shipment to project site. Manufacturing procedures shall comply with PCI MNL 117.

Provide thickness of deck as indicated on Drawings.

Cast precast members in horizontal forms of rigid construction. Carefully set and secure all reinforcement and embedded items prior to placing of concrete. Maintain maximum quality control throughout the casting and finishing process.

Block out insulation for a distance of 3 inches (7.62 cm) around anchorage devices to provide adequate embedment of the devices.

Cut exposed ends of precast concrete deck sections flush.

2.4.03 Reinforcement. Reinforce members as required by the performance requirements. Furnish additional reinforcement as required for the shipment, handling and erection of members. Fabricate the work within the tolerances specified in PCI MNL 117.

2.4.04 Finishes. Cure members under identical conditions to develop required concrete quality and minimize appearance blemishes such as non-uniformity, straining, or surface cracking.

Provide finish for exposed surfaces matching sample on file in the Engineer's office.

Trowel interior exposed surfaces smooth with edges tooled to 3/4 inch (1.9 cm) radius.

Provide 1/2 inch (1.27 cm) chamfer for external corners of exterior surfaces of sill wall panels.

Color exterior and exposed interior concrete. Ensure that exposed to view finish surfaces of precast concrete are uniform in color and appearance.

See Master Specification Section 09900, Painting for exterior applied finishes if applicable.

Plant finish precast concrete deck sections to PCI MNL-116. Formed surfaces shall have a Commercial Grade B finish. Unformed surfaces shall have a floated finish.

2.4.05 Cover. Provide at least 3/4 inch (1.9 cm) cover for reinforcing steel. Do not use metal chairs, with or without coating, in the finished face. Provide embedded anchors, inserts, plates, angles and other cast-in items as indicated on Shop Drawings with sufficient anchorage and embedment for design requirements

2.4.06 Molds. Use rigid molds to maintain units within specified tolerances conforming to the shape, lines and dimensions shown on the approved Shop Drawings. Construct molds to withstand vibration method selected.

2.4.07 Concreting. Convey concrete from the mixer to place of final deposit by methods which will prevent separation, segregation or loss of material.

Consolidate all concrete in the mold by high frequency vibration, either internal or external or a combination of both, to eliminate unintentional cold joints, honeycomb and to minimize entrapped air on vertical surfaces.

2.4.08 Curing. Use a curing method which does not affect adhesion of materials to be applied to concrete, including paint, sealants, coatings and adhesives. Cure precast concrete units until the compressive strength is high enough to ensure that stripping does not have an effect on the performance or appearance of the final product. After the curing period, store the units without further handling or shipment until compressive strength of concrete is verified by tests.

2.4.09 Panel Identification. Mark each precast concrete panel to correspond to identification mark on shop drawings for panel location. Mark each precast concrete panel with date cast.

2.4.10 Acceptance. Structural precast concrete units which do not meet the color and texture range or the dimensional tolerances may be rejected at the option of the Engineer, if they cannot be satisfactorily corrected.

2.5 PROPORTIONING.

2.5.01 Concrete Properties. Proportioning of concrete (mix design) is the responsibility of the precast concrete manufacturer, complying with ACI 318, Chapter 5. Use HRWR (superplasticizer) in the placement of structural concrete. Provide concrete complying with the following.

Maximum water-cement ratio:	0.40
Minimum compressive strength in 28 days:	5000 psi (351.54 kg/cm^2)
Slump:	3 inches (7.62 cm) before addition of HRWR (superplasticizer)
Air content:	6 percent (plus or minus 1 percent)
Face mix moisture absorption by weight:	6 percent maximum
Total water-soluble chloride ion content of mix, including all constituents:	0.15 percent by weight of cement

Do not place concrete until conformity of all material and concrete mixtures with tests and specifications, including 28 day compressive strength, has been established and approved.

2.5.02 Facing Mix. Minimum thickness of face mix after consolidation shall be at least 1 inch (2.54 cm) or a minimum of 1 1/2 times the maximum size of aggregate used; whichever is larger.

Provide water-cement and cement-aggregate ratios of face and backup mix which are similar.

The design mixes shall be prepared by an independent testing facility or qualified personnel at precast concrete manufacturer's plant.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Erect units straight, plumb and in alignment, and securely anchored to the structural framing, without exceeding the erection and location tolerance of PCI MNL-117.

Provide temporary supports and bracing as required to maintain position, stability and alignment as units are being permanently connected.

Set non-loadbearing units dry without mortar, attaining specified joint dimension with lead, steel, plastic or asbestos cement spacing shims. After units are secured in place, remove spacing shims.

Fasten precast concrete units in place by bolting or welding, or both, completing drypacked joints, grouting sleeves and pockets, and/or placing cast-in-place concrete joints as indicated on approved erection drawings.

Temporary lifting and handling devices cast into the precast concrete units shall be completely removed or, if protectively treated, removed only where they interfere with the work of any other trade.

Grout anchors and dowels with 1-to-3 cement-and-sand grout. Fill erection and unused anchor holes with grout, flush with adjacent surface.

Coat welded connections with prime paint.

Touch-up damaged zinc coating in the field with zinc-rich paint applied in accordance with manufacturer's instructions.

Precast concrete deck: Install bearing pads at bearing ends of planks as indicated. Install headers at openings as required. Adjust differential camber between precast members to tolerance before final attachment and grouting. Adjust differential elevation between precast members to tolerance before final attachment. Grout plank joints and trowel smooth. Transition differential elevation of adjoining planks with grout to a maximum slope of 1:12 to provide a smooth surface. Secure units in place. Welding to comply with AWS D1.1 or D1.4, as applicable. Seal all joints on exposed surfaces.

3.1.02 Joints. Maintain joints at a uniform width as indicated on the Drawings. Maintain surfaces of joints to be weatherproofed clean and approved by the sealant manufacturer.

3.1.03 Damaged Units. Do not install units having broken corners or edges, spalls, cracks or other defects in the work. Remove units erected and later found to be broken, spalled, cracked or otherwise damaged, and replace with approved units matching the adjacent work, unless patching of minor defects is approved in writing.

3.1.04 Cleaning. After installation and joint treatment, clean soiled precast concrete surfaces. Starting at the top of the structure with detergent and water, use fiber brush and sponge, and rinse thoroughly with clean water in accordance with precast concrete manufacturer’s recommendation. Use cleaning materials or processes which will not change the character of exposed concrete finishes. Rinse thoroughly with clean water immediately after using cleaner.

Use extreme care to prevent damage to precast concrete surfaces and adjacent materials.

3.2 FIELD QUALITY CONTROL. Perform quality control and inspection procedures to comply with applicable sections of PCI MNL-117. Conduct water absorption test on units in accordance with PCI MNL-117.

3.2.01 Field Testing. Conduct strength tests and determine slump and air content as specified in Master Specification Section 03300, Cast-in-Place Concrete and also in accordance with ASTM C143. Keep quality control records available for the Engineer upon request for two years after final acceptance.

Test specimens in accordance with ASTM C39. Two specimens will be tested to determine the stripping strength and two specimens will be tested at 28 days for acceptance for each strength test.

Make at least one strength test for each 40 cubic yard (30.58 m^3) or fraction thereof, of each mix design of concrete placed in any one day in accordance with ASTM C31.

Conduct a minimum of three absorption tests for each mix design as per PCI MNL-117, Appendix D, Section 2.1.2(9).

End of Section

SECTION 03600

GROUT

PART 1 - GENERAL

1.1 SCOPE. This section covers grouting of pump, motor, and equipment baseplates or bedplates; column baseplates and miscellaneous baseplates; and other uses of grout as indicated on the drawings. Unless otherwise specified, all grouting shall be done with non-shrinking grout.

This section also covers epoxy grouting of anchor bolts, threaded rod anchors, and reinforcing bars to be installed in hardened concrete. Anchor bolts, adhesive anchors, and threaded rod anchors are covered in the anchor bolts and expansion anchors section.

Grout for masonry is covered in Master Specification Section 04065, Masonry Mortar and Grout.

1.2 GENERAL.

1.2.01 Governing Standards

ASTM C882, “Bond Strength of Epoxy-Resin Systems Used with Concrete by Slant Shear.”

ASTM D638, “Test Method for Tensile Properties of Plastics.”

ASTM D695, “Compressive Properties of Rigid Plastics.”

ASTM D790, “Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.”

1.3 QUALITY ASSURANCE. Perform Work per ACI 301 and ACI 304R.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit product data describing the grout, including recommended mixing and placing instructions.

1.4.02 Certifications. Provide copies of material certificates signed by material producer and Contractor, certifying that each material item complies with or exceeds specified requirements.

1.5 DELIVERY, STORAGE AND HANDLING. It should be stored under cover and on pallets. In cold weather, store in a warm place for a least 24 hours; 70 degrees F (21 degrees C) is preferred. In hot weather, store in a relatively cool shaded area.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Nonshrinking Grout. Use for grouting equipment base plates, column base plates, pumps, compressors, miscellaneous structural equipment supports, skid mounted equipment, vertical and horizontal vessels, exchangers, blowers, etc.

Non-shrink cement-based grout shall be Grade A (Prehardening Volume Controlled), Grade B (Post Hardening Volume Controlled) or Grade C (Combination Volume Controlled). Must meet all performance criteria of most current version of ASTM C 1107 at a flowable, plastic, and stiff consistency. Compressive strengths at flowable consistency must have at least 7000 psi (492.16 kg/cm^2) at 28 days. Premium Non-Shrink Grout Manufacturers include: Master Builder Technologies, “Set Grout”, L&M Chemicals Inc., “Crystex”, Five Star Products, “Five Star Grout”, Saureisen Cements, “Grout No. F-100”, Sika, “Sikagrout 328”, or equal.

2.1.02 Precision Fluid Non-Shrink Grout with Extended Working Time. Use when base plates are larger than 36 inches 991.44 cm), clearances are less than 1-1/2 inches (3.81 cm), temperatures are greater than 75 degrees F (23.89 degrees C), extended working time is needed, pumping long distances, or anticipated shear loads will be present.

Fluid non-shrink cement-based grout with extended working time shall be Grade B (Post Hardening Volume Controlled) or Grade C (Combination Volume Controlled). Grout shall conform to the most current version of ASTM C 1107 when tested at a fluid consistency of 20-30 seconds per CRD 611/ASTM C 939 at temperature extremes of 45 and 90 degrees F (7.2 and 32.2 degrees C) with an extended working time of 30 minutes at 45 and 90 degrees F (7.2 and 32.2 degrees C). Grout shall have strength of 7500 psi (527.31 kg/cm^2) at 28 days when mixed at fluid consistency. Fluid Grout with Extended Working Time Manufacturers include: Five Star Products, “Five Star 110”, BASF, “Masterflow 928”, Sika, “Sikagrout 328”, or equal.

2.1.03 Metallic Fluid Grout with Extended Working Time. Use when application temperatures are between 55 and 75 degrees F (12.78 and 23.89 degrees C), base plates are larger than 36 inches (91.44 cm) clearance between foundation and plate is less than 1-1/2 inches (3.81 cm), under dynamic load applications, or where shear loads will be anticipated.

Fluid non-shrink metallic grout with extend working time shall be Grade B (Post Hardening Volume Controlled). Grout shall conform to the most current version of ASTM C 1107 wen tested at a fluid consistency of 20 30 seconds per CRD 611/ASTM C 939 at recommended temperatures. Grout shall have strength of 7500 psi (527.31 kg/cm^2) at 28 days when mixed at fluid consistency. Fluid Metallic Grout with Extended Work Time Manufacturers include BASF, “Embeco 885 Grout”, or equal.

2.1.04 Epoxy Grout for Reinforcing Bars and Threaded Rod Anchors. Adhesive For Floors and Horizontal Surfaces for low viscosity shall be moisture-insensitive; BASF Concresive LVI or Sika "Sikadur 35, Hi-Mod LV". For medium viscosity use moisture-insensitive; BASF "Concresive Liquid LPL" or Sika "Sikadur 32, Hi-Mod" or equal..

Adhesive for vertical surfaces and overhead applications shall be Nonsag consistency Moisture-insensitive; Hilti HIT-HY 200, or engineered approved alternate.

2.1.05 Epoxy Grout for Headed Anchor Bolts. Adhesive shall be moisture-insensitive; BASF Masterflow 648 CP+.

Aggregate shall be as recommended by the epoxy grout manufacturer. Aggregate must be completely dry.

2.1.06 Water. Shall be potable quality.

2.1.07 Reinforcing Bars. Shall be ASTM A615, Grade 60, deformed.

PART 3 - EXECUTION

3.1 PREPARATION.

3.1.01 Nonshrinking Grout. Shall be furnished factory premixed so that only water is added at the jobsite. Grout shall be mixed in a mechanical mixer. (No more water shall be used than is necessary to apply product.

Surface Preparation: Steel and concrete surfaces shall be free of dirt, oil, grease or other contaminants.

All surfaces should be roughened to remove laitance and expose sound concrete. When dynamic, shear or tensile forces are anticipated, concrete surfaces should be chipped with a “chisel point” hammer to a roughness of (plus or minus) 3/8 inch (9.5 mm).

Concrete surfaces should be rough and saturated (ponded) with clean water for 24 hours just prior to grouting.

Bolt holes must be grouted before the major portion of grout is placed. Shade the foundation from summer sunlight 24 hours before and 24 hours after grouting. All free-standing water must be removed from the foundation and bolt holes prior to grouting.

Forms should be liquidtight and nonabsorbent. Seal forms with grout, putty or caulking compound. Side and end forms should be a minimum 1 inch (2.5 cm) horizontally away from the object being grouted to permit expulsion of air and any remaining saturation water as the grout is placed. Provide sufficient bracing to prevent the grout from leaking. Large non-supporting grout areas should be eliminated wherever possible. Forms should extend a minimum of 1 inch (2.5 cm) higher than the bottom of the equipment being grouted.

Temperatures for the foundation and plates, mixing water and grout should be 45°F (7° C) minimum, 50 to 80° F (10 to 27 ° C) preferred, and 90° F (32° C) maximum.

Mixing shall be performed with potable water only. Place estimated water into a mortar mixer, then slowly add the dry grout. Adjust the water to achieve the desired flow. Recommended flow for Master Builders fluid grouts is 25 to 30 seconds using the CRD-611 Flow Cone method.

Mix grout a minimum of 5 minutes after all material and water is in the mixer. Do not mix more grout than that can be placed within the working time of the grout. Transport by wheelbarrow, buckets or pump to the equipment to be grouted. Minimize the transporting distance as much as possible. Do not retemper grout by adding water and remixing after it stiffens.

3.1.02 Epoxy Grout. Epoxy grout shall consist of a two-component liquid epoxy adhesive of viscosity appropriate to the location and application, and an inert aggregate filler component, if recommended by the adhesive manufacturer. Components shall be packaged separately at the factory and shall be mixed immediately before use. Proportioning and mixing of the components shall be done in accordance with the manufacturer's recommendations.

Epoxy grout should be placed only on properly cured foundations. The concrete surface must be chipped to expose sound aggregate and to ensure that all laitance and weak float is removed. The concrete base shall be clean, dry and free of oil, wax and other contaminants.

If an anchor bolt sleeve is to be filled, be sure all water is removed. If the anchor bolt sleeve is to be left ungrouted, seal the bolt hole with felt, foam rubber or other means.

Cover all shims, anchor bolts and leveling screws with putty or clay to keep the grout from adhering. Use model clay, glazing putty or anything of a putty consistency which will stick but not harden. Shade the foundation from summer sunlight for at least 24 hours before and 48 hours after grouting.

Where indicated on the drawings, anchor bolts, threaded rod anchors, and reinforcing bars shall be epoxy grouted in holes drilled into hardened concrete. Diameters of holes shall be as follows:

For Reinforcing Bars and Threaded Rod Anchors	Diameter shall be 1/8 inch (3.2 mm) larger than the outside diameter of the bar or the rod
For Headed Anchor Bolts	Diameter shall be bolt diameter plus 2 inches (5.08 cm)

The embedment depth for epoxy grouted anchor bolts, threaded rod anchors, and reinforcing bars shall be at least 15 bolt, rod, or bar diameters, unless otherwise indicated on the drawings.

Holes shall be prepared for grouting as recommended by the grout manufacturer.

The bonding surfaces of the base or plate to be grouted should be sandblasted to “white metal” and be free of coatings, wax, grease or scale.

Since the grout will come up at least 1/2 inch (1.27 cm) to 3/4 inch (1.9 cm) onto the equipment, protect above this area with masking tape.

To permit easy clean up, wax or cover all surfaces where the grout may splash.

Forms should extend a minimum of 3/4 inch (1.9 cm) higher than the bottom of the equipment being grouted. Large non-supporting grout areas should be eliminated wherever possible. Protect the foundation and equipment from rain or moisture. Areas not to be grouted must be sealed off.

Forms must be liquid tight. They may be sealed with putty or caulking. Seal wood forms to vertical concrete surfaces by applying putty or caulk below top of concrete, then press form into place.

Place forms within a maximum of 6 inches (15.24 cm) and a minimum of 1 inch (2.54 cm) from the edge of each individual base, rail or sole plate being grouted.

Where a deep pour is necessary, 1/2 inch (1.27 cm) rebar on 12 (30.48) to 18 (45.72) inches (cm) centers shall be used to minimize stress cracking. The top tier should be located about 2 inches (5.08 cm) below the equipment base. A bottom tier should be located about 2 inches (5.08 cm) above the foundation surface. Additional tiers, if required, should be spaced equal distances in the grout pour with vertical supports as required.

Contractor shall use clean and dry mortar mixer (3 to 6 cubic foot (0.085 to 0.170 m^3) size), wheelbarrow, and buckets or shovels for transporting the grout. Have plenty of clean rags for wiping hands and tools. Ready a pail of solvent (T-430, Xylol, Lacquer Thinner) for cleaning hands and tools. Use rubber gloves.

During mixing, do not add solvent, water or any other material to the grout. Do not alter the liquid hardener proportions. Pour the hardener into a pail of grout liquid and stir until well mixed (approximately three minutes). Pour the mixed liquid and hardener into the mixer. Add the grout aggregate one bag at a time and mix until completely wet.

3.2 INSTALLATION.

3.2.01 Nonshrinking Grout. Grout should always be placed from only one side of the equipment to prevent entrapment of air or water beneath the equipment.

After placement, trim the surfaces with a trowel and cover the exposed grout with clean wet rags and maintain this moisture for 5 to 6 hours.

The grout should offer stiff resistance to penetration with a pointed mason’s trowel prior to removing the grout forms or cutting back excessive grout.

Cure all exposed grout with an approved membrane curing compound such as Master Builders Masterkure-N-Seal HS immediately after the wet rags are removed to further minimize the potential moisture loss within the grout.

Do not vibrate grout. Steel straps inserted under the plate may be used to aid in movement of the grout.

Unless otherwise (3.81 cm) specified or indicated on the drawings, grout under baseplates shall be 1-1/2 inches (3.81 cm) thick. Grout shall be placed in strict accordance with the directions of the manufacturer so that all spaces and cavities below the top of baseplates and bedplates are completely filled, without voids. Forms shall be provided where structural components of baseplates or bedplates will not confine the grout.

In all locations where the edge of the grout will be exposed to view, the grout shall be finished smooth after it has reached its initial set. Except where shown to be finished on a slope, the edges of grout shall be cut off flush at the baseplate, bedplate, member, or piece of equipment.

Nonshrinking grout shall be protected against rapid loss of moisture by covering with wet cloths or polyethylene sheets. After edge finishing is completed, the grout shall be wet cured for at least 7 days and then an acceptable membrane curing compound shall be applied.

3.2.02 Epoxy Grout. When grouting closed areas, start at one end of the form and fill the cavity completely as you advance toward the other end to prevent air entrapment.

Low foundation and ambient temperatures decrease flowability. Strapping will assist movement of grout in low clearance applications. Do not vibrate grout.

Check frequently for leaks. Leaks do not self-seal. If not stopped they will cause voids.

Anchor bolts, threaded rod anchors, and reinforcing bars shall be clean, dry, and free of grease and other foreign matter when installed. The bolts, rods, and bars shall be set and positioned and the epoxy grout shall be placed and finished in accordance with the recommendations of the grout manufacturer. Care shall be taken to ensure that all spaces and cavities are filled with epoxy grout, without voids.

During assembly of all threaded stainless steel components, anti-seize thread lubricant shall be liberally applied to the threaded portion not embedded in concrete.

End of Section

SECTION 03650

CEMENT STABILIZED FLY ASH

PART 1 - GENERAL

1.1 SCOPE. This section covers labor, equipment, materials and operations necessary to complete fly ash backfilling operations as indicated on the drawings and as specified herein.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C138, “Unit Weight, Yield, and Air Content (Gravimetric) of Concrete.”

ASTM C143/C143M, “Slump of Hydraulic Cement Concrete.”

ASTM C618, “Coal Fly Ash and Raw or Calcimined Natural Pozzolan for use as a Mineral Admixtures in Concrete.”

ASTM C150, “Portland Cement.”

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Cement. Cement shall conform to ASTM C150, Type I.

2.1.02 Fly Ash. The fly ash shall be Class F and meet the requirements of ASTM C618 with no limits on the loss on ignition, fineness, or detailed requirements of the specification.

The Manufacturer shall certify, in writing that the material supplied is non-contaminated in accordance with the current Environmental Protection Agency (EPA) requirements.

2.1.03 Water. Use potable water.

2.1.04 Measuring and Mixing. The stabilized fly ash mixture shall contain 5 percent (plus or minus ½ percent) of Portland cement based on the dry weight of the fly ash. The temperature of the mix shall not be less than 50 degrees F (10 degrees C), measured at the point of placement.

The slump shall be measured at the point of placement. The mixture used for general backfill in trenches, against structures etc., will normally have a slump of from 7 to 10 inches (17.78 to 25.4 cm).

The mixture used for backfill that is required to stand and not flow laterally, or that which is to be used in water will normally have a slump of from 4 to 6 inches (10.16 to 15.24 cm).

The stabilized fly ash mixture shall have a specified unconfined compressive cube strength of 100 psi minimum at 28 days of age. In the event that the laboratory strength does not reach the required 28 day strength. The backfill material supplier must demonstrate that the required strength has been met. This may be done by the use of penetrometer, CBR laboratory test adapted to the field, or an appropriate plate load test.

PART 3 - EXECUTION

3.1 PREPARATION.

3.1.01 Measuring of Materials. The method used to measure fly ash and cement shall be submitted for acceptance. Cement content shall be based on the dry weight of the fly ash in the mix.

The batched weight of fly ash shall be corrected for its moisture content and measured in such a way that compliments the type of batch plant being utilized, thus assuring that the percentage of cement based on the dry weight of fly ash is being satisfactorily controlled.

Water shall be measured, although its control will be a function of consistency (slump and workability of the mix).

A standard unit weight can be determined by use of a standard bucket using ASTM C138 as a guide with the exception that the material should not be rodded. When weights of material are established, the unit weight bucket along with delivery weights can be used as a basis of payment.

3.1.02 Batching and Mixing. The stabilized fly ash can be mixed by a pug mill, central concrete mixer, ready-mix truck, turbine mixer, or other acceptable equipment or method.

The actual batch weights, mixing time, and mix temperature shall be recorded for each slump test and set of test specimens made.

Foreign material may be acceptable providing it has no deleterious effect on the mixer, placing procedure or mixture properties. Generally, occasional lumps of solid material limited to a maximum of 2 inches (5.08 cm) in diameter can be permitted.

3.2 INSTALLATION.

3.2.01 Placement. The material shall be placed by end or side dumping, chutes, conveyors, or other suitable method.

Lines and grades shall be as shown on the Drawings.

Stabilized fly ash shall be protected from freezing temperatures for the initial 24 hours after placement. Protection may consist of earth cover, straw, or a sacrificial layer of the stabilized fly ash mix. Strength gain from the Portland cement will be slow with temperatures of 50 degrees F (10 degrees C) and lower.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Testing. The moisture content as measured by ASTM D2216 shall be used in the mixing process to provide for the moisture correction required for control of production.

Slump tests shall be in accordance with ASTM C143. These shall be made as required to establish slump for a new application and as a control of continuing usage.

One set of 3 cubes 2 inches (5.08 cm) in size shall be made for each test of the compressive strength of the flowable fly ash backfill material. The mold should be filled by jarring the wet material into the form without rodding. Cubes shall remain in the molds for at least 3 days to develop adequate strength to prevent damage caused by handling and then placed in water for curing. The cubes should be removed from the water 24 hours before testing. During this time they should be covered to prevent drying. The specimens should be maintained at a minimum temperature of 70 degrees F (21 degrees C) at all times.

End of Section

SECTION 03700

CONCRETE RESTORATION

PART 1 – GENERAL

1.1 SCOPE. This includes the work of repairing cracks, spalling and other defects in hardened Portland cement concrete. This includes but is not limited to by epoxy injection process.

1.2 GENERAL. The Contractor shall furnish all materials, tools equipment, appliances, transportation, and labor required to restore cracked, spalled or damaged concrete.

1.2.01 Governing Standards.

ASTM C882, “Bond Strength Of Epoxy Resin Systems Used with Concrete, by Slant Shear.”

ASTM D638, “Test Method for Tensile Properties of Plastics.”

ASTM D695, “Compressive Properties of Rigid Plastics.”

ASTM D790. “Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.”

ASTM D2842-01, “Standard Test Method for Water Absorption of Rigid Cellular Plastics.

1.3 QUALITY ASSURANCE.

1.3.01 Contractors Qualifications. Concrete restoration or repair shall be performed by a certified applicator of the structural concrete bonding process with a minimum 5-years experience in structural concrete bonding.

1.3.02 Applicator Qualifications. Contractor’s workmen engaged in the repair process should have satisfactorily completed a program of instructions in the methods of restoring concrete structures, wooden timbers and beams utilizing the epoxy injection process specified. The curriculum shall include theory on the nature and causes of cracking in concrete, methods for permanently repairing damaged concrete structures, the technical aspects of correct material selection and use, and the operation, maintenance and troubleshooting of equipment.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. The Contractor shall submit product data for the repair material to be used.

1.4.02 Certifications. The Contractor shall submit certification for workmen who will engage in the repair of the concrete structures.

1.4.03 Test Reports. The Contractor shall submit test data for all field quality control testing.

PART 2 – PRODUCTS

2.1 MATERIALS.

Material selected for concrete repair shall be appropriate for the application. Use of a bonding agent should be as required by the product manufacturer's specification. Material selection must be approved by the Engineer.

The Hydraulic Cement shall have adequate strength to hold injection fittings firmly in place and to resist injection pressures adequately to prevent leakage during injection.

2.1.01 Chemical Grout Materials for Injection. The Contractor shall use a high-solids, hydrophobic, expanding chemical grout to prevent water infiltration, as manufactured by Sika or approved equal, for repair of water tanks, wet wells, chambers, and other similar structures under hydraulic pressure.

2.1.02 Shotcrete. The Contractor may use shotcrete as a concrete repair material in accordance with Master Specifications Section 03371, Shotcrete for applications appropriate to the manufacturer.

2.1.03 Gravity Feed Grout. The Contractor shall use Sika "Sikadur 35 Hi-Mod LV" for gravity feed applications as indicated in the Specifications. Prepare area and install grout as per manufacturer's recommendations.

2.1.04 Metallic Aggregate Epoxy Repair Mortar. The Contractor shall use a metallic aggregate epoxy repair mortar for repair of spalled areas and mortar. The epoxy repair mortar shall be Emaco 588-CI, as manufactured by BASF or approved equal. The repair mortar shall achieve 7,600 psi (534.34 kg/sq cm) compressive strength at 28 days.

Contractor shall follow manufacturer recommendation for replacement of repair mortar. Repair mortar, where required shall be placed to a thickness slightly in excess of the finished surface and shall be steel-trowel-finished, flush with the adjacent surface. Repair mortar shall be BASF EMACO Series for structural repair, EMACO R Surface for Surface Blemishes, or equal.

2.2 Equipment. The equipment used to meter and mix the two injection adhesive components and the mixed adhesive into the crack or aggregate shall be portable, positive displacement type pumps with interlock to provide positive ratio control of exact proportions of the two components at the nozzle. The pumps shall be electric or air powered and shall provide in-line metering and mixing.

The injection equipment shall have automatic pressure control capable of discharging the mixed adhesive at any pre-set pressure up to 160 psi (11.25kg/sq cm) and shall be equipped with a manual pressure control override.

The equipment shall have the capability of maintaining the volume ratio for the injection adhesive prescribed by the manufacturer of the adhesive within a tolerance of plus or minus 5 percent by volume at any discharge pressure up to 160 psi (11.25 kg/sq cm).

The injection equipment shall be equipped with sensors on both the component A and B reservoirs that will automatically stop the machine when only one component is being pumped to the mixing head.

PART 3 – EXECUTION

3.1 PREPARATION.
Surfaces shall be prepared according to product manufacturer's specifications. Conflicts between manufacturer's preparation instructions and these specifications should be resolved by the Engineer.

3.1.01 Spall and Crack Repair. Surfaces adjacent to cracks, chipped out sections and other areas of application shall be cleaned of dirt, dust, grease, oil, efflorescence or other foreign matter detrimental to bond of injection surface seal system. Acids and corrosives shall not be permitted for cleaning.
Entry ports shall be provided along the crack at intervals of not less than the thickness of the concrete at that location. Entry port should intersect the crack approximately half-way through the concrete. Port diameter shall be consistent with manufacturer's recommendations.

Spalled concrete areas shall be chipped to sound concrete and any exposed rebar shall be cleaned. Spalling shall be checked to a minimum of 2 feet (61.0 cm) width at each crack.

Areas chipped to sound concrete shall be formed and the formed portion shall be packed with hydraulic cement to a minimum of 3/4 inches (1.9 cm) thickness.
Route or sawcut cracks identified by the Engineer for repair.
Surface seal material shall be applied to the face of the crack between the entry ports. For cracks completely through the concrete, surface seal shall be applied to both faces.

The surface seal material shall have cured to 50 percent of design strength before proceeding with the injection.

The Contractor shall follow manufactures specifications regarding the need for a backer rod.

3.2 INSTALLATION.

3.2.01 Injection. Injection of material shall begin at a lower entry port or at the lowest port of minimal flow and continue until there is an appearance of material at the next entry port adjacent to the entry port being pumped.

When material travel is indicated by appearance at the next adjacent port, injection shall be discontinued on the entry port being pumped, and injection shall be transported to the next adjacent port where material has appeared. Each port shall be sealed before pumping of the next port. Perform material injection continuously until cracks are completely filled. If port-to-port travel of material is not indicated, the work shall immediately be stopped and the Engineer must be notified.

Areas to be patched where spalling had been shall be injected in a manner that completely fills all voids between aggregate and existing concrete.

3.2.02 Finishing-Crack Repair. When cracks and patched areas are completely filled, material shall be cured for sufficient time to allow removal of surface seal without any draining of run-back of material from cracks or patches.

Surface seal material and injection adhesive runs or spills shall be removed from concrete surfaces.

The face of crack and patched areas shall be finished flush to the adjacent concrete showing no indentations or protrusions caused by the placement of entry ports.

The procedure for filling field control testing core holes consists of using two-component bonding agent applied to the surfaces of cored holes followed by application of grout mix placed by hand trowel, thoroughly rodded and tamped in place, and finished to match color, finish and texture of existing concrete to the satisfaction of the Engineer. Materials and procedures for filling testing core holes shall be submitted to and approved by the Engineer before proceeding with this work.

3.2.03 Finishing-Spalling Repair. Contractor shall trowel smooth all spall-repaired areas until initial cure, with material no longer movable.

Contractor shall stone grind all protruding repaired surfaces.

3.2.04 Gravity Feed Grout. Pour neat Sikadur 35, Hi Mod LV into vee-notched crack as indicated in Project Drawings. Continue placement until completely filled.

3.3 FIELD QUALITY CONTROL.

3.3.01 Core Testing. It is imperative that no reinforcing steel be cut during coring.

3.3.02 Initial Cores. The Contractor shall obtain three 4 inches (10.2 cm) diameter initial core samples in the first one hundred lineal feet of crack repaired and one core for each one hundred lineal feet (30.5 m) thereafter. The cores shall be for full crack depth and taken from locations as selected by the Engineer. The Contractor shall provide at no additional expense to the Owner the following labor, materials, and services required for core sampling and testing of additional cores as directed by the Engineer.

Preparation, handling, storage and transportation of concrete core test specimens will be as directed by the engineer. The contractor will provide suitable containers for the storage, curing and transportation of test specimens as well as provide suitable storage for test equipment and other items required for sampling and testing.

Initial cores will be tested to determine the degree of penetration and the bond strength. Testing of initial core samples will be performed by the Contractor at the Contractor’s expense. Additional cores also called verification cores may be required if the initial cores fail. They will also be tested by the contractor at the Contractor’s expense.

3.3.03 Testing Methods Verification. Penetration will be tested by a visual examination.

Bond strength/compression test will be based upon a concrete failure prior to adhesive failure.

Penetration will be considered adequate when a minimum of 90 percent of the crack shall be full of crack sealing material.

Concrete failure shall occur before adhesive failure, or at stress of 6,500 psi (457 kg/sq cm) with no failure of either concrete or adhesive.

3.3.04 Evaluation of Acceptance of Tests. If the initial cores pass tests as specified above, sealant injection work at the area represented by the cores will be accepted.

If initial cores fail either by lack of penetration or bond strength, the work shall not proceed further until the area represented by the cores are reinjected, and retested for acceptance.

After re-work of areas represented by failed initial cores is complete, the Contractor shall obtain verifying cores, the number and location top is determined by the Engineer. Verifying cores shall be tested in the same manner as initial cores.

3.2.05 Pressure Test. The mixing head of the injection equipment shall be disconnected and the two-adhesive component delivery lines shall be attached to the pressure check device. The pressure check devices shall consist of two independent valved nozzles capable of controlling flow rate and pressure by opening or closing the valve. There shall be a pressure gauge capable of sensing the pressure build-up behind each valve. The valves on the pressure check device shall be closed and the equipment operated until the pressure gauge on each line reads 160 psi (11.25 kg/sq cm). The pumps shall be stopped and the pressure gauge shall not drop below 150 psi (10.55 kg/sq cm) within 3 minutes.

The pressure test shall be run for each injection unit at the beginning and after meal break of every shift that the unit is used in the work of crack repair.

3.3.06 Ratio Test. The mixing head of the injection equipment shall be disconnected and the two adhesive components shall be pumped simultaneously through the ratio check device. The ratio check device shall consist of two independent, valved nozzles capable of controlling back pressure by opening or closing the valve. There shall be a pressure gauge capable of sensing the back pressure behind each valve. The discharge pressure shall be adjusted to 160 psi (11.25 kg/cm^2) for both adhesive components. Both components shall be simultaneously discharged into separate calibrated containers. The amounts discharged into the calibrated containers simultaneously during the same time period shall be compared to determine that the volume/discharged conforms to the manufacturers recommended ratio for applicable material.

3.3.07 Test Reports. At all times during the course of the work the Contractor shall keep complete and accurate records of the pressure and ratio test specified above, available to the Engineer.

In addition, the Engineer, may, at any time with or without prior notification to the Contractor, request the Contractor to conduct the tests specified above in the presence of the Engineer.

End of Section

SECTION 03800

CONCRETE REPAIR

PART 1 - GENERAL

1.1 SCOPE. This section shall be used for structural repairs for concrete. This includes all labor, materials, equipment, and incidentals required to repair and refinish or otherwise modify for reuse, parts of existing structures, piping, pipe supports, equipment, and finishes after demolition and removal work is performed, as indicated on the Drawings or as specified. This shall include, but not be limited to, cutting, or enlarging and finishing new and existing openings, pipe, pipe supports, steel work and the like as required to complete the work included in the Contract.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM A82, “Steel Wire, Plain, for Concrete Reinforcement.”

ASTM A615/A615M, “Deformed and Plain Billet Steel Bars for Concrete Reinforcement.”

ASTM A996/A996M, “Rail Steel and Axle – Steel Deformed Bars for Concrete Reinforcement.”

ASTM C33, “Specifications for Concrete Aggregates.”

ASTM C150, “Portland Cement.”

ASTM C404, “Aggregates for Masonry Grouts.”

ASTM C882, “Bond Strength of Epoxy Resin Systems Used with Concrete by Slant Shear.”

ASTM D638, “Test Method for Tensile Properties of Plastics.”

ASTM D695, “Compressive Properties of Rigid Plastics.”

ASTM D790, “Flexural Properties Of Unreinforced And Reinforced Plastics And Electrical Insulating Materials.”

AWS D1.4 (American Welding Society), “Structural Welding Code for

Reinforcing Steel."

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. Company specializing in manufacturing products specified in this section with minimum five (5) years documented experience.

1.3.02 Applicator Qualifications. A company specializing in concrete repair with minimum five (5) years documented experience and approved by manufacturer.

1.4 SUBMITTALS. The Contractor shall submit for approval, prior to any installation in the work, complete data on the materials proposed to be used in the work for doweling and grouting, including setting plans, and if requested, samples.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. For concrete bonding adhesive use Concresive Liquid LPL by BASF, or equal.

For non-shrink, natural aggregate grout, use Master Flow 928 by BASF, or equal.

For non-shrink, metallic aggregate grout, use Embeco 885 by BASF, or equal.

For structural repairs, use Embeco S Series from BASF or equal.

PART 3 – EXECUTION

3.1 INSTALLATION. All pipe, equipment, and supports shall be installed by skilled mechanics and in accordance with the instructions of the manufacturer.

In setting steel supports and other items of equipment customarily grouted, the Contractor shall make an allowance of at least 1 inch (2.5 cm) for grout under the equipment bases. Shims used to level and adjust the bases shall be steel. Shims may be left embedded in the grout, in which case they shall be installed neatly and to be as inconspicuous as possible in the completed work.

Where such procedure is impracticable, the method of placing grout shall be as approved by Engineer. After the grout has hardened sufficiently, all forms, hoppers, and excess grout shall be removed, and all exposed grout surfaces shall be patched in an approved manner, and if necessary, given a burlap-rubbed finish.

In grouting pipe sleeves in new or existing wall openings, special precautions shall be taken to ensure a complete filling of space with a dense waterproof grout in complete contact with the sleeve, its waterstop, and the existing concrete. The existing wall reinforcing that was cut in making the opening shall be replaced and supplemented as necessary and as detailed on the Drawings, to maintain the structural integrity of the original wall. Approved vibrating equipment and methods shall be employed to ensure a dense and complete watertight closure in the walls. Prior to placing grout, the prepared surface of the opening and the exterior surface of the pipe sleeve shall receive an application of epoxy bonding agent in accordance with the manufacturer's recommendations.

Openings made in existing slabs or walls shall be cut to the required finished size. The cut surface shall receive an application of Concresive Liquid LPL concrete bonding adhesive by BASF or approved equal.

The Contractor shall be responsible for providing adequate temporary supports for all floor and roof slabs while making the required alterations and for leaving such temporary supports in place until grout attains sufficient strength.

3.1.01 Modifying or Repairing Existing Concrete. Remove concrete to the depths shown or required. Roughen contact surfaces by chipping, waterblasting, sandblasting, scarifying, or other approved methods. Thoroughly clean the surface, removing loose particles and dust.

Cut off projecting reinforcement when required to provide at least 1 inch (2.5 cm) cover. Where shown, reinforcement shall be bent across cut face and covered with new concrete.

Thoroughly wash the roughened concrete surface and keep the surfaces saturated for at least 6 hours before placing new concrete. An epoxy bonding compound as specified may be used in lieu of saturating surface for 6 hours.

Repair mortar, where required, shall be placed to a thickness slightly in excess of the finished surface and shall be steel-trowel-finished, flush with the adjacent surface.

When the finish surface is not specified to be coated, the color of new concrete in the exposed surfaces shall match the color of the existing adjoining concrete as closely as possible.

3.1.02 Connections, New Concrete to Existing Concrete. Unless otherwise noted on the Drawings, No. 5 dowels set 6 inches (15.2 cm) into the concrete, and projecting 24 inches on center shall be used.

Where it is necessary to expose existing reinforcement, the reinforcing rods shall be cleaned by wire brushing and new reinforcement shall be hooked into existing reinforcement and lapped or welded as directed. Reinforcing rods shall have at least 3/4 inch (1.9 cm) clearance around each bar.

Preparation of concrete surfaces: Surfaces must be clean and sound. Surfaces may be dry, damp, or wet, but free of standing water. Remove dust, laitance, grease, curing compound, impregnations, waxes, foreign particles, and disintegrated materials by mechanical abrasion methods such as sandblasting. Steel must be sandblasted to the appropriate finish.

If the concrete surfaces are sound and it is only necessary to remove laitance, grease, or dust, the Contractor may, with the prior written approval of the Engineer, forego sandblasting and wash the concrete with a degreasing and etching chemical applied in accordance with the manufacturer's (PROSOCO, Inc., Kansas City, KS, or approved equal) written instructions and as stipulated in the Specifications hereinafter.

Degreasing and etching chemicals shall not contain pigments. Color shall be Water White. Flash point shall be above 150 degrees F (65.6 degrees C). Weight/gallon shall be 9.0 pounds (1.08 kg/l). Composition and materials shall be a blend of organic and inorganic acids with a special solvent system incorporating wetting agents for emulsification.

To apply degreasing and etching compound, pre-wet concrete surfaces with clean water. Brush concentrated cleaner onto concrete surface. Let stand 3 to 4 minutes and reapply, brushing stained areas vigorously. Rinse off with fresh water applied at a minimum pressure of 800 psi (56.25 kg/cm^3) and a minimum volume of 5 gallons (18.93 l) per minute.

3.1.03 Openings in Concrete. Where openings are required for pipes, thimbles for gates, gate stems, or other installations in existing concrete structures, the Contractor shall cut the existing concrete within the limits required, as shown on the Drawings or as specified, expose the existing reinforcing steel, and perform the work in such a manner as to prevent damage to the existing adjacent structures or equipment.

Where concrete is cut to provide openings for gate stems, pipe sleeves shall be accurately installed and grouted in place in an approved manner.

The exposed reinforcement shall be cleaned by wire brushing, then cut and bent to permit the installation, and finally bent around the new pipe or thimble. Additional reinforcement shall be provided as shown on the Contract Drawings for typical reinforcing details of openings in walls and slabs, except as otherwise shown, specified or required.

After installation of pipelines and thimbles, etc., the existing concrete shall be prepared as specified above, and the void between the outside of the pipe or thimble and the existing concrete shall be filled with non-shrink grout.

3.1.04 Grouting Under Equipment Bases, Base Plates, and Structural Members. Where grout is required under equipment bases, base plates, structural supports, non-shrink grout shall consist of factory premixed non-metallic, non-catalyzed grout such as Master Flow 928 Grout by BASF or equal. For additional information, refer to Master Specification Section 3600, Grout.

End of Section

INDEX

DIVISION 4 – MASONRY

SECTION 04065

MASONRY MORTAR AND GROUT

PART 1 – GENERAL

1.1 SCOPE. This section includes mortar and grout for all masonry work.

1.2 GENERAL.

1.2.01 Coordination.

1.2.02 Governing Standards.

ASTM (American Society for Testing and Materials) C94/C94M - Ready-Mixed Concrete.

ASTM C143/C143M – Test Method for Slump of Hydraulic Cement Concrete

ASTM C144 – Aggregate for Masonry Mortar

ASTM C150 – Portland Cement

ASTM C207 – Hydrated Lime for Masonry Purposes

ASTM C270 – Mortar for Unit Masonry

ASTM C387 – Packaged, Dry, Combined Materials for Mortar and Concrete.

ASTM C404 – Aggregates for Masonry Grout

ASTM C476 – Grout for Masonry.

ASTM C780 - Test Method for Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry

ASTM C1019 – Test Method for Sampling and Testing Grout.

ASTM C1314 – Compressive Strength of Masonry Prisms

ASTM C1329 - Mortar Cement.

ASTM C1357 - Methods for Evaluating Masonry Bond Strength.

ASTM E329 – Specification for Agencies Engaged in the Testing and/or

Inspection of Materials Used in Construction.

Masonry Standards Joint Committee (MSJC) Code/American Concrete Institute (ACI) 530/American Society of Civil Engineers (ASCE) 5/The Masonry Society (TMS) 402 – Building Code Requirements for Masonry Structures

MSJC Specification/ACI 530.1/ASCE 6/TMS 602 – Specifications for Masonry Structures.

1.3 QUALITY ASSURANCE. Perform work in accordance with MSJC code and specifications or as indicated on the drawings.

1.3.01 Testing. Sampling, testing and reporting will be performed by an acceptable testing agency conforming to the applicable requirements of ASTM E329 and this section.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit design mix required.

Submit complete plan of procedure before starting construction when grouting is to be placed in temperatures less than 40 degrees F (4 degrees C).

Submit mortar manufacturer’s instructions for each type of mortar or grout provided.

1.4.02 Certifications. Manufacturer shall certify that products meet or exceed specified requirements.

1.4.03 Samples. Submit 2 samples of mortar, illustrating mortar color and color range.

1.4.04 Test Reports. Submit reports on mortar indicating conformance of mortar to property requirements of ASTM C270. Test and evaluation reports shall conform to ASTM C780 for aggregate ratio and water content, air content, consistency and compressive strengths. Submit reports on grout indicating conformance of grout to property requirements of ASTM C476 and test and evaluation reports to ASTM C1019.

1.5 DELIVERY, HANDLING AND STORAGE. Store cementious materials in a place and manner to exclude moisture and contaminants. Deliver and store aggregates in a manner to avoid segregation or contamination with other aggregate size fractions or other materials.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide products from Blue Circle Cement, Medusa Cement Co., SGS Solomon Colors, The Quikrete Companies, or an approved equal.

2.2 MATERIALS. Portland Cement shall be ASTM C150, Type I or II.

Mortar Cement shall be ASTM C1329, Types M or S.

Premix Mortar shall be ASTM C387, Type M or S.

Mortar and grout aggregates shall be fine aggregate MDOT Type 2NS.

Hydrated Lime shall be ASTM C207, Type S, SA, N, NA.

Water shall be clean and potable.

Admixtures are not permitted.

Mortar for structural masonry shall be ASTM C270, Type M, S or N.

Mortar for non-structural masonry shall be ASTM C270, Type M, S, N or O.

Pointing Mortar shall be ASTM C270, Type N or O.

Stain resistant pointing mortar shall be one part Portland cement, 1/8 part hydrated lime, and two parts graded (80 mesh) aggregate, proportioned by volume. Add aluminum tristearate, calcium stearate, or ammonium stearate equal to 2 percent of Portland cement by weight. Use stain resistant pointing mortar where maximum stain or soil resistance are needed for pointing mortar where used with materials such as glazed unit masonry.

Mortar for glass unit masonry shall be ASTM C270, Type S or N.

Pointing mortar for glass unit masonry shall be ASTM C270, Type O with maximum 2 percent ammonium stearate or calcium stearate per cement weight with beach silica sand aggregate.

Thoroughly mix mortar ingredients in accordance with ASTM C270 in quantities needed for immediate use. Add water in amounts necessary to obtain a mortar of the consistency required for the work. Achieve uniformly damp sand immediately before the mixing process. Mortar may be remixed but shall not be retempered or used after it has begun to set.

Table 1 – Typical Mortar Mix Formulas By Volume

Mortar Type	*Minimum Compressive Strength at 28 Days (psi)*	*Masonry Cement*	*Portland Cement*	*Hydrated Lime*	*Damp, Loose Aggregate*
M (High Strength)	2500	1(Type II) -	1 1	- 0 - ¼	2 ¼ to 3 times the sum of cement & lime volumes used.
S (Medium High Strength)	1800	1 (Type II) -	½ 1	- ¼ - ½	
N (Medium Strength)	750	1 (Type II) -	- 1	- ½ - 1 ¼	
O (Medium Low Strength)	350	1 (Type I or II) -	- 1	- 1 ¼ - 1 ½	

Grout for non-structural masonry shall be 2,000 psi (13789.6 kPa) mixed in accordance with ASTM C476 fine coarse grout.

Grout for structural masonry shall be 2,500 psi (17237 kPa) mixed in accordance with ASTM C476 fine coarse grout.

Fine and Coarse grouts are used with low lift and high lift grouting techniques. Both grout types may be used on the same Project.

If grout is transit mixed, mix grout in accordance with ASTM C94, modified to use ingredients complying with ASTM C476.

If grout is mixed onsite, thoroughly mix grout ingredients in quantities needed for immediate use in accordance with ASTM C476. Add water in amounts necessary to obtain a grout of the consistency required for the work. Grout may be remixed but shall not be retemerped or used after it has begun to set.

In certain conditions where a highly fluid grout is required, the Engineer may specify a grout composed of cement, fly ash and water. The cement to ash ratio may vary from 1:1 to 1:3, depending on the stiffness required.

PART 3 – EXECUTION

3.1 EXAMINATION. Request inspection of spaces to be grouted. After inspection, wet surfaces, install mortar and grout.

3.2 PREPARATION. Apply bonding agent to existing concrete and masonry surfaces.

Maintain materials and surrounding air temperature at maintain 50 degrees F (10 degrees C) or above prior to, during, and 48 hours after completion of work. Conform with MSJC specification regarding weather protection.

3. 3 INSTALLATION. Install mortar and grout in accordance with MSJC specification. Work grout into cavities to eliminate voids and clean concrete grout spaces of excess mortar and debris.

3.3.01 Grout Installation. Set reinforcing steel and anchors in required positions and secure against displacement before grouting is started. Place grout in cores and/or collar joints while fluid and before initial set has taken place. Puddle or vibrate grout into place. Place grout in such a way as to prevent segregation of materials. Pour grout fluid enough to flow into all crevices of grout spaces leaving no voids. Grout beams over openings in one continuous operation. Grout vertical cores in maximum of 5 feet (1.5 m) lifts. Stop grout pours 1 1/2 inches (3.8 cm) below a mortar joint, except at top of wall. Where bond beams are used stop grout pour 1/2 inch (1.3 cm) below top. Use metal lath, mortar, or special units to confine grout to area required. Do not use materials which may inhibit bond or are combustible. Use acceptable cold weather precautions in placing and curing of grout when temperature is less than 32 degrees F(0 degrees C). Follow requirements of Section 04300 for Low-Lift and High-Lift Grouting.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. Test grout mixes in accordance with ASTM C1019 for compressive strength, and in accordance with ASTM C143 for slump.

Test flexural bond strength of mortar and masonry units to ASTM C1357; test in conjunction with masonry unit sections specified.

Test compressive strength of mortar and masonry to ASTM C1314; test in accordance with masonry unit sections specified.

End of Section

SECTION 04216

GLASS UNIT MASONRY

PART 1 - GENERAL

1.1 SCOPE. This Section includes: A. Glass block, hollow. (For solid glass block, refer to section 04300, Unit Masonry assemblies).

1.2 GENERAL.

1.2.01 Related Sections. Related Sections include the following:

A. Section 05500 - Metal Fabrications: Steel channels, sills, lintels, and jambs.

1.2.02 References.

B. ASTM A 82 - Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.

C. ASTM A 153 - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

D. ASTM C 144 - Standard Specification for Aggregate for Masonry Mortar.

E. ASTM C 150 - Standard Specification for Portland Cement.

F. ASTM C 207 - Standard Specification for Hydrated Lime for Masonry Purposes.

G. ASTM C 270 - Standard Specification for Mortar for Unit Masonry.

H. ASTM D 1187 - Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.

I. ASTM D 1227 - Standard Specification for Emulsified Asphalt Used as a Protective Coating for Roofing.

J. ASTM E 163 - Standard Methods of Fire Tests of Window Assemblies.

K. CAN 4-S106 - Fire Test of Window and Glass Block Assemblies.

L. UL 9 - Standard for Fire Tests of Window Assemblies.

1.3 SUBMITTALS

A. Submit under provisions of Section 01080.

B. Product Data: Manufacturer's literature on each product to be used, including:
1. Preparation instructions and recommendations.
2. Storage and handling requirements and recommendations.
3. Installation methods.

C. Verification Samples:
1. Two glass block units of each type specified, showing size, design, and pattern of faces.
2. Representative samples of panel reinforcing, panel anchors, expansion strips, and sealant, as required for project.

D. Fire Test Reports: Submit documents verifying glass block units are classified for the specified fire exposure according to ASTM E 163, CAN 4-S106, or UL 9 "Fire Tests of Window Assemblies." Label cartons of tested units with appropriate UL label.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging in clean, cool, dry area until ready for installation.

B. Protect opened cartons of glass block against windblown rain or water run-off with tarpaulins or plastic covering.

1.5 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

B. Do not install glass block units when temperature is 40 degrees F (4 degrees C) and falling.

1.6 WARRANTY

A. Glass Block Units: Limited 5 year warranty on product only.

PART 2 - PRODUCTS

3.1 ACCEPTABLE MANUFACTURERS: Pittsburgh Corning Corporation, which is located at: 800 Presque Isle Dr. ; Pittsburgh, PA 15239-2799; Toll Free Tel: 800-624-2120; Tel: 724-327-6100; Fax: 724-325-9704; Email: request info; Web:

www.pittsburghcorning.com, or approved equal.

3.2 MATERIALS

3.2.01 Glass Block: PC Standard Premiere Series block; hollow; 3-7/8 inches (98 mm) thick.

3.2.02 Physical Properties:

Face Size: Actual face size is 1/4 inch (6 mm) less than nominal.
Weight Installed With Mortar: 20 lb/sq ft (98 kg/sq m).
Thermal Conductance (U Value): 0.51 Btu/hr sq ft deg F (2.9 W/sq m K); winter night.
Thermal Resistance (R Value): 1.96 deg F hr sq ft/Btu (0.35 (K sq m)/W).
Visible Light Transmission: 75 percent.
Shading Coefficient: 0.65.
Fire Rating: 45 minute rated window assemblies for panels in masonry walls up to 120 sq ft (11 sq m) with maximum height or width of 12 feet (3658 mm); and for panels in non-masonry walls up to 94 sq ft (9 sq m) with maximum height or width of 10.75 feet (3277 mm); rating does not apply to all 12 inch (305 mm) by 12 inch (305 mm) blocks.
Sound Transmission: No rating for sizes not square.
Pattern: DECORA.
Face Size: 8 inches (203 mm) by 8 inches (203 mm), nominal.

PART 3 - EXECUTION

3.1 EXAMINATION.

Do not begin installation until substrates have been properly prepared.

If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

Verify that structural members supporting glass blocks are designed for maximum deflection of L/600 under installed load.

Verify that panel anchors or channels for support at head and jambs are properly installed.

3.2 PREPARATION

Clean surfaces thoroughly prior to installation.

Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

Install in accordance with manufacturer's instructions with glass block set in full mortar bed with joint reinforcing at 16 inches (406 mm) on center and in joints immediately above and below openings.

Paint sills of all panels with heavy coat of asphalt emulsion and dry for minimum two hours before first mortar bed is placed.

Make provision for expansion and movement at jambs and heads of all panels; do not allow structural loads to bear on glad blocks.

Mix mortar and apply in accordance with manufacturer's recommendations.

3.4 CLEANING

Remove excess sealer from glass surfaces immediately following application.

Remove excess mortar from faces of glass block at time joints are struck or tooled.

3.5 PROTECTION

Protect installed products until completion of project.

Maintain temperature of glass unit masonry above 40 degrees Fahrenheit (4 degrees Celsius) for first 48 hours after construction.

Touch-up, repair or replace damaged products before Substantial Completion.

End of Section

SECTION 04300

UNIT MASONRY ASSEMBLIES

PART 1 - GENERAL

1.1 SCOPE. This section covers building masonry, unit masonry assemblies, glass unit masonry, concrete masonry units, bricks, reinforcement anchorage, and all accessories and appurtenances.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) A82 - Steel Wire, Plain for Concrete Reinforcement.

ASTM A153/A153M - Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A167 – Stainless and Heat Resisting Chromium-Nickel Steel Plate, and Strip.

ASTM A480/A480M – General Requirement for Flat-Rolled Stainless Steel Plate, Sheet, and Strip.

ASTM A615/A615M – Deformed and Plain Billet Steel Bars for Concrete Reinforcement.

ASTM A635/A635M – Steel, Sheet and Strip, Heavy-Thickness Coils, Carbon, Hot-Rolled

ASTM A641 – Zinc-Coated (Galvanized) Carbon Steel Wire.

ASTM A951 – Masonry Joint Reinforcement.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM B209 – Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM C32 – Sewer and Manhole Brick (Made from Clay or Slate).

ASTM C55 – Concrete Test Methods for Brick.

ASTM C67 – Test Methods Sampling and Testing Brick and Structural Clay

Tile.

ASTM C90 - Load-Bearing Concrete Masonry Units.

ASTM C126 – Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units.

ASTM C129 - Non-Load Bearing Concrete Masonry Units.

ASTM C140 – Test Methods of Sampling and Testing Concrete Masonry Units and Related Unites.

ASTM C144 – Aggregate for Masonry Mortar.

ASTM C150 – Portland Cement.

ASTM C207 – Hydrated Lime for Masonry Purposes.

ASTM C216 – Facing Brick (Solid Masonry Units Made from Clay or Shale.

ASTM C270 - Mortar for Masonry Purposes.

ASTM C404 – Aggregates for Masonry Grout.

ASTM C476 - Grout for Masonry (Solid Masonry Units Made from Clay or Shale).

ASTM C568 – Limestone Dimension Stone.

ASTM C612 – Mineral Fiber Block and Board Thermal Insulation.

ASTM C744 - Prefaced Concrete and Calcium Silicate Masonry Units.

ASTM D226 – Asphalt-Saturated Organic Felt used in Roofing and Waterproofing.

ASTM D226 - Asphalt Saturated Organic Felt used in Roofing and Waterproofing.

ASTM D1056 - Flexible Cellular Materials-Sponge or Expanded Rubber.

ASTM D2000 - Rubber Products in Automotive Applications.

ASTM D2240 – Test Method for Rubber Property-Durometer Hardness.

ASTM E119 - Fire Tests of Building Construction and Materials.

Cleaning Brick Masonry; Technical Notes on Brick Construction, No. 20 Revised H; Brick Institute of America (BIA).

NCMA-TEK 45 - Removal of Stains from Concrete Masonry Walls; National Concrete Masonry Association.

Masonry Standards Joint Committee (MSJC) Code/American Concrete Institute (ACI) 530/American Society of Civil Engineers (ASCE) 5/The Masonry Society (TMS) 402 – Building Code Requirements for Masonry Structures.

MSJC Specification ACI 530.1/ASCE 6/TMS 602 – Specifications For Masonry Structures.

1.3 QUALITY ASSURANCE. Perform work in accordance with MSJC Code and MSJC Specification.

1.3.01 Installer Qualifications. Installer shall be company specializing in performance work of this section with minimum of five years of documented experience.

1.3.02 Fire Rating. Where fire-rated masonry construction is indicated or required, provide materials and construction methods identical to those of assemblies tested in accordance with ASTM E119 for hourly ratings required. Provide evidence acceptable to governing authority that proposed construction complies with performance requirements.

1.3.03 Grout Tests. Employ an independent testing agency approved by the Engineer to test grout prior to sample wall construction, in accordance with ASTM C1019, for compatibility with each masonry unit.

Determine grout mix that provides slump between 8 and 11 inches (20.32 cm and 27.94 cm) and meets the strength requirements contained in Section 04065 based on the unit coverage area and weather conditions.

Submit grout mix showing the pounds (kg) of Portland cement/lime, gallons (liters) of water, pounds (kg) of fine aggregate, pounds (kg) of coarse aggregate, and allowable time of mix per batch.

1.3.04 Tolerances. Variation from plumb shall not exceed the following tolerances in vertical elements, including surfaces of walls, columns, and arises:

¼ inch (6.4 mm) in 10 feet (3.05 m).

3/8 inch (9.5 mm) in one story height, or 20 feet (6.10 m), whichever is less, except 1/4 inch (6.4 mm) for external corners, expansion joints, and other highly conspicuous vertical elements.

½ inch (1.27 cm) in 40 feet (12.19 m) or more.

Plus or minus 1/4 inch (6.4 mm) in 10 feet (3.05 m), 1/2 inch (1.27 cm) maximum, for vertical alignment of head joints.

Variation from level shall not exceed the following construction tolerances for bed joints and lines of exposed lintels, sills, parapets, horizontal grooves, and other conspicuous horizontal elements:

¼ inch (6.4 mm) in one bay or in 10 feet (3.05 m) maximum.

½ inch (1.27 cm) in 20 feet (6.10 m) or more.

Variation from plan lines shall not exceed the following horizontal construction tolerances for related portions of columns, walls, and partitions:

½ inch (1.27 cm) in any bay or in 20 feet (6.10 m) maximum.

¾ inch (1.9 cm) in 40 feet (12.19 m) or more.

Variation in cross section shall not exceed the following construction tolerances for thickness of walls and other masonry elements:

Minus 1/4 inch (6.4 mm).

Plus 1/2 inch (1.27 cm).

Variation in mortar joint thickness shall not exceed the following construction tolerances for thickness of mortar joints:

Bed joints: Plus or minus 1/8 inch (3.2 mm).

Head joints: Minus 1/4 inch (6.4 mm), plus 3/8 inch (9.5 mm).

1.4 <u>SUBMITTALS</u>.

1.4.01 <u>Drawings and Data</u>. Submit shop drawings showing gaskets at all masonry conditions and locations, annotating each profile and its dimension. Also submit shop drawings showing building expansion joints at all masonry conditions and locations, annotating each profile, its dimensions and color. Submit published data from manufacturers of products and accessories specified, indicating compliance with requirements.

Submit shop drawings for reinforcing bars in masonry walls".

1.4.02 Certifications. Submit statement of compliance for masonry units specified by reference to standard specifications that the units have been tested within 6 months of date for receipt of bids. Include results of efflorescence tests where required by the standard specification.

Submit a written description of the cold weather and hot weather construction procedures based on the project requirements specified.

1.4.03 Samples. Furnish samples for approval of all proposed masonry units and accessories prior to delivery of materials to the site. Include submit sample panel, or five units showing extreme range of color and texture.

Include plain and decorative concrete masonry units, glazed concrete masonry units, face brick, each shape, worked and cored, and glass masonry units as applicable.

Submit sample of wall reinforcement 18 inches (45.72 cm) in length, showing at least 2 cross joints, actual size of each type, and location.

Submit sample of anchors and ties (actual size of each type and location), control joint filler, and gaskets (actual size of each type and location).

Submit sample of mortar color.

1.4.04 Mock-up. Prior to commencement of exposed masonry work, erect sample panel (10’ x 13’4”) to serve as standard of appearance and workmanship throughout construction period.

Build at location and to design as indicated on drawings, or as otherwise directed by the Engineer.

When directed, demolish and remove mock-ups from Project site. Accepted mock-ups in undisturbed condition at time of Substantial Completion may become part of completed work.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver, handle, and store masonry units by means which will prevent mechanical damage and deterioration due to moisture, temperature changes, and contamination by other materials. Store masonry units off the ground in a dry location, covered and protected from the elements.

Provide protection which will limit moisture absorption of concrete masonry units to the maximum allowable percentage specified for Type I units at a relative humidity which is normal for the project site.

Protect cementitious materials from precipitation and absorption of ground moisture.

Store masonry accessories to prevent corrosion, dirt accumulation, and other deterioration.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.1.01 Allowable Working Stresses in Unreinforced Unit Masonry.

[1]Allowable axial or flexural compressive stresses in pounds per square inch gross cross-sectional area (except as noted). The allowable working stresses in bearing directly on concentrated loads may be 50 percent greater than these values.
[2]This value of tension is based on tension across a bed joint, i.e., vertically in normal masonry work.
[3]No tension allowed in stack bond across head joints.
[4]The values shown here are for tension in masonry in the direction of running bond, i.e., horizontally between supports.
[5]Net area in contract with mortar or net cross-sectional area.

2.2 MATERIALS.

2.2.01 Brick Masonry Units. Face Brick that is 4 inch (10.16 cm) in size shall comply with ASTM C216 SW FBS.

Provide specially molded units as required to meet conditions indicated, unless standard units can be sawn to produce the same effect. Do not use standard units in any configuration, which exposes cores.

Provide color of brick, texture, and physical properties as selected by Engineer. Brick for underground masonry applications shall conform to ASTM C32 or C55 as applicable and shall be placed where indicated on the drawings.

2.2.02 Concrete Masonry Units. Concrete Block standard units with nominal face dimensions of 16 inches (40.6 cm) long and 8 inches (20.3 cm) high shall be 15 5/8 by 7 5/8 inches (39.7 by 19.4 cm) actual size, with nominal thicknesses as indicated on drawings for various locations.

Provide special block types where required for corners, control joints, headers, lintels, and other special conditions, whether or not specifically indicated on the drawings as special.

Outside corners shall be bullnose units except where otherwise indicated.

All units exposed to the exterior shall be manufactured with integral water repellent.

Manufacturer shall be Rheomix 235 or approved equal.

Hollow load-bearing units shall be ASTM C90, Type I, Moisture-controlled units, of normal weight, exposed faces shall be manufacturer's standard color and texture.

Non-load-bearing units shall be ASTM C129, hollow, Type I, Moisture-controlled units, of medium weight.

Solid load-bearing units shall be ASTM C90, Type I, Moisture-controlled units of normal weight. Exposed faces shall be manufacturer's standard color and texture.

Acoustical Concrete Masonry Units shall be sound absorbing units equal to Acousta-Wal Type IVRF; Trenwyth Industries, Inc. Provide standard units with nominal face dimensions of 16 inches (40.64 cm) long and 8 inches (20.32 cm) high (15-5/8 by 7-5/8 actual), with nominal thicknesses as indicated on drawings for various locations.

Slots shall be funnel shaped.

Fillers shall be factory inserted fiberglass.

Septum shall be metal, laminated to fiberglass fillers.

2.2.03 Decorative Concrete Masonry: Units shall conform to ASTM C90 normal weight. Burnished units shall be Best Block Bagley, or approved equal. Split face units shall Best Block Bagley, or approved equal.

2.2.03b: Glazed Block: Furnish light weight concrete block units that conform to ASTM C90, with glazed faces conforming to ASTM C216, Grade G. All exposed surfaces shall be glazed unless noted. Provide special shapes as necessary and as shown on drawings. Use Premier Glazed units; Spectra Glaze or approved equal. Color: match architect's sample.

2.2.04 Hollow Glass Block. Provide non-load-bearing blocks compressing two half-blocks of pressed glass fused to produce a partial vacuum, with manufacturer's standard factory-applied edge coating.

Glass block shall have pattern similar to Vistabrik, stipple finish by Pittsburgh Corning, PC Glass Block and be nominal 3 inches (7.62 cm) thick and 8 inches (20.32 cm) square. Edge coating color shall be Manufacturer's standard white color. Provide product of Pittsburgh Corning Corporation or approved equal.

2.2.05 Stone Trim Units. Shall be Indiana monolitic limestone as quarried in Lawrence, Monroe and Owen Counties, Indiana, complying with ASTM C568, Category II (medium density). Color shall be buff, the grade shall be select, and the finish shall be smooth as defined by the Indiana Limestone Institute of America (ILI).

Cut stone accurately to shape and dimensions indicated, with exposed faces dressed true, beds and joints at right angles to face; comply with ILI fabricating tolerances.

2.2.06 Lintel. Plainly mark tops of all lintels to show number and size of bars.

Precast Concrete Lintels shall be free from cracks and chipped or broken edges, with uniformly smooth, dense surface; exposed to view; surfaces resembling the texture of adjacent concrete masonry units or burnished masonry units; minimum compressive strength of lintels at 28 days, 3000 psi (210.92 kg/sq cm); 7 5/8 inches (19.36 cm) high; and reinforced as follows, unless otherwise indicated.

Up to 8 feet (7.44 m) span - four no. 3 bars.

8 to 9 feet (2.44 to 2.74 m) span - four no. 4 bars.

9 to 10 feet (2.74 to 3.05 m) span - four no. 5 bars.

2.2.07 Joint Materials. Compressible joint filler shall be Williams Products, Inc. “Williams Expand-O-Foam 1380 Series” or approved equal; closed cell expanded polyethylene, shape as indicated.

Air seal gasket shall be Williams Product, Inc. “Williams Neoprene Type NN1, 1040 Series” or approved equal; shape as indicated and size required to provide 25 percent compression.

Control joint filler shall be Williams Products, Inc., “Slot Seal Standards 2015-3” or approved equal; synthetic rubber complying with ASTM D2000 designation 3BA 810, having durometer hardness of 80 when tested in accordance with ASTM D2240, and having minimum shear strength of 540 psi (37.97 kg/cm^2).

Isolation material shall be mineral fiber board complying with ASTM C612, Class 1, nominal density 2 to 4 lbs. per cubic foot (32.04 to 64.07 kg per cubic meter).

2.2.08 Reinforcing Materials. Reinforcing bars for bond beams, vertical wall reinforcement and lintels shall be ASTM A615, Grade 60; bars larger than No. 2, deformed, round.

Horizontal wall reinforcement shall be fabricated from cold drawn steel wire complying with ASTM A82 and zinc coated in accordance with ASTM A153, Class B-2 (1.50 oz. per square foot (458 grams per square meter) coating, with 9 gage (3.9 mm) longitudinal and cross wires, furnished in flat sections not less than 10 feet (3.05 m) in length with out-to-out spacing of longitudinal wires 1 3/4 inches (4.45 cm) less than nominal width of the back-up wythe of concrete masonry wall. Locate longitudinal wire 1 1/4 inches (3.18 cm) back from the face of the weather wythe and 1/2 inch (1.27 cm) in from interior face of back-up wall.

Wall reinforcement for cavity walls shall be 3-wire ladder type without moisture drip. Use AA Wire Products Co. “Tri-Lok”, Dur-O-Wal, Inc. “Ladur Type Trirod”, Hohmann & Barnard, Inc. “Tri-Mesh”, or approved equal.

Wall reinforcement for cavity walls with coursing in facing offset from coursing in backing shall be 2-wire truss type with 3/16 inch (4.8 mm) (wire adjustable ties for facing wythe, designed to allow no more than 1/16 inch (1.6 mm) movement perpendicular to the wall, between the eyelet and pintle leg, having maximum coursing offset vertically of 1/2 inch (1.27 cm), having relation between location of eyelet and face of cavity wall insulating as indicated. Use AA Wire Products Co. “Adjustable Blok-Trus”, Dur-O-Wal, Inc. “Dur-O-Eye”, Hohmann & Barnard, Inc. “Adjusto-Flex-Truss-Mesh”, or approved equal.

Wall reinforcement for single wythe walls and partitions shall be truss type without moisture drip. Use AA Wire Products Co. “Blok-Trus”, Dur-O-Wal, Inc “Dur-O-Wal

Truss", Hohmann & Barnard, Inc. "Trus-Mesh", or approved equal. Bar Positioner shall be 9 gage galvanized wire as manufactured by AA Wire Products Co; Dur-O-Wal, Inc; Masonry Corp. of America; or as approved.

2.2.09 Joint Reinforcement and Anchorage Materials. Anchors and ties shall be steel zinc-coated in accordance with ASTM A153, Class B-2 (1.50 oz. per square foot (458 grams per square meter)) coating, of approved types for each application. Wire mesh ties for furring shall be 1/2 inch (1.27 cm) mesh of 16 gage diameter coated steel wire, length not less than 20 inches (50.8 cm), and width 1 1/2 inches (3.81 cm) less than width of masonry units.

Metal ties shall be minimum 7/8 inch (2.22 cm) wide, 22 gage (0.9 mm) coated steel sheet, corrugated or crimped and in length as indicated.

Dovetail anchors, Type 1 shall be 6 gage (5.0 mm) coated steel wire, triangular in shape, nominal size indicated, with coated steel wire or bar dovetail clip. Type 2 shall be 1 inch (2.54 cm) wide, 16 gage (1.6 mm) coated steel sheet, straight or with a 1 inch (2.54 cm) turndown profile, unless otherwise indicated.

Rigid steel anchors shall be 3/16 inch (4.8 mm) coated steel, 1 1/4 inches (3.18 cm) wide, turned up 2 inches (5.08 cm) at one end and down 2 inches (5.08 cm) at other end, length required to fit into cells of concrete masonry units.

Flexible anchors shall be 6 gage (50 mm) coated steel wire, triangular in shape, nominal size indicated, with coated steel wire welded to structural elements.

Channel slot anchors shall be Dur-O-Wal. "D/A 903" or as approved, using 11 gage coated steel slotted channels and anchors. Type 1 shall be "D/A 911", 1/8 x 1 1/4 inch (3.2 mm x 3.18 cm) coated steel anchors, length as indicated. Type 2 shall be "D/A 913", 1/8 x 1 1/4 inch (3.2 mm x 3.18 cm) coated steel anchor with end bent down 1 inch (2.54 cm), length as indicated. Type 3 shall be "D/A 918-921", 6 gage (50 mm) coated steel wire, triangular in shape, nominal size indicated, with coated steel clip.

