The flue pipe and fittings for power vented equipment and power vented unit heaters requiring a 6 inch (150 mm) or larger flue shall be of double wall construction with a nominal 1 inch (25 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.035 inch (0.9 mm) AISI Type 304 or Type 316 stainless steel, as required, and the outer jacket of at least 0.025 inch (0.6 mm) aluminum coated steel for interior locations and Type 304 or AISI Type 316 stainless steel, as required, for the portions of the stack exposed to the outdoor environment. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

2.4.08.02 Metal Flues. The flue pipe and fittings for horizontally power vented unit heaters requiring a 5 inch (125 mm) or smaller flue shall be constructed of at least 24 gage (0.61 mm) thickness galvanized steel and shall be sized and arranged as recommended by the vented equipment manufacturer or as directed by Engineer. The flue system shall include all necessary fittings, hangers, supports, and flashings.

2.4.09 Packaged Air Conditioning /Heat Pump Units. Packaged air conditioning units, denoted by the symbol "PAC" and an identifying number, and packaged heat pumps denoted by the symbol "PHP" and an identifying number shall be furnished and installed where indicated on the drawings. Each unit shall be designed for outdoor installation on a full perimeter curb or equipment pad as indicated on the drawings. The packaged air conditioning unit shall be manufactured by Trane, Carrier, McQuay, York, or approved equal.

2.4.09.01 <u>Performance and Design Requirements</u>. The units shall be completely factory assembled and tested, piped, internally wired, fully charged with Refrigerant-22 and compressor oil, and shipped in one piece. The unit shall be designed for direct expansion cooling and configured for heating type indicated. The unit shall be suitable for the power supply and shall have the capacities indicated on the drawings.

The refrigeration system shall be capable of satisfactory operation at outdoor ambient air temperatures of 50°F (10°C) in the cooling mode and for heat pumps, 0°F (-18°C) in the heating mode. When the system must operate in the cooling mode at a lower temperature than the factory standard, a low ambient kit shall be installed. The low ambient kit shall be designed for ambient temperature of 0°F (-18°C) consisting of a solid state controller to vary the speed of the outdoor fan motor in response to refrigerant condensing temperature.

2.4.09.02 <u>Casing</u>. The unit casing shall be of weatherproof design and shall be constructed of 20 gage (0.91 mm) or heavier zinc-coated steel. The casing shall be properly reinforced and braced for maximum rigidity. The casing shall be given a factory-applied coat of rust-inhibitive primer and shall be provided with the manufacturer's standard baked enamel finish. Interior surfaces of exterior casing members in contact with the airstream shall have one inch (25mm) thick, one pound (454 kg) density, insulation coated on the air side. Aluminum foil-faced glass fiber insulation shall be used in gas fired heating sections. Hinged, insulated, neoprene gasketed access doors or removable panels shall be provided to permit easy inspection and maintenance. Removable insulated access panels shall have aluminum or steel covering on the interior to protect the insulation. The unit base shall be a one-piece, welded assembly with suitable roof curb sealing gasket and curb overhang for water runoff. Drains shall be provided to accommodate outdoor coil runoff.

Where an economizer package is not specified, a manually set air damper shall be furnished to provide the indicated outside air volume.

2.4.09.03 <u>Indoor Coil Section</u>. The indoor coil shall be multirow of seamless copper tubing mechanically bonded to heavy-duty aluminum fins. The coil shall be factory leak tested underwater at 200 psig (1380 kPa gauge). The coil shall be provided with expansion device or valve, filter-dryer, and moisture indicator. The indoor coil section shall have fully insulated, sloped drain pan extending under the entire coil section and extending sufficiently past the coil to capture and collect any condensate carryover that may be produced when the unit is operating within the specified operating conditions.

2.4.09.04 Heating Sections. When indicated on the drawings, the unit shall have an electric heating coil, gas heating section, or auxiliary electric heating coil. Electric heater coils shall be completely factory assembled and wired integral within the unit. Coils shall be heavy-duty nickel chromium with an automatic reset device to de-energize all staging contactors on high temperature. The heating coils shall be electrically subdivided within the unit into balanced, individually fused stages as required by the National Electrical Code. The heating coil shall have the minimum number of stages indicated in the schedules on the drawings.

Gas-fired heating sections shall be completely factory assembled and wired integral within the unit. When located upstream of the cooling coil, the heating section shall be AGA design certified specifically for outdoor applications upstream of a refrigerant cooling coil. The heat exchanger shall be of constructed of minimum 20 gage (0.91mm) aluminized steel. The burner shall be induced or forced draft type with pressure regulator, redundant main gas valve, manual shutoff valve, and intermittent spark ignition. A flame sensing device and high limit safety controls shall be provided. The number of heating stages shall be as indicated in the schedules on the drawings.

The unit shall be supplied with natural gas having a calorific value of approximately 1000 Btu per cubic foot (37 MJ/m^3) at an inlet pressure as indicated.

2.4.09.05 Filters. Filters shall be mounted integral within the packaged air conditioning or heat pump unit and shall be 2 inches (50 mm) thick. Hinged access doors shall be provided. Filters shall conform to the requirements in the Air Filtration Equipment paragraph. Filters shall be washable and reusable.

2.4.09.06 Fans and Motors. The indoor supply fan shall be forward-curved, multiblade, centrifugal type and shall be statically and dynamically balanced by the fan manufacturer. The fan shall have die-formed, streamlined inlets and the scroll shall be constructed of steel with all seams sealed airtight. The fan shall have steel shafts operating in self-aligning, grease lubricated ball bearings.

Units 5 tons (17.5 kW) and smaller shall have direct or belt driven fans. Where direct driven fans are used, the fan shall have multiple speeds to allow for airflow adjustment. Units greater than 5 tons (17.5 kW) shall have V-belt drive with adjustable sheaves and shall be designed for 50 percent overload. The supply fan motor shall conform to the requirements of the Motors and Motor Controls paragraph. Vibration isolators shall be provided for the fan assembly and motor assembly.

Static pressure values indicated on the drawings are external to the complete unit. Internal coil(s), dampers, filters and fan housing losses are not included. A filter allowance of 0.35 inch water column (0.087 kPa) shall be used for 2 inch (50 mm) pleated filter losses.

The outdoor fans shall be direct drive, vertical discharge, propeller type with aluminum blades. Fan motors shall be weatherproof with permanently lubricated ball bearings and built-in thermal overload protection. A corrosion resistant wire guard shall be installed over the fan opening.

2.4.09.07 Compressors. Compressors shall be of the reciprocating hermetic, semi-hermetic, or scroll type mounted on vibration isolators. The compressor motor shall have temperature and current sensitive overload protection devices. Each packaged air conditioning or heat pump unit shall have a minimum number of capacity reduction steps as indicated in the schedules on the drawings.

Reciprocating hermetic compressors shall be suction gas cooled with internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, and automatic reset timer to prevent the compressor from rapid cycling.

Reciprocating semi-hermetic compressors shall be suction gas cooled, internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, oil level sight glass, and automatic reset timer to prevent the compressor from rapid cycling. Capacity reduction shall be provided by automatic suction valve unloaders. Each compressor shall start unloaded.

Scroll compressors shall be suction gas cooled with high and low pressure cutout switches and automatic reset timer to prevent the compressor from rapid cycling. The compressor shall have radial and axial compliant scroll plates to allow the compressor to handle liquid slugging without damage to the compressor.

2.4.09.08. Refrigerant Circuit. The factory sealed refrigerant system shall consist of compressors, outdoor coils, indoors coils, expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, refrigerant piping, and a full operating charge of refrigerant. Service gauge connections shall be furnished on the suction, discharge, and liquid lines. Units with multiple compressors shall have multiple circuits with separate expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, compressor, and refrigerant charge. All factory installed gauges, switches, and other devices connected to the refrigerant circuit shall have isolation valves.

2.4.09.09 Outdoor Coil. The outdoor coil shall be of the air-cooled integral finned tube type. The coil shall be constructed of copper tubes with aluminum fins permanently and securely bonded to the tubes. The coil shall be factory leak and pressure tested. The coils shall be protected with hail guards.

2.4.09.10 Accessories. Where indicated on the drawings, the packaged unit shall be provided with economizer cycle to automatically utilize up to 100 percent of outside air for cooling. The economizer shall be controlled as required, and shall modulate return and outside air dampers to maintain proper discharge temperature into the conditioned space. The dampers shall be equipped with automatic lockout when the outside air temperature is too high for proper cooling, and shall have adjustable minimum position control. The damper motor shall be spring return and shall operate to close the outside damper during shutdown. Means for 100 percent relief of the return air shall be provided.

Where indicated on the drawings, hot gas bypass shall be installed to provide reduced capacity control.

When indicated, packaged units shall be furnished with a roof mounting curb. The curb shall be constructed of at least 16 gage (1.52 mm) zinc-coated steel with nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply and return air openings. The curb shall be a minimum of 16 inches (405 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.4.09.11 Controls. Each packaged unit shall be completely factory wired and shall have a single point power connection and unit mounted disconnect switch. All wiring shall be installed in accordance with the National Electrical Code.

The unit shall be provided with remote control and monitoring panel consisting of system operation switches and signal lights. The signal lights shall be for power, outage, dirty filters, and reset relay.

Packaged units shall be provided with a factory wired control panel containing full voltage magnetic starters for compressor, outdoor fan, and indoor fan motors, and internal volt control power transformer.

Defrost controls, electronic timed initiated and temperature terminated with field adjustable timer shall be provided for all packaged heat pumps. When auxiliary electric heating is provided, a factory installed emergency heat package shall be provided. When heating is locked out, the auxiliary heat shall be activated as necessary.

Units with multiple compressors shall have a built-in time delay to prevent both compressors from starting simultaneously.

All internal panel wiring shall be neatly run in gutters or bundles to terminal strips for connection of external wiring. All wires and terminal strips shall be numbered or color coded in accordance with the wiring diagram. All internal and external controls, gauges, lights, and switches shall be identified with nameplates. A complete wiring diagram showing the compressor and fan starting circuits and the control circuit shall be furnished.

Terminal blocks shall be factory wired to provide terminal points for permissive start for each stage of cooling or cooling and heating from a remotely located control panel or thermostat; terminal points to energize remote dirty filter, heating mode, cooling mode, and service indicating lights; and terminal points to de-energize the unit upon detection of smoke.

A thermostat for operation of the unit shall be furnished and installed as indicated and located where indicated on the drawings.

The thermostat shall be a manual changeover, automatic changeover, or programmable heating and cooling type. The number of stages shall be suitable for the unit control and operation. The thermostat shall have a range of approximately 50 to 90°F (10 to 32°C) with at least a 5°F (3°C) deadband between heating and cooling. The thermostat shall have a subbase to control system and fan operation.

2.4.10 Makeup Air Units. Makeup air units, denoted by the symbol "MAU" and an identifying number, shall be Hastings "SBD", Hartzell "GMC", Engineered Air "Series HE", or approved equal for direct fired units and Hastings "Counterflo", Engineered Air "Series DJ", or approved equal for indirect fired units as indicated in the schedules on the drawings. The makeup air units shall be constant volume, gas-fired type, and shall be completely assembled, wired, and flame tested at the factory.

Where indicated in the schedules on the drawings, makeup air units shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.4.10.01 Construction. The casing of the makeup air unit shall be of sectionalized construction consisting of a fan section, a gas-fired burner section, a filter section, and, when located outdoors, an inlet hood with motorized control damper. The unit housing shall be constructed of heavy gage galvanized paint grip carbon steel or aluminized steel, braced and reinforced with steel framework as needed for the operating pressures. The cabinet and casing shall be provided with the manufacturer's standard enamel finish. Gasketed and hinged doors shall be furnished to provide access to all internal components. An observation port shall be provided on the burner section for viewing the pilot and main flames.

The burner section shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density foil-faced fiberglass blanket insulation securely fastened to the panels. The fan and accessory sections shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density mat-faced cleanable fiberglass blanket insulation securely fastened to the panels. Where the insulation is not installed below the floor, the insulation shall be protected by a metal liner. The insulation shall meet the requirements of NFPA.

Makeup air units installed outdoors shall be of weatherproof construction, with roof panels pitched for drainage. The roof panels shall be constructed with triple-break seams which overlap the side panels on all sides. All exterior joints shall be bolted or screwed with a gasket, or shall be welded, and shall be sealed weather tight.

Makeup air units installed outdoors shall have a stormproof weather hood with birdscreen sized for 100 percent outside air shall be mounted on the unit inlet. The hood shall include a two-positioned motorized control damper which opens when the unit is energized and closes when it is de-engerized.

2.4.10.02 Fan Section. The makeup air units shall be equipped with centrifugal fans with forward-curved blades which shall be dynamically balanced and tested after being installed in the factory assembled fan section. Bearings shall be heavy-duty, self-aligning, grease lubricated type for units with motors greater than 15 horsepower (11.2 kW) and permanently lubricated or grease lubricated for units with 15 horsepower (11.2 kW) motors and smaller. Units with regreasable bearings shall have externally mounted, grease lubricated bearings or lubrication fittings extended to the exterior fan casing with aluminum or copper tubing and grease fittings rigidly attached to the casing.

Static pressure values indicated in the schedules are external to the complete unit. Internal burner or heat exchanger, filter, and fan housing losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for filter losses.

2.4.10.03 Motor and Drive. Units located outdoors shall have internally mounted motors. Units located indoors shall have fan motors mounted either in or on the fan housing. Internally mounted motors shall be installed on a steel base mounted on internal vibration isolators and coated with the manufacturer's standard protective coating. Where unit is installed in a seismic area, seismic restraints shall be provided. Externally mounted motors shall be installed on integral casing framework on the exterior of the casing. Units with externally mounted motors shall be furnished with vibration isolator units as indicated in the schedules on the drawings. External belts and drive assemblies shall be protected by a belt guard with tachometer opening.

Fan drive motors and controls shall be as specified in the Electrical paragraph.

Makeup air units with smaller than 10 horsepower (7.5 kW) motors shall have V-belt driven fans with adjustable pitch sheaves and units with 10 horsepower (7.5 kW) and larger motors shall have fans with fixed sheaves. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is selected at the mid-position of the sheave range. Fixed sheaves shall be replaced as necessary with sheaves of the proper size during the air system balancing to provide the required fan speed for the specified airflow. Multiple belts shall be provided in matched sets.

2.4.10.04 Heating Section. The complete fuel burning assembly shall conform to the requirements of UL/ETL, FM, or IRI. The burner assembly and gas piping arrangement shall include, but not be limited to, pilot and main burner gas manual shutoff valves, pilot and main gas regulators, pilot and main gas safety shutoff valves, manual pilot adjustment valves, and electric modulating main gas valves. The burner assembly and gas manifold shall be completely piped and tested at the factory prior to shipment.

The unit shall be suitable for use with the gas pressure range as indicated.

2.4.10.04.01 Direct Fired. Burners shall be in-line type, suitable for use with natural or propane gas, as required, and shall be complete with stainless steel firing plates, cast iron gas feed, and stainless steel side plates for flame rods and ignition spark rods mounted in ceramic isolated bushings. The profile plates shall be adjustable and shall be sized to maintain the required velocity across the burner. The burners shall be capable of modulating turndown of 20 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff.

2.4.10.04.02 Indirect Fired. Burners shall be modulating power type suitable for use with natural or propane gas, as required. The burners shall be capable of modulating turndown of at least 8 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff. The heat exchanger shall be of 3 or 4 pass design consisting of 400 series stainless steel primary drum heat exchanger with multitube secondary heat exchanger.

2.4.10.05 Filter Section. Filter sections for makeup air units shall be of the flat or angular arrangement and shall be selected to limit the filter velocity to 350 feet per minute (1.5 m/s) at design conditions unless otherwise indicated in the schedules on the drawings. Access doors shall be provided for removal of filters from either side of the section. The filters shall be 2 inch (50 mm) pleated type and shall conform to the Air Filters paragraph. All filters shall be washable and reusable.

2.4.10.06 Controls. Each unit shall be furnished with a complete control system consisting of fan starters and overload devices, an airflow proving switch, control circuit fuses, an electronic discharge air temperature sensor and controller, and a disconnect switch. Controls shall be suitable for interfacing with and enacting the control sequence and concept indicated on the drawings. The controls shall include controls to lock out the burner when the outside air temperature is above the controller setpoint.

A remote control station shall be furnished with the makeup air unit and located where indicated on the drawings. The control station shall allow for remote operation of the unit with a fan "On-Off" switch, a "Winter-Summer" switch, a supply temperature setpoint adjustment, and indicating lights for fan, heat, lockout, and dirty filters. Where indicated in the sequence of operations, a room override thermostat shall be mounted on the panel.

Unit mounted panels shall house adequately sized combination starters rated in accordance with NEMA standards, and dead-front 3 lock nonfused disconnect switches.

2.4.10.07 Accessories. Makeup air units indicated or shown to be curb mounted shall be furnished with a roof mounting curb. The curb shall be constructed of 14 gage (1.90 mm) thickness zinc-coated steel with a nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply air opening as indicated on the drawings. The curb shall be a minimum of 16 inches (400 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.4.11 Heaters. Heaters of the types, sizes, and capacities specified herein shall be furnished and installed where indicated on the drawings. All heaters shall be complete with controls and accessories required for satisfactory operation. Heaters shall be UL listed unless otherwise indicated.

2.4.11.01 Electric Duct Heaters. Electric duct heaters, denoted by the symbol "EDH" and an identifying number, shall be manufactured by Indeeco, Brasch, or approved equal.

Electric duct heaters shall be furnished and installed where indicated on the drawings.

Electric duct heaters shall be open coil or finned tube, as required, and zero clearance type with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames with 2 inch (50 mm) wide flanges suitable for fastening to the ductwork.

Bushings for open coils shall be ceramic and terminals shall be stainless steel. Elements for finned tubular coils shall be centered in steel tubes filled with compacted magnesium oxide and copper plated fins brazed to the tube. The assembly shall be finished with high temperature aluminum coating.

Heaters shall be completely factory wired and shall be provided with disconnecting backup and safety contactors, transformers, an automatic reset thermal cutout, a manual reset thermal cutout, a disconnect switch, and a differential pressure airflow switch. All interconnecting wiring shall be enclosed in a terminal box fastened to the heaters and oriented as indicated on the drawings. The terminal boxes shall be furnished with double doors.

Contactors shall be 600 volt rated, 3 pole, UL listed, and shall have a life expectancy for 100,000 operations. A built-in industrial dry type 480/120 volt control transformer shall be furnished to carry the full contactor holding coil load. Transformer primary and secondary windings shall be fused. Secondary windings shall have one lead grounded.

The duct heaters shall be furnished with a silicone controlled rectifier (SCR) control unit mounted in the duct heater terminal box. The control unit shall be suitable for the temperature range of 32 to 132°F (0 to 55°C), and shall be a solid-state proportioning controller designed to modulate the heater output from 0 to 100 percent. The duct heaters shall be controlled by a thermostat as indicated on the drawings. The duct heater SCR controller shall be compatible with the signal from the thermostats.

The duct heater output in kW shall be as specified at 460 volts, 60 Hz, 3 phase. The heater elements shall be suitable for operation on 480 volt, 60 Hz, 3 phase power.

2.4.11.02 Electric Unit Heaters. Electric unit heaters, denoted by the symbol "EUH" and an identifying number, shall have the capacity indicated in the schedules on the drawings.

Electric Unit Heaters (non-explosionproof). Electric unit heaters located in unclassified areas shall be Chromalox "LUH" or "VUH", Brasch, or approved equal. Each heater shall include a fan and motor assembly, a built-in contactor, safety disconnect switch, and a control transformer for 120 volt control, and shall be suitable for use with the power supply indicated in the heater schedule on the drawings. Heater elements shall be steel plate, fin type, with elements brazed to common fins for maximum strength and heat transfer. Each unit heater fan motor shall be provided with automatic reset thermal overload protection. Where shown on the drawings to be wall hung, a wall mounting bracket shall be provided.

Electric Unit Heaters (explosionproof). Where indicated in the heater schedule on the drawings to be explosionproof, unit heaters shall be manufactured by Indeeco "Ultra-Safe", Ruffneck, Markel, or approved equal. Explosionproof electric unit heaters shall be of the fan forced type with a heat exchanger, fan and motor assembly, automatic reset thermal cutout, built-in contactor, factory installed three pole disconnect switch in NEMA 7 enclosure, and 24 volt control transformer. The heater shall be suitable for use with the power supply indicated in the heater schedule on the drawings. The heater shall be listed for installation in a Class I, Division 1 or 2, Group D location and shall have an NEC ignition code of T3B or better.

The heater cabinets shall be constructed of a corrosion resistant cabinet fabricated from an epoxy coated 14 gage (1.90 mm) thickness steel with individually adjustable outlet blades. Cabinet fasteners shall be stainless steel.

The heat exchanger shall be an efficient liquid to air design utilizing a copper or steel core with aluminum fins. The heat exchanger shall be provided with a coating suitable for use in a corrosive atmosphere consisting of hydrogen sulfide. The heating elements shall be housed in an inhibited propylene or ethylene-glycol heat transfer fluid that is suitable for temperatures down to -49°F (-45°C). A pressure relief valve shall provide overpressure protection for the heat exchanger.

The fan and motor assembly shall consist of an aluminum fan connected to a explosionproof, permanently lubricated ball bearing type motor with built-in thermal overload protection. The motor shall be prewired to the control enclosure providing for a heater that is suitable for use with a single point power connection.

2.4.11.03 Gas Unit Heaters. Gas unit heaters, denoted by the symbol "GUH" and an identifying number, shall be Modine Model HS, Reznor, Trane, Sterling, or approved equal.

Gas unit heaters shall be furnished and installed where indicated on the drawings. Each heater shall be of the type, size, and capacity indicated in the schedules on the drawings; shall be suitable for use with the gas type and pressure as required; and shall be of a type approved and listed in the AGA Directory of Approved Gas Appliances and Accessories.

Each gas-fired unit heater shall be power vented, horizontal discharge, propeller type, and suitable for two point suspending mounting. The heater burner and heat exchanger shall be constructed of E-3 (AISI Type 409) stainless steel. Each heater shall be furnished with a vent cap.

Each gas unit heater shall be furnished complete with a 24 volt transformer, single-stage gas control with a regulated combination redundant gas valve, a spark-ignited, intermittent safety pilot with electronic flame supervision and all required limit and safety controls. Units larger than 125,000 Btu (132,000 kJ) input shall have two-stage gas controls.

The fan motor shall be suitable for use with a 120 volt, 60 Hz, single phase power supply, and shall be provided with automatic reset thermal overload protection.

2.4.11.04 Wall Heaters. Wall heaters, denoted by the symbol "WH" and an identifying number, shall be manufactured by Electromode "Model EWA", Brasch, or approved equal.

Wall heaters shall be downflow type; designed for surface mounting; and shall include an electric heating element, a thermal limit switch, a fan delay switch, a fan and motor assembly, and a built-in thermostat. The heaters shall be suitable for use with the specified power supply and shall have the capacity indicated in the schedules on the drawings.

2.4.12 Fans. Each fan shall be complete with an electric motor, a drive, and accessories required for satisfactory operation. Belt-driven fans shall be complete with a V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Adjustable pitch sheaves shall be furnished for fans with less than 10 horsepower (7.5 kW) motors and fixed sheaves for 10 horsepower (7.5 kW) and larger motors. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the proper size after the air system balancing if necessary, to provide the required fan speed for the specified airflow.

Fan drive motors and controls shall be as specified in the Electrical paragraph, unless otherwise indicated. Fans shall be suitable for use with the power supply indicated on the drawings.

Fans indicated in the schedules on the drawings to be explosionproof shall be suitable for installation in a NEC Class I, Division 2, Group D environment.

The external static pressure values indicated in the schedules on the drawings are external to the complete unit. Internal fan housing and when furnished, backdraft damper and filter losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for pleated filter losses.

A solid state variable speed controller shall be provided for each direct-driven fan motor less than 1/2 hp (0.4 kW) to balance the fan airflows to the specified rates. The speed controller shall have a capacity range of approximately 50 through 100 percent of the design airflow rate specified. The speed controller shall be mounted on or in the fan housing unless otherwise indicated.

Where indicated in the schedules on the drawings, fans shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.4.12.01 Cabinet Fans. Cabinet fans, denoted by the symbol "CF" and an identifying number, shall be Greenheck "Model SP" or “Model CSP”, Penn Ventilator, Loren Cook, or approved equal. Cabinet fans shall have steel, forward-curved, squirrel-cage type wheels. The fans shall be statically and dynamically balanced. Motors shall be open dripproof, PSC, with permanently lubricated ball bearings and internal thermal overload protection, and shall be suitable for use with the power supply indicated in the schedules on the drawings. Fan housings shall be fabricated of heavy gage carbon steel with welded seams and shall be acoustically lined and factory primed. Fans shall be installed in the configuration indicated on the drawings. A removable access panel or exhaust grille shall be provided on the bottom of each fan and a factory installed backdraft damper shall be provided on the fan discharge. Vibration isolator units and wall caps shall be provided for each fan as indicated in the schedules on the drawings.

2.4.12.02 Duct In-Line Fans. Duct fans, denoted by the symbol "DF" and an identifying number, shall be Greenheck "SQ", Penn Ventilator, Loren Cook, or approved equal. Duct fans shall be of the centrifugal in-line type, and shall be direct or belt driven, as indicated in the schedules on the drawings. Fan wheels shall be aluminum, backward inclined type, dynamically and statically balanced at the factory.

The fan housing shall be square, constructed of aluminum or heavy gage steel as required, and shall be furnished with duct mounting collars. Access doors or panels shall be provided for servicing internal parts without removing the fan from the ductwork. Vibration isolation units shall be provided for each unit. The interior of the fan housing shall be lined with 1 inch (25 mm) fiberglass duct liner.

Motors and drives shall be isolated from the airstream. The wheel shaft shall be of ground and polished steel, mounted in heavy-duty, permanently sealed pillow block bearings.

Flexible wiring leads shall be provided from the fan motor to an external junction box and disconnect switch which shall be accessible for servicing without disconnecting the field wiring.