Extended channel slot anchor shall be Dur-O-Wal, Inc. "D/A 902" or as approved, with 11 gage (3.1 mm) coated steel legs of length required to project anchor beyond depth of field-applied fireproofing.

Zinc-rich Paint shall be ZRC Products Co. "Z.R.C." or other acceptable product complying with DOD-P-21035A.

Use products from AA Wire Products Company, Dur-O-Wal, Inc., Heckmann Building Products, Inc., Hohmann and Barnard, Inc., Masonry Reinforcing Corporation of American, National Wire Products Industries, Inc., or an approved equal.

2.2.10 Miscellaneous Masonry Accessories. Expansion joint strips shall be neoprene filler strips complying with ASTM D1056, Classification 2 A1, capable of 35 percent compression and sized for specific conditions indicated.

Premolded control joints shall be strips sized for standard sash block and designed to allow movement while maintaining lateral stability, and meet ASTM D2000, Styrene-butadiene rubber compound; Designation 2AA-805.

Bond Breaker Strips shall be ASTM D226, Type I; No. 15 asphalt felt.

Sealant and Backer Rod shall be as specified in Division 7.

Wall drainage system shall be 1 inch (2.54 cm) thick x 10 inch (2.54 cm) high x continuous high density polyethylene or nylon mesh in trapezoidal configuration designed to allow moisture to flow downward in the cavity. Manufacturer to be “The Mortar Net” by Mortar Net USA, Ltd., 1-800-664-6638.

2.2.11 Metal Flashing and Trim. Stainless steel sheet shall meet ASTM A167, Type 302 or 304 sheets or strips, dead soft fully annealed, 2D finish per ASTM A480.

Prefinished aluminum sheets shall be ASTM B209 manufacturer’s standard alloy and temper for indicated applications. Finish 20 percent “Kynar 500” or “Hylor 5000 resin finish over epoxy primer.

Metal flashing joint sealant shall be non-drying, non-skinning, non-oxidizing, butyl sealant complying with AMA Specification 808.3, such as Protective Treatments, Inc. “PTI 707”.

Interlocking flashing shall be Cheney Flashing Co. “3-Way Flashing”, 16 oz (454 g), high strength copper sheet or 0.015 inch (0.4 mm) thick stainless steel sheet, deformed to provide a keyed mortar bond.

Reglet for flashing in concrete wall shall be Keystone Flashing Company “Keystone Simplex” formed of 16 oz (454 g) copper or 0.015 inch (0.4 mm) thick, dead soft stainless steel, complete with prepunched nail holes at 12 inches (30.48 cm) on center and required matching nails or screws.

Metal flashing under masonry coping shall be the interlocking type, profile as indicated with a double fold turned down. Provide for 3 inch (7.62 cm) lap joints.

Metal flashing under masonry bearing on foundation walls to protect waterproofing from masonry construction shall be profile as indicated. Provide for 2 inch (5.08 cm) lap joints, cleaned and bonded with metal joint sealant. Use pop-rivets at lap joints. Seal pop-rivets.

Metal flashings other than interlocking type shall be 10 oz (284 g) lead-coated copper or 0.010 to 0.015 inch (0.25 to 0.4 mm) stainless steel, profile as indicated. Provide for 2 inch (5.08 cm) minimum lap joints, cleaned and then bonded with metal flashing joint sealant. Use pop-rivets at lap joints. Seal pop-rivets.

Form ends of non-continuous flashing at locations such as over openings and adjacent to doors to provide a one inch (2.54 cm) high dam (end dam). Construct front dams where indicated to provide a one inch (2.54 cm) high dam (front dam).

Solder external and internal corners as required to make a continuous membrane.

Before soldering stainless steel, clean, roughen and pretin edges of sheet metal to be soldered. Remove all flux residue from acid type flux by scrubbing, neutralizing with ammonia.

2.2.12 Masonry Cleaner. Shall be general-purpose acidic cleaner designed for new masonry surfaces, comprised of blended acids combined with special wetting systems, and approved by manufacturer of masonry units.

2.2.13: Burnished Block Sealer: Use sealer as recommended by block manufacturer to enhance color and luster to match architect's sample.

PART 3 - EXECUTION

3.1 PREPARATION. Refer to ACI 530.1 for erection of masonry, including bracing and protection, and for installation of reinforcement and metal accessories.

3.1.01 Cold Weather Construction. Perform all masonry construction so that the in-wall components will not be below 39 degrees F (4 degrees C) for a minimum of 24 hours after placement.

Do not work with or upon frozen materials.

Do not lay masonry units which have wet surfaces or units which are below freezing. Remove ice or snow from masonry bed by careful application of heat. Remove masonry damaged by freezing.

When air temperature is 40 degrees F (4.4 degrees C) to 32 degrees F (0 degrees C) maintain mortar temperature between 40 degrees F (4.4 degrees C) and 120 degrees F (48.9 degrees C) by heating water or sand before mixing. Protect masonry from rain or snow for at least 24 hours by covering with weather-resistive membrane.

Do not lay masonry units when air temperatures are below 32 degrees F (0 degrees C).

For grouted construction when minimum anticipated night time temperature is 32 degrees F (0 degrees C) or less, in addition to procedures above, heat grout materials to 90 degrees F (32.2 degrees C) to produce in-place grout temperature of not less than 70 degrees F (21.1 degrees C) at end of work day. Retain protective blankets or enclosures for not less than 48 hours. Period may be reduced to 24 hours if Type III Portland cement is used.

Clay masonry units must be wetted before laying because initial rate of absorption (suction) is greater than 1 gram per square inch (6.45 cm^2) per minute. (ASTM C67). If the surface temperature is above 32 degrees F (0 degrees C), sprinkle with water heated to 70 degrees F (21.1 degrees C) or above, just before laying. If the surface temperatures is below 32 degrees F (0 degrees C), sprinkle with water heated to 130 degrees F (54.4 degrees C) or above, just before laying.

Do not heat water for mortar or grout to more than 160 degrees F (71.1 degrees C).

3.1.02 Hot-Weather Protection. Cover or shade masonry units and mortar materials and use cool water for mortar whenever ambient air temperature is 90 degrees F (32.2 degrees C) or greater. At air temperatures of 85 degrees F (29.4 degrees C) or above, if relative humidity is less than 30 percent or wind is in excess of 15 miles per hour (24.1 kmh), provide protection by immediately covering newly constructed walls, by providing windbreaks, or by using fog spray to reduce rate of evaporation.

The maximum temperature of water used for mortar shall be 110 degrees F (43.3 degrees C).

3.1.03 Mixing Mortar. Mix mortar according to approved mortar mix. Do not employ hand mixing without approval by the Engineer.

3.2 INSTALLATION.

3.2.01 Placement. Lay masonry plumb, true to line, with level courses and joints of uniform width and in thickness and pattern indicated. Lay exposed masonry in running bond except where other bonds are indicated. Tap wills lightly with hammer in each course at end of each workday. Before resuming, clean exposed surfaces and remove loose masonry units and mortar.

Lay solid masonry units in full bed of mortar, with full head joints, uniformly jointed with other Work. Lay hollow masonry units with face shell bedding on head and bed joints. Coursing for concrete masonry units shall be one unit and one mortar joint to equal 8 inches (20.32 cm). Coursing for brick units shall be tree units and three mortar joints to equal 8 inches (20.32 cm).

Adjust each unit to its final position in the wall while the mortar is still soft and plastic. Remove any unit which is disturbed after mortar has been placed in the head and bed joints and compressed into final position and relay the unit with fresh mortar. Avoid over-plumbing and pounding of corners and jambs to fit.

Build chases as indicated or as required to accommodate cabinets, pipes, ducts, conduits or other work provided under other Master Specification Sections. Keep chases free of mortar and debris.

For cutting of masonry units, employ masonry mechanics with masonry saws.

Leave openings in masonry as required for subsequent installation of equipment and services. Make openings in designated locations and in exact size required, if known; otherwise; leave rough openings in approximate size required and complete masonry work after installation of equipment, matching adjoining masonry.

Where fresh masonry joins masonry that is set, clean and lightly wet the contact surface of the set masonry. Remove loose mortar.

Solidly fill spaces around metal door frames and other built-in items with mortar. Rake out joint between frame and masonry for caulking, unless otherwise indicated. Unless other conditions are specifically detailed, solidly grout cores for at least 24 inches (60.96 cm) below bearing plates, lintels, and similar features and conditions.

Build in items required to be embedded in masonry in a manner to avoid cutting and patching. At locations where built-in items are to be connected to hollow unit masonry, solidly grout cores to provide adequate anchorage.

Unless otherwise indicated, construct partitions from floor to underside of floor or roof construction above, less specified separation from structure.

Provide an open joint 1/2 inch (1.27 cm) wide minimum, unless otherwise indicated, with isolation material to separate masonry units of non-bearing walls and partitions from contact with structural components.

3.2.02 <u>Cavity walls</u>. Keep cavity clean and free of mortar droppings by using wood strips resting on adjustable ties and lifted up as construction progresses.

Provide weep holes in the weathering face at 24 inch (60.96 cm) spacing at bottom of cavity and in first course above flashing, full height and width of head joint, and free of mortar droppings. Use a form that starts at flashing back dam and extends out past the weathering face a minimum of one inch (2.54 cm) for ease of removal. After wall is completed between shelf angle supports, remove weep hole forms.

Provide a cavity a minimum of 4 inches (10.16 cm) wide, composed of a nominal 2 inch (5.08 cm) cavity and 2 inches (5.08 cm) of cavity wall insulation, unless otherwise indicated, to separate facing and backing. Bond facing and masonry backing together with horizontal wall reinforcement or adjustable ties.

Apply parge material Type 1 (vapor retarder) to the cavity side face of concrete masonry backing, 3/16 inch (4.8 mm) thick, trowled to a smooth, dense surface as follows, when cavity wall insulation is used:

Apply primer by roll or brush at a rate of 1 1/2 gallons per 100 square feet 0.61 liters per square meter. Let dry to touch.

Apply parge in one coat at a rate of 5 gallons per 100 square feet 2.04 liters per square meter).

Apply an additional coat where face of masonry backing varies to provide a flush surface for installation of insulation. Vapor permeance in grains per square foot per hour when tested in accordance with ASTM E96 shall be 0.0077 initially and 0.000 after 90 days.

Impale cavity wall insulation into the parge without back voids and with tightly butted joints and with vertical joints staggered. Install cavity wall insulation full height of wall against inner wythe between ties, leaving 2 inch (5.08 cm) minimum cavity between insulation and outer wythe.

Provide running center bond pattern, unless otherwise indicated or specified.

Anchor walls and partitions to abutting structure at a maximum spacing of 16 inches (40.64 cm). Anchor to new concrete with dovetail anchors and to steel structure with Type 2 or 3 channel slot anchors as indicated, or with flexible anchors for interior locations as indicated. Anchor to existing concrete with Type 3 channel slot anchors, and to underside of floor or roof deck with Type 1 channel slot anchors.

Anchor walls and partitions to steel beams at 32 inch (81.28 cm) spacing. Where anchors are welded to structural steel, coat the welds with zinc-rich paint.

Tie intersections of load-bearing and fire-rated walls together with rigid steel anchors, at maximum vertical spacing of 4 feet (1.22 m) with vertical legs embedded in coarse grout.

Bearing course under floor joists and slabs and under lintels less than 8 feet (2.44 m) in span length shall be 4 inches (10.16 cm) in height of solid masonry, filled-cell blocks or solid-top blocks, except where bond beam is indicated. Bearing course under beams, girders and trusses and under lintels 8 feet (2.44 m) or more in span length shall be solid masonry or concrete as indicated, but not less than 8 inches (20.32 cm) in height.

Provide horizontal wall reinforcement in all walls as indicated. Locate horizontal wall reinforcement at maximum vertical spacing of 16 inches (40.64 cm) and in first and second bed joints above and below openings, extending 24 inches (60.96 cm) beyond opening. Provide prefabricated horizontal wall reinforcement tees and angles at intersecting walls and partitions, unless control joints are indicated. Discontinue horizontal wall reinforcement at any vertical brick expansion joint and any concrete masonry control joint.

Provide continuous vertical rod reinforcement in walls, of size and location as indicated. If the use of continuous rods is impractical, lap the splices 48 bar diameters, in addition to the 48 inch (1.22 m) lift requirement and tie with wire. Length of vertical wall reinforcement includes lift and lap requirement.

Lap joint reinforcements ends minimum 6”.

Place vertical wall reinforcement plus or minus 1/2 inch (1.27 cm) from center of cell and not closer than one inch (2.54 cm) from any web. Install vertical bar positioners at 54 inch (1.37 m) vertical spacing. Remove any loose material from the cells of concrete masonry. Solidly fill cells that contain reinforcing with coarse grout, in maximum lifts of 48 inches (1.22 m).

Vibrate or puddle coarse grout in cells of concrete masonry at each intermediate lift to consolidate material placement. Terminate the top of grout at intermediate lifts half the height of the unit for keying of the adjacent lift.

3.2.03 Masonry Construction. Provide special shapes required for a complete installation.

Use hollow load-bearing units for walls and partitions, unless otherwise specified.

Use solid load-bearing units or concrete building brick at the top of partitions terminating below ceiling or below exposed roof or floor construction.

Use solid load-bearing or hollow load-bearing fire-rated units for walls or partitions indicated to be 6 inch (15.24 cm) unplastered and indicated or required by the authority having jurisdiction to have a 2 hour fire resistance rating.

Lightly wet previously laid clay masonry units, which have rate of absorption of more than 1 gram per square inch per (6.45 cm^2) minute (ASTM C67), before laying fresh masonry.

In surfaces exposed to view, tool mortar joints, when thumbprint hard, with a round jointer.

Construct head joints for hollow units by buttering both the unit being placed and the adjoining unit with mortar.

Cut mortar joints flush in furnaces to be plastered or covered with other construction. Remove mortar protrusions into cells or cavities to be reinforced and filled.

In glazed concrete masonry, rake setting mortar 1/4 inch (6.4 mm), allow to dry and tuckpoint raked joints. Where masonry is scored to simulate stack bonding, align the joints and scores vertically and tuckpoint the raked joints and scores at the same time. Finished mortar color shall be uniform.

Provide bond beams as indicated, constructed as a continuous course of bond-beam units filled with coarse grout and reinforced with two No. 4 bars, unless otherwise indicated. Lap bars a minimum of 48 bar diameters at splices.

In 2 hour fire rated partitions, fill cells of 6 inch (5.24 cm) units, which contain junction boxes or other penetrations with coarse grout.

Support grout in filled cells with wire mesh ties or metal lath.

Provide lintels for openings in masonry walls of types indicated at all openings. Notch lintels abutting columns or concrete walls to fit flush with both legs of seat angle.

3.2.04 Brick Masonry Construction. Before laying brick, check the units for color, chippage, dimensional tolerances and warpage.

Provide face brick for brick exposed to view. Use concrete building brick only for concealed portion of brick walls and partitions.

Add moisture to brick having absorption rates, determined in accordance with ASTM C67, in excess of 25 grams per 30 square inch (193.55 cm^2) per minute sufficiently so that the rate of absorption when the brick is laid does not exceed this amount.

Insure that each unit is nearly saturated, surface dry when laid.

Lay each horizontal course complete unless topping off is required for construction purposes. If topping off is required, rack the brick back 1/2 brick length in each course. Toothing, or projecting end stretchers of alternate courses, will not be permitted, except upon written approval.

Lay brick with full bed and head mortar joints, unless otherwise specified. Deep furrowing of the bed joints of mortar is not permitted.

Exposed “J” joints shall be 3/8 inch (9.5 mm) thick, tooled with round jointer. Joints below grade shall be trowel-pointed. Other joints not tooled shall be flush cut.

Tie veneer facing to backing as specified in ACI 530.1. Ties to masonry backing shall be metal, except where horizontal wall reinforcement is required.

Anchors to concrete backing shall be dovetail anchors. Anchors to structural steel shall be channel slot anchors welded to structural steel and coated with zinc-rich paint after welding or fastened with powder actuated fasteners.

Anchors to existing concrete and exiting masonry shall be Type 3 channel slot anchors, attached with two fastener per tie. Anchor to metal studs (interior condition) shall be channel slot anchors attached to metal studs with hollow wall expansion fasteners.

3.2.05 <u>Masonry Expansion and Control Joints</u>. In interior masonry walls and partitions, provide vertical control joints where indicated but not exceeding a maximum spacing of 40 feet (12.19 m). Form control joint with metal sash jamb blocks both sides of joint and fill with control joint filler. Extend control joints through bond beams.

Where control joints are located at the end of lintels, install building paper in bed joint of lintel. Install control joint at both ends of lintel for the remaining height of concrete masonry unit. Use a control joint filler engaged into sash type units to provide lateral support for the masonry wall.

For exterior masonry movement joints outer wythe – brick expansion joints shall be of width indicated and kept free of mortar by installation of compressible joint filler.

Keep horizontal joints under shelf angles or plate supports free of mortar, and install compressible filler as indicated.

For inner wythe – concrete masonry control joint, install air seal gasket in joint in backing and where indicated. Compress gasket 25 percent into joint. Install control joint filler between sash type units in backing of cavity walls. Control joint width shall be 3/8 inch (9.5 mm) plus or minus 1/16 inch (1.6 mm), set by installation of control joint filler.

3.2.06 <u>Cavity Wall Construction</u>. Connect wythes of cavity walls with individual ties staggered in alternate courses and spaced at 16 inches (40.64 cm) on center maximum vertically and 16 inches (40.64 cm) on center maximum horizontally.

3.2.07 Glass Unit Masonry. Lay glass unit masonry on full bed joints and with head joints completely filled; lay units plumb and level, with mortar joints of uniform thickness.

Do not use steel tools to tap units into position, and do not allow glass masonry units to come into contact with metal framing or reinforcing.

3.2.08 Anchoring Masonry. Structural framing anchorage; anchor masonry to structural framework at points of adjacency, and as follows.

Maintain open space of 1 inch (2.54 cm) or more between face of framing member and masonry elements.

Fasten anchors to structure and embed in mortar joints, at 16 inches (40.64 cm) o.c. as masonry is laid.

3.2.09 Installing Reinforced Unit Masonry. Clean reinforcement bars of loose rust. Do not use bars which have rusted excessively or which have bends or kinks not shown on drawings.

Secure reinforcement accurately at locations indicated and to avoid displacement; minimum spacing between bars or to masonry surfaces shall be bar diameter or 1/4 inch (6.4 mm) for fine grout and 1/2 inch (1.27 cm) for coarse gout, whichever is greater.

Provide lapped splices of minimum size indicated or permitted by governing code at locations shown; other methods or locations must be approved by the Engineer.

Construct formwork where required for temporary support of reinforced masonry, bracing as required to maintain proper shape during placement and curing of grout and adequately tight to avoid grout leakage.

3.2.10 Low-Lift Grouting. In hollow unit masonry construction, limit low-lift grouting to maximum wall height of 5 feet (1.52 m) per lift. Vertical cores to be grouted shall have minimum clear dimension between sides of the core of 2 inches (5.08 cm) and clear area of 8 square inch (51.61 cm^2).

In double and multiple wythe masonry construction to be low-lift grouted, limit the height of the outer wythe to 18 inches (45.72 cm) before grouting, and the height of the inner wythe to 8 inches (20.32 cm) before grouting.

Collar joints to be grouted shall have minimum clear dimension of ¾ inch (1.9 cm) plus the width required for reinforcing bars in the joint. Where collar joint exceeds 4 inch (10.16 cm) width, embed masonry units in grout so that ¾ inch (1.9 cm) of grout surrounds sides and ends of each unit. Do not embed units or pieces of units, which are less than 10 cubic inches (163.87 cm^3).

Remove misplaced grout immediately and clean affected areas.

3.2.11 High-Lift Grouting. Grout hollow unit masonry in accordance with this section when erected to height in excess of 5 feet (2.52 m) before grouting. Vertical cores to be grouted shall have minimum clear dimension of 3 inches (7.62 cm) and clear are of 10 square inches (64.52. cm^2)

Grout collar joints in double and multiple wythe masonry when erected to height in excess of 8 inches (20.32 cm) before grouting in accordance with this section. Collar joints shall have minimum clear dimension of 2 inches (5.08 cm) plus diameter of horizontal reinforcing bars in joint.

In double or multiple wythe masonry, tie wythe together with metal ties anchored in mortar bed joints and spaced not more than 24 inch (60.96 cm) on center horizontally and 18 inches (45.72 cm) on center vertically, or use joint reinforcement in alternate courses. Where stacked bond and metal ties are used, reduce horizontal and vertical spacing to 12 inch (30.48 cm).

Provide cleanout openings at 12 square inch minimum are opposite each vertical bar at bottom course or in foundation wall.

Clean core and collar joints of mortar droppings and foreign material, position reinforcement, and close cleanout openings before grouting starts.

Place vertical barriers consisting of masonry units and mortar in bond beam type hollow units and in collar joints to be grouted at 30 feet (9.15 m) maximum to limit horizontal flow of grout.

Pour grout in 5 feet (1.52 m) lifts maximum allowing minimum of 30 minimum and maximum 1 hour before pour before plasticity is lost. Reconsolidation may occur as next lift is poured.

Do not erect masonry to a height more than 80 times, minimum clear grout space before grouting with a maximum of 30 feet (9.14 cm) unless otherwise acceptable.

Do not use high-lift grouting method until masonry units have been in place 3 days minimum, unless permitted.

Do not permit water or foreign material to fall in grout space while grout is being placed and curing.

Remove misplaced grout immediately and clean affected areas.

3.2.12 Installing Concealed Masonry Flashing. Whether or not specifically indicated, install flashing at all conditions such as lintel and shelf angles, where the downward flow of any water within the masonry will be interrupted, so that such water will be diverted to the exterior. Extend flashings full width at such obstructions and at least 4 inches (10.16 cm) into adjoining masonry, or turn up to form watertight pan at non-masonry construction. Remove or cover protrusions or sharp edges on substrates which could puncture flashings. Place flashings on sloped mortar bed; seal lapped ends and penetrations of flashing before covering with mortar.

Extend metal flashings through exterior face of masonry and turn down to form drip.

Bring through-wall flashings completely through inner wythe and turn up where concealed by other construction; otherwise stop not more than 1/2 inch (1.27 cm) from inner face. Drop flashing at least 4 inches (10.16 cm) before bringing through outer wythe.

Turn up ends of flashing at least 2 inches (5.08 cm) at heads and sills to form a pan, and seal joints.

Seal all joints in flashing to assure watertight integrity. Seal deformed metal flashing at ends by lapping at least 2 inches (5.08 cm) and interlocking deformations. Install sealant at lapped edge. Lap end joints of flexible flashings at least 4 inches(10.16 cm); seal in accordance with manufacturer's instructions.

Provide weep holes in head joints of the first course of masonry immediately above concealed flashings. Space at intervals of 24 inches (60.96 cm) on center.

3.2.13 Installing Stone Units. Install all limestone units in compliance with Indiana Limestone Institute of America requirements and guidelines.

3.2.14 Masonry Trim Installation. For precast concrete and masonry combination, provide copings of length indicated, but not exceeding 5 feet (1.52 m).

Set copings in full beds of mortar 1/2 inch (1.27 cm) thick with no. 3 stainless steel rod embedded in mortar and discontinuous at joints, key in underside of opening filled solid with mortar, and bed joint tooled on roof side. Keep face of units clean and free of mortar. Provide 3/8 inch (9.5 mm) wide vertical joints, filled with 3/8 inch (9.5 mm) thick compressible joint filler compressed firmly in joint. Die cut filler to size so as to provide a recess along edges of joint 3/8 inch (9.5 mm) deep for sealing. Sealing is specified in Master Specification Section 07600, Caulking and Sealers. Rake out recess and keep completely free of mortar.

Set sills in full bed of mortar, unless otherwise specified. Set lugged sills with ends only embedded in mortar and balance of joint left open until finally pointed.

After setting, thoroughly dampen and point mortar joints flush. Point pen joints under lugged sills to a minimum depth of 1 inch (2.54 cm).

Form weep holes by omitting head joint, at a height of 2 5/8 inch (6.67 cm).

Reglets and other accessories shall be installed to receive flashing where indicated.

3.2.15 Repairing Masonry. Carefully remove areas of damaged masonry and replace with matching, undamaged units using mortar which matches original work.

During pointing remove mortar with visible holes or mortar which cannot be compacted properly because of hidden voids, and replace with fresh mortar, filling each joint completely and tooling to match adjacent work.

3.2.16 Protection. Cover tops of incomplete masonry elements with waterproof sheet material at end of each work day and when masonry work is not under way.

Secure weather protection in place with weights or by use of temporary fasteners.

Immediately remove mortar, soil, and other such materials from exposed masonry faces to prevent staining.

Prevent splashing and soiling of masonry near ground level by spreading sheet material to cover soil or masonry faces.

Protect horizontal masonry elements from mortar droppings.

Do not apply uniform floor or roof loads for at least 12 hours, or concentrated loads for at least 3 days, after completion of masonry elements.

3.2.17 Cleaning. Protect Limestone with clear sealant prior to cleaning of masonry.

Dry brush concrete masonry at the end of each day’s work and after final pointing. Clean masonry after mortar is thoroughly set and cured. Remove mortar spots and repair cracks. Cut out defective joints and repoint with mortar.

Scrape off adhered mortar particles by hand, using non-metallic tools.

Scrub precast concrete trim with soap and water, using fiber brushes, and rise with clean water from a hose.

Test cleaning methods on half of sample panel, leaving other half in original state.

Protect adjacent surfaces from cleaner with appropriate coating or polyethylene sheet.

Before applying cleaning solution, saturate masonry surfaces with water; rinse thoroughly immediately after cleaning.

Use bucket and brush hand-cleaning method described in BIA Technical Notes No. 20 Revised for brick masonry, using acidic cleaner applied in accordance with manufacturer's instructions.

Comply with directions of concrete unit masonry manufacturer and NCMA Tek Bulletin No. 45 for cleaning CMU.

3.2.18 Burnished Block Sealer: Apply field coat of Burnished Block sealer to clean and dry Burnished Block walls.

End of Section

SECTION 04811

CAVITY WALLS

PART 1 - GENERAL

1.1 SCOPE. This section includes double wythe cavity wall construction made with brick, structural clay tile, or decorative and prefaced concrete masonry units, or any combination of such units in which facing and backing are completely separated, except for the ties, which serve as bonding.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the following publications and standards.

(American Society for Testing and Materials) A153 – Zinc Coating (Hot-Dip) and Steel Hardware.

ASTM A615/A615M – Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM A653/A653M – Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A580/A580M – Stainless Steel Wire.

ASTM A666 – Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM A641/A641M – Zinc-Coated (Galvanized) Carbon Steel Wire.

ASTM A951 – Masonry Joint Reinforcement.

ASTM B370 – Copper Sheet and Strip for Building Construction.

ASTM C34 – Structural Clay Load-Bearing Wall Tile.

ASTM C55 – Concrete Brick.

ASTM C56 – Structural Clay Non-Load Bearing Tile.

ASTM C62 – Building Brick (Solid Masonry Units Made From Clay or Shale).

ASTM C67 – Test Methods for Sampling and Testing Brick and Structural Clay Tile.

ASTM C73 – Calcium Silicate Brick (Sand-Lime Brick).

ASTM C90 – Load-Bearing Concrete Masonry Units.

ASTM C126 – Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units.

ASTM C129 – Non-Load-Bearing Concrete Masonry Units.

ASTM C140 – Testing Methods of Sampling and Testing Concrete Masonry Units and Related Units.

ASTM C212 – Structural Clay Facing Tile.

ASTM C216 – Facing Brick (Solid Masonry Units Made From Clay or Shale).

ASTM C315 – Clay Flue Linings.

ASTM C530 – Structural Clay Non-Load-Bearing Screen Tile.

ASTM C652 – Hollow Brick (Hollow Masonry Units Made From Clay or Shale).

ASTM C744 – Prefaced Concrete and Calcium Silicate Masonry Units.

ASTM D226 – Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

Masonry Standards Joint Committee (MSJC) Code/American Concrete Institute (ACI) 530/American Society of Civil Engineers (ASCE) 5/The Masonry Society (TMS) 402 – Building Code Requirements for Masonry Structures.

MSJC Specification/ACI 530.1/ASCE 6/TMS 602 – Specifications for Masonry Structures.

1.3 QUALITY ASSURANCE. Perform work in accordance with MSJC code and specification.

1.3.01 Contractor's Qualifications. Employ an installer with a minimum of 5 years documented experience installing cavity walls. Submit evidence of experience, including a list of projects for which the work was similar in scope and quality to that specified.

1.3.02 Testing. Testing shall comply with testing provisions defined in MSJC.

Testing agency shall have a minimum of 5 years experience in performing concrete and masonry tests of type specified in this section and capable of performing testing in accordance with ASTM C140.

1.3.03 Source Quality Control. Perform quality control and inspection procedures to comply with applicable sections of MSJC specifications.

Conduct water absorption test on units in accordance with MSJC code.

1.3.04 Tolerances. Maximum variation from alignment of columns and pilasters shall 1/4 inch (6.4 mm).

Maximum variation from unit to adjacent unit shall be 1/16 inch (1.6 mm).

Maximum variation from plane of wall shall be 1/4 inch (6.4 mm) in 10 feet (3.05 m) and 1/2 inch (1.27 cm) in 20 feet (6.10 mm).

Maximum variation from plumb shall be 1/4 inch (6.4 mm) per story non-cumulative with a maximum of 1/2 inch (1.27 cm) in two stories or more.

Maximum variation from level coursing shall be 1/8 inch (3.2 mm) in 3 feet (91.44 cm), 1/4 inch (6.4 mm) in 10 feet (3.05 m), and 1/2 inch (1.27 cm) in 30 feet.

Maximum variation of joint thickness shall be 1/8 inch (3.2 mm) in 3 feet (91.44 cm).

Maximum variation from cross sectional thickness of walls shall be 1/4 inch (6.4 mm).

Maximum variation for steel reinforcement shall be plus or minus 1/2 inch (1.27 cm) when distance from centerline of steel to opposite face of masonry is 8 inches (20.32 cm) or less; plus or minus 1 inch (2.54 cm) when the distance is between 8 and 24 inches (20.32 and 60.96 cm); plus or minus 1 1/4 inch (3.18 cm) when the distance is greater than 24 inches (60.96 cm); and plus or minus 2 inches (5.08 cm) from the location along the face of the wall.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings prepared by or under the supervision of a professional engineer experienced in cavity walls. Shop drawings shall include unit shapes (elevations and sections), dimensions, finishes, reinforcement, joint, and connection details. Also include location, dimensional tolerances, details of anchorage devices that are embedded in or attached to wall structures, and any other items cast into wall panels. Show also the relationship to adjacent cavity wall components.

Submit data for decorative prefaced masonry units and fabricated wire reinforcement, anchors, ties, flashing, joint reinforcement, joint materials, and insulation.

1.4.02 Certifications. Manufacturer shall certify that products meet or exceed specified requirements.

1.4.0.3 Samples. Submit four samples each of decorative concrete masonry units, face brick, prefaced concrete masonry units and two samples of other units and accessories. Units shall illustrate color, texture and extremes of color range.

1.4.04 Mock-Up. Prior to installation, construct a cavity masonry wall into a panel sized 8 feet (2.44 m) long by 6 feet (1.83 m) high, which includes masonry, mortar and accessories. Do not proceed with installation of units until the mock-up unit has been approved. Approved mockup construction shall represent the standard of workmanship.

1.5 DELIVERY, STORAGE, AND HANDLING. Transport and store units in original packaging consistent with manufacture’s handling instructions in order to avoid damage. Support units during shipment on shock-absorbing material.

Store and protect units to prevent contact with soil, staining, and physical damage and do not store units directly on ground.

Store units, unless otherwise specified, on non-staining, resilient supports located in same position as when transported on firm, level, and smooth surfaces to prevent cracking, distortion, warping or other physical damage.

Place stored units so that identification marks are discernible and product can be inspected.

1.6 WARRANTY. Warrant the work for 5 years against defects in materials and workmanship resulting in warping, spalling or disintegration, and against other defects affecting the strength, durability or appearance of the work.

During this period, restore defective work to the standard of the contract documents, including all materials, labor, refinishing and other costs incidental to the work. Inspect the work within 24 hours after receipt of notice from the Engineer and immediately repair leaks in the work. Restore work found to be defective, as defined in the Contract documents, within 10 days after receipt of notice from Engineer.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Hot and cold weather requirements shall comply with MSJC Specification.

2.2 ACCEPTABLE MANUFACTURERS. Provide materials from Amcor Inc.; Best Block & Products, Inc.; Oldcastle Architectural Products; Shiely Masonry Products; Solite Corp.; Trenwyth Industries, Inc.; or approved equal. Local suppliers that carry some of these products include:

> American Brick Company, 27303 W. Eight Mile, Detroit, MI 48240, (313) 538-6636, (800) 248-8280
>
> Grace Masonry Products, 7221 W. Parkland Ct., Milwaukee, WI 53223, (800) 558-7066
>
> Master Builders, Inc., 23700 Chagrin Blvd., Cleveland, OH, (800) MBT-9990

2.3 MATERIALS.

2.3.01 Components. Face brick shall meet ASTM C216.

Building brick shall meet ASTM C62.

Hollow facing and building brick shall meet ASTM C652.

Sand-lime face brick shall meet ASTM C73.

Ceramic glazed face brick shall meet ASTM C126.

Clay load-bearing wall tile shall meet ASTM C34

Clay non-load-bearing tile shall meet ASTM C56.

Clay non-load-bearing screen tile shall meet ASTM C530

Clay facing tile units shall meet ASTM C212.

Hollow load-bearing concrete masonry units (CMU) shall be ASTM C90, Type I – Moisture Controlled.

Solid load-bearing concrete masonry units (CMU) shall be ASTM C90, Type I – Moisture Controlled.

Hollow or solid non-load-bearing concrete masonry units (CMU) shall be ASTM C129, Type I – Moisture Controlled.

Decorative concrete masonry units shall be ASTM C90, Type I – Moisture Controlled.

Prefaced concrete masonry units shall be ASTM C744 with resinous surfacing on ASTM C90 or ASTM C129 masonry units, Grade N, Type I – Moisture Controlled. Provide single or double faced units. Provide coved base units at first course above finished floor.

Concrete brick units shall be ASTM C55, Grade N, Type I – Moisture Controlled.

2.3.02 Accessories. Multiple wythe joint reinforcement shall be truss or ladder type; with moisture drip; adjustable type, hot dip galvanized to ASTM A641 Class 3 after fabrication, or cold drawn steel wire conforming to ASTM A951.

Reinforcing steel shall be ASTM A615 type, specified in Master Specification Section 03200, Concrete Reinforcement.

Wall ties shall be formed steel wire, thick, adjustable, eye and pintle type, hot dip galvanized to ASTM A153.

Dovetail anchors shall be bent steel strap, galvanized to ASTM A153 finish.

Anchor bolts shall be headed, J-shaped or L-shaped.

Cooper shall be ASTM B370, cold rolled soft temper; natural finish.

Galvanized steel shall be ASTM A653 G90 finish core steel.

Stainless steel shall be ASTM A666, Type 304, soft temper; smooth finish.

Lap sealant shall be acrylic type as specified in Master Specification Section 07600, Caulking and Sealers.

Preformed control joints shall be rubber, neoprene or polyvinyl chloride material.

Provide with corner and tee accessories, cement fused joints.

Joint filler shall be closed cell polyvinyl chloride, polyethylene, polyurethane or rubber oversized 50 percent to joint width; self-expanding.

Building paper shall be ASTM D226, No. 15 asphalt saturated felt.

Cavity vents shall be molded polyvinyl chloride grilles, insect resistant.

Weep holes shall be formed using rope or leaving joint ungrouted. Tubes shall not be used.

Cleaning solution shall be non-acidic, not harmful to masonry work or adjacent materials.

Precast concrete lintels shall be as specified.

PART 3 – EXECUTION

3.1 INSPECTION. Verify that field conditions are acceptable and are ready to receive work. Verify items provided by other sections of work are properly sized and located. Verify that built-in items are in proper location, and ready for roughing into masonry work.

3.2 PREPARATION. Direct and coordinate placement of metal anchors to be supplied by concrete trade.

Deliver glazed prefaced units to project site in such quantities and at such times to assure continuity of installation.

Provide temporary bracing during installation of masonry work. Maintain in place until building structure provides permanent support.

3.3 INSTALLATION. Establish lines, levels, and coursing indicated. Protect from displacement.

Maintain masonry courses to uniform dimension. Form bed and head joints of uniform thickness.

3.3.01 Coursing of Concrete Masonry Units. Bond shall be running. Coursing shall be one unit and one mortar joint to equal 8 inches (20.32 cm). Mortar joints shall be concave.

3.3.02 Coursing of Brick Units. Bond shall be running. Coursing shall be three units and three mortar joints to equal 8 inches (20.32 cm). Mortar joints shall be concave.

3.3.03 Coursing of Prefinished Decorative Clay Tile Units. Bond shall be running. Coursing shall be one unit and one mortar joint to equal 8 inches (20.32 cm). Mortar joints shall be concave.

3.3.04 Placing and Bonding. Lay solid masonry units in full bed of mortar, with full head joints. Lay hollow masonry units with face shell bedding on head and bed joints. Buttering corners of joints or excessive furrowing of mortar joints are not permitted. Remove excess mortar as work progresses.

Interlock intersections and external corners.

Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove mortar and make adjustment and replace with new mortar. Perform job site cutting of masonry units with proper tools to provide straight, clean, unchipped edges. Prevent broken masonry unit corners or edges. Cut mortar joints flush where wall tile is scheduled, cement parging is required, resilient base is scheduled, cavity insulation vapor barrier adhesive is applied, or bitumen dampproofing is applied. Isolate masonry from vertical structural framing members with a movement joint. Isolate top of masonry from horizontal structural framing members and slabs or decks with compressible joint filler.

Lay clay tile flue linings vertical, bedded in mortar, immediately adjacent to concrete block clay tile units.

3.3.05 Weeps and Vents. Provide weeps and vents in outer wythe at 24 inches (60.96 cm) o.c. horizontally above through-wall flashing and at bottom of walls.

Do not permit mortar to drop or accumulate into cavity air space or to plug weeps. Build inner wythe ahead of outer wythe to receive cavity insulation air/vapor barrier adhesive.

3.3.06 Joint Reinforcement and Anchorage. Install horizontal joint reinforcement 16 inches (40.64 cm) o.c. Place masonry joint reinforcement in first and second horizontal joints above and below openings. Extend minimum 16 inches (40.94 cm) each side of opening. Place joint reinforcement continuous in first and second joint below top of walls. Lap joint reinforcement ends minimum 6 inches (15.24 cm). Embed anchorages in every second block or sixth brick joint. Reinforce joint corners and intersections with strap anchors 16 inches (40.64 cm).

3.3.07 Masonry Flashings. Extend flashings horizontally through outer wythe at foundation walls and at bottom of walls, turn down on outside face to form a drip. Turn flashing up minimum 8 inches (20.32 cm) and bed into mortar joint of masonry backing. Lap end joints minimum 6 inches (15.24 cm) and seal watertight. Turn flashing, fold, and seal at corners, bends, and interruptions.

3.3.08 Lintels. Install precast concrete lintels over openings. Install reinforced unit masonry lintels over openings where steel or precast concrete lintels are not scheduled. Do not splice reinforcing bars. Support and secure reinforcing bars from displacement. Place and consolidate grout fill without displacing reinforcing. Allow masonry lintels to attain specified strength before removing temporary supports.

3.3.09 Grouted Components. Reinforce bond beam and pilaster as shown in drawings. Lap splices bar diameters required by code. Support and secure reinforcing bars from displacement. Place and consolidate grout fill without displacing reinforcing. At bearing locations, fill masonry cores with grout for a minimum 12 inches (30.48 cm) either side of opening.

Do not continue horizontal joint reinforcement through control and expansion joints.

Install preformed control joint device in continuous lengths. Seal butt and corner joints.

Form expansion joint by omitting mortar and cutting unit to form an open space.

3.3.10 Built-in Work. As work progresses, install built-in metal door and glazed frames, fabricated metal frames, window frames, wood nailing strips, anchor bolts, plates, and other items to be built-in the work and furnished by other sections. Install built-in items plumb and level. Bed anchors of metal door and glazed frames in adjacent mortar joints. Fill frame voids solid with grout or mortar. Fill adjacent masonry cores with grout minimum 12 inches (30.48 cm) from framed openings. Do not build in materials subject to deterioration.

3.3.11 Cutting and Fitting. Cut and fit for chases, pipes, conduit, sleeves, electric ground. Coordinate with other sections of work to provide correct size, shape, and location. Obtain approval prior to cutting or fitting masonry work not indicated or where appearance or strength of masonry work may be impaired.

3.3.12 Cleaning. Remove excess mortar and mortar smears and replace defective mortar to match adjacent work. Clean soiled surface with cleaning solution, and use non-metallic tools in cleaning operations.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. Test each type of brick and clay tile unit in accordance with ASTM C67, using 5 random units for each 50,000 units installed.

Test each type of concrete masonry units in accordance with ASTM C140.

End of Section

SECTION 04813

MASONRY VENEER

PART 1 – GENERAL

1.1 SCOPE**.**

Section includes face brick, concrete masonry units, pre-faced glazed unit masonry, reinforcement, anchorage, and accessories.

1.2 GENERAL.

1.2.01 Coordination. Convene minimum one week prior to commencing Work of this section for a pre-installation meeting.

1.2.02 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

ASTM (American Society for Testing and Materials) A153/A153M – Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A580/A580M – Stainless Steel Wire.

ASTM A641/A641M – Zinc Coated (Galvanized) Carbon Steel Wire.

ASTM A653/A653M – Steel Sheet, Zinc Coated, (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A666 – Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM A951 – Masonry Joint Reinforcement.

ASTM B370 – Copper Sheet and Strip for Building Construction.

ASTM C55 – Concrete Brick.

ASTM C67 – Test Methods of Sampling and Testing Brick and Structural Clay Tile.

ASTM C73 – Calcium Silicate Face Brick (Sand-Lime Brick).

ASTM C90 – Load-Bearing Concrete Masonry Units.

ASTM C140 – Sampling and Testing Concrete Masonry Units, and Related Units.

ASTM C126 – Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units.

ASTM C129 – Non-Load-Bearing Concrete Masonry Units.

ASTM C216 – Facing Brick (Solid Masonry Units Made From Clay or Shale).

ASTM C270 – Mortar for Unit Masonry.

ASTM C476 – Grout for Masonry.

ASTM C652 – Hollow Brick (Hollow Masonry Units Made From Clay or Shale).

ASTM C744 – Pre-faced Concrete and Calcium Silicate Masonry Units.

ASTM D226 – Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM E119 – Test Methods for Fire Tests of Building Construction and Materials.

MSJC (Masonry Standards Joint Committee) Code – ACI (American Concrete Institute) 530/ASCE (American Society of Civil Engineers) 5/TMS (The Masonry Society) 402 – Building Code Requirements for Masonry Structures.

MSJC Specification – ACI 530.1./ASCE (American Society of Civil Engineers) 6/TMS 602 – Specifications For Masonry Structures.

1.3 QUALITY ASSURANCE. Perform Work in accordance with MSJC Code and MSJC Specification. Comply with referenced unit masonry standard for cold-weather construction. Do not lay masonry units that are wet or frozen. Remove masonry damaged by freezing conditions.

1.3.01 Testing Laboratory Qualifications. To qualify for employment in performing tests and inspection specified in this Section, an independent testing laboratory must demonstrate to Engineer’s satisfaction, based on evaluation of submitted criteria conforming to ASTM C1093, that it has the experience and capability to conduct the testing indicated without delaying the progress of the Work.

1.3.02 Installer Qualifications. Company specializing in performing Work of this section with minimum five years documented experience.

1.3.03 Fire Performance Characteristics. Where indicated, provide materials and construction identical to those of assemblies whose fire resistance has been determined per ASTM E119 by a testing and inspecting organization, by equivalent concrete masonry thickness, or by another means acceptable to authorities having jurisdiction.

1.3.04 Single- Source Responsibility for Masonry Units. Obtain exposed masonry units of uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from one manufacturer for each different product required for each continuous surface or visually related surfaces.

1.3.05 Single-Source Responsibility for Mortar Materials. Obtain mortar ingredients of uniform quality, including color for exposed masonry, from one manufacturer for each cementitious component and from one source and producer for each aggregate.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit data for decorative pre-faced masonry units, anchors, ties, flashings, and joint materials. submit certifying that products meet or exceed specified requirements.

Submit cold- and hot-weather construction procedures that show compliance with unit masonry standards.

1.4.02 Certifications. Submit data for firms and persons specified in “Quality Assurance” Article demonstrating their capabilities and experience. Include list of completed projects.

1.4.03 Samples. Submit two samples each of miscellaneous units, decorative concrete masonry units, face brick, pre-faced concrete masonry units, faced brick and/or pre-faced concrete masonry units, to illustrate color, texture and/or extremes of color ranges.

Colored masonry mortar samples for each color are required showing the full range of colors expected in the finished construction. Label samples to indicate type and amount of colorant used.

Supply 20 each size, color, and type of glazed pre-faced units for repair stock.

1.4.04 Test Reports. Material test reports are required from a qualified independent testing laboratory employed and paid by the Contractor indicating and interpreting test results relative to compliance of mortar complying with property requirements of ASTM C270. Similar reports are required for grout mixes, including description of type, proportions of grout ingredients, and masonry units.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver masonry materials to project in undamaged condition.

Store masonry units off the ground, under cover, and in a dry location to prevent their deterioration or damage due to moisture, temperature changes, contaminants, corrosion, and other causes. If units become wet, do not place until units are in an air-dried condition.

Store cementitious materials off the ground, under cover, and in dry location.

Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

Store masonry accessories including metal items to prevent corrosion and accumulation of dirt and oil.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS.

Best Block Co.

Oldcastle Architectural Products

Trenwyth Industries, Inc.

or Approved Equal.

2.2 COMPONENTS.

2.2.01 General. Comply with the following requirements applicable to each form of brick required. Provide special molded shapes where indicated and as follows:

For applications requiring brick of form, color, texture, and size on exposed surfaces that cannot be produced by sawing standard brick sizes.

For applications where stretcher units cannot accommodate special conditions including those at corners, movement joints, bond beams, sashes, and lintels.

Provide units without cores or frogs and with all exposed surfaces finished for ends of sills, caps, and similar applications that expose brick surfaces that otherwise would be concealed from view.

2.2.02 Hollow Brick. Meet requirements of ASTM C652.

Provide units of grade and minimum average net area compressive strength of Grade SW and 3000 psi.

Type HBX (for general use in exposed masonry requiring minimum variations in size and color ranges).

Provide bricks manufactured to the tolerances specified in ASTM C652.

2.2.03 Face Brick. ASTM C216, Type FBS, Grade MW/SW/NW; and color as selected by the Engineer.

2.2.04 Sand-Lime Face Brick. Meet ASTM C73, Grade SW/MW.

2.2.05 Ceramic Glazed Face Brick. Meet ASTM C126.

2.2.06 Hollow Load - Bearing Concrete Masonry Units (CMU). Meet ASTM C90, Type I – Moisture Controlled; normal weight.

2.2.07 Solid Load – Bearing Concrete Masonry Units (CMU). Meet ASTM C90, Type I – Moisture Controlled; normal weight.

2.2.08 Hollow Non-Load – Bearing Concrete Masonry Units (CMU). Meet ASTM C129, Type I – Moisture Controlled; normal weight.

2.2.09 Decorative Concrete Masonry Units. Meet ASTM C90, Type I – Moisture Controlled; color as selected.

2.2.10 Concrete Brick Units. Meet ASTM C55, Grade, Type I – Moisture Controlled; normal weight.

2.2.11 Joint Reinforcement. Truss or Ladder type; steel wire hot dip galvanized to ASTM A641 Class after fabrication, or cold drawn steel wire conforming to ASTM A951, stainless steel wire conforming to ASTM A951, or stainless steel conforming to ASTM A580 Type 304.

Provide joint reinforcement complying with requirements of referenced unit masonry standard.

Welded-wire units shall be prefabricated with deformed continuous side rods and shall have plain cross rods that run into straight lengths of not less than 10 feet (3.05 m), with prefabricated corner and tee units.

Subject to compliance with requirements, provide joint reinforcement by:

AA Wire Products Co.

Dur-O-Wal, Inc.

Heckman Building Products, Inc.

Or Approved Equal.

2.2.12 Strap Anchors. Bent steel shape, size as indicated, hot dip galvanized to ASTM A153 finish.

2.2.13 Wall Ties. Corrugated formed sheet metal, hot dip galvanized to ASTM A153 finish.

2.2.14 Wall Ties. Formed steel wire, adjustable, eye and pintle type, hot dip galvanized to ASTM A153 finish.

2.2.15 Dovetail Anchors. Bent steel strap, galvanized to ASTM A153 finish.

2.2.16 Nailing Strips. Softwood, preservative treated for moisture resistance, dovetail shape, sized to masonry joints.

2.2.17 Weeps. Preformed plastic tubes, cotton wick filled or vents with sloping louvers with cotton rope.

2.2.18 Cavity Vents. Molded polyvinyl chloride grilles aluminum insect resistant.

2.2.19 Preformed Control Joints. Rubber, Neoprene or Polyvinyl chloride material. Provide with corner and tee accessories, heat or cement fused joints.

2.2.20 Joint Filler. Closed cell polyvinyl chloride, polyethylene, polyurethane or rubber oversized 50 percent to joint width; and self-expanding.

2.2.21 Building Paper. Meet ASTM D226, No. 15 or 30 asphalt saturated felt.

2.3 MISCELLANEOUS ANCHORS.

2.3.01 Anchor Bolts. Steel bolts shall comply with A 307, Grade A. Hex nuts shall comply with ASTM A563, where indicated. Provide flat washers. Hot-dip galvanized materials shall comply with ASTM A153, Class C. Utilize proper diameter and length as necessary. Nonheaded bolts shall be bent in manner indicated. Headed bolts shall be I – shaped or L – shaped.

2.4 EMBEDDED FLASHING MATERIALS.

2.4.01 Laminated Flashing. Manufacturer’s standard laminated flashing.

2.4.02 Copper-Fabric Laminate. Copper sheets of 5 oz weight per sq. ft. (1526 grams per square meter) shall be bonded with asphalt between 2 layers of glass fiber cloth. Use where flashing is fully concealed in masonry.

2.4.03 Adhesive for Flashing. Provide type recommended by manufacturer for proposed flashing material to be used as indicated.

2.4.04 Products. Subject to compliance with requirements. Products for copper fabric laminate flashing include:

“Copper Fabric,” Afco Products Inc.

“Type FCC-Fabric Covered Copper,” Phoenix Building Products.

“Copper Fabric Flashing,” Sandell Manufacturing Co., Inc.

“York Copper Fabric Flashing,” York Manufacturing, Inc.

or Approved Equal.

2.5 MISCELLANEOUS MASONRY ACCESSORIES.

2.5.01 Bond Breaker Strips. Asphalt-saturated organic roofing felt complying with ASTM D226, Type I (No. 15 asphalt felt).

2.5.02 Weep Holes. Vinyl Weep Hole/Vent shall be provided by one-piece offset T-shaped units formed to fit in a vertical mortar joint by injection molding of flexible wings to seal against ends consisting of a louvered vertical leg with flexible wings to seal against ends of masonry units, and top flap; in color approved by Engineer to match that of mortar.

Subject to compliance with requirements, provide “Williams-Goodco Brick Vent” by Williams Products, Inc. or equal.

2.6 MASONRY CLEANERS. Proprietary Acidic Cleaner of manufacturer’s recommended standard strength material shall be used. The general purpose of cleaner is designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry surfaces.

For masonry not subject to metallic oxidation stains, use formulation consisting of a concentrated blend of surface-acting acids, chelates, and wetting agents by “Sure Klean Vana Trol,” ProSoCo, Inc. or approved equal.

For additional guidelines consult “Masonry Cleaning, Restoration, and Finishing”.

2.7 MORTAR AND GROUT MIXES.

2.7.01 General Do not add admixtures including coloring pigments, air-entraining agents, accelerators, retarders, water repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

Do not add calcium chloride to mortar or grout.

2.7.02 Mortar for Unit Masonry. Comply with ASTM C270, Property Specification for job-mixed mortar and ASTM C1142 for ready-mixed mortar.

Limit cementitious materials in mortar to Portland Cement and/or lime.

Use Type N for exterior, reinforced masonry, above-grade load-bearing and non-load-bearing walls and parapet walls; for interior load-bearing walls; for interior non-load-bearing and non-load-bearing partitions, reinforced masonry and for other applications where another type is not indicated.

2.7.03 Colored Pigmented Mortar. Select, mix and proportion pigments with other ingredients to produce color required to match Engineer’s sample.

2.7.04 Grout for Unit Masonry. Comply with ASTM C476 and referenced “Unit Masonry” standard and Master Specification Section 04065, Masonry Mortar and Grout.

PART 3 – EXECUTION

3.1 EXAMINATION. Verify that field conditions are acceptable and are ready to receive work.

Verify items provided by other sections of work are properly sized and located.

Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other specific conditions, and other conditions affecting performance of unit masonry.

For the record, prepare written report, endorsed by Contractor listing conditions detrimental to performance of unit masonry.

Examine rough-in and built-in construction to verify actual locations of piping connections prior to installation.

Do not proceed until unsatisfactory conditions have been corrected.

3.2 PREPARATION. Direct and coordinate placement of metal anchors supplied to other sections.

3.3 INSTALLATION. Comply with referenced unit masonry standard and other requirements indicated applicable to each type of installation included in the Work.

3.3.01 Thickness. Build cavity and composite walls and other masonry construction to the full thickness shown. Build single-wythe walls to the actual thickness of the masonry units, using units of nominal thickness indicated.

Build chases and recesses as shown or required to accommodate items specified in this and other Master Specification Sections. Provide not less than 8 inches (20.32 cm) of masonry between chase or recess and jamb of openings and between adjacent chases and recesses.

Leave openings for equipment to be installed before completion of masonry. After installation of equipment, complete masonry to match construction immediately adjacent to the opening.

Cut masonry units with motor-driven saws to provide clean, sharp, unchipped edges. Cut units as required to provide continuous pattern and to fit adjoining construction. Use full-size units without cutting where possible.

3.4 CONSTRUCTION TOLERANCES. Comply with construction tolerances of referenced unit masonry standard. Establish lines, levels, and coursing indicated, and maintain masonry courses to uniform dimension. Form bed and head joints of uniform thickness.

3.5 PLACING AND BONDING. Lay solid masonry units in full bed of mortar, with full head joints. Lay hollow masonry units with face shell bedding on head and bed joints. Buttering corners of joints or excessive furrowing of mortar joints are not permitted. Remove excess mortar as Work progresses.
Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate location of openings, movement-type joints, returns, and offsets. Avoid the use of less-than-half-size units at corners, jambs, and where possible at other locations.

Lay out walls to comply with specified construction tolerances, with courses accurately spaced and coordinated with other construction.

Interlock intersections and external corners. Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove mortar and replace.

Perform job site cutting of masonry units with proper tools to provide straight, clean, unchipped edges. Prevent broken masonry unit corners or edges.

Isolate top of masonry from horizontal structural compressible joint filler.

3.6 BONDING PATTERN FOR EXPOSED MASONRY. Lay exposed masonry in the following bond pattern. Do not use units with less that nominal 4-inch (10.16 cm) horizontal face dimensions at corners or jambs.

Lay one-half running bond with vertical joint in each course centered on units in courses above and below for brick with triple score concrete masonry units. One-quarter running bond for brick with single score.

Lay concealed masonry with all units in a wythe in running bond or bonded by lapping not less than 2 inches (5.08 cm). Bond and interlock each course of each wythe at corners. Do not use units with less than nominal 4-inch (10.16 cm) horizontal face dimensions at corners or jambs.

3.6.01 Stopping and Resuming Work. In each course, rack back ½-unit length for one-half running bond or 1/3-unit length for one-third running bond. Do not tooth in units. Clean exposed surfaces of set masonry, than wet clay masonry units lightly (if required), and remove loose masonry units and mortar prior to laying fresh masonry.

3.6.02 Built-In Work. As construction progresses, build-in items specified under this and other Master Specification Sections. Fill in solidly with masonry around built-in items.

Fill space between hollow metal frames and masonry solidly with mortar, unless otherwise indicated.

At exterior frames insert extruded polystyrene board insulation around perimeter of frame in thickness indicated but not less than ¾ inch (1.9 cm) to act as a thermal break between frame and masonry.

Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath in the joint below and rod mortar or grout into core. Fill cores in hollow concrete masonry units with grout 3 courses (24 inches (60.96 cm)) under bearing plates, beams, lintels, posts, and similar items, unless otherwise indicated.

3.7 MORTAR BEDDING AND JOINING. Lay solid masonry units in full bed of mortar, with full head joints. Lay hollow masonry units with face shell bedding on head and bed joints. Buttering corners of joints or excessive furrowing of mortar joints are not permitted. Remove excess mortar as Work progresses.. Fill cores in hollow concrete masonry units with grout 3 courses (24 inches (60.96 cm)) under bearing plates, beams, lintels, posts, and similar items, unless otherwise indicated. Cut joints flush for masonry walls to be concealed or to be covered by other materials, unless otherwise indicated.

3.8 WEEPS AND VENTS. Provide weeps and vents in outer veneer at 24 inches (60.96 cm) on center horizontally above through-wall flashing, above shelf angles and lintels, at bottom of walls.

Form weep holes with products specified in this section. In air spaces insulated cavities cover cavity/air space side of open weep holes with copper or plastic insect screening before placing loose-fill masonry insulation in cavity.

3.9 FLASHING.

3.9.01 General. Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to the downward flow of water in the wall, and where indicated.

Prepare masonry surfaces so that they are smooth and free from projections that could puncture flashing. Place through-wall flashing on sloping bed or mortar and cover with mortar. Seal penetrations in flashing with adhesive sealant or tape as recommended by flashing manufacturer before covering with mortar.

At lintels and shelf angles, extend flashing a minimum of 4 inches (10.16 cm) into masonry at each end. Extend flashing from exterior face of outer wythe of masonry, through the outer wythe, turned up a minimum of 4 inches (10.16 cm), and through the inner wythe to within ½ inches (1.27 cm) of the interior face of the wall in exposed masonry. Where interior surface of inner wythe is concealed by furring, carry flashing completely through the inner wythe and turn up approximately 2 inches (5.08 cm), unless otherwise indicated.

At head and sills, extend flashing as specified above unless otherwise indicated but turn up ends not less than 2 inches (5.08 cm) to form a pan. Cut off flashing flush with face of wall after masonry wall construction is completed.

Extend flashings horizontally through outer wythe at foundation walls, above ledge or shelf angles and lintels, under parapet caps, and at bottom of walls, and turn down outside face to form a dip. Turn flashing up minimum 8 inches (20.32 cm) and bed into mortar joint of masonry seal to concrete or seal to sheathing over wood or steel stud framed backing. Lap end joints minimum 6 inches (15.24 cm) and seal watertight. Turn flashing, fold, and seal at corners, bends, and interruptions.

Also comply with Master Specification Section 07500, Flashing and Trim.

3.10 LINTELS. Install steel lintels where indicated.

Provide masonry lintels where shown and wherever openings of more than 1’0” (30.48 cm) for brick size units and 2’-0” (60.96 cm) for block size units are shown without structural steel or other supporting lintels. Provide precast or formed-in-place masonry lintels. Cure precast lintels before handling and installation. Temporarily support formed-in-place lintels.

For hollow concrete masonry unit walls, use specially formed bond beam units with reinforcement bars placed as indicated and filled with coarse grout.

Provide minimum bearing of 8 inches (20.32 cm) at each jamb, unless otherwise indicated.

3.11 MOVEMENT (CONTROL AND EXPANSION) JOINTS: Install control and expansion joints in unit masonry where indicated. Build in related items as the masonry progresses. Do not form a continuous span through movement joints unless provisions are made to prevent in-plane restraint of wall or partition movement. Do not continue horizontal joint reinforcement through control and expansion joints.

To form control joints in concrete masonry, fit bond breaker strips into hollow contour in ends of block units on one side of control joint. Fill the resultant core with grout and rake joints in exposed faces. Install preformed control joint gaskets designed to fit standard sash block in continuous lengths. Seal butt and corner joints. Install special shapes designed for control joints. Install bond breaker strips at joint. Keep head joints free and clear of mortar or rake joint.

Build in horizontal pressure-relieving joints where indicated; construct joints by either leaving an air space or inserting nonmetallic 50 percent compressible joint filler of width required to permit installation of sealant and backer rod specified in Master Specification Section 07600, Caulking and Sealers. Locate horizontal pressure-relieving joints beneath shelf angles supporting masonry veneer and attached to structure behind masonry veneer.

3.12 CAVITY BEHIND VENEER. Do not permit mortar to drop or accumulate into cavity air space or to plug weeps. Build outer wythe to permit installation of cavity insulation and air/vapor barrier adhesives.

3.13 JOINT REINFORCEMENT AND ANCHORAGE. Install horizontal joint reinforcement 16 inches (40.6 cm) on center. Place masonry joint reinforcement in first and second horizontal joints above and below openings. Extend minimum 16 inches (40.6 cm) each side of opening. Place joint reinforcement continuous in first and second joint below top of walls. Lap joint reinforcement ends minimum 6 inches (15.2 cm).

Embed wall ties in masonry backing to bond veneer for every 2 - 2/3 sq. ft. (0.25 sq m) on center each way around perimeter of within 12 inches (30.5 cm) of openings. Secure wall ties, rod, strap, anchors, to stud framed backing and embed into masonry veneer at maximum 16 inches (40.6 cm) on center vertically and 36 inches (91.4 cm) on center horizontally. Place a maximum 3 inches (7.6 cm) on center each way around perimeter of openings, within 12 inches (30.5 cm) of openings. Reinforce stack bonded unit, joint corners, and intersections with strap anchors 16 inches (40.6 cm) on center.

3.14 FIELD QUALITY CONTROL.

3.14.01 Brick and Clay Tile Units. Test each type in accordance with ASTM C67 at a rate of 5 random units for each 50,000 units installed.

3.14.02 Concrete Masonry Units. Test each type in accordance with ASTM C140.

3.15 REPARING AND POINTING. Remove excess mortar and mortar smears. Replace defective mortar. Match adjacent work.

Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or if units do not match adjoining units. Install new units to match adjoining units and in fresh mortar or grout, pointed to eliminate evidence of replacement.

During the tooling of joints, enlarge any voids or holes, except weep holes, and completely fill with mortar. Point-up all joints including corners, openings, and adjacent construction to provide a neat, uniform appearance, prepared for application of sealants.

3.16 CLEANING. Clean soiled surfaces with cleaning solution. Use non-metallic tools in cleaning operations.

3.16.01 Final Cleaning. After mortar is thoroughly set and cured, clean masonry as follows:

> Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.

Test cleaning methods on sample wall panel; leave ½ panel uncleaned for comparison purposes. Obtain Engineer's approval of sample cleaning before proceeding with cleaning of masonry.

Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering then with liquid strippable masking agent, polyethylene film, or waterproof masking tape.

Wet wall surface with water prior to application of cleaners; remove cleaners promptly by rising thoroughly with clear water.

Clean brick by means of bucket and brush hand-cleaning methods described in BIA "Technical Note No. 20 Revised" using the following masonry cleaner:

Proprietary acidic cleaner; apply in compliance with directions of acidic cleaner manufacturer.

Provide final protection and maintain wall condition, in a manner acceptable to Installer, ensuring that unit masonry is without damage and deterioration at time of Substantial Completion.

End of Section

SECTION 04820

REINFORCED UNIT MASONRY ASSEMBLIES

PART 1 – GENERAL

1.1 SCOPE. This section includes steel reinforced, structural and load bearing masonry, usually with high slump grout or concrete filled cores, cavities, and horizontal bond beams and lintels.

1.2 GENERAL

1.2.01 Coordination. Conduct preinstallation conference at Project site as required in Contract Documents.

1.2.02 Governing Standards. Comply with the requirements and recommendations set forth in the following publications and standards.

ASTM (American Society for Testing and Materials) A153/A153M – Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A183 – Steel Welded Wire Fabric, Plain for Concrete Reinforcement.

ASTM A496 – Steel Wire Deformed, for Concrete Reinforcement.

ASTM A497 – Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement.

ASTM A563 – Carbon and Alloy Steel Nuts.

ASTM A580/A580M – Stainless Steel Wire.

ASTM A615/A615M – Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM A641 – Zinc-Coated (Galvanized) Carbon Steel Wire.

ASTM A653 – Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A666 – Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM A775/A775M – Epoxy-Coated Reinforcing Steel Bars.

ASTM A951 – Masonry Joint Reinforcement.

ASTM B370 – Copper Sheet and Strip for Building Construction.

ASTM C34 – Structural Clay Load-Bearing Wall Tile.

ASTM C55 – Concrete Brick.

ASTM C56 – Structural Clay Non-Load-Bearing Tile.

ASTM C62 – Building Brick (Solid Masonry Units Made from Clay or Shale).

ASTM C67 – Test Method for Sampling and Testing Brick and Structural Clay Tile.

ASTM C73 – Calcium Silicate Brick (Sand-Lime Brick).

ASTM C90 – Load-Bearing Concrete Masonry Units.

ASTM C91 – Masonry Cement.

ASTM C126 – Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units.

ASTM C129 – Non-Load-Bearing Concrete Masonry Units.

ASTM C140 – Test Methods for Sampling and Testing Concrete Masonry Units and Related Units and Related Units.

ASTM C144 – Aggregate for Masonry Mortar.

ASTM C150 – Portland Cement.

ASTM C207 – Hydrated Prime for Masonry Purposes.

ASTM C212 – Structural Clay Facing Tile.

ASTM C216 – Facing Brick (Solid Masonry Units Made from Clay or Shale)

ASTM C270 – Mortar for Unit Masonry.

ASTM C315 – Clay Flue Linings.

ASTM C404 – Aggregate for Masonry Mortar.

ASTM C476 – Grout for Masonry.

ASTM C516 – Virminiculite Loose Fill Thermal Insulation.

ASTM C530 – Structural Clay Non-Load-Bearing Screen Tile.

ASTM C652 – Hollow Brick (Hollow Masonry Units Made From Clay or Shale).

ASTM C744 – Prefaced Concrete and Calcium Silicate Masonry Units.

ASTM C1261 – Firebox Brick for Residential Fireplaces.

ASTM D226 – Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM E119 – Test Methods for Fire Tests of Building Construction and Materials.

Masonry Standards Joint Committee (MSJC) Code/American Concrete Institute (ACI) 530/American Society of Civil Engineers (ASCE) 5/The Masonry Society (TMS) 402 – Building Code Requirements for Masonry Structures.

MSJC Specification/ACI 530.1/ASCE 6/TMS 602 – Specifications For Masonry Structures.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Contractor shall have a minimum of five years documented experience in the construction of reinforced unit masonry assemblies on projects of this size and type. Contractor shall provide a list of completed projects with project names, addresses, telephone numbers, names of Owners, and other information specified.

1.3.02 Testing Laboratory Qualifications. To qualify for employment in performing tests and inspection specified in this Section, an independent testing laboratory must demonstrate to Engineer’s satisfaction, based on evaluation of submitted criteria conforming to ASTM C1093, that it has the experience and capability to conduct the testing indicated without delaying the progress of the Work.

1.3.03 Fire Performance Characteristics. Where indicated, provide materials and construction identical to those of assemblies whose fire resistance has been determined per ASTM E119 by a testing and inspection organization, by equivalent concrete masonry thickness, or by another means acceptable to authorities having jurisdiction.

1.3.04 Single-Source Responsibility for Masonry Units. Obtain exposed masonry units of uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from one manufacturer for each different product required for each continuous surface or visually related surfaces.

1.3.05 Single-Source Responsibility for Mortar Materials. Obtain mortar ingredients of uniform quality, including color for exposed masonry, from one manufacturer for each cementitous component and from one source and producer for each aggregate.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Shop drawings for reinforcing detailing fabrication, bending, and placement of unit masonry reinforcing bars. Comply with ACI 315 “Details and Detailing of Concrete Reinforcing” showing bar schedules, stirrup spacing, diagrams of bent bars, and arrangement of masonry reinforcement.

Submit product data for each different masonry unit, accessory, and other manufactured product indicated.
Submit cold and hot-weather construction procedures indicating compliance with requirements specified in referenced unit masonry standard.

1.4.02 Certifications. Submit material certificates signed by manufacturer and Contractor certifying that each material complies with requirements for the following:

Each different cement product required for mortar and grout including name of manufacturer, brand, type, and weight slips at time of delivery.

Each material and grade indicated for reinforcing bars.

Each type and size of joint reinforcement.

Each type and size of anchors, ties, and metal accessories.

1.4.03 Samples. Submit four samples of full-size units for each different exposed masonry unit required showing full range of exposed color, texture, and dimensions to be expected in completed construction. Include size variation data verifying that actual range of sizes for brick falls within ASTM C216 dimension tolerances for brick where modular dimensioning is indicated.

Submit four samples of colored masonry mortar samples for each color required showing the full range of colors expected in the finished construction. Label samples to indicate type and amount of colorant used.

1.4.04 Test Reports. Submit material test reports from a qualified independent testing laboratory employed and paid by Contractor showing that mortar complies with property requirements of ASTM C270.

1.4.05 Mock-Ups. Prior to installation of unit masonry, erect sample wall panels to further verify selections made under sample submittals and to demonstrate aesthetic effects as well as qualities of materials and execution. Build mock-ups at location determined by Engineer.

Build mock-ups for each type of exposed reinforced masonry wall and typical exterior face brick wall in sizes of approximately 9 feet long by 6 feet (2.74 by 1.83 meters) high by full thickness, including face and backup wythes as well as accessories.

Notify Engineer one week in advance of the dates and times when mock-ups will be erected, and protect mock-ups from the elements with weather-resistant membrane.

Retain and maintain mock-ups during construction in undisturbed condition as standard for judging completed unit masonry construction.

When directed, demolish and remove mock-ups from Project site. Accepted mock-ups in undisturbed condition at time of Substantial Completion may become part of completed unit of work.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver masonry materials to project site in undamaged condition.

Store and handle masonry units off the ground, under cover, and in a dry location to prevent their deterioration or damage due to moisture, temperature changes, contaminants, corrosion, and other causes. If units become wet, do not place until units are in an air-dried condition.

Store cementitious materials off the ground, under cover, in dry location, and aggregates where grading and other required characteristics can be maintained and contamination avoided.

Store masonry accessories including metal items to prevent corrosion and accumulation of dirt and oil.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS.

2.1.01 Protection of Masonry. During erection, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress. Extend cover a minimum of 24 inches (60.96 cm) down both sides and hold cover securely in place.

Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24 inches (60.96 cm) down face next to unconstructed wythe and hold cover in place.

Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns.

2.1.02 Stain Prevention. Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Remove immediately any grout, mortar, and soil that come in contact with such masonry.

Protect base of walls from rain-splashed mud and mortar splatter by means of coverings spread on ground and over wall surface.

Protect sills, ledges, projection, surfaces of window and door frames, as well as similar products with painted and integral finishes from mortar droppings.

2.1.03 Cold-Weather Construction. Comply with unit masonry standards for cold-weather construction. Do not lay masonry units that are wet or frozen. Remove masonry, which is damaged by freezing conditions.

2.1.04 Hot-Weather Construction. Comply with unit masonry standards for hot weather construction.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.2.01 Allowable Working Stresses in Reinforced Masonry.

Type of Stress	*Type of Unit*	*Hollow Clay Units[1] Grade LB or Hollow Concrete Units Grade A*		*Grouted Solid, Hollow Units: Concrete, Grade A Clay, Grade LB or Solid Units 2500 psi on Gross*		*Solid Units 3000 psi on Gross*	
Ultimate compressive strength	*f'm*	675	1350	750	1500	900	1800
Compressive – Axial, walls	*0.2 f'm*	135	270	150	300	180	360
Compressive – Axial, columns	*.18 f'm*	122	244	135	270	162	324
Compression-Flexural	*.33 f'm*	225	450	250	500	300	600

Shear							
No shear reinforcement[2]	*.02 f'm*	15	27	15	30	15	36
Reinforcement taking entire shear;							
Flexural members	*.05 f'm*	50	67	50	75	50	90
Shear walls	*.04 f'm*	30	54	30	60	30	72
No shear reinforcement,							
Flexural2	$1.1\sqrt{f'm}$	25	40	25	43	25	47
Shear walls							
M/Vd ≥ 1	$.9\sqrt{f'm}$	17	33	17	34	17	34
M/Vd = 0	$2.0\sqrt{f'm}$	25	50	25	50	25	50
Reinforcing taking all shear,							
Flexural	$3.0\sqrt{f'm}$	75	110	75	116	75	127
Shear walls							
M/Vd ≥ 1	$1.5\sqrt{f'm}$	35	55	35	58	35	64
M/Vd = 0	$2.0\sqrt{f'm}$	52	73	55	77	60	85

[1]Stresses for hollow unit masonry are based on net section.
[2]Web reinforcement shall be provided to carry the entire shear in excess of 20 psi whenever there is required negative reinforcement and for a distance of one-sixteenth the clear span beyond the point of infection.

2.3 MATERIALS. Comply with referenced unit masonry standard and other requirements specified in this Section applicable to each material indicated.

2.3.01 Clay Masonry Units. Provide special molded shapes for applications requiring brick of form, color, texture, and size on exposed surfaces that cannot be produced by sawing standard brick sizes as well as where stretcher units cannot accommodate special conditions including those at corners, movement joints, bond beams, sashes, and lintels.

Provide units without cores and with all exposed surfaces finished for ends of sills, caps, and similar applications that expose brick surfaces that otherwise would be concealed from view.

Hollow brick shall be ASTM C652, Grade SW, Type HBX (for general use in exposed masonry requiring minimum variations in size and color ranges) with minimum average net area compressive strength of 3000 psi (210.92 kg/cm^2).

Provide bricks manufactured to the following actual dimensions within the tolerances specified in ASTM C652 as 3 5/8 inches thick by 3 5/8 inches (9.21 by 9.21 cm) high by 11 5/8 inches (29.53 cm) long with a single score.

2.3.02 Concrete Masonry Units. Provide special shapes for lintels, corners, jambs, sash, control joints, headers, bonding, and other special conditions, bullnose units for outside corners unless otherwise indicated. Utilize square-edged units for outside corners, except where indicated as bullnose.

Concrete masonry units shall be Type I, moisture-controlled units manufactured to specified dimensions of 3/8 inch (9.5 mm) less than nominal widths by nominal heights by nominal lengths indicated on drawings.

Where special patterns are indicated, provide units with exposed faces matching color, texture and pattern of Engineer's sample.

Hollow load-bearing concrete masonry units shall be ASTM C90, Grade N. Provide units with minimum average net area compressive strength of 1900 psi (133.59 kg/cm^2) with light weight classification.

Splitface Concrete Block lightweight concrete units shall have exposed aggregate and exposed weathering face complying with ASTM C90.

Subject to compliance with requirements, provide "Rickstone" by United Glazed Products, "Preier Line" by E. Dillion & Co., Splitface by Grand Blanc Cement Products, Inc., or an approved equal.

2.3.03 Mortar and Grout Materials. Portland Cement shall be ASTM C150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce required mortar color.

Masonry Cement shall be ASTM C91. For colored pigmented mortars use premixed colored masonry cements of formulation required to produce color indicated or if not indicated as selected from manufacturer's standard formulations.

Ready-Mixed Mortar shall be comprised of cementitious materials, water, and aggregate complying with requirements specified in this article, combined with set-controlling admixtures to produce a ready-mixed mortar complying with ASTM C1142.

Hydrated Lime shall be ASTM C207, Type S for hydrated lime.

Aggregate for mortar shall meet ASTM C144, except for joints less than 1/4 inch (6.4 mm) use aggregate graded with 100 percent passing the No. 16 sieve.

Aggregate in grout shall meet ASTM C404.

Colored mortar pigments shall be natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with record of satisfactory performance in masonry mortars. Subject to compliance with requirements, provide “Centurion Pigments” by Centurion; “True Tone Mortar Colors” by Davis Colors, A Subsidiary of Rockwood Industries, Inc.; “SGS Mortar Colors” by Solomon Grind-Chem Services, Inc.; or an approved equal.

Water shall be clean and potable.

2.3.04 Reinforcing Steel. Provide reinforcing steel complying with requirements of referenced unit masonry standards and this article.

Steel reinforcing bar material and grade shall be epoxy-coated billet steel complying with ASTM A615 and ASTM A775, Grade 60.

Deformed reinforcing wire shall be per ASTM A496. Plain welded wire fabric shall be per ASTM A185. Deformed welded wire fabric shall be per ASTM A497.

2.3.05 Joint Reinforcement. Provide joint reinforcement complying with requirements of referenced unit masonry standard and this article, formed from stainless steel wire, Type 304 complying with ASTM A580.

Welded-wire units shall be prefabricated with deformed continuous side rods and plain cross rods into straight lengths of not less than 10 feet (3.05 m), with prefabricated corner and tee units, and complying with requirements indicated below:

Wire Diameter for Side Rods: 0.1875 inch (4.8 mm).

Wire Diameter for Cross Rods: 0.1875 inch (4.8 mm).

For single-wythe masonry, provide truss design with continuous diagonal cross rods spaced not more than 16 inches (40.6 cm) o.c. type as follows with single pair of side rods.

The number of side rods for multiwythe concrete masonry shall be one side rod for each face shell of hollow masonry units more than 4 inches (10.2 cm) in nominal width plus one side rod for each wythe of masonry 4 inches (10.2 cm) or less in nominal width.

Tab design with single pair of side rods and rectangular box-type cross ties spaced not more than 16 inches (40.6 cm) o.c.; with side rods spaced for embedment within each face shell of backup wythe and ties extended to engage the outer wythe by at least 1 1/2 inches (3.8 cm).

Subject to compliance with requirements, provide joint reinforcement by AA Wire Products Co., Dur-O-Wal, Inc., Heckman Building Products, Inc., or an approved equal.

2.3.06 Rigid Anchors. Provide straps of form and length indicated, fabricated from metal strips of 1 1/2 inches (3.8 cm) wide by 1/4 inch (6.4 mm) thick.

2.3.07 Anchor Bolts. Steel bolts shall comply with A307, Grade A; hex nuts shall comply with ASTM A563 and flat washers shall be provided where indicated, hot-dip galvanized to comply with ASTM A153, Class C. All items shall be of diameter and length indicated and nonheaded bolts shall be bent in manner indicated.

2.3.08 Laminated Flashing. Manufacturer’s standard laminated flashing shall be of Copper-Fabric Laminate. Copper sheet of 5 oz weight per square foot (1526 grams per square meter), bonded with asphalt between 2 layers of glass fiber cloth. Apply where flashing is fully concealed in masonry.

Subject to compliance with requirements, provide Copper Fabric” by Afco Products Inc.;“Type FCC-Fabric Covered Copper” by Phoenix Building Products.; “Copper Fabric Flashing” by Sandell Manufacturing Co., Inc.; “York Copper Fabric Flashing” by York Manufacturing, Inc.; or an approved equal.

Use adhesive of type recommended by flashing manufacturer for use indicated.

2.3.09 Bond Breaker Strips. Asphalt-saturated organic roofing felt complying with ASTM D226, Type I (No. 15 asphalt felt).

2.3.10 Weep Holes. Provide Vinyl Weep Hole/Vent as one-piece offset T-shaped units formed to fit in a vertical mortar joint by injection molding of flexible polyvinyl chloride and consisting of a louvered vertical leg, flexible wings to seal against ends of masonry units and top flap; in color approved by Engineer to match that of mortar. Subject to compliance with requirements, provide weep hole/ventilators products by “Williams-Goodco Brick Bent”, Williams Products, Inc. or approved equal.

2.3.11 Insulation. Loose Granular Vermiculite Insulation shall be per ASTM C516, Type II (surface-treated for water repellency and limited moisture absorption), Grade 3 (fine), complying with 29 CFR 1926 by containing less than 0.10 percent by weight of asbestos and that demonstration shows will not release asbestos fibers in excess of 0.1 fibers per cubic centimeter under reasonably foreseeable jobsite conditions.

2.3.12 Proprietary Acidic Cleaner. Manufacturer’s standard-strength, general-purpose cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry surfaces of type indicated below without discoloring or damaging masonry surfaces; expressly approved for intended use by manufacturer of masonry units being cleaned:

For masonry not subject to metallic oxidation stains, use formulation consisting of a concentrated blend of surface-acting acids, chelating, and wetting agents.

Subject to compliance with requirements, provide by “Sure Klean Vana Trol”, ProSoCo, or approved equal.

2.3.13 Mortar and Grout Mixes. Do not add admixtures including coloring pigments, air-entraining agents, accelerators, retarders, water repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated, and do not use calcium chloride in mortar or grout.

2.3.14 Mortar for Unit Masonry. Comply with ASTM C270, property specification for job-mixed mortar and ASTM C1142 for ready-mixed mortar. Limit cementitious materials in mortar to Portland cement-lime.

For exterior, reinforced masonry, above-grade load-bearing and non-load-bearing walls and parapet walls; for interior loadbearing walls; for interior non-load-bearing and non-load-bearing partitions, reinforced masonry and for other applications where another type is not indicated use type N.

2.3.15 Colored Pigmented Mortar. Select and proportion pigments with other ingredients to produce color required. Mix to match Engineer’s sample.

2.3.16 Grout for Unit Masonry. Comply with ASTM C476 and referenced unit masonry standard.

PART 3 – EXECUTION

3.1 INSPECTION. Examine conditions, with installer present, for compliance with requirements for installation tolerances and other specific conditions, and other conditions affecting performance of unit masonry. Prepare written report, endorsed by Contractor, listing conditions detrimental to performance of unit masonry.

Examine rough-in and built-in construction to verify actual locations of piping connections prior to installation. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION. Comply with MSJC Code, specifications, and other requirements indicated as applicable to each type of assembly included in Project.

3.2.01 Thickness. Build cavity and composite walls and other masonry construction to the full thickness shown. Build single-wythe walls to the actual thickness of the masonry units, using units of nominal thickness indicated.

Build chases and recesses as shown or required to accommodate items specified in this and other Master Specification Sections. Provide not less than 8 inches (20.32 cm) of masonry between chase or recess and jamb of openings and between adjacent chases and recesses.

Leave openings for equipment to be installed before completion of masonry. After installation of equipment, complete masonry to match construction immediately adjacent to the opening.

Cut masonry units with motor-driven saws to provide clean, sharp, unchipped edges. Cut units as required to provide continuous pattern and to fit adjoining construction. Use full-size units without cutting where possible.

3.2.02 Placement. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate locating of openings, movement-type joints, returns, and offsets. Avoid the use of less-than-half-size units at corners, jambs, and where possible at other locations.

Lay up walls to comply with specified construction tolerances, with courses accurately spaced and coordinated with other construction.

3.2.03 Bond Pattern for Exposed Masonry. Lay exposed masonry in a bond pattern of one half running bond with vertical joint in each course centered on units in courses above and below for brick with triple score and concrete masonry units and one quarter running bond for brick with single score. Do not use units with less than nominal 4 inch (10.16 cm) horizontal face dimensions at corners or jambs.

Lay concealed masonry with all units in a wythe in running bond or bonded by lapping not less than 2 inches (5.08 cm). Bond and interlock each course of each wythe at corners. Do not use units with less than nominal 4-inch (10.16 cm) horizontal face dimensions at corners of jambs.

3.2.04 Stopping and Resuming Work. In each course, rack back 1/2-unit length for one-half running bond or 1/3-unit length for one-third running bond; do not tooth. Clean exposed surfaces of set masonry, wet clay masonry units lightly (if required), and remove loose masonry units and mortar prior to laying fresh masonry.

3.2.05 Built-In Work. As construction progresses, build in items specified under this and other Master Specification Sections. Fill in solidly with masonry around built-in items. Fill space between hollow metal frames and masonry solidly with mortar, unless otherwise indicated.

At exterior frames insert extruded polystyrene board insulation around perimeter of frame in thickness indicated but not less than 3/4 inch (1.91 cm) to act as a thermal break between frame and masonry.

Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath in the joint below and rod mortar or grout into core. Fill cores in hollow concrete masonry units with grout 3 courses (24 inches (60.96 cm)) under bearing plates, beams, lintels, posts, and similar items, unless otherwise indicated.

3.2.06 Mortar Bedding and Jointing. Lay hollow concrete masonry units with full mortar coverage on horizontal and vertical face shells. Provide bed webs in mortar in starting course on footings and in all courses of piers, columns, and pilasters, and where adjacent to cells or cavities to be filled with grout.

For starting course on footings where cells are not grouted, spread out full mortar bed including areas under cells.

Cut joints flush for masonry walls to be concealed or to be covered by other materials, unless otherwise indicated.

3.2.07 Structural Bonding of Multiwythe Masonry. Use individual metal ties installed in horizontal joints to bond wythes together.

Use continuous horizontal joint reinforcement installed in horizontal mortar joints for bond tie between wythes.

Use structural bonding system specified above and as indicated on Drawings.

Provide interlocking masonry unit bond in each course at corners, unless otherwise shown.

Provide continuity with horizontal joint reinforcement at corners using prefabricated “L” units, in addition to masonry bonding.

For intersecting and abutting walls, unless vertical expansion or control joints are shown at juncture, provide same type of bonding specified for structural bonding between wythes and space using individual metal ties and prefabricated “T” units to provide continuity with horizontal joint reinforcement.

For non-bearing interior partitions, build full height of story to underside of solid floor or roof structure above. Install pressure-relieving joint filler in joint between top of partition and underside of structure above. Wedge non-bearing partitions against structure above with small pieces of tile, slate, or metal.

3.2.08 Cavity Wall and Masonry-Cell Insulation. Pour granular insulation into cavities as shown to fill void spaces completely. Maintain inspection ports to show presence of insulation at extremities of each pour area. Close ports after complete coverage has been confirmed. Limit fall of insulation to one story in height, but not to exceed 20 feet (6.10 m).

3.2.09 Horizontal Joint Reinforcement. Provide continuous horizontal joint reinforcement as indicated. Install longitudinal side rods in mortar for their entire length with a minimum cover of 5/8 inch (1.59 cm) on exterior side of walls and 1/2 inch (1.27 cm) elsewhere. Lap reinforcing a minimum of 6 inches (15.24 cm). Cut or interrupt joint reinforcement at control and expansion joints, unless otherwise indicated.

Provide continuity at corners and wall intersections by use of prefabricated “L” and “T” sections. Cut and bend reinforcement units as directed by manufacturer for continuity at returns, offsets, column fireproofing, pipe enclosures, and other special conditions.

3.2.10 Movement (Control and Expansion) Joints. Install control and expansion joints in unit masonry where indicated. Build in related items as the masonry progresses. Do not form a continuous span through movement joints unless provisions are made to prevent in-plane restraint of wall or partition movement.

Fit bond breaker strips into hollow contour in ends of block units on one side of control joint. Fill the resultant core with grout and rake joints in exposed faces. Install preformed control joint gaskets designed to fit standard sash block. Install special shapes designed for control joints. Install bond breaker strips at joint. Keep head joints free and clear of mortar or rake joint.

Build in horizontal pressure-relieving joints where indicated; construct joints by either leaving an air space or inserting nonmetallic 50 percent compressible joint filler of width required to permit installation of sealant and backer rod specified in Master Specification Section 07600, Caulking and Sealers.

Locate horizontal pressure-relieving joints beneath shelf angles supporting masonry veneer and attached to structure behind masonry veneer.

3.2.11 Lintels. Install steel lintels where indicated.

Provide masonry lintels where shown and wherever openings of more than 1 foot (30.48 cm) for brick size units and 2 feet (60.96 cm) for block size units are shown without structural steel or other supporting lintels. Provide precast or formed-in-place masonry lintels. Cure precast lintels before handling and installation. Temporarily support formed-in-place lintels.
For hollow concrete masonry unit walls, use specially formed bond beam units with reinforcement bars placed as indicated and filled with coarse grout.

Provide minimum bearing of 8 inches (20.32 cm) at each jamb, unless otherwise indicated.

3.2.12 Flashing/Weep Holes. Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to the downward flow of water in the wall, and where indicated.

Prepare masonry surfaces so that they are smooth and free form projections that could puncture flashing. Place through-wall flashing on sloping bed of mortar and cover with mortar. Seal penetrations in flashing with adhesive/sealant/tape as recommended by flashing manufacturer before covering with the mortar.

Install flashings as follows at lintels and shelf angles, extending flashing a minimum of 4 inches (10.16 cm) into masonry at each end. Extend flashing from exterior face of outer wythe of masonry, through the outer wythe, turned up a minimum of 4 inches (10.16 cm), and through the inner wythe to within 1/2 inch (1.27 cm) of the interior face of the wall in exposed masonry. Where interior surface of inner wythe is concealed by furring, carry flashing completely through the inner wythe and turn up approximately 2 inches (5.08 cm), unless otherwise indicated. At heads and sills, extend flashing as specified above unless otherwise indicated but turn up ends not less than 2 inches (5.08 cm) to form a pan.

Cut off flashing flush with face of wall after masonry wall construction is completed.

Install weep holes in the head joints in exterior wythes of the first course of masonry immediately above embedded flashing. In air spaces insulated cavities, cover the cavity/air space side of open weep holes with copper or plastic insect screening before placing loose-fill masonry insulation in cavity.

3.2.13 Reinforced Unit Masonry. Do not place grout until entire height of masonry to be grouted has attained sufficient strength to resist grout pressure.

Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other temporary loads that may be placed on them during construction.

3.2.14 Repairs. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or if units do not match adjoining units. Install new units to match adjoining units and in fresh mortar or grout, pointed to eliminate evidence of replacement.

3.2.15 Pointing. During the tooling of joints, enlarge any voids or holes, except weep holes, and completely fill with mortar. Point-up all joints including corners, openings, and adjacent construction to provide a neat, uniform appearance, prepared for application of sealants.

3.2.16 Final Cleaning. After mortar is thoroughly set and cured, clean exposed masonry.

Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.

Test cleaning methods on sample wall panel; leave 1/2 panel uncleaned for comparison purposes. Obtain Engineer's approval of sample cleaning before proceeding with cleaning of masonry.

Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent, polyethylene film, or waterproof masking tape.

Clean brick by means of bucket and brush hand-cleaning method described in BIA "Technical Note No. 20 Revised" using proprietary acidic cleaner and apply in compliance with directions of acidic cleaner manufacturer.

3.2.17 Protection. Provide final protection and maintain conditions, in a manner acceptable to Engineer, that ensures unit masonry is without damage and deterioration at time of Substantial Completion.

End of Section

SECTION 04900

MASONRY RESTORATION AND CLEANING

PART 1 – GENERAL

1.1 SCOPE. This section includes restoration of masonry surfaces of brick, stone, clay tile, terra cotta, and block by water, steam, sand blasting, or chemical cleaning. Sand blast cleaning of masonry is not recommended except in special circumstances. Replacement of masonry units and repointing of joints are also included.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publication and addenda thereto of the following standards:

> ASTM (American Society for Testing and Materials) C91 – Masonry Cement.
>
> ASTM C144 – Aggregate for Masonry Mortar.
>
> ASTM C150 – Portland Cement.
>
> ASTM C270 – Mortar for Unit Masonry.
>
> Masonry Standards Joint Committee (MSJC) Code/American Concrete Institute (ACI) 530/American Society of Civil Engineers (ASCE) 5/The Masonry Society (TMS) 402 – Building Code Requirements for Masonry Structures.
>
> MSJC Specification/ACI 530.1/ASCE 6/TMS 602 – Specifications For Masonry Structures.

Submit installation procedures for the products selected for use, manufacturer's installation instructions, and perimeter conditions requiring special attention.

1.3 QUALITY ASSURANCE. Perform work in accordance with local Code and MSJC Specification.

1.3.01 Manufacturer Qualifications. Company specializing in manufacturing products specified in this section with minimum five years documented experience.

1.3.02 Contractor's Qualifications. Work of this section must be performed by firms specializing in restoration with having not less than 5 years successful documented experience in comparable masonry restoration projects and employing personnel skilled in the restoration processes and operations indicated.

1.3.03 Cleaning. Demonstrate materials and methods to be used for cleaning each type of masonry surface and condition where directed. Test adjacent non-masonry materials for possible reaction with cleaning materials. Allow waiting period of duration recommended by manufacturer, but not less than 7 calendar days, after completion of sample cleaning to permit study of sample panels for negative reactions.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings detailing all shoring, bracing and temporary or permanent supports. Indicate setting details of cut stone, special brick shapes and special supports for the work.

Submit data on cleaning compounds and cleaning solutions.

1.4.02 Samples. Submit four samples of concrete masonry units, face brick, stone, terra cotta, or clay tile; units to illustrate color, texture and extremes of color range to match existing.

1.4.03 Mock-up. Restore and repoint a masonry wall sized 8 feet (2.44 m) long by 6 feet (1.83 m) high, which includes mortar and accessories, wall openings and flashings.

Clean a 10 x 10 foot (3.05 x 3.05 m) panel of wall to determine extent of cleaning, cleaning methods and cleaning products.

Repeat, using different cleaning methods on up to three different panels, until acceptable.

Acceptable panel and method of procedure will become the standard for work of this section.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver masonry and stone neatly stacked and tied on pallets. Store clear of ground with adequate waterproof covering.

Store sand blasting, acid solution and restoration cleaner materials in manufacturer's packaging.

Store mortar ingredients in manufacturer's packaging, or if delivered loose, with adequate weatherproof covering.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Clean masonry surfaces only when air temperatures are 40 degrees F (4.4 degrees C) and above and will remain so until masonry has dried out, but for not less than 7 days after completion of cleaning.
Do not repoint mortar joints unless air temperatures are between 40 degrees F (4.4 degrees C) and 80 degrees F (26.7 degrees C) and will remain so for at least 48 hours after completion of work.

Prevent grout or mortar used in repointing and repair work from staining face of surrounding masonry and other surfaces. Remove immediately grout and mortar in contact with exposed masonry and other surfaces.

Protect sills, ledges and projections from mortar droppings.

2.2 MATERIALS.

2.2.01 Mortar. Portland Cement shall be ASTM C150, Type 1. For masonry, provide non-staining natural or white cement (as required to produce mortar color selected), complying with staining requirement of ASTM C91 for not more than 0.03% water soluble alkali.

Hydrated Lime shall be ASTM C207, Type S.

Aggregate shall be ASTM C144, unless otherwise indicated. Natural or manufactured sand selected to produce mortar color selected. For pointing mortar provide sand with rounded edges. Match size, texture and gradation of existing mortar as closely as possible.

Water shall be clean, free of oils, acids, alkalis and organic matter.

2.2.02 Cleaning Materials And Equipment. Water for Cleaning shall be clean, potable, free of oils, acids, alkalis, salts, and organic matter.

Brushes shall be fiber bristle only.

Use a standard two-part masonry cleaner consisting of alkaline cleaner for prewash and acidic cleaner for afterwash. Acceptable products include "Sure Klean Limestone Prewash and Afterwash" as manufactured by ProSoCo, Inc. or approved equal.

Provide spray equipment for controlled spray application of water and chemical cleaners, if any, at rates indicated for pressure and volume as measured at spray tip.

For spray application of chemical cleaners, provide low-pressure tank or chemical pump suitable for chemical cleaner indicated, equipped with cone-shaped spray-tip. For spray application, of water provide fan-shaped spray-tip which disperses water at an angle of not less than 15 degrees.

For application of steam, provide a steam generator capable for delivering live steam at nozzle head.

2.2.03 Mortar Mixes. Measure cementitious and aggregate material in a dry condition by volume or equivalent weight. Do not measure by shovel, use known measure. Mix materials in a clean mechanical batch mixer.

Thoroughly mix cementitious and aggregate materials together before adding any water. Then mix again adding only enough water to produce a damp, unworkable mix which will retain its form when pressed into a ball. Maintain mortar in this dampened condition for 1 to 2 hours. Add remaining water in small portions until mortar of desired consistency is reached. Use mortar within 30 minutes of final mixing; do not retemper or use partially hardened material.

Do not use admixtures of any kind in mortar, unless otherwise indicated.

For pointing mortar use one part white Portland cement, 2 parts lime and 6 parts colored mortar aggregate.

For rebuilding mortar use ASTM C270, Proportion Specification, Type N, unless otherwise indicated with cementitious material content limited to Portland cement-lime.

2.2.04 Chemical Cleaning Solutions. Unless otherwise indicated, dilute chemical cleaning materials such as alkaline and acid cleaner with water to produce solutions of concentration not greater than that recommended by chemical cleaner manufacturer.

PART 3 – EXECUTION

3.1 PREPARATION. Comply with recommendations of manufacturers of chemical cleaners for protecting building surfaces against damage from exposure to their products.

Protect persons, motor vehicles, surrounding surfaces of building whose masonry surfaces are being restored, building site, and surrounding buildings from injury resulting from masonry restoration work.

Prevent chemical cleaning solutions from coming into contact with pedestrians, motor vehicles, landscaping, building and other surfaces which could be injured by such contact.

Do not clean masonry during winds of sufficient force to spread cleaning solutions to unprotected surfaces.

Protect glass, unpainted metal trim and polished stone from contact with chemical cleaners by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape. Apply masking agent to comply with manufacturer's recommendations. Do not apply liquid masking agent to paint or porous surfaces. Protection can be eliminated subject to Engineer's approval, if testing demonstrates no detrimental effect from exposure to cleaning solutions.

3.2 PERFORMANCE.

3.2.01 Sequencing/Scheduling. Perform masonry restoration work in the following sequence when items listed occur in the same location:

Rake-out existing mortar from joints to be repointed.

Repoint existing mortar joints as required.

Clean existing masonry surfaces.

Install joint sealers.

Coordinate with the Engineer sequencing, scheduling, and notification procedures relating to removals of masonry to expose concealed conditions for inspection and observation.

3.2.02 Cleaning Existing Masonry. Proceed with cleaning in orderly manner; work from top to bottom of each scaffold width and from one end of each elevation to the other.

Use only those cleaning methods indicated for each masonry material and location.

Perform each cleaning method indicated in a manner which results in uniform coverage of all surfaces, including corners, moldings, interstices and which produces an even effect without streaking or damage to masonry surfaces.

Rinse off chemical residue and soil by working upwards from bottom to top of each treated area at each stage or scaffold settings.

Water Application Methods: For prolonged spraying soak masonry surfaces by applying water continuously and uniformly to limited area for time period indicated. Apply water at low pressures and low volumes in form of multiple fine sprays using perforated hoses or multiple spray nozzles. Erect protective enclosure constructed of polyethylene sheeting to cover area being sprayed.

For other spray applications spray water onto masonry surfaces to comply with requirements indicated for location, purpose, water temperature, pressure, volume and equipment. Unless otherwise indicated, hold spray nozzle not less than 6 inches (15.24 cm) from surface of masonry and apply water from side to side in overlapping bands to produce uniform coverage and an even effect using the appropriate pressure and volume below.

> Low Pressure Spray: 100-400 psi (689.48 – 2757.42 kPa); 3-6 gallons (11.36 – 22.71 liters) per minute.
>
> Medium Pressure Spray: 400-800 psi (2757.92 – 5515.84 kPa); 3-6 gallons (11.36 – 22.71 liters) per minute.
>
> High Pressure Spray: 800-1200 psi (5515.84 – 8273.76 kPa); 3 gallons (11.36 liters) per minute.

To steam wash apply steam to masonry surfaces at pressure not exceeding 80 psi. Hold nozzle not less than 6 inches (15.24 cm) from surfaces of masonry and apply steam from side to side or in direction of tooling in overlapping bands to produce uniform coverage and an even effect.

Apply chemical cleaners to masonry surfaces to comply with chemical manufacturer's recommendations using brush or spray application methods. Do not allow chemicals to remain on surface for periods longer than that indicated or recommend by manufacturer.

Apply to pressures not exceeding 50 psi (344.74 kPa), unless otherwise indicated.

Do not apply chemical cleaners to same masonry surfaces more than twice. If additional cleaning is required use steam wash.

3.2.03 Cleaning Brickwork. At all brick masonry to receive surface grouting or clear sealer, clean brick masonry surface with cold water applied with low pressure spray.

3.2.04 Cleaning Stonework. At all stone masonry to receive clear sealer, clean stone surfaces with cold water applied with low-pressure spray.

Where indicated, clean limestone surfaces with two-part systems using cleaners of dilution indicated, applied as follows:

Pre-set stone with cold water applied by low-pressure spray.

Apply alkaline cleaner for prewash to stone by bush or roller. Let cleaner remain on surface for period recommended by cleaner manufacturer or as determined by preliminary testing.

Rinse stone with cold water to remove chemical and oils, applied by medium pressure spray.

Apply acidic cleaner for afterwash to stone while it is still wet using low-pressure spray equipment or deep nap roller or soft fibered brush. Let cleaner remain on surface for period recommend by cleaner manufacturer or as determined by preliminary testing.

Rinse stone with cold water to remove chemicals and soil, applied by medium pressure spray.

Repeat entire cleaning procedure above where required to produce cleaning effect established by testing. Do not apply more than twice.

3.2.05 Repointing Existing Masonry.

Joint Raking: Rake out mortar from joints to depths equal to 2 1/2 times their widths but not less than 1/2 inch (1.27 cm) nor less than that required to expose sound, unweathered mortar.

Remove mortar from masonry surfaces within raked-out joints to provide reveals with square backs and to expose masonry for contact with pointing mortar. Brush, vacuum or brush joints to remove direct and loose debris.

Do not spall edges of masonry units or widen joints. Replace any masonry units which become damaged.

Cut out old mortar by hand with chisel and mallet, unless otherwise indicated.

Power operated rotary hand saws and grinders will be permitted but only on specific written approval of the Engineer based on submission of a satisfactory quality control program and demonstrated ability of operators to use tools without damage to masonry. Quality control program shall include provisions for supervising performance and preventing damage due to worker fatigue.

Joint Pointing: Rinse masonry joint surfaces with water to remove any dust and mortar particles. Time application of rinsing so that, at time of pointing, excess water has evaporated or run-off, and joint surfaces are damp but free of standing water.

Apply first layer of pointing mortar to areas where existing mortar was removed to depths greater than surrounding areas. Apply in layers not greater than 3/8 inch (9.5 mm) until a uniform depth is formed. Compact each layer thoroughly and allow to become thumbprint-hard before applying next layer.

After joints have been filled to a uniform depth, place remaining pointing mortar in 3 layers with each of first and second layers filling approximately 2/5 of joint depth and third layer the remaining 1/5. Fully compact each layer and allow to become thumbprint hard before applying next layer. Where existing masonry has rounded edge, recess final layer slightly from face. Take care not to spread mortar over edges onto exposed masonry surfaces, or to featheredge mortar.

When mortar is thumbprint hard, tool joints to match original appearance of joints, unless otherwise indicated. Remove excess mortar from edge of joint by brushing.

At horizontal joints above ledges, setbacks, sills, and at copings, rake out mortar to receive sealant.

Take precautions to avoid plugging weep holes, newly drilled or otherwise.

Cure mortar by maintaining in a damp condition for not less than 72 hours.

Where repointing work precedes cleaning of existing masonry allow mortar to harden not less than 30 days before beginning cleaning work.

3.2.06 Final Cleaning. Perform final cleaning of repaired and repainted stonework in addition to any other cleaning operations scheduled or indicated.

After mortar has fully hardened, thoroughly clean exposed masonry surfaces of excess mortar and foreign matter using stiff nylon or bristle bushes and clean water wash.

Use of metal scrapers or brushes will not be permitted.

Use of acid or alkali cleaning agents for final cleaning purposes will not be permitted. Use only at specific locations for stain removal as indicated.

DIVISION 5 – METALS

PAGE NO.

SECTION 05120

STRUCTURAL STEEL

PART 1 – GENERAL

1.1 SCOPE. This section includes fabrication and erection of structural steel. Structural steel is that work defined in American Institute of Steel Construction (AISC) "Code of Standard Practice" and as otherwise shown on drawings.

Steel joists, metal decks, grating and handrails are specified elsewhere.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

AISC Steel Construction Manual

AISC (American Institute of Steel Construction) – Specification for Structural Steel Buildings, Allowable Stress Design (ASD).

AISC - Code of Standard Practice for Structural Steel Buildings and Bridges.

AISC - Seismic Provisions for Structural Steel Buildings.

ASTM (American Society of Testing Materials) A6/A6M – Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.

ASTM A27/A27M - Specification for Steel Castings, Carbon, for General Application.

ASTM A36/A36M – Specification for Carbon Structural Steel.

ASTM A48 – Specification for Gray Iron Castings.

ASTM A53/A53M - Specification for Pipe, Steel, Black and Hot-Dipped, Zinc Coated, Welded and Seamless.

ASTM A108 - Specification for Steel Bars, Carbon Cold-Finished, Standard Quality.

ASTM A123/A123M - Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A143 – Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedures for Detecting Embrittlement.

ASTM A153/A153M - Specification for Zinc Coating (Hot Dip) on Iron and Steel Hardware.

ASTM A240/A240M – Specification for Heat-Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels.

ASTM A242/A242M - Specification for High-Strength, Low-Alloy Structural Steel.

ASTM A307 - Specification for Carbon Steel Bolts and Studs, 60 ksi Tensile Strength.

ASTM A325 – Specification for Structural Bolts, Steel, Heat-Treated, 120/105 ksi Minimum Tensile Strength.

ASTM A366/A366M – Specification for Commercial Steel Sheet, Carbon, Cold-Rolled.

ASTM A434 – Specification for Steel Bars, Alloy, Hot-Wrought or Cold-Finished, Quenched and Tempered.

ASTM A449 – Specification for Quenched and Tempered Steel Bolts and Studs.

ASTM A490 - Specification for Heat-Treated Steel Structural Bolts, 150 ksi Minimum Tensile Strength.

ASTM A500 - Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A501 - Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.

ASTM A514/A514M - Specification for High-Yield Strength, Quenched and Tempered Alloy Steel Plate, Suitable for Welding.

ASTM A529/A529M - Specification for High-Strength Carbon-Manganese Steel of Structural Quality.

ASTM A563 – Specification for Carbon and Alloy Steel Nuts.

ASTM A568/A568M - Specification for Steel, Sheet, Carbon and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled.

ASTM A572/A572 – Specification for High-Strength, Low-Alloy Columbium-Vanadium Structural Steel.

ASTM A700 – Practice for Packaging, Marking, and Loading Methods for Steel Products for Domestic Shipment.

ASTM A780 – Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

ASTM A992/992M – Standard Specifications for Structural Steel Shapes.

ASTM A1011 – Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM B209 – Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B211 – Specification for Aluminum and Aluminum-Alloy Bar, Rod and Wire.

ASTM B308/B308M – Specification for Aluminum-Alloy 6061-T6 Standard Structural Profiles.

ASTM B429 – Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.

ASTM C1107 – Specification for Packaged Dry, Hydraulic-Cement Grout (nonshrink).

ASTM E94 – Guide for Radiographic Testing.

ASTM E164 – Practice for Ultrasonic Contact Examination of Weldments.

ASTM E165 – Test Method for Liquid Penetrant Examination.

ASTM E709 – Guide for Magnetic Particle Examination.

ASTM F436 – Specification for Hardened Steel Washers.

ASTM F593 – Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.

ASTM F594 – Specification for Stainless Steel Nuts.

ASTM F844 – Specification for Washers, Steel, Plain (Flat), Unhardened for General Use.

ASTM F959 – Specification for Compressible-Washer Type Direct Tension Indicators for Use with Structural Fasteners.

AWS (American Welding Society) A2.4 - Standard Symbols for Welding, Brazing, and Nondestructive Examination.

AWS D1.1 - Structural Welding Code – Steel.

RCSC (Research Council on Structural Connections) (RCSC) – Specification for Structural Joints Using ASTM A325 or A490 Bolts, ASD.

SSPC (Steel Structures Painting Council (SSPC) – Steel Structures Painting Manual, Volumes 1 and 2.

1.3 QUALITY ASSURANCE.

1.3.01 Codes and Standards. Comply with provisions of the following, except as otherwise indicated:

AISC “Code of Standard Practice for Steel Buildings and Bridges,” Paragraph 4.2.1 is hereby modified by deletion of the following sentence:

“This approval constitutes the owner’s acceptance of all responsibility for the design adequacy of any detail configuration of connections developed by the fabricator as a part of his preparation of these shop drawings.”

AISC - “Specifications for Structural Steel Buildings,” including “Commentary.”

ASTM A325 or A490 - “Specifications for Structural Joints using Bolts” approved by the Research Council on Structural Connections.

AWS D1.1 - “Structural Welding Code – Steel.”

ASTM A6 – “Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.”

ASTM 123 - “Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.”

1.3.02 Welding Qualifications. Refer to Master Specification Section 05500, Metal Fabrications, for welding requirements. Provide certification that welders to be employed in work have satisfactorily passed AWS qualification tests. If verification of welders is required, retesting will be Contractor’s responsibility.

1.3.03 Plant Certification. All fabricating plants providing structural steel under these specifications shall be certified in accordance with the AISC Quality Certification Program. Fabricating plants shall be certified in accordance with Category I, Conventional Steel Structures.

All shop drawings shall be prepared by or under the direct control of a Category I quality certified plant.

1.3.04 Testing. At contractor’s expense, an independent testing agency acceptable to the Engineer shall perform specified tests and other services required for quality assurance.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete product data, manufacturer’s specifications, installation instructions, detailed drawings, and setting or erection drawings covering all structural and miscellaneous metal items.

Submit complete Shop Drawings complying with the requirements of the current AISC specifications, showing complete information for fabrication and erection of component parts of the structure, including location, type of bolts, size of bolts and welds. Be fully responsible for preparation of Shop Drawings, clearly indicate revisions made on erection drawings and pieces of any resubmittal.

Prepare erection drawings, complete with all necessary plans, elevations and sections, to indicate size and relative position of members. Do not reproduce design drawings for use as erection drawings. Include erection drawings with each submittal indicating marks of all members, assemblies and loose pieces included in the submittal. Indicate on details of all pieces, principal column lines where members are located. Provide setting drawings and direction for installation of anchor rods (bolts) and other anchorage to be embedded in concrete.

Submittals for high strength bolts and load indicator washers shall include statements from the bolt manufacturer certifying satisfactory compliance with the governing standards and the specified tests.

Submit product data or manufacturer’s specifications and installation instructions for products.

High-Strength bolts (each type), including nuts and washers.

Submit shop drawings prepared under supervision of a licensed Structural Engineer, including complete details, schedules for fabrication and assembly of structural steel members, procedures and diagrams.

Include details of cuts, connections, camber, holes and other pertinent data. Indicate welds by standard AWS symbols while showing size, length and type of each weld.

Provide setting drawings, templates and directions for installation of anchor bolts and other anchorages to be installed as work of other sections.

1.4.02 Certifications. Submit certified copies of mill reports for structural steel (each type) covering chemical and physical properties.

1.4.03 Test Reports. Submit laboratory test reports and other data to show compliance with specifications (including specified standards).

Submit test reports conducted on shop and field-bolted and welded connections. Include data on type(s) of tests conducted and test results.

1.5 DELIVERY, STORAGE AND HANDLING.

1.5.01 Packing, Shipping, Handling and Unloading. Follow ASTM A700 Standard Practice for Delivery of Rolled Steel Plates, Shapes, Sheet Piling and Bars for Structural Use.

1.5.02 Delivery of Material. Deliver items to jobsite as complete units, wherever practicable, ready for installation or erection with all anchors, hangers, fasteners and miscellaneous metal items required for installation.

Deliver, store and handle components in such a manner as to protect the finished surfaces from scratches, nicks, gouges, dents and other damage.

Identify, match, and mark all materials, items and fabrications, for installation and field assembly.

Deliver materials to site at such intervals to ensure uninterrupted progress of work.

Deliver anchor bolts and anchorage devices, which are to be embedded in cast-in-place concrete or masonry, in ample time not to delay work.

1.5.03 Storage of Material. Store components in a dry, clean location, away from uncured concrete and masonry. Cover with waterproof paper, tarpaulin, or polyethylene sheeting. Keep handling to a minimum.

Store materials to permit easy access for inspection and identification. Keep steel members off ground by using pallets, platforms or other supports. Protect steel members and packaged materials from erosion and deterioration. If bolts become dry or rusty, clean and relubricate before use.

Do not store materials on structure in a manner that might cause distortion or damage to members or supporting structures. Repair or replace damaged materials or structures as directed by the Engineer.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. The fabricator is responsible for the design and provision of connections that meet performance standard established in the Contract Documents. Approval of Shop Drawings shall not relieve the fabricator of this responsibility.

Prior to preparing Detailed Shop Drawings, submit drawings showing typical details of connections, including framed beam connections, moment connections, and bracing connections. Include design calculations for these typical connections signed and sealed by a Professional Engineer registered in the State of Michigan. Base connection design on the load and reaction indicated and follow AISC requirements. For reactions not indicated on the drawings, design the connections to support ½ of the total allowable uniform load of the beam as given in the latest edition of the AISC Construction Manual. Arrange to meet with the Engineer at the Engineer’s office approximately one week after submittal to review drawings and basis for developing detailed Shop Drawings.

Submit calculations along with Shop Drawings, signed and sealed by a Professional Engineer registered in the State of Michigan, for any connection not previously approved as a typical connection.

2.2 MATERIALS.

2.2.01 Metal Surfaces - General. For fabrication of work that will be exposed to view, use only materials that are smooth and free of surface blemishes including pitting, rust and scale seam marks, roller marks, rolled trade names and roughness. Remove such blemishes by grinding, or by welding or by grinding, prior to cleaning, treating and applying surface finishes.

2.2.02 Steel.

Shapes, Plates and Bars	ASTM A36 or ASTM A572, Grade 50 as per Drawings, or ASTM A992/A992M
Sheets	ASTM A366 or A1011
Pipe	ASTM A53, Type E or S, Grade B; ASTM A500, Grade B, C, or D; or ASTM A501
Square and Rectangular Structural Tubing	ASTM A500, Grade B or C

2.2.03 Bolts and Nuts.

High Standard	ASTM A325, Type 1, tested in accordance with Article 9.2
Unfinished	ASTM A307
Nuts, Self-Locking	Prevailing torque type; IFI-100, Grade A

2.2.04 Washers.

Flat	ASTM F844
Flat, Hardened	ASTM F436
Lock	ANSI/ASME B18.21.1, helical spring type
Load Indicator	ASTM F959, compressible-washer-type direct tension indicator as manufactured by J&M Turner, Inc.; tested in accordance with Article 10.2 of ASTM F959.
Cast Iron	ASTM A48, Class 35B or better

2.2.05 Stainless Steel.

Plates	ASTM A240, Type 304L
Bolts	ASTM F593, Alloy Group 1 or 2
Nuts	ASTM F594, Alloy Group 1 or 2

Washers – Flat	ANSI B18.22.1
Washers – Lock	ANSI/ASME B18.21.1, helical spring type

2.2.06 Aluminum.

Sheet and Plate	ASTM B209, Alloy 6061-T6
Rolled Sections	ASTM B308, Alloy 6061-T6
Rod and Bar	ASTM B211, Alloy 6061-T6 or 2017-T4
Extrusions	ASTM B221, Alloy 6063-T5 or T6
Pipe	ASTM B429, Alloy 6061-T6 or 6063-T6
Bolts, Stainless Steel	ASTM F593, Alloy Group 1 or 2
Nuts, Stainless Steel	ASTM F594, Alloy Group 1 or 2
Washers – Flat	ANSI B18.22.1
Washers – Lock	ANSI/ASME B18.21.1, helical spring type
Checkered Plate	Alcoa C102, Alloy 6061-T6

Except as otherwise specified or indicated on the drawings, all materials and work shall conform to the applicable provisions of the AISC “Manual of Steel Construction – Allowable Stress Design”, Parts 1, 2, 3 and 4 and the “Specification for Structural Steel Buildings”.

2.2.07 Steel Castings. Provide ASTM A27, Grade 65-35, medium-strength carbon steel.

2.2.08 Structural Steel Primer Paint. Provide Universal rust-inhibiting primer, which can accept epoxy, epoxy esters and phenolic paints as finish coats.

2.3 MANUFACTURE AND FABRICATION. Fabricate and assemble structural assemblies in shop to greatest extent possible. Fabricate for delivery sequence which expedites erection and minimizes material handling in field.

Structural steel items built into or anchored into masonry or concrete shall be completely fabricated and shall be furnished with bolts, anchors, clips and stud anchors to engage with adjacent construction.

Fabricate structural steel items in accord with AISC Specifications and details shown on reviewed and stamped final shop drawings.

Camber structural members to deflection shown or specified. If cambers are not shown, follow AISC specifications.

2.3.01 Shop Assembly. Properly mark and match-mark materials for field assembly. Where finishing is required, complete assembly, including unit welding, before starting finishing operations.

2.3.02 Shop Connections. Weld or bolt shop connections as shown. Install non-high-strength bolts, except where high-strength bolts are shown. Bolt field connections, except where welded connections or other connections are shown.

2.3.03 High-Strength Bolted Construction. Install and tighten high-strength threaded fasteners per ASTM A325.

2.3.04 Holes. Cut, drill or punch holes perpendicular to metal surfaces. (Drill holes in bearing plates) Do not flame cut holes or enlarge holes by burning.

Provide holes for securing other work to structural steel framing, and for passing other work through steel framing members, as shown on Shop Drawings.

2.3.05 Welded Construction. Comply with AWS Code for procedures, appearance and weld quality, and methods used in correcting welding work. Connections exposed after installation shall be continuously welded. Weld continuously along entire contact area except where tack welding is shown.

Assemble and weld built-up sections by methods, which produce, true axis alignment without warp.

2.3.06 Shear Connectors. Prepare steel surfaces as recommended by shear connector manufacturer. Shop weld shear connectors, spaced as shown, to beams or girders in composite construction. Automatic end weld headed stud shear connectors in accord with manufacturer's printed instructions.

2.3.07 Steel Wall Framing. Select members which are true and straight for steel wall framing fabrication. Straighten when required to provide uniform, square and true members throughout complete wall framing.

2.4 FINISHES. Shall be in accordance with Master Specification Section 09900, Painting.

2.4.01 Surface Preparation. After inspection and before shipping, clean steel work to be painted. Remove loose rust, loose mill scale and splatter, slag or flux deposits. Clean steel in accord with procedures defined in SSPC-SP10 "Near-White Blast Cleaning."

2.4.02 Shop Priming. Immediately after surface preparation, apply structural steel primer paint in accord with manufacturer's instructions at rates that provide not less than 1.5 mils (0.04 mm) dry film thickness or as directed in Master Specification Section 09900, Painting. Prime embedded steel, which is partially exposed on exposed portions.

Do not prime initial 2 inches (5.1 cm) of embedded areas. Do not prime surfaces which are to be welded or high-strength bolted with friction-type connections. Do not prime surfaces which are scheduled to receive sprayed-on fireproofing.

2.4.03 Application of Coating. Galvanize steel members, fabrications and assemblies after fabrication by hot-dip process in accord with ASTM A123.

2.4.04 Shop Painting. Use painting methods which result in full coverage of joints, corners, edges and exposed surfaces. Apply two coats of paint to surfaces which are inaccessible after assembly or erection. Change second coat color to distinguish it from first.

2.4.05 Bituminous Coating. SSPC – paint 12, solvent type bituminous mastic, normally free of sulfur compound for 15 mil dry film thickness per coat.

2.5 SHOP COATINGS. All structural and miscellaneous metal items shall be shop coated as specified. Surfaces shall be dry and of proper temperature when coated, and shall be free of grease, oil, dirt, dust, grit, rust, loose mill scale, weld flux, slag, weld spatter and other objectionable substances. Articles to be galvanized shall be pickled before galvanizing. All other ferrous metal surfaces shall be cleaned by high-speed power wire brushing or by blasting to the extent recommended by the paint manufacturer. Welds shall be scraped, chipped and brushed to remove all weld spatter.

Sharp projections of cut or sheared edges of ferrous metals which will be submerged in operation, except for items specified to be hot-dip galvanized, shall be ground to a radius as required to ensure satisfactory paint adherence.

The coating weight shall conform with ASTM A123 or Table 1, ASTM A153. The surface finish shall be continuous, adherent, smooth, evenly distributed and free from defects detrimental to coated article's stated end use. Adhesion shall withstand normal handling consistent with coating nature and thickness and normal article use.

2.5.02 Castings. Shop coating of miscellaneous iron castings will not be required.

2.5.03 Steel. Unless otherwise specified, all ungalvanized structural and miscellaneous steel shall be given a universal prime coat in the shop after fabrication. Unless galvanized, bar joists shall receive a shop coat of red oxide primer and a field coat of universal primer which must be compatible with both the primer and finish coating. Steel surfaces shall be prime-coated as soon as practicable after cleaning. All painting shall be done in a heated structure if the outside air temperature is below 50 degrees F (10 degrees C). Steel shall not be moved or handled until the shop coat is dry and hard. Structural tubes and headers for Roll-Up Doors shall be galvanized.

2.5.04 Stainless Steel. Unless otherwise specified or permitted, all items fabricated from stainless steel shall be thoroughly cleaned, degreased and passivated after fabrication. Passivating shall produce a modest etch and shall remove all embedded iron and heat tint. Passivated surfaces shall be subjected to a 24 hour water test or a ferroxyl test to detect the presence of residual embedded iron and shall be repassivated as required to remove all traces of iron contamination. Passivated surfaces shall be adequately protected during shipping, handling and installation to prevent contact with iron or steel objects or surfaces. Blast cleaning of stainless steel will not be acceptable.

2.5.05 Other Surfaces. Shop coating of zinc coated steel, stainless steel or bronze surfaces will not be required.

2.5.06 Film Thickness. The dry film thickness of the shop coating shall be at least 2 mils (0.05 mm) for universal primer and at least 5 mils (0.1 mm) for epoxy enamel.

2.6 CONTROLS.

2.6.01 Testing. Provide access for testing agency to places where structural steel work is being fabricated or produced so that required inspection and testing can be accomplished.

Testing agency may inspect structural steel at plant before shipment. The Engineer reserves the right, at any time before final inspection, to reject material not complying with specified requirements.

PART 3 – EXECUTION

3.1 INSPECTION. Structural and miscellaneous metal work shall be fabricated in conformity with dimensions, arrangements, sizes and weights or thicknesses as specified or indicated on the drawings.

All members and parts, as delivered and erected, shall be free of kinks, warps, local deformations and unauthorized bends. Holes and other provisions for field connections shall be accurately located and shop checked so that proper fit will result when the units are assembled in the field. Erection drawings shall be prepared and each separate piece shall be marked as indicated thereon. All field connection materials shall be furnished.

Structural and miscellaneous metal work shall be stored on blocking so that no metal touches the ground and water cannot collect thereon. The material shall be protected against bending under its own weight or superimposed loads.

Before assembly, surfaces to be in contact with each other shall be thoroughly cleaned. All parts shall be assembled accurately as indicated on the drawings. Light drifting will be permitted to draw parts together, but drifting to match unfair holes will not be permitted. Any enlargement of holes necessary to make connections in the field shall be done by reaming with twist drills. Enlarging holes by burning will not be permitted.

3.2 PREPARATION. Employ Professional Engineers or Land Surveyors for accurate structural steel layout and location measurements. Check concrete and masonry bearing surface elevations, and anchor bolts and similar device locations before beginning erection work. Report discrepancies to Engineer. Do not proceed with erection until corrections have been made, or until compensating adjustments to structural steel work have been agreed upon with Engineer.

Clean steel bearing surfaces and other surfaces which shall be in permanent contact before assembly.

Clean bond-reducing materials from concrete and masonry bearing surfaces and roughen to improve bond-to surfaces. Clean base and bearing plate bottom surfaces.

3.3 INSTALLATION.

3.3.01 Erection. Erect structural steel in accordance with AISC Specifications.

Structural steel shall be erected so that individual pieces are plumb, level, and aligned within a tolerance of 1:500. The elevations of the top of the floor and of the roof members shall be within 1/16 inch (1.6 mm) of the elevations indicated on the drawings. The faces of girts and other supporting members for rigid wall panels shall be in vertical planes within a maximum variation of 1/8 inch (3.2 mm). Base plates shall be set level in exact position and grouted in place.

Do not field cut or alter structural members. After erection, prime welds, abrasions and surfaces not primed.

Unless otherwise acceptable to the Engineer, a platform or other means of access shall be provided at each field connection to facilitate inspection.

3.3.02 Setting Bases and Bearing Plates. Set attached and unattached base plates and bearing plates for structural members on wedges, shims or adjusting nuts or other adjusting devices.

Tighten anchor bolts after supporting members have been positioned and plumbed. Do not remove wedges or shims, but if protruding, cut off flush with base edge or bearing plate before packing with grout.

3.3.03 Protection. Provide temporary shores, guys, and bracing members with sufficiently strong connections to bear imposed loads during erection. Also keep structural steel secure, plumb and in alignment against temporary construction loads.

Remove temporary members and connections when permanent members are in place and final connections are made. Provide temporary guy lines to achieve proper alignment as erection proceeds.

3.3.04 Site Tolerances. Establish required leveling and plumbing measurements on mean operating temperature of structure. Level and plumb individual structure members within AISC tolerances.

Set structural steel accurately in locations and to lines and elevations shown. Comply with AISC Specifications for bearing, temporary connections, alignment and paint removal on surfaces. Splice members only where shown and accepted on shop drawings. Align and adjust various members forming complete frame elements or structure(s) before permanently fastening.

3.3.05 Connections. Unless otherwise noted, connections shall conform to the details indicated on the drawings.

Unless welded connections are noted on the drawings, the shop fabricated portions of structural connections may be welded or bolted. The shop portion of beam-to-column connections shall be attached to the beam unless otherwise indicated on the drawings.

Unless otherwise noted, bolted connections for structural steel, as defined in the AISC manual, shall be made with ASTM A325 high strength bolts equipped with load indicator washers.

Field-welded connections will not be acceptable for structural steel unless indicated on the drawings.

Connections for miscellaneous steel fabrications not included in the AISC definition of structural steel may be made with unfinished bolts. All unfinished bolts shall be equipped with self-locking nuts or with unfinished nuts and lock washers.

Bolted connections shall be friction type, except where other types are specifically indicated on the drawings. Contact surfaces of friction connections shall not be painted. When assembled, all joint surfaces, including those adjacent to the bolt heads, nuts or washers, shall be free of loose mill scale, dirt, burrs, oil, paint, lacquer, galvanizing and other foreign material that would prevent solid seating of the parts.

Bolt holes shall have a diameter nominally 1/16 inch (1.6 mm) larger than the nominal bolt diameter. Bolt holes for 1 ply only of vertical diagonal bracing connections may be oversized to a diameter nominally 3/16 inch (4.8 mm) larger than the nominal bolt diameter. If oversized holes are provided in an outer ply, a hardened flat washer shall be installed over each hole during bolting. Slotted holes shall not be used except for girt connections and other locations specifically indicated on the drawings.

Only light drifting shall be permitted to draw parts together. Drifting to match unfit holes shall not be permitted. Do not enlarge unfit holes in members by burning. Hole enlargements essential to make connections shall be done by reaming and twist drills and using proper size bolts. Do not enlarge unfit holes in members by use of drift pins, except in secondary bracing members.

3.3.06 Bolted Structural Connections. Except as modified or supplemented herein, high strength bolts, the method of installation, and bolting tools and equipment shall conform to the requirements of the “Specification for Structural Joints Using ASTM A325 or A490 Bolts” as approved by the Research Council on Structural Connections. Bolt length shall be increased 1/8 inch (3.2 mm) to allow for the thickness of the installed load indicator washer, 1/4 inch (6.4 mm) if the indicator washer is used in conjunction with one hardened flat washer and 3/8 inch (9.5 mm) if two flat washers are required.

Load indicator washers shall be installed in accordance with the manufacturer’s recommendations, as supplemented herein.

To facilitate proper tightening of fastener assemblies, a hardened flat washer shall be installed under the turned element (bolt head or nut) and between the turned element and the indicator washer protrusions in all cases.

Whenever possible, the indicator washer shall be installed on the head end of the bolt. If the bolt head will not be visible for inspection of the indicator washer after inspection, or if the bolt head must be turned to tighten the assembly, the indicator washer may be installed on the nut end of the bolt.

Tightening of each assembly shall progress systematically from the most rigid part of the joint toward the free edges until the indicator washers on all bolts have been closed to the average gap stipulated by the washer manufacturer.

Load indicator washers shall not be substituted for the hardened flat washers required for oversized holes in the outer ply of vertical diagonal bracing connections.

3.3.07 Gas Cutting. Do not use gas cutting torches in field for correcting fabrication errors in primary structural framing. Cutting is permitted only on secondary members which are not under stress. (When authorized, finish gas-cut sections equal to sheared appearances.)

3.3.08 Structural And Miscellaneous Aluminum. Connections not specifically detailed on the drawings shall develop the full strength of the least strength member of the connection.

Unless otherwise noted, connections shall be all-bolted bearing type, using 3/4 inch (1.9 cm) bolts and nuts equipped with a helical spring lock washer under the stationary element (bolt head or nut) and a flat washer under the turned element. Bolts and nuts for structural aluminum and aluminum stair connections shall be stainless steel. Bolts and nuts for nonstructural miscellaneous aluminum assemblies shall be aluminum. A sufficient number of bolts shall be provided in each connection to develop the shear strength of the members. Unless otherwise noted, welded connections will not be acceptable.

Structural aluminum shall be erected so that individual pieces are plumb, level, and aligned within a tolerance of 1:500. The elevation of horizontal members shall be within 1/16 inch (1.6 mm) of the elevation indicated on the drawings.
Baseplates shall be set level in exact position and grouted in place.

3.3.9 Touch-Up Painting. Immediately after erection, clean field welds, bolted connections and abraded areas. Apply some paint to exposed areas using same material as used for final painting. Apply touch-up paint by brush or spray to provide 1.5 mils (0.04 mm) dry film thickness, minimum.

Remove temporary shoring, members, guys, bracing and connections when permanent members are in place and final connections made and tested.

Clean field welds, bolted connections and abraded areas, and apply galvanizing repair paint according to ASTM A780.

3.4 FIELD QUALITY CONTROL. Engage independent testing and inspection agencies to inspect high-strength bolted connections, welded connections, to conduct tests, and prepare test reports.

Testing agency shall conduct and interpret tests, state in each report whether test specimens comply with requirements, and specifically identify any deviations.

Provide access for testing agency to places where structural steel work is being assembled, so that required inspection and testing can be accomplished.

High-Strength Field-Bolted Connections shall be tested and inspected according to RCSC's "Specification of Structural Joints Using ASTM A325 bolts." Direct tension indicator gaps shall be verified to comply with ASTM F959, Table 2.

3.4.01 Adjusting. Errors in shop or field work which prevents proper assembling and parts fitting by moderate drift pin use, or moderate reaming and slight clipping, shall be corrected at Contractor's expense.

End of Section

SECTION 05210

STEEL JOISTS

PART 1 – GENERAL

1.1 SCOPE. This section includes structural steel open web joists, long span joists, deep long span joists, and joists girders for roof and floor framing. Anchorage, bearing plates, and shop finishing are also included in this section.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations as set in the following standards:

ASTM (American Society for Testing and Materials) A36/A36M – Specification for Carbon Structural Steel.

ASTM A108 – Specification for Steel Bars, Carbon, Cold-Finished, Standard Quality.

ASTM A123/A123M – Specification for Zinc (Hot Dipped Galvanized) Coatings on Iron and Steel Products.

ASTM A153/A153M – Specification for Zinc Coating (Hot Dip) on Iron and Steel Hardware.

ASTM A307 – Specification for Carbon Steel Bolts and Studs, 60 ksi Tensile Strength.

ASTM A325 – Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.

AWS (American Welding Society) D1.1 – Structural Welding Code.

SJI (Steel Joist Institute) – Specifications, Load Tables, and Weight Tables for Steel Joists and Joist Girders.

SSPC (Steel Structures Painting Council) – Steel Structures Painting Manual.

SSPC SP 1 – Sealant Cleaning.

SSPC SP 10 – Near White Blast Cleaning.

SSPC Paint No. 15 – Steel Joint Shop Paint Type 1, red oxide.

SSPC Paint No. 20 – Zinc Rich Primers, Type 1 (Inorganic), Type II (Organic).

1.3 QUALITY ASSURANCE. Perform Work in accordance with SJI Load Tables, and Weight Tables, including headers and other supplementary framing.

1.3.01 Contractor Qualifications. Fabricator and erector contractors shall specialize in performing Work of this section and shall have a minimum of 5 years documented experience.

Design connections not detailed on the drawings shall be designed under direct supervision of a Professional Engineer experienced in design of this Work and licensed in the State of Michigan.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate standard designations, configuration, sizes, spacing, locations of joists and joists leg extensions.

1.4.02 Certifications. Submit certificates that welders employed on the Work have certified within the previous 12 months and meet AWS qualifications.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers include Butler Manufacturing Co., New Millennium Building Systems LLC, Vulcraft Steel Joist, or an approved equal.

2.2 MATERIALS.

2.2.01 Open Web Joists Members. Members include: SJI Type K or LH Longspan, DLH Deep Longspan and DLH Deep Joist Girders.

2.2.02 Anchor Bolts, Nuts and Washer Assemblies. Assemblies shall be per ASTM A307 or A325, galvanized to ASTM A153.

2.2.03 Shear Stud Connectors. Connectors shall be per ASTM A108, forged steel headed and uncoated.

2.2.04 Structural Steel. Supplementary framing and joist leg extensions shall be per ASTM A36.

2.2.05 Welding Materials. Materials shall be per AWS D1.1 type required for materials being welded.

2.2.06 Shop and Touch-up Primer. Primer shall be per SSPC 15 Type 1 red oxide.

2.2.07 Touch-up Primer for Galvanized Surfaces. Primer shall be per SSPC 20 Type I Inorganic or Type II Organic.

2.3 FABRICATION. Provide bottom and top chord extensions as indicated. Drill holes in chords necessary for attachment of wood nailers. Weld threaded lugs to chords for attachment of wood nailers. Fabricate to achieve end bearing of 2 1/2 inches (6.4 cm) on steel and 4 inches (10.2 cm) on masonry. Frame special sized openings in joist web framing as detailed. Space stud shear connectors as detailed.

2.4 FINISH. Prepare joist component surfaces in accordance with SSPC SP 2.

Shop prime joists and supplementary framing members. Do not prime surfaces that will be fireproofed, field welded, or in contact with concrete.

Galvanize steel ledge angles, and anchors to ASTM A123. Provide minimum 1.25 ounce per square foot (381.4 g per sq m) galvanized coating.

PART 3 – EXECUTION

3.1 INSTALLATION. Erect and bear joists on supports. Allow for erection loads. Provide sufficient temporary bracing to maintain framing safe, plumb, and in true alignment. Coordinate placement of anchors in concrete or masonry construction for securing bearing plate and angles.

After joist alignment and installation of framing, field weld joist seat to bearing plates and angles. Position and field weld joist chord extensions and wall attachments as detailed. Do not field cut or alter structural members without approval of joist manufacturer.

Do not permit erection of decking until joists are braced, bridged, secured or until completion of erection and installation of permanent bridging and bracing. After erection, prime welds, abrasions, and surfaces not shop primed except surfaces to be in contact with concrete.

3.1.02 Erection Tolerances. Maximum variation from plumb shall be 1/4 inch (6.4 mm). Maximum offset from true alignment shall be 1/4 inch (6.4 mm).

3.2 FIELD QUALITY CONTROL. Provide shop testing and analysis of steel sections.

End of Section

SECTION 05310

METAL FLOOR DECK

PART 1 – GENERAL

1.1 SCOPE. This section contains shop formed, cellular or non-cellular, and plain or ribbed, structural metal floor deck, including miscellaneous accessories.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements set forth in the current publications and addenda thereto of the following standards:

AISI (American Iron and Steel Institute) – Specification for the Design of Cold-Formed Steel Structural Members.

ASTM (American Society for Testing and Materials) A36/A36M - Specification for Carbon Structural Steel.

ASTM (American Society for Testing and Materials) A108 - Specification for Steel Bars, Carbon, Cold-Finished, Standard Quality.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A780 – Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

AWS (American Welding Society) D1.1 – Structural Welding Code – Steel.

AWS D1.3 – Structural Welding Code – Sheet Steel.

DOD-P-21035A (Military Specification) – Paint, High Zinc Dust Content, Galvanizing Repair.

SDI (Steel Deck Institute) – Design Manual for Composite Decks, Form Decks, Roof Decks, Cellular Metal Floor Deck with Electrical Distribution.

SSPC (Steel Structures Painting Council) – Painting Manual. SSPC Paint No. 15, Steel Joist Shop Paint Type 1, red oxide; SSPC-20, Type I – Inorganic; and SSPC-20, Type II – Organic.

UL (Underwriters Laboratories, Inc.) – Fire Resistance Directory.

1.3 QUALITY ASSURANCE. Comply with provisions of the following codes and standards, except as otherwise indicated: American Iron and Steel Institute (AISI) “Specification for the Design of Cold-Formed Steel Structural Members,” and Steel Deck Institute (SDI) “Design Manual for Composite Decks, Form Decks and Roof Decks.”

1.3.01 Welding Qualifications. Comply with Metal Fabrication section and applicable provisions of AWS D1.1 “Structural Welding Code-Steel” and AWS D1.3 “Structural Welding Code-Sheet Steel.” Submit welder certificates signed by Contractor certifying that welders comply with requirements specified under the “Quality Assurance” article. Certify welders employed on the Work, verifying AWS qualification within the previous 12 months.

1.3.02 Engineer Qualifications. The design engineer shall be legally authorized to practice in the State of Michigan and experienced in providing engineering services of this type with a record of successful performance.

1.3.03 Installer Qualifications. Engage an experienced installer with 5 years successful documented experience installing steel decks of this type.

1.3.04 Testing Agency Qualifications. To qualify for acceptance, an independent testing agency must demonstrate to Engineer’s satisfaction, based on evaluation of agency-submitted criteria conforming to ASTM E699, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Project.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete shop drawings showing metal deck placement, location of stud shear connectors, and large scale cross-sectional detail of deck. Include details showing stud shear connectors, bearing lengths, methods of attachment of deck and accessories, reinforcing of openings and other pertinent sections. Show details required for installation and erection of metal deck and stud shear connectors. Indicate deck plan, support locations, projections, reinforcement, cellular raceways, outlet box locations and other pertinent details.

For steel deck indicated to comply with certain design loadings, include structural analysis data sealed and signed by the qualified professional engineer who was responsible for its preparation.

Submit product data for each type of deck, accessory and product specified. Submit manufacturer's installation instructions with detailed sketches and installation sequence.

1.4.02 Certifications. Submit product certificates signed by manufacturers of steel deck certifying that their products comply with specified requirements.

1.5 DELIVERY, STORAGE AND HANDLING. Protect steel deck from corrosion, deformation, and other damage during delivery, storage and handling. Cut plastic wrap to encourage ventilation. Do not use decking for storage or as working platforms until it has been permanently secured in position. Stack steel deck on platforms or pallets and slope to provide drainage. Protect with a waterproof covering and ventilate to avoid condensation.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Design metal deck in accordance with SDI Design Manual. Calculate to structural working stress design and maximum vertical deck deflection of 1/240 of the span.

2.1.01 Deck Requirements. Composite steel floor deck and concrete, of specified type and thickness, which is indicated to be fire-rated, shall be listed in the UL Fire Resistance Directory under the applicable Design No. for 2 hour rating and bear the UL listing mark.

2.1.02 Deck Type and Manufacturer. Deck nominal depth shall be 2 inches (5.08 cm) with a minimum flute spacing of 12 inches (30.48 cm) on centers. Minimum average width of flutes between webs shall be 6 inches (15.24 cm). The Side lap shall be of vertical male and female type.

2.2 ACCEPTABLE MANUFACTURERS. Subject to compliance with requirements, provide products by one of the following or an approved equal:

ASC Pacific, Inc.

CANAM Steel Corp.
Consolidated Systems, Inc.
Epic Metals Corp.
Marlyn Steel Products, Inc.
New Millennium Building Systems, LLC.

Roof Deck, Inc.

Verco Manufacturing Co.
Vulcraft Div. Of Nucor Corp.
Walker Div. Of Butler Manufacturing Co.

2.3 MATERIALS.

2.3.01 Noncomposite Steel Form Deck. Fabricate ribbed-steel sheet noncomposite form deck panels conforming to SDI Publication No. 28 “Specifications and Commentary for Noncomposite Steel Form Deck.”

2.3.02 Galvanized-Steel Sheet. Shall be ASTM A653, Grade A, with G90 galvanized coating according to ASTM A653. Profile depth shall be 1 1/2 inches (3.8 cm). Design uncoated-steel thickness shall be 0.0358 inch (0.9 mm). Span condition shall be triple span or more. Side joints shall be overlapped or interlocking seam at Contractor’s options. For acoustical perforations and sound insulations, provide deck panels with manufacturer’s standard perforated vertical webs. Provide non-organic glass fiber sound absorbing batts in rib openings.

2.3.03 Welding Materials. Shall comply with AWS D1.1.

2.3.04 Metal Closure Strips, Cover Plates and Related Accessories. Provide 18 gage (1.3 mm) sheet steel of required profiles and size. G90 coating shall conform to ASTM A653.

2.3.05 Bearing Plates and Angles. Provide ASTM steel, unfinished.

2.3.06 Paint and Printer. Shall be in accordance with Master Specification Section, 09900, Painting. Provide manufacturer’s baked-on, rust-inhibitive paint, for application to metal surfaces that have been chemically cleaned and phosphate chemical treated. Provide SSPC Paint No. 15, Steel Joist Shop Paint Type 1, red oxide.

2.3.07 Stud Shear Connectors. Provide ASTM A108 Grade 1015 forged steel, heated, uncoated.

2.4 MANUFACTURE AND FABRICATION. Fabricate deck units and accessories of zinc coated steel sheets of structural quality complying with ASTM A653, quality SQ, Grade 33 ksi (227.5 MPa), with coating designation (G90). Furnish zinc coating which is compatible with the composite action for deck performance.

Fabricate deck units and accessories of flat-rolled carbon steel sheets of structural quality, complying with ASTM A1008 Grade C (33 ksi (227.5 MPa) yield), with top surface (in contact with concrete) phosphate-treated and prime painted with a manufacturer's standard primer on the exposed side.

Provide coating which is compatible with materials specified in Master Specification Section 07950, Firestopping and Smokestopping.

Form deck units in lengths to span three or more supports, with flush, telescoped, or nested 2 inch (5.1 cm) laps at ends and interlocking or nested side laps, of metal thickness, depth, and width as indicated.

Provide decking with integral embossing or raised pattern to furnish mechanical bond between deck and concrete. Demonstrate the composite load carrying capacity of slab system by load tests performed under the supervision of a Professional Engineer. Based on the test results, establish the allowable loads and submit to the Engineer upon written request.

2.4.01 Unit Construction. Design thickness of uncoated sheet steel for deck units shall be 0.0474 inch (1.2 mm) – Type No. 18. Closures shall use 0.0474 inch (1.2 mm) – Type No. 18 and for reinforcing use 0.0747 inch (1.9 mm) – Type No. 14.

The maximum permissible negative tolerance from the design thickness shall be 5 percent.

2.4.02 Metal Closure Strips. Fabricate metal closure strips, for cell raceways and openings between deckings and other construction, of not less than 18 gage (1.3 mm) sheet steel. Form to provide tight-fitting closures at open ends of cells or flutes and sides of decking.

2.4.03 Floor Drain Pan. Fabricate of sheet steel with flat bottom and sloped sides, recessed 1 1/2 inches (3.8 cm) below floor deck surface, bearing flange 3 inches (7.6 cm) wide, sealed watertight.

2.4.04 Fasteners. Provide stainless or galvanized hardened steel fasteners, self tapping.

2.4.05 Weld Washers. Provide mild steel, uncoated 3/4 inch (1.9 cm) outside diameter, 1/8 inch (3.2 mm) thick.

2.5 ACCESSORIES. Provide accessory materials for steel deck that comply with requirements indicated and recommendations of the steel deck manufacturer.

2.5.01 Mechanical Fasteners. Provide manufacturer's standard, corrosion-resistant, low-velocity, powder-actuated or pneumatically driven carbon steel fasteners, or self-drilling, self-threading screws.

2.5.02 Side Lap Fasteners. Provide manufacturer's standard, corrosion-resistant, hexagonal washer head, self-drilling, carbon steel screws, No. 10 minimum diameter.

2.5.03 Rib Closure Strips. Provide manufacturer's standard vulcanized, closed-cell, synthetic rubber.

2.5.04 Miscellaneous Roof Deck Accessories. Provide steel sheet, 0.0359 inch (0.9 mm) thick minimum ridge and valley plates, finish strips and reinforcing channels of same material as roof deck.

2.5.05 Pour Stops and Girder Fillers. Provide steel sheet, of same material as deck panels, and of thickness, and profile indicated with sufficient strength and thickness to support the weight of wet concrete plus 20 psf (0.96 kPa) construction load.

2.5.06 Column Closures, End Closures, Z-Closures and Cover Plates. Provide steel sheet, of same material and thickness as deck panels, unless otherwise indicated.

2.5.07 Weld Washers. Provide manufacturer's standard uncoated-steel sheet weld washers, shaped to fit deck rib, 0.0598 inch (1.5 mm) thick with 3/8-inch (9.5 mm) minimum diameter prepunched hole.