2.4.12.03 Duct Axial Fans. Duct axial fans, denoted by DAF and an identifying number, shall be Hartzell, Greenheck, Penn Ventilator, Loren cook, or approved equal. The model and type (fiberglass or stainless steel) of each fan is per Fan Schedule shown on the Drawings. Duct axial fans shall be of the axial belt drive type fan built to be installed in duct systems for process ventilation applications, and where the nature of the corrosive airstream warrants isolation of the motor and drive assembly from the airstream.

The fan housing shall be round, constructed of fiberglass or heavy gage stainless steel as required, and shall be furnished with duct mounting collars. Vibration isolation units shall be provided for each installed fan.

Motor and drives shall be isolated from the air stream. The six-blade propeller shaft shall be stainless steel construction, mounted in heavy duty self-aligning bearings.

2.4.12.04 Power Roof Ventilators. Power roof ventilators, denoted by the symbol "PRV" and an identifying number, shall be Greenheck "G" or "GB", Penn Ventilator "Domex", Loren Cook, or approved equal.

Power roof ventilators shall be centrifugal or propeller type, as indicated in the schedules on the drawings, and shall be statically and dynamically balanced for quiet, vibration-free operation. Each fan shall be complete with a weather hood, a safety disconnect switch mounted in the hood, a 1/2 inch (13 mm) mesh aluminum bird screen over all openings, and, where indicated in the schedules on the drawings, a backdraft damper. Fan housings shall be constructed of aluminum and shall have an aluminum base of the self-flashing type, suitable for mounting on the curbs indicated on the drawings.

2.4.12.05 Propeller Fans. Propeller fans, denoted by the symbol "PF" and an identifying number, shall be Greenheck "Model S" or "Model SC" for direct drive and "Model SB" or "Model SBC" for belt drive, Penn Ventilator, Loren Cook, or approved equal.

Propeller fans shall consist of a panel frame, a wire guard, a motor, and fan blades. Fan blades shall be steel or aluminum, as required. Propeller fans shall be statically and dynamically balanced to ensure quiet, vibration-free operation, and be suitable for mounting as indicated.

When indicated in the schedules on the drawings, a wall mounting kit shall be provided. The wall mounting kit shall consist of a wall collar, motor wire guard, backdraft damper, and weather hood with birdscreen.

2.4.12.06 Utility Fans. Utility fans, denoted by the symbol "UF" and an identifying number, shall be Greenheck "Model SWB", Penn Ventilator, Loren Cook, or approved equal.

Utility fans shall be multiblade, squirrel-cage type, with nonoverloading type blades. The fans shall be statically and dynamically balanced for quiet, vibration-free operation and shall be provided with vibration isolators. Fan inlets and outlets shall be provided with removable angles and bolts for attaching flexible connections. Fan housings shall be heavy gage steel, of all-welded construction and shall be shop coated with universal primer. Fan bearings shall be of the self-aligning, ball type.

2.4.12.07 Wall Fans. Wall fans, denoted by the symbol "WF" and an identifying number, shall be Greenheck "Model GW" or "Model GWB", Penn Ventilator, Loren Cook, or approved equal. Wall fans shall be suitable for sidewall installation; shall be direct or belt driven, centrifugal type, with aluminum wheels and housing, and a wheel guard located on the discharge side; and shall be statically and dynamically balanced at the factory. The fan motors shall be of adequate size to prevent overloading when operating at the specified capacity and shall be suitable for use with the power supply indicated in the schedules on the drawings.

2.4.12.08 Vault Supply Fans. Vault supply fans shall be in-line centrifugal type fiberglass construction, belt driven with removable fiberglass motor guard. Units shall be furnished with integral flanges and straightening vanes. Fan shaft shall be stainless steel construction with Viton seals. Bearing to be sealed pillow block type. Refer to drawings and fan equipment schedule for additional information.

2.4.13 Roof Hoods. Roof hoods, denoted by the symbol "RH" and an identifying number, shall be Greenheck "Model FHI" or "FHR", Penn Ventilator, Loren Cook, or approved equal.

Roof hoods shall be suitable for air intake or exhaust and shall have throat dimensions as indicated in the schedules on the drawings. As required, the roof hood assembly shall be constructed of galvanized steel or aluminum. Each roof hood shall be complete with a weather hood, a 1/2 inch (13 mm) mesh aluminum or galvanized bird screen over all openings, and a mounting base suitable for installation on a curb as indicated on the drawings.

Where indicated in the schedules on the drawings, roof hoods shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.4.14 Dampers.

2.4.14.01 Backdraft Dampers. Backdraft dampers, denoted by the symbol "BDD", shall be Arrow United Industries "Type 655", Ruskin, or approved equal. Backdraft dampers shall be constructed with a 1 by 4 inch by 0.081 inch thick (25 by 100 mm by 2 mm) extruded aluminum frame. Blades shall be of 0.081 inch (2 mm) aluminum, with silicone rubber seals on the edges, and with aluminum shafts and ball bearings.

2.4.14.02 Control Dampers. Control dampers shall be denoted by the symbol "CD" and an identifying number. Dampers with an area larger than 25 square feet (2.3 m^2) or with any dimension exceeding 48 inches (1200 mm) shall be built in sections. All dampers shall be carefully inspected before and after installation, and any damper having poorly fitted blades, insufficient framed rigidity, or excessive clearance or backlash in moving parts will be rejected and shall be replaced with an acceptable unit.

Two-position dampers shall have parallel operating blades. Modulating dampers shall have opposed operating blades.

Damper blades shall be installed on a steel shaft operating in synthetic bearings suitable for industrial service. Dampers shall be close-fitting and shall be designed to offer minimum resistance to the airflow when in the fully open position. Damper blade linkage shall be concealed in the frame.

Control dampers shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.4.14.02.01 Duct Mounted Control Dampers. Control dampers and face bypass dampers mounted in ductwork and equipment curbs shall be Ruskin "CD-50", Arrow United Industries "Type AFD-20", or approved equal. The damper frames shall be constructed of 5 inch (125 mm) Type 6063 T5 extruded aluminum. Damper blades shall be constructed of 6 inch (150 mm) wide airfoil-shaped extruded aluminum.

Control dampers denoted on the drawings to be face and bypass dampers shall be vertically arranged. The face damper dimensions shall be coordinated with the heating coil dimensions. The bypass area shall be half the area of the face damper. Face and bypass damper submittals shall indicate coil size, face dimensions, and bypass dimensions.

2.4.14.02.02 Wall Mounted Control Dampers. Control dampers mounted in walls behind louvers shall be Ruskin "CD-40", Arrow United Industries "Type AFD-20", or approved equal. Control damper frames shall be constructed of 4 by 1 inch (100 by 25 mm) 6063 T5 extruded aluminum. Damper blades shall be constructed of 4 inch (100 mm) wide airfoil-shaped extruded aluminum.

2.4.14.02.03 Round Control Dampers. Round control dampers shall be Arrow United Industries "Type 70, 75, or 80", or approved equal. The damper frames and blades shall be constructed of the material as required.

2.4.14.03 Volume Control Dampers. Volume control dampers shall be denoted by the symbol "VCD". Volume control dampers in round ductwork shall be Arrow United Industries "Type 200 VCRD", Ruskin “Model MDRS25” , or approved equal. Volume control dampers in rectangular ductwork shall be Arrow United Industries "Type 1770", Ruskin “Model MD35” , or approved equal.

Rectangular volume control dampers shall be fabricated of 16 gage (1.52 mm) thickness galvanized steel, with a nominal 4 or 5 inch by 1 inch (100 mm or 125 mm by 25 mm) channel frame, and opposed operating blades. Round dampers shall be fabricated of galvanized steel, with a nominal 7 inch (178 mm) long, 22 gage (0.76 mm) thickness frame, and a minimum 20 gage (0.91 mm) thickness circular blade.

The dampers shall be provided with adjustment quadrants and locking devices so arranged that the position of the damper will be indicated and the damper will not move when locked.

2.4.14.04 Fire Dampers. Fire dampers, denoted by the symbol “FD”, installed in positions having a fire resistance rating of less than 3 hours shall be Air Balance Inc. “Model D19”, Ruskin “Model DIBD2”, or approved equal. Fire dampers installed in partitions having a fire resistance rating of 3 hours or more shall be Air Balance Inc. “Model D30”, Ruskin “Model DIBD23”, or approved equal. Fire dampers shall be style “B” for ducted and style “A” for non-ducted applications unless otherwise indicated on the Drawings.

Dampers shall have a 5 inch (125mm) side galvanized steel channel frame, galvanized steel interlocking blades, stainless steel closure springs and latches, 165°F (74°C) fusible links, and a 20 gage (0.91 mm) thickness galvanized steel housing. Factory fabricated sleeves and mounting angles shall be furnished for each damper for mounting as indicated on the Drawings. Fire dampers shall be rated in accordance with UL-555 for use in dynamic systems.

2.4.15 Damper Operators. The damper operators shall be direct coupled or linkage type. Where linkage type operators are used, each operator shall be complete with all necessary crank arms, ball joint connectors, push rods, linkages, and mounting brackets.

Each operator shall have sufficient torque to operate the connected control damper area. Each damper operator shall have at least a 50 inch-pound (5.6 N-m) normal running torque. Where the required damper torque exceeds the damper operator running torque rating, multiple operators shall be furnished to produce the normal running torque required to operate the damper. Control dampers shall fail to the closed position unless otherwise indicated on the drawings. Face dampers shall fail to the closed position and bypass dampers to the open position.

Where damper operators are installed in explosionproof rated areas indicated on the drawings, the operators shall be furnished and installed in explosionproof housings suitable for installation in an NEC Class I, Division 2, Group D area. Where damper operators are installed outdoors, the operators shall be furnished and installed in weathertight enclosures.

Two-position direct coupled electric damper operators shall be Belimo "NF120-S", Honeywell "ML4195", Johnson Controls, or approved equal. Linkage type electric damper operators shall be Honeywell "Model M4185", Johnson Controls "Model M100", or approved equal. Two-position electric damper operators in hazardous areas shall be installed in explosion proof housings.

Damper operators shall be spring return and shall have one internal spdt auxiliary switch rated 5 amperes at 120 volts ac. Damper operators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers, where required, shall be factory wired to the damper operator and installed in a NEMA Type 1 enclosure fastened to the motor housing.

Direct coupled two position electric damper operators shall be housed in a galvanized steel or aluminum case. Operators shall use a "V" shaped bolt and cradle design to eliminate slippage on the damper shaft. Single bolt or set screw type designs are not acceptable. The operators shall be suitable for direct mounting to shafts up to 1 inch (25 mm) and shall be complete with mounting brackets and damper position indicator.

Linkage type two-position electric damper operators shall be housed in a die-cast aluminum case with a mounting flange. Motor and gear train components shall be immersed in oil. Damper operators shall have a 3/8 inch (9.5 mm) square, double-ended drive shaft.

2.4.16 Air Outlet and Inlet Devices. Air outlet and inlet devices shall be manufactured by Price, Tuttle & Bailey, Titus, or approved equal. Air outlet and inlet devices shall be furnished and installed where indicated on the drawings.

Air outlet and inlet devices shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.4.16.01 Ceiling Diffusers. Diffusers shall be square or rectangular, constructed of the materials indicated in the schedules on the drawings. Diffusers shall have a key-operated, opposed-blade damper mounted in the neck where indicated in the schedules on the drawings. Size, location, and direction of airflow shall be as indicated on the drawings.

2.4.16.02 Registers and Grilles. Registers and grilles shall be constructed of aluminum or steel as indicated in the schedules on the drawings. The front blades of adjustable blade models shall be parallel to the short dimension unless otherwise indicated, and the front blades of fixed blade models shall be horizontal unless otherwise indicated. All registers shall be furnished with key-operated opposed blade dampers. The dampers shall be constructed of the same material as the attached grille.

2.4.17 Flexible Connections. Flexible connections located indoors shall be Ventfabrics "Ventglas", or approved equal. Flexible connections installed outdoors or exposed to sunlight or weather shall be Ventfabrics "Ventlon", or approved equal.

Ductwork connections to the air handling equipment, and where indicated on the drawings, shall be made using fabric connectors with sheet metal collars. The fabric shall be fire resistant, waterproof, mildew-resistant, and airtight. At least 3 inches (76 mm) of fabric shall be exposed. Flexible connections shall be in accordance with the requirements of UL and NFPA.

Fabric for flexible connections protected from sunlight and the weather shall be suitable for a temperature range of -20 to 180°F (-29 to 82°C) and shall weigh at least 27 ounces per square yard (915 g/m^2).

Fabric for flexible connections exposed to sunlight or the weather shall be suitable for a temperature range of -10 to 250°F (-23 to 121°C) and shall weigh at least 24 ounces per square yard (814 g/m^2).

2.4.18 Air Filtration Equipment.

2.4.18.01 Pleated Air Filters. Pleated air filters shall be American Air Filter "AM-AIR 300X", Farr "30/30", or approved equal. Filters shall be washable and reusable type, high-loft blend of cotton and synthetic fiber pleated media. The media shall be rated as Class 1 or Class 2 in accordance with UL 900. A metal support grid shall be bonded to the media. The filter frame shall be constructed of rigid, high-strength, moisture-resistant beverage board. The pleated media pack shall be bonded to the inside of the frame. All filters shall have an average efficiency of 25 to 30 percent based on the ASHRAE 52.1 test method.

One inch (25 mm) filters shall have at least 14 pleats per linear foot (0.3 m) and at least 1.9 square feet of media per square foot of filter area (1.9 square meters per square meter). One inch (25 mm) filters shall have a maximum initial resistance of 0.10 inch wc at 300 feet per minute (0.02 kPa at 1.5 m/s).

Two inch (50 mm) filters shall have at least 12 pleats per linear foot (0.3 m) and at least 4.2 square feet of media per square foot of filter area. (4.2 square meters per square meter). Two inch (50 mm) filters shall have a maximum initial resistance of 0.13 inch wc at 300 feet per minute (0.03 kPa at 1.5 m/s).

2.4.18.02 Side Access Filter Housings. Side access filter housings shall be American Air Filter "Access Air", Farr "Model 4P Glide/Pack", or approved equal. Side access filter housings shall be single-stage, factory-fabricated of 16 gage (1.52 mm) thickness galvanized steel and shall be equipped with flanges for connection to the ductwork. Access doors shall be 16 gage (1.52 mm) thickness galvanized steel and shall be positioned to allow replacement of filters from either side of the housing. Filter housings and doors shall be insulated and of double-wall construction. Filter tracks shall be provided to accommodate nominal 2 inch (51 mm) thick washable and reusable filters as described herein. Leakage at the rated airflow shall be less than 1 percent at a 3 inch wc (0.75 kPa) differential.

2.4.19 Draft Gauges. Draft gauges shall be Dwyer Instruments, Inc. "2000 Series Magnehelic Air Filter Gauge", or approved equal.

Diaphragm actuated dial type draft gauges, located for easy readability, shall be installed across all air filters. The gauges shall have a dial of at least 3-1/2 inch (89 mm) diameter, a die cast aluminum housing, an adjustable signal flag, mounting hardware, an ambient temperature range of 20 to 140°F (-7 to 60°C), and a range of 0 to 1.0 inch wc (0.25 kPa), with a full range accuracy of 2 percent. Each gauge shall be furnished with an air filter kit consisting of a mounting panel, two static pressure tips with integral compression fittings, aluminum tubing, and vent valves.

2.4.20 Sheet Metal Work. The ductwork, accessories, bracing, and supports shall be constructed of the material as required. Galvanized ductwork located in air conditioned spaces shall be constructed of G-60 or better lockforming quality in accordance with ASTM A653. All other galvanized ductwork shall be constructed of G-90 or better galvanized steel. Accessories, bracing, and supports shall be constructed of similar materials as the ductwork. Ductwork, turning vanes, and other accessories shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Plenums shall be constructed of reinforced 16 gage (1.52 mm) thickness galvanized sheet metal.

Sheet metal ductwork shall be sealed according to the classifications described in the SMACNA HVAC Duct Construction Standards. Ductwork shall be fabricated, reinforced, supported, and sealed for the operating pressures indicated in the schedules for the connected equipment. All ductwork shall have a pressure classification of at least 1 inch (25 mm).

Sheet metal fan boxes shall be fabricated with 12 gage (2.66 mm) thickness galvanized sheet metal skin and structural steel framing of sufficient strength to support the fan box and the fan mounted on the box. The framing shall be coated with a universal primer. All welds on galvanized metal shall be cleaned and coated with a zinc-rich paint. Drawings of the fan boxes shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

All joints, seams, connections, and penetrations in ductwork located outdoors shall be sealed watertight and weatherproof. Transverse joints shall be flanged and shall be provided with a continuous gasket and flange cap.

Where indicated on the drawings, ductwork and accessories shall be given a protective coating resistant to the corrosive atmosphere.

2.4.21 Duct Insulation. Interior duct liner shall be Knauf "Duct Liner E M", CertainTeed "ToughGard R", Schuller "Permacote-Linacoustic", or approved equal.

Interior duct liner shall be 1-1/2 pound per cubic foot (24 kg/m^3) density, spray coated duct liner with an "R" value of at least 3.6 $ft^2 \cdot hr \cdot$ °F/BTU (0.63 $m^2 \cdot$ °C/W) per 1 inch (25 mm) thickness. The insulation shall be suitable for temperatures up to 250°F (121°C) and shall have at least a 0.55 NRC per 1 inch (25 mm) thickness. The insulation shall conform to ASTM C1071.

2.4.22 Flexible Duct and Takeoffs. Flexible duct shall be Flexmaster "Type 9", Flexible Technologies "Thermaflex Type G-KM", or approved equal. Takeoffs shall be Buckley Air Products "Air-Tite Bellmouth BM-D", or approved equal.

Flexible duct shall be a galvanized or vinyl-coated spring steel helix, bonded to a polymer liner, and wrapped with glass fiber insulation suitable for use in heating and cooling systems. The insulation shall provide an "R" value of at least 4.2 $ft^2 \cdot hr \cdot$ °F/BTU (0.74 $m^2 \cdot$ °C/W). The outer jacket shall be a vapor barrier of fire retardant polyethelene or polyolefin material. The flexible duct shall be listed under UL 181 as Class 1 flexible air duct and shall comply with the latest edition of NFPA 90A.

Takeoffs for the flexible duct shall be bellmouth type manufactured of galvanized steel with a neoprene gasket and predrilled holes. Each takeoff shall be equipped with a balance damper constructed of 26 gage (0.45 mm) thickness galvanized steel. Scoops or other obstructions in the main duct will not be acceptable.

2.4.23 Access Doors. Access doors shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Access doors shall be double skin insulated type for insulated ductwork and single skin type for noninsulated ductwork. Duct-mounted access doors and panels shall be fabricated of the same material as the ductwork, with sealing gaskets and quick-fastening locking devices. Where access doors are insulated, a sheet metal cover shall be installed over the insulation.

2.4.24 Temperature Controls. The temperature control components and systems shall be manufactured by Honeywell; Johnson Controls; Siemens Building Technologies, Landis Division, or approved equal. Where manufacturers are not specified, materials and equipment furnished shall meet the performance and design requirements indicated.

2.4.24.01 Performance and Design Requirements. Contractor shall coordinate with the Work to make certain that the field wiring associated with the work of this section is completed in accordance with the requirements of the heating, ventilating, and air conditioning equipment furnished and their interconnection. Where cable and conduit is not indicated on the drawings but is needed for a complete and functional control system in accordance with the sequence of operation it shall be provided as specified herein. The control wiring shall be installed so that all HVAC equipment will function as described in the HVAC sequence of operation.

Conduit and control wiring for all control circuits needed between all field mounted HVAC controlling and indicating devices, such as, but not limited to, damper actuators, thermostats, temperature control panels, pressure differential switches, control switches, motor starters, and the HVAC equipment, shall be furnished and installed as specified in the Electric Wiring paragraph. Cable and conduit for all HVAC power circuits shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.4.24.02 Tolerances. Unless otherwise indicated, the controls shall maintain space temperatures within ± 2°F (1.1°C), and the relative humidity within ± 5 percent of the setpoint.

2.4.24.03 Thermostats.

Two Position Wall Mounted Thermostats. Two position wall mounted thermostats shall be Honeywell "T631A Airswitch", Penn Controls "A19BAC-1", Siemens Building Technologies, or approved equal.

Two position wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 3.5°F (2°C). The thermostats shall have a spdt switch rated for 1 horsepower (0.746 kW).

Low Limit Thermostats. Low limit thermostats shall be Honeywell "L480", Penn Controls "Model A11A-1", Siemens Building Technologies, or approved equal.

Low limit thermostats used for low temperature cutout shall be capillary, line-voltage type, complete with spst switches. The sensing elements shall be at least 20 feet (6 m) long. The thermostat shall be responsive to the lowest temperature along the measuring element, shall have a range of approximately 35°F to 45°F (2°C to 7°C), and shall be manually reset.

Modulating Duct Mounted Thermostats. Modulating, duct mounted thermostats shall be Honeywell "Model T991", Penn Controls "Model A80ABA-2", Siemens Building Technologies, or approved equal.

Modulating, duct mounted thermostats shall be modulating, proportional control, low voltage type. The thermostats shall have a range of approximately 10°F to 90°F (-12°C to 32°C) with an adjustable throttling range of approximately 5°F to 24°F (3°C to 13°C), and shall be furnished with a duct mounting kit.

Explosion-proof Thermostats. Explosion-proof wall-mounted thermostats controlling explosion-proof equipment in Class I, Division 2, Group D areas shall be Honeywell "Model T6051B", Johnson Controls, Siemens Building Technologies, or approved equal.

Duct-mounted thermostats controlling explosion-proof equipment in Class I, Division 2, Group D areas shall be Indeeco "Model T94A-70".

Explosion-proof thermostats shall be suitable for installation in explosion-proof areas.

2.4.24.04 Temperature Control Panels. Temperature control panels, denoted by the symbol "TCP" and an identifying number, shall be NEMA Type 12 designed for wall mounting and shall be completely prewired and checked. Temperature control panel enclosures shall be manufactured by Hoffman Engineering, Integration Technology Systems Inc, Par Metal Products Inc, or approved equal.

All electrical accessory devices and internal wiring shall be furnished and installed.

All controllers, selector relays, switching relays, interlock relays, manual switches, timers, alarm and indicating lights, and other devices indicated to be panel mounted shall be mounted in or on the respective control panel. Accessories such as indicating lights and selector switches shall be mounted on the front hinged covers of the panels. The accessories shall be identified with an identification plate as described in the Equipment Identification paragraph. The identification plates shall be fastened to the panel with corrosion-resistant pan head screws.

Each temperature control panel shall supply power to all associated control system field control components, including but not limited to, damper operators, thermostats, sensors, and smoke detectors. The controls shall include all necessary relays, interlocks, and control devices to enable the control panel to function as described in the sequence of operation on the drawings.

All interconnecting wiring and wiring to terminals for exterior connection shall be stranded copper, insulated for not less than 600 volts, with a moisture resistant and flame resistant covering rated for at least 90°C. Power distribution wiring on the line side of panel fuses shall be at least 12 AWG. Wiring for secondary power distribution and for control, annunciator, and indicating light circuits shall be at least 14 AWG. Wiring shall be color coded in accordance with the legend on the panel wiring diagrams.

Selector Switches. Selector switches shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Selector switches shall be heavy-duty oiltight type with gloved-hand or wing lever operators. Position legends shall be engraved on switch faceplate. Switches for electric circuits shall have silver butting or sliding contacts, rated 10 amperes continuous at 120 volts ac. Contact configuration shall be as indicated on the drawings or as necessary for the application. Switches used in electronic signal circuits shall have contacts suitable for that duty.

Push Buttons. Push buttons shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Push buttons shall be heavy-duty, oiltight type, with legends engraved on the faceplate. Contacts shall be rated 10 amperes continuous at 120 volts ac.

Indicating Lights. Indicating lights shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Alarm, indicator, and running status lights shall be furnished with bulbs. Indicating lights shall be heavy-duty, push-to-test, oiltight type with low voltage bulbs and built-in transformers. Legends shall be engraved on the lens or on a legend faceplate. Bulbs shall be easily replaceable from the front of the device.

Alarm Horns. Alarm horns shall be Federal Signal "Model 350", or approved equal. Alarm horns shall have a sound output of 100 dB at 10 feet (3 m) and shall be rated for 120 volts ac. Horns shall be furnished with mounting hardware suitable for flush mounting.

Relays. Relays shall be Eagle Signal "Series 22, 80"; Potter & Brumfield "Series KRP, CB"; Struthers-Dunn "Series A3, A4", or approved equal. Relays shall be of the plug-in socket base type, with dustproof plastic enclosures unless noted otherwise. Relays shall be UL recognized and shall have not less than double-pole, double-throw contacts. Control circuit relays shall have silver-cadmium oxide contacts rated 10 amperes at 120 volts ac. Electronic switching-duty relays shall have gold-plated or gold alloy contacts suitable for use with low level signals. Relays used for alarm input or indicating light service shall have contacts rated at least 3 amperes. Time-delay relays shall have dials or engraved switch settings marked in seconds and shall have timing repeatability of ± 2 percent of setting. Latching and special purpose relays shall be as needed for the specific application.

Terminal Blocks and Panel Wiring. Terminal blocks for external connections shall be suitable for 12 AWG wire and shall be rated 30 amperes at not less than 300 volts. Terminal blocks shall be fabricated, shall be complete with marking strip, covers, and pressure connectors, and shall be labeled to agree with the identification on the temperature control manufacturer's submittal drawings.

A terminal shall be provided for each conductor of external circuits, plus one ground cable. At least 8 inches (200 mm) of clearance shall be provided between the terminal strips and the base of vertical panels for conduit and wiring space. At least 25 percent spare terminals shall be provided.

All wiring shall be grouped or cabled and firmly supported inside the panel. Wiring shall be bundled in groups and bound with nylon cable ties or shall be routed in Panduit or similar nonmetallic slotted ducts.

Ducts shall be readily accessible within the panel, with removable covers, and shall have a space of at least 40 percent of the depth of the duct available for future use after the installation including all field wiring, has been completed. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables.