2.5.08 Recessed Sump Pans. Provide manufacturer's standard size, single piece steel sheet 0.071 inch (1.8 mm) thick minimum, of same material as deck panels, with 1 1/2 inch (3.8 cm) minimum deep level recessed pans and 3 inch (7.6 cm) wide flanges. Cut holes for drains in the field.

2.5.09 Steel Sheet Accessories. Shall be ASTM A653, G60 coating class, galvanized according to ASTM A653.

2.5.10 Galvanizing Repair Paint. Shall be SSPC-Paint No. 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

2.5.11 Shear Connectors. Provide headed stud shear connectors made from ASTM A108, Grade Designation 1015 material, and conforming to AWS, D1.1, Table 7-1, Type B.

PART 3 – EXECUTION

3.1 INSPECTION. Examine supporting framing and field conditions for compliance with requirements for installation tolerances and other conditions affecting performance of steel deck.

3.2 PREPARATION. Do not place deck panels on concrete supporting structure until concrete has cured and is dry. Locate decking bundles to prevent overloading of supporting members.

3.3 INSTALLATION. Install deck panels and accessories according to applicable specifications and commentary of SDI Publication No. 28, manufacturer’s recommendations, and requirements of this Section.

Install temporary shoring before placing deck panels when required to meet deflection limitations.

Place deck panels on supporting framing and adjust to final position with ends accurately aligned and bearing on supporting framing before being permanently fastened. Do not stretch or contract side lap interlocks.

Place deck panels flat and square and fasten to supporting framing without warp or deflection.

Cut and neatly fit deck panels and accessories around openings and other work projecting through or adjacent to the decking.

Provide additional reinforcement and closure pieces at openings as required for strength, continuity of decking, and support of other work.

Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds and methods used in correcting welding work. Use welding washers where recommended by deck manufacturer. Mechanical fasteners, either powder-actuated or pneumatically driven, may be used in lieu of welding. Locate mechanical fasteners and install in accordance with deck manufacturer’s instructions.

Fasten roof deck units to steel supporting members by not less than 1/2 inch (1.3 cm) diameter puddle welds or elongated welds of equal strength, spaced not more than 12 inches (30.5 cm) at every support, and at closer spacing where indicated. In addition, secure deck to each supporting member in ribs where side laps occur.

Mechanically fasten side laps of adjacent deck units between supports, at intervals not exceeding 36 inches (91.4 cm) o.c., using self-tapping No. 8 or larger machine screws.

3.3.01 Uplift Loading. Install and anchor roof deck units to resist gross uplift loading of 30 psf (1.44 kPa) at eave overhang and 20 psf (0.96 kPa) for other roof areas.

3.3.02 Cutting and Fitting. Cut and neatly fit deck units and accessories around other work projecting through or adjacent to the decking, as shown.

3.3.03 Reinforcement at Openings. Provide additional metal reinforcement and closure pieces as required for strength, continuity of decking, and support of other work shown.

3.3.04 Closure Strips. Provide metal closure strips at open uncovered ends and edges of decking and in voids between decking and other construction. Weld into position to provide a complete decking installation.

Provide flexible closure strips instead of metal closures, at Contractor’s option, wherever their use will ensure complete closure. Install with adhesive in accordance with manufacturer’s instructions.

3.3.05 Touch-Up Painting. After decking installation, wire brush, clean and paint scarred areas, welds and rust spots on top and bottom surfaces of decking units and supporting steel members. Touch up painted surfaces with same type of shop paint used on adjacent surfaces.

3.4 REPAIRS AND PROTECTION. Prepare and repair damaged galvanized coatings on surfaces with galvanized repair paint according to ASTM A780 and the manufacturer’s instructions.

Provide final protection and maintain conditions to ensure steel decking is without damage or deterioration at time of Substantial Completion.

End of Section

SECTION 05311

STEEL ROOF DECK

PART 1 – GENERAL

1.1 SCOPE. This section includes shop formed, non-cellular, acoustic or non-acoustic type, structural steel roof deck with miscellaneous accessories.

1.2 GENERAL.

1.2.01 Governing Standards. Shall comply with the requirements set forth in the following standards:

ASTM (American Society of Testing Materials) A36/A36M – Specification for Carbon Structural Steel.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

AWS (American Welding Society) D1.1 – Structural Welding Code - Steel.

AWS D1.3 – Structural Welding Code - Sheet Steel.

SDI (Steel Deck Institute) - Design Manual for Composite Decks, Form Decks, Roof Decks, Cellular Metal Floor Deck with Electrical Distribution.

SSPC (Steel Structures Painting Council) – Painting Manual. SSPC Paint No. 15 Steel Joist Shop Paint Type 1, red oxide; SSPC-20 Type 1 – Inorganic; and SSPC-20 Type II – Organic.

1.3 QUALITY ASSURANCE. Comply with provisions of the following codes and standards, except as otherwise indicated: American Iron and Steel Institute (AISI), “Specification for the Design of Cold-Formed Steel Structural Members,” and Steel Deck Institute (SDI), “Design Manual for Composite Decks, Form Decks and Roof Decks.”

1.3.01 Welding Qualifications. Comply with applicable provisions of AWS D1.1 “Structural Welding Code – Steel” and AWS D1.3 “Structural Welding Code – Sheet Steel.” Certify that welders on the work have passed AWS qualification tests for welding processes involved within the previous 12 months or undergone re-certification if needed.

1.3.02 FM Listing. Provide steel roof deck evaluated by Factory Mutual and listed in Factory Mutual “Approval Guide” for Class 1 fire rating and Class 1-60 windstorm ratings.

1.3.03 Engineer Qualifications. The design engineer shall be legally authorized to practice in the State of Michigan and experienced in providing engineering services of this type with a record of successful performance.

1.3.04 Installer Qualifications. Engage an experienced installer who has completed steel deck similar in material, design and extent to that indicated for this project and with a record of successful in-service performance.

1.3.05 Testing Agency Qualifications. To qualify for acceptance, an independent testing agency must demonstrate to Engineer’s satisfaction, based on evaluation of agency-submitted criteria conforming to ASTM E699, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Project.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate deck plan, support locations, projections, openings, reinforcement, pertinent details and accessories. Drawings shall indicate sizes and locations of roof framing supports and the depths, profiles, thicknesses, locations, lengths and markings of deck units to correspond with the sequence of installation. Drawings shall indicate fastening methods for deck units, accessories, closure pieces, fittings, and auxiliary supports, and the type and sequence of welded connections.

Submit deck profile characteristics and dimensions, structural properties and finishes. Submit producer’s or manufacturer’s data for products. Include sufficient data to show compliance with roof deck manufacturer, accessories manufacturer, type of deck and mill certificates. Submit manufacturer’s installation instructions.

1.4.02 Certificates. Certify that products meet or exceed specified requirements.

1.5 DELIVERY, STORAGE AND HANDLING. Protect steel deck from corrosion, deformation, and other damage during delivery, storage and handling. Cut plastic wrap to encourage ventilation. Separate sheets and store deck on dry wood sleepers. Slope for positive drainage. Stack steel deck on platforms or pallets and slope to provide drainage. Protect with a waterproof covering and ventilate to avoid condensation.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Galvanized steel for metal roof decking and accessories shall conform to ASTM Designation A653 Grade A having a minimum yield strength of 33,000 psi (227.5 MPa). The unit design stress shall not excel 20,000 psi (137.9 MPa). Galvanizing shall be by the hot dipped process conforming to ASTM Designation A653, Coating Class G90. Live load deflection shall not exceed 1/240 of the span.

Submit mill certificates to the Engineer as evidence that the steel decking conforms to the above requirements.

2.2 MATERIALS.

2.2.01 Wide Rib Type B Deck. Type B. metal roof decking shall be galvanized steel sections with ribs not less than 1 1/2 inches (3.8 cm) deep, 6 inches (15.2 cm) on center, with ends formed to telescope at end laps and of sufficient length to bear on at least four supports. Longitudinal rib openings, measured on top surface of deck shall not be more than 2 1/2 inches (6.3 cm) wide. Top surface of deck shall be flat, without stiffening grooves. Sheet steel for decking, before galvanizing, shall be 20 gauge (1.0 mm) thickness or 18 gauge (1.3 mm) thickness as indicated on the drawings. Material shall be by one of the following manufacturers:

Wheeling Corrugating Company,

United Steel Deck, Inc.,

Vulcraft,

Consolidated Systems, Inc.,

Or equal

2.3 ACCESSORIES. Roof sump pans shall be standard 14 gauge (2.0 mm) galvanized sheet steel, flat or recessed type, suitable to receive roof sumps.

Cant strips and closure plates shall be not less than 20 gauge (1.0 mm) thickness galvanized sheet steel, formed, flanged and prepared for each particular installation. Edges to be nailed shall be punched with 3/16 inch (4.8 mm) diameter holes at 8 inches (20.3 cm) on centers.

Unless otherwise indicated on the drawings, attachments shall secure the deck to the structure against a net uplift of at least 60 psf (2.87 kPa) along the roof perimeter for at least 10 feet (3 m) from the interior walls and at eave overhangs. In all other roof areas, deck attachments shall secure the deck to the structure against a net uplift of at least 30 psf (1.44 kPa).

All accessories, such as flashings, closure pieces, roof drain sumps, metal cants, and other items as indicated or required, shall be fabricated of the same material and finish as deck units, in the thicknesses indicated or recommended by the deck manufacturer. Accessories shall be welded in place or secured with self-tapping screws.

2.4 COLD GALVANIZING COMPOUND FOR GALVANIZED SURFACES. ZRC Products Company, or as approved.

2.5 FASTENERS. Galvanized hardened, self-tapping.

PART 3 – EXECUTION

3.1 INSTALLATION. Verify existing conditions prior to beginning Work. Erect metal deck in accordance with SDI Manual and manufacturer's instructions. Bear deck on steel supports with 1-1/2 inch minimum bearing. Align and level. Weld in accordance with AWS D1.1.

Ends of adjacent deck units shall be staggered on supporting members so that ends are not terminated on any one supporting member except at roof edges or at roof openings.

Deck units shall start and terminate at the center of supporting member at ends of runs, at roof openings or elsewhere as required. Panels must be driven up snug before welding to supporting members. Provide and install vertical sections of metal decking where required.

Unless otherwise indicated on the drawings, roof deck panels shall be secured to each supporting member with fusion welds at least 5/8 inch (1.6 cm) in diameter at 8 inch (20.3 cm) centers unless otherwise indicated. Deck edges shall be secured to perimeter members parallel to the deck span at 6 inch (15.2 cm) centers with fusion welds at least 5/8 inch (1.6 cm) in diameter. Welds shall seal the metal completely, leaving no openings through the deck. Welds shall penetrate all layers of deck material at the point of welding and shall achieve complete fusion to the supporting member. Suitable welding washers shall be used if welds satisfactory to the Engineer cannot be achieved.

Deck unit side laps shall be screw fastened, with self-drilling, self-tapping, cadmium plated sheet metal screws 3/4 inch (1.9 cm) in length at supporting members and 12 inch (30.5 cm) centers between supporting members unless otherwise indicated.

Care shall be taken not to fasten the joints with one panel depressed below adjoining panels.

Sheet metal screws shall be similar to Teks hex washer head 10-16 x 3/4 inch (1.9 cm) in length.

Roof openings shall be provided in deck for roof sump pans, vent pipes, hatches, curbed roof openings and other openings as required. Also provide openings in roof sump pans for sump installations in sizes as required. Cut holes neatly without ragged edges.

Unless indicated otherwise on the drawings, reinforce the deck at all roof sumps and other roof openings, on the underside, with two 2 stiffener angles of sufficient length to extend three 3 ribs beyond each side of openings. Weld angles to each rib.

Install sheet steel closures and angle flashings to close openings between deck and walls, columns, and openings. Position roof sump pans with flange bearing on top surface of deck. Fusion-weld each deck flute. Place metal cant strips in position and fusion-weld. Immediately after welding deck and other components in position, coat welds, burned areas, and damaged surface coating with two coats of cold galvanizing compound which imparts cathodic action against corrosion. Surface preparation and application shall be in accordance with the manufacturer's instructions.

3.1.01 Valley and Peak Construction. Where the roof deck has a pitch of 1/8 inch per ft. (3.2 cm per 30.5 cm) or greater on slopes between valleys and peaks and where the decking strips are to be laid at right angles to lines of valleys and peaks, the decking shall not be laid continuously across valleys or peaks. All strips of decking for the sloped roof surfaces shall be terminated at valleys and peaks by butt joints in straight lines parallel with valley and peak lines. These valley and peak joints shall be covered with 8 inch (20.3 cm) wide bent galvanized sheet steel closures, of the same thickness as the decking and they shall be welded to the decking along one side only.

End of Section

SECTION 05400

COLD-FORMED METAL FRAMING

PART 1 – GENERAL

1.1 SCOPE. This section includes axially loaded steel studs, slotted channels, joists, purlin framing and connections, usually of 0.033 inch (0.8 mm) to 0.097 inch (2.5 mm) metal thickness. Section also includes bracing, fasteners and accessories.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

AISI (American Iron and Steel Institute) – Cold-Formed Steel Design Manual.

ASTM (American Society of Testing Materials) A123/A123M – Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A645/A645M - Specification for Pressure Vessel Plates, Five Percent Nickel Alloy Steel, Specially Heat Treated.

ASTM A653/A653M - Specification for Steel Sheet, Zinc Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A780 – Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

ASTM A924/A924M – Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High Strength Low-Alloy with Improved Formability.

ASTM A1011 – Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High- Strength Low-Alloy and High Strength Low-Alloy with Improved Formability.

ASTM C840 – Specification for Application and Finishing of Gypsum Board.

ASTM C841 – Specification for Installation of Interior Lathing and Furring.

ASTM C842 – Specification for Application of Interior Gypsum Plaster.

ASTM C926 – Specification for Application of Portland Cement-Based Plaster.

ASTM C954 - Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 inch (0.8 mm) to 0.112 (2.8 mm) in Thickness.

ASTM C955 – Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners, (Tracks) and Bracing or Bridging for Screw Application of Gypsum Panel Products and Metal Plaster Bases.

ASTM C1007 – Specification for the Installation of Load-Bearing (Transverse and Axial) Steel Studs and Related Accessories.

AWS (American Welding Society) D1.1 – Structural Welding Code – Steel.

AWS D1.3 – Structural Welding Code – Sheet Steel.

DOD (Military Specification) P – 21035A – Print, High Zinc Dust Content, Galvanizing Repair.

ML/SFA 540 (Metal Lath/Steel Framing Association, Division of National Association of Architectural Metal Manufacturers, NAAMM) – Lightweight Steel Framing Systems Manual.

SSPC (Steel Structures Painting Council) Paint No. 15 – Steel Joist Shop Paint Type I, red oxide.

SSPC Paint No. 20 – Zinc Rich Primers, Type I (Inorganic), Type II (Organic).

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Use qualified welders and comply with American Welding Society (AWS) D1.3, “Structural Welding Code – Sheet Steel.” Certify that welders on the work have passed AWS qualification tests for welding processes involved within the previous 12 months or undergone recertification if needed.

1.3.02 Manufacturer Qualifications. Company specializing in manufacturing products specified in this section with minimum of 5 years documented experience.

1.3.03 Installer Qualifications. Company specializing in performing Work of this section with minimum of 5 years documented experience, approved by manufacturer.

Installer shall design structural elements under direct supervision of a Professional Structural or Civil Engineer experienced in design of this Work and licensed in the State of Michigan.

Installer shall form, fabricate, install and connect components in accordance with ML/SFA 540 – Lightweight Steel Framing Systems Manual.

1.3.04 Fire-Rated Assemblies. Where framing units are components of assemblies indicated for a fire-resistance rating, including those required for compliance with governing regulations, provide units that have been approved by governing authorities that have jurisdiction.

1.3.05 Tolerances. Bolt or weld wall panels (at both horizontal and vertical junctures) to produce flush, even, true-to-line joints.

Maximum variation in plane and true position between prefabricated assemblies should not exceed 1/16 inch (1.6 mm).

Vertical alignment (plumbness) of studs shall be within $1/960^{th}$ (1/8 inch (3.2 mm)) in 10 foot (3.1 m) of the span.

Horizontal alignment (levelness) of walls shall be within $1/960^{th}$ (1/8 inch (3.2 mm)) in 10 foot (3.1 m) of their respective lengths.

Spacing of studs shall not be more than 18 inch (45.7 cm) +/- from the designed spacing providing that the cumulative error does not exceed the requirements of the finishing materials.

Prefabricated panels shall be not more than 1/8 inch (3.2 mm) +/- out of square within the length of that panel.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings illustrating materials, shop coatings, steel thickness, details of fabrication, details of attachment to adjoining work, size, location and spacing of fasteners for attaching framing to itself. Details of attachment to the structure, accessories, and their installation and critical installation procedures shall also be included. Drawings may include plans, elevations, sections and details. Indicate component details, framed openings, bearing, anchorage, loading, welds, type and location of fasteners, and accessories or items required of related work. Indicate stud, floor joist, ceiling joist, roof joist, roof rafter, roof truss and layout. Describe method for securing studs to tracks and for bolted, welded framing connections.

Provide calculations for loadings and stresses of specially fabricated framing, roof trusses, under a Professional Engineer's seal.

Submit data on standard framing members. Describe materials and finish, product criteria and limitations. Submit Manufacturer's literature containing product and installation specifications and details for approval.

1.4.02 Certifications. Mill certificates for the steel delivered to the site shall be made available to the Engineer at the time delivery of the steel is made to the job site. Mill certificates shall include as a minimum the steel bare metal thickness in 0.001 inch (0.03 mm), yield strength, tensile strength, total elongation in a 2 inch (5.1 cm) or 8 inch (20.3 cm) gauge length, chemical analysis, and galvanized coating thickness.

Certifications shall be statements from the manufacturer certifying that the materials conform to the appropriate requirements as outlined in the contract documents.

1.4.03 Samples. Submit representative samples of all framing component parts and accessories. Unless otherwise specified, pieces shall be 12 inch (30.5 cm) long and tagged with name of part and manufacturer.

1.5 STORAGE OF MATERIALS. Products shall be protected from conditions that may cause any physical damage. Materials shall be stored on a flat plane. Any damaged materials shall be removed from the job site immediately.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Engineering Calculations or data shall be submitted verifying the framing assembly's ability to meet or exceed design requirements as required by local codes and authorities, or by the Engineer. These calculations shall include, but not be limited to the following items:

> Calculate structural properties of studs and joists in accordance with AISI "Specification for Design of Cold-Formed Steel Structural Members."
>
> Steel Framing used to support rigid materials shall be designed for an

allowable deflection of L/360. Steel framing used to support semi-rigid materials shall be designed for an allowable deflection of L/240.

All connections (member to member, and member to structure), shall be thoroughly examined and designed.

Selected exterior and interior walls, as required, shall be designed to provide frame stability and lateral load resistance. If diagonal steel strapping is used to transfer lateral loads to the structure and foundation, additional studs may be required to resist the vertical component of the load from the diagonal bracing.

Wall bridging shall be designed to provide resistance to minor axis bending and rotation of wall studs.

In accordance with AISI Specifications, rigid collateral facing materials may be considered as adequate support of members against rotation.

2.2 ACCEPTABLE MANUFACTURERS. Subject to compliance with requirements, provide products of one of the following manufacturers or an approved equal.

Alabama Metal Industries Corp.

ClarkDietrich Building Systems LLC

Marino\WARE

Superior Steel Studs, Inc.

USG Industries

United States Steel

2.3 CONSTRUCTION.

2.3.01 System Components. Use manufacturers' standard steel studs and joists of type, size, shape and gage as indicated. With each type of metal framing required, provide manufacturer's standard steel runners (tracks), blocking, lintels, clip angles, shoes, reinforcements, fasteners and accessories for applications indicated, as needed to provide a complete metal framing system.

2.3.02 Materials and Finishes. For 16 gage (1.6 mm) and heavier units, fabricate metal farming components of structural quality steel sheet with a minimum yield point of 40,000 psi (275.8 MPa); ASTM A653, A1008 or A1011.

For 18 gage (1.3 mm) and lighter units, fabricate metal framing components of commercial quality steel sheet with a minimum yield point of 33,000 psi; (227.5 MPa), ASTM A653, A1008 or A1011.

Provide galvanized finish to metal framing components complying with ASTM A653 for minimum G60 coating. Finish of installation accessories shall match main framing components, unless otherwise indicated.

2.3.03 Fasteners. Provide nuts, bolts, washers, screws and other fasteners with corrosion-resistant plated finish.

2.3.04 Electrodes for Welding. Comply with AWS Code and as recommended by stud manufacturer.

2.3.05 Galvanizing Repair. Where galvanized surfaces are damaged, prepare surfaces and repair in accordance with procedures specified in ASTM A780.

2.4 MANUFACTURE AND FABRICATION. Fabricate assemblies of formed sections of sizes and profiles required. Fit, reinforce and brace framing members to suit design requirements.

Fit and assemble in largest practical sections for delivery to site, ready for installation. Framing components may be prefabricated into assemblies before erection. Fabricate panels plumb, square, true to line and braced against racking with joints welded. Perform lifting of prefabricated units to prevent damage or distortion. Fabricate units in jig templates to hold members in proper alignment and position and to assure consistent component placement.

2.4.01 Fastenings. Attach similar components by welding. Attach dissimilar components by welding, bolting, or screw fasteners as standard with manufacturer. Wire tying of framing components it not permitted.

2.4.02 Fabrication Tolerances. Fabricate units to a maximum allowable tolerance variation from plumb, level and true to line of 1/8 inch (3.2 mm) in 10 feet (3.1 m).

2.4.03 Shop Painting. All studs, tracks, headers, joists, purlins, bracing, furring, bridging, plates, gussets and clips shall be galvanized to ASTM A123 G90 coating class. Prime paint.

2.5 ACCESSORIES. Use formed sheet steel, thickness determined by performance requirements specified.

Use SSPC Paint 15, Type I, red oxide for in-shop and field touch-up priming. For galvanized surfaces, use SSPC Paint 20, Type I Inorganic, Type II Organic, zinc rich.
2.5.01 Fasteners.

Self-Drilling, Self-Tapping Screws, Bolts, Nuts, and Washers: Provide steel, hot-dip galvanized to ASTM A123, 1.25 ounce per square foot (119.1 grams per sq m).

Anchorage Devices: Use power actuated, drilled expansion bolts, screws with sleeves.

Welding: Shall be in conformance with AWS D1.1 and AWS D1.3.

PART 3 – EXECUTION

3.1 PREPARATION. Prior to start of installation of metal framing systems, conduct Pre-installation conference at project site with installers of other work including door and window frames and mechanical and electrical work. Review areas of potential interference and conflicts and coordinate layout and support provisions for interfacing work.

3.2 INSTALLATION. Install metal framing systems in accordance with manufacturer's printed or written instructions and recommendations. Methods of construction may be either piece by piece (stick-built), or by fabrication into panels either on-or off-site.

Connections shall be accomplished with self-drilling screws or welding so that the connection meets or exceeds the design loads required at that connection.

Transversely loaded studs need not sit squarely in tracks but must be attached to them with the exception of special slip conditions that must be designed accordingly.

Axially loaded studs shall be installed seated squarely (within 1/16 inch (1.6 mm)) against the web portion of the top and bottom tracks. Tracks shall rest on a continuous, uniform bearing surface.

Cutting of steel framing members may be accomplished with a saw or shear. Torch cutting of load bearing members is not permitted. Cutting of loaded members is not permitted unless under supervision of the Engineer.

Temporary bracing shall be provided and left in place until work is permanently stabilized.

Bridging shall be of size and type shown on the drawings and as called for in the design calculations.

Diaphragm rated sheathing materials may be substituted for bridging, however, it shall be installed prior to loading the wall. If such a material is installed on one side of the wall only, then the other stud flanges shall be bridged with suitable bridging. This bridging may be removed if and when such diaphragm rated sheathing is installed.

Install headers in all openings that are larger than the stud spacing in that wall. Form headers as shown on the drawings.

Insulation equal to the job requirements shall be placed in all jamb and header type conditions that will be inaccessible after their installation into the wall.

Provide jack studs to support each end of headers. These studs shall be securely connected to the header and must seat squarely in the lower track of the wall and be properly attached to it.

If by design, a header is low in the wall, the less than full-height studs (cripples) that occur over the header shall be designed to carry all imposed loads.

Wall track shall not be used to support any load unless specifically designed for that purpose.

All axially loaded members shall be aligned vertically, to allow for full transfer of the loads down to the foundation. Vertical alignment shall be maintained at floor/wall intersections or alternate provisions for load transfer may be made.

Holes that are field cut into steel framing members shall be within the limitations of the product and its design. Provide reinforcement where holes are cut through load bearing members in accordance with manufacturer’s recommendations and as approved by the Engineer.

Touch up all steel bared by welding using zinc rich paint.

Studs shall be spaced to suit the design requirements and limitations of collateral facing materials.

Gypsum board shall be attached to steel studs in accordance with ASTM Specification C840, except that the steel drill screws used (Specification ASTM C954) shall be spaced not more than 8 inches (20.3 cm) on center at the edges and ends, and not more than 12 inches (30.5 cm) on center in the field of the board.

Metal plaster bases shall be attached in accordance with ASTM Specification C841, except screw heads shall be of size and type suitable for positive (no movement) attachment.

Care should be taken to allow for additional studs at intersections, corners, doors, windows, control joints, etc., and as called for in the shop drawings or design calculations.

Provision for structure movement (expansion) shall be allowed where indicated and necessary by design or code requirements.

Splicing of axially loaded members shall not be permitted. Wire tying of members is not permitted.

3.2.01 Panelized Construction. Panels shall be designed to resist construction and handling loads as well as live loads.

Handling and lifting of prefabricated panels shall not cause permanent distortion in any member or collateral material.

Make all stud to track connections prior to hoisting of panel.

Where splicing of track is necessary between stud spacings, a piece of stud shall be placed in the track fastened with two screws or welds per flange to each piece of track.

Complete bearing shall be maintained under tracks to provide for load transfer in axially loaded assemblies. If the erecting contractor is bearing on work set by another trade, it is his responsibility to insure that bearing criteria are met. Any discrepancy shall be brought to the attention of the Engineer.

Attachment of the panel to the structure shall be as shown on the shop drawings.

Align all panels to provide continuity of any wall/floor surface.

3.2.02 Runner Tracks. Install continuous tracks sized to match studs. Align tracks accurately to layout at base and tops of studs. Secure tracks as recommended by stud manufacturer for type of construction involved, except do not exceed 24 inches (61.0 cm) o.c. spacing for mail or power-driven fasteners or 16 o.c. (40.6 cm) for other types of attachment. Provide fasteners at corners and ends of tracks.

Align track accurately at supporting structure and fasten to structure as shown on shop drawings. Track intersections shall butt evenly. Studs shall be plumbed, aligned and securely attached to flanges or webs of up and lower tracks. Where splicing of track is necessary between stud spacing, a piece of stud shall be placed in the track fastened with two screws or welds per flange to each piece of track.

Complete bearing shall be maintained under tracks to provide for load transfer in axially loaded assemblies. If the erecting contractor is bearing on work set by another trade, it is his responsibility to insure that bearing criteria are met. Any discrepancy shall be brought to the attention of the Engineer prior to the commencement of the work.

3.2.03 Joists. Install level, straight and plumb, complete with bracing and reinforcing as indicated on drawings. Provide not less than 1 1/2 inch (3.8 cm) end bearing. Joist shall be located directly over bearing studs or a load distribution member shall be provided to transfer loads.

Reinforce ends with end clips, steel hangers, steel angle clips, steel stud section or as otherwise recommended by joist manufacturer. Where required, reinforce joists at interior supports with single short length of joist section located directly over interior support, snap-on shoe, 30 percent side-piece lapped reinforcement or other method recommended by joist manufacturer.

Secure joists to interior support systems to prevent lateral movement of bottom flange. Provide web stiffeners where necessary at reaction points and at points of concentrated loads. Joists shall be installed with their web area perpendicular to the bearing surface. Bridging, either steel strap or solid, shall be provided as shown on the shop design calculations.

Provide additional joists under parallel partitions where the partition length exceeds 1/2 of the joist span. Provide additional framing around all floor/roof openings that are larger than the joist spacing. End blocking shall be provided where joist ends are not otherwise restrained from rotation. Joist ends must be built solidly into masonry construction prior to placing any load on the joist.

All bridging, bracing, blocking, strapping, web reinforcement, etc., must be in place prior to loading of floors. If the floor is to be of concrete, care must be exercised in its placement. Care must be taken by all trades not to disturb joist placement, alignment, plumbness, etc., prior to the completion of the floor system. Care must be taken not to overload the floor system during construction. Place heavy loads, materials, equipment, etc., directly over structural supports, bearing walls or as directed by the Engineer.

3.2.04 Fastenings and Attachments. Anchorage of the tracks to the structure shall be with methods designed for that specific application. Size, penetration, type and spacing shall be determined by design.

Welds shall conform to the requirements of AWS E1.3, AWS D1.3, and AISI Manual. Welds may be butt, fillet, spot or groove type, the appropriateness of which shall be determined by and within the design calculations. All welds shall be touched-up using zinc rich paint.

Steel drill screws shall be of the minimum diameter indicated by the design of the particular attachment detail. Penetration through joined materials shall not be less than 3 exposed threads.

Screws shall have a protective coating at least equivalent to zinc plating when used in exterior assemblies.

Secure studs to top and bottom runner tracks by either welding or screw fastening at both inside and outside flanges.

Set studs plumb, except as needed for diagonal bracing or required for non-plumb walls or warped surfaces and similar requirements.

Where stud system abuts structural columns or walls, including masonry walls, anchor ends of stiffeners to supporting structure.

Install supplementary framing, blocking and bracing in metal framing system wherever walls or partitions are indicated to support fixtures, equipment, services, casework, heavy trim and furnishings, and similar work requiring attachment to the wall or partition. Where type of supplementary support is not otherwise indicated, comply with stud manufacturer’s recommendations and industry standards in each case, considering weight or loading resulting from item supported.

Frame wall openings larger than 2 feet (61.0 cm) square with double stud at each jamb of frame except where more than two are either shown or indicated in manufacturer’s instructions. Install runner tracks and jack studs above and below wall openings. Anchor tracks to jamb studs with stud shoes or by welding and space jack studs same as full-height studs of wall. Secure stud system wall opening frame in manner indicated.
Frame both sides of expansion and control joints with separate studs. Do not bridge the joint with components of stud system.

Install horizontal stiffeners in stud system, spaced (vertical distance) at not more than 48 inches (1.2 m) o.c. Weld at each intersection.

3.2.05 Field Painting. Touch-up damaged shop-applied protective coatings. Use compatible primer for prime-coated surfaces; use galvanizing repair system for galvanized surfaces.

3.3 FIELD QUALITY CONTROL.

3.3.01 Inspections. Inspections by a qualified/independent authority shall be performed in order to assure strict conformance to the shop drawings at all phases of construction. Inspections where and as required by local codes shall be controlled inspections.

All members shall be checked for bearing, completeness of attachments, reinforcement, etc. All attachments shall be checked for conformance with the shop drawings and/or the design calculations. General inspection of structure shall be completed prior to applying loads to those members.

End of Section

SECTION 05500

METAL FABRICATIONS

PART 1 – GENERAL

1.1 SCOPE. Section includes all materials, tools, equipment, apparatus, labor and supervision required to fabricate and furnish all metals to the required dimensions, tolerances and finishes as shown on the drawings.

Fabrication of structural steel consists of manufacturing the parts required to construct the steel frames of buildings and related structures.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements set forth in the current publications and addenda thereto of the following standards:

AA (Aluminum Association) DAF-45 – Designation System for Aluminum Finishes.

AAMA (American Architectural Manufacturers Association) 603.8 9 – Performance Requirements and Test Procedures for Pigmented Organic Coatings on Extruded Aluminum.

AAMA 605.2 - Specification for High Performance Organic Coatings on Architectural Extrusions and Panels.

AAMA 606.1 – Specifications and Inspection Methods for Integral Color Anodic Finishes for Architectural Aluminum.

AAMA 607.1 – Specifications and Inspection Methods for Clear Anodic Finishes for Architectural Aluminum.

AAMA 608.1- Specification and Inspection Methods for Electrolytically Deposited Color Anodic Finishes for Architectural Aluminum.

ANSI A14.3 - Ladders, Fixed, Safety Requirements.

ASTM (American Society of Testing and Materials) A27/A27M – Specification for Steel Castings, Carbon, for General Application.

ASTM A36/A36M – Specification for Carbon Structural Steel.

ASTM A47/A47M – Specification for Ferritic Malleable Iron Castings.

ASTM A48 – Specification for Gray Iron Castings.

ASTM A53/A53M - Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

ASTM A123/A123M - Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A143 – Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and procedure for Detecting Embrittement.

ASTM A153/A153M - Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A167 – Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

ASTM A276 – Specification for Stainless Steel Bars and Shapes.

ASTM A283/A283M - Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.

ASTM A307 – Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.

ASTM A325 – Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.

ASTM A366/A366M – Specification for Commercial Steel Sheet, Carbon, Cold-Rolled.

ASTM A500 - Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A501 - Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.

ASTM A510 – Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel.

ASTM A615/A615M – Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM A786/A786M – Specification for Rolled Steel Floor Plates.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM A1011 – Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM B26/B26M – Specification for Aluminum-Alloy Sand Castings.

ASTM B85 – Specification for Aluminum-Alloy Die Castings.

ASTM B177 – Guide for Chromium Electroplating on Steel for Engineering Use.

ASTM B209 - Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B210 – Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes.

ASTM B211 – Specification for Aluminum and Aluminum-Alloy Bar, Rod, and Wire.

ASTM B221 – Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

ASTM B316/B316M – Specification for Aluminum and Aluminum-Alloy Rivet and Cold-Heading Wire and Rods.

ASTM B632/B632M – Specification for Aluminum-Alloy Rolled Tread Plate.

AWS (American Welding Society) A2.4 – Symbols for Welding, Brazing, and Nondestructive Examination.

AWS D1.1 – Structural Welding Code-Steel.

AWS D1.2 – Structural Welding Code – Aluminum.

AWS D1.3 – Structural Welding Code – Sheet Steel.

SSPC (Steel Structures Painting Council) – Painting Manual.

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification. Qualify welding processes and welding operators in accordance with AWS D1.1 “Structural Welding Code – Steel,” D1.3 “Structural Welding Code – Sheet Steel”, and D1.2 “Structural Welding Code – Aluminum.”

1.3.02 Fabricator Qualifications. Firm shall have five years documented experience in successfully producing and erecting metal fabrications of type indicated for this Project, with sufficient production capacity to produce required units without causing delay in the work.

1.3.03 Installer Qualifications. If possible, Fabricator shall erect metal fabrications. Otherwise, installer shall have five years documented experience in successfully erecting metal fabrications of this type and shall be approved and certified by manufacturer.

1.3.04 Engineer Qualifications. The design Engineer shall be licensed in Michigan and have five years documented experience successfully providing engineering services of the type indicated for this project.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings detailing fabrication and erection of each metal fabrication indicated. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other sections.

Indicate profiles, sizes, connection attachments, reinforcing, anchorage, size and type of fasteners, and accessories. Include erection drawings, elevations, and details where applicable. Indicate welded connections using standard AWS A2.0 welding symbols. Indicate net weld lengths.

Where installed, metal fabrications are indicated to comply with certain design loadings, include structural computations, material properties, and other information needed for structural analysis that has been signed and sealed by the qualified Professional Engineer who was responsible for their preparation.

Submit product data for products used in miscellaneous metal fabrications, including paint products and grout.

1.4.02 Certifications. Welder certificates signed by Contractor certifying that welders comply with requirements specified under “Quality Assurance” article.

Submit certifications for firms and persons specified in “Quality Assurance” article to demonstrate their capabilities and experience. Include list of completed projects with project name, addresses, names of Engineers and Owners, and other information specified.

1.4.03 Samples. Samples representative of materials and finished products as may be requested by Engineer.

1.5 DELIVERY, STORAGE, AND HANDLING. Accept metal fabrications on site in labeled shipments. Inspect for damage. Protect metal fabrications from damage by exposure to weather.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Check actual locations of walls and other construction to which metal fabrications must fit, before fabrication; show recorded field measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of work.

Where field measurements cannot be made without delaying the work, guarantee dimensions and proceed with fabrication of products without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to guaranteed dimensions. Allow for trimming and fitting.

2.2 METALS.

2.2.01 Metal Surfaces. For metal fabrications exposed to view upon completion of the work, provide materials selected for their surface flatness, smoothness, and freedom from surface blemishes. Do not use materials whose exposed surfaces exhibit pitting, seam marks, roller marks, rolled trade names, roughness, and, for steel sheet, variations in flatness exceeding those permitted by reference standards for stretcher-leveled sheet.

2.2.02 Steel

Plates, Shapes, and Bars	ASTM A786
Rolled Steel Floor Plates	ASTM A36
Bars for Gratings	ASTM A1011 or ASTM A36

Wire Rod for Grating Cross Bars	ASTM A510
Tubing, Cold-Formed	ASTM A500, Grade A or B as indicated
Tubing, Hot-Formed Steel	ASTM A501
Coatings for Exterior Tubing or as indicated	ASTM A53, hot-dip galvanized coating
Uncoated Structural Sheet, Cold-Rolled	ASTM A1008, Grade A
Uncoated Structural Sheet, Hot-Rolled	ASTM A1011, Grade 30
Uncoated Sheet, Cold-Rolled	ASTM A366
Uncoated Sheet, Hot-Rolled	ASTM A1011
Galvanized Sheet, Structural quality	ASTM A653; Grade A, and G90 coating designation unless otherwise indicated
Galvanized Sheet, Commercial quality	ASTM A653, G90 coating designation unless otherwise indicated
Pipe	ASTM A53. Schedule 40, Type F or S, Grade A or B, black finish unless otherwise indicated. Galvanized finish for exterior installations

2.2.03 Iron.

Gray Iron Castings	ASTM A48, Class 30
Malleable Iron Castings	ASTM A47, Grade 32510

2.2.04 Brackets, Flanges and Anchors. Cast or formed metal of the same type material and finish as supported rails unless otherwise indicated.

2.2.05 Concrete Inserts. Threaded or wedge type; galvanized ferrous castings, either malleable iron, ASTM A47, or cast steel, ASTM A27. Provide bolts, washers, and shims as required, hot-dip galvanized per ASTM A153.

2.2.06 Welding Rods and Bare Electrodes. Select in accordance with AWS specifications for the metal alloy to be welded.

2.2.07 Stainless Steel.

Bar Stock	ASTM A276, Type 302 or 304
Plate	ASTM A167, Type 302 or 304

2.2.08 Aluminum and Alloys.

Extruded Bars and Shapes	ASTM B221
Bearing Bars of Gratings and Shapes	6061-T6 or 6063-T6
Grating Cross Bars	6061-T1
Rolled Tread Plate	ASTM B632, 6061-T6 for platforms, , 6061-T4 for treads
Rivets	ASTM B316, alloy 6053-T4 or 6061-T6
Sheet for Expanded Aluminum Grating	ASTM B209, alloy 5052-H32
Fasteners for Aluminum Gratings	Use fasteners made of same basic metal as fastened metal except use galvanized fasteners complying with ASTM A153 for exterior aluminum units, unless otherwise indicated. Do not use metals that are corrosive or incompatible with metals joined

2.3 GROUT AND ANCHORING CEMENT.

2.3.01 Nonshrink Metallic Grout. Provide premixed, factory-packaged, ferrous aggregate grout complying with CE CRD-C621, specifically recommended by manufacturer for heavy duty loading applications of type specified in this section.

2.3.02 Interior Anchoring Cement. Provide factory pre-packaged, nonshrink, nonstaining, hydraulic controlled expansion cement formulation for mixing with water at project site to create pourable anchoring patching, and grouting compound. Use for interior applications only.

2.3.03 Erosion-Resistant Anchoring Cement. Provide factory pre-packaged, nonshrink, nonstaining, hydraulic controlled expansion cement formulation for mixing with water at project site to create pourable anchoring, patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without need for protection by a sealer or waterproof coating and is recommended for exterior use by manufacturer.

2.3.04 Acceptable Manufacturers. Subject to compliance with requirements, provide one of the following or an approved equal:

Nonshrink Metallic Grouts:

“Met-Ox Grout”; Chem-Masters Corp.
“NS Metallic Grout”; Euclid Chemical Co.
“Embeco 885”; BASF Corp.

Nonshrink Nonmetallic Grouts:

“Diamond-Crete Grout”; Concrete Service Materials Co.
“Five Star Grout”; Five Star Products
“Kemset”; Chem-Masters Corp.
“Crystex”; L & M Construction Chemicals, Inc.
“Masterflow 713”;BASF Corp.
NS Grout; Euclid Chemical Co.
ProSpec C-1107 Construction Grout; ProSpec
“Vibropruf #11; Lambert Corp.
588-10k Grout; W.R. Meadows

Interior Anchoring Cement:

“Por-Rok”; CGM Inc.
Sakrete Anchor Cement; Sakrete

Erosion-Resistant Anchoring Cement:

“Super Por-Rok”; CGM, Inc.

2.4 FASTENERS. Provide zinc-coated fasteners for exterior use or where built into exterior walls. Select fasteners for the type, grade, and class required.

Bolts and Nuts	ASTM A307, Grade A,

	regular hexagon head type
Lag Bolts	FS FF-B-561, Square head type
Machine Screws	Cadmium plated steel, FS FF-S-92
Wood Screws	FS FF-S-111, Flat head carbon steel
Plain Washers	FS FF-W-92, Round, carbon steel
Drilled-In Expansion Anchors	FS FF-S-325, Group VIII (anchors, expansion, non-drilling, Type I (internally threaded tubular expansion anchor); and machine bolts complying with FS FF-B – 0575, Grade 5
Toggle Bolts	Tumble-wing type, FS FF-B-588
Lock Washers	Helical spring type carbon steel, FS FF-W-84

2.5 PAINTS AND FINISHES.

2.5.01 Shop Primer for Ferrous Metal. Provide manufacturer's or fabricator's standard, fast-curing, lead-free, universal modified alkyd primer selected for good resistance to normal atmospheric corrosion, for compatibility with finish paint systems indicated, and for capability to provide a sound foundation for field-applied topcoats despite prolonged exposure complying with performance requirements of FS TT-P-645. Also comply with Master Specification Section 09900, Painting.

2.5.02 Structural Steel Primer Paint. Provide Universal rust-inhibiting primer which can accept epoxy, epoxy esters and phenolic paints as finish coats.

2.5.03 Zinc Chromate Primer. Shall meet FS TT-P-645.

2.5.04 Galvanizing Repair Paint. Provide high zinc dust content paint for regalvanizing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD-P-21035 or SSPC Paint-20.

2.5.05 Bituminous Paint. Provide cold-applied asphalt mastic complying with SSPC Paint-12 except containing no asbestos fibers.

2.5.06 Shop Coatings Manufacturers. Provide one of the following or an approved equal:

Universal Primer	Carboline Carbogard “888 Primer”, or Tnemec “Series 37H Chem-Prime H.S.”
Red Oxide Primer	SSPC 15, Type 1, or Fed Spec TT-P-636
Epoxy Enamel	Gray; Ameron “Amerlock 400 High-Solids Epoxy Coating”, Carboline “Super Hi-Gard 891”, or Tnemec “Series 140 Pota-Pox Plus”.
Asphalt Varnish	Fed Spec TT-C-494

2.5.07 Galvanizing. All galvanizing shall be done by the hot-dip process after fabrication, in conformity with the requirements of ASTM A123, A153 and A385. Alternatively, blast clean and flux steel. The average minimum thickness of galvanizing shall be 5.0 mils (0.1 mm). The purchaser shall be furnished certification that samples representing each lot have been either tested or inspected as directed by ASTM A123 and the specified minimum thickness of 5.0 mils (0.1mm) has been met. A report of the test results shall be furnished to the purchaser.

Galvanize bolts, nuts and washers and iron and steel hardware components in accord with ASTM A153. Where galvanized bolts are indicated on the drawings or specified, the use of zinc-plated bolts will not be acceptable.

Safeguard products against steel embrittlement in conformance with ASTM A143. Handle galvanized articles in manner to avoid mechanical damage and to minimize distortion.

2.5.08 Post-Galvanizing Treatments. Shall comply with Master Specification Section 09900, Painting on shop priming and painting. Prepare galvanized metal surfaces to be field painted in accord with paint manufacturer’s recommendations. Shop-coat galvanized metal surfaces with approved primers for galvanized or other approved coatings.

2.6 CONCRETE FILL AND REINFORCING MATERIALS.

2.6.01 Concrete Materials and Properties. Comply with requirements of Master Specification Division 3, Concrete for normal weight, ready-mix concrete with minimum 28-day compressive strength of 2,500 psi (17,237 kPa), 440 lb/ft³ (7,048.2 kg per cu m) cement minimum, and W/C ratio of 0.65 maximum, unless higher strengths indicated.

2.6.02 Nonslip Aggregate Finish. Provide factory-graded, packaged material containing fused aluminum oxide grits or crushed emery as abrasive aggregate; rust-proof and non-glazing unaffected by freezing, moisture, or cleaning materials.

2.6.03 Reinforcing Bars. Shall be ASTM A615, Grade 60, unless otherwise indicated.

2.7 ROUGH HARDWARE. Furnish bent or otherwise custom fabricated bolts, plates, anchors, hangers, dowels, and other miscellaneous steel and iron shapes as required for framing and supporting woodwork, and for anchoring and securing woodwork to concrete or other structures.

Fabricate items to sizes, shapes, and dimensions required. Furnish malleable-iron washers for heads and nuts which bear on wood structural connections; elsewhere, furnish steel washers.

2.8 LADDERS.

2.8.01 Steel Ladders. Fabricate ladders for the locations shown, with dimensions, spacings, details and anchorages as indicated. Comply with requirements of ANSI A14.3.

Siderails shall be continuous steel flat bars, 1/2 inch (1.3 cm) x 2 1/2 inches (6.4 cm), with eased edges, spaced 18 inches (45.7 cm) apart.

Bar Rungs shall be round steel bars, 3/4 inch (1.9 cm) diameter, spaced 12 inches (30.5 cm) o.c.

Fit rungs in centerline of side rails, plug weld and grind smooth on outer rail faces.

Support each ladder at top and bottom and at intermediate points spaced not more than 5'-0" (1.52 m) o.c. by means of welded or bolted steel brackets.

Size brackets to support design dead and live loads indicated and to hold centerline of ladder rungs clear of the wall surface by not less than 7 inches (17.8 cm).

Extend side rails 42 inches (106.7 cm) above top rung, and return rails to wall or structure unless other secure handholds are provided. If the adjacent structure does not extend above the top rung, goose-neck the extended rails back to the structure to provide secure ladder access.

Provide non-slip surface on top of each rung, either by coating the rung with aluminum oxide granules set in epoxy resin adhesive, or by using a type of manufactured rung which is filled with aluminum oxide grout.

2.8.02 Aluminum Ladders. Fabricate aluminum ladders with rails and rungs for location as shown on the plans.

Ladder shall meet applicable requirements of OSHA, ANSI, State Basic Safety Code, or other regulatory authority.

The rung shall be designed to provide a nonslip power grip surface with a flat 1-inch wide serrated top surface and a semicircular bottom. The straight sides and semicircular bottom shall have striations at approximately 5/16-inch centers for hand grip. The rung shall be an aluminum extrusion, alloy 6063-T6, of sufficient section modulus and moment of inertia to withstand the design loads. Rungs shall have a mill finish.

The side rail shall be 1-1/2-inch Schedule 40 or Schedule 80 aluminum pipe, alloy 6061-T6 or 6105-T5. Pipe shall conform to ASTM B429 or B221 and shall have an anodized finish Aluminum Association AA-M32-C22-A41. Schedule 40 side rails to be attached to supporting vertical surface at a maximum of 6 feet center-to-center. Schedule 80 side rails to be attached at a maximum of 7 feet center-to-center.

Ladder rungs shall be designed to withstand a concentrated load of 250 pounds plus 30 percent impact. Maximum rung deflection shall not exceed L/360. The design load shall be applied at the center of the rung on a 4-inch wide area. Ladders side rails shall be designed to withstand a minimum of two 250-pound loads plus 30 percent impact concentrated between any two consecutive attachments.

Ladder manufacturer to submit test reports to verify that the ladder rung will withstand the specified load within the deflection allowed. The rung to be tested attached to the ladder side rails to simulate actual ladder construction and usage. The load shall be applied and released a minimum of 200,000 times to demonstrate fatigue resistance and a safe extended service life. At completion of testing the rung, attachments and side rails shall be inspected for cracks, looseness, distortion, bending (permanent set), or other obvious defects or damage.

Ladder safety climb devices shall be required at all ladder locations.

Provide stainless steel bolts for ladder attachments.

Welded, pop riveted, or glued construction will not be acceptable for aluminum ladders. Ladders to be shop assembled in as long as practical modules, but not to exceed 24 feet in length.

Unless shown on the plans the Contractor / Fabricator shall design the ladders per latest Michigan building code and meet OSHA (MIOSHA) requirements and submit the shop drawings and calculations for Engineer’s review.

Ladder Safety Post. Equip all ladders installed beneath sidewalk doors, roof hatches, or other floor or roof openings with telescoping tubular safety post, spring balanced and automatically locking in the raised position, with release lever for unlocking, except when ladder is equipped with Safety Climb Device.

Hot-dip galvanized post

Spring Mechanism.

Corrosion-resistant steel alloy.

Manufacturer: Bilco Co., New Haven, CT, Bilco “Ladder Up” Model 2.

2.8.03 Ships Ladders. Provide ship’s ladders where indicated. Fabricate of open type construction with structural steel channel or steel plate stringers, pipe handrails, and open steel grating treads, unless otherwise indicated. Provide all necessary brackets and fittings for installation.

Galvanize ladders, including, brackets and fasteners, in exterior locations and interior locations where indicated.

2.8.04 Ladder Safety Cages. Fabricate ladder safety cages to comply with ANSI A14.3; assemble by welding or riveting.

Primary hoops shall be steel bars, 5/16 inch (7.9 mm) x 4 inches (10.2 cm), for top, bottom, and for cages longer than 20 feet (6.1 m), intermediate hoops spaced not more than 20’-0” (6.1 m) o.c.

Secondary intermediate hoops shall be steel bars, 5/16 inch (7.9 mm) x 2 inches (5.1 cm) hoops spaced not more than 4 feet – 0 inches (1.2 m) o.c. between primary hoops.

Vertical bars shall be steel, 5/16 inch (7.9 mm) x 2 inches (5.1 cm), secured to each hoop, spaced approximately 9 inches (22.9 cm) o.c.

Fasten assembled safety cage to ladder rails and adjacent construction as indicated.

Galvanize ladder safety cages, including fasteners, in exterior locations and interior locations, where indicated.

2.9 NOSINGS. Fabricate curb nosings from structural steel shapes as indicated, of all welded construction with mitered corners and continuously welded joints. Provide anchors welded to nosings for embedding in concrete or masonry construction, spaced not more than 6 inches (15.2 cm) from each curb end, 6 inches (15.2 cm) from corners and 24 inches (61.0 cm) o.c., unless otherwise indicated.

Galvanize nosings in exterior locations and interior locations where indicated.

2.10 LOOSE BEARING AND LEVELING PLATES. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction, made flat, free from warps or twists, and of required thickness and bearing area. Drill plates to receive anchor bolts and for grouting as required. Galvanize after fabrication.

2.11 LOOSE STEEL LINTELS. Fabricate loose structural steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated.

Weld adjoining members together to form a single unit where indicated.

Size loose lintels for equal bearing of one inch per foot (8.3 cm per m) of clear span but not less than 8 inches (20.3 cm) bearing at each side of openings, unless otherwise indicated.

Galvanize loose steel lintels located in exterior wall.

2.12 MISCELLANEOUS FRAMING AND SUPPORTS. Provide steel framing and supports for applications indicated or which are not a part of structural steel framework, as required to complete work.

Fabricate units to sizes, shapes, and profiles indicated and required to receive adjacent other construction retained by framing and supports. Fabricate from structural steel shapes, plates, and steel bars of welded construction using mitered joints for field connection. Cut, drill, and tap units to receive hardware, hangers, and similar items.
Equip units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units must be installed after concrete is placed.
Except as otherwise indicated, space anchors 24 inches (61.0 cm) o.c. and provide minimum anchor units in the form of steel straps 1 1/4 inches (3.2 cm) wide x 1/4 inch (6.4 mm) x 8 inches (20.3 cm) long.

Galvanize miscellaneous framing and supports in exterior locations and interior locations where indicated.

2.13 SHELF AND RELIEVING ANGLES. Fabricate shelf and relieving angles from steel angles of sizes indicated and for attachment to concrete framing. Provide slotted holes to receive 3/4 inch (1.9 cm) bolts, spaced not more than 6 inches (15.2 cm) from ends and not more than 24 inches (61.0 cm) o.c. unless otherwise indicated.

For cavity walls, provide vertical channel brackets to support shelf/relieving angles from back-up masonry and concrete. Align expansion joints in angles with indicated expansion joints in cavity wall exterior wythe.

Galvanize shelf angles to be installed on exterior concrete framing.

Furnish wedge-type concrete inserts, complete with fasteners, for attachment of shelf angles to cast-in-place concrete.

2.14 METAL BAR AND EXPANDED METAL BAR GRATINGS. Refer to Master Specification Section 05530, Gratings.

2.15 STEEL PIPE RAILINGS AND HANDRAILS. Refer to Master Specification Section 05520, Handrails and Railings.

2.16 STEEL FRAMED STAIRS. Refer to Master Specification Section 05510, Metal Stairs.

2.17 WHEEL GUARDS. Provide wheel guards of 3/4 inch (1.9 cm) thick, hollow core, gray-iron castings, of size and shape indicated. Provide holes for countersunk anchor bolts and grouting.

2.18 PIPE BOLLARDS. Fabricate pipe bollards from Schedule 80 steel pipe. Cap bollards with 1/4 inch (6.4 mm) minimum thickness steel base plate.

Fabricate sleeves for bollard anchorage from steel pipe with 1/4 inch (6.4 mm) thick steel plate welded to bottom of sleeve.

2.19 FLOOR ACCESS DOORS. Access doors leaf shall be 1/4 inch (6.4 mm) diamond pattern aluminum designed for H-20 loading. The doors shall open and close freely in temperatures ranging from –10 degrees F (-23 degrees C) to 106 degrees F (41 degrees C). The channel frame and door leaf reinforcement shall be not less than 1/4 inch (6.4 mm) aluminum. The frame shall have perimeter anchor flange. Door hardware shall be all stainless steel, compression spring operators with automatic hold-open arm with release handle. A drain shall be provided in the channel frame, piped into the basin. All door surfaces in contact with concrete to be coal tar-epoxied. The schedule of floor access doors on the contract drawings are to be furnished and installed under this section. The door shall be Type J or JD as manufactured by Bilco or approved equal.

2.20 FINISHES. Comply with NAAMM “Metal Finishes Manual” for recommendations relative to application and designations of finishes. Finish metal fabrications after assembly.

2.20.01 Steel and Iron Finishes. For those items indicated for galvanizing, apply zinc-coating by the hot-dip process in compliance with the following requirements:

ASTM A153 for galvanizing iron and steel hardware.

ASTM A123 for galvanizing both fabricated and unfabricated iron and steel products made of uncoated rolled, pressed, and forged shapes, plates, bars, and strip 0.0299 inch (0.8 mm) thick and heavier.

For shop priming, prepare uncoated ferrous metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed metal fabrications:

Exteriors (SSPC Zone 1B): SSPC-SP6 “Commercial Blast Cleaning.”

Interiors (SSPC Zone 1A): SSPC-SP3 “Power Tool Cleaning.”

Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finish or to be embedded in concrete, sprayed-on fireproofing, or masonry, unless otherwise indicated. Comply with requirements of SSPC-PA1 “Paint Application Specification No. 1” for shop painting.

Stripe paint all edges, corners, crevices, bolts, welds, and sharp edges.

2.20.02 Aluminum Finishes. Finish designations prefixed by “AA” shall conform to the system established by the Aluminum Association for designating aluminum finishes.

Fabricated finish shall be AA-M10 (Mechanical Finish: as fabricated, unspecified).

Class I Clear Anodized Finish shall be AA-M12C22A41 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class (Architectural: clear film thicker than 0.7 mil (0.02 mm)) complying with AAMA 607.1.

2.21 STEEL PLATFORM. Provide steel platform as shown on the drawings. The platform shall be designed to support the weight and dynamic forces associated with the weight of equipment and associated piping. Join pieces together by welding unless otherwise indicated. Provide complete platform assemblies including metal framing, hangers, columns, struts, clips, brackets, bearing plates and other components necessary for the support of platforms, and as required to anchor and contain the platform on the floor. Note that the grating and handrails are fabricated out of fiberglass.

2.22 TRENCH DRAINS FRAME AND GRATE. Trench drain frame and grate shall be heavy duty, cast iron. Frame and grate shall be coal tar epoxy coated prior to installation.

Trench drains shall be Neenah, R-4990 with Type A grate, EJIW 6900 with Type M2 grate, or approved equal.

Size of trench drain grate shall be as indicated on the drawings.

2.23 CHECKERED PLATE.

2.23.01 Steel. Thickness. As shown, minimum 1/4 inch, meet Federal Specification QQ-F-461, Class I.

Galvanize after fabrication.

2.23.02 Aluminum. Alloy 6061-T6, tread plate, thickness as shown, minimum 1/4 inch.

Fasten accessories by welding or stainless steel bolts or screws.

2.23.03 Stainless Steel. ASTM A167, Type 316, tread plate thickness as shown, minimum 1/4-inch.

2.24 MANUFACTURE AND FABRICATION. Form metal fabrications from materials of size, thickness, and shapes indicated but not less than that needed to comply with performance requirements indicated. Work to dimensions indicated or accepted on shop drawings, using proven details of fabrication and support. Use type of materials indicated or specified for various components of each metal fabrication. Work shall be true to line and level with accurate angles and surfaces and straight sharp edges.

Allow for thermal movement resulting from a maximum change of 100 degrees F (55.5 degrees C) in ambient temperature in the design, fabrication, and installation of installed metal assemblies to prevent buckling, opening up of joints, and overstressing of welds and fasteners. Base design calculations on actual surface temperatures of metals due to both solar heat gain and nighttime sky heat loss.

Shear and punch metals cleanly and accurately. Remove burrs. Ease exposed edges to a radius of approximately 1/32 inch (0.8 mm), unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work. Remove sharp or rough areas on exposed traffic surfaces.

Weld corners and seams continuously to comply with AWS recommendations. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surface matches those adjacent.

Form exposed connections with hairline joints, flush and smooth, using concealed fasteners wherever possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joint where least conspicuous.

Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to provide adequate support for intended use.

Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

Cut, reinforce, drill and tap miscellaneous metal work as indicated to receive finish hardware, screws, and similar items.

Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.

PART 3 – EXECUTION

3.1 PREPARATION. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions, and directions for installation of anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to project site.

3.2 INSTALLATION.

3.2.01 Sequencing and Scheduling. Sequence and coordinate installation of wall handrails as follows:

Mount handrails only on completed walls. Do not support handrails temporarily by any means not satisfying structural performance requirements.

Mount handrails only on wall assemblies reinforced to receive anchors, and where the location of concealed anchor plates has been clearly marked for benefit of Installer.

3.2.02 Fastening to In-Place Construction. Provide anchorage devices and fasteners where necessary for securing miscellaneous metal fabrications to in-place construction; include threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws, and other connectors as required.

Center nosings on tread widths with noses flush with riser faces and tread surfaces. Set sleeves in concrete with tops flush with finish surface elevations; protect sleeves from water and concrete entry.

3.2.03 Cutting, Fitting, and Placement. Perform cutting, drilling, and fitting required for installation of miscellaneous metal fabrications. Set metal fabrication accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rake; and measured from established lines and levels.

Provide temporary bracing or anchors in formwork for items that are to be built into concrete masonry or similar construction.

Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units which have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.

3.2.04 Welding. Welding and related operations shall conform to applicable provisions of the Structural Welding Code, AWS D1.1. All welding shall be performed in accordance with written procedures, using only those joint details which have prequalified status when performed in accordance with AWS D1.1. Welding processes shall be limited to those listed in AWS D1.1, Paragraph 1.3.1, except that the short circuiting transfer mode shall not be used. Filler metal shall be of the type listed in AWS D1.1. Connections for structural steel and for stairs shall be made with filler metal having a minimum tensile strength of 70 ksi (482.6 MPa).

Comply with AISC Specifications for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds. On exposed welded construction, remove erection bolts, fill holes with plug welds and grind smooth at exposed surfaces. Leave finish surfaces of members exposed in final structure free of markings, burrs and other defects.

Connections for miscellaneous steel fabrications not included in the AISC definition of structural steel, except stairs, shall be made with filler metal having a minimum tensile strength of 60 ksi (413.7 MPa) or greater.

Welds not dimensioned on the drawings shall be sized to develop the full strength of the least strength component of the connection.

When the steel is to be welded, a welding procedure suitable for the grade of steel and intended use or service shall be utilized. See ASTM A6 for information on weldability.

Where structural or miscellaneous steel connections are welded, all butt and miter welds shall be continuous and, where exposed to view, shall be ground smooth. Intermittent welds shall have an effective length of at least 2 inches (5.1 cm) and shall be spaced not more than 6 inches (15.2 cm) apart.

Stiffener plates shall be tightly fitted to bear against both flanges and web before welding.

3.2.05 Field Welding. Comply with AWS Code for procedures of manual shielded metal-arc welding, appearance and quality of welds made and methods used in correcting welding work. In addition, use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surface matches those adjacent.

Inspect and test during erection of structural steel. Certify welders and conduct inspections and tests. Record types and locations of defects found in work. Record work required and performed to correct deficiencies. Perform visual inspection of all welds.
Perform tests of welds as follows:

Liquid Penetrant Inspection	ASTM E165
Magnetic Particle Inspection	ASTM E109 performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration not acceptable
Radiographic Inspection	ASTM E94 and ASTM E142; minimum quality level “2-2T”.
Ultrasonic Inspection	ASTM E164

Correct deficiencies in structural steel work which inspections and laboratory test reports show as not in compliance with requirements. Carry out additional tests, at Contractor’s expense, to reconfirm any original work non-compliance and to show corrected work compliance.

3.2.06 Corrosion Protection. Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint or zinc chromate primer.

3.3 SETTING LOOSE PLATES. Clean concrete and masonry bearing surfaces of any bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of bearing plates.

Set loose leveling and bearing plates on wedges, or other adjustable devices. After the bearing members have been positioned and plumbed, tighten the anchor bolts. Do not remove wedges or shims, but if protruding, cut off flush with the edge of the bearing plate before packing with grout.

Use metallic nonshrink grout in concealed locations where not exposed to moisture; use nonmetallic nonshrink gout in exposed locations, unless otherwise indicated. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.4 INSTALLATION OF WHEEL GUARDS. Anchor wheel guards to concrete or masonry construction to comply with manufacturer’s instructions. Fill coarse solidly with air-entrained concrete having a 28-day minimum compressive strength at 3,000 psi (20,684 kPa).

3.5 INSTALLATION OF BOLLARDS. Anchor bollards in concrete by means of pipe sleeves preset and anchored into concrete. After bollards have been inserted into sleeves, fill annular space between bollard and sleeve solid with nonshrink, nonmetallic grout, mixed and placed to comply with grout manufacturer’s directions.

3.6 ADJUSTING AND CLEANING. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 requirements for touch-up of field painted surfaces. Apply by brush or spray to provide a minimum dry film thickness of 2.0 mils (0.05 mm).

3.6.01 Touch-Up Painting. Clean and touch-up painting of field welds, bolted connections, and abraded areas of the shop paint on miscellaneous metal. Refer to Master Specification Section 09900, Painting.

For galvanized surfaces, clean welds, bolted connections, and abraded areas and apply galvanizing repair paint to comply with ASTM A780.

End of Section

SECTION 05510

METAL STAIRS

PART 1 - GENERAL

1.1 SCOPE. This section includes shop fabricated steel stairs, preassembled stair towers, and integral handrails and balusters. Shop cast concrete treads are also included in this section.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations of the following standards.

ASTM (American Society for Testing and Materials) A36/A36M – Specification for Carbon Structural Steel.

ASTM A53/A53M – Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

ASTM A123/A123M – Specification for Zinc (Hot - Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A153/A153M – Specification for Zinc-Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A283/A283M – Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.

ASTM A307 – Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.

ASTM A325 – Specification for Structural Bolts, Steel, Heat-Treated, 120/105 ksi Minimum Tensile Strength.

ASTM A500 – Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A501 – Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip process.

ASTM E935 – Test Methods for Performance of Permanent Metal Railing and Systems and Rails for Buildings.

ASTM E985 – Specification for Permanent Metal Railing Systems and Rails for Buildings.

AWS (American Welding Society) A2.0 - Standard Welding Symbols.

AWS D1.1 – Structural Welding Code – Steel

NAAMM (National Association of Architectural Metal Manufacturers) - Metal Stairs Manual.

NAAMM) – Metal Bar Grating Manual.

SSPC – (Steel Structures Painting Council) – Painting Manual.

1.3 QUALITY ASSURANCE. Perform work in accordance with ASTM E985 – Permanent Metal Railing Systems and Rails for Buildings.

Prepare shop drawings under direct supervision of a Professional Engineer experienced in design of this work and licensed in the State of Michigan.

Welders' Certificates: Submit under provisions of this Section, certifying welders employed on Work and verifying AWS qualification within the previous 12 months.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Contractor shall submit shop drawings, indicating profiles, sizes, connection attachments, reinforcing, anchorage, size, type of fasteners, and accessories. Indicate welded connections using standard AWS A2.0 welding symbols. Also, indicate net weld lengths on shop drawing submittals. Submit design calculations with all shop drawing submittals.

1.5 STORAGE OF MATERIALS. Products shall be protected from conditions that may cause any physical damage. Materials shall be stored on a flat plane. Any damaged materials shall be removed from the job site immediately.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.1.01 Structural Design. Stair assembly shall support a uniform live load of 100 pounds, per square foot (12.0 kPa) with deflection of stringer or landing framing not to exceed 1/180 of span. Test in accordance with ASTM E935.

Stair assembly shall also meet NAAMM – Metal Stairs Manual for industrial, commercial and architectural classes of service.

Railing assembly, wall rails, and attachments shall resist a lateral force of 200 pounds at any point without damage. Test in accordance with ASTM E935.

Pipe shall be ASTM A53, Grade B Schedule 40.

Steel Tubing shall be ASTM A500, Grade B.

Sheet Steel shall be galvanized with 0.25 ounce per square foot (76 g per sq m) galvanized coating in accordance with ASTM A653.

2.1.02 Tread and Landing Concrete Reinforcement. Mesh or Bar type as detailed, galvanized or unfinished.

2.1.03 Bolts, Nuts, and Washers. ASTM A325 or A307 galvanized to ASTM A153 for galvanized components.

2.1.04 Exposed Mechanical Fastenings. Flush countersunk screws or bolts, consistent with design of stair structure.

2.1.05 Welding Materials. Materials shall meet AWS D1.1 for type of materials being welded.

2.1.06 Shop and Touch-Up Primer. Primer used for shop primer painting and field touch-up priming shall be SSPC No.15, Type 1, red oxide.

2.1.07 Touch-up Primer for Galvanized Surfaces. Primer shall be SSPC No. 20 Type I Inorganic or Type II Organic zinc rich.

2.1.08 Gratings. Gratings shall be per NAAMM, Metal Bar Grating Manual, welded or pressure locked type.

2.1.09 Plastic Handrail Cover. Use extruded PVC for cover.

2.1.10 Infill Panels. Panels shall be tempered glass, polycarbonate or acrylic clear panels.

2.1.11 Stair Treads. Shop cast concrete in metal pan shall have rough surface with a non-slip edge.

2.1.12 Shop Cast Concrete Treads. Width shall be as detailed with no bar reinforcement, rough finish and radiused nosings.

2.1.13 Concrete. Type shall be as specified in Master Specification Section 03300, Cast-in-Place.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers include Chicago Ornamental Iron Co., Lapeyre Stair Model, The Sharon Co., Inc., Summit Steel Fabricators, Inc., or an approved equal.

2.3 MANUFACTURE AND FABRICATION. Fit and shop assemble components in largest practical sections, for delivery to site. Fabricate components with joints tightly fitted and secured. Continuously seal joined pieces by continuous welds.

Grind exposed joints flush and smooth with adjacent finish surface. Make exposed joints butt tight, flush, and hairline. Ease exposed edges to small uniform radius.

Exposed mechanical fastenings shall be flush countersunk screws or bolts, unobtrusively located; consistent with design of component, except where specifically noted otherwise.

Supply components required for anchorage of fabrications. Fabricate anchors and related components of same material and finish throughout, except where specifically noted otherwise.

Accurately form components required for anchorage of stairs, landings and railings to each other or to building structure.

2.3.01 Surface Preparation. After inspection and before shipping, clean steel stair components to be painted. Remove loose rust, loose mill scale, splatter, slag or flux deposits. Clean steel in accord with procedures defined in SSPC-SP/10, “Neon White Blast Cleaning.”

2.3.02 Steel Framed Stairs. Construct stairs to conform to sizes and arrangements indicated. Join pieces together by welding, unless otherwise indicated. Provide complete stair assemblies, including metal framing, hangers, columns, railings, newels, balusters, struts, clips, brackets, bearing plates, and other components necessary for the support of stairs and platforms, and as required to anchor and contain the stairs on the supporting structure.

Comply with “Recommended Voluntary Minimum Standards for Fixed Metal Stairs” in NAAMM “Metal Stair Manual” for class of stair designated, except where more stringent requirements are indicated. Use Commercial class, unless otherwise indicated.

Fabricate treads and platforms of exterior stairs to accommodate slopes to drain in finished traffic surfaces.

2.3.03 Stair Framing. Fabricate stringers of structural steel channels, or plates, or a combination thereof, as indicated. Provide closures for exposed ends of stringers. Construct platforms of structural steel channel headers and miscellaneous framing members as indicated. Bolt or weld headers to strings, newels, and framing members to strings and headers; fabricate and join so that bolts, if used, do not appear on finish surfaces.

Where masonry walls support steel stairs, provide temporary supporting struts designed for erection of steel stair components before installation of masonry.

Attach risers and subtreads to stringers by means of brackets made of steel angles or bars. Weld brackets to stringers and attach metal pans to brackets by welding, riveting or bolting.

2.3.04 Stair Treads and Platforms. Stair and landings can be pre-fabricated or erected at the job site.
2.3.05 Pan Stairs and Landings. Pan stairs and landings can be prefabricated and pre-poured or erected and poured at the job site.

Prefabricated stair assemblies with pre-filled treads consisting of pre-poured reinforced concrete fill shall be manufactured with non-slip aggregate finish, in welded sheet metal pan, and attached to installed stringers using manufacturer’s standard connection detail. Provide sub-platforms of configuration and construction indicated; or if not indicated, of same metal as risers and sub-treads, in thicknesses required to support design loading. Attach sub-platform to platform framing members with welds. Construct sub-platforms with smooth soffits. Subject to compliance with requirements, provide Speedstair by American Stair Corp, Inc, or an approved equal

If field poured, fabricate stairs and landings with closed or open risers and treads of metal pan construction, ready to receive concrete. Form treads and risers with minimum 14 gage (2.0 mm) thick which are sheet steel stock. Secure reinforced tread pans to stringers with clip angles, welded or bolted in place.

Form stringers shall be rolled steel channels 12 inches (30.5 cm) deep. Weld fascia plates to channels using 14 gage (2.0 mm) thick steel sheet across channel toes. Form landings with minimum 14 gage (2.0 mm) thick sheet stock. Reinforce underside with angles to attain design load requirements. Form balusters with 1 1/2 (3.8 cm) inch diameter steel sections, welded to stringers.

2.3.06 Checkered Plate Stairs and Landings. For raised steel floor plate treads and platforms, provide plate in pattern indicated or, if not indicated, as selected from manufacturer's standard patterns. Form treads of 1/4 inch (6.4 mm) thick raised pattern steel floor plate with integral nosing and back edge stiffener. Weld steel supporting brackets to stringers and treads to brackets. Use steel plates with prime paint galvanized finish. Fabricate platforms of raised pattern steel floor plate of thickness indicated. Provide nosing matching that on treads at all landings. Secure to platform framing members with welds.

Form stringers with rolled steel channels 12 inches (30.5 cm) deep with a prime paint or galvanized finish. Form landings with checkered steel plate with a prime paint or galvanized finish. Reinforce underside with angles to attain design load requirements. Form balusters with 1 1/2 inch (3.8 cm) diameter steel sections, welded to stringers with a prime paint or galvanized finish.