Where signal wiring must be routed to more than one panel or device, the requested circuit routing shall be as indicated on the electrical one-line diagrams.

Control Power Transformers. Where 24 volt ac control power is necessary for the temperature control components, 120/24 volt transformers shall be furnished and mounted in the respective temperature control panel. Control power transformers shall be sized by the manufacturer based on the equipment load of the panel, shall be copper wound, vacuum impregnated with solid polyester varnish, and shall be 100 percent tested in strict compliance with ANSI, CSA, and UL codes. Control power transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded. The control power transformers shall be sized by the manufacturer based on the equipment load of the panel.

Painting. Interior and exterior surfaces of all panels shall be thoroughly cleaned and painted with rust-inhibitive primer. The panel interior shall be painted white with the manufacturer's standard coating. All pits and blemishes in the exterior surfaces shall be filled before the surface is painted with one or more finish coats of the manufacturer's standard coating. Finish coats shall have a dry film thickness of at least 4 mils (100 μm). One quart (0.95 L) of paint shall be furnished with the panels for future touchup painting.

2.4.24.05 Temperature Indicators.

2.4.24.05.01 Dial Thermometers. A dial thermometer shall be supplied and installed at each remote bulb sensor for calibration and calibration checks. The range of the dial thermometers shall be -40°F to 120°F (-40°C to 49°C).

In ducted systems containing coils or electric duct heaters, a dial thermometer shall be furnished and installed on the downstream side of the coil or heater. Thermometers shall be complete with averaging type elements.

2.4.24.06 Smoke Detectors. Smoke detectors, denoted by the symbol "SMD" and an identifying number, shall be System Sensor “DH100”, Simplex, Grinnell, or approved equal.

Detectors shall be designed to detect combustion gases, fire, and smoke in air conditioning and ventilating duct systems in compliance with the NFPA 90A and shall contain a detector and air sampling chamber which serves as a reference point to help stabilize the detector against the effects of changes in temperature, humidity, and pressure.

Smoke detectors shall be duct mounted photoelectric type and shall be completely self-contained, including integral power supply, supervisory and control circuitry and three sets of isolated contacts. The alarm contacts shall be spst normally open; the auxiliary alarm contact shall be spdt, and the trouble contact shall be spdt and shall indicated detector malfunction. The alarm and trouble contacts shall be rated 2 amperes at 30 volts dc. The auxiliary alarm contact shall be rated 10 amperes at 120 volts ac. Pilot lights shall be provided for visual indication of alarm and power supply status on the front of the unit. A remote key-operated test station with alarm light and power supply status shall also be furnished and installed where indicated on the drawings. Detectors shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply.

Detectors shall be provided with sampling tubes extending the width of the air duct.

2.4.24.07 Pressure Differential Switches. The pressure differential switches, denoted by the symbol "PDS" and an identifying number, shall be furnished and installed as indicated on the drawings and the sequence of operation. Each pressure switch operating range shall be selected so that the setpoint is between 25 and 75 percent of the scale range. Initial setpoints shall be as indicated on the drawings. Differential switches shall be UL listed.

Where indicated on the drawings, pressure differential switches shall be provided with an explosion-proof housing suitable for a NEC Class 1, Division 2, Group D environment. Where differential pressure switches are located outdoors, a NEMA 4 rated weather enclosure shall be provided.

2.4.24.07.01 Airflow Switches. Pressure differential airflow switches shall be Dwyer Instruments, Inc. "Series 1800", or approved equal. Pressure differential switches for airflow service shall be diaphragm operated by differential air pressure between duct and atmosphere or across a filter. The switch shall be spst, shall be rated 5 amperes at 120 volts ac and for a temperature range of -20°F to 125°F (-29°C to 52°C), and shall be provided with corrosion resistant mounting brackets. Pressure differential switches located across filters shall be initially set at 0.5 inch wc (125 Pa).

2.4.24.08 Control Stations. Control stations for high rate ventilation fans shall include a two position selector switch with nameplate labeled "High Rate Ventilation On/Off". Control stations shall also include two indicating lights for "On/Off" indication. Indicating lights and selector switches shall be heavy duty oiltight NEMA

Type 13. The control station enclosure shall be NEMA Type 4. Control stations shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.4.24.09 Emergency Ventilation Shutoff Switches. Emergency ventilation shutoff switches shall be double-action manual fire alarm stations. The switches shall be Simplex "Series 2099", or approved equal. The switch operation shall require that a hammer, hung on the front of the station, be lifted and thrown downward against the glass window, thus breaking it to expose the recessed pull lever. The switches shall be provided with phenolic nameplates identifying the switches as "VENTILATION SYSTEM EMERGENCY SHUTOFF". The nameplates shall cover the words "FIRE ALARM" on the switches. Switches located on the exterior of the building shall be provided with a weather protective shield.

2.4.24.10 Accessory Components. All additional control components, including, but not limited to, electric relays, temperature sensors and transmitters, humidity sensors and transmitters, controllers, and position switches, shall be furnished where necessary to ensure a complete, properly operating installation. All components shall be products of the temperature control manufacturer. Accessory components not mounted inside the temperature control panels shall be furnished with equipment enclosures. Relays shall be provided with 120 volt coils and at least 10 ampere contacts.

2.4.24.11 Electrical Wiring. Detailed wiring diagrams shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The wiring diagrams shall show the internal connections of the temperature control panels and all field wiring to equipment remote from the control panels including wiring to Owner-furnished equipment. The wiring diagrams shall be complete, showing all connections necessary to place the temperature control systems in operation.

Control wiring shall be in accordance with the National Electric Code (NEC). Cable shall be multi-conductor, at least 18 AWG size, specifically designed for industrial systems and UL listed for indoor/outdoor installations.

Conduit for all HVAC control circuits shall be EMT, except in areas designated on the electrical drawings as Area Type 1A, Area Type 4, or Area Type 12. In areas designated Type 1A, conduit shall be exposed rigid PVC non-metallic conduit with PVC fittings, boxes, and accessories. In areas designated Type 4 and Type 12, conduit shall be IMC with gasketed enclosures and fittings. All conduit and conduit installation shall be in accordance with the requirements of Master Specification Section 16050, Electrical General Requirements and NEC.

2.4.25 Electrical. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.4.26 Drive Units. Drive units shall be designed for 24 hour continuous service.

2.4.26.01 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor.

2.4.26.02 Safety Guards. All belt drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.4.26.03 Electric Motors. Motors furnished with equipment shall meet the following requirements.

A manufacturer's standard motor may be supplied on packaged equipment and fans in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feed and chemical handling locations.

4. Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor’S option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase. Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

Motors to be used with adjustable frequency drives shall be rated for inverted service.

2.4.27 Shop Testing. The equipment furnished under this section shall be tested at the factory according to the standard practice of the manufacturer. Ratings shall be based on tests made in accordance with applicable AMCA, ASHRAE, ARI, NBS, NFPA, and UL Standards.

2.4.28 Balance. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Field Measurement. Contractor shall be responsible for verifying all field dimensions, and for verifying location of all equipment relative to any existing equipment or structures.

3.2.02 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Flues. Flues for all equipment exhausting combustible material shall be installed where indicated on the drawings. Flue gas systems shall be gastight to prevent leakage of combustible products into the building and shall be complete with all fittings, hangers, supports, and flashing necessary for proper installation.

Roof penetrations shall be flashed and counterflashed to provide a weathertight installation. The installation shall include, where necessary, ventilating collars to give proper clearance from floors, ceilings, and roofs constructed of combustible materials.

Flues shall be supported where indicated on the drawings and where required by the system manufacturer. Supports, guides, and all appurtenances required for a complete system shall be furnished and installed at locations determined by the flue systems manufacturer. The entire system from the equipment connection to the termination, including accessories, shall be from one manufacturer.

The flue height dimensions indicated on the drawing are minimum and shall be increased to conform to any local codes which pertain to such work.

All vertical flues shall be equipped with a capped tee to serve as a condensate drain. Flues 6 inches (150 mm) and larger shall be equipped with a condensate drain connection.

When power vented equipment is listed as being suitable for use with "Type B" gas vents, "Type B" gas vents may be used when all vent joints are sealed to prevent leakage.

Where metal flues are used, each joint shall be sealed with sealant and/or aluminum or teflon tape suitable for the operating temperatures to prevent leakage. The tape shall be wrapped two full turns around each joint. Where single wall metal flues are used to vent equipment, a double wall flue shall be used outside and shall extend through the wall a minimum of 6 inches (150 mm). The annular space of the double wall flue shall be sealed at the connection point between the double and single wall flues. Single wall flues routed through unconditioned spaces or in locations below 8 feet (2.4 m) above the finished floor shall be insulated to prevent condensation or limit the cold face temperature to 150°F (65°C).

Gas unit heater flues shall be installed with a minimum of 12 inches (300 mm) of straight pipe attached to the venter outlet before the installation of an elbow.

3.3.02 Packaged Air Conditioning Units/Packaged Heat Pumps. The packaged air conditioning units and packaged heat pumps shall be installed in accordance with the manufacturer's installation instructions. Each unit shall be leveled and installed to maintain the manufacturer's recommended clearances. The units shall be firmly anchored where indicated on the drawings.

3.3.03 Makeup Air Units. Flexible connections shall not be in tension when the fans are operating.

3.3.04 Heaters. The bottom elevation of unit heaters shall be 8 feet (2.4 m) above finished floor unless otherwise indicated.

Gas fired unit heaters with side burner and control access shall have the access located on heater side opposite the wall.

Electric duct heaters shall be installed with a minimum distance of 4 feet (1.2 m) from all ductwork transitions and obstructions on both sides of the heater.

3.3.05 Fans. Flexible connections shall be installed between fan inlet and outlet sheet metal connections. Flexible connections shall not be in tension when the fans are operating. Where fan inlets and outlets are exposed, safety screens shall be installed over the opening. Scroll drains for equipment installed indoors shall be piped to the nearest floor drain.

Power roof ventilators shall be secured with corrosion resistant lag screws to the roof curb.

3.3.06 Roof Hoods. Roof hoods shall be secured with corrosion resistant lag screws to the roof curb.

3.3.07 Damper Operators. Damper operators shall be installed on a mounting bracket rigidly attached to the damper frame or duct. Where the bracket attaches to the duct, suitable stiffeners shall be installed on the duct to prevent noticeable deflection of the duct when the damper operates. Damper operators may be installed inside or outside the duct but consideration shall be given to the environment and duct dimensions in which the operators are installed. Where the damper installation inside the duct may or actually prevents the design airflow from being achieved, the damper operator shall be installed outside the duct. Damper operators shall be readily accessible and access doors shall be provided when the operator is installed inside the duct.

The number of operators furnished for each damper shall provide the torque necessary to operate the damper. Unless otherwise indicated, control dampers shall fail to the closed position, face dampers shall fail to the closed position, and bypass dampers to the open position.

3.3.08 Air Outlet and Inlet Devices. Diffusers with balance dampers installed in the flexible duct takeoffs shall not have an opposed blade damper mounted in the throat of the diffuser.

Ceiling mounted air terminals or services weighing 20 pounds (89 N) shall be supported directly from the structure.

3.3.09 Draft Gauges. Draft gauges for filters located more than 8 feet (2.4 m) above the finished floor shall be mounted on the nearest wall, 5.5 feet (1.7 m) above the finished floor. Each gauge shall be installed with vent valves in the connecting tubing adjacent to the gauge for checking and re-zeroing functions.

3.3.10 Sheet Metal Work. Ductwork, turning vanes, and other accessories shall be installed and supported in accordance with the latest SMACNA Duct Construction Standards. The locations, arrangement, and sizes of ductwork shall be as indicated on the drawings. The duct sizes indicated are clear dimensions inside the duct or duct lining. Sheet metal sizes are larger for ductwork with interior linings.

Ductwork shall be constructed and installed in accordance with the drawings. When acceptable to Owner, modifications in the size and location of ductwork may be made where required to avoid interference with the building structure, piping systems, or electrical work. The installation shall be coordinated with other phases of work to establish space and clearance requirements. Unless otherwise indicated by a bottom of duct elevation, all ductwork shall be routed as high as possible, with a minimum height of 8 feet (2.4 m) above the finished floor. Ductwork installed above suspended ceilings shall be installed with at least 8 inch (200 mm) lighting allowance between the ceiling and the bottom of the ductwork.

In vertical ducts with a closed bottom which terminate less than 24 inches (600 mm) above finished floor, the bottom of the ductwork shall be broken and sloped to a 1/2 inch (12.5 mm) drain hole in the bottom of the duct.

Single-thickness turning vanes shall be installed in all turns with 45 degree or greater angles.

3.3.11 Duct Insulation. Insulation materials shall be installed in accordance with the manufacturer's written instructions and recommendations. Surfaces which are to be insulated shall be cleaned and dried. Insulation shall be kept clean and dry and shall not be removed from the factory container until it is installed. Packages or factory containers shall have the manufacturer's stamp or label bearing the name of the manufacturer and description of the contents.

Insulation shall be terminated at items mounted in ductwork such as thermometers, controls, damper linkages, flexible connections, access doors, etc., to avoid interference with their function and/or replacement.

The duct liner in the corners of the duct sections shall be folded and compressed or shall be cut and fit to ensure overlapping, butted edges. Top and bottom pieces shall overlap the side pieces. Longitudinal seams shall be made only at corners unless duct dimensions and standard liner product dimensions make seams necessary at other locations.

The duct liner shall be held to the duct by a coat of waterproof, fire-retardant adhesive applied over the entire duct surface. Where duct dimensions exceed 8 inches (200 mm) on any side, mechanical fasteners shall be used in addition to the adhesive. All exposed edges of the duct liner shall be tightly butted and coated with adhesive.

The following ducts shall be insulated with a one inch (25 mm) thick interior duct liner unless otherwise indicated or indicated on the drawings to be wrapped:

Makeup or outside air ducts.

Air conditioning system supply and return ducts.

Other ducts where indicated on the drawings.

3.3.12 Flexible Duct and Takeoffs. The length of the flexible ductwork shall not exceed 8 feet (2.4 m). All support saddles for flexible duct shall be a minimum of 6 inches (150 mm) wide.

3.3.13 Access Doors. Airtight access doors shall be provided for inspection of all control dampers, fire dampers, smoke dampers, operators, filters, smoke detectors, duct-mounted coils, and at other locations indicated on the drawings. The access doors shall be of a size suitable for the duct dimensions and at least 8 inches (200 mm) square for hand access, 18 inches (450 mm) for shoulder access, or as indicated on the drawings. Each access door shall be installed to open against the pressure in the duct.

3.3.14 Temperature Controls. Automatic temperature controls shall be furnished and installed as indicated on the drawings and as specified herein.

Contractor shall be responsible for determining that all equipment supplied is suitable for installation in the space indicated on the drawings. Control equipment shall be installed with adequate space for operating and maintenance access.

3.3.14.01 Temperature Control Panels. The panels shall be mounted so that selector switches and indicating lights on the panel are located approximately 5 feet (1.5 m) above the finished floor.

3.3.14.02 Thermostats. Wall-mounted thermostats shall be mounted above the finished floors as indicated in Master Specification Section 16050, Electrical General Requirements. Insulating spacers shall be provided for thermostats mounted on exterior building walls. The spacers shall be installed between the thermostat and its mounting surface, so that the thermostat will not be affected by surface temperatures.

Wall-mounted thermostats in non air-conditioned areas shall be furnished and installed with a cast aluminum or wire guard.

3.14.03 Device Tag Numbering System. All field mounted control devices shall be identified with an identification plate as described in the Equipment Identification paragraph securely fastened to the device. The device identification shall agree with those listed on the drawings. Hand-lettered or tape labels will not be acceptable.

Identification plates for thermostats, control stations, and emergency ventilation shutoff switches shall in addition to the device identification list the controlled equipment in parenthesis below the device number.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15510

HEATING BOILERS AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heating system boilers and associated devices and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

When required, each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable

municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Equipment Motors

Name of manufacturer.

Type and model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Bearing types and numbers.

Weight.

Overall dimensions.

Full load amperes, efficiency, and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Data and Manuals. When required, operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

Flue piping and fittings shall be factory built, laboratory tested, listed by Underwriters' Laboratories, and shall comply with NFPA 211.

Gas fired boilers shall be rated in accordance with the provisions of the American Gas Association, shall have AGA certified input and gross output ratings, and shall be listed by I-B-R. The gas fired boilers and control components shall be tested in accordance with ANSI Z21.13b. All electrical safety controls shall be of accepted quality and shall be UL and AGA certified. Each boiler shall be constructed in accordance with Section IV of the ASME Boiler and Pressure Vessel Code, shall be stamped with the official ASME symbol, and shall be hydrostatically pressure tested before shipment in accordance with Section IV of the ASME Boiler and Pressure Vessel Code.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. As required, extra materials shall be furnished for the equipment.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment capacities shall be as indicated on the schedules. Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as required.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as required.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound, as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 GAS-FIRED HEATING WATER BOILERS. Gas fired heating water boilers, denoted by the symbol "HWB" and an identifying number, shall be Weil-McLain, Peerless, or approved equal. The boiler model shall be as required.

The boiler shall be furnished complete with a burner assembly, firing controls, control panel, fuel valve gas trains, electrical wiring, safety equipment, a structural steel base, and all accessories and appurtenances specified or required for a complete, properly operating installation.

2.5.01 Performance and Design Requirements. The boiler shall be listed by I-B-R, shall be designed for the I-B-R capacities indicated in the schedule on the drawings, and shall be capable of developing the full I-B-R listed output at 100 percent firing rate. The heating water boiler shall be stamped for the maximum working pressure as required.

2.5.02 Boiler Construction. The boiler shall be a factory assembled package, atmospheric or forced draft burner type as required, low pressure, wet base design, cast iron, sectional type.

Where the boiler physical size precludes the use of a packaged unit and with the written concurrence of Engineer, a field assembled unit will be acceptable. To minimize field assembly work, major components shall be shop assembled to the maximum extent practicable.

The boilers shall be designed for vertical travel of flue gas. Each section of the boiler shall be manufactured with cast-on heat absorbing studs to achieve efficient and rapid heat transfer from the combustion gases to the boiler water. Boiler sections shall be fabricated with ground-faced metal-to-metal joints which do not need putty, cement, or other filler.

Each boiler shall be equipped with access openings for cleaning the flueways between sections.

The boilers shall be provided with a built-in air elimination system to ensure positive separation of air from circulating water. The boilers shall be constructed to provide balanced water flow through the entire boiler. Forced draft boilers shall be designed and constructed so that the combustion chamber is completely surrounded by circulating water.

The boiler sections shall be furnished with a flue collector hood and horizontal to vertical draft hood constructed of heavy gage aluminized steel. The flue collector hood shall be securely bolted to the top of the boiler sections. A gastight seal shall be maintained between the flue collector hood and the top of the boiler sections.

The boilers shall be furnished with insulated heavy gage steel jackets with baked enamel finish and insulated with heavy density fiberglass on the left and right ends, top, back, and interior panels. The jackets shall be designed for installation after the supply and return piping have been connected and shall be easily removable.

Observation ports shall be mounted on the front and back sections of the boiler to permit visual inspection of the burner flame.

The boiler end sections shall be provided with suitable tappings for connection of supply and return piping and controls.

2.5.03 Burner Assembly. The boiler shall be furnished with and designed for use with the burner type and fuel gas type as required.

The atmospheric type main burners shall be aluminized steel of one-piece construction suitable for high flame temperature, quiet ignition and extinction, and reliable flame retention. The burners shall be designed so the proper amount of primary combustion air will be drawn into the burner throat entry over a range of burner manifold gas pressures as required.

The forced draft type burner shall be modulating, low fire start, power gas type, designed to burn the type of fuel as required without vibration, noise, or pulsations. The burner shall incorporate a stainless steel flame retention type combustion head and shall be equipped with an external primary-secondary air ratio adjustment and total air volume adjustment. A permanent observation port shall be provided to allow observation of both pilot and main flames. The burner shall be equipped with a forced draft air fan sized to supply the air required for proper combustion of the specified fuel. The unit shall be equipped with an airflow switch to shut off the fuel supply upon failure of the combustion air.

The complete fuel burning assembly shall conform to the requirements of the UL, FM, or the IRI as required. The fuel train shall consist of pressure regulators, shutoff valves, gas valves, high and low gas pressure switches, and vent valves. The fuel train piping shall include 1/4 inch (6 mm) pressure tappings with pipe plugs upstream and downstream from each valve and regulator.

2.5.04 Boiler Trim. The boilers shall be furnished with combination pressure-temperature gauges to indicate boiler water temperature and system pressure. The combination gauges shall be of rugged, guarded type construction with clearly marked and easy to read dials.

Each boiler shall be furnished with a relief valve. The relief valve shall be of the side outlet discharge type, shall be ASME certified, and shall be set to relieve at the rated boiler ASME working pressure. The valve shall have a discharge capacity equal to or greater than the listed I-B-R gross output of the boiler.

A stack thermometer shall be furnished with each boiler for installation in the boiler vent.

2.5.05 Controls. Burner controls shall be provided for control of the fuel supply to the burner and pilot. The gas control components shall be located outside the boiler jacket for easy access, adjustment, and servicing. The automatic safety pilot system shall provide 100 percent shutoff.

Electronic flame rectification controls and intermittent electric ignition pilot systems shall be provided for each boiler. The safety pilot shall be intermittent burning, electrically ignited, and electronically supervised. In the event of flame failure, the controls shall automatically interrupt the fuel supply to the pilot and burner, sound an audible alarm, and light a visual indicator. After shutdown caused by flame failure, the burner shall have to be manually restarted.

Controls shall provide at least a 30 second pre-purge of the combustion chamber before ignition of the fuel and a 15 second or longer post-purge after interruption of the fuel supply.

The boilers shall be furnished with operating, high temperature, and low water cut-off controls. The operating controller shall be set to maintain the temperature of the water leaving the boiler. The high limit control shall be set at least 20°F (11°C) higher than the design leaving water temperature. The low water cut-off control shall be manually reset and shall automatically prevent boiler operation when the boiler water level falls below the safe limit.

The controls shall include automatic spark ignition and provisions for automatic restarting after a power failure or momentary interruption of the fuel supply.

2.5.06 Control Panel. The boiler controls shall be mounted on an electrical control panel which shall include a circuit breaker for 480 volt, 60 Hz, 3 phase power supply, a forced draft blower motor starter for forced draft type burners, burner firing controls, an ignition transformer, an alarm bell, and all electrical controls and devices specified herein or otherwise required for proper operation of the equipment.

All controls shall be housed in NEMA Type 1 enclosures. All external wiring shall be enclosed in conduit.

All electrical components shall be factory-installed and wired so that only connection of the power supply circuit to the control panel is required during installation of the equipment. A control power transformer for the load of all accessory devices listed in the Sequence of Operations shall be included to supply 120 volt control power.

The boiler control panel shall include an isolated contact for use with the temperature control system to indicate boiler trouble. The contact shall close in the event boiler operation is interrupted by flame failure, low water cutoff, or limit control.

2.6 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.7 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.7.01 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.7.02 Electric Motors. Motors furnished with equipment shall meet the following requirements unless otherwise specified in the motors specification:

A manufacturer's standard motor may be supplied on packaged equipment, in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), departure from rated voltage and frequency, poor ventilation, or frequent starting, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
   115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
   460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase. Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.8 SHOP TESTING. Each individual section of the gas fired boilers shall be hydrostatically pressure tested before shipment in accordance with Section IV of the ASME Boiler and Pressure Vessel Code.

When required, the equipment shall be factory tested. Factory test results shall be delivered to Engineer. Equipment shall not be shipped until Engineer has reviewed the test results and advised Contractor, in writing, that the equipment is acceptable for shipment. Such acceptance, however, will not be considered as final acceptance, which will only be made on the basis of the test results of the equipment after installation.

2.9 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of topcoats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.3.01 Valves. Valves shall be installed with their stems horizontal or vertical and above the valve body.

3.3.02 Gas Heating Water Boiler. The boilers shall be installed in accordance with the manufacturer's recommendations, and in a neat and workmanlike manner.

The boiler sections shall be held together by individual draw rods at the front and back of the assembly. A permanent gastight seal shall be maintained between the boiler sections.

Boiler installation shall include provisions for removing burners; adjusting, cleaning, and lubricating working parts; and replacing controls, safety devices, and other control components.

All boiler sections shall be sealed with high temperature mastic sealant in accommodating sealing grooves to provide a permanent gastight seal. Each port opening shall be equipped with a flexible elastomer sealing ring to ensure a permanent watertight seal between the boiler sections.

Care shall be exercised to avoid the transmission of pipe stresses to the equipment. The boiler shall be operated, adjusted, and tested after installation to confirm proper adjustment and operation of all controls.

Where required by applicable codes, gas train vent piping shall be routed to outdoors at a location acceptable to Engineer.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. When required, an experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field tests and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Initial startup of the boilers, including all burner equipment and burner controls, shall be provided through a qualified manufacturer's representative who shall record all burner and control settings. Copies of the records shall be made available to Engineer prior to acceptance of the equipment.

3.4.03 Operator Instruction and Training. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided as required. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as needed.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

3.5 CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner. Each boiler shall be thoroughly cleaned in accordance with the manufacturer's instructions prior to being placed in service.

End of Section

SECTION 15515

HYDRONIC SPECIALTIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of specialty valves, expansion tanks, air separators, pumps, devices, and appurtenances associated with the heating, ventilating and air conditioning hydronic systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturer's names have been listed as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable

municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as specified in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, and valves denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment

Name of manufacturer

Type and model

Construction materials, thicknesses, and finishes

Manufacturer's performance data

Overall dimensions and required service clearances

Net weight and loading distribution

Pumps

Name of manufacturer

Type and model

Construction materials, thicknesses, and finishes

Rotative speed

Size of suction and discharge nozzles

Overall dimensions and required service clearances

Net weight and loading distribution

Performance curves with the specified operating point clearly identified for each unit, type, and model with capacity in gallons per minute (L/s) as the abscissa and NPSH required and total pump head as the ordinate. The curves shall also indicate pump efficiency and brake horsepower.

Type of coupling

Data on shop painting

Motors

Name of manufacturer

Type and model

Horsepower (kW) rating and service factor

Temperature rise and insulation rating

Full load rotative speed

Type of bearings and method of lubrication

Net weight

Overall dimensions

Efficiency at full, 3/4, and 1/2 loads

Full load current and power factor

Locked rotor current

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting

Parts lists and predicted life of parts subject to wear

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. One mechanical seal for each size and type of pump shall be furnished for the equipment.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment capacities shall be as indicated on the schedules.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces except motors shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Cast iron or welded steel baseplates shall be provided for pumps, compressors, and other equipment. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection. Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.08 Piping. Unless otherwise indicated herein, piping shall be as specified in Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies.

2.4.09 Valves. Unless otherwise specified herein, all valves shall be as specified in Master Specification Section 15100, Miscellaneous Valves.

Unless otherwise indicated, 2 inch (50 mm) and smaller valves shall have threaded end connections and 2-1/2 inch (65 mm) and larger valves shall be flanged.

2.4.09.01 Flow Control Valves. Flow control valves shall be Bell & Gossett "Circuit Setter", Taco, or approved equal. Readout kits shall be Bell & Gossett "Model RO-2", Taco “Model 789” , or approved equal.

Flow control valves shall be suitable for a working pressure of 125 psig (862 kPa gauge) at 250°F (121°C). Each flow control valve shall be equipped with readout ports fitted with an integral check valve designed to minimize system fluid loss during the balancing and monitoring process, and shall have a calibrated nameplate to ensure specific settings. Valves shall be located as indicated on the drawings, and shall be of the same size as the pipe in which they are installed. All valves shall be provided with preformed, molded insulation blocks to permit access for balancing and readout without disturbing system insulation.

A readout kit, compatible with the valves furnished, shall be provided as required. The kits shall be complete with one percent accurate, 0 to 100 feet (0 to 180 kPa) range pressure gauge; color coded hoses for low and high pressure connections; shutoff and vent valves; and carrying case. Upon completion of the work, the kit shall be delivered to Owner.

2.4.09.02 Combination Pump Discharge Valves. Combination pump discharge valves shall be Bell & Gossett "Triple Duty Valve", Taco, or approved equal.

Combination pump discharge valves shall be of straight pattern, flanged, with cast iron body and bolt-on bonnet. The valves shall be suitable for a working pressure of 175 psig (1207 kPa gauge) at 250°F (121°C). Each valve shall be equipped with nonslam check valve with spring-loaded bronze disc and seat, stainless steel stem, and calibrated adjustment for flow regulation. Each combination pump discharge valve shall be equipped with readout ports fitted with an integral check valve design to minimize the system fluid loss during the balancing and monitoring process. The valves shall be of the same size as the pipe in which they are installed and shall be suitable for use with the readout kits specified in the Flow Control Valves paragraph. The combination pump discharge valve shall be used for balancing service, not for isolation of the pump discharge.

2.4.09.03 Pressure Relief Valves. Pressure relief valves shall be Bell & Gossett "Model 790", or approved equal.

Pressure relief valves shall have a low blowdown differential and shall be designed to relieve system pressure as indicated on the drawings, within the maximum operating limits of the valve. Pressure relief valves shall be ASME rated and shall bear ASME nameplates. The valves shall incorporate fail-safe disc to ensure normal operation under emergency conditions.

2.4.09.04 Pressure Reducing Valves. Pressure reducing valves shall be Bell & Gossett "Model FB38", or approved equal.

Pressure reducing valves shall be diaphragm operated, with a low inlet pressure check valve and inlet strainer. The strainer shall be easily removed without shutting down the system. The valve seat, strainer, and stem shall be removable and shall be fabricated of corrosion-resistant material. The pressure reducing valve shall be set at the pressure indicated on the drawings.

2.4.10 Expansion Tanks. Expansion tanks shall be manufactured by Bell & Gossett "Series B" for bladder type, or “Series D” for diaphragm type, Taco, or approved equal.

The expansion tanks shall be pressurized diaphragm or bladder type. The tanks shall be furnished complete with a charging valve and other connections indicated on the drawings or otherwise required for a complete installation. The tanks shall be constructed of steel in accordance with the ASME Code for Unfired Pressure Vessels for a working pressure of 125 psig (862 kPa gauge) and shall bear ASME stamp. The tanks shall have an exterior coating of universal type primer.

The expansion tanks shall have the dimensions and capacity as required. Tanks oriented vertically shall be provided with an integral base suitable for vertical floor mounting. Tanks oriented horizontally shall be suitable for horizontal ceiling-hung installation.

2.4.11 Air Separators. The air separators shall be Bell & Gossett "Model R", Taco, or approved equal.

Air separators shall be constructed of carbon steel in accordance with ASME Code for Unfired Pressure Vessels for working pressures of 125 psig (862 kPa gauge) and shall bear ASME stamp. The air separator connections shall be of the same size as the pipe in which it is installed, and the air separator performance capacity shall be suitable for the system flow rate. The air separators shall include strainers with 3/16 inch (5 mm) perforations and a free area at least five times the cross sectional area of the connecting pipe. The maximum pressure drop shall not exceed 1 psi (7 kPa) at design flow. The air separators shall have an exterior coating of universal primer.

2.4.12 Air Vents.

2.4.12.01 Manual Air Vents. Manual air vents shall be Bell & Gossett "Model 4V", Taco, or approved equal.

Manual air vents shall have bronze bodies and nonferrous internal parts. The vents shall be manually operated using a screwdriver or thumbscrew.

Manual air vents shall have 1/8 inch (3 mm) discharge connections and 1/2 inch (15 mm) inlet connections. Air vents shall be designed for 150 psig (1034 kPa gauge) working pressure and 225°F (107°C) operating pressure.

2.4.12.02 Automatic Air Vents.

a. Type 1 Vents. Type 1 air vents shall be Bell & Gossett "Model 107A", Taco, or approved equal.

Type 1 air vents shall be float.actuated, non-modulating, high capacity type designed to purge air and provide shutoff at pressures up to 150 psig (1034 kPa gauge) and 250°F (121°C). The vent shall be constructed of cast iron and fitted with AISI Type 313 stainless steel, brass, EPDM, and silicone rubber internal components.

b. Type 2 Vents. Type 2 air vents shall be Bell & Gossett "Model 87", Taco, or approved equal.

Type 2 air vents shall be designed to purge air and to provide shutoff at pressures up to 150 psig (1034 kPa gauge) and 240°F (116°C). The vents shall be constructed of brass and cast iron with nonferrous internals.

2.4.12.03 Air Control Accessories. Other piping specialties shall be provided as indicated on the drawings or as needed for a complete system. Specialties shall be manufactured by the expansion tank manufacturer.

All supports, rods, anchors, and accessories required to properly support the tanks, separators, and specialties shall be provided.

2.4.13 Test Plug. Test plug fittings shall be Sisco "P/T Plugs", or approved equal.

Test plug fittings suitable for pipeline pressure and temperature testing shall be furnished and installed where indicated on the drawings. Test plug fittings shall be 1/2 inch (13 mm) NPT solid brass with dual seal core of neoprene and shall be rated zero leakage to 500 psig (3447 kPa gauge). Each fitting shall be furnished with a marked, color coded cap with gasket and brass cap chain. Fitting body shall be long enough to extend past the insulation on the piping.

In addition, Contractor shall furnish a test kit compatible with the test plug fittings furnished. The test kit shall consist of two thermometers with 1 inch (25 mm) dial faces, pressure gauges with 3-1/2 inch (89 mm) dial faces and gauge adapter. The thermometers shall have ranges of approximately 25°F to 125°F (-4°C to 52°C) and 0°F to 220°F (-17°C to 104°C) and the pressure gauges shall have ranges of approximately 0-60 psig (0-414 kPa gauge) and 0-150 psig (0-1034 kPa gauge). The kit shall include internally padded and fitted carrying case.

2.4.14 Chemical Feed Pot. Chemical feed pots shall be Hydac "By-Pass Chemical Feeder", or approved equal.

Chemical feed pots shall be furnished and installed where indicated on the drawings to feed poly-functional corrosion inhibiting chemical solutions to the water system. The feed pots shall be of steel, with a 5 gallon (23 L) capacity, and shall be suitable for use with water at a pressure of 150 psig (1034 kPa gauge) and a temperature of 210°F (99°C). Each feed pot shall have inlet and outlet connections, a bottom drain connection, and at least 3-1/2 inch (89 mm) fill opening with a fill cap. The feed pot shall be designed so that the fill cap cannot be removed when the chemical feeder is pressurized.

A plastic instruction panel engraved in at least 1/4 inch (6 mm) high black letters on white background shall be mounted adjacent to the feed pot, describing the valve sequence to be used.

2.4.15 Base Mounted Pumps and Accessories. Base mounted water pumps, denoted by the symbols "HWP" for heating water pumps, "CWP" for chilled water pumps, or “CDWP” for condenser water pumps and an identifying number, shall be Bell & Gossett "Series 1510", Taco, or approved equal.

Each base-mounted pump assembly shall consist of a pump, electric motor, coupling, coupling guard, and all other accessories required for proper operation. Pump capacities shall be as indicated in the schedules on the drawings.

Pumps shall be horizontal single stage, end suction, centrifugal type, of back pullout design suitable for being serviced without disturbing piping connections. The pump casings shall be cast iron, with gauge ports at the nozzles and vent and drain ports at the top and bottom of the casing. The impellers shall be bronze, enclosed type, keyed to the shaft. The casing wearing rings and shaft sleeve shall be constructed of bronze. Pump shafts shall be stainless steel. Shaft seals shall be a mechanical type, suitable for continuous operation at temperatures up to 225°F (107°C).

Pumps shall be electric motor driven and shall be direct connected to the drive motor through a flexible coupling. Each pump and motor shall be mounted on a common cast iron or fabricated steel sub-base suitable for installation on a concrete foundation as indicated.

Bearings shall be grease lubricated ball type with an L_{10} Life Rating of at least 40,000 hours at specified operating conditions. Pump motors shall conform to the requirements of the Electric Motors paragraph and shall be suitable for use with the power supply indicated on the schedules.

Heating water pumps shall be suitable for use with 200°F (93°C) water.

2.4.15.01 Suction Diffusers. Suction diffusers shall be furnished and installed for the heating, chilled, and condenser water pumps, as required. Each diffuser unit shall consist of cast iron angle type body with inlet vanes and combination diffuser strainer with 3/16 inch (5 mm) openings for pump protection. The units shall be designed for 175 psig (1207 kPa gauge) working pressure and at least 250°F (121°C) operating temperature. Each unit shall be provided with an adjustable support foot to carry the weight of the suction piping and shall be sized to fit the pump and system piping connections.

2.4.15.02 Flexible Connectors. Flexible connectors shall be Resistoflex "Model R6904", or approved equal.

Flexible connectors shall be furnished and installed for the suction and discharge of each pump and where indicated on the drawings. The connectors shall be multiple arch type with TFE T62 teflon bellows, monel reinforcing rings, control units, and flanged ends. The connectors shall be designed for use with water at a pressure of 100 psig (689 kPa gauge) and a temperature of 250°F (121°C).

2.4.16 Pressure Gauges. Pressure gauges shall be Ashcroft "Duragauge 1279", Weiss Instruments, Inc, or approved equal.

Except as modified or supplemented herein, all gauges shall conform to the requirements of ANSI B40.1. Accuracy shall be ANSI Grade A or better. Gauges shall be indicating dial type with C-type phosphor bronze Bourdon tube, stainless steel rotary geared movement, phenolic open-front turret, stainless steel or phenolic ring, case, adjustable pointer, and acrylic or shatterproof glass window.

The dial shall be 4-1/2 inch (114 mm) in diameter with black markings on a white background. The units of measurement shall be indicated on the dial face. The pointer shall span not less than 200 degrees nor more than 270 degrees. The scale shall be so arranged that the normal operating reading is near the midpoint of the range.

Each gauge shall be provided with a threaded end ball-type shutoff valve as specified in Master Specification Section 15091, Miscellaneous Ball Valves.

All stem-mounted gauges shall be provided with 1/2 inch (13 mm) NPT connections.

2.4.17 Thermometers. Thermometers shall be furnished and installed where indicated on the drawings. The thermometer range shall be selected so that when installed and operating, the thermometer will read within the middle two-thirds of the scale range.

Each thermometer shall be furnished with a stainless steel thermowell for installation in steel piping systems or brass thermowell for installation in copper piping systems. The thermowells shall have 3/4 inch (20 mm) NPT thread mounts, a minimum pressure rating of 250 psig (1725 kPa gauge), and a nominal 4 inch (102 mm) insertion length.

2.4.17.01 Dial Type Thermometers. Thermometers shall be Weksler Instruments "Adjust Angle", Ashcroft "Series EI Everyangle", Weiss Instruments, Inc. , or approved equal

Dial type thermometers shall be bimetal type and shall have at least 4-1/2 inch (114 mm) dial with black markings on a white background. Pointer travel shall span not less than 200 degrees nor more than 270 degrees. Each thermometer shall have a stainless steel case, bezel, fittings, and stem and shall be hermetically sealed, with external pointer adjustment and an acrylic or shatterproof glass window.

Each indicator shall be furnished with an angularly adjustable frame for convenient viewing.

2.4.17.02 Stem Type Thermometers. Stem type thermometers shall be Weksler Instruments "Adjust Angle Thermometer" Weiss Instruments, Inc. "9VU", or approved equal.

Stem type thermometers shall be mercury type and shall have at least a 9 inch (225 mm) scale with black markings on a white background. Each thermometer shall have molded Valox polyester case, acrylic or shatterproof glass front, and angularly adjustable stem for convenient viewing.

2.5 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit.

2.6 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.6.01 Safety Guards. All couplings and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.6.02 Electric Motors. Motors furnished with equipment shall meet the following requirements.

A manufacturer's standard motor may be supplied on packaged equipment, fans, pumps, and heaters, in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

Outdoor equipment.

Equipment for installation below grade.

Equipment operating in chemical feed and chemical handling locations.

Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor’S option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof or submersible motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

Below 1/2 hp (0.4 kW).
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

1/2 hp (0.4 kW) and above.
460 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.7 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the lastest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.3.01 Valves. Valves of the types and sizes specified herein shall be furnished and installed where indicated on the drawings and in the schedules and where required for proper operation of the systems. Where valves are furnished as an integral part of the equipment, additional valves serving the same purpose will not be required. Valves shall be installed with their stems horizontal or vertical and above the valve body.

All drain valves shall be 3/4" (19 mm) with hose connection unless otherwise indicated.

Except at circulating pump locations, all 4 inch (100 mm) and larger valves shall be installed in horizontal piping.

Provide all low points in the hydronic water system piping with drain connections.

3.3.02 Air Vents. Manual air vents shall be installed at all high points in the hydronic piping systems and at other locations indicated on the drawings.

Automatic air vents shall be installed in the hydronic piping systems where indicated on the drawings.

3.3.03 Base Mounted Pumps. The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field tests and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15525

DIGESTER HEATING BOILERS

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installing digester gas fueled heating water boilers as indicated on the drawings.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the Engineer.

1.2.01 General Equipment Stipulations. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Governing Standards. All work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, and laws and regulations of the state which pertain to such work. In case of conflict between these specifications and any state law or municipal ordinance, the latter shall govern.

All work shall comply with Underwriters' Laboratories safety requirements.

The boiler and burner safety controls shall comply with the following:

ASME Section IV, Boiler and Pressure Vessel Code

Factory Mutual (FM)

Industrial Risk Insurers (IRI)

ASME CSD-1, Controls and Safety Devices for Automatically Fired Boilers.

NFPA 54, National Fuel Gas Code.

Definitions of terms and hydraulic considerations shall be as set forth in the Hydraulic Institute Standards.

1.2.03 Coordination. The Contractor shall assume full responsibility for coordination of the boilers with the heating water system, including verification that all structures, piping, and equipment components are compatible. The Contractor shall start up the system and shall make all necessary adjustments so that the system is placed in proper operating condition.

The drawings indicate the extent and general arrangement of the system. If the Contractor deems any departures from the drawings are necessary, details of such departures and the reasons therefor shall be submitted as soon as practicable to the Engineer for review. No such departures shall be made without the prior written concurrence of the Engineer.

1.2.04 Quality Assurance. The equipment to be furnished under this section shall be essentially the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the products of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Major items of mechanical equipment shall be of the best quality normally used for the purpose in good commercial practice and shall be the products of reputable manufacturers.

Several manufacturers are indicated as acceptable for each item of equipment in these specifications. The Contractor shall be responsible for determining that all equipment supplied for the project is suitable for installation in the space provided, as indicated on the drawings, with adequate operating and maintenance access space.

1.2.05 Elevation. The equipment will be operated at an elevation as required.

1.2.06 Power Supply. Power supply to equipment shall be as required.

1.2.08 Shop Painting. All ferrous metal surfaces of each boiler which are to be insulated shall be shop painted with a universal primer prior to installation of the insulation and protective enclosure. Panel boards and electrical controls shall be painted with black enamel. All other surfaces shall be painted with gray enamel. Heated surfaces shall be painted with heat resistant paint.

1.2.05 Tagging. Each item of equipment and each part shipped separately shall be tagged and identified with indelible markings for the intended service as required. Tag number shall be clearly marked on all shipping labels and on the outside of all containers.

1.3 SUBMITTALS. Complete assembly and installation drawings, together with detailed specifications and data covering material used and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master

Specification Section 01080, Projects Submittals. Device tag numbers indicated on the contract documents shall be referenced on the wiring and schematic diagrams where applicable.

The data and specifications for the boilers shall include, but shall not be limited to, the following:

Boiler

Manufacturer and model.

Performance data.

Dimensions.

Connection sizes and locations.

Approximate weight, wet and dry.

Control panel schematics and layout drawings.

Fuel Train

Valve manufacturer.

Valve materials.

Schematic.

Burner

Manufacturer and model.

Sequencing Control Panel

Schematics and layout drawings

1.3.03 Operation and Maintenance Data and Manuals. When required, adequate operation and maintenance information shall be supplied. Operation and maintenance manuals with Master Specification Section 01160, Training and Operation and Maintenance Manuals shall be submitted in accordance with the submittals section.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND SHIPPING. handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as required.

Spare parts shall be suitably packaged as required. Spare parts shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Each boiler will be used to heat water for digester and building heating. Each boiler will be dual-fueled with automatic switchover capabilities. Primary fuel shall be digester gas with backup fuel as required.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Each boiler shall be designed for the performance and design requirements as required.

2.4 DIGESTER HEATING BOILER.

2.4.01 Fire Tube Boiler. When required, boilers shall be a packaged, horizontal, multi-pass, fire tube, scotch marine type boiler with front and rear gasketed doors or panels to allow access for inspection and cleaning of the tubes and tube sheets. Boilers shall be constructed with water cooled combustion chamber and multi-pass fire tubes with separate tube sheets. Boilers shall be designed to provide a minimum of 5 square feet of heating surface area per rated boiler horsepower. Boilers shall be factory assembled.

2.4.01 Cast Iron Sectional Boiler. The boiler shall be a factory assembled package, cast iron, sectional type. Boilers shall be designed for vertical travel of flue gas. Each section of the boiler shall be manufactured with cast-on heat absorbing studs to transfer heat from the combustion gases to the boiler water. Boilers shall be designed and constructed so that the combustion chamber is completely surrounded by circulating water. Boiler sections shall be fabricated with ground-faced metal-to-metal joints which do not need putty, cement, or other filler. Each boiler shall be equipped with access openings for cleaning the flueways between sections.

Where the boiler physical size precludes the use of a packaged unit and with the written concurrence of Engineer, a field assembled unit will be acceptable. To minimize field assembly work, major components shall be shop assembled to the maximum extent practicable.

Boilers shall be furnished complete with a burner assembly, firing controls, control panel, fuel valve gas trains, electrical wiring, safety equipment, a structural steel base, lifting lugs, and all accessories and appurtenances specified or required for a complete, properly operating installation.

2.4.02 Burner Assembly. The burner shall be capable of operating on digester gas at the conditions as required and shall automatically switch to the secondary fuel. The pilot shall be suitable for operating fuel as required.

2.4.03 Burner Firing Controls. Burner controls shall provide positive control of the fuel supply to the burner and pilot. Burner controls shall be microprocessor based.

Control shall provide at least a 30 second purge of the combustion chamber before ignition of fuel and a 15 second or longer purge after interruption of the fuel supply.

An electronic scanning device shall sense pilot and main burner flame. Upon flame failure, the controls shall automatically interrupt the fuel supply to the pilot and the burner, sound an audible alarm, and light a visual indicator. A manual reset, low water cutoff switch, and a limit thermostat shall also interrupt operation of each unit. An isolated contact in the low water cutoff switch, which shall close on low water level, shall be wired to terminals in the control panel.

Except when flame failure occurs, automatic spark ignition and provisions for automatic restarting after a power failure or momentary interruption of the fuel supply shall be provided.

When required a signal shall be sent to start a boiler pump when a boiler is energized. The boiler shall not fire until flow is confirmed.

Each boiler unit shall be provided with a fuel selector switch with DIGESTER GAS, AUTO, and secondary fuel positions. When the switch is in the DIGESTER GAS or the secondary fuel position, the boiler shall operate on the single fuel indicated. In the AUTO position, priority shall be given for firing on digester gas, with automatic switchover to the secondary fuel on low digester gas supply pressure. The AUTO mode shall not allow automatic return from the secondary fuel firing to digester gas firing until the remote digester discharge gas pressure input contact indicates sufficient digester gas pressure has returned after an adjustable timer has timed out. Time delay shall be set with a timer furnished in the boiler control panel.

Digester gas and the secondary fuel shall be ignited by a proven gas pilot.

The boiler unit shall be provided with pressure regulators, valves, strainers, filters, fuel pump, and controls as required for the use of the specified fuels.

The burner shall be full modulation type. The gas train shall meet code requirements for burner safety controls as required. All materials in contact with digester gas shall be suitable for the gas. Unless otherwise specified, all valve trim in contact with digester gas shall be fabricated of stainless steel or aluminum. All automatic shutoff valves or vent valves shall have stainless steel bodies, hard-faced stainless steel seats, chrome plated stainless steel discs, and Viton seals, and shall be Maxon with trim 5-3. Pressure reducing valves shall have cast iron bodies and shall be Fisher or approved equal.

2.4.04 Air Fan. Each unit shall be equipped with a forced draft air fan sized to supply the air required for proper combustion of the fuel. Fan motor controls shall be interlocked with the automatic ignition system and the two fuel valves to provide the specified purge period prior to ignition and following cessation of ignition of the fuel. Each fan motor shall be suitable for operation with the specified power supply and shall be provided with a suitable starter.

Each unit shall be provided with all devices required to properly purge the combustion chamber and positively control the air volume produced by each fan to ensure proper combustion of the fuel.

2.4.05 Control Panel. An electrical control panel shall be provided and mounted on each boiler unit. A circuit breaker for suitable for the power supply shall be mounted on the control panel. In addition, fan motor starter, burner firing controls, control transformer, ignition transformer, alarm horn, fuel selector switch, lights, and all electrical controls and devices specified herein or otherwise required for proper operation of the equipment shall be mounted on the panel. The complete control panel shall have an interrupting rating of at least 42,000 amperes at 480 volts ac.

All controls shall be housed in NEMA Type 12 enclosures. All external wiring shall be enclosed in conduit.

Isolated contact outputs shall be provided as required. All contacts shall be rated for 5 amperes at 120 volt ac.

All electrical components of each unit shall be factory installed and wired so that only connection of the power supply circuit to the control panel is required during installation of the equipment.

All electrical components of the boiler unit shall be factory installed and wired so that connections of the power supply circuit to the control panel is required during installation of the equipment.

2.4.06 Boiler Trim. Boilers shall be provided with ASME safety relief valve, burner flame observation ports and additional trim items as required.

Observation ports shall be mounted on the front and back sections of the boiler to permit visual inspection of the burner flame.

Boiler pressure relief valves shall be of the side discharge type and shall be piped to the bottom of the unit. The valves shall be set to relieve at the rated boiler ASME working pressure. The valve shall have a discharge capacity equal to or greater than the listed output of the boiler.

2.4.07 Unit Enclosure. Each boiler shall be furnished with insulated heavy gage steel jacket with baked enamel finish and insulated with heavy density fiberglass.

2.5 SEQUENCING PANEL. When required a sequencing panel suitable for operating multiple boilers shall be provided. A loop-powered temperature transmitter, located in the boiler discharge header, shall be provided and shall send a 4-20 mA signal to the panel to allow automatic sequencing of lead/lag boilers and full modulation control of the burners. The control system shall be microprocessor based, pre-engineered and programmed. The sequencing panel shall be powered as required and shall be enclosed in a lockable steel, NEMA 1 enclosure. The panel controls shall be UL and CSA listed.

The panel shall include the following:

ON, OFF, AUTO, STANDBY selector switch for each boiler

Manual/Automatic Lead/Lag rotation switch.

Normally open contact for burner start/stop.

Control power transformer as required.

Burner firing rate controller.

Lead and activated boiler lights.

Ignition start adjustment for each boiler.

Modulation start adjustment for each boiler.

Terminals for accepting discrete signals from remote-mounted emergency shutdown switches.

Terminals for accepting a 4-20 mA signal from remote-mounted digester gas pressure switch.

Terminals for accepting a 4-20 mA signal from remote-mounted temperature transmitter

Temperature setpoint adjustment knob.

Purge timer.

Battery backup.

LED display of actual temperature, setpoint temperature, gain adjustment, and boiler percent modulation.

The lead/lag control of the boilers and modulation of the burner shall be based on the heating water supply temperature. On drop of supply water temperature, the lead boiler shall be energized. Following a time delay to allow the boiler to be fired, the controls shall begin modulating the lead burner upward at a rate proportional to the supply temperature rate of change. When the burner on lead boiler goes to high fire, the first lag boiler shall be energized and controlled similar to the lead boiler. When the burner of the first lag boiler goes to high fire, the second lag boiler shall be energized and controlled similar to the lead boiler. As the supply temperature rises, the modulation of the last boiler on line shall decrease until it gets to its ignition start point. It shall be held at that point until the previous on line boiler burner has been modulated to its ignition start point. The last boiler on line then shall be de-energized.