2.3.07 Open Grating Stairs and Landings. For floor grating treads and platforms, provide patterns, spacing, and bar sizes indicated; fabricate to comply with NAAMM "Metal Bar Grating Manual." Use steel bars welded or bolted to supports with a prime paint or galvanized finish. Fabricate grating treads with steel plate nosing on one edge and with steel angle or steel plate carrier at each end for stringer connections. Secure treads to stringers with bolts. Fabricate grating platforms, with nosing matching that on grating treads, at all landings. Provide toe plates at open-sided edges of grating platform. Secure steel grating to platform frame with welds and aluminum grating to platform frame with saddle clips. Finish shall be shop applied primer and shop- or field-applied paint, as indicated. Also refer to and comply with Master Specification Section 05530, Gratings.

Form hollow stringers with rolled steel channels with a prime paint or galvanized finish. Form landings in accordance with ANSI A202.1 same as treads with a prime paint or galvanized finish. Reinforce underside with angles to attain design load requirements. Form balusters with 1 1/2 inch (3.8 cm) diameter steel sections welded to stringers with a prime paint or galvanized finish.

2.3.08 Unit Stair Towers. Fabricate self-supporting steel stair towers with formed treads and risers. Utilize steel channel stringers and landing platforms. Corner structural support members shall be designed to support full weight of complete stair tower plus design live load; with steel railings, newel posts, and balusters. All units shall be sectored for transport.

2.3.09 Handrails and Railings. Fabricate newels of steel tubing and provide newel caps of gray-iron castings, as shown. Railings may be bent at corners, rail returns, and wall returns, instead of using prefabricated fittings. Connect railing posts to stair framing by direct welding, unless otherwise indicated. Also refer to and comply with applicable requirements specified in Master Specification Section 05520, Handrails and Railings.

2.4 SHOP FINISHING. Clean surfaces of rust, scale, grease, and foreign matter prior to finishing. Do not prime surfaces in direct contact with concrete or where field welding is required. Prime paint items with two coats. Galvanize items to minimum 1.25 ounces per square foot (381 g per square meter) zinc coating in accordance with ASTM A123.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that field conditions are acceptable and are ready to receive work. Verify concealed blocking and reinforcement is installed and correctly located to receive wall mounted handrails.

3.2 PREPARATION. Clean and strip primed steel items to bare metal where site welding is required. Supply items required to be cast into concrete and or embedded in masonry with setting templates.

3.3 INSTALLATION. Convene minimum of one week prior to commencing work of this section. Install components plumb and level, accurately fitted and free from distortion or defects. Provide anchors, plates, angles, hangers, and struts required for connecting stairs to structure. Provide sufficient temporary bracing to maintain true alignment of erected loads until completion of erection and installation of permanent attachments.

Field weld components indicated on shop drawings. Perform field welding in accordance with AWS D1.1. Field bolt and weld to match shop bolting and welding. Conceal bolts and screws whenever possible. Where not concealed, use flush countersunk fastenings. Mechanically fasten joints butted tight, flush, and hairline. Grind welds smooth and flush.

Obtain approval prior to site cutting or creating adjustments not scheduled.

Prime welds, abrasions, and surfaces not shop primed after erection and galvanized surfaces indicated to receive field coats, except when surfaces are to be in contact with concrete.

End of Section

SECTION 05520

HANDRAILS AND RAILINGS

PART 1 – GENERAL

1.1 SCOPE. Section includes carbon steel, stainless steel, aluminum or polyvinyl chloride pipe, tube railings, balusters, fittings, handrails and plastic covered handrails.

1.2 GENERAL.

1.2.01 Coordination. Prior to the beginning of work, conduct a pre-installation conference at the job site. Provide seven calendar days advance written notice ensuring the attendance by competent authorized representatives of the fabricator, building owner’s representative, Engineer, and subcontractors whose work interfaces with the work of this Section. Review the specifications to determine any potential problems, changes, scheduling, unique job site conditions, installation requirements and procedures and any other information pertinent to the installation. Record the results of the conference and furnish copies to all participants.

1.2.02 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

AAMA (American Aluminum Manufacturer’s Association) 603.8 - Voluntary Performance Requirements and Test Procedures for Pigmented Organic Coatings on Extruded Aluminum.

AAMA 605.2 - Voluntary Specification for High Performance Organic Coatings on Engineerural Extrusions and Panels.

AAMA 606.1 - Voluntary Guide Specifications and Inspection Methods for Integral Color Anodic Finishes for Engineerural Aluminum.

AAMA 607.1 - Voluntary Guide Specification and Inspection Methods for Clear Anodic Finishes for Engineerural Aluminum.

AAMA 608.1 - Voluntary Guide Specification and Inspection Methods for Electrolytically Deposited Anodic Finishes for Engineerural Aluminum.

ASTM (American Society of Testing and Materials) A53/A53M – Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

ASTM A123/A123M - Specification for Pipe Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A500 - Specification for Pipe Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A501- Specification for Pipe Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.

ASTM B177 – Guide for Chromium Electroplating on Steel for Engineering Use.

ASTM B211 - Specification for Pipe Aluminum and Aluminum-Alloy Bar, Rod, and Wire, Profiles, and Tubes.

ASTM B221 - Specification for Pipe Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes.

ASTM B241/B241M - Specification for Pipe Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube.

ASTM B483/B483M – Specification for Pipe Aluminum and Aluminum-Alloy Drawn Tubes for General Purpose Applications.

ASTM E935 - Test Methods for Performance of Permanent Metal Railing Systems and Rails for Buildings.

ASTM E985 – Specification for Pipe Permanent Metal Railing Systems and Rails for Buildings.

SSPC (Steel Structures Painting Council) – Painting Manual.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Contractor shall have 5 years documented experience in this specialty and shall furnish references listing projects of similar size and scope.

1.3.02 Regulatory Requirements. Components and installation are to be in compliance with state and local code authorities. Components and installation are to follow current ADA and CABO/ANSI guidelines.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings that indicate profiles, sizes, connection attachments, anchorage, size and type of fasteners, and accessories. Submit manufacturer's data on each product.

1.4.02 Certifications. Furnish certification that all components and fittings are furnished by the same manufacturer or approved by the primary component manufacturer. Furnish certification that components were installed in accordance to manufacturer's engineering data to meet the specified design loads.

1.4.03 Samples. Submit two samples of handrails, elbow, tee, wall bracket, and end stop.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver materials to the job site in good condition and properly protected against damage to finished surfaces.

Store material on site in a location and in a manner to avoid damage. Stack in a way to prevent bending. Store material in a clean, dry location away from uncured concrete and masonry. Cover with waterproof paper, tarpaulin, or polyethylene sheeting in a manner that will permit circulation of air inside the covering.

Keep handling on site to a minimum. Exercise particular care to avoid damage to finishes of material.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Handrail assemblies and attachments shall withstand a minimum concentration of 200 pounds (90.7 kg) applied in any direction at any point along the top.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers include Blumcraft of Pittsburgh, Hollaender Manufacturing Company, Superior Aluminum Products, Inc., Julius Blum & Company, Inc., or an approved equal.

2.3 ALUMINUM RAILING SYSTEM COMPONENTS.

2.3.01 Rails and Posts. Extruded tubing conforming to ASTM B221 or B483.

2.3.02 Fittings. Elbows, T-shapes, wall brackets, escutcheons; cast or machined aluminum.

2.3.03 Mounting. Adjustable brackets and flanges, with aluminum inserts for casting in concrete or with aluminum brackets for embedding into masonry. Prepare backing plate for mounting in masonry wall construction.

2.3.04 Splice Connectors. Concealed spigot or collar with locking set screws or welding collars; cast or machined aluminum.

2.3.05 Exposed Fasteners. Flush countersunk screws or bolts consistent with design of railings. Finish coatings shall conform to AAMA 606.1, 607.1, 608.1.

2.3.06 Exterior Aluminum Surfaces. AAMA A42 or A44 anodized, prepared with a mechanical or chemical pre-treatment, anodized to a clear color.

2.4 STEEL RAILING SYSTEM COMPONENTS.

2.4.01 Steel Tubing. ASTM A500, Grade B.

2.4.02 Fittings. Elbows, T-shapes, wall brackets, escutcheons; cast or machined steel.

2.4.03 Mounting. Adjustable brackets and flanges, steel inserts for casting in concrete or with steel brackets for embedding in masonry. Prepare backing plate for mounting in masonry wall construction.

2.4.04 Exposed Fasteners. Flush countersunk screws or bolts consistent with design of railing.

2.4.05 Splice Connectors. Steel concealed spigots or welding collars or threaded collars.

2.4.06 Plastic Handrail Cover. Extruded PVC, profile and color as selected.

2.4.07 Pipe. ASTM A53, Grade B Schedule 40.

2.5 STEEL PIPE RAIL AND HANDRAILS. Fabricate pipe railings and handrails to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including wall thickness of pipe, post spacings, and anchorage, but not less than that required to support structural loads.

Interconnect railing and handrail members by butt-welding or welding with internal connectors, at fabricator’s option, unless otherwise indicated.

At tee and cross intersections, notch ends of intersecting members to fit contour of pipe to which end is joined and weld all around.

Form changes in direction of railing members by insertion of prefabricated elbow fittings, radius bends of radius indicated, mitering at elbow bends, or bending, as applicable for the change of direction involved.

Form simple and compound curves by bending pipe in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross-section of pipe throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of pipe.

Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated.

Close exposed ends of pipe by welding 3/16 inch (4.8 mm) thick steel plate in place or by use of prefabricated fittings, except where clearance of end of pipe and adjoining wall surface is 1/4 inch (6.4 mm) or less.

2.5.01 <u>Toe Boards</u>. Where indicated, provide toe boards at railings around openings and at the edge of open-sided floors and platforms. Fabricate to dimensions and details indicated, or if not indicated, use 4 inch (10.2 cm) high x 1/8 inch (3.2 mm) steel plate centered between and welded to each railing post.

2.5.02 <u>Brackets, Flanges, Fittings, and Anchors</u>. Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnections of pipe and attachment of railings and handrails to other work. Furnish inserts and other anchorage devices for connecting railings and handrails to concrete or masonry work.

For railing posts set in concrete fabricate sleeves from steel pipe not less than 6 inches (15.2 cm) long and with an inside diameter not less than 1/2 inch (1.3 cm) greater than the outside diameter of post, with steel plate closure welded to bottom of sleeve.

Provide friction fit, removable covers designed to keep sleeves clean and hold top edge of sleeve 1/2 inch (1.3 cm) below finished surface of concrete.

For removable railing posts, fabricate slip-fit sockets from steel pipe whose inside diameter is sized for a close fit with posts and to limit deflection of post without lateral load, measured at top, to not more than 1/12 of post height. Provide socket covers designed and fabricated to resist accidental dislodgement.

2.5.03 <u>Fillers</u>. Provide steel sheet or plate fillers of thickness and size indicated or required to support structural loads of handrails where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses. Size fillers to produce adequate bearing to prevent bracket rotation and overstressing of substrate.

For exterior steel railings and handrails formed from steel pipe with galvanized finish, galvanize all fittings, brackets, fasteners, sleeves, and other ferrous components.

For interior steel railings and handrails formed from steel pipe with galvanized finish, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.

For interior steel railings formed from steel pipe with black finish, provide nongalvanized ferrous metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.

2.6 MANUFACTURE AND FABRICATION. Verify field measurements prior to fabrication. Fit and shop assemble components in largest practical sizes for delivery to site. Fabricate components with joints tightly fitted and secured. Provide spigots and sleeves to accommodate site assembly and installation.

2.6.01 Exposed Mechanical Fastenings. Flush countersunk screws or bolts, unobtrusively located, consistent with design of component, except where specifically noted otherwise.

Supply components required for anchorage of fabrications. Fabricate anchors and related components of same material and finish as fabrication, except where specifically noted otherwise.

2.6.02 Exterior Components. Continuously seal joined pieces by continuous welds. Grind exposed joints flush and smooth with adjacent finish surface. Make exposed joints butt tight, flush and hairline. Ease exposed edges to small uniform radius. Accurately form components to suit stairs and landings, connected to each other and to building structure.

Accommodate for expansion and contraction of members and building movement without damage to connections or members.

PART 3 – EXECUTION

3.1 INSPECTION. Verify that field conditions are acceptable and are ready to receive work. Verify concealed blocking and reinforcement is installed and correctly located to receive wall mounted handrails.

3.2 PREPARATION. Clean and strip primed steel items to bare metal where site welding is required.

Supply items required to be encased into concrete and or embedded in masonry placed in partitions with setting templates to appropriate sections.

3.3 INSTALLATION. Install in accordance with shop drawings and manufacturer's instructions. Install components plumb and level, accurately fitted, free from defects or distortion detrimental to appearance.

3.3.01 Hand Railings. Anchor railings to structure with anchors bolts, plates, or angles.

If welding, field weld anchors as indicated on shop drawings. Touch-up welds with primer. Grind welds smooth.

If using bolts and screws, conceal whenever possible. Where not concealed, use flush countersunk fastenings.

Assemble with spigots and sleeves to accommodate tight joints and secure installation.

3.3.02 Steel Pipe Railings. Adjust railings prior to anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated, or if not indicated, as required for design loads. Plumb posts in each direction. Secure posts and railing ends to building construction as follows:

Anchor posts in concrete by means of pipe sleeves preset and anchored into concrete. After posts have been inserted into sleeves, fill annular space between post and sleeve solid with anchoring material, mixed and placed to comply with anchoring material manufacturer's directions.

If preset pipe sleeves are not indicated, anchor posts in concrete by core drilling holes not less than 5 inches (12.7 cm) deep and 3/4 inch (1.9 cm) greater than outside diameter of post. Clean holes of all loose material, insert posts and fill annular space between post and concrete with non-shrink, nonmetallic grout or anchoring cement, mixed and placed to comply with anchoring material manufacturer's directions.

For interior applications or as indicated, cover anchorage joint with a round steel flange either Welded to post after placement of anchoring material or attached by set screws.

For exterior applications or as indicated, leave anchorage joint exposed, wipe off surplus anchoring material, and leave 1/8 inch (3.2 mm) build-up, sloped away from post. For installations exposed on exterior, or to flow of water, seal anchoring material to comply with grout manufacturer's directions.

Anchor posts to steel with steel oval flanges, angle type or floor type as required by conditions, welded to posts and bolted to steel supporting members.

Anchor rail ends into concrete and masonry with steel round flanges welded to rail ends and anchored into wall construction with lead expansion shields and bolts.

Anchor rail ends to steel with steel oval or round flanges welded to rail ends and bolted to structural steel members, unless otherwise indicated.

Install removable railing sections where indicated in slip-fit metal sockets cast into concrete. Accurately locate sockets to match post spacing.

Secure handrails to wall with wall brackets and end fittings. Provide bracket with not less than 1 1/2 inch (3.8 cm) clearance from inside face of handrail and finished wall surface. Locate brackets as indicated, or if not indicated, at spacing required to support structural loads. Secure wall brackets and wall return fittings to building construction using either a bracket with flange tapped for concealed anchorage to threaded hanger bolt or a bracket with pre-drilled hole for exposed bolt anchorage, as indicated. For concrete and solid masonry anchorage, use drilled-in expansion shield and either concealed hanger bolt or exposed lag bolt, as applicable. For hollow masonry anchorage, use toggle bolts having square heads. For steel framed gypsum board assemblies, fasten brackets directly to steel framing or concealed anchors using self-tapping screws of size and type required to support structural loads.

3.3.03 Expansion Joints. Provide expansion joints as needed to allow for thermal expansion. Provide along pipe and hand railings at locations indicated, or if not indicated, at intervals not to exceed 40 feet (12.2 m). Provide slip joint with internal sleeve extending 2 inches (5.1 cm) beyond joint on either side; fasten internal sleeve securely to one side; locate joint within 6 inches (15.2 cm) of posts.

3.3.04 Cleaning. After installation is completed, wash thoroughly using clean water and soap and rinse with clean water. Do not use acid solution, steel wool or other harsh abrasives. If stain remains after washing, remove finish and restore in accordance with NAAMM Metal Finishes Manual.

Finish must not be removed from anodized aluminum. If aluminum finish is damaged, return component to anodizer for re-anodizing.

3.4 FIELD QUALITY CONTROL. Remove stained or otherwise defective work and replace with material that meets specification requirements.

End of Section

SECTION 05530

GRATINGS

PART 1 – GENERAL

1.1 SCOPE. This section includes metal bar gratings and floor plates. These items, usually supporting pedestrian or light vehicle loads, are either custom fabricated or of proprietary manufacturer. Support framing for formed openings is included in this section.

1.2 GENERAL.

1.2.01 Governing Standards. Comply with the requirements and recommendations of the following standards:

ASTM (American Society for Testing and Materials) A36/A36M – Specification for Pipe Carbon Structural Steel.

ASTM A123/A123M – Specification for Pipe Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A653/A653M – Specification for Pipe Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A666 – Specification for Pipe Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM A1011 – Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM B209 – Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B211 – Specification for Pipe Aluminum and Aluminum-Alloy Bar, Rod, and Wire.

ASTM B221 – Specification for Pipe Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

ASTM B633 – Specification for Electrodeposited Coatings of Zinc or Iron and

Steel.

AWS (American Welding Society) D2.0 – Standard Welding Symbols.

AWS D1.2 - Structural Welding Code – Aluminum.

AWS D1.3 – Structural Welding Code – Sheet Steel.

AWS D1.1 – Structural Welding Code – Steel

NAAMM (National Association of Architectural Metal Manufacturers) – Metal Bar Grating Manual.

NAAMM - Heavy Duty Metal Bare Grating Manual.

SSPC (Steel Structures Painting Council) – Painting Manual.

1.3 QUALITY ASSURANCE.

1.3.01 Fabricator Qualifications. A firm experienced in producing gratings similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

Design gratings under direct supervision of a Professional Engineer experienced in design of this work and licensed in the State of Michigan.

1.3.02 Metal Bar Grating Standards. Comply with applicable requirements of the following:

ASTM B221, "Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes."

Non-Heavy-Duty Metal Bar Gratings: Metal Bar Grating Manual for Steel, Stainless Steel, and Aluminum Gratings and Stair Treads.

Heavy-Duty Metal Bar Gratings: Comply with NAAMM MBG 532, Heavy-Duty Metal Bar Grating Manual.

1.3.03 Welding. Qualify procedures and personnel according to the following:

AWS D1.1, Structural Welding Code – Steel.

AWS D1.2, Structural Welding Code – Aluminum.

AWS D1.3, Structural Welding Code – Sheet Steel.

Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

Take field measurements prior to preparation of shop drawings and fabrication where required, to ensure proper fitting of the work.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Show fabrication and installation details for gratings. Include plans, elevations, sections, and details of connections. Show anchorage, accessory items while providing templates for anchors and bolts specified for installation under other sections. Shop drawings shall show the dimensions and placement of grating panels including grating clips and fastener details. The submittal shall contain coordination with equipment suppliers where openings for equipment are required. Submit manufacturer's specifications, load tables, anchor details and standard installation details.

Submit computations or load tables to show that the grating can support 150 psf (7.2 kPa) live load with no more than 1/4 inch (6.4 mm) deflection.

Provide documentation for clips and anchorage devices for gratings and paint products.

1.4.02. Certifications. Submit certifications for welders employed on the Work verifying they have met AWS qualifications within the previous 12 months.

1.4.03 Samples. Provide samples of each type of grating for approval by Engineer prior to fabrication. Samples shall include main support member, tie members, and banding. Submit samples of materials proposed for use, where required for testing.

1.5 DELIVERY, STORAGE AND HANDLING. For long term storage, store grating on pallets, Keep all FRP materials covered. Do not drag panels across one another. Seal any scratches, crushed or chipped edges.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.1.01 General. All grating and grating stair treads shall be aluminum or steel as indicated on the drawings. Depth of bearing bars for grating and treads shall be as indicated on the drawings.

Except as modified herein, the manufacture, fabrication, and installation of grating shall comply with recommendations in the “Metal Bar Grating Manual” of the National Association of Architectural Metal Manufacturers.

2.1.02 Structural Performance. Provide gratings capable of withstanding structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections.

2.1.03 Floors. Capable of withstanding a uniform load of 260 lbf per square foot (12.4 kPa) or a concentrated load of 3000 lbf (1360.8 kg) whichever produces the greater stress.

2.1.04 Walkways and Elevated Platforms. Capable of withstanding a uniform load of 60 lbf per square foot (2.9 kPa). Limit deflection to L/360 or 1/4 inch (6.4 mm) whichever is less.

2.1.05 Walkways and Elevated Platforms. Capable of withstanding a uniform load of 100 lbf per square foot (4.8 kPa) or a concentrated load of 300 lbf (136.1 kg) on an area of 4 square inch (25.8 sq cm) whichever produces the greater stress. Limit deflection to L/360 or 1/4 inch (6.4 mm), whichever is less.

2.1.06 Sidewalks and Vehicular Driveways. Capable of withstanding a uniform load of 250 lbf per square foot (12.0 kPa) or a concentrated load of 8000 lbf (3628.8 kg), whichever produces the greater stress.

2.2 ACCEPTABLE MANUFACTURERS. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to, the following:

Metal Bar Gratings:

All American Grating, Inc.

Barnett/Bates Corp.

Harsco IKG.

Ohio Gratings, Inc.

Seidelhuber Metal Products, Inc.

Tru-Weld Grating, Inc.

Or Equal

2.3 MATERIALS.

2.3.01 Aluminum. Extruded bars and shapes shall comply with ASTM B221, alloys as follows:

6061-T6 or 6063-T6 – for bearing bars of gratings and shapes.

6061-T1 – for grating crossbars.

Aluminum Sheet shall comply with ASTM B209 alloy 5052-H32.

Aluminum grating shall be the mechanically locked type, with cross bars deformed or swaged to prevent turning. Grating stair treads shall be pressure locked or one-piece cast or extruded type. Bearing bars shall be at least 3/16 inch (4.8 mm) thick flat stock or equivalent I-bars, with center-to-center spacing of 1 3/16 inches (3.0 cm).

2.3.02 Steel Grating. Steel grating shall be welded type. Bearing bars shall be at least 3/16 inch (4.8 mm) thick, with center-to-center spacing of 1 3/16 (3.0 cm) inches. Grating shall be galvanized after fabrication. Bearing and cross bars shall be flush at surface. Provide nonslip surface.

2.3.03 Paint. Prepare surfaces to be primed in accordance with SSPC SP 2. Cold-applied asphalt mastic paint shall comply with SSPC Paint No. 12, except containing no asbestos fibers, or cold-applied asphalt emulsion per ASTM D1187.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 General. Grating panels shall be arranged so that openings are centered on a joint between panels. Toeplates extending the full depth of the grating and 4 inches (10.2 cm) above the top shall be provided around openings 2 inches (5.1 cm) and greater in diameter and on the open sides of stairway landings, overhead platforms, overhead walkways, and other locations indicated on the drawings. Ends of bearing bars in grating floor panels shall be provided with full-depth bands. Bands and toeplates shall be 3/16 inch (4.8 mm) thick. Toeplates shall be welded to each bearing bar. Bands shall be welded to the first, the last, and every fourth intermediate bar. Cross bars shall be cut off flush with the outside face of side bars.

All angular, circular, re-entrant, and other cuts in aluminum grating shall be sawed or sheared. Angular, circular and re-entrant cuts in steel grating may be made by flame cutting. All other cuts in steel grating shall be sawed or sheared. Cuts shall be smooth and clean, without fins, beads or other projections. Provide cut outs as required for the passage of pipes, valves and equipment operators, conduit, stems, and similar work. Cut outs for circular obstructions shall be at least 2 inches (5.1 cm) larger in diameter than the obstruction.

Grating shall be fabricated in panels that can be easily handled by plant personnel. Unless otherwise indicated on the drawings, the weight of individual panels shall not exceed 150 pounds (68.0 kg). Panels shall be within ± 3/16 inch (4.8 mm) of authorized length and ± 1/8 inch (3.2 mm) of authorized width, and shall have a maximum difference in length of opposite diagonals of 1/4 inch (6.4 mm). The spacing of bearing bars shall be within 1/32 inch (0.8 mm) of authorized spacing.

Cross bars and edge bars of adjacent panels shall align. After installation, there shall be not more than 1/4 inch (6.4 mm) clearance between panels. All bearing bars shall be parallel. Bands and toeplates shall align within 1/8 inch (3.2 mm) tolerance, vertical and horizontal.

All grating shall lie flat, with no tendency to rock when installed without the use of wedges or shims. Poorly fitting or damaged grating will be rejected.

Steel frames anchored to or cast in concrete to support grating shall be hot-dip galvanized after fabrication.

Provide removable sections of grating with suitable end bearing where noted on the drawings or otherwise required.

Grating stair treads shall be provided with carrier plats and Wooster “120” abrasive nosings. Stair treads shall be fastened to stair stringers with galvanized bolts. Nosings shall be attached with stainless steel bolts and self-locking nuts.

2.4.02 Shop Assembly. Fabricate grating sections in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

Form from materials of size, thickness, and shapes indicated, but not less than that needed to support indicated loads.

Shear and punch metals clearly and accurately. Remove any burrs on grating.

Ease exposed edges to a radius of approximately 1/32 inch (0.8 mm), unless otherwise indicated.

Fit exposed connections accurately together to form hairline joints.

2.4.03 Welding. Comply with AWS recommendations. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately.

Provide for anchorage of type indicated and coordinate with supporting structure. Fabricate and space anchoring devices to secure gratings, frames, and supports rigidly in place and to support indicated loads.

Fabricate toeplates for attaching in the field. Toeplate Height shall be 4 inches, (10.2 cm) unless otherwise indicated.

2.5 METAL BAR GRATINGS. Produce metal bar gratings of description indicated per NAAMM marking system that comply with the following:

Metal Bar Grating Standard "Standard Specifications for Metal Bar Grating and Metal Bar Grating Treads" published in ANSI/NAAMM A202.2 "Metal Bar Grating Manual."

Heavy Duty Metal Bar Grating Standard: "Guide Specifications for Heavy Duty Metal Bar Grating" published in NAAMM "Heavy Duty Metal Bar Grating Manual."

2.5.01 Welded and Pressure-Locked Steel Gratings. Mark/Size shall be W-15-4 (welded with bearing bars 15/16 inch (2.4 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), W-19-4 (welded with bearings bars 1 3/16 inch (3.0 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), or as indicated with bearing bar sizes as indicated.

2.5.02 Riveted Steel Gratings. Mark/Size shall be R-12-7 (riveted with 3/4 inch (1.9 cm) space between bearing bars and cross bars 7 inches (17.8 cm) o.c.), R-18-7 (riveted with 1 1/8 inch (2.9 cm) space between bearing bars and cross bars 4 inches (10.2 cm) o.c.), or as indicated with bearing bar sizes as indicated.

2.5.03 Pressure-Locked Rectangular Bar Aluminum Gratings. Mark/Size shall be P-7-4 (pressure-locked with bearing bars 7/16 inch (1.1 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), P-15-4 (pressure-locked with bearing bars 15/16 inch (2.4 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), P-19-4 (pressure-locked with bearing bars 1 3/16 inches (3.0 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), or as indicated with rectangular bearing bar sizes as indicated.

2.5.04 Pressure-Locked I-Bar Aluminum Gratings. Mark/Size shall be P-16-2 (pressure-locked with bearing bars 1 inch (2.5 cm) o.c. and cross bar 2 inches (5.1 cm) o.c.), P-19-4 (pressure-locked with bearing bars 1 3/16 inch (3.0 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), or as indicated with I-shaped bearing bar sizes as indicated.

2.5.05 Welded Heavy Duty Steel Gratings. Mark/Size shall be W-19-4 (welded with bearing bars 1 3/16 inch (3.0 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), W-30-4 (welded with bearing bars 1 7/8 inch (4.8 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.), or as indicated with bearing bar sizes as indicated. Grating will be sized to comply with structural performance requirements.

2.5.06 Pressure-Locked, Heavy Duty Stainless Steel Gratings. Mark/Size shall be P-38-4 (riveted with bearing bars spaced 2 3/8 inches (6.0 cm) o.c. and cross bars 4 inches (10.2 cm) o.c.) or as indicated with bearing bar sizes as indicated. Grating will be sized to comply with structural performance requirements.

2.5.07 Riveted Heavy Duty Steel Gratings. Mark/Size shall be R-19-3-1/2 (riveted with 1 3/16 inch (3.0 cm) space between bearing bars and cross bars 3 1/2 inches (8.9 cm) o.c.) or as indicated with bearing bar sizes as indicated. Grating will be sized to comply with structural performance requirements.

2.5.08 Traffic Surface for Steel Bar Gratings. Traffic surfaces shall be plain, serrated, knurled, applied abrasive finish (consisting of aluminum oxide aggregate in an epoxy resin adhesive), or as indicated.

2.5.09 Traffic Surface for Aluminum Bar Gratings. Traffic surfaces shall be plain, grooved, applied abrasive finish (consisting of aluminum oxide aggregate in an epoxy resin adhesive), or as indicated.

2.5.10 Steel Finish. For interior finishes or as indicated, apply prime paint in shop in accordance with manufacturer’s standard practice.

For exterior finishes or as indicated, apply hot-dip galvanized with a coating weight of not less than 1.8 ounce per square foot (549 g per sq m) of coated surface.

2.5.11 Aluminum Finish. Provide Mill or Class I Clear anodized finish as indicated.

Fabricate removable grating sections with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type indicated, or if not indicated, as recommended by manufacturer, for attachment to supports.

Provide grating panels in 6 feet – 0 inches (1.8 m) maximum widths.

Provide 12 inch (30.5 cm) wide banded panels at all stop gate locations.

Provide not less than 4 anchor blocks for each section of heavy duty grating composed of bearing bars over 3/16 inch (4.8 mm) in thickness, with each block shop-welded to 2 bearing bars.

Provide not less than four saddle clips for each grating section composed of rectangular bearing bars 3/16 inch (4.8 mm) or less in thickness and spaced 15/16 inch (2.4 cm) or more o.c. Each clip shall be designed and fabricated to fit over two bearing bars. Furnish galvanized malleable-iron flange clamp with galvanized bolt for securing grating to supports. Furnish as a system designed to be installed from above grating by one person.

Subject to compliance with requirements, a product that may be incorporated into the work includes, but is not limited to, “Grate-Fast” by Struct-Fast Inc.

Provide not less than 4 flange blocks for each section of aluminum I-bar grating, with block designed to fit over lower flange of I-shaped bearing bars.

Furnish threaded bolts with nuts and washers for each clip required.

Furnish self-drilling fasteners with washers for each clip required.

Attach toe plates to grating by welding, unless otherwise indicated.

Furnish toe plates for attachment in field.

Toe plate height shall be 4 inches (10.2 cm), unless a greater height is indicated.

Fabricate cutouts in grating sections for penetrations indicated. Arrange layout of cutouts to permit grating removal without disturbing items penetrating gratings.

Edge band openings in grating that interrupt 4 or more bearing bars with bars of same size and material as bearing bars.

Do not notch bearing bars at supports to maintain elevation.

Fabricate frames for aluminum gratings from extruded-aluminum shapes to sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter and weld connections. Cut, drill, and tap units to receive hardware and similar items.

Equip units with integrally welded anchors for casting into concrete or building into masonry.

Unless otherwise indicated, space anchors 24 inches (61.0 cm) o.c. and provide minimum anchor units in the form of steel straps 1 1/4 inches (3.2 cm) wide by 1/4 inch (6.4 mm) thick by 8 inches (20.3 cm) long.

Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

Finish gratings, frames, and supports after assembly.

2.6 EXPANDED METAL GRATINGS. Provide expanded metal gratings in material, style, size, thickness, weight, and type indicated, or if not indicated, as recommended by manufacturer for indicated applications and design loadings.

Material shall be steel or aluminum as indicated.

Steel Finish shall be unfinished and oiled, shop prime painted, or hot-dipped galvanized after fabrication as indicated.

Aluminum Finish shall be mill as fabricated.

Cut, drill and fit grating sections in shop to maximum extent possible.

Fabricate cutouts in grating sections for penetrations of sizes and at locations indicated. Cut openings neatly and accurately to size; edge-band openings with bars having a thickness not less than overall grating thickness at contact points.

Wherever gratings are pierced by pipes, ducts, and structural members, cut openings neatly and accurately to size and weld a steel strap collar not less than 1/8 inch (3.2 mm) thick to the cut ends. Divide panels into sections only to extent required for installation wherever grating platforms and runways are to be placed around previously installed pipe, ducts, and structural members.

Fit exposed connections accurately together to form hairline joints.

2.7 FASTENERS.

2.7.01 General. Provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B633, Class Fe/Zn 5, where built into exterior walls.

2.7.02 Fasteners for Aluminum Gratings. Provide fasteners of aluminum, nonmagnetic stainless steel, zinc-plated steel, or other material warranted by the manufacturer to be compatible with aluminum gratings and other components.

PART 3 – EXECUTION

3.1 INSPECTION. Verify field measurements prior to fabrication.

Where gratings are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the work.

Coordinate installation of anchorages for gratings, grating frames, and supports. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to project site in time for installation.

Upon receiving, inspect materials thoroughly for damage or inaccuracies. Grating shall not be damaged during handling and installation.

Verify that opening sizes and dimensional tolerances are acceptable.

Verify that supports and anchors are correctly positioned.

3.2 INSTALLATION. Place frames in correct position, plumb and level. Mechanically cut galvanized finish surfaces. Do not flame cut. Anchor by welding, bolting through saddle clips, flange blocks. Set perimeter closure flush with top of grating and surrounding construction.

Secure to prevent movement. Alignment of supports must be checked before placement of grating units. All bearing surfaces must be clean. Place units on supporting members and adjust into final position with proper bearing, alignment at joints and supports then immediately fasten. Use anchoring devices as supplied or approved by the grating manufacturer and in accordance with the manufacturer's instructions. Coat all cut or sanded surfaces with resin furnished by the grating manufacturer in accordance with the manufacturer's instructions.

Grating covers for flumes, manholes, or pits may rest unanchored in recesses constructed for the purpose. To avoid excessive tolerances, an extra-long panel shall be provided for each unanchored grating cover that exceeds 20 feet (6.1 m) in length. The panel shall be field cut to the required dimension after the remainder of the grating panels have been installed. All other grating shall be securely anchored in place. Each grating panel shall be fastened in place with saddle-clips or flange blocks as illustrated in the NAAMM "Metal Bar Grating Manual". Lindapter "Grate-Fast" or Grating Specialty Co., Inc., "G-Clip" stepped locking fasteners. Clips for steel grating shall be stainless steel. Clips or flange blocks for aluminum grating shall be stainless steel. Clips shall be fastened to supporting steel with Nelson stud-type bolts at least 1/4 inch (6.4 mm) in diameter. All fastener parts shall be stainless steel.

3.2.02 Fastening to In-Place Construction. Provide anchorage devices and fasteners where necessary for securing gratings to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

3.2.03 Cutting, Fitting, and Placement. Perform cutting, drilling, and fitting required for installing gratings. Set units accurately in location, alignment, and elevation measured from established lines, levels and free from rack.

Provide temporary bracing or anchors in formwork for items that are to be built into concrete or masonry.

Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

3.2.04 Field Welding. Use materials and methods that minimize distortion, develop strength and develop corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately after welding operations.

3.2.05 Corrosion Protection. Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

3.2.06 Installation of Metal Bar Gratings. Install gratings to comply with recommendations of NAAMM grating standard referenced under Part 2 that apply to grating types and bar sizes indicated, including installation clearances and standard anchoring details.

Secure removable units to supporting members with type and size of clips and fasteners indicated, or if not indicated as recommended by grating manufacturer for type of installation conditions shown.

Secure non-removable units to supporting members by welding where both materials are the same; otherwise, fasten by bolting as indicated above.

Attach toe plates to gratings by welding, at locations indicated.

3.2.07 Installation of Expanded Metal Gratings. Comply with manufacturer's instructions for installation of gratings.

Place units with straight edge of bond up and with the long direction of diamond-shaped openings parallel with direction of span.

Attach removable units to supporting members by bolting at 6 inch (15.2 cm) intervals.

Attach non-removable units to supporting members by welding, unless otherwise indicated. Space welds at 6 inch (15.2 cm) intervals.

Attach aluminum units to steel supporting members by bolting at 6 inches (15.2 cm) intervals.

Butt edges parallel to long way of diamonds and weld at every second bond point. Place individual grating sections so that diamonds of one piece are aligned with those of adjacent sections.

3.2.08 Cleaning. Clean all exposed surfaces as recommended by the manufacturer. Clean welds and damaged coatings and apply two coats of touch-up primer.

End of Section

SECTION 05550

ANCHOR BOLTS AND EXPANSION ANCHORS

PART 1 – GENERAL

1.1 SCOPE. This section covers cast-in-place anchor bolts, epoxy grouted anchor bolts, threaded rod anchors, adhesive anchors, and expansion anchors to be installed in hardened concrete and masonry.

Additional requirements for equipment anchor bolts are covered in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

Adhesive for the adhesive anchors is specified herein. Epoxy grouting of anchor bolts and threaded rod anchors is covered in Master Specification Section 03600, Grout.

1.2 GENERAL. Unless otherwise specified or indicated on the drawings, all anchor bolts shall be cast-in-place bolts, shall have a diameter of at least 3/4 inch (1.9 cm), and shall be straight-headed. Also acceptable is straight type with embedded nut with or without a plate, or L-shaped. Epoxy grouted anchor bolts, threaded rod anchors which are epoxy grouted, and adhesive anchors indicated or accepted instead of cast-in-place anchor bolts for equipment or structural framing shall be at least 3/4 inch (1.9 cm) in diameter. All cast-in-place anchors in grout-filled masonry shall be at least 1/2 inch (1.27 cm) but not more than 3/4 inch (1.9 cm) in diameter. All expansion anchors shall be at least 1/2 inch (1.27 cm) in diameter.

Anchor bolts and threaded rod anchors for buried service and in splash zones shall be hot-dip galvanized. Anchor bolts, threaded rod anchors, adhesive anchors, and expansion anchors for immersed service shall be stainless steel. Expansion anchors and adhesive anchors for buried service and in splash zones shall be stainless steel. All other anchor bolts, threaded rod anchors, adhesive anchors, and expansion anchors shall be carbon steel unless otherwise specified or indicated on the drawings.

1.2.01 Governing Standards. Comply with the requirements and recommendations set forth in the current publications and addenda thereto of the following standards:

> ASTM (American Society of Testing Materials) A36/A36M – Specification for Pipe Carbon Structural Steel.
>
> ASTM A153/A153M – Specification for Pipe Zinc-Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A307 – Specification for Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength

ASTM A385 – Practice for Providing High-Quality Zinc Coatings (Hot-Dip).

ASTM A615/A615M – Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM E488 – Test Methods for Strength of Anchors in Concrete and Masonry Elements

ASTM E754 – Test Method for Pullout Resistance of Ties and Anchors Embedded in Masonry Mortar Joints

ASTM E1512 - Test Methods for Testing Bond Performance of Adhesive-Bonded Anchors

ASTM F593 – Specification for Pipe Stainless Steel Bolts, Hex Cap Screws, and Studs.

ASTM F594 – Specification for Pipe Stainless Steel Nuts.

ASTM F1554 – Specification for Anchor Bolts, Steel, 36, 55, and 105-KSI Yield Strength

IFI – Industrial Fastener Institute.

1.3 QUALITY ASSURANCE. Bolts, washers etc. used for anchor installation shall be per Industrial Fastener Institute.

1.3.01 Design Standards. Allowable loads for expansion anchors shall be based upon the final embedment depth after torquing. The final embedment may be assumed to be equal to the embedment depth, as specified on the design document, minus one nut height.

Allowable tension loads shall be equal to or greater than the total of all tension loads acting concurrently on an anchor. For example, direct tension plus the resultant tension caused by applied moments on the connection.

Allowable shear loads shall be equal to or greater than the total of all shear loads acting concurrently on an anchor. For example, direct shear plus the shear caused by a torsional moment applied to the connection.

Anchor embedment depth shall be calculated by subtracting from the total bolt length the threaded length of bolt, the thickness of the plate, and the thickness of the grout or concrete topping. Anchor embedment depth should not be less than the minimum embedment depth specified in the drawing.

If the actual anchor spacing is less than the required spacing, reduce the allowable loads as follows: An anchor having spacing less than the required spacing with only one other anchor, reduce the allowable load by the ratio of the actual to required spacing. An anchor having spacing less than the required spacing with two or more anchors, reduce the allowable loads by the square of the ratio of the actual to required spacing. Actual spacing shall not be less than 50 percent of the required spacing.

Required spacing between two different diameter anchors shall be average spacing, $[(10D_1 + 10D_2)/2]$. If the actual anchor spacing is less than the required average spacing, reduce the allowable loads as specified above. Spacing violations between grouted-in bolts or embedded bolts shall be evaluated by using shear cone theory on a case-by-case basis.

The anchor size, anchor length and spacing should be indicated in the appropriate design documents. The manufacturer's standard anchor length shall be specified after allowing for the thickness of the connected parts, any necessary grout, space for nuts and washers, 2 inch (5.08cm) concrete topping if applicable, and the minimum embedment.

1.4 SUBMITTALS.

1.4.01 Drawing and Data. Submit product data on all anchors.

1.4.02 Certificates. Submit ICC-ES Evaluation Reports for all anchors.

PART 2 – PRODUCTS

2.1 MATERIAL.

2.1.01 Anchor, Bolts and Nuts.

Carbon Steel	ASTM A307
Stainless Steel	Bolts, ASTM F593, Alloy Group 1 or 2; nuts, ASTM F594, Alloy Group 1 or 2.
Galvanized Steel	Carbon steel bolts and nuts; hot-dip galvanized, ASTM A153 and A385.

2.1.02 Threaded Rod, Anchors and Nuts.

Carbon Steel	ASTM A307 or ASTM F1554, Grade 36
Stainless Steel	Bolts, ASTM F593, Alloy Group 1 or 2; nuts, ASTM F594, Alloy Group 1 or 2, IFI-104, Grade 304 or 316.
Galvanized Steel	Carbon steel bolts and nuts; hot-dip galvanized, ASTM A153 and A385.

2.1.03 Adhesive Anchors (for concrete and grout filled masonry).

System	Hilti “HIT-HY 200System”, ITW Ramset/Redhead “Epcon Ceramic 6 System
Threaded Rod, Anchors and Nuts	As specified for threaded rod anchors.
Adhesive	Two-component liquid, moisture-insensitive epoxy adhesive with viscosity appropriate for the location and application. Components shall be packaged at the factory in a dual-chambered cartridge.

2.1.04 Adhesive Anchors (for hollow masonry).

System	Hilti HI-HY 70, ITW Ramset/Redhead “Epcon Ceramic 6 System
Threaded Rod, Anchors and Nuts	As specified for threaded rod anchors.
Adhesive	Two-component liquid, moisture-insensitive epoxy adhesive with viscosity appropriate for the location and application. Components shall be packaged at the factory in a dual-chambered cartridge.
Screen Tubes	As recommended by the manufacturer.

2.1.05 Flat Washers. Shall be ANSI B18.22.1, of the same material as anchor bolts and nuts.

2.1.06 Expansion Anchors for Concrete. Shall be Hilti “Kwik-Bolt III”, ITW Ramset/Redhead “Thrubolt Wedge Anchor”, Powers “Power-Stud Anchor”, or approved equal.

Anchors shall comply with Fed Spec FF-S-325. Wedge type shall be Group II, Type 4, Class 1 or 2; self-drilling type shall be Group III, Type 1; and nondrilling type shall be Group VIII, Type 1 or 2.

2.1.07 Expansion Anchors for Masonry. Shall be Fed Spec FF-S-325; lag shield (zinc) type, Group II, Type 1; or split shield type, Group II, Type 3, Class 3, and be Hilti, ITQ Ramset-Redhead, Powers, or approved equal.

2.1.08 Reinforcing Bars. Shall be ASTM A615, Grade 60, deformed.

PART 3 – EXECUTION

3.1 GENERAL. Cast-in-place bolts shall have a diameter of at least 1/2 inch (1.27 cm) and shall be "L" shaped unless otherwise indicated or accepted. Expansion anchors for equipment or structural framing shall have a diameter of at least 3/4 inch (1.9 cm). All other expansion anchors shall have a diameter of at least 1/2 inch (1.27 cm).

3.2 ANCHOR BOLTS. Anchor bolts shall be delivered in time to permit setting before the structural concrete is placed. Anchor bolts which are cast-in-place in concrete shall be provided with sufficient threads to permit a nut to be installed on the concrete side of the concrete form or supporting template. Anchor bolts which are to be epoxy grouted shall be clean and free of coatings that would weaken the bond with epoxy.

Two nuts, a jam nut, and a washer shall be furnished with each anchor bolt indicated on drawings to have locknuts. Two nuts and a washer shall be furnished for all other anchor bolts.

Anti-seize thread lubricant shall be liberally applied to projecting threaded portions of stainless steel anchor bolts immediately before final installation and tightening of the nuts.

Anchor bolts shall be cast in place and, when acceptable to the Engineer or indicated on the drawings, may be epoxy grouted anchor bolts, threaded rod anchors, or adhesive anchors. Anchor bolts, threaded rod anchors, and adhesive anchors which are to be epoxy grouted shall be clean and free of coatings that would weaken the bond of the epoxy. Anchor bolts which are to be epoxy grouted shall not be installed in fresh concrete until it has been allowed to cure for 14 days.

3.3 THREADED ROD ANCHORS. When acceptable to the Engineer, threaded rod anchors may be used in locations where cast-in-place anchor bolts are specified. Adhesive for threaded rod anchors shall be as specified in the Master Specification Section 03600, Grout. The embedment depth for threaded rod anchors shall be at least 15 rod diameters.

3.4 ADHESIVE ANCHORS. When adhesive anchors are indicated on the drawings, only an acceptable adhesive anchor system shall be used. Alternative anchoring systems may be used only when acceptable to the Engineer. An acceptable adhesive anchor system may be used as an alternative in locations where epoxy grouted anchor bolts and threaded rod anchors are specified or indicated. The embedment depth for adhesive anchors shall be at least 15 rod diameters.

Adhesive for adhesive anchors shall be statically mixed in the field during application. All proportioning and mixing of the components shall be in accordance with the manufacturer's recommendations.

When acceptable to the Engineer, adhesive anchors shall be anchored in holes drilled into hardened concrete or grout filled masonry. Diameter of holes shall be 1/16 inch (1.6 mm) larger than the outside diameter of the rod. Holes shall be prepared for insertion of the anchors by removing all dust and debris using procedures recommended by the adhesive manufacturer.

Adhesive anchors and holes shall be clean, dry and free of grease and other foreign matter at the time of installation. The adhesive shall be placed, the rods shall be set and positioned, and the adhesive shall be finished, all in accordance with the recommendations of the material manufacturer. Care shall be taken to ensure that all spaces and cavities are filled with adhesive, without voids, and remain filled with adhesive until completion of the curing period. Adhesive shall be cured in accordance with the recommendations of the adhesive manufacturer.

3.5 EXPANSION ANCHORS. When expansion anchors are indicated on the drawings, only an acceptable expansion anchor shall be used. Alternative anchoring systems may be used only when acceptable to the Engineer. Expansion anchors shall be installed in conformity with the manufacturer's recommendations for maximum holding power, but in no case shall the depth of the hole be less than six bolt diameters. The minimum distance between the center of any expansion anchor and an edge or exterior corner of concrete shall be at least six times the diameter of the bolt. Unless otherwise indicated on the drawings, the minimum distance between the centers of expansion anchors shall be 12 times the diameter of the bolt.

Nuts and washers for expansion anchors shall be as specified for anchor bolts. Anti-seize thread lubricant shall be liberally applied to threaded stainless steel components of expansion anchors immediately before installation.

Expansion anchors shall not be installed in fresh concrete until it has been allowed to cure for 28 days.

End of Section

SECTION 05630

ACCESS HATCHES

PART 1 - GENERAL

1.1 SCOPE. This section includes access hatches with integral curbs, frames, and attachments.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. The roof hatches shall have a clear opening as shown on the drawings, and shall consist of an insulated cover and frame. Material shall be G90 galvanized steel and have a factory applied coat of primer or .090 Aluminum H-14 3003, with a mill finish. Corners shall be fully welded and ground smooth. A gasket between cover and frame shall create a weathertight seal.

Floor hatches shall have a clear opening as shown on the drawings, and shall consist of a cover and frame. Material shall be G90 galvanized sheet and shall have a factory applied coat of primer or .090 aluminum H-14 3003, with a mill finish. Corners shall be fully welded and ground smooth. A gasket between cover and frame shall create an air and watertight seal.

1.2.02 Governing Standards. Comply with the requirements and recommendations set forth in the following standards:

AA – The Aluminum Association.

AAMA – American Architectural Manufacturer's Association.

ASTM (American Society for Testing and Materials) A36/A36M – Specification for Pipe Carbon Structural Steel.

ASTM A568/A568M – Specification for General Requirements for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled.

ASTM A653/A653M – Specification for Pipe Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

AWS (American Welding Society) D1.1 – Structural Welding Code – Steel.

FMRC – Factory Mutual Research Corporation.

UL – Underwriters Laboratory, Inc.

1.3 QUALITY ASSURANCE. Components and installation shall comply with state and local code authorities. Components and installation shall follow current ADA and CABO/ANSI guidelines.

1.3.01 Manufacturer Qualifications. Furnish assemblies from 1 manufacturer with a minimum of 5 years of documented experience in the fabrication of trench cover, access cover and trench liner assemblies.

1.3.02 Installer Qualifications. Firm shall have 5 years of documented experience in the installation of systems required by this project and acceptable to the manufacturer of the system. Furnish references listing projects of similar size and scope.

1.3.03 Sequencing. Submittals shall be completed and approved prior to award of subcontract for system components. Subcontract for the work of this section shall be planned to allow sufficient time for manufacturer's production and delivery scheduling.

1.3.04 Source Quality Control. All products shall be furnished from an ISO 9002 certified manufacturing facility.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings showing complete fabrication details for all access hatches, including required anchorage to surrounding construction, recesses, blocking, and connections between similar and dissimilar trench cover assemblies. Submit manufacturer's specifications and technical data, including Material Safety Data Sheets, installation instructions and, as required, catalog cuts and templates explaining construction and providing for incorporation into the project.

1.4.02 Certifications. Furnish certification that all components and fittings are furnished by the same manufacturer or approved by the primary component manufacturer. Furnish certification that components were installed in accordance to manufacturer's engineering data to meet the specified design loads. Submit certificates, copies of independent test reports or research reports showing compliance with specified performance requirements.

1.5 DELIVERY, STORAGE AND HANDLING. Provide temporary protective cover on finished surfaces. Deliver access hatches to job site in clean, new, unopened crates of sufficient size and strength to protect materials during transit. Store components in original containers in a clean, dry location. Handle components with equipment of sufficient size to preclude hazard to personnel or components. Examine hatches upon arrival on site. Notify the carrier and manufacturer of any damage. Store hatch until installation under roof, if possible; or, if stored outside, under a tarp or suitable cover.

1.6 WARRANTY. Manufacturer shall warrant materials to be free of defects in material and workmanship for a period of five years from the date of purchase. Should a part fail to function in normal use within this period, manufacturer shall furnish a new part at no charge.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURER'S. Acceptable manufacturers include Bilco Inc.; Halliday, Inc.; Precision Ladders; Wasco Products, Inc., or approved equal.

2.2 MATERIALS.

2.2.01 Curb. Form curbs from 14 gauge (2.0 mm) galvanized steel of lockforming quality with G90 coating or .090 aluminum H-14 3003, mill finish. Sheathed with 1 inch (2.5 cm) of rigid fiber board insulation. Height shall be 12 inches (30.5 cm) unless indicated otherwise on drawings with 4 inches (10.2 cm) integral flange for securing to roof. Hinges connecting curb to door shall be 1/8 inch (3.2 mm), 2 piece formed steel with 3/8 inch (9.5 mm) pivot pin.

2.2.02 Cover. Form cover from 14 gauge (2.0 mm) galvanized steel of lockforming quality with G90 coating or .090 aluminum H-14 3003, mill finish. Liner shall be 22 gauge (.085 mm) galvanized steel with G90 coating or .090 aluminum H-14 3003, mill finish.

Insulation between cover and liner shall be 1 inch (2.5 cm) thick U.L. plain fiberglass 0.75# density. Cover shall be reinforced as required with 11 gage (3.1 mm) steel or aluminum channel. Extruded rubber gasket with a 20 gauge (1.0 mm) formed steel track shall be securely attached to the liner to make the unit weathertight. A one point cab lock is to be provided with a built-in inside handle on units with a length of 4 feet 6 inches (1.4 m) or less. On units of greater length, a 2 point slam lock shall be provided.

Exterior of cover shall be devoid of hardware with the exception of the outside handle. Outside handle shall be vinyl coated, steel T-handle. Automatic hold-open device shall be formed from 3/16 inch (4.8 mm) steel flat bar and 1/2 inch (1.3 cm) diameter steel round stock with a vinyl grip. Padlock provisions shall be provided on both interior and exterior of unit.

2.2.03 Pressure Control. Opening/closing assistance/resistance shall be provided by enclosed spring shocks.

2.2.04 Hardware. Corrosion resistant hardware and fasteners shall be provided.

2.2.05 Fabrication. The hatch shall be completely fabricated ready for installation before shipment to the site.

2.2.06 Finish. Provide red oxide primer or mill aluminum finish as identified.

2.2.07 Roof Curbs. Prefabricated roof curb shall be of box section design constructed using minimum 18 gauge galvanized (1.3 mm) steel with fully mitered and welded corners, 3 inch (7.6 cm) cant. Roof curbs shall be internally reinforced on any side longer than 3 feet (91.4 cm) and shall have factory installed base plate. Roof curbs shall be insulated with 1 1/2 inch (3.8 cm) thick 3 pound (1.4 kg) density fiberglass insulation and factory installed wood nailers fastened from underside with screws. Curb height shall be 8 inches (20.3 cm) above the finished roof or as detailed. Roof curbs shall be level at the top with pitch built in when deck slopes 1/4 inch per foot (2.1 cm per meter) or greater or as detailed.

PART 3 – EXECUTION

3.1 INSPECTION. Examine rough opening in roof for opening size and awareness.

3.2 PREPARATION. Prior to the beginning of work, conduct a pre-installation conference at the job site. Provide seven calendar days advance written notice ensuring the attendance by competent authorized representatives of the fabricator, building owner’s representative, Engineer, and subcontractors whose work interfaces with the work of this Section.

Review the specifications to determine any potential problems, changes, scheduling, unique job site conditions, installation requirements and procedures and any other information pertinent to the installation. Record the results of the conference and furnish copies to all participants.

3.3 INSTALLATION. Furnish and install access hatch, curbs and accessories per manufacturer’s installation instructions at all openings as detailed on the drawings.

End of Section

INDEX

DIVISION 6 – WOOD AND PLASTICS

SECTION 06100

FRAMING AND SHEATHING CARPENTRY

PART 1 - GENERAL

1.1 SCOPE. This section includes structural floor, wall, and roof framing; built-up structural beams and columns; floor, wall, and roof sheathing; sill gaskets and flashings; preservative treatment of wood; fire retardant treatment of wood; miscellaneous framing and sheathing; and telephone and electrical panel back boards.

1.2 GENERAL.

1.2.01 Governing Standards. The work in this section shall comply with the following specifications as appropriate:

AHA (American Hardboard Association) A135.4 - Basic Hardboard.

ALSC (American Lumber Standards Committee) - Softwood Lumber Standards.

ANSI (American National Standards Institute) A208.1 – Mat-Formed Wood Particleboard.

APA/EWA (APA/The Engineered Wood Association) – Certification.

ASTM (American Society of Testing and Materials) A153/A153M – Specification for Zinc Coating (Hot Dip) on Iron and Steel Hardware.

ASTM C220 – Specification for Flat Asbestos–Cement Sheets.

ASTM E84 – Test Method for Surface Burning Characteristics of Building Materials.

AWPA (American Wood Preservers Association) C1 – All Timber Products - Preservative Treatment by Pressure Processes.

AWPA C20 – Structural Lumber-Fire retardant Treatment by Pressure Processes.

AWPB (American Wood Preservers Bureau) Standard – LP-2 – Softwood Lumber, Timber and Plywood Pressure Treated with Water-Borne Preservatives for Above-Ground Use.

Fed. Spec. (Federal Specification) – TT-P-38D – Paint, Aluminum, Ready-Mixed.

NELMA (Northeastern Lumber Manufacturers Association).

NFPA (National Forest Products Association).

National Design Specification for Wood Construction.

NIST PS 1 (National Institute of Standards and Technology) – Construction and Industrial Plywood.

NIST PS 20 – American Softwood Lumber Standard.

NLGA (National Lumber Rules Authority).

RIS (Redwood Inspection Service) – Lumber Grading Rules.

SPIB (Southern Pine Inspection Bureau) – Lumber Grading Rules.

WCLIB (West Coast Lumber Inspection Bureau) - Lumber Grading Rules.

WWPA (Western Wood Products Association) – Lumber Grading Rules.

1.3 QUALITY ASSURANCE. All lumber shall be in accordance with a Lumber grading Agency Certified by ALSC. All wood structural panels shall be stamped and certified by EWA (The Engineered Wood Association).

Lumber shall comply with NIST PS 20 and approved grading rules and inspection agencies. Each piece of lumber shall have grade stamp applied by inspection agency and showing compliance with each specified requirement.

Construction panels shall comply with NIST PS 1 where veneer plywood is specified. Comply with APA PRP-108 where APA rated panels are specified, bearing APA trademark showing compliance with each specified requirement.

Particleboard shall comply with ANSI A208.1, factory marked with grade mark.

Each piece of fire-retardant treated lumber or plywood shall have stamp applied by inspection agency, and showing compliance with specified standards.

1.3.01 Tolerances. Framing members shall not exceed 1/4 inch (6.4 mm) from true position, maximum.

Surface flatness of floor shall not exceed 1/4 inch in 10 feet (6.3 mm in 3 m) maximum, and 1/2 inch in 30 feet (1.4 cm in 10 m) maximum.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings for all shop and site fabricated truss frames showing dimensions, wood species and grades, component profiles, drilled holes, fasteners, connectors, erection details and sequence.

Submit technical data on insulated sheathing, preservative treatment of lumber, and application instructions.

1.4.02 Certifications. Submit Manufacturer's Certificate that products conform to specified requirements.

1.5 DELIVERY, STORAGE, AND HANDLING. Protect wood products against moisture and dimensional changes. Support stacks at several uniformly spaced points to prevent deformation. Store stacks raised above ground. Cover to protect from rain and snow. Select and arrange cover to allow air circulation under and all around stacks to prevent condensation. Maintain and restore displaced coverings. Remove from the site any wood products that have been subjected to moisture or that do not comply with the specified requirements.

PART 2 - PRODUCTS

2.1 LUMBER MATERIALS. Specify lumber either by specifying by Stress Group or by generic lumber species. Verify that either method used addresses the stress requirements.

Stress Group Species (Commercial Design)

A - Douglas Fir, Larch
B - Hem-Fir
C - Eastern Hemlock, Tamarack, Jack Pine, Pacific Coast Yellow Cedar
D - Pacific Coast Sitka Spruce, Ponderosa Pine, Spruce-Pine-Fir
E - Eastern White Pine, Red Pine, Western Cedars, Western White Pine

2.1.01 Lumber Grading Rules. Lumber shall conform to and bear the grade and trademark of Manufacturer’s Association under which produced. Each piece of lumber and plywood shall be marked at the factory with grade, type, mill, and grading agency except on lumber intended to receive transparent finish.

Joist, Rafter, and Stud Framing for above grade applications shall be Spruce-Pine-Fir (S.P.F.) species, 19 percent maximum moisture content. Below Grade Joist and Stud Framing shall be Stress Group B and preservative treated. Below Grade Wall Sheathing shall be plywood, 3/4 inch (1.9 mm) thick, 24 x 48 inch (61.0 x 122.0 cm) sized sheets, tongue and groove edges, and preservative treated. Sloped Roof Sheathing shall be plywood, 3/8 inch (9.5 mm) thick, 24 x 48 inch (61.0 x 122.0 cm) sized sheets, square edges; appearance grade facing inward.

2.1.02 Materials. Studs, posts and miscellaneous light framing shall be stud grade or better Douglas Fir, Hem-Fir, S.P.F. or Southern Pine. Wall framing shall typically be of 2 x 4 inch (5.1 x 10.2 cm) or 2 x 6 inch (5.1 x 15.2 cm) (nominal size) wood studs and plates, stud spacing and sizes shall be as indicated on the drawings.

All sill plates in contact with concrete shall be preservative treated. Sill plate at exterior walls shall rest on 1/2 inch (1.3 cm) thick glass fiber or polyfoam sealer blanket of full width of plate. Sill plates shall be anchored to foundation walls with 1/2 inch (1.3 cm) diameter anchor bolts spaced at 4 feet (1.2 m) center to center maximum.

Subflooring shall be 3/4 inch (1.9 cm) thick 48/24 tongue-and-groove underlayment grade Southern Yellowpine plywood, interior grade with exterior glue or 3/4 inch (1.9 cm) tongue-and-groove oriented strand board (OSB). Subflooring shall have its long sheet dimensions perpendicular to the span direction of floor trusses, with ends of sheets staggered except at perimeter of the building. Subflooring shall be both glued and nailed to floor trusses.

Stairs shall have fir treads, risers and stringers. Treads and stringers shall be nominal 2 inch (5.1 cm) thickness, risers shall be nominal 1 inch (2.5 cm) thickness.

Provide metal “T” straps at all exterior building corners for wind bracing and stability. Cover all exposed wood with 15# felt prior to the application of finish siding or brick veneer.

Sheathing at exterior walls and at gable end shall be 1/2 inch (1.3 cm) thick C-D fir plywood with exterior glue or 1/2 inch (1.3 cm) thick oriented strand board (OSB). All exterior walls shall be wrapped with one layer of DuPont TYVEK Housewrap before installation of exterior finish materials.

Roof sheathing shall be 1/2 inch (1.3 cm) thick CDX plywood with exterior glue. Roof sheathing shall have unsupported edges blocked with “H” clips (one per unsupported space less than 48 inches (1.2 m) and two for broader spaces).

Headers, rafters, and other members shall be Southern Pine or Douglas Fir, No. 2 or better with the following properties according to the specific span dimensions contained in the National Forest Products Association span tables:

> Minimum allowable bending stress of F_b = 1000 psi (6,894.8 kPa), (1150 psi (7,929 kPa) repetitive).
>
> Shear stress F_v = 90 psi (620.5 kPa).
>
> Modulus of elasticity E = 1,600,000 psi (11,031.7 kPa).

Nailers and interior blocking shall be utility grade spruce, pine, fir or equivalent grade of Southern Pine, surfaced four sides. Use pressure treated material to resist rot and fungus in areas in contact with concrete.

Plywood for interior rough carpentry shall be C-D Interior APA in thickness shown on drawings, species to be selected accordingly. Plywood for built in shelving units shall be premium grade, 3/4 inch (1.9 cm) solid red oak material.

Plywood soffits shall be American Plywood Association rough sawn fir plywood. Plywood shall be A/C grade or better, tightknot, 3/8 inch (9.5 mm) thick. Provide 2 inch (5.1 cm) wide continuous aluminum soffit vent with integral screen in all soffit vent with integral screen in all soffit areas, color as selected by the Engineer.

Exterior wood trim shall be rough sawn cedar, 1 inch (2.5 cm) nominal thickness, No. 2 tight knot or better.

Plastic flashing around door and window openings shall be 6 mil (0.2 mm) thickness of sheet polyethylene, wrapping the rough framing and sheathing at head, jambs and sill, bonds and corners.

Provide wooden roof and floor trusses where shown on the drawings, with spacing indicated on the drawings. Trusses shall be manufactured by a company experienced in the fabrication of wood trusses. Shop drawings of trusses shall be submitted by the manufacturer and shall bear the seal of an Engineer registered in the State of Michigan. Truss drawings shall include each type of truss and it’s suitability for the span and spacing. Roof trusses to have heel height as indicated on the drawings. Provide truss location drawings when submitting roof truss drawings for review.

2.1.03 Preservative Treatment of Lumber.

Lumber that will be installed below grade, exposed to the environment, or as requested by the Engineer shall be pressure treated by a process of Koppers Company (Wolman Preservative Department) or equal impregnating it with preservative salts in a closed cylinder by vacuum pressure process in accordance with treatment specifications of the processor.

Lumber that will be exposed to high temperatures such as on roofs or as requested by the Engineer will be non-combustible.

Where required by code or as requested by the Engineer, lumber shall be both pressure treated and non-combustible “Exterior Fire X” fire-retardant pressure impregnated lumber produced by Hoover Treated Wood Products of Pine Bluff, Arkansas or Milford, Virginia or equal. Lumber shall be treated with a fire hazard classification in Underwriter Laboratories tests or 30 minutes duration, showing flame-spread rating not exceeding 25 and no evidence of significant progressive combustion. After treatment, all lumber up to 2 inches (5.1 cm) in thickness shall be dried to maximum moisture content of 18 percent.

Each piece of lumber shall bear a label indicating conformance to standards of the processor.

2.2 ACCESSORIES. Fasteners shall be hot dipped galvanized steel for high humidity and treated wood locations, unfinished steel elsewhere.

Anchors shall be toggle bolt type for anchorage to hollow masonry. Use expansion shield and lag bolt types for anchorage to solid masonry or concrete. Use bolt or ballistic fastener for anchorage to steel.

Sill gasket on top of foundation wall shall be 1/4 inch (6.4 mm) thick, plate width, closed cell polyethylene foam from continuous rolls.

Sill flashing (under sill gasket) 6 mil (0.2 mm) thick, polyethylene sheet.

Subfloor glue shall be EWA AFG-01, waterproof, base, air cure type, cartridge dispensed.

Building paper shall be No.15 asphalt felt plain untreated cellulose building paper and spun bonded polyethylene.

Termite shield shall be galvanized sheet steel, plastic.

PART 3 - EXECUTION

3.1 FRAMING. Set structural members level and plumb, in correct position. Place horizontal members, crown side up. Coordinate installation of wood decking, wood chord metal joists, glue laminated structural units, prefabricated wood trusses, and wood joists. Coordinate curb installation with installation of decking and support of deck openings, roofing vapor retardant, and parapet construction.

Make provisions for sufficient temporary bracing of erection loads to maintain structure safe, plumb, and in true alignment until completion of erection and installation of permanent bracing.

Double up members at openings over 60 inches (1.5 m) wide. Frame double joist headers rigidly into joists at floor opening; ceiling openings, and under wall stud partitions that are parallel to floor joists. Bridge or brace between joist framing in excess of 8 feet (2.4 m) span at mid-span to prevent buckling. Fit solid blocking bridging at ends of members. Space short studs over and under opening to stud spacing.

Place full width continuous sill flashings under framed walls on cementitious foundations. Overlap flashing joints by 4 inches (10.2 cm). Place sill gasket directly on cementitious foundation. Puncture gasket clean and fit tight to protruding foundation anchor bolts.

3.2 <u>SHEATHING</u>. Attach roof sheathing with longer edge (strength axis) perpendicular to framing members, with ends staggered, and sheet ends over bearing structure. Use sheathing clips at joints between sheathing sheets along edges perpendicular to roof framing members.

Secure wall sheathing with long dimension to wall studs, with ends over firm bearing, perpendicular for exterior and parallel for interior walls. Place building paper horizontally over wall sheathing; weather lap edges and ends.

Secure subfloor sheathing with longer edge perpendicular to floor framing, with end joints staggered, and sheet ends over bearing structure. Attach with subfloor glue and nails. Place building paper between floor underlayment and subflooring. Install flooring underlayment after dust and dirt generating activities have ceased and prior to application of finished flooring. Apply underlayment perpendicular to subflooring and stagger joints of underlayment.

Install telephone and electrical panel back boards with wood structural panel sheathing material where required. Size the back board12 inches (30.5 cm) beyond size of electrical panel.

3.3 <u>SITE APPLIED WOOD TREATMENT</u>. Brush-apply two coats of preservative treatment on wood in contact with cementitious materials roofing and related metal flashings. Treat site-sawn cuts. Allow preservative to dry prior to erecting members.

End of Section

SECTION 06114

WOOD BLOCKING AND CURBING

PART 1 - GENERAL

1.1 SCOPE. This section specifies roof curbs, cants, and perimeter nailers; blocking in wall and roof openings; wood furring and grounds; and concealed wood blocking for support of bathroom accessories, wall cabinets, and wood trim.

1.2 GENERAL. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

ALSC (American Lumber Standards Committee) – Softwood Lumber Standards.

APA/EWA (APA/Engineered Wood Association) – Certification.

ASTM E84 (American Society for Testing and Materials) - Test Method for Surface Burning Characteristics of Building Materials.

AWPA C1 (American Wood Preservers Association) – All Timber Products - Preservative Treatment by Pressure Process.

AWPA C20 – Structural Lumber Fire Retardant Treatment by Pressure Process.

AWPA C27 – Plywood – Fire-Retardant Treatment by Pressure Processes.

NFPA (National Forest Products Association) – Lumber Grading Rules.

NLGA (National Lumber Rules Authority).

RIS (Redwood Inspection Service) – Lumber Grading Rules.

SPIB (Southern Pine Inspection Bureau) – Lumber Grading Rules.

WCLIB (West Coast Lumber Inspection Bureau) – Lumber Grading Rules.

WWPA (Western Wood Products Association) – Lumber Grading Rules.

1.3 QUALITY ASSURANCE. Perform Work in accordance with a Lumber Grading Agency that is certified by ALSC.

The Plywood Grading Agency shall be certified by APA/EWA.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit technical data on wood preservative and fire retardant treatment materials and provide application instructions where required.

PART 2 - PRODUCTS

2.1 MATERIALS. Lumber grading rules shall follow WWPA Standards.

Stress Group Species (Commercial Design)

A - Douglas Fir, Larch

B - Hem-Fir

C - Eastern Hemlock, Tamarack, Jack Pine, Pacific Coast Yellow Cedar

D - Pacific Coast Sitka Spruce, Ponderosa Pine, Spruce-Pine-Fir

E - Eastern White Pine, Red Pine, Western Cedars, Western White Pine

Miscellaneous framing, to include blocking and curbing shall be stress Group D or better, No. 2 grade, and 19 percent maximum moisture content after treatment.

Lumber for curbing shall be non-combustible.

2.1.01 Accessories. Use hot dipped galvanized steel fasteners for high humidity and treated wood locations. Use unfinished steel elsewhere.

Use toggle bolt type anchors for anchorage to hollow masonry. Use expansion shield and lag bolt type for anchorage to solid masonry or concrete. Use bolt or ballistic fastener for anchorage to steel.

2.2 WOOD TREATMENT. Each piece of lumber shall be stamped to reflect treatment and conformance to standards for treatment.

2.2.01 Preservative Treatment of Lumber. Non- finish lumber that will be installed below grade, exposed to the environment, or as requested by the Engineer shall be pressure treated by a process of Koppers Company (Wolman Preservative Department) or equal impregnating it with preservative salts in a closed cylinder by vacuum pressure process in accordance with treatment specifications of the processor.

2.2.02 Fire Retardant Treated Wood. Lumber that will be exposed to high temperatures such as on roofs or as requested by the Engineer will be fire retardant treated wood (FRTW) impregnated with fire-retardant chemicals and complying with AWPA C20 for lumber and with AWPA C27 for plywood. Lumber shall have surface burning characteristics not exceeding a flame spread of 25 when tested in accordance with ASTM E84 for not less than 10 minutes.

2.2.03 Exterior Fire Retardant Treated Wood. Where required by code or as requested by the Engineer, lumber shall be both pressure treated and non-combustible fire-retardant pressure impregnated “Exterior Fire X” lumber produced by Hoover Treated Wood Products, “NCX” by Koppers Company, or equal. Lumber shall be treated with a fire hazard classification in Underwriters Laboratories tests of 30 minutes duration, showing flame-spread rating not exceeding 25 and no evidence of significant progressive combustion. After treatment, all lumber up to 2 inches (5.08 cm) in thickness shall be dried to maximum moisture content of 18%.

PART 3 - EXECUTION

3.1 CURB ROOF OPENINGS. Construct curb members of solid full length wood sections without splices. Form corners by alternating lapping side members. Coordinate curb installation with installation of decking and support of deck openings, roofing vapor retardant, and parapet construction.

3.2 BLOCKING. Blocking shall be provided behind wall cabinets, hand rails, bathroom accessories, wood trim, and telephone and electrical panel backboards.

3.3 SITE APPLIED WOOD TREATMENT. Brush apply one coat of preservative treatment on wood in contact with cementitious materials roofing and related metal flashings. Treat site-sawn cuts. Allow preservative to dry prior to erecting members.

End of Section

SECTION 06170

TRUSSES, JOISTS, AND ROOFING SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section includes trusses fabricated from dimension lumber, metal-web and plywood I Joists, plate connectors, engineering of trusses, erection of trusses, erection accessories, bracing, bridging, and attachment to structure.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

ALSC (American Lumber Standards Committee) – Softwood Lumber Standards.

ANSI (American National Standards Institute, Inc.) A208.1 – Mat-Formed Wood Particleboard.

APA (American Society for Testing and Materials) – Plywood Grading Rules.

APA/EWA TB-200 (APA/Engineered Wood Association) – Technical Bulletin (Fire Retardant).

ASTM (American Society for Testing and Materials) A167 – Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

AWPA (American Wood Preservers Association) C1 – All Timber Products Preservative Treatment by Pressure Process.

NFPA (National Forest Products Association) – Lumber Grading Rules.

NIST (National Institute of Standards and Technology) PS20C – American Softwood Lumber Standard.

RIS (Redwood Inspection Service) – Lumber Grading Rules.

SPIB (Southern Pine Inspection Bureau) – Lumber Grading Rules.

TPI (Truss Plate Institute) 80 - "Design Specification for Metal Plate Connected Parallel Chord Wood Trusses."

TPI-85 - "Design Specification for Metal Plate Connected Wood Trusses."

TPI-89 - "Quality Standard for Metal Plate Connected Wood Trusses."

TPI DSB-89 - Recommendations Design Specification for Temporary Bracing of Metal Plate Connected Wood Trusses.

TPI HIB-91 – Commentary and Recommendations for Handling, Installing and Bracing Metal Plate Connected Wood Trusses.

ANSI/TPI 1 - National Design Standard for Metal Plate Connected Parallel Chord Wood Trusses.

WCLIB (West Coast Lumber Inspection Bureau) – Lumber Grading Rules.

WWPA (Western Wood Products Association) – Lumber Grading Rules.

1.3 QUALITY ASSURANCE. Provide trusses fabricated as specified herein and complying with the following:

TPI-85 - "Design Specification for Metal Plate Connected Wood Trusses."

TPI-80 - "Design Specification for Metal Plate Connected Parallel Chord Wood Trusses."

TPI-89 - "Quality Standard for Metal Plate Connected Wood Trusses."

Lumber quality shall comply with NIST PS 20 and applicable grading rules. Provide factory marking on each lumber member showing type, grade, mill, and grading agency.

1.3.01 Manufacturer's Qualifications. Manufacturer shall have a minimum 5 years of documented experience in successful fabrication of wood trusses similar to type required for this work and shall be licensed by TPI under "Quality Assurance Inspection Program" to apply TPI marks to trusses. Manufacturer shall maintain an in-plant quality control program that assures compliance with TPI QST "Quality Standard for Metal Plate Connected Wood Trusses" and includes independent testing agency inspections.

1.3.02 Contractor's Qualifications. Contractor shall have a minimum of 5 years documented experience in the successful installation of this type of work. Contractor shall be certified by truss manufacturer.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit detailed shop drawings for fabrication and erection of trusses including plans, elevations, and large scale details of special connections, joining, and accessories. Include mark, number, location, and spacing of trusses and bridging. Show dimensions, applied loadings, reactions, and permanent bracing. Provide templates or location drawings of anchors or bearing accessories to be installed as work of other sections. Shop drawings shall be sealed by a Professional Engineer registered in Michigan.

1.5 DELIVERY, STORAGE, AND HANDLING. Handle units to avoid damage. Comply with manufacturer's printed instructions. Schedule delivery of units to arrive in time for prompt erection without prolonged storage on site. Protect structural components from warping or other distortion by stacking vertically and bracing to resist movement.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Design trusses to support dead loads and to withstand live loads as indicated on the drawings.

2.2 ACCEPTABLE MANUFACTURERS.

2.2.01 Wood Trusses. Acceptable manufacturers include Alpine Engineered Products, Inc.; Standard Structures, Inc.; Warren Truss Co.; or approved equal.

2.2.02 Plywood I Joists. Acceptable manufacturers include Georgia Pacific Corp.; Louisiana - Pacific Corp.; Truss Joist Mac Millan; Weyethaeuser Engineered Structural Products; or approved equal.

2.2.03 Metal-Web Wood Joists. Acceptable manufacturers include Apline Engineered Products, Inc.; Rigidply Rafters Inc.; Weyethaeuser Engineered Structural Products; or approved equal.

2.3 LUMBER. Lumber surfacing shall be dressed, S4S. Moisture content shall be 19 percent maximum at time of dressing and shipment.

Provide machine stress rated (MSR) lumber as determined by truss connector plate manufacturer's engineering of trusses having the following minimum design values or visually graded lumber having the following minimum design values listed in the NFPA "Design Values for Wood Construction" (NDS Supplement).

E (modulus of elasticity): 1,400,000 psi (9,652.7 MPa), minimum.

F_b - single (extreme fiber stress in bending): 1500 psi (10342.7 kPa), minimum.

F_c (compression parallel to grain): 1200 psi (8273.8 kPa).

F_t (tension parallel to grain): 900 psi (6205.3 kPa).

Fabricate connector plates from sheet metal meeting the following requirements:

Structural properties shall meet ASTM A 446, any grade.

Finish shall be hot-dip galvanized; ASTM A 525, G60, minimum.

Thickness shall be as required by truss design but not less than 20 gage (1.0 mm).

2.4 CONNECTOR, PLATES, FASTENERS AND ANCHORAGES. Provide size, type, materials, and finish for fasteners as indicated that comply with applicable federal standards for each type of fastener. Finish for nails shall be plain or coated. Threaded steel fasteners shall be zinc or cadmium coated.

2.5 MANUFACTURE AND FABRICATION. Fabricate trusses to achieve structural requirements specified.

Brace wood trusses for support in accordance with TPI HIB-91. Brace all trusses for support during transit.

Provide bottom and top chord extensions as indicated. Fabricate to achieve minimum end bearing area surfaces as defined by truss manufacturer for steel, masonry, or wood as detailed. Frame special sized opening in web framing as detailed.

Shop fabricate wood trusses to comply with TPI QST "Quality Standard for Metal Plate Connected Wood Trusses" and to fulfilL design requirements. Press connectors into both sides of joint simultaneously.

2.5.01 Metal-Web Wood Joists.

Wood Chord Members shall be single top and bottom chord. Finger scarfing shall not be permitted. Web members shall be cold rolled steel tubing, galvanized, minimum yield strength of accurately die stamped, electrically welded. Connecting pins shall be electro-galvanized structural carbon steel. Joist bridging shall be of type, size and spacing recommended by joist manufacturer.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that supports and openings are ready to receive trusses. Verify that bearing areas are in correct location and of proper dimensions.

3.2 PREPARATION. Coordinate placement of support and anchorage accessories. Inspect trusses for damage and loosening of connector plates before installation. If acceptable to the architect, make repairs in accordance with truss connector plate manufacturers; otherwise, replace trusses which cannot be properly repaired.

3.3 INSTALLATION. Install trusses in accordance with manufacturer's instructions for erection. Truss spacing shall be 24 inches (61.0 cm) on center, typical or as detailed. Install trusses true to line and level, with webs plumb, and with ends accurately located. Provide temporary bracing to hold trusses upright and in place until permanently secured. Install permanent bridging, bracing, and anchors to maintain trusses straight and in correct position before installing supported construction or superimposing loads. Field cutting of truss members is not allowed. Coordinate installation of framing to be attached to or supported by trusses. Verify that concentrated loads will occur only at locations incorporated into the design of the trusses. Lift trusses at designated lifting points only.

End of Section

SECTION 06200

FINISH CARPENTRY

PART 1 - GENERAL

1.1 SCOPE. This section covers finish carpentry and includes carpentry work which is exposed to view, is non-structural, and which is not specified as part of other sections.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified the work of this section shall conform to the applicable portions of the following standard specifications.

AHA (American Hardboard Association) A135.4 – Basic Hardboard.

ANSI (American National Standards Institute, Inc.) A208.1 – Wood Particleboard.

ASTM (American Society for Testing and Materials) A153/A153M – Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM C1036 – Specification for Flat Glass.

ASTM C1048 – Specification for Standard Specification for Heat-Treated Flat Glass – Kind HS, Kind FT Coated and Uncoated Glass.

ASTM D2898 – Test Methods for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing.

ASTM E84 – Test Method for Surface Burning Characteristics of Building Materials.

AWI (Architectural Woodwork Institute) – Architectural Woodwork Quality Standards Illustrated.

AWPA C1 (American Wood Preservers Association) – All Timber Products Preservative Treatment by Pressure Processes.

AWPA C20 – Structural Lumber Fire Retardant Treatment by Pressure Processes.

AWPA C27 – Plywood – Fire- Retardant treatment by Processes.

BHMA A156.9 (Builders Hardware Manufacturers Association) – American National Standard for Cabinet Hardware.

Fed. Spec. (Federal Specification) MMM-A-130 – Adhesive, Contact.

HPVA HP-1 (Hardwood Plywood and Veneer Association) – Voluntary Standard for Hardwood and Decorative Plywood.

NEMA LD 3 (National Electric Manufacturer's Association) – High Pressure Decorative Laminates.

NHLA (National Hardwood Lumber Association).

NIST PS 1 (National Institute of Standards and Technology) – Construction and Industrial Plywood.

NIST PS 20.

NIST PS 51.

NIST PS 56.

NWWDA I.S.4 (National Wood Window and Door Association) – Industry Standard for Water-Repellent Preservative Non-Pressure Treatment for Millwork.

WIC (Woodwork Institute of California) – Manual of Millwork Standards of the Woodwork Standards of the Woodwork Industry.

1.3 QUALITY ASSURANCE. Factory-mark each piece of lumber and plywood with type, grade, mill and grading agency identification. Omit marking from surfaces to receive transparent finish, and submit mill certificate that material has been inspected and graded in accordance with requirements if it cannot be marked on a concealed surface.

Mark each unit of fire-retardant treated lumber and plywood with classification marking of Underwriters Laboratory, Inc., or other testing and inspecting agency acceptable to authorities having jurisdiction. Place marking on surfaces which will not be exposed after installation.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit manufacturer's specifications and installation instructions for each item of factory-fabricated siding and paneling. Submit wood treatment manufacturer's instructions for handling, storage, installation and finishing treated materials.

1.4.02 Certifications. Include certification by fire-retardant treating plant indicating type of chemicals used and fire performance characteristics achieved.

1.4.03 Samples. Submit samples for each species and cut or pattern of finish carpentry upon request.

1.5 DELIVERY, STORAGE, AND HANDLING. Protect finish carpentry materials during transit, delivery, storage and handling to prevent damage, soiling and deterioration.

Do not deliver finish carpentry materials, until painting, wet work, grinding and similar operations which could damage, soil or deteriorate woodwork have been completed in installation areas. If finish carpentry materials must be stored in other than installation areas, store only in areas meeting requirements specified for installation areas.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Installer shall advise Contractor of temperature and humidity requirements for finish carpentry installation areas. Do not install finish carpentry until required temperature and relative humidity conditions have been stabilized and will be maintained in installation areas until occupancy.

Maintain temperature and humidity in installation area as required to maintain moisture content of installed finish carpentry within a 1.0 percent tolerance of optimum moisture content, from date of installation through remainder of construction period. The fabricator of woodwork shall determine optimum moisture content and required temperature and humidity conditions.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Softwood lumber shall comply with NIST PS 20 and with applicable grading rules of the respective grading and inspecting agency for the species and product indicated.

Plywood shall comply with NIST PS 1.

Hardwood lumber shall comply with National Hardwood Lumber Association (NHLA) rules.

Hardwood plywood shall comply with NIST PS 51.

Woodworking shall comply with Architectural Woodwork Institute (AWI) "Quality Standards".

Glued-up lumber shall comply with NIST PS 56.

2.3 MATERIALS. Nominal sizes are indicated, except as shown by detailed dimensions. Provide dressed or worked and dressed lumber, as applicable, manufactured to the actual sizes as required by NIST PS 20 or to actual sizes and patterns as shown, unless otherwise indicated.

Provide seasoned softwood (KD) lumber having a moisture content from time of manufacture until time of installation not greater than values required by the applicable grading rules of the respective grading and inspecting agency for the species and product indicated.

Provide kiln-dried hardwood (KD) lumber having a moisture content from time of manufacture until time of installation within the ranges required in the reference woodworking standard.

Lumber to receive a transparent finish (stained or clear) shall be made of solid lumber stock.

Provide concealed nails, screws and other anchoring devices complying with applicable Federal Specifications of the type, size, material, and finish required for application indicated to provide secure attachment. Where finish carpentry is exposed on exterior or in areas of high relative humidity, provide fasteners and anchorages with a hot-dipped zinc coating (ASTM A153).

2.4 WOOD TREATMENT.

2.4.01 Preservative Treatment (Trt-Wd). Following basic fabrication provide 3 minute dip treatment of finish carpentry items indicated to receive preservative treatment in 5 percent solution of pentachlorophenol, with vehicle which will not interfere with finish application and will produce minimum effect upon appearance. Apply brush coat on surfaces cut after treatment.

2.4.02 Fire Retardant Treated Wood (FRTW). Where wood is indicated as "FRTW" impregnate with fire-retardant chemicals and with following requirements.

For lumber, comply with AWPA C 20 except as otherwise indicated.

For plywood, comply with AWPA C 27 except as otherwise indicated.

Provide materials with surface burning characteristics not exceeding flame spread of 25 when tested in accordance with ASTM E84 for not less than standard time period (10 minutes).

For FRTW wood exposed to exterior, use treatment chemicals and process which show no increase in surface burning characteristics when tested in accordance with ASTM D2898, Method A (Standard Rain Test). Subject to compliance with requirements, provide "NCX" by Koppers Co., Inc. or "Exterior Firex" by Hoover Universal, Inc.

For FRTW wood used in interior applications not exposed to relative humidities in excess of 92 percent, use treatment chemicals with reduced hygroscopicity which are non-corrosive to metal fasteners, are non-blooming and permit use of transparent oil based finishes. Subject to compliance with requirements, provide "Dricon"; Koppers Company, Inc., "Flameproof LHC"; Osmose Wood Preserving Co. of America, Inc., "Protex"; Hoover Universal Wood Preserving Division, or approved equal.

Kiln-dry wood after treatment shall have a maximum moisture content of 15 percent for plywood, 19 percent for lumber.

Inspect each piece of lumber and plywood or each unit of finish carpentry after drying; do not use twisted, warped, bowed or otherwise damaged or defective wood.

PART 3 - EXECUTION

3.1 PREPARATION. Condition wood materials to average prevailing humidity conditions in installation areas prior to installing.

Notify painter of material delivery date allowing them sufficient time to backprime lumber for painted finish exposed on the exterior or, where indicated, to moisture and high relative humidities on the interior. Painting shall comply with requirements of Master Specification Section 09900, Painting.

Meet at project site prior to delivery of finish carpentry materials to ensure environmental controls required for proper installation and ambient conditioning in areas to receive work. Include in meeting the Contractor’s, Engineer and Owner Representatives involved with work. Work shall be coordinated with installers of finish carpentry, painting, mechanical work, electrical work and persons responsible for continued operation (whether temporary or permanent) of HVAC system as required to maintain temperature and humidity conditions. Proceed with finish carpentry on interior only when everyone concerned agrees that required ambient conditions can be properly maintained.

3.2 INSTALLATION. Discard units of material which are unsound, warped, bowed, twisted, improperly treated, not adequately seasoned, or too small to fabricate work with minimum of joints or optimum jointing arrangements, or which are of defective manufacture with respect to surfaces, sizes or patterns.

Install the work plumb, level, true and straight with no distortions. Shim as required using concealed shims. Install to a tolerance of 1/8 inch (3.2 mm) in 8 feet (2.4 m) for plumb and level countertops; and with 1/16 inch (1.6 mm) maximum offset in flush adjoining 1/8 inch (3.2 mm) maximum offsets in revealed adjoining surfaces.

Scribe and cut work to fit adjoining work, and refinish cut surfaces or repair damaged finish at cuts. For standing and running trim, install with minimum number of joints possible, using full-length pieces (from maximum lengths of lumber available) to the greatest extent possible. Stagger joints in adjacent and related members. Cope at returns, miter at corners, to produce tight fitting joints with full surface contact throughout length of joint. Use scarf joints for end-to-end joints.

Handle, store and install FRTW in accordance with manufacturer's directions and as required to meet required classification or rating. Provide special fasteners, moldings, adhesives and other accessories as tested and listed for type of fire-retardant materials indicated.

Anchor finish carpentry work to anchorage devices or blocking built-in or directly attached to substrates. Secure to grounds, stripping and blocking with countersunk, concealed fasteners and blind nailing as required for a complete installation. Except where prefinished matching fasteners heads are required, use fine finishing nails countersunk for exposed nailings. Painter to fill flush with finished surface, and matching final finish where transparent is indicated.

3.2.01 Adjustment. Repair damaged and defective finish carpentry work wherever possible to eliminate defects functionally and visually. Where it is not possible to repair properly, replace woodwork. Adjust joinery for uniform appearance.

3.2.02 Cleaning. Clean finish carpentry work on exposed and semi-exposed surfaces. Touch-up shop-applied finishes to restore damaged or soiled areas.

3.2.03 Protection. Contractor shall maintain finish carpentry work at proper temperature and humidity conditions necessary to ensure that work will be without damage or deterioration at time of acceptance.

End of Section

SECTION 06410

CUSTOM CABINETS

PART 1 - GENERAL

1.1 SCOPE. This section covers architectural woodwork for cabinetry and counters, shelving and architectural wood paneling.

1.2 GENERAL.

1.2.01 Coordination. Take field measurements to verify or supplement dimensions indicated. Coordinate size of related work, such as sinks, plumbing and electrical fixtures, architectural hardware, appliances and equipment. Be responsible for accurate fit of the Work.

1.2.02 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

ANSI (American National Standards Institute, Inc.) A208.1 – Particleboard.

ASTM (American Society for Testing and Materials) E84 - Test Method for Surface Burning Characteristics of Building Materials.

AWI (Architectural Woodwork Institute) Architectural Woodwork Quality Standards Illustrated.

BHMA (Builders Hardware Manufacturers Association) – Cabinet Hardware.

Fed. Spec. (Federal Specification) - TT-P-38D – Paint, Aluminum, Ready-Mixed.

FS MM-A-130 – Adhesive, Contact.

NEMA LD 3 (National Electrical Manufacturers Association) - High-Pressure Decorative Laminates.

NIST PS1 (National Institute of Standards and Technology) – Construction and Industrial Plywood.

TT-V-121H – Varnish, Spar, Water-Resisting.

UL (Underwriters Laboratories Inc.) Building Materials Directory 10B - Fire Tests of Door Assemblies.

1.3 QUALITY ASSURANCE. Perform Work in accordance with AWI (Architectural Woodwork Institute) Architectural Woodwork Quality Standards Illustrated, Premium Grade.

1.3.01 Contractors Qualifications. Contractor shall have specialized in installing Work of this section with a minimum of five years documented experience.

1.3.02 Manufacturers Qualifications. Manufacturer shall be a company specializing in performing Work of this section with a minimum of five years documented experience. Manufacturer shall be authorized to use AWI Grade Stamps, licensed by AWI Quality Certification Program and authorized to provide WIC Certified Compliance Certificate.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit Shop Drawings indicating dimensions, locations, architectural wood panels, method of fastening to backing and layout, wood cabinet erection details, field verified conditions in sufficient detail and scale, and other pertinent details. Furnish maintenance instructions for plastic facing and hardware.

1.4.02 Certifications. Submit copy of fabricator's authorization to use AWI Grade Stamps, AWI Quality Certification Program license and Project specific letters to the Owner and architect. Include WIC certified compliance certificate.

Submit in triplicate a notarized certificate, addressed to the State Fire Marshal or other authority having jurisdiction over the Project, stating that only materials specified to meet the minimum acceptable fire hazard classification have been used in the construction of specified items and listing the items so constructed, with exceptions.

If requested by the Engineer, submit evidence of the manufacturer's experience, including a list of projects for which work similar in scope and quality to this Work was provided.

Submit statement of compliance for plywood for wood paneling and particleboard.

1.4.03 Samples. Submit samples in accordance with AWI "Quality Standards", Section 1500 of hardwood and wood veneer to receive the transparent finish specified in Master Specification Section 09900, Painting. Also include plastic laminate, prefinished wall paneling, laminated wood handrail (showing range of color and grain) and method of making joints, and sealant color.

1.4.04 Mock-Up. Provide mock-up of full size base cabinet and upper cabinet including plumbing and electrical fixtures, hardware and accessories. Mock-up may remain as part of the Work.

1.5 DELIVERY, STORAGE AND HANDLING. Protect the Work by means of suitable cartons or paper bags during transportation to the project site. Damaged items, as determined by the Engineer, shall be replaced.

1.5.01 Storage and Protection. Do not store architectural woodwork items in the building or other storage area unless it is sufficiently dry so that the wood materials will not be damaged by excessive changes in moisture content.

Store architectural wood paneling flat with provision for good circulation of air.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Plywood for Transparent Finish. Hardwood plywood shall comply with AWI Quality Standards, Section 200, requirements for Grade A, and the following:
Face veneer – Natural Teak, as manufactured by Brookside Veneers, or Brookline Mahogany #813/V, as manufactured by Brookside Veneers.

Panels shall be 5-ply lumber core or particleboard core construction with solid hardwood lumber edge banding for exposed ends, core and cross banding having no open defects, and of thickness required to produce balanced construction in overall thickness indicated.

Panels shall be good-one-side with back veneer of species and thickness to balance face veneer.

2.1.02 Plywood for Paint Finish. Softwood plywood complying with PS 1, interior type, A-B grade or faced with medium density overlay.

2.1.03 Lumber. Lumber for exposed portions of wood cabinets to receive transparent finish and wood trim shall be hardwood of same species as plywood face veneer and of AWI Grade I.

Common lumber shall be as specified in Master Specification Section 06100, Framing and Sheathing Carpentry.

2.1.04 Plastic Laminate. Plastic laminate face sheet shall be 0.050 inch (1.3 mm) thick with low-gloss finish; Formica Corp. "Formica"; Ralph Wilson Plastics Co. "Wilsonart"; Exxon Chemical Co. "Nevamar"; color as indicated in the Finish Schedule. Shall meet NEMA publication LD3 for general purpose type. Balancing sheet shall be backing sheet grade of same thickness as face sheet.

2.1.05 Particleboard. Shall be smooth surface corestock complying with ANSI A208.1 and having a minimum density of 45 lbs. per cubic foot. (720.84 kg per cu m)

2.1.06 Hardware. For the purpose of establishing the standard of quality and type desired, hardware items are specified by manufacturer's name and catalog number. The products of other manufacturers of equal quality may be used, subject to approval by the Engineer. When substitute products are proposed, submit a list of each item giving the manufacturer's name, catalog number and proposed use. Provide cabinet hardware as follows:

For each drawer:

> 1 set extension drawer slides – for drawers up to 24 inches (61.0 cm) wide - Knape & Vogt No. 1300, Grant No. 338 or Garcy No. 381; for drawers over 24 inches (61.0 cm) wide – Knape & Vogt No. 1305, Grant No. 335 or Garcy No. 382.

> 1 pull – Colonial No. 753, Stanley No. 4484 or Baldwin No. 4676, US26D.

For each drawer to be locked:

> 1 lock - Corbin Cabinet No. 0665 x 7S, Yale No. 5591 x flat strike or as approved by Chicago, MK US26D.

For each 3/4 inch (1.9 cm) thick single door - flush design:

> 1 pair hinges – Stanley No. 1585, Lawrence No. D1225 x fast pin or Hager No. 1822, 2-1/2" US26D.

> 1 pull - Colonial No. 752, Stanley No. 4483-1/2 or Baldwin No. 4674, US26D.

> 1 magnetic catch - Epco No. 541.

For each 3/4 inch (1.9 cm) thick pair of doors to be locked:

> 1 lock - Corbin Cabinet No. 0370 B x 7S, Yale No. 5591 x flat strike or as approved by Chicago, MK US26D.

1 elbow catch - Ives No. 2.

1 magnetic catch – Epco No. 541.

2.1.07 Wood Primer. Primer shall be aluminum linseed oil paint conforming to Fed. Spec. TT-P-38D or water-resisting spar varnish conforming to Fed. Spec. TT-V-121H.

2.1.08 Sealant. Sealant shall be one-part water base silicone sealing compound, Dow Corning Corp. "Trademate" Tile & Fixture Sealant, or as approved, in custom color matching color of plastic laminate or other surface to be sealed.

2.2 CABINET FABRICATION. Cabinets shall include counters and enclosures of all kinds indicated to be Architectural Woodwork. Other terms are defined in the AWI Quality Standards.

2.2.01 General. Fabricate cabinets to comply with AWI Quality Standards, Section 400, for Premium Grade, unless otherwise specified.

Requirements for materials used in labeled construction, except interior of drawers and concealed framing members shall have maximum fire hazard classification of 75 for flame spread and 125 for smoke developed, when tested in accordance with ASTM E84. Materials shall be listed in the UL "Building Materials Directory" and bear the UL classification marking or listing mark.

Details of cabinet front construction shall comply with requirements of AWI Quality Standards, Article 400-G-7, for flush inset.

2.2.02 Drawers. Provide drawer guides having proper clearance, accurately aligned to insure easy operation of drawers without binding.

2.2.03 Doors. Doors wider than 36 inches (91.4 cm) or higher than 66 inches (1.7 m) shall be 1 3/8 inches (3.5 cm) thick, solid core, flush wood doors conforming to AWI Quality Standards, Section 1300.

2.2.04 Shelves for Cabinets. Shall be adjustable, unless otherwise specified, with 5/32 inch (4.0 mm) holes at 1 9/32 inches (3.3 cm) spacing in cabinet sides for shelf supports.

2.2.05 Hardware. Shop install hardware insofar as practicable. Furnish and deliver to the building all hardware items not shop installed, complete with templates, keys, screws and hardware manufacturer's installation directions.

Provide locks for cabinet doors and drawers as indicated. Cabinets having locks that are located in the same room or space shall be keyed alike but unlike those in any other room or space and masterkeyed in accordance with the Engineer's instructions. Provide two keys with each lock and four masterkeys for each masterkey system.

2.2.06 Plastic Laminate Cabinets. Fabricate plastic laminate cabinets specified to be labeled construction of UL-labeled panel systems. Core for plastic laminate shall be 3/4 inch (1.9 cm) thick particleboard or lauan-faced veneer core plywood.

Core for countertops in which sinks occur and for backsplashes for such tops shall be exterior grade lauan-faced plywood or phenolic resin particleboard. Joint between backsplash and countertop shall be waterproof.

Apply plastic laminate face sheet to exposed surfaces of the back of doors and drawer fronts, and top of the cabinet shelves. Finish exposed edges with plastic laminate face sheet or extruded plastic molding. Face semi-exposed surfaces, including bottom of cabinet shelves, with 0.020 inch (0.5 mm) plastic laminate cabinet liner or AWI grade III overlay.

2.3 COUNTER AND APRON UNITS. Counter and apron units, including backsplashes shall be of plastic laminate construction with exposed edges finished with plastic laminate face sheets.

Cut openings in countertop in accordance with sink manufacturer's template.

2.4 LIBRARY SHELVING. Shelving shall be wood cabinets with open fixed shelves, fixed interior shelves, and trim.

Exposed trim shall be lumber for transparent finish. Exposed plywood surfaces, including entire open shelf unit and both faces of doors shall be veneered plywood for transparent finish.

Interior of cabinet, exclusive of interior door face and lumber trim shall be veneered plywood for transparent finish.

2.5 ARCHITECTURAL WOOD PANELING.

2.5.01 General. Comply with AWI "Quality Standards", Section 500A for Premium Grade. Comply with AWI Quality Standards, Section 200, requirements for Grade A.

Use architectural plywood for wood paneling.

Maximum fire hazard classification, as determined in accordance with ASTM E84 shall be 25 for flame spread and 50 for smoke developed. It shall be listed in UL "Building Materials Directory", and bear UL classification marking or listing mark.

2.5.02 High Density Construction. Core and crossbanding shall be approved by UL for untreated face veneers exceeding 34.0 pcf (544.6 kg per cu m) in density, overall thickness as indicated and solid hardwood lumber edge banding on top and bottom edges.

Face veneer shall be Natural teak/Brookline Mahogany #813/V as specified. Panels shall be good-one-side with back veneer of species and thickness to balance face veneer; marked with flitch number, panel number and total number of pieces in the flitch.

2.5.03 Wood Battens. Shall be as specified for architectural plywood and faced on exposed face and sides with hardwood veneer to match architectural wood paneling face veneer.

2.5.04 Matching. Veneer matching and panel matching shall be book match. All panels in a room shall be book matched. Flitch selection shall be as approved by Engineer, by specified manufacturer.

2.5.05 Finish. 4-coat system consisting of sealcoat, toner and two coats of clear conversion varnish, matching approved sample, flat sheen, and complying with the performance requirements of AWI "Quality Standards", Section 1500, for System TR-4, Premium Grade.

PART 3 - EXECUTION

3.1 INSPECTION. Verify adequacy of backing and support framing. Verify location and sizes of utility rough-in associated with work of this section.

3.2 INSTALLATION. Comply with AWI Quality Standards, Section 1700, Premium Grade. Condition the woodwork to average prevailing humidity conditions before installing. Prior to installation of architectural woodwork, examine shop fabricated work for completion, and complete work as required, including back priming and removal of packing.

Before installing architectural woodwork items, paint surfaces abutting building construction with one coat of wood primer.

Install wood cabinets in accordance with approved Shop Drawings. Coordinate installation of countertop sinks with mechanical trade. Install the Work only when normal temperature and humidity conditions approximate the interior conditions that will exist when the building is occupied, not cold and damp, nor hot and dry.

Seal the following joints with sealant: Joints between cabinets, counters and trim pieces and vertical surfaces, including partitions and column enclosures, joints in field-applied backsplash and between backsplash and countertop and joints in countertop.

3.2.01 Architectural Wood Paneling. Install architectural wood paneling on wood grounds with concealed fasteners in strict accordance with approved Shop Drawings. Marred, defaced or otherwise damaged panels that cannot satisfactorily be repaired shall be replaced with new matching panels. Before installing wood paneling, backpaint in accordance with manufacturer's instructions. Edges trimmed or cut in the field shall be resealed immediately with WPA knot sealer or tung oil phenolic spar varnish or shellac.

Cut openings in paneling for junction boxes and other penetrations.

3.2.02 Keying System for Wood Cabinet Locks. Before final acceptance of building, set up a keying index for locks of wood cabinets installed under this Section, listing the key for each lock, and provide keys with metal tags indicating the lock for which the key was cut.

3.2.03 Protection. Protect factory finished architectural woodwork in accordance with manufacturer's directions.

3.3 MAINTENANCE.

3.4 Cleaning. Clean finished surfaces of architectural woodwork items in accordance with manufacturer's instructions.

End of Section

SECTION 06500

PLASTIC FABRICATIONS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous plastic shop fabrications of custom sized and shaped cast plastic components. Materials are usually polyester or proprietary resins.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified the work of this section shall conform to the applicable portions of the following standard specifications:

ASTM (American Society for Testing and Materials) E84 - Test Method for Surface Burning Characteristics of Building Materials.

1.3 QUALITY ASSURANCE. Take field measurements to verify or supplement dimensions indicated. Be responsible for accurate fit of the Work.

1.3.01 Manufacturer Qualifications. Shall be a company specializing in manufacturing products specified in this section with minimum five years documented experience.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings for each item showing details of fabrication and installation. Include data on specified component products, electrical characteristics and connection requirements.

1.4.02 Certifications. Submit product data layout and design computation sealed by a licensed Professional Engineer in the State of Michigan.

1.4.03 Samples. Submit samples of each material representing range of color and texture. Furnish instructions for care and cleaning of plastic materials.

1.5 DELIVERY, STORAGE AND HANDLING. Protect the Work by means of suitable cartons or paper bags during transportation to the Project site. Damaged items, as determined by the Engineer, shall be replaced.

1.6 WARRANTY. Warrant plastic material for vanity tops to be free of manufacturing defects for a period of 10 years.

During the warranty period, the Contractor agrees to replace the plastic material showing manufacturing defects, including labor costs.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Resin. Polyester or Vinylester with integral coloring, stain resistant to domestic chemicals and cleaners.

2.1.02 Polishing Cream. Compatible polishing cream to achieve specified sheen to gel coat.

Core framing may be used for shower stalls; most other components are fabricated of solid resin.

2.1.03 Core Framing. Refer to other Master Specification Sections in Division 6, Wood and Plastics for framing and wood blocking requirements.

2.1.04 Adhesive. As recommended by plastic material manufacturer.

2.2 PLASTIC VANITY TOPS.

2.2.01 Materials. Plastic material shall be Du Pont Co. "Corian", or as approved, homogeneous filled material containing methyl methacrylate, in color and pattern selected by the Engineer from manufacturer's standard range and having a maximum fire hazard classification of 25 for flame spread and 50 for smoke developed, when tested in accordance with ASTM E84.

Adhesives shall be as recommended by plastic material manufacturer for the application.

Sealant for caulked joints shall be silicone formulated to provide an exact color match.

2.2.02 Fabrication. Fabricate vanity tops of plastic material of thickness indicated, with joints, including corner joints, butted. Seal joints in pieces wider than 30 inches (76.2 cm) with joint adhesive.

2.3 FABRICATION. Fabricate components by mold to achieve shape and configuration. Gel coat the finish exposed surfaces smooth and polish to a flat sheen. Finish radius corners and edges. Complete any possible cutting, drilling, and fitting in components at factory prior to shipment, except sheet materials requiring site handling.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that joint preparation and affected dimensions are acceptable.

3.2 PREPARATION. Provide anchoring devices for installation and embedding. Provide templates and rough-in measurements.

3.3 INSTALLATION. Install the Work in accordance with approved Shop Drawings and manufacturer's instruction.

3.3.01 Plastic Vanity Tops. Install plastic vanity tops with adhesive and corrosion-resistant clips. Provide 1/32 inch (0.8 mm) expansion joints at 8 foot (2.4 m) spacing and seal joints indicated to be caulked with sealant.

3.4 CLEANING. Clean and polish fabrication surfaces.

End of Section

SECTION 06550

FRP LADDERS, HANDRAILS AND GRATING

PART 1 – GENERAL

1.1 SCOPE. This section covers furnishing and installing fiberglass reinforced plastic (FRP) ladders, handrails, grating and other FRP fabrications and appurtenances.

1.2 GENERAL.

1.2.01 Coordination. The work in this section shall be completely coordinated with the work of other sections. Verify at the site both the dimensions and work of other trades adjoining items of work in this section before fabrication and installation of items specified herein.

The Contractor shall provide pertinent trades with data and information for all items included under this section that are to be built into the work of other sections.

1.2.02 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

ASTM (American Society for Testing and Materials) A193/A193M – Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service.

ASTM A194/A194M – Specification for Carbon and Alloy Steel Nuts for Bolts for High-Pressure or High-Temperature Service, or Both.

ASTM A276 – Specification for Stainless Steel Bars and Shapes.

ASTM D570 – Test Method for Water Absorption of Plastics.

ASTM D638 – Test Method for Tensile Properties of Plastics.

ASTM D732 – Test Method for Shear Strength of Plastics by Punch Tool.

ASTM D790 – Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

ASTM D792 – Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.

ASTM E84 – Test Method for Surface Burning Characteristics of Building

Materials.

FM (Factory Mutual) – Approval Guide.

UL (Underwriters Laboratories) – Fire Resistance Directory.

WH (Warnock Hersey) – Certification Listings.

1.3 QUALITY ASSURANCE. The manufacturer of the fiberglass reinforced plastic components shall have at least 5 years of experience in the manufacture of items of similar size and quality, and shall present proof to the Engineer of successful installations involving the items under conditions similar to this project.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete specifications and drawings showing materials, properties, and details.

1.4.02 Certifications. The Contractor shall furnish a letter from the manufacturer certifying that the products have been designed in accordance with the load-bearing and deflection provisions for each size, span, and fabrication of items furnished under this section.

1.4.03 Samples. Two sets of samples shall be submitted for review in acceptable representative sizes. Samples shall be representative of construction, workmanship, appearance, and surface finish of the manufactured items which are proposed. Samples shall be from plant production.

1.4.04 Test Reports. Tests shall be performed on actual production samples demonstrating that the products conform to the stress and deflection requirements specified herein. Certified test data from these tests shall be submitted.

The Engineer may reject any item which does not meet project requirements.

1.5 DELIVERY, STORAGE AND HANDLING. All materials shall be delivered to the site to meet the installation schedules. All materials shall be stored under cover to protect them from direct sunlight.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 FRP Materials. Materials shall be as follows:

Resin:	Polyester or vinylester resin with ultraviolet inhibitors suitable for use in the specified environment.
Reinforcements:	Glass fiber with a suitable coupling agent.
Stainless steel:	ASTM A276, Type 316.
Fasteners:	Bolts: ASTM A193 B8M.
	Nuts: ASTM A194 B8M.
Washers:	Flat ANSI B18.22.1, material to match bolts.
	Lock ANSI B18.21.1, helical spring type, material to match bolts.

2.1.02 Plastic Laminate. Laminate shall be as follows:

Tensile Strength at Break	11,000 psi (75,842.8 kPa) minimum, ASTM D638
Flexural Strength	18,000 psi (124,106.4 kPa) minimum, ASTM D790
Tangent Modulus of Elasticity	900,000 psi (6,205.3 MPa) minimum, ASTM D790
Finished Thickness	Within $\pm$ 10 percent of nominal
Fasteners	AISI 18-8 stainless steel

All surfaces of plastic laminate shall be sealed with a resin layer at least 5 mils (0.1 mm) thick. Field-cut surfaces shall be recoated with resin obtained from the fabricator.

2.1.03 Pultruded Structural Grating. Minimum Physical Properties shall be as follows:

Property	Value	Test Method
Tensile Strength (ultimate)	30,000 psi (206,844 kPa)	ASTM D638
Tensile Strength (full section)	20,000 psi at 75 degrees F (137,896 kPa @ 23.8 degrees C)	ASTM D638
Shear Strength, Minimum	5,000 psi (34,474 kPa)	ASTM D732
Modulus of Elasticity	2.3×10^6 psi at 75 degrees F (15,858 MPa @ 23.8 degrees C) 1.8×10^6 psi at 125 degrees F 12,410.6 MPa @ 51.7 degrees C)	ASTM D790
Barcol Hardness	45	ASTM D2583
Water Absorption (by weight)	0.60 %	ASTM D570
Specific Gravity	1.60	ASTM D792
Flexural Strength	30 000 psi (206,844 kPa)	ASTM D790
Flexural Modulus	1.6×10^6 psi (11,031.7 MPa)	ASTM D790

2.2 GRATING. Pultruded grating shall be by MMFG, Pultrex by Creative Pultrusions, Inc. or approved equal.

Outer surfaces, cut edges, or any surfaces which are exposed to air during cure shall be finished so as to obtain complete cure of the resin without air inhibition.

Finishing of exposed surfaces shall be done by coating the surface with resin after initial cure. Upon performance of an acetone test, softening or tackiness of any surface will be considered evidence of incomplete cure.

The fiberglass grating shall be constructed from fire-retardant materials. The grating and stair treads shall have an ASTM E84 rating below 25. The grating shall be suitable for use in a marine, subtropical environment. The top surface shall be a nonskid type utilizing angular silica particles embedded in the upper portion of the grating or a concave profile.

Resin for FRP components shall be an acceptable polyester or vinylester. It shall be integrally resistant without applied coatings to ultraviolet radiation, high concentrations of hydrogen sulfide gas, solutions, and associated compounds. Compatible and equally resistant resin acceptable for shop and field sealing of cut edges shall be provided.

FRP components shall have integral colors acceptable to the Engineer and selected from standard resin colors.

The design and depth of grating shall be approved by the Engineer per manufacturer's design for the required load. The factor of safety shall be 5, based on ultimate stress. Grating shall be a minimum of 2 inches (5.1 cm) deep, and shall have a rectangular bar shape.

FRP grating shall be constructed of straight parallel bearing bars and cross bars composed of glass fiber and resin. No dry glass fibers shall be visible on any surface of bearing bars or cross bars. Bearing bars shall be spaced on 2 inch (5.1 cm) centers. Cross bars shall be spaced on 6 inch (15.2 cm) centers.

The FRP grating shall be designed to meet all applicable loads. In addition to the dead load of the grating, the grating shall be capable of supporting, at a minimum, a uniform live load of 100 pounds per square foot (488.3 kg per sq m), unless noted otherwise on the drawings, while maintaining a maximum deflection of 1/300 of the grating clear span.

The Contractor may reduce the grating clear span by the addition of intermediate support members. Additional member size and location shall be subject to acceptance by the Engineer.

Angle frames shall be continuous around the opening in order to present an even and flat support for the grating except as otherwise indicated on the construction drawings. The angles and anchors shall be detailed on the submitted shop drawings.

FRP grating shall be securely attached to supporting members and angles. Attachment to FRP supporting members shall be stainless steel with stainless steel fasteners. Each grating panel shall be attached to supporting members on the two long edges, with a minimum of two attachments each edge. All materials and incidentals required for attaching grating to angle frame and supports shall be furnished and installed under this section.

The layout of grating panels shall be coordinated with work of other sections to provide openings for approved mechanical equipment, actuators, gates, and other items which require penetrations or openings in the grating. Grating panels shall be further subdivided and supported to provide a maximum panel weight of 110 pounds (49.9 kg).

Fiberglass stair treads shall be sized as indicated on the construction drawings. Each tread shall have a solid nose and a permanent anti-skid surface as specified. The treads shall have a minimum thickness of 1 1/2 inches (3.8 cm) and shall be made of fire-retardant materials.

Where grating is indicated over an opening, it shall cover the entire opening, unless specifically noted or detailed otherwise on the construction drawings. The top surfaces of grating sections adjacent to each other shall be in the same plane.

Fiberglass plates or angles shall be installed where required to fill openings at changes in elevation and at openings between equipment and grating. Angle stops shall be installed at ends of grating to prevent grating from sliding.

PART 3 - EXECUTION

3.1 PREPARATION. Field measurement will be required for each grating installation to enable manufacturer to preassemble the grating. Check supporting members for correct layout and alignment. Verify that surfaces to receive grating are free of debris. Do not proceed with installation until defects are corrected.

3.2 INSTALLATION. All components shall be installed in full accordance with the construction drawings, the final shop drawings, and manufacturer's recommendations by mechanics skilled in the installation of this type of work.

There shall be not more than 1/8 inch (3.2 mm) clearance between the ends of the grating and the inside face of the vertical leg of the shelf angles. The horizontal bearing leg of the shelf angle shall not be less than 2 inches (5.1 cm). Ends of grating and cutouts shall be shop or field resin coated. Field coating shall conform to original manufacturer's materials and shall be in accordance with the manufacturer's recommendations. Cutouts in the grating shall be provided where required for equipment access or protrusion, including valve actuators or stems, and gate frames.

Where an area requires more than one grating section to cover the area, adjacent grating sections shall be clamped together at the 1/4 points with acceptable fasteners.

End of Section

DIVISION 7 - THERMAL & MOISTURE PROTECTION **PAGE NO.**

SECTION 07100

WATERPROOFING
PART 1 - GENERAL

1.1 SCOPE. This section includes miscellaneous bituminous and fluid applied waterproofing and also covers the furnishing and installation of a waterproofing membrane sheet material as indicated on the drawings and specified herein.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) C836 – Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for use with Separate Wearing Course.

ASTM D41 – Specification for Asphalt Primer Used in Roofing, Dampproofing, and Waterproofing.

ASTM D43 – Specification for Coal Tar Primer Used in Roofing, Dampproofing, and Waterproofing.

ASTM D173 – Specification for Bitumen-Saturated Cotton Fabrics Used in Roofing and Waterproofing.

ASTM D226 – Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM D227 – Specification for Cold-Tar-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM D374 – Test Methods for Thickness of Solid Electrical Insulation.

ASTM D412 – Test Methods for Vulcanized Rubber and Thermoplastic Rubbers and Thermoplastic Elastomers – Tension.

ASTM D429 – Test Methods for Rubber Property-Adhesion to Rigid Substrates.

ASTM D449 – Specification for Asphalt Used in Dampproofing and Waterproofing.

ASTM D450 – Specification for Coal-Tar Pitch Used in Roofing, Dampproofing, and Waterproofing.

ASTM D471 – Test Method for Rubber Property-Effect of Liquids.

ASTM D570 – Test Method for Water Absorption of Plastics.

ASTM D624 – Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomer.

ASTM D638 – Test Method for Tensile Properties of Plastics.

ASTM D746 – Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.

ASTM D751 – Test Methods for Coated Fabrics.

ASTM D822 – Practice for Conducting Tests on Paint and Related Coatings and Materials Using Filtered Open-Flame Carbon-Arc Water Exposure Apparatus.

ASTM D1004 – Test Method for Initial Tear Resistance of Plastic Film and Sheeting.

ASTM D1149 – Test Method for Rubber Deterioration-Surface Ozone Cracking in a Chamber.

ASTM D1327 – Specification for Bitumen-Saturated Woven Burlap Fabrics Used in Roofing and Waterproofing.

ASTM D1505 – Test Method for Density of Plastics by the Density–Gradient Technique.

ASTM D1668 – Specification for Glass Fabrics (Woven and Treated) for Roofing and Waterproofing.

ASTM D1693 – Test Method for Environmental Stress-Cracking of Ethylene Plastics.

ASTM D2178 – Specification for Asphalt Glass Felt Used in Roofing and Waterproofing.

ASTM D2240 – Test Method for Rubber Property – Durometer Hardness.

ASTM D2626 – Specification for Asphalt-Saturated and Coated Organic Felt Base Sheet Used in Roofing.

ASTM D2822 – Specification for Asphalt Roof Cement.

ASTM D3468 – Specification for Liquid-Applied Neoprene and Chlorosulfonated Polyethylene Used in Roofing and Waterproofing.

ASTM D3747 – Specification for Emulsified Asphalt Adhesive for Adhering Roof Insulation.

ASTM D4068 – Specification for Chlorinated Polyethylene (CPE) Sheeting for Concealed Water Containment Membrane.

ASTM D4551 – Specification for Poly (Vinyl Chloride) (PVC) Plastic Flexible Concealed Water Containment Membrane.

ASTM D4637 – Specification for EPDM Sheet Used in Single Ply Roof Membrane.

ASTM E96 – Test Methods For Water Vapor Transmission of Materials.

NRCA (National Roofing Contractors Association) – Specification for Waterproofing Manual.

1.3 QUALITY ASSURANCE. Perform work in accordance with NRCA Waterproofing Manual. Test material samples in accordance with ASTM D449 or as appropriate.

1.3.01 Manufacturer’s Qualifications. Manufacturer of specified waterproofing materials shall have experience in the design and manufacture of materials specified and shall submit evidence that the proposed materials have been in satisfactory service for at least five years.

1.3.02 Installer Qualifications. Company approved by manufacturer specializing in performing work of this section with minimum three years of experience.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate flashings, control and expansion joints, locations and details, sealing at openings, projections, penetrations, reglets, and waterproofing of miscellaneous holes, slots, and sleeves. Submit manufacturer's product data, and other pertinent information. Submit special procedures and limitations requiring special attention.

1.4.02 Certifications. Certify that products meet or exceed specified requirements. The HPDE manufacturer shall submit a certification stating that the sheeting meets all the physical property requirements for the intended application.
1.4.03 Sample. Submit representative samples of waterproofing materials.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver materials and products in labeled packages. Store and handle in strict compliance with manufacturer's instructions, recommendations, and material safety data sheets. Protect from damage from sunlight, weather, excessive temperatures and construction operations. Remove damaged material from the site and dispose of in accordance with applicable regulations.

1.6 WARRANTY. Provide three year warranty for miscellaneous waterproofing failing to resist penetration of water, except for membrane waterproofing. The manufacturer of membrane waterproofing materials shall warrant, on a pro-rata basis, the materials against leaks, manufacturing defects and material degradation for a period of 20 years from the date of final acceptance. Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

The manufacturer shall replace any material which fails due to manufacturing defects or material degradation within the warranty period. The manufacturer shall furnish the Engineer with a written warranty covering the requirements specified herein.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS.

2.1.01 Bituminous Waterproofing Materials. Provide products from Carlisle Coatings & Waterproofing, Grace Construction Products, Sonneborn Division of Chem Rex, Tremco Sealant/Weatherproofing Division, W. R. Meadows, Inc., or equal.

2.1.02 Fluid Applied Waterproofing Materials. Provide products from Carlisle Coatings & Waterproofing, Grace Construction Products, Neogard Corp., Seal-Krete Inc., Tremco Sealant/Weatherproofing Division, or equal.

2.1.03 Sheet Membrane Waterproofing Materials. Provide products from Carlisle Coatings & Waterproofing, Grace Construction Products, MiraDri Moisture Protection Products, W. R. Meadows Inc., or equal.

2.1.04 Sheet Bituminous Waterproofing. Provide Bituthene 3000 Waterproofing Membrane by Grace Construction Products, or equal.

2.1.05 Protection Board. Provide Bituthene Protection Board by Grace Construction Products, or equal.

2.1.06 Prefabricated Drainage Composite Hydroduct 220 by Grace Construction Products, or equal.

2.2 MATERIALS. Miscellaneous materials such as primer, mastic, liquid membrane, tape, and accessories shall be as specified or acceptable to manufacturer of sheet membrane waterproofing.

2.2.01 Sheet Membrane Waterproofing. High density polyethylene containing polymers and carbon, black, potable grade shall be manufactured of new, first quality products designed and manufactured specifically for the intended purpose.

The membrane material shall be so produced as to be free of holes, blisters, undispersed raw materials, or any sign of contamination by foreign matter. Any such defect shall be repaired using the extrusion fusion welding technique in accordance with the manufacturer's recommendations.

The HDPE material shall have the physical properties shown in the table below.

Property	Test Method	Minimum Specifications
Density, g/cm^3	ASTM D1505	0.94
Overall Thickness, mils	ASTM D374	60
Tensile Property, each direction Tensile Strength at Break, lbs/in width Elongation at Break, percent, min	ASTM D638, Type IV	 150 700
Hydrostatic Resistance, psi	ASTM D751, Method A. Procedure 1.	300
Environmental Stress Crack, hours, min	ASTM D1693	750
Ozone Resistance	ASTM D1149 (1/8 inch bent loop; 100 pphm; 104 F; 7 day	No cracks at 7 x magnification
Adhesives and Solvents		As recommended by HDPE material manufacturer
Butyl Tape		General Sealant “Type GS4
Stainless Steel Battens		ASTM A167, Type 316 or 304
Bolts		IFI-104, Grade 316 or 304
Expansion Anchors		Type 316 stainless steel; Ramset “Trubolt” or Hilti “Kwik bolts”
Thiokol Sealant		Fed Spec TT-S-00277; poly-

		sulfide rubber, two components; Pecora “GC-5”, PRC “Rubber Calk 350”, Sonneborn “Sonolastic”, or Woodmont “Chem-Calk 200”
Joint Filler		Pacific Polymers “Elasto-Deck No. 5001”, suitable for submerged service

2.3 MANUFACTURER AND FABRICATION. Individual widths of HDPE material shall be maximized to minimize field seams. There shall be no factory seams.

2.3.01 Raw Materials. All compound ingredients of the HDPE materials shall be randomly sampled on delivery to the HDPE manufacturing plant to ensure compliance with specifications. Tests to be carried out shall include Density ASTM D1505 and Melt Index ASTM D1238, Condition E.

2.3.02 Manufactured Roll Goods. Samples of the production run shall be taken and tested according to ASTM D638 to ensure that tensile strength at yield and break, and elongation at yield and break meet the minimum specifications. A quality control certificate shall be issued with the material.

PART 3 – EXECUTION

3.1 INSPECTION. The installer shall inspect conditions of substrates and other conditions under which this work is to be performed and notify Contractor, in writing, of circumstances detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected.

3.2 PREPARATION. Refer to manufacturer’s recommendations for preparation of substrates. Surfaces shall be structurally sound and free of voids, spalled areas, loose aggregate and sharp protrusions. Remove contaminants such as grease, oil, and wax from exposed surfaces. Remove dust, dirt, loose stone and debris. Use repair materials and methods, which are acceptable to manufacturer of applicable waterproofing materials. Treat joints and install flashings as recommended by waterproofing manufacturer.

3.3 INSTALLATION. Refer to manufacturer’s literature for recommendations on installation for waterproofing and related materials.

3.3.01 Bituminous Waterproofing Application. Prime surfaces in accordance with NRCA – Waterproofing Manual. Install cant strips at inside corners. Apply hot moppings of bitumen and embed reinforcement in accordance with NRCA – Waterproofing Manual.

Roll or press reinforcement firmly into bitumen eliminating wrinkles, air pockets, or disruptions of continuity. Lap edges and ends 6 inches (15.2 cm). Apply two additional plies at corners, intersections, angles, and over joints. Apply two additional plies diagonal to inside corner interruptions to membrane.

Extend membrane over cants and up intersecting surfaces at membrane perimeter minimum 6 inches (15.2 cm) above horizontal surface for first ply and 4 inches (10.2 cm) at subsequent plies laid in shingle fashion. Extend membrane into drain clamp flange, apply adequate coating to mastic to assure clamp ring seal. Coordinate with drain installation.

Terminate top edge of membrane under Counterflashing, seal with mastic. Coordinate with Master Specification Section 07500, Flashing and Trim.

Continue reinforced membrane over control joints.

Seal protrusions to and penetrations through membrane with multiple plies of reinforcement and flood coating, and mastic. Seal watertight.

3.3.02 Fluid-Applied Waterproofing Installation. Apply surface conditioner at a rate recommended by manufacturer. Protect conditioner from rain or frost unit dry. Apply 12 inch (30.5 cm) wide strip of joint cover sheet over cracks and non-working joints. At expansion joints from 1/2 to 1 inch (1.3 to 2.5 cm in width, loop cover sheet down into joint between 1 1/4 and 1 3/4 inch (3.2 and 4.4 cm). Extend sheet 6 inches (15.2 cm) on either side of expansion joint.

Center cover sheet over crack or joints. Roll sheet into 1/8 inch (3.2 mm) coating of waterproofing material. Apply second coat over sheet extending minimum of 6 inches (15.2 cm) beyond sheet edges.

Install cant strip strips at inside corners.

Apply waterproofing material. Apply and spread waterproofing material to minimum 1/2 inch (1.3 cm) cured thickness, averaging 3/4 inch (1.9 cm) in thickness. Apply extra thickness of waterproofing material at corners, intersections, angles, and over non-working joints.

Extend membrane over cants and up intersecting surfaces at membrane perimeter minimum 6 inches (15.2 cm) above horizontal surface for first ply and 4 inches (10.2 cm) at subsequent plies laid in shingle fashion.

Seal items protruding to or penetrating through membrane and install Counterflashing membrane material.

Extend waterproofing material and flexible flashing into drain clamp flange, apply adequate coating of liquid membrane to assure clamp ring seal. Coordinate with drain installation.

Install membrane flashings and seal into waterproofing material.

3.3.03 Membrane Waterproofing Materials Application. The installation of the HDPE must be done by applicators certified by the manufacturer using the manufacturer's extrusion or hot wedge welding equipment and installation methods. All supervisors overseeing the liner installation must have two million (2,000,000) square feet (185,800 square meters) of supervisory liner experience. All field technicians must have over two hundred thousand (200,000) square feet (18,580 square meters) of seaming experience.

The HDPE material shall be installed in such a manner as to assure minimum handling. The membrane shall be anchored in accordance with details indicated on the drawings. The sheets shall be of such lengths and widths and shall be placed in such a manner as to reduce field jointing to a minimum.

Projections through the membrane shall be sealed in accordance with the details indicated on the drawings or in accordance with other sealing methods acceptable to the Engineer.

Individual panels of liner material shall be laid out and overlapped by a maximum of 4 inches (10.2 cm) for extrusion weld prior to welding or 5 inches (12.7 cm) for hot wedge weld prior to welding. Extreme care shall be taken by the installer in the preparation of the areas to be welded. The area to be welded shall be cleaned and prepared according to the procedures laid down by the material manufacturer. All sheeting shall be welded together by means of integration of the extrudate bead with the lining material. The composition of the extrudate shall be identical to the lining material, or all sheeting shall be welded together using hot wedge weld.

The welding equipment used shall be capable of continuously monitoring and controlling the temperatures in the zone of contract where the machine is actually fusing the lining material so as to ensure that changes in environmental conditions will not affect the integrity of the weld.

No "fish mouths" shall be allowed within the seam area. Where "fish mouths" occur, the material shall be cut, overlapped, and an overlap extrusion weld shall be applied.

Any weak or unbonded seams shall be repaired with a minimum 6 inch (15.2 cm) patch overlay. All membrane repair shall be made with patches having rounded corners. The installation contractor shall be responsible for all membrane repairs.

3.3.04 Protection. Protect completed membrane waterproofing from subsequent construction activities as recommended by manufacturer.

3.3.05 Cleaning. Remove any masking materials after installation. Clean any stains on materials which would be exposed in the complete work.

3.4 FIELD QUALITY CONTROL. The installation contractor shall employ on-site physical non-destructive testing on all welds.

A quality-control technician shall inspect each seam and submit an inspection report. Any area showing a defect shall be marked and repaired in accordance with HDPE repair procedure.

A test weld 3 feet (91.4 cm) long from each welding machine shall be run each day prior to liner welding and under the same conditions as exist for the liner welding. The test weld shall be marked with date, ambient temperature, and welding machine number, Samples of weld 1/4 inch (6.4 mm) to 1/2 inch (1.3 cm) wide shall be cut from the test weld and pulled by hand in peel. The weld should not peel. Seams should exhibit a film tear bond. The weld sample shall be kept for subsequent testing on laboratory tensiometer equipment in accordance with the applicable ASTM standards. Random weld samples may be removed form the installed welding sheet at a frequency to be agreed (e.g. 1/500 feet (457.2 m) of weld).

End of Section

SECTION 07110

CRYSTALLINE WATERPROOFING

PART 1 - GENERAL

1.1 SCOPE. This section covers crystalline waterproofing of concrete.

1.2 GENERAL. Crystalline waterproofing is a blend of Portland cement, fine treated silica sand and active proprietary chemicals. When mixed with water and applied as a cementitious coating, the active chemicals cause a catalytic reaction that generates a non-soluble crystalline formation of dendritic fibers within the pores and capillary tracts of concrete. This process causes concrete to become permanently sealed against the penetration of liquids from any direction.

1.2.01 Coordination. Adequate ventilation shall be provided to prevent accumulation of hazardous fumes during application of waterproof coating in enclosed spaces. Ventilation shall be maintained until work is complete and coatings have thoroughly cured.

1.3 QUALITY ASSURANCE. Primary materials shall be obtained from a single manufacturer. Secondary materials shall be provided only as recommended by the material manufacturer's representative.

Application of all crystalline waterproofing shall be done under the direction of the approved primary material manufacturer's representative.

Waterproofing application shall be by a firm that has specialized for not less than three years in installation of waterproofing and is acceptable to the manufacturer of the primary materials.

The waterproofing manufacturer’s representative shall provide technical consultation on waterproofing application.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Specifications and data covering physical properties, mixes, and application procedures shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.4.02 Certificates. Provide certificates, signed by manufacturer or manufacturer’s representative, certifying that the materials to be installed comply in all respects with the requirements of this specification and that the applicator is qualified and approved to install the materials in accordance with the manufacturer's product data.

Provide copy of report from manufacturer's representative confirming that the surfaces to which waterproofing material is to be applied are in a suitable condition to receive the coating.

1.5 DELIVERY, STORAGE AND HANDLING. All materials shall be stored in original undamaged containers with manufacturer's seals and labels intact. Materials shall be stored off the ground in a dry enclosed area.

1.6 WARRANTY. Prior to acceptance of work furnish a written certificate stating that all materials and workmanship in connection with the specified work have been furnished and installed in complete conformance with these specifications, and with the approved manufacturer's requirements for this work.

Provide a warranty, issued jointly by the manufacturer and the applicator of the waterproof coating, against moisture penetration through treated surfaces and corrosion for a period of five years.

PART 2 - PRODUCTS

2.1 MATERIALS. The waterproofing system shall be manufactured by Xypex Chemical Corporation and shall consist of Xypex concentrate or Xypex modified. Products by other manufacturers, such as Vandex Super by Aquafin, Inc. and Tegraproof by ChemRex may be acceptable depending upon application. Crystalline waterproofing products shall be obtained from a single manufacturer.

2.2 PROPORTIONING.

2.2.01 Design Mixture. Mix waterproofing material by volume with clean water which is free from salt and deleterious materials. Mix waterproofing material in quantities that can be applied within 20 to 30 minutes from time of mixing. As mixture thickens, stir frequently, but do not add additional water. Do not mix bonding agents or admixtures with crystalline waterproofing materials.

For brush application mix, measure dry powder and place in mixing container. Measure water and mix into the dry powder with a paddle on a slow speed electric drill (250 rpm) or other type mixer which is acceptable to manufacturer. Mixing proportions shall be as follows:

Coverage	Proportions (by Volume)
1.5 lb per sq yd (0.8 kg per sq m)	5 powder to 2 water
2.0 lb per sq yd (1.1 kg per sq m)	3 powder to 1 water

For spray application mix, mixing shall be the same as specified for brush application except that mixture shall be thinner. Use the following proportions as a guide only. Adjust proportions to match type of spray equipment and pressures used. Mixing proportions shall be as follows:

Coverage	Proportions (by Volume)
1.5 lb per sq yd (0.8 kg per sq m)	5 powder to 3 water

PART 3 - EXECUTION

3.1 INSPECTION. All surfaces to be waterproofed shall be examined for form tie holes and structural defects such as honeycombing, rock pockets, and cracks. These areas shall be repaired with non-shrink grout in accordance with ACI and the grout manufacturer's printed instructions.

3.2 PREPARATION. The concrete surfaces shall be cleaned of all debris, material and dirt which would inhibit adhesion of the waterproofing system.

Concrete surfaces shall have an open capillary system to provide tooth and suction and shall be clean; free from scale, excess oil, laitance, curing compounds and any other foreign matter. Horizontal surfaces shall not be troweled or power-troweled, and shall be left with a rough float finish or a broom finish. Vertical surfaces may have a sacked finish or wood form finish.

Smooth surfaces or surfaces covered with excess oil or other contaminants shall be washed, lightly sandblasted, water-blasted, or acid-etched with muriatic acid, as required to provide a clean absorbent surface. Surfaces to be acid-etched shall be saturated with water prior to application of acid.

Prior to application of waterproofing treatment, thoroughly saturate concrete surfaces with clean water as required to ensure migration of crystalline chemicals into voids and capillary tracts of the concrete. Remove free surface water before application.

3.3 INSTALLATION.

3.3.01 Application. Before proceeding with application, the Contractor shall take all necessary steps to adequately protect any and all equipment.

Apply crystalline type waterproofing in strict accordance with the approved manufacturer's instructions.

The waterproofing system shall consist of a two coat application as recommended by the manufacturer.

When brushing, a short, semi-stiff bristle brush or broom shall be used to work the slurry well into the concrete, filling all hairline cracks and surface pores.

When spraying, suitable spray equipment shall be used and the nozzle shall be held close enough to ensure that slurry is forced into pores and hairline cracks.

The second coat shall be applied while first coat is still "green" but after it has reached set as recommended by the manufacturer.

3.3.02 Curing. Curing shall begin as soon as the waterproofing materials have set up sufficiently so as not to be damaged by a fine spray. Treated surfaces shall be mist fog sprayed three times a day for a two to three-day period, or cover treated surfaces with damp burlap for the prescribed period. Allow material to set 12 days before filling the structure with liquid.

Do not lay plastic sheeting directly on the waterproofing coating as air contact is required for proper curing. If poor air circulation exists in treated areas, it may be necessary to provide fans or blown air to aid in curing of waterproofing treatment.

Protect treated surfaces from damage due to wind, sun, rain, and temperatures below 36 degrees F (2.2 degrees C) for a period of 48 hours after application. Arrange protection to permit proper curing conditions for waterproofing material.

If moist curing is not possible, use a chemical curing agent that is specifically designed for or compatible with the approved crystalline waterproofing treatment. Curing agent shall have at least two years of successful field use and shall be approved by the waterproofing manufacturer in writing.

3.3.03 Clean-up. Remove all surplus materials from the premises and leave all areas broom-clean. Sump holes shall also be cleaned. Items used for temporary protection shall be removed carefully to avoid damage to treated surfaces.

End of Section

SECTION 07120

POLYMER MONOLITHIC LINING

PART 1 - GENERAL

1.1 SCOPE. This section covers the materials and application of corrosion-resistant, spray applied, polymer monolithic lining for protection concrete surfaces subjected to corrosive and/or wastewater environments.

1.2 GENERAL.

1.2.01 Coordination. Convene pre-installation conference at the Contractor's direction prior to commencing work to review methods and sequence of installation. The meeting shall include the Engineer, Contractor and/or Subcontractor, Manufacturer's Representative, and other affected parties.

1.2.02 Governing Standards.

ASTM (American Society for Testing and Materials) C109/C109M - Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2 inch (5. 1 cm) cube specimens).

ASTM C321 – Test Method for Bond Strength of Chemical-Resistant Mortars.

ASTM C348 - Test Method for Flexural Strength of Hydraulic-Cement Mortars.

ASTM C596 - Test Method for Drying Shrinkage of Mortar Containing Hydraulic Cement.

COE CRD-C48 - Test Method for Water Permeability of Concrete; U.S. Army Corps of Engineers.

1.3 QUALITY ASSURANCE. Primary materials shall be obtained from a single manufacturer. Secondary materials shall be provided only as recommended by manufacturer's representative.

Application of all Polymer Monolithic Lining material shall be done under the direction of the approved primary material manufacturer's representative.

Installation shall be by a firm which is specialized for not less than three years in installation of waterproofing and is acceptable to the manufacturer of the primary materials. The manufacturer may require the applicator to be pre-qualified to determine qualification and skill.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit specifications and data covering physical properties, mixes, and application procedures.

1.4.02 Certifications. Submit manufacturer's certification that proposed materials, details and systems as indicated and specified fully comply with manufacturer's details and specifications. If any portion of Contract Documents do not conform to manufacturer's standard recommendations, submit notification of portions of design that are at variance with manufacturer's specifications.

1.4.03 Samples. Two samples each of the Polymer Monolithic Linings applied to concrete panels not smaller than 6 inches by 6 inches (15.2 x 15.2 cm), and indicating proposed color, thickness, and texture shall be submitted to the Engineer. After acceptance, the samples will be held to be representative of the properties and characteristics of the finally applied coating.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver materials in manufacturer's unopened containers, fully identified with brand, type, grade, class and all other qualifying information. Provide Material Safety Data Sheets for each product. Handle and protect products from moisture in accordance with manufacturer's instructions. Store off the ground and covered

Take necessary precautions to keep products clean, dry and free of damage.

1.6 WARRANTY. Prior to acceptance of work, a written certificate stating that all materials and workmanship in connection with the specified work has been furnished and installed in complete conformance with these specifications, and with the approved manufacturer's requirements for this work.

Provide a warranty, issued jointly by the manufacturer and the applicator of the waterproof coating, against moisture penetration through treated surfaces and corrosion for a period of five years.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The chemical resistant monolithic material shall be Saureisen Sewergard No. 210S. Products of other manufacturers such as Aquafin, Inc., Sonneborn, or other manufacturers may be used if performance characteristics are equal to Saureisen for protection of concrete. Water infiltration through cracks, holes or weeping must be eliminated prior to application of the polymer monolithic lining material.

The material shall meet or exceed the following properties:

Compressive Strength (ASTM C579)	6800 psi
Flexural Strength (ASTM C580)	4600 psi
Modulus of Elasticity (ASTM C580)	3.3×10^5 psi
Tensile Strength (ASTM C307)	2500 psi
Thermal exp. Coefficient	38.0×10^{-6}in/in/°F

PART 3 - EXECUTION

3.1 PREPARATION. The work shall proceed only after cleaning and repair of the substrate and all penetrating work through the substrate has been completed. The provisions of Master Specification Section 03800, Concrete Repair must be completed before the repair work can begin.

Adequate ventilation shall be provided to prevent accumulation of hazardous fumes during application of Polymer Monolithic Lining material in enclosed spaces. Ventilation shall be maintained until work is complete and coatings have thoroughly cured.

3.1.01 Surface Preparation. All structures to receive the polymer monolithic lining material must be free of laitance, dust, loose particles, oils, grease, chemical contaminants and previously applied paints or protective coatings.

Concrete surfaces that are contaminated with form oils or grease must be cleaned or scarified to remove the contaminants prior to abrasive blasting or hydroblasting to achieve hard firm surface. All active leaks must be stopped by the use of Sauereisen Insta Plug No. F-180, No. F-370 chemical grout or No. F-190 H20PRUF or approved equal material. All structural defects, voids, or cracks in substrate must be repaired prior to the polymer monolithic lining material.

3.2 INSTALLATION.

3.2.01 Application. The polymer monolithic lining material shall be applied by spray method to a thickness of 60 mils (1.5 mm). Consult Manufacturer’s Application Parameters sheet that accompanies the material for specifics on spraying fiber filled systems.

The Contractor shall consult the Manufacturer's Product Material Safety Data Sheets and container label caution statements for any hazards in handling this material.

3.2.02 Curing. Care shall be taken to prevent material from premature drying out due to sunlight or excess air movement.

Self-curing in most sewer manholes, where high humidity and cool air exists. In dry or arid areas a dissipating resin curing compound may be sprayed over the fresh applied material. Consult manufacturer for additional guidance.

Provide air circulation for 24 hours following the application in deep and/or poorly ventilated areas.

Do not allow flowing water or chemicals on the newly applied material for a minimum of 24 hours at 70 degrees F (21.1 degrees C). For temperatures below 70 degrees F (21.1 degrees C), cure a minimum of 48 hours prior to flowing water or chemical exposure.

Follow manufacturer's specifications, if poor air circulation retards curing process, to insure complete curing in enclosed spaces.

Exercise caution when temperatures exceed 90 degrees F (32.2 degrees C); call manufacturer for advice.

3.2.03 Cleaning. Remove all surplus materials from the premises and leave all areas including the floor broom-clean. Items used for temporary protection shall be removed carefully to avoid damage to treated surfaces. Assemble all such materials and remove them from the premises and follow with broom cleaning as noted.

Visual inspection should verify a uniformly treated surface.

Leaks and defective areas shall be remedied to produce a watertight installation at no additional cost to the Client.

Materials left over and any foreign material resulting from the work at the site shall be removed by applicator.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Testing. The polymer monolithic lining material should be tested for pinholes after 24 hour cure. Pinhole testing can be accomplished using a Tinker Razor Holiday Detector Model AP/W or an approved similar model.

End of Section

SECTION 07200

ROOFING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. Section includes vapor retarder, sheathing, insulation, gravel protective coating, base flashings, expansion joints and cant strips for membrane roofing. Section also includes asphalt shingle roofing, metal roofing and roof accessories.

1.2 GENERAL. Furnish all labor, equipment and materials necessary to apply the specified systems, roof insulation, flashing, accessories, wood nailers in the plane of the roof insulation, and related work as specified and as indicated.

1.2.01 Governing Standards.

UL (Underwriters Laboratories) for Wind Uplift Resistance.

U.S. Army Corp of Engineers Guide Specification 07416 (Test Method for Structural Performance of Standing Seam Metal Roof Systems by Uniform Static Air Pressure Difference).

ASTM (American Society for Testing and Materials) A167 – Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM C79/C79M – Specification for Treated Core and Non-treated Core Gypsum Sheathing Board.

ASTM C177 - Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.

ASTM C208 – Specification for Cellulosic Fiber Insulating Board.

ASTM C552 – Specification for Cellular Glass Thermal Insulation.

ASTM C578 – Specification for Rigid, Cellular Polystyrene Thermal Insulation.

ASTM C612 – Specification for Mineral Fiber Block and Board Thermal Insulation.

ASTM C726 – Specification for Mineral Fiber Roof Insulation Board.

ASTM C728 – Specification for Perlite Thermal Insulation Board.

ASTM D41 – Specification for Asphalt Primer Used in Roofing, Dampproofing, and Waterproofing.

ASTM D146 – Test Methods for Sampling and Testing Bitumen-Saturated Felts and Woven Fabrics for Roofing and Waterproofing.

ASTM D226 – Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM D249 – Specification for Asphalt Roll Roofing (Organic Felt) Surfaced with Mineral Granules.

ASTM D312 – Specification for Asphalt Used in Roofing.

ASTM D1227 – Specification for Emulsified Asphalt Used as a Protective Coating for Roofing.

ASTM E1680 – for Air infiltration Pressure Differential Test.

ASTM D1863 – Specification Mineral Aggregate Used on Built-Up Roofs.

ASTM D2178 – Specification for Asphalt Glass Felt Used in Roofing and Waterproofing.