When the boiler fuel selector switch is in the AUTO position, controls shall be provided for automatic fuel switchover from digester gas to natural gas based on a 4-20 mA signal from a remote pressure transmitter. Priority shall be given to firing on digester gas. As the digester gas pressure decreases to a setpoint, the lag boilers shall be switched to fire on natural gas. If the pressure decreases to a setpoint pressure, the lead boiler shall be switched to fire on natural gas. When the pressure increases above the setpoint pressure, after a time delay, the lead boiler shall be switched back to fire on digester gas. If the pressure continues to increase, the lag boiler shall be switched back to fire on digester gas.

2.6 BOILER FLUE. Boiler flues shall be furnished and installed where indicated on the drawings. The boiler flue systems shall be factory built, laboratory tested and listed by Underwriters' Laboratories, and shall comply with the requirements of NFPA 211. Flue systems shall be designed and installed to be gastight to prevent leakage of combustion products into the building.

The boiler flue should be double walled with a nominal 1-inch air space between the walls. The inner and outer jackets shall be constructed of materials as required. The materials and construction of the modular sections shall be as specified by the terms of the product's UL listing.

Drain tee caps, stack caps, storm collars, and flanged boiler kits shall be provided. Caps shall be constructed of stainless steel materials. The systems shall be designed to compensate for all flue gas inducted thermal expansions. Flues shall be supported where indicated on the drawings and as required by the system’s manufacturer. Supports, guides, and all appurtenances required for a complete system shall be furnished at locations determined by the flue systems manufacturer. The entire system from each boiler to the termination, including accessories, shall be the product of one manufacturer.

The flue systems shall be installed according to the manufacturer's installation instructions and shall comply with all applicable codes. The flue systems shall be Selkirk Metalbestos "Model PS" or approved equal.

2.4.08 Anchor Bolts. Anchor bolts and nuts shall be furnished as required for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed.

The bolts shall be at least 3/4 inch (19 mm) in diameter.

Anchor bolts shall be accurately located and centered in pipe sleeves having an inside diameter approximately 2-1/2 times the bolt diameter and a length approximately 8 times the bolt diameter. A square anchor plate with thickness of approximately 1/2 the bolt diameter and side dimensions 4 times the bolt diameter shall be welded to the bottom of each sleeve, with the anchor bolt extended through the plate and welded thereto. Two nuts and a washer shall be furnished with each anchor bolt.

All anchor bolts, nuts, and washers shall be carbon steel, stainless steel, or galvanized steel, as required.

Anchor Bolts and Nuts

Stainless Steel	AISI Type 316, 316L; Bolts ASTM F593, Alloy Group 2; Nuts ASTM F594, Alloy Group 2.
Galvanized Steel	Carbon steel bolts and nuts; hot-dip galvanized, ASTM A153 and A385.
Flat Washers	ANSI B18.221; of the same material as the bolts and nuts.

Anchor bolts shall be long enough to accommodate at least 1-1/2 inches (38 mm) of grout beneath the baseplate and to provide adequate anchorage into structural concrete.

Anti-seize compound will be applied to the threads of all stainless steel bolts before assembly.

2.7 SHOP TESTING.

2.7.01 Hydrostatic Tests. When required, each boiler shall be hydrostatically pressure tested before shipment in accordance with Section IV of the ASME Boiler and Pressure Vessel Code.

2.7.02 Fire Test. When required and after assembly, each boiler shall be filled and brought to and maintained at operating temperature with the furnished burner using either the primary or secondary fuel specified. In addition, control functional tests shall be performed.

2.7.03 Balance. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

PART 3 - EXECUTION

3.1 INSTALLATION. The equipment shall be installed in accordance with the manufacturer's recommendations, and all work shall be completed in a neat and workmanlike manner. Installation shall provide the required accessibility for adjusting, cleaning, and lubricating working parts; and replacing controls, safety devices, and other control components. Care shall be exercised to ensure that piping stresses are not transmitted to the equipment. Each unit shall be operated, adjusted, and tested after installation as required to ensure proper adjustment and operation of all controls.

Each boiler shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. The base for each boiler shall be grouted after initial fitting and alignment, but before final bolting of connecting piping. No stresses shall be transmitted to the boiler flanges. After final alignment and bolting, boiler connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to proper fit.

3.2 INSTALLATION CHECK. An experienced, competent, and authorized representative of the manufacturer of each item of equipment shall visit the site of the Work for at least 1 days (travel time excluded) and inspect, check, adjust if necessary, start-up, and approve the equipment installation. In each case, the manufacturer's representative shall be present when the equipment is placed in operation. The manufacturer's representative shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

Each manufacturer's representative shall furnish to Owner, through Engineer, a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3 TRAINING. Training shall be as specified in the Master Specification Section 01160, Training and Operation and Maintenance Manuals. A minimum of 8 hours of training shall be provided to instruct the Owner's operating and maintenance personnel in the actual operation and maintenance of the new boilers once the equipment is in proper working condition.

The training time required shall be separate from the time required in paragraph 3.2.

End of Section

SECTION 15550

HEATING SYSTEMS EQUIPMENT

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heating system equipment, flues, heaters, and associated devices and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations In Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Equipment Motors

Name of manufacturer.

Type and model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Bearing types and numbers.

Weight.

Overall dimensions.

Full load amperes, efficiency, and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

Flue piping and fittings shall be factory built, laboratory tested, listed by Underwriters' Laboratories, and shall comply with NFPA 211.

Electric heaters shall be UL listed unless otherwise indicated. Electric duct heaters shall comply with the National Electrical Code.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer'S review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 SPARE PARTS. One burner flame detector and boiler pressure relief valve shall be furnished for the equipment.

Spare parts shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Spare parts shall be delivered to Owner as directed.

Spare parts subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment capacities shall be as indicated on the schedules. Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as indicated.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be in accordance with Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound, as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 FLUE SYSTEMS. Flues shall be provided for all equipment that exhausts combustible material. Drain tee caps, stack caps, storm collars, and equipment connection kits shall be provided. The systems shall be designed to compensate for all flue gas-induced thermal expansions. Flue system materials and construction shall be in accordance with the vented equipment manufacturer's recommendations and instructions.

2.5.01 Factory Built Flues. Flue systems for gravity vented equipment and vertically vented unit heaters listed for use with "Type B" gas vents shall be Selkirk Metalbestos, "Type B" gas vents, Metal-Fab, or approved equal. The flue systems for power vented equipment shall be Selkirk Metalbestos "Type PS" gas vent, Metal-Fab "Model PIC", or approved equal.

The flue pipe and fittings for vertically power vented unit heaters requiring a 5 inch (125 mm) or smaller flue and gravity vented equipment shall be a "Type B" gas vent. The flue shall be of double wall construction, with a 0.25 inch (6 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.012 inch (0.3 mm) aluminum and the outer jacket of at least 0.018 inch (0.5 mm) galvanized steel. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

The flue pipe and fittings for power vented equipment and power vented unit heaters requiring a 6 inch (150 mm) or larger flue shall be of double wall construction with a nominal 1 inch (25 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.035 inch (0.9 mm) AISI Type 304 or Type 316 stainless steel, as required, and the outer jacket of at least 0.025 inch (0.6 mm) aluminum coated steel for interior locations and Type 304 or AISI Type 316 stainless steel, as required, for the portions of the stack exposed to the outdoor environment. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

2.5.02 Metal Flues. The flue pipe and fittings for horizontally power vented unit heaters requiring a 5 inch (125 mm) or smaller flue shall be constructed of at least 24 gage (0.61 mm) thickness galvanized steel and shall be sized and arranged as recommended by the vented equipment manufacturer or as directed by Engineer. The flue system shall include all necessary fittings, hangers, supports, and flashings.

2.6 HEATERS. Heaters of the types, sizes, and capacities specified herein shall be furnished and installed where indicated on the drawings. All heaters shall be complete with controls and accessories required for satisfactory operation. Heaters shall be UL listed unless otherwise indicated.

2.6.01 Baseboard Heaters. Baseboard heaters, denoted by the symbol "BH" and an identifying number, shall be Chromalox, Electromode, or approved equal. The heater model shall be as indicated.

Baseboard heaters shall be constructed of heavy gage, cold-rolled steel. The heating element shall be an aluminum finned tube, suitable for a maximum operating temperature of 400°F (204°C) in an ambient temperature of 70°F (52°C). Watt density of the element shall not exceed 187 watts per foot (614 w/m). Heaters shall be equipped with a thermal limit control, built-in thermostat, shall be prewired for service connection in boxes of equal dimensions at both ends and shall be suitable for use with the indicated power supply.

2.6.02 Cabinet Heaters. Cabinet heaters, denoted by the symbol "CH" and an identifying number, shall be manufactured by McQuay, Trane, or approved equal. The heater model shall be as indicated.

Cabinet heaters utilizing the required heat source shall be furnished and installed as indicated on the drawings. Cabinet heaters shall be complete with controls and accessories as needed for satisfactory operation. The cabinet heaters shall include a chassis, coil, fan assembly, filter, motor, motor disconnect, and insulation.

Cabinet heaters shall be vertical or horizontal as indicated in the schedules on the drawings with a front discharge grille, a bottom return, and a built-in thermostat. Heater casings shall be of steel construction with a minimum 16 gage (1.52 mm) thickness front panel and 18 gage (1.21 mm) thickness end and top panels. Exposed corners and edges of the cabinet heater shall be rounded. Heater casings shall be insulated, furnished with removable access panels, and shall be finished with lacquer or enamel. Finish color shall be selected by Engineer from the manufacturer's standard line of colors.

The cabinet heater fans shall be direct driven, centrifugal, forward-curved, double-width wheels statically and dynamically balanced. Fan motors shall have integral thermal overload protection and shall be suitable for use with a 120 volt, 60 Hz, single phase power supply. When necessary, factory-mounted transformers shall be provided to step down voltage for the control circuit.

Water coils shall be 5/8 inch (16 mm) OD seamless copper tubes mechanically bonded to aluminum fins. The coils shall be suitable for a working pressure of 300 psig (2069 kPa gauge), shall be factory tested for leaks under water at 300 psig (2069 kPa gauge), and shall be rated for entering water and entering air temperatures as indicated in the heater schedule on the drawings.

Electric heating elements shall be finned tube or open coil as required. The units shall be factory wired with a unit-mounted heat switch, magnetic contactors, a high temperature cutout safety control, and a fan override thermostat.

Cabinet heaters shall be provided with removable 1 inch (25 mm) disposable filters located in front of the heating coil.

2.6.03 Heating Water Convectors. Heating water convectors, denoted by the symbol "C" and an identifying number, shall be Trane, or approved equal. The heater model shall be as indicated.

Convector elements shall be constructed of copper tubes expanded and rolled into cast iron headers. Fins shall have integral collars which space the fins, and shall be bonded to the tube by mechanical expansion of the tube. End supports shall carry the weight of element and shall be designed to fit over header.

The cabinet shall be constructed of 14 gage (1.9 mm) thickness or heavier carbon steel reinforced with channel stiffeners. Fronts shall be secured by quick-opening fasteners.

Convector cabinets shall have a baked enamel finish of a color selected by Engineer from manufacturer's standard colors.

Dampers to reduce heating capacity by up to 70 percent when closed shall be factory mounted on the element.

Convector capacity shall be as indicated in the schedule on the drawings.

Convectors shall have 24 inch (610 mm) high cabinets.

2.6.04 Electric Duct Heaters. Electric duct heaters, denoted by the symbol "EDH" and an identifying number, shall be manufactured by Indeeco, Brasch, or approved equal.

Electric duct heaters shall be furnished and installed where indicated on the drawings.

Electric duct heaters shall be open coil or finned tube, as required, and zero clearance type with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames with 2 inch (50 mm) wide flanges suitable for fastening to the ductwork.

Bushings for open coils shall be ceramic and terminals shall be stainless steel. Elements for finned tubular coils shall be centered in steel tubes filled with compacted magnesium oxide and copper plated fins brazed to the tube. The assembly shall be finished with high temperature aluminum coating.

Heaters shall be completely factory wired and shall be provided with disconnecting backup and safety contactors, transformers, an automatic reset thermal cutout, a manual reset thermal cutout, a disconnect switch, and a differential pressure airflow switch. All interconnecting wiring shall be enclosed in a terminal box fastened to the heaters and oriented as indicated on the drawings. The terminal boxes shall be furnished with double doors.

Contactors shall be 600 volt rated, 3 pole, UL listed, and shall have a life expectancy for 100,000 operations. A built-in industrial dry type 480/120 volt control transformer shall be furnished to carry the full contactor holding coil load. Transformer primary and secondary windings shall be fused. Secondary windings shall have one lead grounded.

The duct heaters shall be furnished with a silicone controlled rectifier (SCR) control unit mounted in the duct heater terminal box. The control unit shall be suitable for the temperature range of 32 to 132°F (0 to 55°C), and shall be a solid-state proportioning controller designed to modulate the heater output from 0 to 100 percent. The duct heaters shall be controlled by a thermostat as indicated on the drawings. The duct heater SCR controller shall be compatible with the signal from the thermostats.

The duct heater output in kW shall be as specified at 460 volts, 60 Hz, 3 phase. The heater elements shall be suitable for operation on 480 volt, 60 Hz, 3 phase power.

2.6.05 Electric Infrared Heaters. Electric infrared heaters, denoted by the symbol "IH" and an identifying number, shall be manufactured by Chromalox, or approved equal. The heater model shall be as indicated.

Electric infrared heaters shall be metal sheathed double element type, with 30 degree symmetrical reflector for a narrow controlled beam pattern.

Reflectors shall be constructed of clear anodized aluminum. The heater housing shall be constructed of 20 gage (0.91 mm) thickness steel finished with neutral gray baked enamel.

The heaters shall be mounted at 30 degrees from horizontal.

Electric infrared heaters shall be UL listed and suitable for use with the power supply indicated in the heater schedule on the drawings. Capacities shall be as indicated in the heater schedule on the drawings.

2.6.06 Electric Unit Heaters. Electric unit heaters, denoted by the symbol "EUH" and an identifying number, shall have the capacity indicated in the schedules on the drawings.

Electric Unit Heaters (non-explosionproof). Electric unit heaters located in unclassified areas shall be Chromalox "LUH" or "VUH", Brasch, or approved equal. Each heater shall include a fan and motor assembly, a built-in contactor, safety disconnect switch, and a control transformer for 120 volt control, and shall be suitable for use with the power supply indicated in the heater schedule on the drawings. Heater elements shall be steel plate, fin type, with elements brazed to common fins for maximum strength and heat transfer. Each unit heater fan motor shall be provided with automatic reset thermal overload protection. Where shown on the drawings to be wall hung, a wall mounting bracket shall be provided.

Electric Unit Heaters (explosionproof). Where indicated in the heater schedule on the drawings to be explosionproof, unit heaters shall be manufactured by Indeeco "Ultra-Safe", Ruffneck, Markel, or approved equal. Explosionproof electric unit heaters shall be of the fan forced type with a heat exchanger, fan and motor assembly, automatic reset thermal cutout, built-in contactor, factory installed three pole disconnect switch in NEMA 7 enclosure, and 24 volt control transformer. The heater shall be suitable for use with the power supply indicated in the heater schedule on the drawings. The heater shall be listed for installation in a Class I, Division 1 or 2, Group D location and shall have an NEC ignition code of T3B or better.

The heater cabinets shall be constructed of a corrosion resistant cabinet fabricated from an epoxy coated 14 gage (1.90 mm) thickness steel with individually adjustable outlet blades. Cabinet fasteners shall be stainless steel.

The heat exchanger shall be an efficient liquid to air design utilizing a copper or steel core with aluminum fins. The heat exchanger shall be provided with a coating suitable for use in a corrosive atmosphere consisting of hydrogen sulfide. The heating elements shall be housed in an inhibited propylene or ethylene-glycol heat transfer fluid that is suitable for temperatures down to -49°F (-45°C). A pressure relief valve shall provide overpressure protection for the heat exchanger.

The fan and motor assembly shall consist of an aluminum fan connected to a explosionproof, permanently lubricated ball bearing type motor with built-in thermal overload protection. The motor shall be prewired to the control enclosure providing for a heater that is suitable for use with a single point power connection.

<u>Electric Unit Heaters (corrosion resistant)</u>. Where indicated on the drawings to be corrosion resistant, unit heaters shall be manufactured by Indeeco "Traid", Chromolox "HDH", or approved equal. Each heater shall include fan and motor assembly, operating and safety controls, and shall be suitable for use with a single point power supply indicated in the schedules on the drawings.

Heater elements shall be Type 304 or 316 stainless steel, fin tubular type, with stainless steel fittings forming a watertight seal between the elements and the junction box. Unit heater fan motors shall be totally enclosed, permanently lubricated ball bearing type designed to resist corrosion and moisture. The fan blades shall be epoxy coated aluminum and the heater housing shall be at least a 20 gage (0.91 mm) Type 304 stainless steel. Where indicated on the drawings to be wall hung, a swivel wall mounting bracket shall be provided.

The controls shall include automatic reset thermal cutout, fan delay relay, built-in control and motor contactors, control transformer, and terminal block all housed in a NEMA 4X enclosure. A pilot light visible on the heater exterior shall indicate heater operation.

2.6.07 Gas Unit Heaters. Gas unit heaters, denoted by the symbol "GUH" and an identifying number, shall be Reznor Model "Venturion FE", Trane, Sterling, or approved equal.

Gas unit heaters shall be furnished and installed where indicated on the drawings. Each heater shall be of the type, size, and capacity indicated in the schedules on the drawings; shall be suitable for use with the gas type and pressure as required; and shall be of a type approved and listed in the AGA Directory of Approved Gas Appliances and Accessories.

Each gas-fired unit heater shall be power vented, horizontal discharge, propeller type, and suitable for two point suspending mounting. The heater burner and heat exchanger shall be constructed of E-3 (AISI Type 409) stainless steel. Each heater shall be furnished with a vent cap.

Each gas unit heater shall be furnished complete with a 24 volt transformer, single-stage gas control with a regulated combination redundant gas valve, a spark-ignited, intermittent safety pilot with electronic flame supervision and all required limit and safety controls. Units larger than 125,000 Btu [132,000 kJ] input shall have two-stage gas controls.

The fan motor shall be suitable for use with a 120 volt, 60 Hz, single phase power supply, and shall be provided with automatic reset thermal overload protection.

2.6.08 Heating Water Unit Heaters. Heating water unit heaters, denoted by the symbol "HUH" and an identifying number, shall be manufactured by Modine, Trane, Armstrong-Hunt, Inc., or approved equal

Heating water unit heaters shall be of the discharge orientation indicated, propeller type and shall be suitable for use with the power supply indicated in the schedules on the drawings. The heating water unit heaters shall be rated for entering water and entering air temperatures as indicated in the schedules on the drawings. The noise level generated by each heater shall be appropriate for the space in which the heater is installed. Efficient air deflectors shall be provided for each heater. Heater casings shall be of sturdy, rigid steel construction and shall be finished with lacquer or enamel. Each unit heater fan motor shall be provided with automatic reset thermal overload protection. Heating water unit heater capacities and discharge arrangement shall be as indicated in the schedules on the drawings.

Where indicated in the schedules on the drawings to be explosionproof, unit heaters shall be suitable for installation in an NEC Class I, Division 2, Group D area.

2.6.09 Wall Heaters. Wall heaters, denoted by the symbol "WH" and an identifying number, shall be manufactured by Electromode "Model EWA", Brasch, or approved equal.

Wall heaters shall be downflow type; designed for surface mounting; and shall include an electric heating element, a thermal limit switch, a fan delay switch, a fan and motor assembly, and a built-in thermostat. The heaters shall be suitable for use with the specified power supply and shall have the capacity indicated in the schedules on the drawings.

2.7 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements,, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under the electrical section, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.8 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.8.01 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.8.02 Electric Motors. Motors furnished with equipment shall meet the following requirements unless otherwise specified in the motors specification:

> A manufacturer's standard motor may be supplied on packaged equipment, fans, pumps, and heaters, in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally

enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40° C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feed and chemical handling locations.

4. Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor'S option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

1. <u>Below 1/2 hp (0.4 kW)</u>.
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. <u>1/2 hp (0.4 kW) and above</u>.
460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase. Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.9 <u>SHOP TESTING</u>. The equipment shall be factory tested. Factory test results shall be delivered to Engineer. Equipment shall not be shipped until Engineer has reviewed the test results and advised Contractor, in writing, that the equipment is acceptable for shipment. Such acceptance, however, will not be considered as final acceptance, which will only be made on the basis of the test results of the equipment after installation.

2.10 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the lastest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath base plates shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Valves. Valves shall be installed with their stems horizontal or vertical and above the valve body.

3.3.02 Flues. Flues for all equipment exhausting combustible material shall be installed where indicated on the drawings. Flue gas systems shall be gastight to prevent leakage of combustible products into the building and shall be complete with all fittings, hangers, supports, and flashing necessary for proper installation.

Roof penetrations shall be flashed and counterflashed to provide a weathertight installation. The installation shall include, where necessary, ventilating collars to give proper clearance from floors, ceilings, and roofs constructed of combustible materials.

Flues shall be supported where indicated on the drawings and where required by the system manufacturer. Supports, guides, and all appurtenances required for a complete system shall be furnished and installed at locations determined by the flue systems manufacturer. The entire system from the equipment connection to the termination, including accessories, shall be from one manufacturer.

The flue height dimensions indicated on the drawing are minimum and shall be increased to conform to any local codes which pertain to such work.

All vertical flues shall be equipped with a capped tee to serve as a condensate drain. Flues 6 inches (150 mm) and larger shall be equipped with a condensate drain connection.

When power vented equipment is listed as being suitable for use with "Type B" gas vents, "Type B" gas vents may be used when all vent joints are sealed to prevent leakage.

Where metal flues are used, each joint shall be sealed with sealant and/or aluminum or teflon tape suitable for the operating temperatures to prevent leakage. The tape shall be wrapped two full turns around each joint. Where single wall metal flues are used to vent equipment, a double wall flue shall be used outside and shall extend through the wall a minimum of 6 inches (150 mm). The annular space of the double wall flue shall be sealed at the connection point between the double and single wall flues. Single wall flues routed through unconditioned spaces or in locations below 8 feet (2.4 m) above the finished floor shall be insulated to prevent condensation or limit the cold face temperature to 150°F (65°C).

Gas unit heater flues shall be installed with a minimum of 12 inches (300 mm) of straight pipe attached to the venter outlet before the installation of an elbow.

3.3.03 Heaters. The bottom elevation of unit heaters shall be 8 feet (2.4 m) above finished floor unless otherwise indicated.

Gas fired unit heaters with side burner and control access shall have the access located on heater side opposite the wall.

Electric duct heaters shall be installed with a minimum distance of 4 feet (1.2 m) from all ductwork transitions and obstructions on both sides of the heater.

3.4 FIELD QUALITY CONTROL.

3.4.01 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field tests and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

3.2 CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner. Each boiler shall be thoroughly cleaned in accordance with the manufacturer's instructions prior to being placed in service.

End of Section

SECTION 15575

FLUE STACKS, BREECHINGS AND VENTS

PART 1 - GENERAL

1.1 SCOPE. Furnish and install all flue stacks, breechings and vents as shown on the Drawings, schedules and as specified herein.

1.2 RELATED REQUIREMENTS. Section 15855 - Air Handling Units

1.3 SUBMITTALS. Submit, in accordance with Section 01160, the following: Catalog cuts and assembly directions for each type of flue or stack.

1.4 REFERENCE STANDARDS. Underwriters Laboratories (UL).

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

The complete system shall meet all applicable governing codes.

PART 2 - PRODUCTS

2.1 GENERAL. Type H or SS Factory Built Chimney - UL listed for use with residential and commercial buildings when forced venting is not required. The double wall metal chimney shall have an outer casing of aluminum coated steel (0.4 oz/sq ft), an inner casing of Type 430 or equal corrosion resistant stainless steel and a minimum dead air space of 1/2-in. Chimney shall be complete with UL listed support plates, roof thimble and guy wires and other accessories as recommended by the manufacturer for a complete installation as manufactured by Metalbestos or equal.

Type PS - UL listed for use with forced venting equipment (MAUS). The system shall be completely design by the flue manufacturer with accessories required as manufactured by Metalbestos or equal. Outer and inner casings shall be 316 stainless steel.

PART 3 - EXECUTION

3.1 INSTALLATION. Flues for all equipment exhausting combustible material shall be installed where indicated on the drawings. Flue gas systems shall be gastight to prevent leakage of combustible products into the building and shall be complete with all fittings, hangers, supports, and flashing necessary for proper installation.

Roof penetrations shall be flashed and counter flashed to provide a weather tight installation. The installation shall include, where necessary, ventilating collars to give proper clearance from floors, ceilings, and roofs constructed of combustible materials.

The flue height dimensions indicated on the drawing are minimum and shall be increased to conform to any local codes which pertain to such work. Flues shall be supported where indicated on the drawings and where required by the system manufacturer. The entire system from the equipment connection to the termination, including accessories, shall be from one manufacturer.

Install all equipment per manufacturer's recommendations.

End of Section

SECTION 15650

REFRIGERATION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of refrigerant piping and accessories, condensing units, heat pumps, room air conditioners, packaged air conditioning units, package heat pumps, water chillers, and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for functions and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein as indicated in the Contract Documents, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between these specifications and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

The refrigerant systems shall be constructed in accordance with ASHRAE Standard 15.

Refrigeration system equipment shall have a minimum efficiency of not less than specified in the latest edition of ASHRAE 90.1, unless otherwise indicated on the drawings.

Capacity ratings for condensing units, heat pumps, packaged air conditioning units, and packaged heat pumps with capacities less than 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 210/240. For condensing units, heat pumps, packaged air conditioning units over 135,000 BTUH (39 kW) the capacity ratings shall be in accordance with ARI Standard 360. Capacity ratings for packaged heat pumps with capacities over 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 340.

Water chiller construction, ratings, and testing shall conform to the requirements of ANSI/ARI 590.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise indicated or required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, and valves denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Refrigerant Piping

Schematic arrangement showing equipment, coils, piping sizes, valves, and accessories.

A refrigerant piping schematic indicating refrigerant piping sizes and corresponding velocities, accessories, accessory pressure losses, and piping pitch and direction.

Air Cooled Condensing Units/Heat Pumps

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Locations and sizes of field connections.

Certified performance data and ratings.

Capacity and saturated suction temperature at specified conditions.

Equipment efficiency ratings.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Room Air Conditioners

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Certified performance data and ratings.

Capacity at specified conditions.

Overall dimensions and required clearances.

Wiring diagrams and electrical requirements.

Net weight.

Information on local equipment manufacturers' representatives.

<u>Packaged Air Conditioning Units/Packaged Heat Pumps</u>

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Locations and sizes of field connections.

Certified performance data and ratings.

Capacity at specified conditions.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

<u>Water Chillers</u>

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Certified performance data and ratings.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Equipment Motors

Name of Manufacturer.

Type and Model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Bearing types and numbers.

Weight.

Overall dimensions.

Full load amperes, efficiency, and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied and shall be submitted in accordance with the Master Specification Section 01160, Training and Operation and Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. One complete change of lubricating oil and two sets of air filters shall be furnished for the equipment.

Extra materials shall be packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment and coil capacities shall be as indicated on the schedules.

Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as required.

Each fan's operating selection point on the fan curves shall be selected to the right of the peak pressure/efficiency point and below the lowest point along the fan curve, to the left of the peak pressure/efficiency point.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Cast iron or welded steel baseplates shall be provided for pumps, compressors, and other equipment. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection. Baseplates will be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.08 Refrigerant Piping and Accessories. Refrigerant piping shall conform to Master Specification Section 15070, Copper Tubing and Accessories. Piping shall be supported as specified in Master Specification Section 15140, Pipe Supports. Refrigerant filter dryers, expansion valves, solenoid valves, combination sight glass and moisture indicators, charging valves, relief valves, and other accessories shall be furnished and installed as needed for proper operation of the system.

The refrigerant piping size and arrangement shall be in accordance with the manufacturer's recommendations. Pipe routing and isolation shall be selected to minimize vibration and sound transmission to the conditioned space. The refrigerant piping system shall be provided with the necessary traps and risers for uniform oil return to the compressor. The suction gas line shall be sized to produce a minimum load gas velocity of 1,000 feet per minute (5 m/s) in vertical risers with upward gas flow and 500 feet per minute (2.5 m/s) in horizontal piping. The full load pressure drop should not exceed 3 psi (20 kPa) or 2°F (1°C) change in saturated refrigerant temperature. The maximum gas velocity shall not exceed 4,000 feet per minute (20 m/s). The liquid lines shall be sized to limit the pressure loss to an equivalent of 2°F (1°C) of temperature change and a maximum liquid line velocity of 360 feet per minute (1.8 m/s).

2.5 EQUIPMENT.

2.5.01 Condensing Units/ Heat Pumps. Condensing units, denoted by the symbol "CU" and an identifying number and heat pumps denoted by the symbol "HP" and an identifying number, shall be furnished and installed where indicated on the drawings. Each unit shall consist of compressor(s), condenser coil, condenser fan(s) and motor(s), starters, and all controls necessary for proper operation. Condensing units and heat pumps shall be manufactured by Trane, Carrier, McQuay, York, or approved equal.

2.5.01.01 Performance and Design Requirements. Each unit shall be completely factory assembled and tested, piped, internally wired, and shipped in one piece. Condensing units and heat pumps shall be selected to satisfy the cooling and cooling/heating requirements of the air handling unit being served. A 2°F (1°C) suction temperature difference for piping losses shall be allowed between the condensing unit or heat pump and the air handling unit when in the cooling mode.

As required, condensing units and heat pumps shall be capable of satisfactory operation in the cooling mode at the minimum ambient air temperature indicated. When required to operate in the cooling mode at a lower temperature than the factory standard, a low ambient kit shall be installed. The low ambient kit shall be designed for ambient temperature of 0°F (-18°C) consisting of a solid state controller to vary the speed of the outdoor fan motor in response to refrigerant condensing temperature. Heat pumps shall be capable of operating satisfactorily at an ambient air temperature of 0°F (-18°C) in the heating mode.

The condensing units and heat pumps shall be designed to operate on the power supply as indicated on the drawings.

2.5.01.02 Casing. The unit casing shall be of weatherproof design, constructed of heavy gage galvanized or zinc-coated steel, and reinforced and braced for maximum rigidity. All bracing and reinforcing members shall be integral to each unit. The casing shall be given a factory-applied coat of rust-inhibitive universal primer, followed by the manufacturer's standard baked enamel finish. Fasteners shall be stainless steel or coated for corrosion protection. Each unit shall have removable panels or access doors for access to all components and connections. Drainage holes shall be located in the base section for moisture removal. The unit shall be supported above the mounting surface with base rails or feet.

2.5.01.03 Outdoor Coils. Outdoor coils shall be of the air-cooled, finned tube type with liquid accumulator and integral subcoolers. The coils shall be constructed of 3/8 inch (10 mm) OD seamless copper tubing with aluminum fins securely bonded to the surface. Coils shall be factory leak and pressure tested at 425 psig (2930 kPa gauge) and then completely dehydrated and sealed with a holding charge of nitrogen or refrigerant. The coils shall be protected from hail damage by louvered metal grilles or on units 5 tons or less, corrosion resistant wire maybe used.

2.5.01.04 Fans and Motors. Outdoor fans shall be vertical discharge, direct-driven propeller type, and shall be statically and dynamically balanced. Fan guards shall be located on the discharge of each fan. Fan motors shall be TEFC suitable for outdoor installation and shall have permanently lubricated ball bearings and built-in overload protection.

2.5.01.05 Compressors. Compressors shall be of the reciprocating hermetic, semi-hermetic, or scroll type mounted on vibration isolators. The compressor motor shall have temperature and current sensitive overload protection devices. Where the compressors are located outside the cabinet, grilles shall be installed over the openings to protect the compressor area.

Reciprocating hermetic compressors shall be suction gas cooled with internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, and automatic reset timer to prevent the compressor from rapid cycling.

Reciprocating semi-hermetic compressors shall be suction gas cooled, internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, oil level sight glass, and automatic reset timer to prevent the compressor from rapid cycling. Capacity reduction shall be provided by automatic suction valve unloaders. The minimum number of capacity step reductions shall be as required. Each compressor shall start unloaded.

Scroll compressors shall be suction gas cooled with high and low pressure cutout switches and automatic reset timer to prevent the compressor from rapid cycling. The compressor shall have radial and axial compliant scroll plates to allow the compressor to handle liquid slugging without damage to the compressor.

2.5.01.06 Refrigerant Circuit and Accessories. Each unit shall be completely factory assembled, tested, and fully charged with Refrigerant-22 and compressor oil. Each refrigerant circuit shall be equipped with filter-dryer and multiuse liquid and gas line valves. The multiuse valves shall be constructed of brass with service pressure gauge ports. For condensing units and heat pumps larger than 20 tons (70.3 kW), factory mounted suction and discharge pressure gauges shall be provided. All factory installed gauges, switches, and other devices connected to the refrigerant circuit shall have isolation valves.

Heat pumps shall be provided with reversing valve, flow control check valve, and solid state defrost control system. The defrost system shall be a time and temperature initiated system that activates in response to a temperature sensing element mounted at the outdoor coil.

A hot gas bypass kit, including but not limited to a solenoid valve and hot gas bypass valve shall be provided for each condensing unit larger than 5 tons (17.5 kW). For condensing units larger than 20 tons (70.3 kW), the kits shall be factory installed. For condensing units smaller than 20 tons (70.3 kW), the kit maybe field installed.

2.5.01.07 Controls. Condensing units and heat pumps shall be completely factory wired for a single point power supply connection. All wiring shall be installed in accordance with the National Electrical Code.

Condensing units and heat pumps 5 tons (17.5 kW) or less shall be provided with factory wired control panel containing magnetic contactors, relays, and control power transformer. Units larger than 5 tons (17.5 kW) shall be provided with a factory wired control panel containing full voltage magnetic starters for compressor and outdoor fan motors and internal volt control power transformer.

Units with multiple compressors shall have a built-in time delay to prevent both compressors from starting simultaneously.

All internal panel wiring shall be neatly run in gutters or bundles to terminal strips for connection of external wiring. All wires and terminal strips shall be numbered or color coded in accordance with the wiring diagram. All internal and external controls, gauges, lights, and switches shall be identified with nameplates. A complete wiring diagram showing the compressor and fan starting circuits and the control circuit shall be furnished.

Terminal blocks shall be factory wired to provide terminal points for permissive start for each stage of cooling or cooling and heating from a remotely located control panel or thermostat, supply voltage terminal points for remotely located refrigerant solenoid valves, and terminal points to energize remote condensing unit and heat pump indicating lights.

An electrically separate, normally open contact shall be furnished to actuate remote indication of unit shutdown in the event any of the safety interlocks automatically shuts down the unit. The contact shall close on any safety condition except low refrigerant suction pressure.

A thermostat for operation of the unit shall be furnished and installed as indicated on the drawings. The thermostat type shall be as needed to perform the sequence of operation as indicated on the drawings.

The thermostat shall be a programmable or a nonprogrammable heating and cooling type with automatic changeover. The number of stages shall be suitable for the unit control and operation. The thermostat shall have a range of approximately 50 to 90°F (10 to 32°C) with at least a 5°F (3°C) deadband between heating and cooling. The thermostat shall have a subbase to control system and fan operation.

2.5.02 <u>Room Air Conditioner</u>. A room air conditioner denoted by the symbol "RAC" and an identifying number, shall be furnished and installed where indicated on the drawings. The unit manufacturer and model number shall be as indicated.

The unit shall be complete with hermetic motor-compressor, evaporator coil, condenser coil, fan motor, evaporator blower and condensing fan, drain pan, built-in thermostat, and all other necessary operating and safety controls. The slide-out chassis shall be mounted in a heavy gage galvanized steel cabinet. The unit shall provide positive exhaust and ventilation and shall have easily removable, washable filter. The unit shall be designed to operate on the power supply as indicated on the drawings.

2.5.03 <u>Packaged Air Conditioning /Heat Pump Units</u>. Packaged air conditioning units, denoted by the symbol "PAC" and an identifying number, and packaged heat pumps denoted by the symbol "PHP" and an identifying number shall be furnished and installed where indicated on the drawings. Each unit shall be designed for outdoor installation on a full perimeter curb or equipment pad as indicated on the drawings. The packaged air conditioning unit shall be manufactured by Trane, Carrier, McQuay, York, or approved equal.

2.5.03.01 <u>Performance and Design Requirements</u>. The units shall be completely factory assembled and tested, piped, internally wired, fully charged with Refrigerant-22 and compressor oil, and shipped in one piece. The unit shall be designed for direct expansion cooling and configured for heating type indicated. The unit shall be suitable for the power supply and shall have the capacities indicated on the drawings.

The refrigeration system shall be capable of satisfactory operation at outdoor ambient air temperatures of 50°F (10°C) in the cooling mode and for heat pumps, 0°F (-18°C) in the heating mode. When required to operate in the cooling mode at a lower temperature than the factory standard, a low ambient kit shall be installed. The low ambient kit shall be designed for ambient temperature of 0°F (-18°C) consisting of a solid state controller to vary the speed of the outdoor fan motor in response to refrigerant condensing temperature.

2.5.03.02 Casing. The unit casing shall be of weatherproof design and shall be constructed of 20 gage (0.91 mm) or heavier zinc-coated steel. The casing shall be properly reinforced and braced for maximum rigidity. The casing shall be given a factory-applied coat of rust-inhibitive primer and shall be provided with the manufacturer's standard baked enamel finish. Interior surfaces of exterior casing members in contact with the airstream shall have one inch (25mm) thick, one pound (454 kg) density, insulation coated on the air side. Aluminum foil-faced glass fiber insulation shall be used in gas fired heating sections. Hinged, insulated, neoprene gasketed access doors or removable panels shall be provided to permit easy inspection and maintenance. Removable insulated access panels shall have aluminum or steel covering on the interior to protect the insulation. The unit base shall be a one-piece, welded assembly with suitable roof curb sealing gasket and curb overhang for water runoff. Drains shall be provided to accommodate outdoor coil runoff.

Where an economizer package is not specified, a manually set air damper shall be furnished to provide the indicated outside air volume.

2.5.03.03 Indoor Coil Section. The indoor coil shall be multirow of seamless copper tubing mechanically bonded to heavy-duty aluminum fins. The coil shall be factory leak tested underwater at 200 psig (1380 kPa gauge). The coil shall be provided with expansion device or valve, filter-dryer, and moisture indicator. The indoor coil section shall have fully insulated, sloped drain pan extending under the entire coil section and extending sufficiently past the coil to capture and collect any condensate carryover that may be produced when the unit is operating within the specified operating conditions.

2.5.03.04 Heating Sections. When indicated on the drawings, the unit shall have an electric heating coil, gas heating section, or auxiliary electric heating coil. Electric heater coils shall be completely factory assembled and wired integral within the unit. Coils shall be heavy-duty nickel chromium with an automatic reset device to de-energize all staging contactors on high temperature. The heating coils shall be electrically subdivided within the unit into balanced, individually fused stages as required by the National Electrical Code. The heating coil shall have the minimum number of stages indicated in the schedules on the drawings.

Gas-fired heating sections shall be completely factory assembled and wired integral within the unit. When located upstream of the cooling coil, the heating section shall be AGA design certified specifically for outdoor applications upstream of a refrigerant cooling coil. The heat exchanger shall be of constructed of minimum 20 gage (0.91mm) aluminized steel. The burner shall be induced or forced draft type with pressure regulator, redundant main gas valve, manual shutoff valve, and intermittent spark ignition. A flame sensing device and high limit safety controls shall be provided. The number of heating stages shall be as indicated in the schedules on the drawings.

The unit shall be supplied with natural gas having a calorific value of approximately 1000 Btu per cubic foot (37 MJ/m^3) at an inlet pressure as required.

2.5.03.05 Filters. Filters shall be mounted integral within the packaged air conditioning or heat pump unit and shall be 2 inches (50 mm) thick. Hinged access doors shall be provided. Filters shall conform to the requirements in Master Specification Section 15880, Air Distribution Systems.

2.5.03.06 Fans and Motors. The indoor supply fan shall be forward-curved, multiblade, centrifugal type and shall be statically and dynamically balanced by the fan manufacturer. The fan shall have die-formed, streamlined inlets and the scroll shall be constructed of steel with all seams sealed airtight. The fan shall have steel shafts operating in self-aligning, grease lubricated ball bearings.

Units 5 tons (17.5 kW) and smaller shall have direct or belt driven fans. Where direct driven fans are used, the fan shall have multiple speeds to allow for airflow adjustment. Units greater than 5 tons (17.5 kW) shall have V-belt drive with adjustable sheaves and shall be designed for 50 percent overload. The supply fan motor shall conform to the requirements of the Motors and Motor Controls paragraph. Vibration isolators shall be provided for the fan assembly and motor assembly.

Static pressure values indicated on the drawings are external to the complete unit. Internal coil(s), dampers, filters and fan housing losses are not included. A filter allowance of 0.35 inch water column (0.087 kPa) shall be used for 2 inch (50 mm) pleated filter losses.

The outdoor fans shall be direct drive, vertical discharge, propeller type with aluminum blades. Fan motors shall be weatherproof with permanently lubricated ball bearings and built-in thermal overload protection. A corrosion resistant wire guard shall be installed over the fan opening.

2.5.03.07 Compressors. Compressors shall be of the reciprocating hermetic, semi-hermetic, or scroll type mounted on vibration isolators. The compressor motor shall have temperature and current sensitive overload protection devices. Each packaged air conditioning or heat pump unit shall have a minimum number of capacity reduction steps as indicated in the schedules on the drawings.

Reciprocating hermetic compressors shall be suction gas cooled with internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, and automatic reset timer to prevent the compressor from rapid cycling.

Reciprocating semi-hermetic compressors shall be suction gas cooled, internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, oil level sight glass, and automatic reset timer to prevent the compressor from rapid cycling. Capacity reduction shall be provided by automatic suction valve unloaders. Each compressor shall start unloaded.

Scroll compressors shall be suction gas cooled with high and low pressure cutout switches and automatic reset timer to prevent the compressor from rapid cycling. The compressor shall have radial and axial compliant scroll plates to allow the compressor to handle liquid slugging without damage to the compressor.

2.5.03.08 Refrigerant Circuit. The factory sealed refrigerant system shall consist of compressors, outdoor coils, indoors coils, expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, refrigerant piping, and a full operating charge of refrigerant. Service gauge connections shall be furnished on the suction, discharge, and liquid lines. Units with multiple compressors shall have multiple circuits with separate expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, compressor, and refrigerant charge. All factory installed gauges, switches, and other devices connected to the refrigerant circuit shall have isolation valves.

2.5.03.09 Outdoor Coil. The outdoor coil shall be of the air-cooled integral finned tube type. The coil shall be constructed of copper tubes with aluminum fins permanently and securely bonded to the tubes. The coil shall be factory leak and pressure tested. The coils shall be protected with hail guards.

2.5.03.10 Accessories. Where indicated on the drawings, the packaged unit shall be provided with economizer cycle to automatically utilize up to 100 percent of outside air for cooling. The economizer shall be controlled as required, and shall modulate return and outside air dampers to maintain proper discharge temperature into the conditioned space. The dampers shall be equipped with automatic lockout when the outside air temperature is too high for proper cooling, and shall have adjustable minimum position control. The damper motor shall be spring return and shall operate to close the outside damper during shutdown. A means for 100 percent relief of the return air shall be provided unless otherwise noted.

Where indicated on the drawings, hot gas bypass shall be installed to provide reduced capacity control.

When required, packaged units shall be furnished with a roof mounting curb. The curb shall be constructed of at least 16 gage (1.52 mm) zinc-coated steel with nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply and return air openings. The curb shall be a minimum of 16 inches (405 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.5.03.11 Controls. Each packaged unit shall be completely factory wired and shall have a single point power connection and unit mounted disconnect switch. All wiring shall be installed in accordance with the National Electrical Code.

The unit shall be provided with remote control and monitoring panel consisting of system operation switches and signal lights. The signal lights shall be for power, outage, dirty filters, and reset relay.

Packaged units shall be provided with a factory wired control panel containing full voltage magnetic starters for compressor, outdoor fan, and indoor fan motors, and internal volt control power transformer.

Defrost controls, electronic timed initiated and temperature terminated with field adjustable timer shall be provided for all packaged heat pumps. When auxiliary electric heating is provided, a factory installed emergency heat package shall be provided. When heating is locked out, the auxiliary heat shall be activated as necessary.

Units with multiple compressors shall have a built-in time delay to prevent both compressors from starting simultaneously.

All internal panel wiring shall be neatly run in gutters or bundles to terminal strips for connection of external wiring. All wires and terminal strips shall be numbered or color coded in accordance with the wiring diagram. All internal and external controls, gauges, lights, and switches shall be identified with nameplates. A complete wiring diagram showing the compressor and fan starting circuits and the control circuit shall be furnished.

Terminal blocks shall be factory wired to provide terminal points for permissive start for each stage of cooling or cooling and heating from a remotely located control panel or thermostat; terminal points to energize remote dirty filter, heating mode, cooling mode, and service indicating lights; and terminal points to de-energize the unit upon detection of smoke.

A thermostat for operation of the unit shall be furnished and installed as indicated and located where indicated on the drawings.

The thermostat shall be a manual changeover, automatic changeover, or programmable heating and cooling type. The number of stages shall be suitable for the unit control and operation. The thermostat shall have a range of approximately 50° to 90°F (10° to 32°C) with at least a 5°F (3°C) deadband between heating and cooling. The thermostat shall have a subbase to control system and fan operation.

2.5.04 Water Chillers. Packaged water chillers, denoted by the symbol "WC" and an identifying number, shall be furnished and installed where indicated on the drawings. The water chillers shall be manufactured by McQuay, Carrier, Trane, or approved equal.

2.5.04.01 Performance and Design Requirements. The package chillers shall consist of compressors, evaporator, shell and tube type condenser, thermal expansion valve, refrigerant accessories, and control panel. The chillers shall be completely factory assembled, wired, factory run tested. The complete assembly shall be mounted on a structural steel base.

The water chiller capacity and the evaporator and condenser fouling factors shall be as indicated in the schedules on the drawings. The capacity indicated is a minimum capacity. Units furnished shall be provided with sufficient capacities to account for tolerances due to manufacturing and testing variations. The minimum coefficient of performance (COP) and integrated part-load value (IPLV) shall meet the latest version of the ASHRAE Standard 90.1.

2.5.04.02 Compressors. Each compressor shall be a reciprocating, direct drive, 1750 rpm, semi-hermetic type suitable for use with Refrigerant-22. The compressors shall be equipped with suction and discharge service valves, hot gas muffler, internal relief valves, double-mesh suction inlet screens, and shall be mounted on spring isolators.

Each compressor shall be furnished with forced feed lubrication system complete with reversible, positive displacement oil pump, oil charging valve, oil level sight glass, and oil filter arranged to provide lubrication during startup, normal, and stopping operations. A crankcase heater shall be provided to prevent dilution of the oil by the refrigerant.

The compressor motor shall be suction gas cooled with solid state motor protector and shall have automatic capacity reduction equipment consisting of suction valve unloaders. As required, the minimum number of capacity step reductions shall be as indicated. Each compressor shall start unloaded.

2.5.04.03 Evaporators. The evaporators shall be shell and tube type with removable heads, internal water baffles, and integrally finned seamless copper tubes expanded into tube sheets. Each tube shall be individually replaceable. The evaporators shall be constructed, tested, and stamped in accordance with the ASME Code for Unfired Pressure Vessels for a refrigerant side working pressure of 225 psig (1550 kPa gauge) and a water side working pressure of 150 psig (1035 kPa gauge), and shall be insulated with 3/4 inch (19 mm) flexible closed cell plastic insulation.

2.5.04.04 Condensers. The condensers shall be shell and tube design with high strength steel shell and seamless, integral fin, copper tubes expanded into tube sheets. The condensers shall be constructed, tested, and stamped in accordance with the ASME Code for Unfired Pressure Vessels for a refrigerant side working pressure of 300 psig (2070 kPa gauge) and a water side working pressure of 150 psig (1035 kPa gauge). Each condenser shall have an integral subcooler circuit and a safety pressure relief.

Where potable water is supplied to the condenser, the condenser construction shall be suitable for use with potable water. Tubes shall be constructed of 90/10 cuppro-nickel, tube sheets shall be monel clad, and the heads epoxy coated.

2.5.04.05 Refrigerant Circuit. Each package chiller shall have a liquid line shutoff valve, filter dryer, liquid line sight glass with moisture indicator, liquid line solenoid valve, thermal expansion valve, compressor discharge service valve, insulated suction line, pressure relief device, and a charging valve. Chillers which have multiple compressors shall use independent refrigerant circuits. Each circuit shall be permitted to be shutdown without impacting the operation of the other circuit. The chillers shall be pressure tested, evacuated, and given full operating charge of Refrigerant-22 at the factory.

2.5.04.06 Accessories. The compressor shall be enclosed by a sound attenuator consisting of an acoustically lined compartment of 16 gage (1.52 mm) metal with one inch (25mm) of 1-1/2 pound (24 kg/m^3) density glass fiber lining.

When required, the chiller shall have hot gas bypass permitting the unit to operate down to 10 percent of the full load capacity. The hot gas bypass shall include hot gas bypass valve, solenoid valve, manual shutoff valve and all required controls. Units with hot gas bypass need not include a lead-lag compressor control.

Rubber-in-shear or spring isolators shall be provided for installation beneath the unit frame.

Each chiller shall be fitted with a gauge package consisting of high and low side refrigerant pressure gauges per refrigerant circuit and oil pressure gauge per compressor. A shutoff valve shall be included for each gauge.

Each chiller shall be provided with an evaporator and condenser water flow switches.

Condenser water regulating valves shall be provided by the chiller manufacturer.

2.5.04.07 Controls. A factory-built control panel with hinged access doors shall be mounted on each chiller. The control panel shall contain provisions for single point power connection, non-fused disconnect switch, starters, safety controls, control power transformer, fused control circuit, and terminal strips. Each compressor shall be provided with starter and motor contactors, non-recycling three phase compressor overload protection, and current overload protection. The starter type shall be as required. All accessories provided with the unit as specified herein and indicated in the sequence of operations shall be prewired for power and control to the unit control panel by the unit manufacturer.

A standard control package, or a microprocessor based interface shall be provided, as required.

As indicated, a factory-built sequence control panel shall be provided to control a multiple chiller system as set forth in the Sequence of Operations on the drawings.

2.5.04.07.01 Standard Control Package. The control panel shall have lights to indicate the status of all unit safeties, power, and compressor staging. An individual light shall be provided for each safety condition. An electrically separate, normally open contact shall be furnished to actuate a remove indication in the event any of the safety interlocks, except low refrigerant suction pressure, automatically shuts down the unit.

Each chiller circuit shall have recycling pump-down control, high pressure control, low pressure control, motor protector with oil pressure cutout, and low temperature cutout. An anti-recycle timer and timed periodic pumpout shall be provided to prevent rapid compressor cycling and liquid slugging. Except for units with hot gas bypass on one refrigerant circuit, units with multiple compressors shall have lead-lag compressor control.

A chilled water temperature controller and sensor set to maintain a nominal 45°F (7°C) leaving chilled water temperature shall cycle the compressors and activate the cylinder unloaders in response to the supply/return chilled water temperature.

2.5.04.07.02 Microprocessor Based Interface. The control panel shall contain a microprocessor based interface system capable of controlling the unit operation, setting control parameters, and monitoring alarm status. The microprocessor control system shall be pre-programmed with English language display, non-volatile memory, and shall be capable of displaying alarm diagnostics. Entering/leaving evaporator temperatures, entering/leaving condenser water temperatures, suction temperature of each circuit, suction pressure, discharge pressure, and alarm status shall be displayed using the interface system.