ASTM D2626 – Specification for Asphalt-Saturated and Coated Organic Felt Base Sheet Used in Roofing.

ASTM D2822 – Specification for Asphalt Roof Cement.

ASTM D3018 – Specification for Class A Asphalt Shingles Surfaced with Mineral Granules.

ASTM D3462 – Specification for Asphalt Shingles Made from Glass Felt and Surfaced with Mineral Granules.

ASTM D3909 – Specification for Asphalt Roll Roofing (Glass Felt) Surfaced with Mineral Granules.

ASTM D4601 – Specification for Asphalt-Coated Glass Fiber Base Sheet Used in Roofing.

ASTM D4586 – Specification for Asphalt Roof Cement, Asbestos-Free.

ASTM D4897 – Specification for Asphalt-Coated Glass-Fiber Venting Base Sheet Used in Roofing.

ASTM E96 – Test Methods for Water Vapor Transmission of Materials.

AWPB (American Wood Preserves Bureau) LP-2 – Softwood Lumber, Timber and Plywood, Pressure Treated with Water-Borne Preservatives for Above-Ground Use.

FM DS 1-28 (Factory Mutual) – Insulated Steel Deck Construction.

NRCA ML 102 (National Roofing Contractors Association – Roofing and Waterproofing Manual.

UL (Underwriters Laboratories, Inc.) – Building Materials Directory.

UL – Fire Resistance Directory.

UL 790 – Tests for Fire Resistance of Roof Covering Materials.

WH (Warnock Hersey) – Certification Listings.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturers Qualifications. Companies specializing in manufacturing products specified in this section with minimum three years experience.

1.3.02 Contractor Qualifications. Roofing systems shall be applied by a licensed installer properly trained and equipped to apply roofing system in strict accordance with the procedures specified by the manufacturer of materials and having a minimum of five years experience in performing work of this section.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete layout drawings of each item showing details of fabrication and installation. Include items such as fastening or adhering detail, stapled insulation, showing thickness and pitches, preformed cant strips and other pertinent data, with certified materials lists.

Submit manufacturer's written technical information and installation instructions which demonstrate that materials to be installed comply with contract documents.

Submit recommendations of roofing membrane manufacturer regarding use of slip sheets.

1.4.02 Certifications. Submit a letter of acceptance of the roofing system and design, and roofing insulation type and manufacturer, by the roofing membrane manufacturer.

Submit a letter of acceptance of the roof deck surface conditions by the Roofing subcontractor.

1.4.03 Samples. Submit two samples each of proposed materials for approval or for verification of finish and color selection. Submit 3 pound (1.4 kg) minimum samples of gravel materials.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver products in manufacturer's original containers, dry, undamaged, with seals and labels intact. Store products in weather protected environment, clear of ground and moisture. Protect foam insulation from direct exposure to sunlight.

1.6 WARRANTY. Submit manufacturer's standard warranty guaranteeing to correct failures in product for 10 years from final acceptance, which may occur during the warranty period. Warranty shall not reduce or otherwise limit any other rights to correction, which the Owner may have under the contract documents.

Materials and workmanship involved in the application of the roofing system shall be guaranteed on a single document by the manufacturer of materials and the licensed installer. Guarantee shall insure waterproof performance of the roofing system for a period of ten years.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Contractor shall take field measurements to verify or supplement dimensions indicated prior to starting work.

Before starting installation work complete substrate installation including roof penetrations. Substrate shall be smooth, dry, securely anchored, and free of construction debris.

Follow manufacturer's instructions regarding acceptable weather conditions for installation of all roofing materials and accessories.

Provide products which are recommended by manufacturers to be fully compatible with indicated substrates, or provide separation materials as required to eliminate contact between incompatible materials.

2.2 ACCEPTABLE MANUFACTURERS. Roofing products from the following manufacturers that comply with requirements of the contract documents are considered acceptable:

CertainTeed Corporation.

Firestone Building Products Company.

GAF Building Materials Corporation.

Johns Manville

Architectural Metal Systems

Berridge Manufacturing Company

Metl-Span

GS Roofing Products Company, Inc.

Georgia-Pacific Corporation.

Koppers Industries.

Owens-Corning Fiberglass Corporation

Or approved equal.

Acceptable membrane roof manufacturers, if they comply with contract documents, include Carlisle SynTec Incorporated, Firestone Building Products Co., Johns Manville, and approved equals.

2.3 MATERIALS.

2.3.01 Built-up Asphalt Roofing. Use Asphalt-Saturated Organic Felts that comply with ASTM D226, No. 15, 20, 30; unperforated/perforated or Glass Fiber Felts per ASTM D2178, Type III, IV, VI.

Base Sheeting shall comply with ASTM D2626 for No. 43 plain; ASTM D4601 for Type I, II, unperforated; ASTM D4897 for vented or asphalt saturated and coated inorganic base sheet.

Mineral Surfaced Felts shall be ASTM D3909, white or black colored mineral granules.

Dry Sheathing Paper shall be clean, white cellulose, red, rosin paper, and unsaturated.

Asphalt Bitumen shall be ASTM D312 Type IV.

Asphalt Primer shall be ASTM D41

Plastic Cement shall be ASTM D4586 or ASTM D2822 Type I, II, cutback asphalt type.

Asphalt Emulsion shall be ASTM D1227 Type I, II.

Insulation shall be ASTM C208, Type II cellulose fiber board, one or both faces finished with mineral fiber, asphalt and craft paper per ASTM C728, expanded perlite mineral aggregate board or approved alternative material.

Flexible Flashings shall be EPDM, Butyl, Neoprene, or Modified bitumen.

Control or Expansion Joint Flashing shall be sheet butyl, metal counterflashings or wood materials.

Walkway Pads shall be asphalt impregnated mineral boards with granular surfaces.

2.3.02 Membrane Roofing. Single-Ply Roofing Membrane shall be ethylene propylene diene monomers (EPDM) formed into uniform, flexible sheets, formulated for loose laid, ballasted application, and complying with the following:

Tensile Strength (ASTM D 412): 1400 psi (9652.7 kPa).

Ultimate Elongation (ASTM D 412): 300 percent.

Brittleness Temperature (ASTM D 746): 75 degrees F (-59 degrees C).

Tear Resistance (ASTM D 624): 125 lbs. per inch (22.3 kg per cm).

Resistance to Ozone aging (ASTM D 573): Maximum reduction in elongation of 30 percent, maximum loss of tensile strength of 15 percent (168 hours at 240 degrees. F (116 degrees C)).

Thickness: 60 mils (1.5 mm), nominal.

Color: Manufacturer's standard.

Fire ratings, Underwriter's Laboratories Inc., Class A when applied to noncombustible deck.

2.3.03 Metal Roofing. Metal roofing shall be factory painted galvanized steel aluminum alloy not less than 20 USS gauge (1.0 mm) thick. Panels shall be continuous from ridge to eave and down the facia, and shall include all flashings, closures and gutter system, as directly related to the metal roof. Material shall be by a manufacturer acceptable to the Engineer. Metal roofing panels shall have two (2) major corrugations 2 inches high (2 ¾” inches including seam).

Galvanized steel for metal roofing shall conform to ASTM Designation A-446 Grade A having a minimum yield strength of 33,000 psi (227.5 m MPa). The unit design stress shall not exceed 20,000 psi (137.9 MPa). Zinc coating for sheets shall be by the hot-dipped process in accordance with ASTM Designation A446-64T, 1.25 oz (35 g) coating class.

Fasteners shall be self-tapping stainless steel screws installed with metal and neoprene washers to assure watertight conditions.

Sealer for side laps and flashing shall be an approved type pressure sensitive tape. The sealer shall be non-asphaltic, non-shrinking, non-drying, non-toxic and shall have excellent adhesion to metals, plastic and painted surfaces from –10 degrees to + 140 degrees F (-23.3 degrees to 60 degrees C).

Flashing shall be provided at eaves, ridge and at roof openings. Flashing shall be of same gauge and finish as roofing sheets.

Preformed rubber or neoprene closures matching the profile of the roof panels shall be installed along ridge, roof opening flashings, rake and/or eave where required for weather tightness

2.3.04 Asphalt Shingle Roofing. Asphalt shingle roofing shall meet the following:

Be mineral-surfaced, self-sealing, glass fiber base.

Comply with ASTM D3018, Type I, and ASTM D3462.

Fire resistance: Class A, UL labeled.

Type: Square, dimensional shingle.

Color: As selected by Engineer, after contract award, from manufacturer's standard colors.

Be factory prefabricated or field fabricated hip and ridge shingles to match field shingles, at contractor's option.

Design Standard: CertainTeed, New Horizon Shingle.

Underlayment: Asphalt-saturated organic roofing felt, ASTM D226, No. 15 imperforated, Type I, 36 inch (91.4 cm) wide-rolls.

Be UL listed material approved for use in roofing assembly to achieve specified fire rating.
Be factory prefabricated or field fabricated hip and ridge shingles to match field shingles, at contractor's option.

Design Standard: CertainTeed, New Horizon Shingle.

Underlayment: Asphalt-saturated organic roofing felt, ASTM D226, No. 15 imperforated, Type I, 36 inch (91.4 cm) wide-rolls.

Be UL listed material approved for use in roofing assembly to achieve specified fire rating.

2.3.05 Ice Protection Underlayment. Ice protection underlayment shall be rubberized asphalt sheet membrane, self-adhering, minimum 40 mils (1.0 mm) thick, 36 inch (91.4 cm) wide rolls; minimum tensile strength 250 psi (1723.7 kPa), in accordance with ASTM D146.

2.3.06 Fasteners. Use nails or staples at contractor's option.

Nails shall be 11 or 12 gage (2.8 to 3.1 mm), aluminum or hot-dipped galvanized, with barbed shanks, minimum 3/8 inch (9.5 mm) diameter head; length as necessary to penetrate through sheathing, or 3/4 inch (1.9 cm) into solid decking.

Staples shall be 16 gage (1.6 mm) minimum galvanized steel; crown width 15/16 inch (2.4 cm), minimum; length as necessary to be driven into decking or sheathing 3/4 inch (1.9 cm), minimum.

2.3.07 Accessories. Ridge and Hip Vents shall be Cor-A-Vent, V400 or approved equal.

Eave Vent shall be Cor-A-Vent, V400T or approved equal.

Sheet seaming system shall be manufacturer's standard materials for sealing lapped joints, including edge sealer to cover exposed spliced edges as recommended by manufacturer of roofing system.

Flashing accessories shall be types recommended by manufacturer of material, provided at locations recommended by manufacturer including adhesive tapes, flashing cements, and sealants.

Slip Sheet shall be type recommended by manufacturer of material for protection of membrane from incompatible substrates, if required by manufacturer.

Aggregate surface ballast shall be washed, rounded riverbed gravel or other acceptable smooth-faced stone ranging in size from 3/4 inch to 1 1/2 inch (1.9 to 3.8 cm) in diameter, which will withstand weather exposure without significant deterioration. Amount of ballast shall be as recommended by manufacturer.

Insulation shall be ASTM C612, Class 1 glass fiber rigid board, top surface coated with 28 lb/100 sq ft (136.7 kg/sq m) asphalt and Kraft paper.

Board edges shall be square shiplapped.

Insulation board shall be rigid glass fiber composition with bonded asphalt/paper cap sheet. Average "C" factor 0.27 Btu/hr./sq. ft./degrees F/ inch (0.6 Watts/sq m/deg C/cm) of thickness. Provide 3 1/4 inch (8.3 cm) thickness minimum comprised of a minimum of 2 layers. Insulation shall be selected by the manufacturer and submitted for approval.

Tapered insulation board shall be where indicated or where required to achieve positive drainage, and where required to form saddles or crickets, provide tapered insulation board of the same composition as above specified, but formed with 1/4 inch per foot (2.1 cm per m) taper. System shall be a completely designed combination of layers of uniform thickness boards and tapered boards, including corners, to provide positive drainage to roof drains. System shall have minimum R values as specified at its thinnest point. Tapered insulation system shall be selected by the manufacturer and submitted for approval.

If required by roofing manufacturer, cant strips shall be asphalt-impregnated fiberboard, Fed. Spec. LLL-I-535B, Class C, with contact surfaces sealed to retard bitumen absorption and height as required with 3 inch (7.6 cm) minimum face dimension.

Adhesive for bonding insulation shall be type recommended by insulation manufacturer and complying with fire resistance requirements.

Flashing material shall be manufacturer's standard system compatible with flexible sheet membrane.

Wood nailers shall be preservative treated wood nailers in the plane of the roof insulation as a part of the work of this section. Locations of nailers shall be in strict compliance with roofing membrane manufacturer's recommendations, and upper surface shall be flush with insulation surface.

Sheathing adhesive shall be non-combustible type, for adhering gypsum sheathing to metal deck.

Other sheathing fasteners may be used if they are appropriate for purpose intended and approved by Factory Mutual, system manufacturer, and Engineer.

Sheathing joint tape shall be heat resistant and self adhering paper.

Strip Reglet Device shall be galvanized steel, extruded plastic with maximum possible lengths per location.

Insulation joint tape shall be asphalt treated, self-adhering, glass fiber reinforced, 6 inches (15.2 cm) wide.

Insulation fasteners shall be appropriate for purpose intended and approved by Factory Mutual and System manufacturer. Fasteners shall have washers and penetrate through insulation and into deck but not through deck.

Roofing nails shall be galvanized, hot dipped Non-Ferrous type, size and configuration as required to suit application.

2.3.08 Fluorocarbon Enamel Color Finish for Metal Roofing. The exterior surfaces of the galvanized steel sheets of the metal roofing and associated metal items including flashings, closures, and other items which form parts of the roof installation shall be finished with a colored factory applied oven baked protective finish having a basic material fluorocarbon polymeric liquid resin such as “Kynar 500” polyvinylidene fluoride) by Pennwalt Corporation, or equivalent material by Dupont or others. Use an enamel such as Fluropon by Desoto, Inc., Chemical Coatings Div.; Nubelar by Glidden-Durkee Div., SCM Corp; Duronar by PPG Industries, Inc.; or another durable and decorative architectural finish from an approved, licensed manufacturers:

Color of exterior surfaces of the various members shall be as selected by the Engineer. Exposed surfaces shall be of consistent color and shade. Any item varying in color shall be replaced as directed by the Engineer without additional cost to the Owner.

All metals to be coated shall have the surfaces carefully prepared for painting on continuous process coil coating equipment by thorough cleaning and application of a chemical conversion coating system recommended by the coating manufacturer.

The prepared metal sheets shall be given a prime coat of an appropriate primer recommended by the coating manufacturer and compatible with the finish coat. Apply primer to a dry film thickness of 0.2 mil (0.005 mm) minimum and 0.4 mil (0.01 mm) maximum. The prime coat shall be fully cured by oven baking prior to application of the finish coat color.

The colored finish coating shall be applied to the primed galvanized steel sheets to a dry film thickness of 0.7 mil (.02 mm) minimum and 1.3 mil (.03 mm) maximum, and oven baked at a temperature recommended by the coating manufacturer.

All color coated metal items shall have epoxy based prime paint, as previously specified, applied to reverse side.

All prime coatings and finish color coatings shall be applied to the metal in its coil form on a continuous process coil coatings line prior to fabrication. Coatings of items already fabricated into the required profiles will not be allowed, however, component configurations not capable of post-forming from coated coil sheets may be spray coated. All finished surfaces shall be smooth, essentially free of flow lines, streaks, blisters and other surface imperfections.

2.3.08 <u>Roof Hatches</u>. Provide roof hatches by Bilco Co., New Haven, CT; Babcock Davis Associates, Inc.; Arlington, MA; Inryco, Inc., Milcor Div., Milwaukee, WI; or approved equal.

Provide 0.0907 inch (2.3 mm) thick sheet aluminum cover with 3 inch (7.6 cm) beaded flange welded and ground smooth and 1 inch (2.5 cm) thick fiberglass insulation protected by 0.040 inch (1.0 mm) thick sheet aluminum liner.

Provide 0.0907 inch (2.3 mm) thick sheet aluminum curb formed with 3 1/2 inch (8.9 cm) flange with holes for securing curb to roof deck, and integral cap flashing of same materials. Curb of welded construction with all welds ground smooth. Watertight 1 inch (2.5 cm) thick rigid fiberboard insulation around curb.

Match with heavy pintle hinges, compression spring operators enclosed in telescopic tubes, positive snap latch with run handles, padlock hasps inside and out, and neoprene draft seal. Provide automatic hold-open arm complete with vinyl grip handle. All hardware zinc plated.

2.3.10 Prefabricated Metal Roof Curbs. Provide metal roof curbs manufactured by Custom Curb, Inc; The Pate Co., Roof Products & Systems Corp; Thycurb Div. of Thybar Corp; or approved equal.

Fabricate curbs of 14 gage (2.0 mm) steel sheet, all welded construction, fitted with 2 x 4 inch (5.1 to 10.2 cm) treated wood nailer and 1 1/2 inch (3.8 cm) rigid glass fiber insulation. Provide 22 gage (0.9 mm) steel liner. Verify size of curbed opening with equipment supplier. Prime paint or hot-dip galvanize curbs and liners after fabrication.

2.3.11 Prefabricated Equipment Supports. Provide supports for insulated roof decks, as manufactured by Custom Curb, Inc; The Pate Co; Roof Products & Systems Corp; Thycurb Div. of Thybar Corp; or approved equal.

Fabricate shell, base plate and counterflashing of 18 gage (1.3 mm) galvanized steel sheet shall comply with ASTM A653, commercial quality, G90 coating designation, welded with mitered ends, welded areas coated with zinc rich paint.

Wood nailers shall be pressure treated in accordance with AWPB standard LP-2.

2.3.12 Stack Flashing Fittings. Provide type recommended by roofing manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION. Identify obstructions on roof, which will receive substrate. Repair or replace unacceptable work which may affect proper material installation.

3.2 PREPARATION. Remove projections and debris from substrate and secure all vent stacks, curbs, and other penetrations to substrate before starting roofing work.

3.3 INSTALLATION. Install each item in accordance with manufacturer’s instructions, approved Shop Drawings, and specified requirements. Furnish each item with required fasteners.

3.3.01 Membrane Roofing and Flashing. Apply insulation and roofing membrane on fully cured, dry clean concrete roof decks. Apply tapered insulation (where shown or required) wood nailers, roofing membrane, flashings, and ballast. Apply all materials in strict accordance with manufacturer's printed instructions.

Apply primer to concrete slab as recommended by adhesive manufacturer. Embed first layer of insulation in full mopping of adhesive. Lay insulation in ashlar pattern with mopping surface up and joints snug. Apply second layer in full bed of adhesive, staggering joints in both directions and minimum of 12 inch (30.5 cm) from layer below. Keep ultimate top surface completely free of adhesive.

Embed tapered insulation, where indicated, or required, in full application of adhesive. Lay insulation in the sequence indicated by the layout drawings with joints staggered and edges of blocks butted together to form smooth, positive slopes to drains.

Do not install more insulation each day than can be covered with membrane before end of day and before start of inclement weather.

Trim surface of insulation as necessary at roof drain so completed surface is flush with ring of drain. Extend roofing into sump of roof drain in compliance with manufacturer's instructions. Secure clamps in position over membranes.

Start installation of membrane only in presence of manufacturer's technical representative.

Install membrane by unrolling over prepared substrate, fastening at perimeter and at roofing penetrations. Lap adjoining sheets as recommended by roofing membrane manufacturer and bond as recommended by manufacturer, covering top edges of each sheet at seams with uniform fillet of sealant if recommended by manufacturer. Install flashings and counterflashings as shown and as recommended by manufacturer. Apply ballast course in uniform thickness at rate recommended by the membrane manufacturer, spreading with care to minimize possibility of damage to membrane. Provide flashings as indicated on the drawings and detailed in Standard Details.

3.3.02 Built-up Asphalt Roofing.

Wood Deck: Verify flatness and tight joints of wood decking. Seal joints of plywood with tape if a hot bitumen application is to follow. Fill knot holes with latex filler.

Lay one ply of dry sheathing paper; lap edges 2 inches (5.1 cm). Lay asphalt coated base sheet; lap edges 4 inches (10.2 cm). Nail laps 9 inches (22.8 cm) oc. Nail the field area in two rows at 18 inches (45.7 cm) oc staggered.

Two plies of roof felt may also be utilized over separator sheet; lap plies 19 inches (48.3 cm) and nail at 12 inches (30.5 cm) oc along seams. Mop surface with hot bitumen and embed two plies, one ply of roof felt; lap plies 19 inches (48.3 cm), full mop each ply. Apply bitumen at 20 lb/100 sq ft (97.6 kg/100 sq m).

Extend vapor retarder under cant strips and blocking.

Install flexible flashings from vapor retarder to air seal material of wall construction, lap and seal to provide continuity of the air barrier plane.

Glaze top surface of the vapor retarder if insulation is not placed immediately.

Concrete Deck: Fill surface honeycomb and variations with latex filler.

Apply primer at a rate of 1 gal/100 sq ft (40.7 L/100 sq m) and allow to dry.

For vapor retarder, mop surface with hot bitumen and embed two plies of roof felt, full mop each ply; lap plies 19 inches (48.3 mm); apply bitumen at a rate of 20 lb/100 sq ft (97.6 kg/100 sq m).

Lap flexible flashings over air seal material of wall construction to provide continuity of the air barrier plane.

Glass top surface of the vapor retarder if insulation is not placed immediately.

Metal Deck without Gypsum Sheathing: Install preformed sound absorbing glass fiber insulation strips in acoustic deck flutes.

Apply fire resistant vapor retarder to deck surface with adhesive in accordance with manufacturer’s instructions.

The acceptability of applying gypsum sheathing to steel roof decks will be determined by local codes, UL, or FM requirements.

Metal Deck with Gypsum Sheathing: Install gypsum sheathing on metal deck. Lay with long side at right angle to flutes; stagger end joints; provide support at ends.

Cut sheathing cleanly and accurately at roof breaks and protrusions to provide smooth surface. Tape joints to provide secure structure.

Mechanically fasten sheathing using approved fasteners with washers on each sheathing board.

Apply fire resistant vapor retarder to deck surface with adhesive in accordance with manufacturer’s instructions.

3.3.03 Insulation. Ensure vapor retarder is clean and dry, continuous, and ready for application of roofing system.

Mechanically fasten first layer of insulation to deck. Embed a second layer of insulation into flood coat mopping of hot bitumen. Lay second layer of insulation with joints staggered from first layer.

Tapered insulation in single or multiple thicknesses, depending on the insulation system selected.

Place boards parallel or perpendicular to deck flutes with insulation board edges bearing on deck flutes respectively. Lay boards with edges in moderate contact without forcing. Cut insulation to fit neatly to perimeter blocking and around penetrations through roof. Lay tapered boards, cut boards to slop minimum 18 inches (45.7 cm) back from roof drains for positive drainage. Do not apply more insulation than can be covered with membrane in same day. Joint taping is used when recommended by insulation manufacturer.

When two layers of insulation are required, place the second layer of insulation with joints staggered minimum 6 inch (15.2 cm) from joints of first layer.

For insulation placed over flat surfaced or sheathed decks, mechanically fasten boards from roof edge to cover roof surface. Ensure that fasteners do not pierce through roof deck.

For placing insulation over unsheathed fluted metal deck surfaces, place fasteners in each insulation board. Ensure that fasteners do not pierce through roof deck.

Tapered insulation in single or multiple thickness, depending on the insulation system selected, require placement of the constant thickness first layer and the tapered thickness insulation second layer to be in a sloped pattern.

Place boards in unsheathed metal decking parallel or perpendicular to deck flutes with edges over flute surface for bearing support. Lay board with edges in moderate contact without forcing. Cut insulation to fit neatly to perimeter blocking and around penetrations through roof. Lay tapered boards, cut boards to slope for a minimum distance of 18 inches (45.7 cm) back from roof drains for positive drainage. Do not apply more insulation than can be covered with membrane in same day. Tape joints of insulation if recommended by insulation manufacturer.

3.3.04 Roof Felt Plies. The optional ply may count as one ply in a three or four ply roof system. A coated base sheet may be used where the deck or substrate is less than ideal. Lay one ply coated base sheet, coated side down. Lap sides 2 inches (5.1 cm); lap ends 6 inches (15.2 cm).

Apply a minimum of 3 plies of roof felt over coated base ply, weather lap edges and ends, mopped with 20 lbs/100 sq ft (97.6 kg/100 sq m) of bitumen per ply. Apply felt in same opposing directions.

Apply felts smooth, free from air pockets, wrinkles, fish-mouths, or tears.

Extend base ply and membrane felts up cant strips a minimum of 4 inches (10.2 cm) onto vertical surfaces and under gravel stops. Mop on two additional plies of felt and one ply of granular surfaced felt as base flashings over roofing membrane plies. Secure to nailing strips at 4 inches (10.2 cm) on center and at reglets.

Install two plies membrane and bitumen glaze coat for cut-off at end of day's operation. Glaze felts exposed at end of working day. Remove cutoff before resuming roofing.

Mop and seal two additional plies of felt around roof penetrations.

3.3.05 Traffic Pads. Install traffic pads by setting in hot asphalt at 20 lb per 100 sq ft (97.6 kg per 100 sq m) cold mastic at 2 gallon per sq ft (81.5 L per sq m) Set joints 6 inches (15.2 cm) apart.

3.3.06 Flashing Accessories. Verify compatibility of flashing materials with roofing system materials. For flashing and accessories installation, apply granular surfaced felt flexible base flashings to seal membrane to vertical elements.

Install prefabricated or fabricated roofing control and expansion joints to isolate roof into areas as indicated. Make joints watertight.

Coordinate installation of roof drains, sumps and related flashings to drawings.

Mop in and seal flashings and flanges of items penetrating membrane with two plies of felt.

Not less than 400 lb per 100 sq ft (1,953.1 kg per 100 sq m) should be used for the single application. Not less than a total of 600 lb per 100 sq ft (2,929.6 kg per 100 sq m) of aggregate should be used for the double application.

For aggregate multiple surfacing installations, apply uniform flood coat of bitumen at rate of 60 lb per 100 sq ft (293.0 kg per 100 sq m) and while hot, embed a single application of roofing aggregate at rate of 400 lb per 100 sq ft (1,953.1 kg per 100 sq m).

Apply cap sheet, if required, in accordance with manufacturer's recommendations.

3.3.07 Metal Roofing. The metal roofing manufacturer shall be fully responsible for the installation of work specified in this section. Installation shall be performed by trained mechanics of the manufacturer or by a duly authorized agent of the manufacturer. No installation of the metal roofing shall commence until the installation subcontractor has been reviewed by the Engineer.

Roof panels shall be laid continuous where possible from ridge to eave with ribs standing and sidelaps and endlaps sealed with a continuous ribbon of tape sealer. Fasten panel units securely to each supporting member with self-tapping screws. All sidelaps and endlaps shall be fastened together through the high flat of the rib with sheet metal screws.

Ends of adjacent roof sheets shall be staggered on supporting members so that ends are not terminated on any one supporting member except at roof edges or at roof openings.

Roof sheets shall start and terminate at the center of supporting member at ends of runs.

Spacing of all fasteners shall be as recommended by the metal roofing manufacturer for the type of roofing provided. All exposed fasteners shall have colorful caps or heads matching color of panels.

Install all trim including flashings and closures to construct a neat appearance and watertight installation. Install gutters and downspouts for free drainage to the paving slab below.

3.3.08 Shingle Installation. Install shingles in accordance with shingle manufacturer’s instructions or NRCA’s “The NRCA Steep Roofing Manual,” whichever is more restrictive.

Lay out work with horizontal and vertical chalk lines.

Apply one layer of felt horizontally over substrate, with 2 inch (5.1 cm) minimum side laps and 4 inch (10.2 cm) minimum end laps. Secure with roofing nails until shingles are installed.

Install self-adhering ice protection underlayment along full length of eaves from the eave edge to a point 24 inch (61.0 cm) minimum beyond wall line in accordance with underlayment manufacturer’s installation instructions.

Install the following types of flashings and edge protection, to conform with installation details and instructions of “The NRCA Steep Roofing Manual” and to provide a weathertight installation:

Install step flashing at vertical wall for entire length of intersection of roof surface and vertical wall.

Start asphalt shingle installation with row of inverted shingles without tabs or layer of roll roofing placed along full length of eave and fastened. Cutouts to break joints on thirds with shingle course below.

Contractor shall review with Engineer shingle manufacturer's instructions for type of shingles specified.

3.3.09 Prefabricated Metal Roof Curbs. Attach prefabricated curbs to wood nailer on roof deck with wood screws.

Weld prefabricated curbs to metal roof deck or bolt prefabricated curbs to concrete roof deck.

3.3.10 Protection. Where traffic must continue over finished roof membrane, protect surfaces.

3.3.11 Cleaning. Remove construction debris from roof surfaces and clean out gutters and downspouts. Remove bituminous markings from finished surfaces.

In areas where finished surfaces are soiled by bitumen or other source of soiling caused by work of this section, consult manufacturer of surfaces for cleaning advice and conform to their documented instructions. Repair or replace defaced or disfigured finishes caused by work of this section.

3.4 FIELD QUALITY CONTROL. Require roofing and insulation manufacturers to visit site daily during installation of the work.

3.5 MAINTENANCE. Furnish 5 bundles of each asphalt shingle type and color used in the work.

End of Section

SECTION 07210

THERMAL PROTECTION AND BUILDING INSULATION

PART 1 - GENERAL

1.1 SCOPE. This section covers vapor and air retarders, board insulation, batt insulation, loose glass fiber insulation and foamed-in-placed insulation. Refer to the drawings for insulation locations.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) C208 – Specification for Cellulosic Fiber Insulating Board.

ASTM C240 – Test Methods of Testing Cellular Glass Insulation Block.

ASTM C552 – Specification for Cellular Glass Thermal Insulation.

ASTM C578 – Specification for Rigid, Cellular Polystyrene Thermal Insulation.

ASTM C612 – Specification for Mineral Fiber Block and Board Thermal Installation.

ASTM C665 – Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.

ASTM C764 – Specification for Mineral Fiber Loose-Fill Thermal Insulation.

ASTM D2103 – Specification for Polyethylene Film and Sheeting.

ASTM D2842 – Test Method for Water Absorption of Rigid Cellular Plastics.

ASTM E84 – Test Method for Surface Burning Characteristics of Building Materials.

NFPA 255 (National Fire Protection Association) – Test of Surface Burning Characteristics of Building Materials.

UL 723 (Underwriters Laboratories, Inc.) – Tests for Surface Burning Characteristics of Building Materials.

1.3 QUALITY ASSURANCE.

1.3.01 Thermal Resistivity. Where thermal resistivity properties of insulation materials are designated by r-values they represent the rate of heat flow through a homogenous material exactly 1 inch (2.5 cm) thick, measured by test method included in referenced material standard or otherwise indicated. They are expressed by the temperature difference in degrees F between the two exposed faces required to cause one BTU to flow through one square foot per hour at mean temperatures indicated.

1.3.02 Fire Performance Characteristics. Provide insulation materials which are identical to those whose fire performance characteristics, as listed for each material or assembly of which insulation is a part, have been determined by testing, per methods indicated below, by UL or other testing and inspecting agency as acceptable to authorities having jurisdiction.

Surface Burning Characteristics: ASTM E84
Fire Resistance Rating: ASTM E119
Combustion Characteristics: ASTM E136

1.3.03 Sample Construction. Install samples of each type of insulation in appropriate locations a minimum of 8 feet (2.44 m) wide, full height, for approval of workmanship. Approved sample construction shall be a standard of workmanship for the Project and may remain in place.

1.4 SUBMITTALS.

1.4.01 Drawings and Product Data. Submit manufacturer product literature and installation instructions for each type of insulation and vapor retarder material required.

1.4.02 Certifications. Submit installer certificates signed by manufacture certifying that exterior finished system insulation installer complies with specified requirements.

1.4.03 Samples. Submit samples of each type of insulation to be installed.

1.4.04 Test Reports. With product data, submit copies of certified test reports showing compliance with specified performance values, including R-values (aged values for plastic insulations), densities, compression strengths, fire performance characteristics, perm ratings, water absorption ratings and similar properties.

Submit a statement of compliance and compatibility for miscellaneous accessory materials, including sealants, adhesives, tapes and all other similar materials.

1.5 DELIVERY, STORAGE AND HANDLING. Protect insulation materials from physical damage and from becoming wet, soiled, or covered with ice or snow. Comply with manufacturer's recommendations for handling, storage and protection during installation.

Do not expose plastic insulation to sunlight, except to extent necessary for period of installation and concealment. Protect against ignition at all times. Do not deliver plastic insulating materials to project site ahead of installation time. Complete installation and concealment of plastic materials as rapidly as possible in each area of work.

1.6 PROJECT CONDITIONS. Environmental Conditions: Do not install system when ambient outdoor temperatures are 40 degrees F (4.4 degrees C) and falling unless temporary protection and heat is provided to maintain ambient temperatures above 40 degrees F (4.4 degrees C) during installation of wet materials and until they have dried thoroughly and become weather resistant, but for not less than 24 hours after installation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS.

2.1.01 Insulation. Subject to compliance with requirements, provide general insulation products from Amoco Foam Products Co., Dow Chemical U.S.A., Johns Manville, CertainTeed Corp., Owens-Corning Fiberglass Corporation, or approved equal.

2.2 MATERIALS. Provide insulating materials which comply with requirements indicated for materials, compliance with referenced standards, and other characteristics.

Preformed Units shall be in sizes to fit applications indicated, selected from manufacturer's standard thicknesses, widths and lengths.

2.2.01 Extruded Polystyrene Board Insulation. Rigid, cellular thermal insulation with closed-cells and integral high density skin, formed by the expansion of polystyrene base resin in an extrusion process to comply with ASTM C578; with 5-year aged r-values of 5.4 and 5 at 40 degrees and 75 degrees F (4.4 degrees and 23.9 degrees C), respectively; and be Type IV, 1.6 lb per cu ft (25.6 kg per m^3) minimum density, unless otherwise indicated. Surface Burning Characteristics for flame spread and smoke developed values shall be 5 and 165 maximum, respectively.

2.2.02 Isocyanurate Board Insulation. Rigid, cellular thermal insulation with glass-fiber-reinforced isocyanurate closed-cell foam core and aluminum foil facing laminated to both sides; complying with FS HH-I-1972/1, Class 2; aged r-values of 7.2 and 8 at 40 and 75 degrees F (4.4 and 23.9 degrees C), respectively. Surface Burning Characteristics for flame spread and smoke developed values shall be 20 and 150, maximum, respectively.

2.2.03 Unfaced Flexible Glass Fiber Board Insulation. Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C553, Class B-4; with nominal density of 1.5 lbs per cu ft (24.0 kg per m^3) and r-value of 4.13 at 75 degrees F (23.9 degrees C), and maximum flame spread and smoke developed values of 25 and 50, respectively; passing ASTM E136 for testing of combustion characteristics.

2.2.04 Foil-Faced Flexible Glass Fiber Board Insulation. Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C553, Class B-4; with nominal density of 1.5 lbs per cu ft (24.0 kg per m^3) and r-value of 4.13 at 75 degrees F (23.9 degrees C); passing ASTM E136 for testing of combustion characteristics of unfaced board; foil-scrim-kraft vapor-retarder facing on one side with maximum flame spread and smoke developed values of 25 and 50, respectively.

2.2.05 Unfaced Glass Fiber Board Insulation. Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C612 and be Medium Density Semi-Rigid Board, Class 1 and 2, with nominal density of 3.0 lbs per cu ft (48.1 kg per m^3), and an r-value of 4.3 at 75 degrees F (23.9 degrees C). Combustion Characteristics shall pass ASTM E136 test.

2.2.06 Foil-Faced Glass Fiber Board Insulation. Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C612 foil-scrim-kraft vapor-retarder facing on one side with maximum flame spread and smoke developed values of 25 and 50, respectively and be Medium Density Semi-Rigid Board; Class 1 and 2, with a nominal density of 3.0 lbs per cu ft (48.1 kg per m^3), and an r-value of 4.3 at 75 degrees F (23.9 degrees C). Combustion Characteristics shall be as for unfaced board and passing ASTM E136 test.

2.2.07 Unfaced Mineral Fiber Blanket/Batt Insulation. Thermal insulation produced by combining mineral fibers of type described below with thermosetting resins to comply with ASTM C665 for Type I (blankets without membrane facing): Mineral Fiber Type shall be manufactured fibers from glass or slag. Combustion Characteristics shall pass ASTM E136 test. Surface Burning Characteristics for flame spread and smoke developed values shall be 25 and 50 maximum, respectively.

2.2.08 Faced Mineral Fiber Blanket/Batt Insulation. Thermal insulation produced by combining mineral fibers of type described below with thermosetting resins to comply with ASTM C665 for Type III, Class A (blankets with reflective vapor-retarder membrane facing with flame spread of 25 or less); foil-scrim-kraft vapor-retarder membrane on one face, respectively. Mineral Fiber Type shall be fibers manufactured from glass or slag.

Combustion Characteristics shall be for unfaced blanket/batt and passing ASTM E136 test.

Surface Burning Characteristics shall have maximum flame spread and smoke developed values of 25 and 50, respectively.

2.2.09 Loose Glass Fiber Insulation. Glass fibers processed to comply with ASTM C764 for Type 2 (poured applications); passing ASTM E136 for combustion characteristics; maximum flame spread and smoke developed values of 5 and 5, respectively and for use as fire stopping.

2.2.10 Foamed in Place Insulation. Core-Fill 500 Foam Insulation as manufactured by Tailored Chemical Products, Hickory, NC, or approved equal. Core-Fill 500 is a nitrogen-based amino plast plastic foam insulation.

2.3 AUXILIARY INSULATING MATERIALS.

2.3.01 Polyethylene Vapor Retarder. Polyethylene film, not less than 10 mils (0.3 mm), with laboratory-tested vapor transmission rating of 0.2 perms, natural color.

2.3.02 Laminated Plastic/Paper Vapor Retarder. Kraft paper sheets laminated together with asphalt and glass fiber reinforcing, and with laminated black-colored polyethylene protection films both sides; laboratory-tested vapor transmission rating of 0.15 perms.

2.3.03 Metal Foil/Paper Vapor Retarder. 0.3-mil (0.008 mm) reflective aluminum foil laminated with scrim reinforcing to plastic-coated Kraft paper; laboratory-tested vapor transmission rating of 0.03 perms.

2.3.04 Vapor retarder tape: pressure-sensitive tape of type recommended by manufacturer, having fire hazard classification identical to that specified for insulation vapor retarder.

2.3.05 Adhesive for Bonding Insulation. Type recommended by insulation manufacturer, and complying with requirements for fire performance characteristics.

2.3.06 Mechanical Anchors. Type and size indicated or, if not indicated as recommended by insulation manufacturer for type of application and condition of substrate.

2.3.07 Mastic Sealer. Type recommended by insulation manufacturer for bonding edge joints between units and filling voids in work.

2.3.08 Crack Sealer for Board Insulation. Provide polymeric insulating foam in aerosol dispenser designed for filling voids in board insulation.

Product: Subject to compliance with requirements, provide "Polycel 100" by Construction Products Div., W.R. Grace & Co.

2.3.09 Protection Board. Premolded, semi-rigid asphalt/fiber composition board, 1/4" thick, formed under heat and pressure, standard sizes.

2.4 EXTERIOR FINISHED INSULATION SYSTEM. The System refers to an exterior assembly composed of an inner layer of thermal insulation board and an outer layer forming the protective finish coating. Designations for the class and type exterior insulation and finish system specified in this section are based on those developed by the Exterior Insulation Manufacturers Association (EIMA). Refer to the Drawings for the specific classes and types to be installed.

2.4.01 Compatibility. Provide board insulation, reinforcing fabric, base and finish coat materials, mechanical anchors and accessories which are compatible with one another and approved for use by system manufacturer.

Provide color and texture for protective coating to comply with the following requirements: Provide selection made by Owner from manufacturer’s full range of standard colors and textures available for type of finish coat indicated.

2.4.02 Expanded Polystyrene Board Insulation. Rigid, cellular thermal insulation with closed cells and integral high density skin, formed by the expansion of polystyrene base resin to comply with ASTM C578 for Type IV; with 2 lbs cu ft (32.0 kg per m^3) minimum density and 5 year aged r-value of 5.4 and 5 at 40 and 75 degrees F (4.4 and 23.9 degrees C); in manufacturer’s standard lengths and widths; thickness as indicated.

2.4.03 Reinforcing Fabrics. Balanced, alkali-resistant open weave glass fiber fabric treated for compatibility with other system materials, made from continuous multi-end strands with tensile strength of not less than 120 lbs (54.4 kg) and 140 lbs (63.5

kg) in warp and fill directions, respectively, per ASTM D1682 and complying with ASTM D578.

2.4.04 Bonding Agent for Reinforcing Fabric. System manufacturer's standard, factory-mixed copolymer emulsion for bonding reinforcing fabric to board insulation, where required by system manufacturer.

2.4.05 Base Coat Materials. Systems manufacturer's standard mixture complying with the following requirements for material composition and method of combining materials:

Job-mixed formulation of Portland cement complying with ASTM C150, Type I, natural color; clean, washed, silica sand complying with ASTM C897 and system manufacturer's requirements; alkali-resistant chopped glass fibers; and system manufacturer's standard polymer emulsion admixture for base coat use.

Factory-mixed formulation of Portland cement complying with ASTM C15, Type I, natural color; hydrated lime complying with ASTM C206, Type S; natural sand aggregate complying with ASTM C897 alkaline-resistant chopped glass fibers; and system manufacturer's standard dry binders and other admixtures.

Either job-mixed or factory-mixed formulations indicated above are acceptable.

Control Joints shall be prefabricated, one-piece type manufactured with expanded metal flanges, formed to provide double keying action with protective coating, and bellows portion extending only to face of insulation; with removable tape plaster face and joint opening width of 1/4 inch (6.4 mm).

Products, subject to compliance with requirements, similar to "Insuljoint I SV" by Metal Products Div., Keene Corp.

Expansion Joints shall be prefabricated, one-piece type manufactured with expanded metal flanges, formed to provide double keying action with protective coating, and bellows portion extending behind finish coat into gap between insulation boards; with removable tape on plaster face and joint opening width of 1/4 inch (6.4 mm).

Products, subject to compliance with requirements, similar to "Insuljoint I DV" by Metal Products Div., Keene Corp.

Corner Bead shall be prefabricated small-nosed corner bead with expanded metal flanges extending minimum of 2 7/8 (7.3 cm) from corner.

Casing Bead shall be prefabricated one-piece type for attachment to surface of insulation or behind insulation, of depth required to suit thickness of coating, and where attached behind insulating, thickness of insulation as well.

2.4.06 Polymer-Based Portland Cement Finish Coat Materials. System manufacturer's standard moisture complying with the following requirements for material composition and method of combining materials:

Job-mixed formulation of Portland cement complying ASTM C150, Type I, natural color or white; clean, washed, bagged silica sand complying with ASTM C897 and system manufacturer's requirements; color-fast mineral pigments; and system manufacturer's standard polymer emulsion admixture for finish coat use.

Factory-mixed formulation of Portland cement complying with ASTM C150, Type I, natural color; hrydated lime complying with ASTM C206, Type S; natural sand aggregate complying with ASTM C897, alkali-resistant chopped glass fibers; and system manufacturer's standard dry polymer binders and other admixtures.

Either job-mixed or factory-mixed formulation indicated above.

2.4.07 Top Coat for Polymer-Based Portland Cement Finish Coat. System manufacturer's factory-mixed pigmented polymer-based formulation. Top coat to resist mildew and dirt-pickup through integral polymer or silicone formulation.

2.4.08 Water. Clean and potable.

2.4.09 Mechanical Fasteners. System manufacturer's standard corrosion-resistant fastener assemblies, complete with system manufacturer's standard washer attachments, selected for properties of pull-out, tensile, and shear strength required to resist design loads of application indicated, capable of pulling fastener head below surface of insulation board.

2.4.10 Trim Accessories. Material as indicated below and type as designated or required to suit conditions indicated and comply with system manufacturer's requirements; manufactured from zinc alloy; coordinate depth of accessories with thickness of base and finish coats required.

PART 3 - EXECUTION

3.1 INSPECTION. Installer shall examine substrates and conditions under which insulation work is to be performed. A satisfactory substrate is one that complies with requirements of the section in which substrate and related work is specified. Report in writing listing conditions detrimental to performance of work in this section. Commencing installation constitutes acceptance.

3.2 PREPARATION. Clean substrates to manufacturer's requirements of substances harmful to insulations or vapor retarders, including removal of projections which might puncture vapor retarders.

Protect contiguous work from moisture deterioration and soiling resulting from application of systems. Provide temporary covering and other protection needed to prevent spattering of exterior finish coatings on other work.

Protect system, substrates and wall construction behind them from inclement weather during installation. Prevent infiltration of moisture behind system and deterioration of substrates.

3.3 INSTALLATION. Comply with manufacturer instructions for particular conditions of installation in each case. If printed instructions are not available or do not apply to project conditions, consult manufacturer technical representative for specific recommendations before proceeding with work.

Extend insulation full thickness as shown over entire area to be insulated. Cut and fit tightly around obstructions, and fill voids with insulation. Remove projections which interfere with placement.

Apply a single layer of insulation of required thickness, unless otherwise shown or required to make up total thickness.

3.3.01 Vapor Retarders. Extend vapor retarder to extremities of areas to be protected from vapor transmission. Secure in place with adhesives or other anchorage system as indicated. Extend vapor retarder to cover miscellaneous voids in insulated substrates, including those which have been stuffed with loose fiber-type insulation.

Seal joints in vapor retarders by lapping not less than 2 inches (5.1 cm). Fasten vapor retarders at top, end and bottom edges, at perimeter of wall openings and at lap joints; space fasteners 16 inch (40.6 cm) o.c.

Seal overlapping joints in vapor retarders with adhesives or tape per vapor retarder manufacturer's printed directions. Seal butt joints and fastener penetrations with tape of type recommended by vapor retarder manufacturer. Locate all joints over framing members or other solid substrates. Firmly attach vapor retarders to substrates with mechanical fasteners or adhesives as recommended by vapor retarder manufacturer.

Seal joints caused by pipes, conduits, electrical boxes and similar items penetrating vapor retarders with cloth or aluminized tape of type recommended by vapor retarder manufacturer to create an air-tight seal between penetrating objects and vapor retarder.

Repair all tears and punctures in vapor retarders immediately before concealment by other work. Cover with tape or another layer of vapor retarder.

3.3.02 Perimeter and Under-Slab Insulation. On vertical surfaces, set units in adhesive applied in accordance with manufacturer's instructions. Use type of adhesive recommended by manufacturer of insulation.

Protect insulation on vertical surfaces (from damage during back-filling) by application of protection board. Set in adhesive in accordance with recommendations of manufacturer of insulation.

Place horizontal perimeter insulation on an appropriate vapor barrier for concrete work and level to finish flush with underside of floor slab.

Protect top surface of horizontal insulation (from damage during concrete work) by application of protection board.

3.3.03 Cavity Wall and Masonry Cell Insulation. On units of plastic insulation, install small pads of adhesive spaced approximately 1 feet - 0 inch (30.5 cm) o.c. both ways on inside face, as recommended by manufacturer. Fit courses of insulation between wall ties and other confining obstructions in cavity, with edges butted tightly both ways. Press units firmly against inside wythe of masonry or other construction as shown.

Supplement adhesive attachment of insulation by securing boards with two-piece wall ties designed for this purpose.

Foamed in place insulation to be installed when wall sections have been completed and sealed or closed. The foam insulation will be pumped through a 5/8 inch (1.6 cm) hole bored into the mortar joints around the entire wall area approximately 5 feet (1.52 m) from the floor level at each cell cavity. Repeat this method at an approximate height of 10 feet (3.05 m) until completion of the wall area. Foam to be installed from an open top in maximum heights of 10 feet to 12 feet (30.5 to 3.66 m) as wall sections are built.

3.3.04 Blanket Insulation. Install insulation blankets between framing members in as long lengths and width as practicable, with ends and side butted together and against building or construction, and with vapor barrier facing winter heated spaces. Cut insulation as required to fit building construction with no gaps or voids.

Secure insulation blankets to framing members with fastener as recommended by insulation manufacturer. Provide galvanized metal furring or metal bands or wire lacing as required to hold insulation blankets in place without sagging.

3.3.05 General Building Insulation. Apply insulation units to substrate by method indicated, complying with manufacturer's recommendations. If no specific method is indicated, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units.

Seal joints between closed-cell (non-breathing) insulation units by applying mastic or sealant to edges of each unit to form a tight seal as units are shoved into place. Fill voids in completed installation with mastic or sealant.

Set vapor retarder faced units with vapor retarder to warm side of construction, except as otherwise indicated. Do not obstruct ventilation spaces, except for fire stopping.

Tape joints and ruptures in vapor retarder, and seal each continuous area of insulation to surrounding construction to ensure air-tight installation.

Set reflective foil-faced units accurately with air space in front of foil as shown. Provide not less than 0.75 inch (1.9 cm) air space where possible.

Place loose glass fiber insulation into spaces and onto surfaces as shown, either by pouring or by machine-blowing. Level horizontal applications to uniform thickness as indicated, lightly settled to uniform density, but not excessively compacted.

Stuff loose glass fiber insulation into miscellaneous voids and cavity spaces where shown. Compact to approximately 40% of normal maximum volume (to a density of approximately 2.5 lbs per cu. ft. (40.0 kg/m^3)).

3.3.06 Protection. Protect installed insulation and vapor retarders from harmful weather exposures and from possible physical abuse, where possible by non-delayed installation of concealing work or, where that is not possible, by temporary covering or enclosure. Promptly remove protective coatings resulting from finish system installation from window and door grooves, and other surfaces not indicated to receive protective coating.

End of Section

SECTION 07410

SIDING/WALL PANEL SYSTEM

PART 1 – GENERAL

1.1 SCOPE. This section covers miscellaneous metal siding and insulated metal wall. Siding system is for walls, and soffits, with insulation, liners, related flashings and accessory components. Provide building paper back-up over wood or gypsum sheathed walls.

1.2 GENERAL. Extent of each type of siding is indicated on the drawings and by provisions of this section.

1.2.01 Governing Standards.

AAMA (American Architectural Manufacturers Association) 809.2 – Non Drying Sealant.

ASCE (American Society of Civil Engineers) 7 – Minimum Design Loads for Building and Other Structures.

ASTM (American Society for Testing and Materials) A36/A36M – Specification for Carbon Structural Steel.

ASTM A123/A123M – Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A153/A153M – Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A307 – Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.

ASTM A606 – Specification for Steel, Sheet and Strip, High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, with Improved Atmospheric Corrosion Resistance.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A666 – Specification for Annealed or Cold-Worked Austenitic

Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM A755/A755M – Specification for Steel Sheet, Metallic Coated by the Hot-Dip Process and Preprinted by the Coil-Coating Process for Exterior Exposed Building Products.

ASTM A792/A792M – Specification for Steel Sheet, 55% Aluminum-Zinc Alloy-Coated by the Hot-Dip Process.

ASTM A924/A924M – Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

ASTM B117 – Practice for Operating Salt Spray (Fog) Apparatus.

ASTM B209 – Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM C236 – Test Method for Steady-State Thermal Performance of Building Assemblies by Means of a Guarded Hot Box.

ASTM C509 – Specification for Elastomeric Cellular Preformed Gasket and Sealing Material.

ASTM C665 – Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.

ASTM D226 – Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM D714 – Method for Evaluating Degree of Blistering of Paints.

ASTM D822 – Practice for Conducting Tests on Paint and Related Coatings and Materials Using Filtered Open-Flame Carbon-Arc Exposure Apparatus.

ASTM D968 – Test Methods for Abrasion Resistance of Organic Coatings by the Falling Abrasive.

ASTM D1654 – Test Method for Evaluation of Pained or Coated Specimens Subjected to Corrosive Environments.

ASTM D2244 – Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates.

ASTM D2247 – Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.

ASTM D4214 – Test Method for Evaluating the Degree of Chalking of Exterior Paint Films.

ASTM E72 – Test Method of Conducting Strength Tests of Panels for Building Construction.

ASTM E84 – Test Method for Surface Burning Characteristics of Building Materials.

ASTM E330 – Test Methods for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.

ASTM E331 – Test Methods for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls, by Uniform Static Air Pressure Difference.

DOD-P-21035A – Paint, High Zinc Dust Content, Galvanizing Repair.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. Company specializing in manufacturing products specified in this section with minimum 3 years documented experience.

Design metal siding under direct supervision of a Professional Engineer experienced in design of this Work and licensed in the State of Michigan.

1.3.02 Contractor's Qualifications. Metal wall panels and siding shall be installed by the manufacturer or his authorized representative, using workmen skilled in the trade.

Installer shall have 3 years documented experience installing siding/wall panel systems.

1.3.03 Testing: Provide preformed panel systems which have been pretested and certified by manufacturer to provide specified resistance to air and water infiltration and structural deflection and failure when installed as indicated and when tested in accordance with AAMA Standard Test TM-1, "Specification for Method of Test for Metal Curtain Walls for Water Penetration Using Dynamic Pressure".

1.3.04 Insulated Metal Wall Performance Criteria and Tests. Structural Tests: Design shall be verified by structural tests for wind loads by the "Chamber Method" as outlined in ASTM E72 or as approved by the Engineer.

1.3.05 Tolerances. Thermal properties for insulated panels shall provide a "U" value not greater than 0.064 Btu/hr/sq ft/degree F (0.36 watts/sqm/degrees C) when corrected to a 15 mph (24.1 kmh) wind condition for 2 inch (5.1 cm) thick flat panels, when tested in accordance with ASTM C236.

Fatigue test shall show no evidence of metal/foam interface delamination when the wall panel is tested by simulating wind loads of 20 psf (0.96 kPa) (positive and negative loads), when applied for two million alternate cycles. Test shall have been conducted and verified by an independent testing laboratory.

No metal primer interface corrosion and/or delamination shall occur after 1,000 hours at 135 degrees F (57.2 degrees C) and 100 percent relative humidity. No delamination after 2 1/2 hours in a 2-psi (13.8 kPa) 212 autoclave when conducted and verified by an independent testing laboratory.

There shall be no uncontrolled water leakage at 6.24 psf (0.3 kPa) air pressure differential when tested in accordance with ASTM E331. Wall assembly shall contain at least one principal horizontal joint.

Fire hazard: Insulating foam core and panel shall have the following fire hazard classification when tested in accordance with ASTM E84:

	Exterior Surface	Interior Surface	2 inch (5.1 cm) Core Material
Flame spread	10	20	25
Smoke	10	65-110	150

Insurance Ratings: Panels shall be rated and carry one or more of the listings: FM Class 1 rating, UL Guide NYVQ (corner tests), and/or ICBO Research Report PFC-330

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit small-scale layouts of panels on walls and large-scale details of edge conditions, joints, corners, custom profiles, supports, anchorages, trim flashings, closures, and special details. Distinguish between factory and field assembly work.

1.4.02 Certifications. Submit statement of compliance on manufacturer's letterhead stating that materials, fabrication and installation comply with requirements indicated and specified.

1.4.03 Samples. Submit representative samples of metal panels in inspection showing interior and exterior facing sheets, insulating core, tongue and grooved edge joints, continuous gasketing or sealing and finish. Submit 2 samples 12 inch (30.5 cm) sq of each exposed finish material. Submit Samples of accessory items.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver metal panels and siding to the job site in properly braced and covered containers to protect panels from bending kinking, warping, damage to the finish and protection from the elements.

Store metal panels and siding at the job site until installed in place off the ground, in a slightly titled lengthwise position, supported full length, in a dry ventilated area or under weatherproof cover. Protect panels from accelerated weathering by removing or venting sheet plastic wrap.

1.6 WARRANTY. Contractor shall provide a 5 year warranty for metal panels and siding in addition to any other warranties offered by manufacturer.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Design and size components to withstand dead and live loads caused by positive and negative wind pressure acting normal to plane of wall at a design pressure of 20 lbs per sq ft (0.96 kPa) or higher as required by AAMA specifications for the particular geographic area involved. Maximum allowable deflection of panel span when tested for single, double, or triple spurs indicated.

Accommodate movement within system without damage to components or deterioration of seals, movement within system; movement between system and perimeter components when subject to seasonal temperature cycling; dynamic loading and release of loads; deflection of structural support framing.

Provide positive drainage to exterior for moisture entering or condensation occurring within panel system.

2.2 ACCEPTABLE MANUFACTURERS. Subject to compliance with requirements, provide preformed siding products by Atas International, Inc., Centria, Englert Inc., McElroy Metal, Inc., Peterson Aluminum Corp., or approved equal.

2.3 MATERIALS.

2.3.01 Steel for Painting/Coating. Hot-dip zinc coated steel sheet, ASTM A653, Grade A except where higher strength required for performance, G90 zinc coating, surface treated for maximum coating performance.

2.3.02 Metal Finishes. Apply coatings either before or after forming and fabricating panels, as required by coating process and as required for maximum coating performance capability. Protect coating promptly after application and cure, by application of strippable film or removable adhesive cover, and retain until installation has been completed. Provide colors or color matches as indicated or, if not otherwise indicated, as selected by Engineer from manufacturer's standard colors.

Fluoropolymer coating shall be full-strength 70 percent "Kynar 500" coating baked-on for 15 minutes at 450 degrees F (232.2 degrees C), in a dry film thickness of 1.0 mil (0.03 mm), 30 percent reflective gloss (ASTM D 523), over min. 0.2 mil (0.005 mm) baked-on modified epoxy primer.

Provide durable coating which has been field tested under normal range of weathering conditions for minimum of 20 years without significant peel, blister, flake, chip, crack or check in finish, and without chalking in excess of 8 (ASTM D4214), and without fading in excess of 5 NBS units. Abrasion resistance shall be per ASTM D968 following said test and have a minimum coefficient abrasion of SS.

2.3.03 Accessories. Except as indicated as work of another specification section, provide components required for a complete curved siding system, including trim, copings, sills, corner units, ridge closures, clips, seam covers, battens, flashings, closure strips and similar items. Match materials/finishes of curved preformed panels. Fasteners shall be manufacturer's standard non-corrosive types, with exterior heads gasketed.

2.3.04 Insulated Metal Wall Materials. Materials shall comply with the references and requirements specified.

Steel shall be steel sheet, structural quality, galvanized, ASTM A653, Coating Class as specified.

Bars & structural shapes, hot rolled shall comply with ASTM A36.

Insulation shall be urethane or isocyanurate foam listed by UL and having a Factory Mutual (FM) Class 1 rating. Density shall be 2.5 lbs cu ft (40.0 kg/m^3) minimum. Shear strength shall be at least 20 psi (137.9 kPa). Tensile strength shall be 30 psi (206.8 kPa) minimum. Compressive strength shall be 20 psi (137.9 kPa) minimum. Insulation shall have a 93 percent closed cell structure. Insulation shall withstand heat-aging at 158 degrees F (70 degrees C) and 100 percent relative humidity for a period of 14 days with a volume increase not greater than 6.6 percent and withstand heat-aging at 200 degrees F (93.3 degrees C) for a period of 14 days with a volume of 4.0 percent. Insulation shall withstand cold-aging at minus 10 degrees F (-23.3 degrees C) for a period of 14 days with loss in volume not greater than 0.3 percent.

Glass fiber insulation for filling voids in panel system, where foam fill has been removed to accommodate cutting, fitting and forming panels at corners, penetrations, and other locations shall comply with ASTM C665, Type I.

Joint Sealant shall be non-drying non-skinning, non-oxidizing polybutene type complying with AAMA 809.2.

Gasketing shall be continuous neoprene gaskets, if used for sealing tongued and grooved side joints: ASTM C509, Type II.

Clips shall be concealed clip angles for edge fastening of panels: minimum 12 gage (2.8 mm) galvanized steel.

Fasteners shall be self-tapping type, cadmium-plated carbon steel, designed to resist maximum negative pull-off loads and hold the panels mechanically to the structural building girts.

Expansion Shields shall be Fed. Spec. FF-S-325, machine bolt type, tubular type, or self-drilling tubular type.

Steel bolts, standard fasteners shall comply with ASTM A307.

Touch-up paint for field touch-up of galvanized steel sheet shall be ZRC Chemical Products Co. “Z.R.C.”, other zinc-rich paint complying with Mil. Spec. DOD-P-21035, or a type recommended by manufacturer. Such touch-up shall be of a minor nature, subject to inspection

2.4 MANUFACTURER AND FABRICATION. Fabricate and finish panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, and as required to fulfill indicated performance requirements which have been demonstrated by factory testing. Comply with indicated profiles and dimensional requirements, and with structural requirements. Panel profile to be Super-Rib Wall Panel by Centria.

Thickness of metal gages are required to be noted for structural performances, but not less than manufacturer's recommended minimums for profiles and applications indicated, and not less than 8 gage (4.3 mm) for exterior panels.

Fabricate panels and other components of wall system for installed-as-indicated performances of 20 lbs per sq ft (0.96 kPa) inward and 15 lbs per sq ft (0.72 kPa) outward wall loading.

Apply bituminous coating or other permanent separation materials on concealed panel surfaces where panels would otherwise be in direct contact with substrate materials which are non-compatible or could result in corrosion or deterioration of either material or finishes.

Fabricate panel joints with captive gaskets or separator strips, which provide a tight seal and prevent metal-to-metal contact in a manner which will minimize noise from movements within panel system.

2.4.01 Metal Wall Panels. Metal panels shall be 24 inches (61.0 cm) wide and no more than 2 inches (5.1 cm) thick, factory-formed, consisting of exterior and interior face sheets, insulating foamed bonding core and tongued and grooved side joints, continuously sealed or gasketed. Panels shall be in continuous lengths that will best accommodate building elevations required, with minimal or no horizontal joints, and meeting the performance criteria specified.

Exterior face sheet shall be G90 galvanized coated steel in metal thickness required to meet performance criteria specified. Face sheet surface shall be flat with fine vertical ripple or stucco embossed pattern to minimize oil-canning.

Finish for exterior and interior face sheet shall be fluorocarbon. Color shall be as selected by the Engineer.

Accessories such as exposed trim and flashing, other than extruded trim, on exterior shall be of same material and given same finish as exterior facing sheet. Ferrous metal fastenings shall be stainless steel.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that in-place construction on which this Work is dependent is free of defects which may influence satisfactory completion and performance of the Work. Beginning of installation means acceptance of in-place construction.

3.2 PREPARATION. Protect the Work and adjacent construction against damage.

3.3 INSTALLATION. Comply with panel fabricator’s and material manufacturer’s’ instructions and recommendations for installation, as applicable to project conditions and supporting substrates. Anchor panels and other components of the work securely in place, with provisions for thermal/structural movement. Entire installation shall be weather tight and in compliance with performance requirements.

3.3.01 Erection. Erect panels with vertical joints plumb and truly vertical, and with fastenings to structure concealed in joints.
Field-cut panels at corners and other required locations shall be cut maximum practical size so that the ends butt at the corner seal cut edges before installation. Surfaces of cut panels shall not show any buckling or other surface damage beyond edge of corner trim. Cut panels for insertion of window in panels where required. Provide accessories required for installation of panels to steel framing members.

When erecting panels, take care that continuous gaskets or sealant strips are properly in place. Replace any sections which are loose or have fallen out. Maximum variation in plane of adjacent panels shall be 1/16 inch (1.6mm).

Provide flashing, trim and other accessories for a complete and weather tight installation, including head, jamb, sill flashing at openings as well as base flashing. Also provide corner trim, interior and exterior.

3.3.02 Manufacturers Field Services. Where possible, prior to fabrication of prefabricated panels, manufacturer shall take field measurements of structure or substrates to receive panel system. Allow for trimming panel units where final dimensions cannot be established prior to fabrication.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. Maximum offset from true alignment between adjacent members butting or in line shall be 1/16 inch (1.6 mm). Maximum variation from plane or location shall be 1/4 inch (6.4 mm) or as indicated on the drawings.

3.4.02 Inspection. At completion of erection inspect surfaces with the Engineer. Replace panels and other components of the work which have been damaged or have deteriorated beyond successful repair by means of finish touch-up or similar minor repair procedures.

3.4.03 Cleaning. Remove temporary protective coverings and strippable films (if any) as each panel is installed. Upon completion of panel installation, clean finished surfaces as recommended by panel manufacturer, and maintain in a clean condition during construction.

End of Section

SECTION 07500

FLASHING AND TRIM

PART 1 – GENERAL

1.1 SCOPE. This section includes metal counter flashing and base flashing, metal wall flashing and expansion joints, metal scuppers, exposed metal trim, fascia and coping units, cap flashings and miscellaneous sheet metal accessories. It also addresses elastic roof/wall expansion joint systems, laminated and composition flashing, and coatings and slip sheets to isolate sheet metal from dissimilar material.

Roofing accessories which are installed integral with roofing work are specified in Master Specification Section 07200, Roofing and Accessories.

1.2 REFERENCES.

1.2.01 Governing Standards.

AAMA (American Architectural Manufacturers Association) 611 - Standards for Anodized Architectural Aluminum.

AAMA 808.3 - Exterior Perimeter Sealing Compound.

ASTM (American Society for Testing and Materials) A167 – Specification for Stainless and Heat-Resisting Chromium-Nickel-Steel Plate, Sheet, and Strip.

ASTM A480/A480M – Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip.

ASTM A606 – Specification for Steel, Sheet and Strip, High-Strength, Low-Alloy, Hot Rolled and Cold Rolled, with Improved Atmospheric Resistance.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy Coated (Galvannealed) by the Hot-Dip Process.

ASTM A924/A924M – Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

ASTM B32 - Specification for Solder Metal.

ASTM B209 - Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B370 - Specification for Copper Sheet and Strip for Building Construction.

ASTM D226 - Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.

ASTM D2178 – Specification for Asphalt Glass Felt Used in Roofing and Waterproofing.

ASTM D4397 – Specification for Polyethylene Sheeting for Construction, Industrial, and Agricultural Applications.

ASTM D4586 – Specification for Asphalt Roof Cement, Asbestos-Free.

AWS (American Welding Society) D1.3 – Structural Welding Code-Sheet Steel.

DOD-P 21035A – Paint, High Zinc Dust Content, Galvanizing Repair.

FFS (Federal Specification) 325 – Shield, Expansion; Nail, Expansion; and Nail, Drive Screw (Devices, Anchoring, Masonry).

FS TT-C-494B – Coating Compound, Bituminous, Solvent Type, Acid Resistant.

SMACNA (Sheet Metal and Air Conditioning Contractors National Association) – Architectural Sheet Metal Manual.

1.3 QUALITY ASSURANCE.

1.3.01 Contractors Qualifications. A company familiar with installing products included in this section and which has completed at least 20 installations similar in scope to work included in this section.

1.3.02 Quality Standard. Fabricate and install sheet metal work in accordance with Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA) "Architectural Sheet Metal Manual," unless specifically indicated otherwise.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit layout drawings of each item indicating dimensions, material, metal gauges and other pertinent construction and erection details.

Product Data: Submit manufacturer's technical information and installation instructions, in sufficient detail to demonstrate products comply with contract documents.

Samples: Submit two (2) 6 inch (15.2 cm) square samples of each type of metal and finish required.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver materials to the project site in their original unopened containers, or packages or bundles, bearing label clearly identifying manufacturer's name, brand name, and other pertinent information.

Store materials in dry and protected storage facilities until ready for use,

1.6 WARRANTY. Warrant sheet metal work, except items embedded in built-up roofing and forming an integral part of built-up roof system, for 2 years against defective materials, workmanship and leaks, except leaks caused by abuse, lightning, hurricane, tornado, hail storm, unusual climatic phenomena or failure of related work installed by other parties.

During the warranty period, restore defective work to the standard of the contract documents, including all materials, labor, refinishing and other costs incidental to the work. Within 24 hours after receipt of notice from the Engineer, inspect the work and immediately repair leaks. Restore work found to be defective as defined in the contract documents within 10 days after receipt of notice from the Engineer.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide products of Cheney Flashing Co., Keystone Flashing Co., GAF Materials Corp., Peterson Aluminum Corp. or approved equal.

2.2 MATERIALS.

2. 2.01 Galvanized Steel Sheet. ASTM A653, commercial quality, G90 hot-dip galvanized.

2.2.02 Pre-finished Galvanized Steel Sheet. Coil coated, commercial quality steel sheet, ASTM A924 Grade A or ASTM A653, G90 hot-dip galvanized shall be 70 percent "Kynar 500" or "Hylar 5000" resin finish over epoxy primer; minimum system thickness 1.0 mil (0.03 mm). Provide manufacturer’s standard prime coat on underside. Color shall be selected by Owner, after contract award, from manufacturer's standard color selection.

Provide strippable plastic protective film or, pre-finished surface.

2.2.03 Stainless Steel Sheet. ASTM A167, Type 302 or 304 sheets or strips, dead soft fully annealed, 2D or 2B finish per ASTM A480. Fastenings shall be stainless steel nails or screws. Solder shall be ASTM B32, alloy grade 60A bar form (40 percent pig lead and 60 percent pure block tin). Flux shall be acid type for pretinning and activated- rosin-alcohol type for soldering, or non-corrosive type such as Gregory Fabricators "Gregory 200."

2.2.04 Pre-finished Aluminum Sheet. ASTM B209, manufacturer's standard alloy, and temper for indicated applications. Minimum thickness shall be 20 gage (1.0 mm), unless indicated otherwise. Finish shall be 70 percent "Kynar 500" or "Hylar 5000" resin finish over epoxy primer: minimum system thickness 1.0 mil (0.03 mm). Provide manufacturer's standard prime cost on underside. Color shall be selected by Owner after contract award, from manufacturer's standard color selection, Provide strippable plastic protective film on pre-finished surface.

2.2.05 Laminated Sheet Flashing. Laminate 1 layer of asphalt Kraft paper or asphalt impregnated fabric to each face of a 5 ounce copper sheet. Provided they comply with requirements of the Contract documents, provide "AFCO Cop-A-Bond Duplex" by AFCO Products, Inc. and "Cop-R-Tex Duplex" by York Manufacturing, Inc. or approved equal.

2.2.06 Special (Thru-Wall) Flashings. Interlocking flashing: 0.015 inch (0.4 mm) stainless steel sheet, deformed to provide a keyed mortar bond where indicated on the Drawings per SMACNA, Inc. Architectural Sheet Metal Manual, Plate 54, Fig. C.

2.2.07 Reglet. Reglet for flashing in concrete wall: Cheney Flashing Company Type A SnapLock", 1/4 inch (6.4 mm) deep, formed of 0.015 inch (0.4 mm) thick, dead soft stainless steel complete with prepunched nail holes at 12 inches (30.5 cm) on center and required matching nails or screws.

2.2.08 Self-Adhesive Sheet Eaves Ice and Snow Underlayment. Rubberized asphalt sheets with polyethylene film facing packaged in rolls with disposable release paper. Minimum thickness shall be 34 mils (0.9 mm) nominal. Provided they comply with requirements of the contract documents, "Polyguard Dock Guard" Polyguard Products, Inc., "Royston Ice and Water Gard" membrane; Royston Laboratories, Division/Chase Corporation, and "Ice and Water Shield", W. R. Grace & Company or approved equal.

2.2.09 Fasteners. Corrosion-resistant metal of same material as the material being fastened, or other material recommended by sheet metal manufacturer. Match finish and color of exposed fastener heads to finish and color of sheet material being fastened.

Concealed Fasteners shall be of the same metal as item fastened or other noncorrosive metal as recommended by manufacturer,

2.2.10 Mastic Sealant. Polyisobutylene; non-hardening, nonskinnning, nondrying, nonmigrating sealant. Mastic shall be asphalt base mixture complying with ASTM D4586, Type 1.

2.2.11 Foam Rubber Seal. Manufacturer's standard foam.

2.2.12 Metal Joint Sealant. A non-drying, non-skinning, non-oxidizing, butyl sealant complying with AAMA Specification 808.3, such as Protective Treatments, Inc. "PTI 707." Use noncuring type for concealed joints. Use nonsag electromeric type for exposed joints.

2.2.13 Sealant (Aluminum Riveted Joints). Alcoa "GutterSeal."

2.2.14 Adhesives. Types recommended by manufacturer for substrate and project conditions, and formulated to withstand min. 60 psf (2.9 kPa) uplift force. Use two-component noncorrosive epoxy adhesive recommended by metal manufacturer for sealing of nonmoving joints,

2.2.15 Expansion Shields. Fed. Spec, FF-S-325, machine bolt type, tubular type, or self-drilling tubular type.

2.2.16. Bituminous Coating. Heavy bodied, sulfur-free, asphalt-based paint; FS TT-C-494.

2.3 MANUFACTURER AND FABRICATION. Form sheet metal to match profiles indicated, substantially free from oil-canning, fish-mouths, and other defects. Provide fascia and copings equal to Snap-Lok Coping Systems as manufactured by MM Systems Company, which are designed and fabricated to fit applications indicated and to perform optimally with respect to weather resistance, water tightness, durability, strength, and uniform appearance.