2.6 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.7 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.7.01 Adjustable Frequency Drives. Adjustable frequency drives shall be provided as indicated on the drawings and shall be coordinated with the requirements of the associated equipment. The equipment manufacturer shall be responsible for furnishing the adjustable frequency drive, for matching the motor and the drive, and for coordinating the collection of data and the design to limit harmonics to the levels specified.

Adjustable frequency drives shall be as covered in Master Specification Section 16150, Variable Frequency Drives.

2.7.02 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor.

2.7.03 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm thick) or thicker galvanized or aluminum-clad sheet steel or from ½ inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.7.04 Electric Motors. Motors furnished with equipment shall meet the following requirements.

> A manufacturer's standard motor may be supplied on packaged equipment and fans in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

Outdoor equipment.

Equipment for installation below grade.

Equipment operating in chemical feed and chemical handling locations.

Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor's option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

<u>Below 1/2 hp (0.4 kW)</u>.
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

<u>½ hp (0.4 kW) and above</u>.
460 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

Motors to be used with adjustable frequency drives shall be rated for inverted service.

2.8 <u>SHOP TESTING</u>. The equipment furnished under this section shall be tested at the factory according to the standard practice of the manufacturer. Ratings shall be based on tests made in accordance with applicable AMCA, ASHRAE, ARI, NBS, NFPA, and UL Standards.

2.9 <u>BALANCE</u>. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the lastest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will prevent dust or other contaminants from getting on freshly painted surfaces. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath the baseplate shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Valves. Valves shall be installed with their stems horizontal or vertical and above the valve body and with the applicable requirements of the miscellaneous valve sections.

3.3.02 Refrigerant Piping and Accessories. The refrigerant piping shall be sized and arranged in accordance with the manufacturer's recommendations. Pipe routing and isolation shall be selected to minimize vibration and transmission of sound to the conditioned space. The refrigerant piping system shall be provided with the necessary traps and risers for uniform return of oil to the compressor. The suction gas line shall be sized to produce a minimum load gas velocity of 1,000 feet per minute (5 m/sec) in vertical risers with upward gas flow and 500 feet per minute (2.5 m/s) in horizontal piping. The full load pressure drop should not exceed 3 psi (20 kPa) or 2°F (1°C) change in saturated refrigerant temperature. The maximum gas velocity shall not exceed 4,000 feet per minute (20 m/s). The liquid lines shall be sized to limit the pressure loss to the equivalent of 2°F (1°C) of temperature change and a maximum liquid line velocity of 360 feet per minute (1.8 m/s). A piping schematic indicating refrigerant piping sizes and corresponding velocities, accessories, accessory pressure losses, and piping pitch and direction shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

3.3.03 Condensing Units/Heat Pumps. The condensing units and heat pumps shall be installed in accordance with the manufacturer's installation instructions. Each unit shall be leveled and installed to maintain the manufacturer's recommended clearances. The units shall be firmly anchored where indicated on the drawings.

After the refrigerant system has been tested, the system shall be fully charged with refrigerant 22 and compressor oil.

3.3.04 Packaged Air Conditioning Units/Packaged Heat Pumps. The packaged air conditioning units and packaged heat pumps shall be installed in accordance with the manufacturer's installation instructions. Each unit shall be leveled and installed to maintain the manufacturer's recommended clearances. The units shall be firmly anchored where indicated on the drawings.

3.3.05 Water Chillers. Packaged water chillers shall be installed in accordance with the manufacturer's installation instructions. Each chiller shall be installed level on vibration isolators firmly anchored to the concrete equipment base. Piping around chiller shall be arranged for easy dismantling and permit tube cleaning.

The chiller safety relief valve shall be piped to outdoors at a location not less than 15 feet (4.6 m) above grade and not less than 20 feet (6.1 m) from any operable window, ventilation opening, or exit. The discharge termination shall be arranged to prevent direct spray on personnel in vicinity and foreign material from entering the discharge piping. The pipe size shall be as recommended by the water chiller manufacturer.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

If inspection or tests indicate defects, the defective work or material shall be replaced, and inspection and tests repeated. All repairs to piping shall be made with new materials. Caulking of threaded joints or holes will not be acceptable

3.4.03 Operator Instruction and Training. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

3.5. CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner.

End of Section

SECTION 15755

HEAT EXCHANGERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heat exchangers for the locations and services as indicated.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts and Tools shall apply to all equipment provided under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer. At least 3 feet (1 m) of clear access space shall be provided on all sides of the unit.

1.2.03 Tagging. Each item of equipment and each part shipped separately shall be tagged and identified with indelible markings for the intended service. Tag number shall be clearly marked on all shipping labels and on the outside of all containers.

1.2.04 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow convenient collection of waste oil in containers from the operating area or platform without removing the unit from its normal installed position.

1.2.05 Abbreviations. Reference to standards and organizations herein shall be as indicated by the following designations.

AISC	American Institute of Steel Construction
AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
AWS	American Welding Society
NEMA	National Electrical Manufacturers Association
NPT	National Pipe Thread
UL	Underwriters' Laboratories
USS	United States Standard

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment drawings showing dimensions, connection sizes and locations, and maintenance clearances.

Unit shipping and operation weights.

Heat transfer capacity rating.

Design conditions of heat transfer capacity rating.

Heat transfer surface area.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with the Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.5 SPARE PARTS. A matched set of V-belts and matched set of gaskets shall be provided.

Spare parts shall be suitably packaged with labels indicating the contents of each package. Spare parts shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The heat exchangers shall be suitable for the service conditions as indicated.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Heat exchangers and accessories shall be designed for the performance and design requirements as indicated.

2.3 MATERIALS.

Plate and Frame Heat Exchangers	
Plates	As required.
Guide Bars	Stainless or chrome plated steel.
Frame	Carbon steel.
Tie Bolts	Stainless or zinc plated steel.
Gaskets	One-piece molded elastomer suitable for the specified service.
Cover	Galvanized steel, 14 gage (1.89 mm) minimum thickness.
Air-Cooled Heat Exchangers	
Frame	Carbon steel, galvanized.
Core	Continuous aluminum plate fins mechanically bonded to tubes.
Fan Impeller	Aluminum; air foil design.
Shell and Tube Heat Exchangers	
Shell	Fabricated steel.
Tubes	Inhibited Admiralty
Tube Sheets	90-10 Cu Ni
Rust-Preventive Compound	As recommended by manufacturer.

2.4 CONSTRUCTION. Connections 2-1/2 inch (63 mm) and larger shall be ANSI B16.5, Class 150 flanges. Connections 2 inch (50 mm) and smaller shall be NPT threaded.

Each unit shall be provided with provisions for lifting.

Each exchanger shall be designed to ASME Section VIII requirements. The heat exchanger shall bear the ASME stamp for unfired pressure vessels.

2.5 PLATE AND FRAME EXCHANGERS. Plate and frame type heat exchangers shall be constructed with a frame suitable for mounting on a concrete pad foundation. Plates shall be corrugated and shall include flow directors which shall evenly distribute the fluids over the exchange surface. Each plate shall have provisions for support and proper alignment of the members. Plates shall be of standard size of the manufacturer and replaceable with minimum disassembly of the unit. Each heat exchanger shall be provided with a protective sheet metal cover over the plate sections which can be easily removed without disturbing the piping connections. Heat exchangers shall be shop assembled with all openings sealed prior to shipment.

2.6 AIR-COOLED EXCHANGERS. Air-cooled heat exchangers shall consist of the heat exchange core section complete with fan and structural frame suitable for mounting on a concrete pad foundation. Manifolds shall be removable for access to and cleaning of tubes. Core shall be pitched to a drain connection with shutoff valve.

Fans shall be forced draft driven by an electric drive motor.

2.7 SHELL AND TUBE EXCHANGERS. Shell and tube type heat exchangers shall be horizontal tube type with removable tube bundle. Exchangers shall be constructed with fabricated channels at each end. Channels shall have flanged and bolted covers which can be removed without disturbing any piping connections

Shells shall be of welded construction and include provisions for expansion of one of the tube sheets and channels if required by the manufacturer's design for the specified conditions. Shells shall have two supports suitable for mounting on concrete pad foundations. All necessary connections shall be provided for piping, vents, drains and instruments.

Tubes shall be rolled into the tube sheets and shall be adequately supported to prevent sagging or vibration. The method of expanding the tubes shall be such as to not change the size of the tube sheet opening. The tube bundle supports shall be arranged as baffles to obtain the most effective distribution of the fluid above and around the entire tube bundle.

Tube sheets shall be of adequate thickness for the design pressures and physical size of the exchanger with a minimum thickness of one inch. Tube holes shall be arranged on a triangular pitch. Tube hole edges shall be chamfered on the shell side and each hole shall be provided with a minimum of two grooves. The bridge between tube holes shall be not less than 3/16 inch (5 mm) nominal.

2.8 ACCESSORIES.

2.8.01 Relief Valves. A relief valve shall be furnished on each liquid side of each exchanger. Relief valves shall have manual lifting levers and shall be capable of protecting the exchanger from overpressure in the event the exchanger is operated with closed isolation valves.

2.8.02 Temperature Switches. Temperature switches shall be provided in the air-cooled exchanger manifold for control of the fan. Switches shall close on rising temperature to start the fan motor. Switch contacts shall be rated at least 10 amperes at 120 volts ac.

2.8.03 Anchor Bolts. Anchor bolts and nuts shall be furnished as required for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed.

The bolts shall be at least 3/4 inch (19 mm) in diameter.

Anchor bolts shall be accurately located and centered in pipe sleeves having an inside diameter approximately 2-1/2 times the bolt diameter and a length approximately 8 times the bolt diameter. A square anchor plate with thickness of approximately 1/2 the bolt diameter and side dimensions 4 times the bolt diameter shall be welded to the bottom of each sleeve, with the anchor bolt extended through the plate and welded thereto. Two nuts and a washer shall be furnished with each anchor bolt.

All anchor bolts, nuts, and washers shall be carbon steel, stainless steel, or galvanized steel.

Anchor Bolts and Nuts

Carbon Steel	ASTM A307 or ASTM A36.

Stainless Steel

AISI Type 304, 305, 384, 304L	Bolts ASTM F593, Alloy Group 1; Nuts ASTM F594, Alloy Group 1.
AISI Type 316, 316L	Bolts ASTM F593, Alloy Group 2; Nuts ASTM F594, Alloy Group 2.
Galvanized Steel	Carbon steel bolts and nuts; hot-dip galvanized, ASTM A153 and A385.
Flat Washers	ANSI B18.22.1; of the same material as the bolts and nuts.

Anchor bolts shall be long enough to accommodate at least 1-1/2 inches (38 mm) of grout beneath the baseplate and to provide adequate anchorage into structural concrete.

Anti-seize compound will be applied to the threads of all stainless steel bolts before assembly.

2.9 DRIVE UNITS Each fan shall be driven by an electric motor. Drive units shall be designed for 24 hour continuous service.

2.9.01 Belt Drive When belt drives are required by the manufacturer's design, V-belt and sheave groove dimensional tolerances shall be in accordance with the "Engineering Standards - Multiple V-Belt Drives" published by the Multiple V-Belt Drive and Mechanical Power Transmission Association. Belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate power rating of the drive motor. The speed reduction ratio of belt drives shall not exceed 4 to 1. Each belt drive shall include a sliding base or other suitable means of tension adjustment.

2.9.02 Safety Guards All belt drives, fan blades, couplings, and other moving or rotating parts of the units shall be covered on all sides by a safety guard, fabricated from 16 USS gage (1.52 mm thick) or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal and shall be furnished complete with all necessary supports and accessories. Supports and accessories, including bolts, shall be galvanized. Safety guards in outdoor locations shall be designed to keep out rain and dripping water.

2.9.03 Electric Motors. The electric motors shall be as indicated in Master Specification Section 16220, General Purpose Induction Motors.

2.10 SHOP COATING. All steel and iron surfaces shall be protected by suitable shop-applied coatings. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment with coatings suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for coating. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for being top-coated in the field with a universal primer and aliphatic polyurethane system.

Machined, polished, and nonferrous surfaces shall be coated with rust-preventive compound.

All other surfaces to be coated after installation shall be prepared for coating as recommended by the coating manufacturer for the intended service, and then shop coated with one or more coats of the specified shop primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.
2.11 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the contract price for the number of days and round trips to the site as required.

3.2.02 Installation Supervision. The equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the contract price.

Manufacturers' installation supervisor shall observe, instruct, guide, and direct the installing contractor's erection or installation procedures. The equipment manufacturer will be notified with written notification 10 working days prior to the need for such services.

3.3 TRAINING. The manufacturer's representative shall provide training for Owner in proper operation and maintenance of the equipment. Such services shall be included in the contract price.

End of Section

SECTION 15820

DEHUMIDIFICATION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of equipment and accessories associated with the dehumidification systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable local codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thicknesses. Metal thicknesses and gages as indicated on the Contract Documents are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Temperature Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but not be limited to, the following:

Name of manufacturer.

Type and model.

System flow diagram.

Construction materials, thickness, and finishes.

Overall dimensions and required clearances.

Net weight and load distribution.

Process fan horsepower.

Reactivation fan horsepower.

Precooling equipment data and capacities.

Post heating equipment data and input/output capacities.

Reactivation heater equipment data and input/output capacities.

Filter velocities.

Dehumidifier performance curves or data and desiccant type.

Process and reactivation entering and leaving air conditions.

Fan performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least 5 different rotative speeds.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

Equipment Motors

Name of Manufacturer.

Type and Model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Type of bearings and method of lubrication.

Net weight.

Overall dimensions.

Efficiency at full, 3/4, and 1/2 loads.

Full load current and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. A set of air filters, fan belts, and other belts shall be furnished for each equipment unit.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The dehumidifiers shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The dehumidifier capacities shall be as indicated in the schedules on the drawings.

Gas fired dehumidifiers shall be suitable for operation with a natural gas or propane inlet pressure range as indicated.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as required.

2.2.03 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as indicated in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 DESICCANT DEHUMIDIFIERS. Honeycomb wheel type desiccant dehumidifers shall be Bry-Air "Model VFB", Cargocaire, or approved equal. Each unit shall be complete with desiccant wheel, process and reactivation air fans, reactivation heaters, volume dampers, motor starters, and a control panel, and shall be completely assembled, wired, and tested at the factory. The dehumidifier shall be capable of removing moisture continuously from the process air stream.

2.5.01 Casing. The unit casings shall be welded aluminum construction with a thickness of at least 0.125 inches (3.2 mm) and shall be properly braced and reinforced with aluminum framework as needed for the operating pressures. The casing shall be provided with the manufacturers standard finish.

Gasketed removable panels or doors shall be furnished to provide access to all internal parts and components. The cabinet shall be constructed to be vapor tight for indoor installation. An observation window shall be provided to permit visual inspection of the bed while the unit is in operation.

The reactivation air and process air sides of the unit shall be divided by a positive sealing arrangement designed for at least 20,000 hours of normal operation. The seals shall be removable and access doors shall be provided for inspections.

2.5.02 Desiccant Wheel. The dehumidifier shall use an automatic, continuous duty, honeycomb style desiccant wheel as required for the adsorption medium. The desiccant material shall be chemically inert, non-corrosive, non-flammable, non-toxic type, and shall contain no asbestos. The wheel shall have a flame spread of 0 and a smoke developed rating not to exceed 10 when tested in accordance with ASTM E84.

The desiccant wheel shall be belt driven and shall have a maximum wheel rotation speed of 10 revolutions per hour.

2.5.03 Reactivation Heater. The type of reactivation heaters shall be electric, direct fired gas, or steam, as indicated in the schedules on the drawings.

2.5.03.01 Electric Type. Electric reactivation air heaters shall consist of an electric heating coil with solid-state modulating control. The controls shall be able to modulate the electric heating coil capacity from 0 to 100 percent. The electric heating coil shall be of open coil zero clearance construction with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames. Bushings shall be ceramic and terminals shall be stainless steel. The electric heating coil control panel shall be completely factory wired to the unit control panel and shall include disconnecting backup and safety contactors, transformers, fusing, disconnect switch, automatic reset thermal cutout, manually reset thermal cutout, and differential pressure airflow switch.

2.5.03.02 Natural Gas Type. Natural gas reactivation air heaters shall consist of a modulating direct fired burner, suitable for use with natural gas. The controls shall be able to modulate the burner firing rate to match the reactivation air requirements. The complete fuel burning assembly shall conform to the requirements of the UL/ETL, FM, or IRI as required. The burner assembly and gas piping arrangement shall include pilot and main burner gas manual shutoff valves, pilot and main gas regulators, pilot and main gas safety shutoff valves, manual pilot adjustment valve, electric modulating main gas valve, low and high pressure safety switches, flame rod, spark igniter, ignition transformer, and flame safeguard relay. The burner assembly and gas manifold shall be completely piped and tested at the factory prior to shipment and shall be suitable for an inlet gas pressure range as required.

2.5.03.03 Steam Type. Steam reactivation heaters shall provide heat for the dehumidifier by a steam heating coil utilizing steam. The steam coil shall be a non-freeze type constructed of 5/8 inch (16 mm) OD copper tubes with at least a 0.049 inch (1.2 mm) wall thickness mechanically bonded to aluminum fins. Coils shall be rated for 150 psi (1030 kPa) and tested at 300 psi (2070 kPa) steam working pressure.

Modulating dampers capable of modulating the heating capacity from 0 to 100 percent shall control the reactivation air temperature to match the reactivation air requirements.

2.5.04 Fans. Both process and reactivation air fans shall be factory mounted as part of the unit base. The fans shall be of the single width, single inlet, multiblade, centrifugal type with motor, belt, drives, and guards and shall be arranged to provide counterflow arrangement of the process and reactivation airflows. The fans shall be dynamically balanced and tested after being installed in the factory-assembled fan section. Fans shall be mounted on vibration isolators.

Belt-driven fans shall be complete with V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Adjustable pitch sheaves shall be furnished for fans with smaller than 10 horsepower (7.5 kW) motors and fixed sheaves for 10 horsepower (7.5 kW) and larger motors. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the appropriate size after the air system balancing, if necessary, to achieve the fan speed required for the specified airflow.

Multiple belts shall be provided in matched sets.

Static pressure values indicated on the schedules are external to the complete unit. The desiccant wheel, filters, and fan housing losses are not included. A filter allowance of 0.35 inch water column (87 Pa) shall be used for filter losses.

A high static fan shall be provided if required to overcome the fan total static pressure.

2.5.05 Filter Section. Dehumidifiers shall be provided with built-in filter racks or filter enclosures fastened directly to the process and reactivation air inlets. Racks or enclosures shall be suitable for housing two inch (50 mm) thick pleated filters. Gasketed access doors shall be provided for removal of filters. Filters shall be removable when the dehumidifier equipment is installed as indicated on the drawings. Air filters shall conform to the requirements of the Air Filters paragraph.

2.5.06 Accessories. Factory mounted volume dampers shall be factory mounted in both the process and reactivation air streams. Dampers shall be of the opposed blade type with positive locking quadrants. A 4 inch (100 mm) U-tube manometer complete with tubes and probes shall be factory installed across the unit for measuring pressure differentials.

2.6 REFRIGERANT DEHUMIDIFIERS. Refrigerant dehumidifiers shall be Desert Aire "LT Series", Dectron, or approved equal as required. Each unit shall be of the packaged, self-contained, closed loop, refrigerant type, completely factory assembled, piped, wired, and tested at the factory. Dehumidifiers shall be of the horizontal type suitable for suspended mounting. The units shall be complete with supply fan, fan motor, compressor, evaporator coil, condenser coil, refrigeration valves, and electrical controls.

2.6.01 Casing. The unit casing shall be constructed of at least 20 gage (0.91 mm) thickness steel and shall be properly braced and reinforced with steel framework as needed for maximum rigidity. The base panel shall be a minimum 14 gage (1.9 mm) thickness steel with welded 1/8 inch (3 mm) steel angle supports on the underside for maximum rigidity. Removable panels shall be provided to allow easy access to internal parts within each section. Access shall be on the side indicated on the drawings. The unit casing and panels shall be provided with the manufacturer's standard enamel finish. The electrical control panel shall be housed in a separate compartment.

The enclosures shall be internally insulated with a flame-attenuated glass fiber insulation bonded with a thermosetting resin. The air stream surface shall be faced with a black coated mat. The insulation shall be securely fastened to the unit enclosure by mechanical means. The insulation shall not exceed a flame spread rating of 25 when tested in accordance with ASTM E84.

2.6.02 Coils. Both the evaporator and condenser coil tubes shall be fabricated from 1/2 inch (13 mm) OD seamless drawn copper. The fins shall be die-formed, plate-type tempered aluminum for easy cleaning and shall be damage resistant.
The tubes shall be hydraulically extruded into the fins to form a permanent metal-to-metal bond. All manifolds, headers, and connecting tubing shall be made with heavy wall seamless copper tubing. Coils shall be leak tested at pressures not less than 400 psig (2760 kPa gauge). Coils shall be designed and tested in accordance with UL and CSA standards. After testing, coils shall be sealed.

Air velocity across evaporator and condenser coils shall not exceed 500 FPM (2.5 m/s). Evaporator coils shall be at least six rows deep with a maximum of ten fins per inch (25 mm). Condenser coils shall be at least four rows deep with a maximum of twelve fins per inch (25 mm).

2.6.03 Compressors. Compressors shall be heavy-duty hermetic reciprocating type with crankcase heater to protect against liquid slugging or scroll type. Compressors shall be equipped with low and high pressure safety switches, and shall be internally protected from overheating. Compressors shall be vibration-isolated internally and externally.

2.6.04 Fans. Dehumidifiers shall have a double-inlet, double-width, centrifugal, forward-curve fan mounted on permanently lubricated sealed or grease lubricated ball bearings, selected for 200,000 hours of average life. Fans shall be dynamically and statically balanced. Fan housings shall be vibration-isolated.

Belt-driven fans shall be complete with V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Sheaves shall be of the adjustable type and shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the appropriate size after the air system balancing, if necessary, to achieve the fan speed required for the specified airflow.

Multiple belts shall be provided in matched sets.

Static pressure values indicated on the schedules are external to the complete unit. Internal coil(s), filter and fan housing losses are not included. A filter allowance of 0.35 inch water column (87 Pa) shall be used for filter losses.

A high static fan shall be provided, if required, to overcome the fan total static pressure.

2.6.05 Filter Section. Dehumidifiers shall be provided with built-in filter racks or filter enclosures fastened directly to the process air inlets. Racks or enclosures shall be suitable for housing filters one or two inches (25 or 50 mm) thick. Gasketed access doors shall be provided for removal of filters. Filters shall be removable when the dehumidifier equipment is installed as indicated on the drawings. Air filters shall conform to the requirements of the Air Filters paragraph.

2.6.06 Accessories. Dehumidifiers shall be furnished with a sloped condensate drain pan constructed of stainless steel and positioned under the dehumidifier coil. The drain pan shall extend sufficiently past the evaporator coil to capture and collect any condensate carryover that may occur when the unit is operating. It shall be formed of 20 gage (0.91 mm) thickness stainless steel, silver-solder welded, and attached securely to the evaporator end plates. The drain pan shall be pitched to completely drain and fitted with a 1 inch (25 mm) NPT non-corrosive plastic drain connection.

Refrigerant type dehumidifiers shall include the compressor and condenser fan motor starters; start and run capacitors; high and low pressure control with manual reset of the high pressure cut out, and automatic reset of low pressure cut out; anti-cycling timer to protect against compressor cycling, and indicating lights. Indicating lights shall be provided to indicate system, fan, and compressor operation.

Refrigerant type dehumidifiers shall also include an electrically controlled damper assembly within the unit enclosure to maintain optimum coil temperature under varying load conditions. The unit shall be equipped with a low ambient valve to control discharge pressure regardless of ambient condensing temperatures. A hot gas bypass valve to prevent the coil from freezing shall be provided. A diverting valve shall be provided to control refrigerant flow through the condenser coil or water-cooled condenser depending on space temperature requirements.

2.7 AIR FILTERS. Filters shall be American Air Filter "AM-AIR 300X", Farr "30/30", or approved equal. Filters shall be disposable type, with 1 or 2 inch (25 or 50 mm) thick, high-loft blend of cotton and synthetic fiber pleated media. A metal support grid shall be bonded to the media. The filter frame shall be constructed of rigid, high-strength, moisture-resistant beverage board. The pleated media pack shall be bonded to the inside of the frame.

Unless otherwise specified, all filters shall have an average efficiency of 25 to 30 percent based on the ASHRAE 52.1-92 test method. The filters shall have a maximum initial resistance of 0.13 inch water column at 300 feet per minute (30 Pa at 1.5 m/s).

2.8 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.9 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.9.01 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor unless otherwise indicated.

2.9.02 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized.

2.9.03 Electric Motors. Motors furnished with equipment shall meet the following requirements.

> A manufacturer's standard motor may be supplied on packaged equipment in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall

be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feeding and chemical handling locations.

4. Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor’s option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
   115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
   460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase. Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.10 CONTROLS. Dehumidifiers shall be provided with an electrical control panel. The control panels shall be easily accessible after dehumidifier installation. Control panels shall be factory prewired with protective fuses, contactors, motor starters, control transformer, overload protection, pilot lights, relays, and all necessary components to insure continuous automatic operation. The control panels shall be of adequate size to house all electrical controls and devices necessary to provide control as described in the Sequence of Operation. Controls shall be suitable for 120 volts, 60 Hz, single phase power supply.

Humidistats for on-off operation of the unit shall be furnished and installed where indicated on the drawings

A condensation controller for on-off operation of the unit shall be furnished and installed. The controller shall consist of a control power module and a sensor module mounted where indicated on the drawings. The control power module shall contain the power supply, differential setpoint adjustment switch, signal indicating lights, and control relay to start and stop the dehumidifier. The sensor module shall continuously monitor the surface humidity level and the control power module shall compare it to the selected differential dew point setting and control the unit accordingly.

2.11 SHOP TESTING. The equipment shall be factory tested and the test results shall be delivered to Engineer. Equipment shall not be shipped until Engineer has received the test results and advised Contractor, in writing, that the equipment is acceptable for shipment. Such acceptance, however, will not be considered as final acceptance, which will only be made on the basis of the test results of the equipment after installation.