Comply with SMACNA "Architectural Sheet Metal Manual" for applications indicated.

Provide for thermal expansion of exposed sheet metal work exceeding 15 feet (4.6 m) running length.

2.3.01 Flashing and Trim. Provide movement joints at maximum spacing of 10 feet (3.05 m); no joints allowed within 2 feet (61.0 cm) of a corner or intersection. Fabricate fascia and copings to allow not only for movement of metal components in relationship to one another but also to adjoining dissimilar materials, including flashing and roofing membrane materials, in a manner which is sufficient to prevent water leakage, deformation or damage.

Conceal fasteners and expansion provisions wherever possible.

Exposed fasteners are not allowed on faces of sheet metal exposed to public view. Form a 1/2 inch (1.3 cm) hem on underside of exposed edges.

Fabricate cleats and attachment devices from same material as sheet metal component being anchored or from compatible, noncorrosive metal recommended by sheet metal manufacturer.

Gage: As recommended by SMACNA or metal manufacturer for application, but in no case less than gage of metal being secured.

2.3.02 Metal Fabrications. As a minimum, fabricate flashings using materials in the thickness listed for each flashing application, or as indicated on the drawings.

2.3.03 Two Piece, Type II Flashing. The receiver portion shall have outer edge formed into a double fold turned down 1 inch (2.5 cm), unless otherwise indicated, and shall be fabricated as follows:

The upper portion of the receiver shall extend up at an angle and then vertically 3 inches (7.6 cm). The uppermost portion shall be formed outward 1/2 inch (1.3 cm) at 45 degrees to receive sealant.

2.3.04 Pressure Bar. Pressure bar shall be 3/16 inch x 1 inch (4.8 mm x 2.5 cm) stainless steel bars.

2.3.05 Seaming. Provide seams which are appropriate for the various conditions encountered in the work; locked, lapped or cleated, and soldered or sealed watertight with sealant, as indicated or required. Make ample provisions for expansion and contraction.

Standing seams finish shall be not less than 1 inch (2.5 cm) high. Flat seams finish shall not be less than 3/4 inch (1.9 cm) wide. Soldered lap seams finish shall not be less than 1 inch (2.5 cm) wide. Unsoldered plain lap seams lap shall not be less than 3 inches (7.6 cm). All seams on sloped surfaces shall be in direction of waterflow.

2.3.06 Soldering Stainless Steel. Clean, roughen and pretin edges of sheet metal to be soldered. Remove all flux residue from acid type flux by scrubbing, neutralizing with ammonia or washing soda, and rinsing with water. After pretinning and assembling of parts, solder and thoroughly clean the surfaces as recommended by manufacturer of stainless steel sheet.

Clean stainless steel surfaces, using detergent for loose dirt and commercial cleaner containing phosphoric or oxalic acid for stubborn deposits.

2.3.07 Cap Flashing. Fabricate cap flashing of 0.018 inch (0.5 mm) thick stainless steel sheet. Provide 2 piece metal cap flashing, consisting of an upper receiver portion and a lower portion extending over the composition flashing, unless otherwise specified.

For 2 piece cap flashings, fabricate the receiver portion with outer edge formed into a double fold turned down 1 inch (2.5 cm), unless otherwise indicated, and as follows:

At new masonry walls, extend the receiver portion into the wall as indicated, terminated with 1/4 inch (6.4 mm) upstand edge, unless indicated to be higher.

At walls faced with metal siding or preformed metal panels, extend the receiver portion into the wall as indicated and terminate with edge folded over support.

At concrete and existing masonry walls, extend the receiver portion into saw cut or form the receiver portion to retain sealant as indicated, using a 3/16 by 1 inch (4.8 mm x 2.5 cm) stainless steel clamping bar.

At parapet, extend the receiver portion over wood blocking as indicated.

Form the upper edge of the lower portion of metal cap flashing to engage in the double fold of receiver portion, bent to provide spring action against the base flashing, fold the lower edge folded back 1/2 inch (1.3 cm) and lap composition base flashing not less than 4 inches (10.2 cm).

Lap ends of each length of both portions of metal cap flashing not less than 3 inches (7.6 cm). Weld or solder corner joints. Return ends at roof edge into reglet or wall,

Provide 1 piece cap flashing at roof curbs, with top edge formed to retain metal joint sealant and bottom edge folded 1/2 inch (1.3 cm) to provide drip.

2 3.08 Coping. Fabricate coping and accessories of stainless steel sheets of the correct thicknesses. For coping, fabricate to thickness of 0.024 inches (0.6 mm). For splice plates, fabricate to a thickness of 0.015 inches (0.4 mm). For cleat, use 0.036 inches (0.9 mm) thickness.

Shop fabricate coping sections in 8 ft (2.4 m) lengths and of 1 piece material of sufficient width. Provide sections in 1 piece assemblies around internal and external corners, with vertical portion bent and horizontal portion mitered and welded. Form edge on roof side into a double fold turned down 1 inch (2.5 cm). Form vertical face with lower edge folded under 1/2 inch (1.3 cm) and bent to suit cleat.

Provide 12 inch (30.5 cm) wide plates for joints, profiled to suit entire coping, including the bent portion of the cleat.

Provide continuous cleat, 1 3/4 inches (4.4 cm) wide unless otherwise indicated, with 1 inch (2.5 cm) vertical leg and 3/4 inch (1.9 cm) leg bent out at 30 degrees, in sections of maximum practical length.

2.3.09 Roof Penetration Flashing. Fabricate flashing sections of 0.018 inch (0.5 mm) thick stainless steel sheet, with 1/8 by 1 inch (3.2 mm x 2.5 cm) stainless steel clamping bar or draw band (hose clamp type tightened with screw). Fabricate flashing in 2 sections as indicated, with lower section of height indicated and a minimum 4 inch (10.2 cm) wide flange onto roof.

Provide flashing assembly for all roof penetrations, such as vent stacks, piping, equipment supports. Deliver to site in ample time to avoid delays in other work. Installation is specified as part of the built-up bituminous roofing work.

2.3.10 Guffers, Conductors, and Splash Pans. For Type I Gutters, Stainless Steel: Fabricate gutters, apron pieces, and cleats where required to be aluminum of 0.032 inch (0.8 mm) thick aluminum, sheets in sections 10 feet (3.05 m) long. Stiffening bar shall be extruded aluminum.

Fabricate gutters, apron pieces and cleats where required to be stainless steel of .018 inch (0.5 mm) thick, stretcher leveled stainless steel sheet in sections 10 feet (3.05 m) long. Stiffening bar shall be stainless steel.

Form gutters to shape required.

Join adjacent sections by 1 inch (2.5 cm) side laps, riveted at 2 inch (5.1 cm) spacing and soldered where stainless steel is used, and riveted and sealed watertight with the specified sealant if aluminum is used.

Provide transverse gutter spacers at 36 inch (91.4 cm) intervals, 1 1/2 inches (3.8 cm) wide and formed of same material as gutter into a 3/4 inch (1.9 cm) deep channel with 3/4 inch (1.9 cm) end flanges. Attach spacers to front and rear top edges of gutter using rivets, Locate spacers midway between brackets.

Provide gutter expansion joints as required at a maximum of 40 feet (12.2 m) on center or as required.

Provide end pieces at gutter ends.

Apron Pieces: Form gutter apron piece in 8 foot (2.4 m) lengths, with 1 edge extending onto roof not less than 4 inches (10.2 cm). The sheet metal shall extend down over the rear surface of the gutter to form an apron. The apron shall be crimped and lower edge bent to form a drip. Notch apron piece around spacers.

Provide Type I stainless steel gutter brackets to support stainless steel gutters where required of 1/8 x 1 1/2 inch (3.2 mm x 3.8 cm) stainless steel bar..

Provide brackets 6 inches (15.2 cm) from ends and at 36 inch (91.4 cm) intervals over length of gutter runs. Provide 2 holes in bracket for fastening to nailer.

Type I outlet tubes for connection to stainless steel conductors shall be formed of 0.018 inch (0.5 mm) thick stainless steel sheet with locked and soldered longitudinal seam, the upper end of tubes shall be flanged 1/2 inch (1.3 cm) and soldered to gutter inner surface. Tubes shall extend into conductors at least 3 inches (7.6 cm).

Type I Wire basket strainers at stainless steel gutters shall be formed from 0.114 inch (2.9 mm) diameter stainless steel wire. Provide strainers at outlet tubes, fitting snugly in tubes.

Fabricate Type I Conductors at stainless steel gutters of corrugated 0.018 inch (0.5 mm) thick stainless steel sheet. Conductors shall be constructed in 10 foot (3.05 m) lengths where possible. Telescope end joints 1 1/2 inches (3.8 cm) and lock longitudinal joints. Provide necessary elbows, offsets and the like as required to complete the installation. Conductors shall be 3 inches (7.6 cm) in diameter unless otherwise required.

Fabricate Type I Straps at stainless steel conductors of 0.018 inch (0.5 mm) thick stainless steel sheet. Fabricate straps 2 inches (5.1 cm) wide and of design to hold conductor clear of wall. Provide quantity adequate for installation at not over 48 inch (1.2 m) intervals.

Splash Pans: Fabricate splash pans of 0.024 inch (0.6 mm) thick stainless steel sheet. Splash pans shall be fabricated to the required dimensions. Provide baffles and horizontal flanges as required. Rear end of pan shall extend over cant and have top edge formed to engage in receiver or cap flashing built into wall. Provide cap flashing for building

2.3.11 Thru Wall Flashings. Flashings under masonry coping: the interlocking type, profile as required with a double fold turned down 1 inch (2.5 cm). Provide for 3 inch (7.6 cm) lap joints.

Thru wall flashings other than the above: 0.010 to 0.015 inch (0.3 to 0.4 mm) stainless steel, profile as required, Provide four inch (10.2 cm) lap joints. Form ends of non continuous flashing over openings to provide a 1 inch (2.5 cm) high dam.

PART 3 – EXECUTION

3.1 INSPECTION. Examine substrates and conditions under which products of this section are to be installed and verify that work may properly commence. Do not proceed with the work until unsatisfactory conditions have been fully resolved Verity that nailers, blocking, and other attachment provisions for sheet metal work are properly located and securely fastened to resist effects of wind and thermal stresses.

3.2 PREPARATION. Protect this work and adjacent construction against damage during progress of work until completion. Take precautions to prevent damage to work from traffic or placement of heavy materials thereon.

Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal. Isolate dissimilar metals by means of a heavy bituminous coating, approved paint coating, adhered polyethylene sheet, or other means approved by the Engineer.

3.3 INSTALLATION. Surfaces to be flashed or covered with sheet metal shall be clean and free from defects. Clean foreign matter from surfaces. Drive projecting nails flush. Comply with sheet metal manufacturer's installation methods and recommendations in the SMACNA "Architectural Sheet Metal Manual." Coordinate with installation of roof deck and other substrates to receive work of this section, with vapor retarders, roof insulation, roofing membrane, flashing, and wall construction; as required to ensure that each element of the work performs properly, and that combined elements are waterproof and weather tight. Anchor products included in this section securely to structural substrates, adequate to withstand lateral and thermal stresses as well as inward and outward loading pressures.

3.3.01 Isolation. Where metal surfaces of units are installed in contact with dissimilar metal or corrosive substrates, including wood, apply bituminous coating on concealed metal surfaces, or provide other permanent separation as recommended by manufacturer.

Secure flashings in place using concealed fasteners. Apply plastic cement compound between metal flashings and felt flashings. Fit flashings tight in place. Make corners square, surfaces true and straight in planes, and lines accurate to profiles. Install snow guards up slope from eaves and valleys. Secure gutters and downspouts in place using concealed fasteners. Slope gutters minimum 1/4 inch per ft (2.1 cm per m). Set splash pans under down spouts.

3.3 02 Eaves Ice and Snow Underlayment. Install 1 layer of self adhesive underlayment starting at the roof edge and extending as indicated on the drawings, with minimum 4 inch (10.2 cm) side laps and 6 inch (15.2 cm) end laps.

3.3.03 Sealed Joints. Seal water joints watertight. Form minimum 1 inch (2.5 cm) hooked joints and embed flange into sealant or adhesive. Form metal to completely conceal sealant or adhesive. Use joint adhesive for nonmoving joints specified not to be soldered.

3.3.04 Moving Joints. When ambient temperature is moderate (40 to 70 degrees F (4.4 to 21.1 degrees C)) at time of installation, set joined members for 50 percent movement either way. Adjust setting position of joined members proportionally for temperatures above 70 degrees F (21.1 degrees C).

Do not install sealant at temperatures below 40 degrees F (4.4 degrees C). Clean surfaces to be soldered, removing oils and foreign matter.

3.3.05 Cap Flashing. Install metal cap flashing over composition base flashing which turns up onto vertical surfaces.

In new masonry work, set flashing in a bed of mortar both above and below the metal.

At concrete and existing masonry walls, wedge the receiver portion into a saw cut with coiled metal plugs compatible with the receiver or neoprene wedges, 12 to16 inches (30.5 to 40.6 cm) on center, unless otherwise indicated, or anchor clamping bar to wall with screws and expansion shields, as indicated.

At concrete walls in cavity construction, insert the receiver portion into the reglet.

Insert lower portion into receiver portion and fasten with screws at 12 inch (30.5 cm) spacing and of length required to join the metal but not project into substrate behind flashing.

At roof curbs, apply metal joint sealant and install 1 piece cap flashing as indicated.

Lap section ends a minimum of 3 inches (7.6 cm) and seal watertight with mastic.

3.4 PROTECTION. Protect sheet metal work as recommended by the installer so that completed work will be clean, secured and without damage at substantial completion.

3.5 CLEANING. Remove protective film from pre-finished sheet metal immediately after installation. Clean exposed metal surfaces in accordance with manufacturer's instructions. Touch up damaged metal coatings. Remove from sheet metal surfaces any debris or substances which will inhibit uniform weathering.

Repair or replace work which is damaged or defaced, as directed by the Engineer. Refinish marred and abraded areas of pre-finished sheet using finish manufacturer's recommended methods and materials. Replace units which, in the opinion of the Engineer, cannot satisfactorily be refinished in place.

End of Section

SECTION 07600

CAULKING AND SEALANTS

PART 1 - GENERAL

1.1 SCOPE. This section covers caulking and sealing.

1.2 GENERAL.

1.2.01 Coordination. At least 2 weeks prior to installation of caulking or sealant work, arrange a meeting with the Engineer and a representative of the sealant manufacturer to review sealing procedures and products to be used. Give at least 2 weeks notice to concerned parties.

Furnish for review at the meeting, samples of sealant on production runs of substrate material, prepared as described below, as proof of adhesion of each sealant to each respective substrate. Furnish substrate samples prepared, cleaned, primed (if required) and sealant installed the same as for the sealant work. After the sealant manufacturer's recommended curing period, immerse the samples in tap water for at least 24 hours and present for review while immersed.

1.2.02 Governing Standards.

ASTM (American Society for Testing and Materials) C794 – Test Method for Adhesion-in-Peel of Elastomeric Joint Sealants.

ASTM C834 – Specification for Latex Sealants.

ASTM C919 – Practice for Use of Sealants in Acoustical Applications.

ASTM C920 – Specification for Elastomeric Joint Sealants.

ASTM C1021 – Practice for Laboratories Engaged in the Testing of Building Sealants.

ASTM C1087 – Test Method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems.

ASTM C1115 – Specification for Dense Elastomeric Silicone Rubber Gaskets and Accessories.

ASTM C1193 – Guide for Use of Joint Sealants.

ASTM C1311 – Specification for Solvent Release Sealants.

ASTM D1056 – Specification for Flexible Cellular Materials – Sponge or Expanded Rubber.

ASTM D1667 – Specification for Flexible Cellular Materials – Vinyl Chloride Polymers and Copolymers (Closed-Cell Foam).

ASTM D2628 – Specification for Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Caulking and sealing work shall be installed by a contractor that has specialized in the type of Work specified and indicated on the Drawings for at least the past 5 years. Submit evidence of successful experience on projects similar in size and scope to this Work.

1.3.02 Testing. Provide comprehensive test data for each type of caulk or sealant based on tests conducted by a qualified independent testing laboratory on current product formulations within a 24 month period preceding date of Contractor's submittal of test results to Engineer.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Caulk and sealant manufacturer's product descriptions with instructions, including limitations for storage, joint opening preparation, and installation of caulk, sealants and joint components. Indicate where primers will be used or submit printed statement from manufacturer that no primers are required for adequate adhesion.

Joint sealant backing and bond breaker manufacturer's product description with instructions, including limitations for storage, handling and installation.

Caulk and sealant manufacturer's standard color range for color selection, unless indicated otherwise.

1.4.02 Certifications. Submit statement written on applicable manufacturer's official letterhead and signed by the responsible representative, indicating that products proposed for use have been tested and conform to the requirements of the Contract Documents and the following:

The sealant meets applicable referenced specification requirements.

The sealant is compatible with specified sealant backing materials and does not adhere to specified bond breaker as determined by ASTM C1087.

The sealant is compatible with and has been tested for adequate adhesion to each respective substrate. Include identification of any primers required to obtain adequate adhesion.

Furnish manufacturer's statement dated no earlier than one year prior to submittal. Submit test reports, as partial fulfillment of these requirements, from the manufacturers or an independent laboratory. Testing shall comply with ASTM C1021. Include a list of tests made and their results. Test data more than two years old may be submitted provided manufacturer indicates in the statement of compliance that the tested sealants have not changed in formula or manufacture sufficient to produce different results.

Schedule sufficient time for the conducting of testing, certification of results and submission, to not cause a delay in the progress of the work.

1.4.03 Samples. Submit samples of each type and color of cured caulk and sealant after color selection has been made. Submit samples of sealant backing materials, minimum 12 inches (30.5 cm) long, and sealant bond breaker materials.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver products to the project site in their original unopened containers bearing the name of the manufacturer and brand and other information such as color, expiration period for use, pot life, curing time, and mixing instructions for multi-component materials. Store and handle products as recommended by the manufacturer to prevent damage and deterioration. Additionally, store sealants at a temperature between 40 degrees and 80 degrees F (4.4 degrees and 27 degrees C) and store sealant backing and bond breaker so they will not become damp, wet or frost covered.

1.6 WARRANTY. Provide installation warranty for a period of 5 years against defective materials and workmanship.

During the warranty period, restore defective Work to the standard of the Contract Documents without additional compensation, including all materials, labor, refinishing and other costs incidental to the Work. Within 24 hours after receipt of notice from the Engineer, inspect the Work and immediately repair leaks. Restore

Work found to be defective, as defined in the Contract Documents, within 10 days after receipt of notice from the Engineer.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Do not install exterior sealant in damp or rainy weather. Do not install interior or exterior sealants until after substrate surfaces have thoroughly dried. Do not install sealant when ambient temperature is below 40 degrees F (4.4 degrees C) unless approved in writing, with appropriate application procedures, by the sealant manufacturer.

Do not proceed with installation of joint sealers where joint widths are less than allowed by joint sealer manufacturer for application indicated. Do not proceed with installation of joint sealers until contaminants capable of interfering with their adhesion are removed from joint substrates.

2.2 ACCEPTABLE MANUFACTURERS. Provide products manufactured by General Electric (silicone products), Pecora Corp., Tremco, Inc., Sonneborn Div. of ChemRex, Dow Corning Corp., or equal.

2.3 MATERIALS. Provide caulk, joint sealers, joint fillers and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience. Provide color of exposed joint sealers indicated or, if not otherwise indicated, as selected by Engineer from manufacturer's entire range of colors.

2.3.01 Elastomeric Joint Sealants (High Performance General Purpose Exterior): Provide manufacturer's standard chemically curing, elastomeric sealant of polysulfide, silicone or urethane base polymer which complies with ASTM C920 requirements, including Type, Grade, Class and Uses, subject to approval.

One-Part Mildew-Resistant Silicone Sealant should be Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated.

Single-component, silicone, elastomeric sealant shall comply with ASTM C920, Type S, Grade NS, Class 25, Use NT. Dow Corning "790", "791" or "795"; Pecora "890"; or equal.

Two component, polysulfide rubber elastomeric sealant to provide nonsag, nonsubmerged service shall be Bostik “Chem-Calk 200”, Pecora “GC-5”, Sonneborn “Sonolastic Polysulfide Sealant”, or an approved equal. For self-leveling use Bostik “Chem-Calk 250”, or equal.

Multi-component, urethane, elastomeric sealant complying with ASTM C920, Type M, Class 25, Use T, nonsubmerged service. Provide primer recommended by sealant manufacturer. For Grade NS, use LymTal International, Inc. “Iso-Flex 881” or approved equal. For Grade P, use LymTal International, Inc. “Iso-Flex 880GB”, Sonneborn “SL2”, Sonneborn “NP2”, or equal.

For multi-component, urethane sealant, comply with ASTM C920, Type M, Class 25, Use T, submerged service, NSF 61 approved. For Grade NS, use Polymeric Systems, Inc. “PSI - 270 Reservoir Sealant” or approved equal. For Grade P, use Polymeric Systems, Inc. “PSI - 270 SL Reservoir Sealant” Sonneborn “Polvsulfide Sealant”, or equal.

For two component, urethane sealant to provide nonsag, nonsubmerged service, use Bostik “Chem-Calk 500”, Tremco “Vulkem 227”, or Pecora “Dynatrol II”. For self-leveling, use Bostik “Chem-Calk 500”, Tremco “Vulkem 245”, Pecora “Urexpan NR-200”, or Tremco “THC-900”, Sonneborn “NP2”, or equal.

For single-component, silicone sealant complying with ASTM C920, for high humidity/moisture exposure use Dow Corning “786”; Pecora “898; Sonneborn “OMNIPLUS”, or equal.

2.3.02 Non-elastomeric Sealants. For (general purpose interior) Single-component, latex sealant complying with ASTM C834, use Pecora “AC-20 + silicone”; Tremco “Tremflex 834”; Sonneborn “Sonolac”, or equal.

2.3.03 Bath/Tile Sealant. For white silicone that meets ASTM C920, Uses M and A; single component, mildew resistant, use Dow Corning Trademate Tub Tile and Ceramic Sealant, Sonneborn “OMNIPLUS”, or equal.

2.3.04 Acoustical Sealants. For single-component, non-hardening synthetic rubber complying with ASTM C1311, use PTI “707” or “757”; Tremco “Acoustical Sealant”; Pecora “BA-98”; Sonneborn “200 Adhesive”, or equal.

2.3.05 Solvent-Release Curing Joint Sealants. Manufacturer’s standard one-part, nonsag, solvent-release-curing, acrylic terpolymer sealant complying with ASTM C920 for Type S; Grade NS; Uses NT, M, G, A, and, as applicable to joint substrates indicated, O; except for selected test properties which are revised as follows. Heat-aged hardness shall not exceed 40 to 50. Weight loss shall not exceed 15%. Maximum cyclic movement capability shall not exceed plus or minus 12 1/2%.

Acceptable products include “Mono 555”; Tremco Inc., or equal.

2.3.06 Preformed Foam Compression Sealant. Manufacturer’s standard preformed, pre-compressed, impregnated foam sealant manufactured from high-density urethane foam impregnated with a nondrying, water repellent agent; factory-produced in pre-compressed sizes and in roll or stick form to fit joint widths indicated and to develop a watertight and airtight seal when compressed to the degree specified by manufacturer. Product should be permanently elastic, mildew-resistant, non-migratory, non-staining, compatible with joint substrates another joint sealers, subject to approval.

2.3.07 Solvent. Oil-free cleaning solvent (for example: toluene, xylene, methyl ethyl ketone, acetone, 50/50 mixture of isopropyl alcohol and water, and mineral spirits) as recommended by sealant manufacturer.

2.3.08 Primer. Where required, use a non-staining primer recommended by the sealant manufacturer.

2.3.09 Sealant Backing. Furnish sealant backing material for the application as recommended by the sealant manufacturer, of the following types:

Plastic Foam Joint Fillers: Preformed, compressible, resilient, non-waxing, non-extruding strips of flexible, non-gassing plastic foam of material indicated below; non-absorbent to water and gas; and of size, shape and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

Open Cell: Expanded open cell polyurethane shape compressed a minimum of 25 percent of its dimension at time of installation in the joint opening. Furnish Backer Rod Mfg., Inc. “Denver Foam”; Industrial Thermo Polymers Limited “TundraFoam”; or equal.

Closed Cell: Expanded closed cell polyethylene shape compressed no more than 25 to 33 percent of its dimension at the time of installation in the joint opening. Furnish Industrial Thermo Polymers Limited “ITP Standard Backer Rod”; Nomaco, Inc. “Green Rod”; W.R. Meadows, Inc. “Sealtight Kool-Rod”; or equal.

Foam Tape: Self-adhesive, rectangular shape, expanded open cell polyurethane or closed cell polyethylene, sized for the application and as manufactured by Williams Products Inc.; H-O Products Corp.; Norton Co.; or equal.

2.3.10 Elastomeric Tubing Joint Fillers. Neoprene, butyl, EPDM, or silicone tubing complying with ASTM D1056, non-absorbent to water and gas, capable of remaining resilient at temperatures down to –26 degrees F (-15 degrees C). Provide products with low compression set and of size and shape to provide a secondary seal, to control sealant depth, and otherwise contribute to optimum sealant performance.

2.3.11 Bond Breaker. Heavy duty, 14 mil (0.4 mm) minimum thickness, colored, polyethylene or Teflon, self-adhesive bond breaker of type recommended by sealant manufacturer and suitable for conditions of usage. Liquid bond breaker is not permitted.

PART 3 – EXECUTION

3.1 INSPECTION. Examine joints indicated to receive joint sealers, with Installer present, for compliance with requirements for joint configuration, installation tolerances and other conditions affecting joint sealer performance.

Inspect joint opening prior to sealant installation for proper installation of sealant backing or bond breaker, proper opening depth and proper substrate preparation, cleaning and (where required) priming.

3.2 PREPARATION. Protect the Work and adjacent construction against damage. Clean Work adjacent to joints free of smears of sealant as Work progresses. Protect surfaces difficult to clean with masking tape or other suitable means not injurious to surfaces being protected. Verify that in-place construction on which this Work is dependent is free of defects which may influence satisfactory completion and performance of the Work. Beginning of installation means acceptance of in-place construction.

3.2.01 Substrates. Prepare joint openings in substrate in conformance with manufacturer's written instructions, ASTM C1193, ASTM C919 for sealants in acoustical applications, and as specified.

Dry, sound and thoroughly clean sealant substrates are required when primer (where required by manufacturer for optimum adhesion) and sealant are installed. Allow concrete, masonry or other porous substrates wetted by rain or other sources of moisture to dry for at least 24 hours under good drying conditions before application of primer or sealant. Protect surfaces that have been cleaned from contamination by deleterious materials such as oil, dust and rain, until primer (where required) and sealant are applied.

Use cleaning solvents as recommended by the sealant manufacturer. Furnish containers for cleaning solvent storage that are clean, oil-free and suitable for use with the solvent.

3.2.02 Masonry, Concrete or other Porous Substrates. Remove loose particles, dirt, paint, foreign matter, and concrete curing compound by sandblasting, nylon bristle brush or other sealant manufacturer approved method not injurious to the substrate material and that will not change the appearance of the exposed surfaces adjacent to the sealant joint opening. Expose fine aggregate of concrete substrates to be sealed. Remove dust created by cleaning by repeated brushing with a soft bristle brush or by blowing dust from the substrate with oil-free compressed air.

Where indicated or specified, rake out mortar joints to width and depth indicated to receive sealant. Bring joints having excessive depth to proper depth with sealant backing specified. Rake out to proper depth, joints that are too shallow.

Clean sealant joint opening of mortar droppings and any other materials that affect finished sealant joint performance prior to installation of sealant backing material.

3.2.03 Metal Substrates. Remove oils, residues from forming processes, corrosion and oxide build-up by nylon bristle brush, chemical cleaners or other sealant manufacturer approved method. Following removal, clean the substrate surface using the two-cloth system with a clean, lint free, white cloth soaked in solvent which is poured, not dipped, onto the cloth, followed by wiping the substrate surface dry, with the second clean, lint free, dry, white cloth before the solvent evaporates. Change to clean rags frequently. Brush application of solvents is not permitted.

3.2.04 Coated Metal or other Non-Porous Substrates. Clean the substrate surface using the two-cloth system with a clean, lint free, white cloth soaked in solvent which is poured, not dipped, onto the cloth, followed by wiping the substrate surface dry with the second dry, clean, lint free, white cloth before the solvent evaporates. Change to clean rags frequently. Brush application of solvents is not permitted.

Clean organically coated (PVF, silicone-polyester, etc.) panels or other similar factory applied finishes with sealant and finish manufacturer approved solvent that is compatible with organic coating system.

3.2.05 Elastomeric Rubber and other Organic Substrates. Submit organic materials to sealant manufacturer for compatibility testing by ASTM C1311 and adhesion testing by ASTM C794.

Remove lubricants, release agents, dusting agents, and other materials from the substrate surface, using cleaning procedures based on the successful completion of the above testing, as provided in writing by the sealant manufacturer.

3.2.06 Primer. Apply primer, as recommended by the sealant manufacturer, only to previously cleaned substrate surfaces to which sealants will be applied. The preferred method for application is with a clean, lint-free cloth for non-porous substrates and a clean natural bristle brush for porous substrates. Apply primer to the cloth or brush by pouring; dipping is not permitted. Take adequate measures, such as masking joint opening edges, to prevent primer from being applied to the face of adjacent surfaces. Allow primer to cure as recommended by the sealant manufacturer before installation of sealant.

Prime only those substrate surfaces that can be sealed immediately after the recommended primer curing period to preclude dust, oil, rain, condensation or other deleterious conditions to contaminate primer.

3.2.07 Sealant Backing Material. Install sealant backing, of proper type and size, at proper depth in joint to provide specified joint dimensions. Place sealant backing into the joint to avoid lengthwise stretching, twisting, braiding or lapping. Provide continuity with tight butt joints. Install dry sealant backing immediately prior to installing sealant. Apply sealant with sealant backing in place unless otherwise indicated.

Install closed cell sealant backing using good practices to avoid compression in excess of that specified or puncturing of the sealant backing material.

If the sealant backing is to function as a temporary joint seal for weather protection or other reasons, for a period of time before sealant installation, remove the backing and replace it immediately prior to sealant installation with new sealant backing.

3.2.08 Bond Breaker. Install properly sized bond breaker tape so that the entire surface is covered. One tape may be lapped over another to achieve total coverage. Do not extend bond breaker tape onto the substrate surfaces to interrupt or prevent adhesion of the sealant to the substrate.

3.2.09 Joint Dimensions. Create joint opening depth (as measured at the sealant and substrate interface) for sealant contacting and bonded to substrate surfaces no less than 1/4 inch (6.4 mm) in depth. Minimum sealant depth at the mid-point of the joint width shall be 1/8 inch (3.2 mm).

Unless indicated otherwise on the drawings, for joint opening widths from 1/4 inch (6.4 mm) up to 1/2 inch (1.3 cm) wide, provide joint opening depth of 1/4 inch (6.4

mm); for joint opening widths over 1/2 inch to 3/4 inch (1.3 to 1.9 cm) wide, provide joint opening depth of one half the width; for joint opening widths over 3/4 inch to 2 inches (1.9 to 5.1 cm) wide, provide joint opening depth no greater than 3/8 inch (9.5 mm); and for joint opening widths exceeding 2 inches (5.1 cm), provide depth as determined by the sealant manufacturer.

Refer to the drawings for joint opening requirements.

3.3 INSTALLATION. Install sealant in conformance with the manufacturer's written instructions, ASTM C1193, ASTM C962 for elastomeric sealants, ASTM C804 for solvent release curing sealants, ASTM C790 for latex sealants, ASTM C919 for sealants in acoustical applications and as specified.

Do not apply sealant to damp, wet or frost covered substrates, sealant backing or bond breaker.

Dry-tool exposed sealant surface immediately using no lubricant such as soap and water. A lubricant is allowed, if permitted by the sealant manufacturer and is a solvent or similar type product as recommended in writing by the sealant manufacturer.

Where required or specified, to avoid smearing sealant on surfaces adjacent to joint opening, use masking tape or other suitable means and remove after tooling sealant surface and before sealant begins to cure. Organically coated (PVF, silicone-polyester, etc.) panels or other similar factory applied finishes shall be protected.

Use drop cloths to cover horizontal or other surfaces likely to receive sealant droppings during installation.

3.3.01 Sealant Backings. Install joint fillers of type indicated to provide support of sealants during application and at position required to produce the cross-sectional shapes and depths of installed sealants relative to joint widths which allow optimum sealant movement capability. Do not leave gaps between ends of joint fillers. Do not stretch, twist, puncture, or tear joint fillers. Remove absorbent joint fillers which have become wet prior to sealant application and replace with dry material.

Install bond breaker tape between sealants and joint fillers, compression seals, or back of joints where adhesion of sealant to surfaces at back of joints would result in sealant failure.

Install compressible seals serving as sealant backings to comply with requirements indicated above for joint fillers.

3.3.02 Non-Sag or Gunnable Sealant. Apply non-sag sealant into joint opening with hand- or air-powered sealant gun so as to fill void completely. Use gun nozzle of proper size to fit joint opening.

Take care not to smear adjoining surfaces with sealant. Force sealant, by tooling, fully into joint opening and intimate contact with substrate surface. Tool exposed joint surface so that a slight concave surface is formed. Use of the sealant gun for tooling is not allowed.

3.3.03 Pourable or Self-Leveling Sealant. Apply self-leveling sealant to finish close to the joint opening surface without overflowing and to form a slightly concave joint surface. Where required due to slope or other conditions, install a non-sag formulation of the same sealant in accordance with the procedures specified for that sealant type.

3.3.04 Tooling of Nonsag Sealants. Immediately after sealant application and prior to time skinning or curing begins, tool sealants to form smooth, uniform beads of configuration indicated, to eliminate air pockets, and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents which discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

Provide concave joint configuration per Figure 6A in ASTM C962, unless otherwise indicated. Provide flush joint configuration per Figure 6B in ASTM C962, where indicated. Use masking tape to protect adjacent surfaces of recessed tooled joints.

3.3.05 Installation of Preformed Foam Sealants. Install each length of sealant immediately after removing protective wrapping, taking care not to pull or stretch material, and to comply with sealant manufacturer’s directions for installation methods, materials, and tools which produce seal continuity attends, turns, and intersections of joints.

3.3.06 Cleaning. Clean off excess sealants or sealant smears adjacent to joints as work progresses by methods and with cleaning materials approved by manufacturers of joint sealers and of products in which joints occur.

3.3.07 Protection. Protect joint sealers during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage/deterioration occurs, cut out and remove damaged/deteriorated joint sealers immediately and reseal joints with new materials to produce joint sealer installations with repaired areas indistinguishable from original work.

End of Section

SECTION 07950

FIRESTOPPING AND SMOKESTOPPING

PART 1 - GENERAL

1.1 SCOPE. This section includes firestopping in spaces between materials and all penetrations through fire barriers, where indicated on the drawings, including voids around pipes, ducts, conduits, and other openings, as required by authorities having jurisdiction.

This section also includes smokestopping in spaces between materials and all penetrations through smoke barriers, where indicated on the drawings, including voids around pipes, ducts, conduits, joints between smoke barriers, other construction, and other joints and openings, as required by authorities having jurisdiction.

1.1.01 Work Not Included. Repairing penetrations made in error and repairing penetrations which are too large to be sealed by the methods indicated; these are to be repaired using the original material of the construction.

1.1.02 Products Furnished but Not Installed. Sleeves which are an integral part of the firestopping assembly but which must be set by installer of other construction.

1.2 GENERAL.

1.2.01 Coordination. Prior to the start of work which involves cutting penetrations, conduct a meeting with installers of such work to identify fire and smoke barriers and required configurations of penetrations and to discuss the proper procedures and time schedule for cutting, patching, and sealing penetrations in such assemblies, with emphasis on avoiding unnecessary cutting and patching.

Perform firestopping and smokestopping work after completion of work, which penetrates fire and smoke barriers, but prior to covering up or eliminating access to the penetration. Coordinate with installers of such other work.

1.2.02 Governing Standards.

ASTM (American Society for Testing and Materials) E84 – Test Method for Surface Burning Characteristics of Building Materials.

ASTM E119 - Test Method for Fire Tests of Building Construction and

Materials.

ASTM E814 – Test Method for Fire Tests of Through-Penetration Fire Stops.

FM (Factory Mutual Engineering Corporation) – Fire Hazard Classifications.

FM P7825 – Approval Guide (with supplement I).

UL (Underwriters Laboratories, Inc.) - Fire Resistance Directory.

UL 263 – Fire Tests of Building Construction and Materials.

UL 723 – Test for Surface Burning Characteristics of Building Materials.

UL 1479 – Fire Tests of Through-Penetration Firestops.

WH (Warnock Hersey) – Directory of Listed Products.

1.2.03 Definitions.

Fire Barrier. Any wall, floor, ceiling, or roof which is indicated as having a fire-resistance rating.

Smoke Barrier. Any wall, floor, ceiling, or roof which is indicated as being designed to prevent passage of smoke and gases; may be indicated as "smoke barrier," "smoke partition," "smoke wall," etc.

Firestopping. A sealing or stuffing material or assembly placed in spaces between and penetrations through building materials to arrest the movement of fire, smoke, heat, and hot gases through fire rated construction.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Company specializing in fire and smokestopping for projects of this size with a minimum of three years documented experience.

1.3.02 Testing. Testing shall have been conducted or witnessed by an independent testing agency acceptable to governing authorities.

Test methods shall comply with ASTM E814 and ASTM E119; as indicated for each

penetration seal.
Conduct tests with a measurably higher pressure inside the chamber than outside.
The listing of the assembly to be used in the current edition of either Underwriters Laboratories Inc. “Fire Resistance Directory” or Factory Mutual System “Approval Guide” will be considered evidence of acceptable testing.

A current evaluation report by BOCA Research and Evaluation Committee ("BOCA Research Report") will be considered evidence of acceptable testing:

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit manufacturer’s data on product characteristics, performance, limitations, and installation instructions. Include detailed instructions for repair and for modification due to changes in penetrating items.

1.4.02 Certifications. Certify products meet or exceed specified requirements.

1.4.03 Schedule of Firestopping. Provide complete list, for approval, of opening locations and sizes and penetrations to be sealed, indicating location, fire rating of penetrated assembly, identification of penetration seal to be used, fire rating of penetration seal, and evidence of acceptable testing.

1.4.04 Schedule of Smokestopping. Provide complete list, for approval, of opening locations and sizes and penetrations to be sealed, indicating location, construction of penetrated assembly, and identification of penetration seal to be used.

1.4.05 Preinstallation Inspection Report. Identify penetrations, which need to be repaired using the original material of the assembly.

1.4.06 Project Record Documents. Drawings showing locations of all fire and smoke barriers, the actual penetrations through them, and the manner in which they have been sealed; cross-referenced to maintenance data.

1.5 DELIVERY, STORAGE, AND HANDLING. Coordinate delivery of products to minimize storage time at site.

Deliver products to project site in original unopened containers bearing the name of the manufacturer, product name, type, and testing agency's identification mark. Store products in accordance with manufacturer's instructions.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide products manufactured by, Dow Corning Corporation, Hilti Corporation, 3M Fire Protection Products, Pecora

Corporation, United States Gypsum Company, or an approved equal.

2.2 MATERIALS.

2.2.01 Firestopping. It is the contractor's responsibility to determine the types of penetrations to be sealed and to select appropriate firestopping assemblies.

Provide penetration seal assemblies whose fire-resistance ratings have been determined by testing in the configurations required and which have fire-resistance ratings at least as high as that of the fire-rated assembly in which they are to be installed.

If a tested assembly is not available for a particular penetration configuration, modify the penetration configuration to suit available assemblies; do not modify assembly configuration except as specifically stated in the test report or as approved by the authority having jurisdiction.

Provide products which allow normal expansion and contraction movement of the penetrating item without failure of the penetration seal. They should emit no hazardous, combustible, or irritating by-products during installation or curing period and do not require special tools for installation.

2.2.02 Smokestopping. Use any gunnable or pourable joint sealant suitable for the application; use only fully curing types where accessible in the finished work. Provide products which allow normal expansion and contraction movement of the penetrating item without failure of the penetration seal. They should emit no hazardous, combustible, or irritating by-products during installation or curing period and do not require special tools for installation.

2.2.03 Primer. Type recommended by firestopping manufacturer for specific substrate surfaces and suitable for required fire ratings.

2.2.04 Installation Accessories. Provide clips, collars, fasteners, temporary stops or dams, and other devices required to position and retain materials in place.

PART 3 - EXECUTION

3.1 INSPECTION. Inspect all fire and smoke barriers for penetrations of any type; mark or otherwise identify all penetrations indicating action required whether it be: 1) repair; 2) firestopping; or 3) smokestopping.

Conduct inspection prior to covering up or enclosing walls or ceilings jointly with Engineer and authorized representative of authority having jurisdiction.
Submit a report detailing findings of inspection to the Engineer.

If the configuration of a particular penetration does not conform to the configuration necessary for the required firestopping assembly, notify the installer of the penetration for modification of the configuration to suit the assembly; do not use the firestopping assembly in other configurations except as specifically stated in the test report or as approved by the authority having jurisdiction.

3.2 PREPARATION. Prepare penetrations in accordance with the material manufacturer's instructions, prior to installing firestopping or smokestopping.

3.3 INSTALLATION. Install firestopping materials in exact accordance with manufacturer's instructions and the conditions of the testing; provide all accessory materials required and apply primer where recommended by manufacturer.

3.3.01 Application. Remove combustible forming materials, unless they are a required component of the tested assembly.

3.3.02 Cleaning. Clean up excess material adjacent to penetrations promptly; use methods and materials approved by the manufacturers of the penetration seals and of surfaces to be cleaned.

3.3.03 Protection. Protect adjacent surfaces from damage during installation.

Protect installed work during curing period from damage from construction operations using substantial barriers if necessary.

Repair damaged materials in accordance with manufacturer's instructions.

3.4 FIELD QUALITY CONTROL. Inspect completed installations for completeness and correct installation. If installed work is to be covered in completed work, inspect and obtain approval prior to covering. Obtain the approval of the authority having jurisdiction.

End of Section

INDEX

DIVISION 8 – DOORS AND WINDOWS

SECTION 08110

STEEL DOORS AND FRAMES

PART 1 – GENERAL

1.1 SCOPE. This section covers steel doors and frames.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society of Testing and Materials) A554 - Specification for Welded Stainless Steel Mechanical Tubing.

ASTM A653/A653M - Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A666 - Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM A1011 – Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM C509 – Specification for Elastomeric Cellular Preformed Gasket and Sealing Material.

AWS (American Welding Society) D9.1 - Sheet Metal Welding Code.

Mil. Spec. (Military Specification) DOD-P-21035A – Paint, High Zinc Dust Content, Galvanizing Repair.

NFPA (National Fire Protection Association) 80 – Standard for Fire Doors and Windows.

1.3 QUALITY ASSURANCE. All steel doors and frames shall comply with the building code enforced by the municipality paving jurisdiction and with NFPA 80. All fire door assemblies shall be welded by an approved agency. Ensure that approved agency classification markings for labeled hollow metal doors and frames are metal and mechanically applied with drive screws or rivets.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit Shop Drawings showing elevation and details of each frame and door type, location in building of each, conditions at openings with various wall thicknesses and materials, typical and special details of construction, method of assembling sections, location and installation requirements for hardware, size, shape and thickness of materials, joints and connections. Include hollow metal frames for prefitted doors specified elsewhere. Submit type and performance data for door louvers giving percentages of free area for louvers to be installed.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver doors and frames palleted, wrapped, or crated to provide protection during transit and job storage.

Inspect doors and frames on delivery for damage. Minor damages may be repaired by Contractor provided repaired items match new work including finish, and are acceptable to the Engineer responsible for installation. Otherwise, remove and replace damaged items as directed.

Store doors and frames at building site under cover. Place units on minimum 4 inch (10.2 cm) high wood blocking. Avoid using nonvented plastic or canvas shelters that could create a humidity chamber. If wrappers on doors become wet, remove cartons immediately. Provide minimum 1/4 inch (6.4 mm) spaces between stacked doors to promote air circulation.

1.6 WARRANTY. Warrant the Work for 2 years against defective materials or workmanship, or both, and against leakage, except where such leakage is caused by lightning, hurricane, tornado, hail storm or other unusual climatic phenomena of the elements, or failure of related work installed by other parties, or abuse or vandalism.

During the warranty period, the Contractor agrees to restore defective Work to the standard of the Contract Documents, including materials, labor, refinishing and other costs incidental to the Work. Within 24 hours after receipt of notice from the owner, the Contractor shall inspect the Work and immediately repair leaks in the Work. The Contractor agrees to restore Work found to be defective as defined in the Contract Documents within 10 days after receipt of notice from the Owner.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Acme Steel Door Corp.; American Steel Products Corp.; Curries Co.; Macotta Manufacturing; Overly Manufacturing Co.; Pioneer Industries; Steelcraft; Trussbilt, Inc.; Windsor Door; or approved equal.

2.2 MATERIALS.

2.2.01 Steel Sheet shall be cold-rolled, complying with ASTM A1008; hot-rolled, complying with ASTM A1011, pickled and oiled; or galvannealed complying with ASTM A653, A25 coating designation, unless otherwise specified, mill phosphatized, and shall be free from surface or internal defects, and with clean smooth surfaces.

Steel sheet for doors, in addition to the above shall be stretcher leveled.

Steel for exterior doors and frames, and interior doors and frames indicated as A60 galvannealed including their anchors shall be ASTM A653/A653M, commercial quality, A60 coating designation, mill phosphatized.

Steel for doors and frames indicated as G90 shall be galvanized and be ASTM A653/A653M, commercial quality, and G90 coating designation.

2.2.02 Stainless Steel. Stainless steel tubes shall be ASTM A554

Flat sheet and plate shall be ASTM A666, Type 302 or 304, No. 4 finish, unless otherwise specified.

Filler metal for welding shall be the type recommended by the manufacturer of stainless steel.

2.2.03 Sound-Deadening Liner for Doors. For non-labeled doors, sound-deadening liner shall be rockwool or other approved synthetic resin based liner.

For labeled doors sound-deadening liner shall be as required by the labeling authority.

2.2.04 Louvers. Louvers for interior doors shall be sightproof, stationary type with inverted "V" blade or inverted "Y" blade at the option of the manufacturer; blades formed of not less than 20 gage (1.0 mm) steel sheets set at not more than 3 inch (7.6 cm) spacing; not less than 30 percent free air opening.

Louvers for exterior doors shall be stationary type "Z" blade design with insect screen; blades formed from not less than 20 gage (1.0 mm) galvanized steel sheets and spaced approximately 1-1/2 inches (3.8 cm) apart; bronze 14 x 18 inch (35.6 x 45.7 cm) mesh insect screen mounted to interior face of louver, complete with standard folded frame.

Louvers for labeled doors shall be labeled and having U.S.S. 18 gage (1.3 mm) steel adjustable blades with fusible link set for 135 degrees F (57.2 degrees C); 35 percent minimum free air opening.

2.2.05 Integral Seal. Shall be closed cell neoprene complying with ASTM C509.

2.2.06 Zinc-Rich Paint. Shall be ZRC Products Co., "Z.R.C." or other acceptable product complying with DOD-P-21035A.

2.2.07 Metal Gages. Metal gages for steel sheets and strips for hollow metal work shall be to manufacturer's standard, with minimums as follows:

Frames for doors and side lights:	
Exterior frames	14 ga. (1.9 m)
Interior frames	16 ga. (1.6 m)
Rough bucks	12 ga. (2.7 m)
Mullions	same as frame
Moldings	20 ga. (1.0 m)
Frames for borrowed lights:	
Frames and mullions	16 ga. (1.6 m)
Moldings	18 ga. (1.3 m)
Full flush doors (metal core reinforcement):	
Face sheets for interior doors	18 ga. (1.3 m)
Face sheets for exterior doors	16 ga. (1.6 m)
Core stiffener channels or "Z" member	20 ga. (1.0 m)
Optional core - continuous trusscore	28 ga. (0.5 m)

Moldings	18 ga. (1.3 m)

2.3 MANUFACTURER AND FABRICATION. Insofar as practicable, fabricate the Work at shop, ready for delivery and erection at building. Trial-fit Work that is not able to be completely fabricated in shop. Assemble at shop to insure proper assembly at building. Provide holes, connections, fastenings for and to work of other trades abutting, adjoining or intersecting the Work.

2.3.01 Welding. Welding shall comply with AWS D9.1. Fabricate the Work with all joints and connections continuously welded surfaces in alignment, straight and free from defects such as warp, or buckling. Unless indicated otherwise, make all corners square and edges sharp. Join molding neatly and weld. Dress all joints flush with base metal surface. Provide bracing necessary to support movable parts.

Provide concealed reinforcement of sheet or bar steel for hardware, including automatic devices, and other attached work, where and as required by conditions. Hinge reinforcement shall not be less than 3/16 inch (4.8 mm) thick by not less than 1-1/2 inches (3.8 cm) wide by not less than 6 inches (15.2 cm) longer than hinge. Reinforcement for other hardware and attached work shall not be less than 12 gage (2.7 mm) and of sufficient size to receive fastenings. Secure hinge, door closer and door holder reinforcements with at least 6 spot welds. Secure other reinforcement with at least 2 spot welds.

2.3.02 Hardware Preparation. Drill and tap Work as required for mortised hardware. Locate by template provided by manufacturer.

Prepare hollow metal door frames and hollow metal doors for finish hardware. Coordinate fitting of hardware on frames for doors specified in other Master Specification sections, which require factory fitting of hardware. Provide sinkages or mortises, as required, formed accurately to template so that mortised hardware will fit neatly into depressions, with hardware member surface flush with surface of door or frame, unless otherwise required.

Provide reinforcing plates, less drilling and tapping, for doors and frames to receive surface applied hardware, except push plates and kick plates.

Provide plaster guards or mortar boxes in back of hardware cutouts welded to frame.

Punch interior door frames to receive door silencers. For single door frames, provide for 3 silencers in lock side jambs. For double door frames, provide for one silencer for each leaf in frame head.

For double door frames with flush transom panels, provide continuous sponge neoprene silencer at transom rabbeted stop.

Provide necessary additional space, cut-outs, reinforcements and provisions for fastening in doors and frame heads to receive overhead door closers concealed in frame members.

Provide continuous hardware reinforcement for hinges for lead-lined doors.

2.3.03 Shop Painting. Remove oil, grease, sand, dirt and other foreign substances. After cleaning, chemically treat cold-rolled and galvanized metal surfaces to assure maximum paint adherence.

Touch up welds and abrasions in galvannealed and galvanized surfaces with zinc-rich paint.

For Primed Finish, apply dip or spray coat of rust-inhibitive metallic oxide or synthetic resin metal primer, baked on or oven-dried, to cold rolled ferrous metal surfaces which are smooth and free from irregularities and rough spots.

For Bituminous Paint Finish, in addition to primed finish, paint back surfaces of frames, reinforcing struts and other ferrous parts concealed by building construction one heavy coat of approved bituminous paint.

2.3.04 Hollow Metal Frames. Form frames for doors, transoms, side-lights, borrowed lights, interior glazed panels and other items indicated as being hollow metal of steel sheets. Fabricate frames as indicated. Vary forming from that indicated where special conditions necessitate changes from indicated details, as approved.

Unless otherwise indicated, provide combination type frames with integral buck, integral seal where indicated, jamb and trim, welded construction, with all contact edges of corner joints closed tight, and with trim faces mitered and continuously welded. Provide plaster flanges and Master #2246 keys for frames located in plastered walls. Seal joints in exterior frames watertight.

Provide mullion and transom bars in frames using closed or tubular construction with rabbets for doors, glass, and transom panels. Fasten mullions and transom bars at crossings and to jambs by butt welding. Reinforce joints between members with concealed clip angles of same metal gage as frame.

Reinforce heads of frames in non-load bearing masonry partitions less than 8 inches (20.3 cm) thick. Unless otherwise indicated, provide continuous channel head reinforcing formed from not less than 12 gage (2.7 mm) steel sheet, of width and depth the greatest dimensions possible to suit frame head condition, and welded to back of frame at head. Other methods of reinforcing may be employed subject to the approval of the Engineer. Reinforcing at stainless steel frames shall be stainless steel members as required.

Provide cabinet jambs consisting of rough bucks with applied combination type frame with integral or applied trim as indicated. Provide jambs for required wall openings that do not extend down to floor level which entirely surround opening. Fabricate rough bucks in channel shape with web of same depth as wall thickness and flanges 1/4 inch (6.4 mm) less than frame depth. Cope and weld corners of bucks that do not extend to ceiling.

2.3.05 Wall and Floor Anchors for Hollow Metal Frames. Provide metal anchors of shape and sizes required for adjoining wall construction. Fabricate wall anchors of steel, not less than 18 gage (1.3 mm).

For frames set in masonry, except labeled openings, use adjustable, flat or perforated or corrugated, T-type sliding anchors, 3 inches by 10 inches (7.6 cm by 25.4 cm) long, with anchor head of width and length to fill void in back of frame. Locate anchors on each jamb near top and bottom of frame and at intermediate points not over 24 inches (61.0 cm) apart.

For labeled openings, use anchors approved by the Testing Agency as appropriate for type of wall construction. At new masonry walls, use masonry "tee" anchors. At previously placed concrete or masonry walls, provide approved spacers. Locate anchors in accordance with Testing Agency requirements.

For frames set in metal stud partitions, use metal jamb anchor clips, notched and punched type at truss type studs, and with turned down edge at channel type studs. Weld clips to inside of each jamb. Provide anchors, which are suitable for type of metal studs specified under Master Specification Section 05400, Cold-Formed Framing. Provide 4 anchors per jamb for frames 7 feet (2.13 m) or less in height. Locate anchors immediately above and below top hinge reinforcement and above other hinge reinforcements. Locate anchors on strike side directly opposite the anchors on the hinge side. For frames over 7 feet (2.13 m) high, use additional anchors per jamb spaced not more than 18 inches (45.7 cm) apart.

For frames set in previously placed concrete or masonry walls, provide flat-head machine bolt and shield anchors through frame stops. Provide steel spacer or plate reinforcing welded to frame behind stop at each anchor location. Locate anchors on each jamb near top and bottom of frame and at intermediate points not over 24 inches (61.0 cm) apart. Provide continuous rough buck or plate welded to legs of frame.

For frames set in steel subframes, provide flat-head machine bolt through frame stops. Provide steel spacer or plate reinforcing welded to frame behind stop at each anchor location. Locate anchors on each jamb near top and bottom of frame and at intermediate points not over 24 inches (61.0 cm) apart. Provide continuous rough buck or plate welded to legs of frame.

For frame jambs, and mullions extending to floor, use floor anchor clips of not less than 10 gage (3.5 mm) steel, with 2 holes for anchoring to floor, and welded to trim flanges. Where separate topping is indicated, extend door frames and mullions to concrete subslab. Provide temporary removable steel spreaders or shipping bars across bottom of frames and tack weld to jambs and mullions.

2.3.06 Moldings. Provide moldings with hollow metal frames having openings for glass, panels and other locations where trim moldings are indicated. Fabricate glazing moldings of steel, removable type, square or rectangular, suitable for 1/4 inch (6.4 mm) thick glass assembled with butted corners, and secured with countersunk oval-head Phillips machine screws, uniformly spaced not more than 12 inches (30.5 cm) apart.

Fabricate moldings for panels other than glass of shape indicated, suitable for panel thickness indicated. Assemble molded shapes with mitered corners and square or rectangular shapes with butted corners. Secure as specified for glazing moldings.

Provide stainless steel moldings and accessories at stainless steel frames.

2.3.07 Stops. Provide terminated hospital sanitary stops on interior hollow metal door frames in locations indicated. Stops shall be terminated 4 inches (10.2 cm) above finished floor. Cut stops at 45 degrees and close end of stop flush. Cover bottom of frame with steel filler plate welded in place.

2.4 HOLLOW METAL DOORS. Fabricate hollow metal doors of full flush door construction, unless indicated to be stile and rail door construction.

2.4.01 Full Flush Door Construction. Construct doors of 2 outer steel sheets with edges continuously welded and finished flush, without visible seams or joints on door faces or edges. Reinforce doors with metal core framing consisting of interlocking steel channels, or Z-shaped members, placed vertically and extending through full door height, spaced not more than 6 inches (15.2 cm) on centers and spot-welded not more than 3 inches (7.6 cm) on centers to interior surfaces of outer sheets. Reinforce tops and bottoms of doors horizontally along the full width of door by steel channels spot welded to outer sheets. Provide weep holes in bottom channel. Fill spaces between metal core framing members with approved sound-deadening liner.

As an optional framing core inner core may be continuous truss formed from not less than 28 gage (0.47 mm) sheet metal and spot-welded to interior surfaces of outer sheets not more than 3 inches (7.6 cm) on centers horizontally and vertically over entire surface on both sides. Fill spaces with approved sound-deadening liner.
2.4.02 Door Clearances. For non-labeled doors, provide 3/32 inch (2.4 mm) clearance at jambs and heads, 1/8 inch (3.2 mm) at meeting stiles of pairs of doors, and 3/4 inch (1.9 cm) at bottom, including thickness of resilient floor covering. Labeled doors shall be in accordance with NFPA 80.

2.4.03 Stile Edges. Beveled at 1 to 16 slope, unless otherwise specified.
Lock stile edges for double-acting doors shall be rounded.

2.4.04 Edge Closures. Top and bottom edges of exterior hollow metal doors shall be closed with flush cap to produce a weatherseal.

Top and bottom edges of interior doors where indicated shall be closed and filled flush to provide a sanitary surface.

Provide closure as part of door construction or by the addition of inverted steel channels or other suitable shapes welded to face.

2.4.05 Glass Openings. Provide open panels in doors for glazing, of sizes indicated. Provide rabbets as part of door construction or by the addition of steel stops. Secure glass with removable glazing moldings on room side for doors facing corridors, on interior side for exterior doors. Fabricate glazing moldings of steel, square or rectangular stops, suitable for 1/4 inch (4 mm) glass, assembled with butted corners, and secured with countersunk oval-head Phillips machine screws spaced not more than 9 inches (22.9 cm) apart.

Provide metal louvers in doors as indicated, built in as part of door without the use of overlapping moldings on the surface of door facing sheets.

2.5 ACCESSORIES. Labeled hollow metal door and frame required by the Testing Agency for each fire class of opening, shall take precedence over project details and specifications, except when the Project Specifications require thicker gages than the Testing Agency for labeled doors and frames. In the case of an inconsistency between Testing Agency's requirements and the requirements indicated or specified, or both, submit the matter to the Engineer for adjustment before fabricating such work. Rated construction without label will not be accepted.

For hollow metal doors and frames, including transom panels, in labeled openings, provide the Testing Agency's classification marking for the fire class of opening indicated.

Where authorities with jurisdiction over the Project require deviation from the Testing Agency's requirement for latching device, reinforce doors and frames for surface mounted exit device.

Furnish astragals for all pairs of labeled doors, all pairs of doors in fire-rated partitions, and all pairs of exterior doors.

PART 3 – EXECUTION

3.1 INSTALLATION. Install hollow metal work in correct locations, in alignment, plumb and to true planes. Make breaks, angles and corners square with walls. Where coordination with adjoining work is necessary, take job measurements. Installation shall be in accordance with approved Shop Drawings.

Install hollow metal frames prior to construction of enclosing walls and ceilings. Brace frames securely until permanent anchors are set. Anchor bottom of frames with anchor bolts and lead expansion shields, or with drop-in expansion bolts. Build wall anchors into walls, or secure wall anchors to adjoining construction. Provide required wedging or blocking for frames. Remove and reinstall frames, which exceed the recommended tolerances.

Provide steel shims required under floor anchors.

End of Section

SECTION 08120

ALUMINUM DOORS AND FRAMES

PART 1 – GENERAL

1.1 SCOPE. This section covers aluminum doors and frames.

1.2 GENERAL.

1.2.01 Governing Standards.

AA (Aluminum Association) CA-92 - Care of Aluminum

AAMA (American Architectural Manufacturers Association) 605.2 - Specification for High Performance Organic Coatings on Architectural Extrusions and Panels.

ASTM (American Society for Testing and Materials) A36/A36M - Specification for Carbon Structural Steel.

ASTM B26/B26M - Specification for Aluminum-Alloy Sand Castings.

ASTM B108 – Specification for Aluminum-Alloy Permanent Mold Castings.

ASTM B209 – Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B221 – Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes.

AWS (American Welding Society) C1.1 – Recommended Practices for Resistance Welding.

NAAMM (National Association of Architectural Metal Manufacturers) Specifications for Rubber-Like Gasket Materials.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. Provide aluminum doors and frames produced by a single manufacturer with not less than 5 years of documented experience in the fabrication of assemblies of the type and quality required.

1.3.02 Installer Qualifications. Entrances shall be installed by a firm that has not less than 5 years of documented experience in the installation of systems similar to those required.

1.3.03 Testing. Demonstrate compliance with performance requirements by testing according to the test methods indicated.

Standard for Air Infiltration Testing shall be per ASTM E283. Report result as cubic feet (0.0283 cubic meters) per minute per unit of measurement indicated, at pressure differential indicated.

Standard for Condensation Resistance Testing shall be per AAMA 1503.1. Report result as CRF.

Standard for Thermal Transmission Testing shall be per AAMA 1503.1. Report result as U-value (Btu per hr per sq ft per degree F).

1.3.04 Tolerances. Design exterior assembles shall comply with the following performance criteria:

> Air infiltration for pairs of doors shall not be more than 1.0 cfm per linear foot (929 cu cm per minute per linear cm) of crack. In addition, for each door there shall not be infiltration of more than 0.06 cfm per square foot (1.83 cu cm per sq minute per sq cm) of fixed area.
>
> Condensation resistance for door frames shall be 45 or higher.
>
> Thermal transmittance (U-Value) for door frames shall be no more than 0.65.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. The Contractor shall submit shop drawings indicating layout and elevations, sections, thickness and gage of metals, fastening, proposed method of anchoring, size and spacing of anchors, details of construction, method of glazing, corner post details and erection details. He will also submit manufacturer's material specifications, drawings of standard components, and installation recommendations.

1.4.02 Samples. Submit samples of finish for exposed aluminum surfaces, applied to sample of each alloy to be used approximately 6 inches (15.2 cm) long.

1.5 DELIVERY, STORAGE AND HANDLING. Protect the Work and materials from damage during transportation to the project site, storage at site and during progress of the Work until completion. Store units upright on pieces of lumber in a dry location and under cover.

1.6 WARRANTY. Warrant the Work for 2 years against defective materials or workmanship, or both, and against leakage, except where such leakage is caused by lightning, hurricane, tornado, hail storm or other unusual climatic phenomena of the elements, or failure of related work installed by other parties, or abuse or vandalism.

During the warranty period, the Contractor agrees to restore defective Work to the standard of the Contract Documents, including materials, labor, refinishing and other costs incidental to the Work. Within 24 hours after receipt of notice from the owner, the Contractor shall inspect the Work and immediately repair leaks in the Work. The Contractor agrees to restore Work found to be defective as defined in the Contract Documents within 10 days after receipt of notice from the Owner.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Take field measurements to verify or supplement dimensions indicated. Be responsible for accurate fit of the Work.

2.2 ACCEPTABLE MANUFACTURERS. Provide product of PPG Industries, Inc.; Tubelite Architectural Systems; Kawneer Co.; Cupples Products, Inc.; Flour City Architectural Metals; General Bronze Architectural Products; or approved equal.

2.3 MATERIALS.

2.3.01 Aluminum. Extruded bars, rods, shapes and tubes shall be ASTM B221, 6063 alloy, unless otherwise specified.

Flat sheet and plate shall be ASTM B209, 1100, 3003 or 5052 alloy, unless otherwise specified.

Aluminum castings shall be ASTM B108 for permanent mold castings, and B26, Class 25, for sand castings.

2.3.02 Fasteners. Screws, nuts, washers, bolts, rivets, anchors, and other miscellaneous fastening devices used in fabrication of the work shall be stainless steel and of sufficient size and strength to perform the function for which they are used. Exposed fasteners shall be finished to match aluminum finish.

2.3.03 Steel. Structural steel shapes and bars shall be ASTM A36.

2.3.04 Glazing Gaskets. Shall be EPDM complying with NAAMM "Specifications for Rubber-Like Gasket Materials", of configuration recommended and as furnished by the manufacturer of the aluminum work for a watertight installation.

2.4 MANUFACTURERS AND FABRICATION. Welding shall comply with AWS C1.1.

2.4.01 Aluminum Doors. Door type will be narrow stile with glazed opening, single or in pairs and in size as indicated. Width of stiles and top rail shall be 2 inches (5.1 cm) minimum.

2.4.01.1 Construction. Stiles and rails shall be extruded aluminum tubular sections 1 3/4 inches (4.4 cm) deep with 1/8 inch (3.2 mm) nominal wall thickness. Width of bottom rail shall be 6 inches (15.2 cm) nominal. Door leaf shall be equipped with an adjustable mechanism located at the top rail near the lock stile, which will provide for minor clearance adjustments after installation.

Doors will be reinforced and through-bolted, with joints made by mechanical fastening or by concealed welding and mechanical fastening. Mechanical joints shall be accurately milled to a hairline joint and provide controlled water weepage.

2.4.01.2 Single-Acting Doors. Stiles for single-acting doors shall be beveled. Meeting stiles for pairs of single-acting doors shall be rounded with mortised weatherstripping in one stile.

2.4.01.3 Weatherstripping. Weatherstripping mortised in stiles shall be polypropylene pile in aluminum or stainless steel housing, adjustable and replaceable.

2.4.01.4 Hardware Cutouts and Reinforcing. Provide cutouts, recesses, mortising, or milling operations required for finish hardware, including automatic devices, accurately to templates. Provide backing plate reinforcing as required to insure adequate strength of connection.

2.4.01.5 Glazing Shapes shall be extruded aluminum, square stop design. Stops on exterior side of door shall be lock-in tamper-proof type.

Glazing beads shall be snap-in type with glazing gasket designed for 1/4 inch (6.4 cm) thick glass. Exposed screws will not be permitted.

2.4.01.6 Location of Hardware. Refer to Master Specification Section 08710, Finish Hardware.

2.4.02 Aluminum Frames. Fabricate principal parts of frames for aluminum doors of extruded aluminum tubular sections not less than 1/8 inch (3.2 mm) nominal wall thickness, and not less than width and depth indicated.

Door frames in curtain wall openings: extruded aluminum sections designed to fit into glazing recess of curtain wall members.

2.4.02.1 Construction. Construct the Work to provide for thermal movement based on 100 degree F (37.8 degrees C) temperature differential, to withstand wind loads normal to plane of door of 25 psf (122.0 kg/sq m) positive and negative pressures with maximum deflection limited to 3/4 inch (1.9 cm) or 1/175 of the clear span, whichever is the least, and to assure neat appearance. Fabricate joints to remain flush and hairline tight.

Provide steel members, as may be required for additional reinforcement of aluminum door frames, as an integral part of the prefabricated units. Provide frames with anchors and reinforcement for door hinges, locks and other finish hardware items.

2.4.02.2 Glazing Provisions. Provide face clearance from rabbet or glazing bead to glass of 1/8 inch (3.2 mm) minimum all around. Provide bite of not less than 3/8 inch (9.5 mm) for glass size up to 100 united inches (2.5 united meters), and not less than 1/2 inch (1.3 cm) for glass size over 100 united inches (2.5 united meters).

2.4.02.3 Weatherstripping. Weatherstrip door heads, jambs and meeting stiles Weatherstripping in door stops shall be extruded EPDM.

2.4.02.4 Accessories. Furnish aluminum trim, closures, and other components necessary for the complete installation of the Work. Use extruded aluminum shapes where possible.

Minimum thickness of brake metal, if used shall be 0.0641 inch (1.63 mm)
Provide weathertight closures to interface with curtain wall members.

2.4.03 Aluminum Finish. Provide organic finish to match curtain wall if applicable.

Insulate aluminum which will come in contact with concrete, masonry, wood, or dissimilar metals (except stainless steel, white bronze, or solid zinc) by application of heavy brush coat of alkali resistant bituminous paint or zinc chromate prime paint.

PART 3 – EXECUTION

3.1 INSTALLATION. Install the Work in accordance with manufacturer's printed directions and the approved Shop Drawings. Set members plumb, level, and true in openings. Fastenings shall be concealed.

3.1.01 Setting. Set aluminum doors in alignment, plumb, straight and in true planes. Refer to specifications or installation of finish hardware. Seal frames in curtain wall openings with glazing gaskets. Anchor framing members to adjoining or adjacent construction as indicated on details and approved Shop Drawings. Drill and tap steel and other work for the attachment of framing members, trim and accessories.

3.1.02 Hardware Adjustments. Before final acceptance of building, check and readjust the operating hardware. Leave the Work in complete and operating condition.

3.1.03 Cleaning. Before final acceptance, thoroughly wash finished surfaces with clean water and soap, and rinse with clean water in accordance with AA CA-92. Do not use acid solutions, steel wool or other harsh abrasives. Clean or restore aluminum surface finishes, which have been stained or discolored in accordance with AA CA-92 and the aluminum finish manufacturer's recommendations. Replace stained, discolored, and abraded components that cannot be repaired with new units.

3.2 MAINTENANCE. Submit manufacturer’s maintenance instructions for finished materials.

SECTION 08130

STAINLESS STEEL DOORS AND FRAMES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS
- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY
- A. This Section includes the following:
  1. Stainless Steel doors.
  2. Stainless Steel door frames.
  3. Stainless Sidelight frames
  4. Stainless Borrowed-light frames.

- B. Related Sections include the following:
  1. Division 4 Section "Unit Masonry Assemblies" for installing anchors and grouting frames in masonry construction.
  2. Division 5 Section "Formed-Metal Fabrications" for customized hollow-metal work other than doors, panels, and frames.
  3. Division 8 Section "Door Hardware (Scheduled by Naming Products)" for door hardware and weather stripping.
  4. Division 8 Section "Door Hardware (Scheduled by Describing Products)" for door hardware and weather stripping.
  5. Division 8 Section "Glazing" for glass in glazed openings in doors and frames.

1.3 REFERANCES
- A. ANSI A250.4 - Test Procedure and Acceptance Criteria for Physical Endurance for Steel Doors and Hardware Reinforcing.
- B. ASTM A 167 - Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
- C. ASTM E 90-90 - Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions.
- D. ASTM E 413 - Classification for Rating Sound Insulation.
- E. UL10c - Positive Pressure Fire Test of Door Assemblies
- F. ASTM E 152 - Standard Methods of Fire Tests of Door Assemblies.
- G. AWS D9.1 - Sheet Metal Welding Code.
- H. NAAMM Metal Finishes Manual.
- I. SDI 100 - Recommended Specifications Standard Steel Doors and Frames.
- J. SDI 105 - Recommended Erection Instructions for Steel Frames.

1.4 SUBMITTALS
- A. Product Data: For each type of door and frame indicated, include door designation, type, level and model, material description, core description,

construction details, label compliance, sound and fire-resistance ratings, and finishes.

B. Shop Drawings: Show the following:
1. Elevations of each door design.
2. Details of doors including vertical and horizontal edge details.
3. Frame details for each frame type including dimensioned profiles.
4. Details and locations of reinforcement and preparations for hardware.
5. Details of each different wall opening condition.
6. Details of anchorages, accessories, joints, and connections.
7. Coordination of glazing frames and stops with glass and glazing requirements.

C. Samples for Verification: For each type of exposed finish required, prepare a sample not less than 3 by 5 inches (75 by 125 mm) and of same thickness and material indicated for final unit of Work.

D. Door Schedule: Use same reference designations indicated on Drawings in preparing schedule for doors and frames.

E. Oversize Construction Certificates: For door assemblies required to be fire-protection rated and exceeding size limitations of labeled assemblies.

1.5 QUALITY ASSURANCE

A. Steel Door and Frame Standard: Comply with ANSI A 250.8, unless more stringent requirements are indicated.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver doors and frames cardboard-wrapped or crated to provide protection during transit and job storage.

B. Inspect doors and frames on delivery for damage, and notify shipper and supplier if damage is found. Remove and replace damaged items.

C. Store doors and frames at building site under cover. Place units on minimum 4-inch-(100-mm-) high wood blocking. Provide minimum 1/4-inch (6-mm) spaces between stacked doors to permit air circulation and ventilation.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Steel Doors and Frames
   a. Stainless Doors Incorporated
   b. Next Door Company
   c. Stiles Custom Metal Inc.
   d. Kawneer

2.2 MATERIALS

A. Stainless Steel Type:
1. Steel: ASTM A 167, commercial quality type #316 stainless steel.

B. Finish:
1. Finish: No. 8 High Luster Mirror