2.12 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or its components shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Field Measurement. Contractor shall be responsible for verifying all field dimensions, and for verifying location of all equipment relative to any existing equipment or structures.

3.2.02 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. The dehumidification systems shall be installed where indicated on the drawings. Flexible connections shall be installed between fan inlet and outlet sheet metal connections. Flexible connections shall not be in tension when the fans are operating. The flexible connections shall comply with the requirements of Master Specification Section 15880, Air Distribution Systems.

Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.4.03 Operator Instruction and Training. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided as required. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as necessary for compliance.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15845

REGISTERS AND GRILLES

PART 1 - GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of stainless steel supply registers and exhaust grilles, and appurtenances associated with heating and ventilation systems. It shall include the following duct mounted air outlets and inlets:

Supply Registers

Exhaust Grilles

1.2 SUBMITTALS.

1.2.01 Product Data. For each model indicated, include the following:

Data Sheet: Indicate construction, finish, and mounting details for each type of air outlet, inlet, and accessory indicated.

Performance Data: Include throw and drop, static-pressure drop, and noise ratings for each type of air outlet and inlet indicated.

Schedule of registers and grilles indicating drawing designation, room location, quantity, model number, size, and accessories.

Assembly Drawing: Indicate materials and methods of assembly of components for each type of air outlet and inlet indicated.

1.3 QUALITY ASSURANCE. NFPA Compliance: Install diffusers, registers, and grilles according to NFPA 90A, "Standard for the Installation of Air-Conditioning and Ventilating Systems."

PART 2 - PRODUCTS

2.1 MANUFACTURERS. In other Part 2 articles where subparagraphs titles below introduce lists, the following requirements apply for product selection:

Products: Subject to compliance with requirements, provide one of the products specified.

2.2 REGISTERS.

2.2.01 Supply Register. Stainless Steel, 3/4” spacing, Double-Deflection

Acceptable Manufacturers:

Titus; Model 300 RL-SS.

Krueger

Or approved equal

Material: Roll-formed, Type 304 Stainless Steel

Face Blade Arrangement: Adjustable parallel to short dimension

Rear Blade Arrangement: None.

Frame: 1-1/4 inches

Mounting: On Ductwork.

Damper Type: Adjustable opposed-blade assembly, Type 304 Stainless Steel.

2.3 GRILLES.

2.3.01 Exhaust Grille. Stainless Steel, 3/4” spacing, 45° fixed deflection

Acceptable Manufacturers:

Titus; 350 RL-SS

Krueger

Or approved equal

Material: Roll-formed, Type 304 Stainless Steel

Face Blade Arrangement: 45° Fixed parallel to long dimension

Frame: 1-1/4 inches

Mounting: On Ductwork.

2.4 SOURCE QUALITY CONTROL.

2.4.01 Testing. Test performance of registers and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 INSTALLATION. Ductwork-Installed outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practicable.

Install registers, and grilles with airtight connection to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

End of Section

SECTION 15855

AIR HANDLING UNITS

PART 1 - GENERAL

1.1 SCOPE. Furnish and install all indoor make-up air handling units with filters as shown on the Drawings, scheduled and as specified herein.

1.2 SCHEDULES. All units shall be of the type, capacity and arrangement as listed on the schedules. Units shall consist of the components listed in the schedule and those components obviously required for the type of unit. Unit shall be capable of being installed together in sections in the final location where shown on the drawing or as one entire unit. The order of component assembly will be as called for on the schedule. Particular attention must be paid to the remarks and notes in these schedules.

1.3 SUBMITTALS. Submit, in accordance with Sections 01160 and 15501, the following:

Unit data sheets; to include catalog data, a description of the proposed unit, size, type, arrangement, and materials of construction.

For belt drive equipment, provide drive data indicating sheave sizes, belt size, number and length.

Each submittal shall include pertinent equipment dimensional data, heating and cooling coil operating data. Submit, in accordance with Sections 01160 and 15501, all data and the fan schedules. The submittal shall include fan data sheets with a description of the proposed fan, fan size, type, arrangement, materials of construction, weight, motor horsepower, motor type, power supply, and frame size. Provide catalog data and selections for vibration isolators, include materials of construction. For belt drive equipment; provide drive data indicating the sheave sizes, belts size, number and length. Each submittal shall include pertinent equipment dimensional data, fan performance (operating data information, and a performance curve showing the fan operating point and range. Minimum curve size shall be 8-in by 6-in. Faxed copies of curves are not acceptable. A list of accessories to be furnished shall be included on each submittal. Copies of operating and maintenance manuals shall be submitted.

Significant dimensional differences between the specified equipment and the proposed equipment shall be noted on the equipment submittal. The Contractor shall provide data to show the dimensionally different equipment will fit within the space and still provide suitable clearance. Where corrosion resistance is required, provide conformation of material suitability for the specified service.

For condensing sections provide information on number and type of compressors, type of refrigerant and refrigerant charge, and controls provided and operating weight. Provide electrical data for power and controls. For condensing coils, provide air entering and leaving conditions, air pressure drop, size, type, arrangement, and materials of construction.

List of accessories to be furnished shall be included on each submittal. Provide a recommended list of spare parts.
Significant dimensional differences between the specified equipment versus the proposed equipment shall be noted on the equipment submitted.

For units that will be shipped exposed, provide a description of the protective packaging that will be used during transit.

All submittals shall contain a statement that Section 15501, and all other Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal.

Submit to the Engineer as provided in Section 01730, Operating and Maintenance Manuals. The following information shall be considered a minimum. Where applicable, provide information required for specific pieces of equipment.

Personnel familiar with the operation and maintenance of the specific information shall prepare manuals.

Equipment shall be identified with the Engineers Equipment Numbers and Identification as shown in the Schedules and on the Drawings.

Provide information in three ring binders. All sheets shall have reinforced punches. Tabbed dividers shall separate all sections. Drawings will be bound in the manual, or contained in envelopes bound into the manual.

Contents - Each volume shall contain the following minimum contents:

Installation including instructions for unpacking, installing, aligning, checking and testing. Foundation data, allowable piping loads, and electrical design shall be included.

Operating Instructions to provide pre-operational checks, start up and shut down, and description of all control modes. Include emergency procedures for all fault conditions and actions to be taken for all alarms. Procedures for long term storage shall be included.

Maintenance shall include preventive, and corrective. Schedules for test of other functions are to be included. Provide a list of tools required to service the equipment. Trouble shooting instructions to include a trouble-shooting guide shall be included.

Shop Drawing Data to include performance curves, data sheets, flow diagrams, wiring diagrams, and descriptive drawings.

In general, corrections or comments or lack there of, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4 REFERENCE STANDARDS. All equipment to be furnished under this section shall be designed, constructed, and tested in accordance with the following standards:

American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE)

ASHRAE 52 - Method of Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter.

Air Movement and Control Association (AMCA) National Fire Protection Association (NFPA)
NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems

NFPA 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems.

American Society for Testing and Materials (ASTM)

ASTM C581 - Standard Practice for Determining Chemical Resistance of Thermosetting Resins Used in Glass- Fiber- Reinforced Structures Intended for Liquid Service.

ASTM C1071 - Standard Specification for Thermal and Acoustical Insulation (Glass Fiber, Duct Lining Materials).

Air-conditioning and Refrigeration Institute (ARI)

American Society of Mechanical Engineers (ASME)

National Electrical Code (NEC)

National Electrical Manufacturers Association (NEMA)

Association of Home Appliance Manufacturers (AHAM)

Factory Mutual (FM)

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.5 QUALITY ASSURANCE. All equipment of a given type included in this section shall be furnished by or through a single manufacturer or as specified on the schedules. Inspection by the Engineer's representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents. The Owner and Engineer reserve the right to sample and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements. An authorized representative of the manufacturer shall perform the initial startup of the equipment. The Owner and Engineer shall witness startup. The use of local sales representatives to perform this work is not acceptable, unless the manufacturer provides documented evidence that the sales representative has been specifically trained for this work. All rotating parts of equipment shall be dynamically balanced at the factory.

1.6 DELIVERY, STORAGE AND HANDLING. Shipping, handling and storage are detailed in the Master Specification Section 01180.

Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer.

All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container.

All equipment shipped that is exposed such as on a flatbed truck shall be protected during transit. The equipment shall be protected from moisture, road salt, dirt and stones or other materials thrown up from other vehicles. Electrical components shall be protected as above, but with special attention to moisture. The method of shipment protection shall be defined in the submittals.

Instructions for the servicing and startup of equipment in long term prolonged storage shall accompany each item.

All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.7 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts and shall meet the requirements of Sections 01180.

Furnish all special tools required for normal operation and proper servicing of the equipment. Spare parts shall include all items on the manufacturer's standard list of spare parts and the following for each unit:

One complete set of drive belts for each piece of belt driven equipment

One complete shaft seal for all fans with shaft seals. Three full sets of air filters if not otherwise specified.

1.8 WARRANTY. In addition to the General Warranty, the equipment manufacturer shall warrant against parts and labor and any defect in material, construction, or performance of the Make Up Air Units and its components for a period of five (5) years from the date of acceptance for the Equipment, without any cost to the owner.

1.8.01 MAINTENANCE SERVICE. Concurrent with Parts and Labor Warranty, Manufacturer shall provide Five (5) year Full Maintenance program. Maintenance program shall include monthly service visits on each unit subject to the following:

Filter changes

Digital Performance Log

Check and/or replacement of belts

Check, Lubrication and/or replacement of fan bearing assemblies

Check and/or adjustment/replacement of electrical or control components

Check and/or adjustment/replacement of damper and operators

Check and/or adjustment/replacement of cabinetry seals, latches, panels etc

Check and/or cleaning of interior unit and coil surfaces

The above at a minimum shall appear on a Monthly Maintenance Sheet for each unit. Verification of maintenance via this sheet shall bear Witness signature of DWSD representative and turned in monthly in hard copy and/or digital copy in quantities up to Five (5) sets as determined by the DWSD. Sheet and format to be approved by DWSD prior to commencement of Five (5) Year Program.

1.8.02 WARRANTY SUBMITTAL. Submit a Written warranty signed by manufacturer agreeing to repair, restore, or replace defective work and maintain as specified in this section, within the specified warranty period without any cost to the owner.

PART 2 - PRODUCTS

2.1 MAKE-UP AIR UNITS. Acceptable manufacturers shall be Rush Air or approved equal.

2.2 DESIGN AND CONSTRUCTION. In general, units shall be factory assembled, packaged industrial type with fan, heating section, filters, motorized intake dampers, access sections with hinged access doors, motor, starters, motor base, gas train, gas pressure reducing valve, controls, drive, drive guard and vibration isolators. Rooftop units shall be completely weather proof. All units as shown and specified shall be furnished by the same manufacturer. Units shall be designed to provide an integrated assembly and factory tested when all of the components are assembled. All transition sections and filler pieces required between sections are to be provided as part of the unit. The equipment dimensions shall be coordinated to fit in the space allocated in the Mechanical Room. Support brackets or rails are to be provided with the floor- mounted unit. Units shall have all rotating components internally isolated from the main unit with vibration isolators and floor mounting rails.

2.2.01 Casings. The unit casing shall be 2” double wall constructed of 20 ga, 304 Stainless Steel for both inner and outer liner. Unit floor shall be double wall 14 ga, 304 Stainless Steel. In addition, Unit frame, unit coil frames and all structural components shall be constructed of 304 Stainless Steel. Removable panels and access doors shall be 2” double wall constructed utilizing 20ga 304 Stainless Steel for both inner and outer skins. Insulation: Insulation shall be 2” thick closed cell foam. All sections including, but not limited to, filter, spacers, access sections, fan cabinet, shall be insulated. Insulation shall be 25.4 mm (1-in) verify all English units dims provided mat faced or neoprene coated fiberglass liner, 24 kg/M3 (1-1/2 lb/ft3) minimum density, installed with stick clips and adhesives to prevent erosion of the insulation.

2.2.02 Fan Section. Fans shall be centrifugal cabinet fans with belt drives. Extended external lubrication fittings shall be provided. Drives shall be adjustable V-belt type, with motor mounted on an adjustable slide base.

Backward curved wheels shall be airfoil types.

All fans shall be statically and dynamically balanced before shipment. All fans shall be AMCA rated for sound and air performance.
Motor shall be energy efficient TEFC, with internal load protection.

Factory wired controls shall be provided in the unit control panel. Panel shall include all safety controls and interlocks, control devices and terminal strip for remote wired devices. Control type shall be as specified on the schedules. Control voltage shall not exceed 120 Volt.

Makeup AHU’s shall utilize SWSI plenum style fans for supply air. Fans shall be constructed of 304 stainless steel. Fans performance shall be as scheduled. Fan Bearings shall be rated for L10 at 200000. Fan housing shall be vibration isolated.

2.2.03 Filters. Filter Box shall have tracks for the specified filter types, to allow filter replacement from either side. Sealing material shall be provided at tracks and ends to prevent air by-passing the filters.

Disposable Filters shall be framed filters, 50.8 mm (2-in) thickness as scheduled. Filter pressure drop for clean filters at 91 M\min (300 fpm) face velocity shall be 0.15-in wg for 50.8 mm (2-in) thick filters. Filter shall have 30 to 35 percent efficiency on ASHRAE Test Standard 52. Manufacturers and type shall be American Air Filter Co., AmAir 300X; Farr Co., 30/30 Disposable; Cambridge, Aeroplate or equal.

A total of three complete sets of filter media shall be provided for each unit.

For all types of filters, each filter section shall be provided with a magnehelic type gauge to indicate static pressure across the filter. Where more than one filter is used in series, each filter shall be provided with its own gauge. Where a control panel is provided gauges shall be mounted in the control panel.
2.2.04 Unit Control Panel. Remote panels shall include all stand alone DDC controls, and all safety controls and interlocks, heavy duty fused visible break, disconnect, control devices, motor starters and terminal strip for remote wired devices. Control type and sequence shall be as specified in other Sections and on the Drawings. Control voltage shall not exceed 120 Volts. Control panel door shall be provided with a keyed lock. A complete wiring diagram shall be permanently attached to the inside of the panel door. Provide hardware and software as required to monitor with
remote building central DDC management system. Remote LCD display shall show lights for dirty filter, alarm, fan on/off, air temperature heat on/off etc.

All air handling control devices shall be compatible with control devices supplied under Section 15950 by the successful Temperature Control Contractor Division 15. The Make-up Air Unit Manufacturer shall coordinate with the Control and Mechanical contractors.

For self-contained package units, split systems and fuel burning units, factory wired control panel shall be furnished and mounted on the unit. Panels shall include all controls required in other sections, and all safety controls and interlocks, heavy duty fused visible break, disconnect, control devices, motor starters and terminal strip for remote wired devices. Control type and sequence shall be as specified in other Sections and on the Drawings. Control voltage shall not exceed 120V. Control panel door shall be provided with a keyed lock. A complete wiring diagram shall be permanently attached to the inside of the panel door.

Where specific area classifications are called for or shown on the electrical drawings, all equipment and wiring shall be in conformance with the requirements for that classification. Unless otherwise specified herein or shown on the Drawings, electrical enclosures shall have the following ratings:

NEMA 12 for indoor locations.

2.2.05 Accessories. Dampers shall be opposed blade type with blades mounted on 1/2-in minimum steel rods. Dampers shall be provided with low friction bushings and edge gaskets to reduce air leakage. Blades shall be sectionalized to limit unsupported blade length and warping at full system fan static pressures. Maximum damper blade width shall not exceed 6-in.

Provide top discharge section for air discharge.

Access sections shall have hinged doors for servicing.

Provide smoke detector, low and high temperature stats with additional contacts and accessories.
Provide airflow sensing switch to prove airflow and set visual and audible alarm in case of failure.

2.3 TESTING. Factory performance testing shall be provided using the governing standards of ARI, ASHRAE and SMACNA. These tests will be performed with the option of witnessing by the owner or owner's representative. Complete test procedure must be submitted for approval prior to testing. Approved testing procedures may then be scheduled. Run test will include but not limited to Air flow. Energy consumption, largest panel deflection test, per SMACNA and component verification (match components to submittal data).

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment shall be installed in accordance with manufacturer's recommendation. Provide piping and ductwork connections in accordance with the requirements of the other related Sections. Wire and install any equipment shipped loose for field installation.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

When units are shipped disassembled, field connect all sections including wiring together as shown on the Drawings to form single air handling unit. Seal all joints with gaskets and/or sealants.

Do not operate equipment without filters. Do not run equipment with dirty filter pressure drop more than twice clean filter pressure drop. A total of three complete sets of filters shall be provided. The first set is to be installed for start-up, test and balancing. The second set shall be installed after final cleanup and acceptance by the Owner. The third set shall be turned over to the Owner as a spare.

The Contractor shall start up each piece of equipment and system and shall make all adjustments so that the system is placed in proper operating condition.

Install unit level and plumb, maintaining manufacturer's recommended clearances and tolerances.

Install wall sleeves in finished wall assembly; seal and weatherproof. Joint-sealant materials and applications are specified in Division 7 Section "Joint Sealants."

Install wall sleeves to withstand, without damage to equipment and structure, seismic forces required by building code.

Provide necessary supports to accommodate weight of unit. Supports shall be epoxy coated to withstand corrosion. Provide vibration isolation fittings.

3.2 CONNECTIONS. Electrical System Connections: Comply with applicable requirements in Division 16 Sections for power wiring, switches, and motor controls. Ground equipment according to Division 16 Section "Grounding and Bonding."

End of Section

SECTION 15880

AIR DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of air distribution equipment, coils, fans, ductwork, duct mounted devices, and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable

municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements. Fans shall be UL listed.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thicknesses and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, ductwork, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.3.05 Ductwork. As required, ductwork shall be identified with nameplates as specified herein, or stenciled painting as specified in Master Specification Section 09900, Painting. Ductwork shall be identified with the equipment number and area served, direction of airflow, and service (supply, return, mixed, exhaust, and outside air). The identification shall be located at equipment, at each side of structure or enclosure penetrations, and at each obstruction.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section

01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Central Station Air Handling Units

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Coil capacities and velocities.

Filter velocities.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower (kW), static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least five different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

Makeup Air Units

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Burner or heating coil capacities.

Filter velocities.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least five different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

Fans

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least three different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Schematic control wiring diagrams showing multiline wiring for the unit and all interconnecting devices. Wiring diagrams shall be detailed to the degree required for field construction, with all terminals identified.

Equipment

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Sheet Metal Fabrication Drawings

Duct layout drawings indicating shop fabricated sections and dimensions.

Pressure and seal classifications.

Access panel and door construction, sizes, and locations.

Duct sealant, adhesive, gasket, and tape information.

Coatings.

Ductwork materials.

Coatings

Name of manufacturer.

Coating type.

Chemical resistance data.

Temperature range data.

Surface preparation and application data.

Film thickness per coat.

Drying and curing time.

Color.

Equipment Motors

Name of Manufacturer.

Type and Model.

Horsepower (kW) rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Type of bearings and method of lubrication.

Net weight.

Overall dimensions.

Efficiency at full, 3/4, and 1/2 loads.

Full load current and power factor.

Locked rotor current.

Adjustable Frequency Drive

Type and model.

Name of manufacturer.

Operating speed range, rpm.

Rated bhp (kW) at maximum speed.

Efficiency at maximum speed, percent.

Maximum heat output, BTUH (kW).

Speed at maximum heat output, rpm.

Dimensions and net weight of complete panel.

Catalog and data sheets on all components.

Electrical schematics and wiring diagrams.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4.03 Samples. Samples of protective coatings for equipment as required shall be submitted to Engineer for approval. The samples shall be at least 3 inches by 3 inches (75 mm by 75 mm) in size, and shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.5 QUALITY ASSURANCE.

Central station air handling units shall be certified in accordance with ARI 430.

Central station air handling unit coil capacities, pressure drops, and selection procedures shall be certified in accordance with ARI 410.

Electric heating coils shall comply with the National Electrical Code.

Direct fired makeup air units shall be independently certified to meet ANSI Z83.4.

Fans shall be rated in accordance with AMCA standards, shall be licensed to bear the AMCA Certified Rating Label unless otherwise indicated in the Fan Schedule on the drawings, and shall be UL listed.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. One set of matched belts per unit and two sets of air filters per unit shall be furnished for the equipment.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

1.8 FRP DUCTWORK REGULATORY REQUIREMENTS. Comply with NFPA No. 255 for flame spread rating of 25 or less. Comply with NBS-15p69 and ASTM D4097.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment and coil capacities shall be as indicated on the schedules.

Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as indicated.

Each fan's operating selection point on the fan curves shall be selected to the right of the peak pressure/efficiency point and below the lowest point along the fan curve, to the left of the peak pressure/efficiency point.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for topcoating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 CENTRAL STATION AIR HANDLING UNITS. Central station air handling units, denoted by the symbol "AHU" and an identifying number, shall be manufactured by McQuay, Trane, York, or approved equal. Each central station air handling unit shall be complete with all sections and components indicated on the drawings.

2.5.01 Casing. Central station air handling units shall be factory built and tested draw-through units. The units shall be constructed of properly braced and reinforced steel framework with G90 galvanized steel panels as needed for the operating pressures. Gasketed removable panels or doors shall be furnished to provide access to all internal parts and components. The unit shall be constructed such that removal of side panels will not affect the structural integrity of the unit.

The casing shall be of sectional construction, consisting of a fan section, a cooling coil section with a sloped drain pan, a heating coil section, a face and bypass damper section, a filter section, blender section, and an access/spacer section as indicated on the drawings. The cabinets and casing shall be provided with the manufacturer's standard galvanized finish. Where indicated in the schedules on the drawings, units shall be double wall construction. When a unit is indicated to have double wall construction, all sections shall be constructed with internal liners. Liners shall be constructed of at least 20 gage (0.91 mm) thickness galvanized steel.

Sloped drain pans shall extend under the entire cooling coil section and sufficiently past the coil to capture and collect any condensate carryover when the unit is operating within the specified conditions. The unit design shall not require a drain pan in any downstream section to contain coil condensate. The drain pan shall be accessible for inspection and cleaning. The drain pan shall be constructed of stainless steel cross broken and pitched (double sloped) to the drain connection. The drain pans shall be completely insulated.

The interior of the fan section, coil section, and accessory sections shall be insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density, cleanable blanket type fiberglass insulation securely fastened to the panels. Insulation shall meet the requirements of the NFPA.

2.5.02 Fan Section. The fans shall be of the double width, double inlet, multiblade type. Wheel type shall be as indicated in the schedules on the drawings. Fans shall be dynamically balanced and tested after being installed in the factory-assembled fan section. The maximum fan speed shall not exceed 80 percent of the first critical speed. The units shall have externally mounted grease lubricated bearings or lubrication fittings extended to the exterior fan casing, with copper tubing and grease fittings rigidly attached to the casing. The fan bearings shall be self-aligning, grease lubricated ball type with an average life (L50) of at least 200,000 hours.

Static pressure values indicated in the schedules on the drawings are external to the complete unit. Internal coil(s), face and bypass damper, filter, and fan housing losses are not included. A filter allowance of 0.35 inches water column (87 Pa) shall be used for 2 inch (50 mm) pleated filter losses and 0.80 inches water column (200 Pa) shall be used for extended surface air filter losses.

2-5.03 Motor and Drive. Units located outdoors shall have internally mounted motors. Units located indoors shall have fan motors mounted either in or on the fan housing. Internally mounted motors shall be installed on a steel base mounted on internal vibration isolators and coated with the manufacturer's standard protective coating. Where unit is installed in a seismic area, seismic restraints shall be provided. Externally mounted motors shall be installed on integral casing framework on the exterior of the casing. Units with externally mounted motors shall be furnished with vibration isolator units as indicated in the schedules on the drawings. External belts and drive assemblies shall be protected by a belt guard with tachometer opening.

Fan drive motors and controls shall be as specified in the Electrical paragraph.

Central station air handling units with smaller than 10 horsepower (7.5 kW) motors shall have V-belt driven fans with adjustable pitch sheaves and units with 10 horsepower (7.5 kW) and larger motors shall have fans with fixed sheaves. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is selected at the mid-position of the sheave range. Fixed sheaves shall be replaced as necessary with sheaves of the proper size during the air system balancing to provide the required fan speed for the specified airflow. Multiple belts shall be provided in matched sets. Belt drives shall be designed for 1.5 times the fan brake horsepower.

Where indicated in the schedules on the drawings to be explosionproof, central station air handling units shall be suitable for installation in an NEC Class I, Division 2, Group D area.

2.5.04 Coil Section. The cooling and heating coils required by the central station air handling units shall be manufactured by the same manufacturer as the air handling units. Cooling and heating coils shall conform to the requirements of the Coils paragraph. Coil headers and return bends shall be completely enclosed by the unit casing. Coil connections, vents, and drains shall extend outside the unit casing and shall be clearly labeled.

Central station air handling units with hydronic cooling coils shall be selected to limit cooling coil velocities to 550 feet per minute (2.8 m/s) at the design airflow unless otherwise indicated in the schedules on the drawings. Central station air handling units with hydronic heating coils shall be selected to limit the heating coil velocities to 750 feet per minute (3.8 m/s) at the design airflow unless otherwise indicated in the schedules on the drawings.

2.5.05 Filter Section. Filter sections for central station air handling units shall be of the flat or angular arrangement and shall be selected to limit the filter velocity to 300 feet per minute (1.5 m/s) for pleated air filters or 500 feet per minute (2.5 m/s) for extended surface air filters at design conditions, unless otherwise indicated in the schedules on the drawings. Gasketed access doors shall be provided for removal of filters from either side of the section. The filter thickness shall be as indicated in the schedules on the drawings and shall conform to the Air Filters paragraph.

2.5.06 Face and Bypass Damper Section. Face and bypass damper sections for central station air handling units shall be of the internal or external type as indicated in the schedules on the drawings. The dampers shall be opposed blade, low leakage type arranged to match the heating coil face area with top bypass. The damper shall have a maximum leakage rate of 10 cubic feet per minute per square foot at 4 inches water column (0.05 m^3/s per m^2).

2.5.07 Air Blender Section. Air blender sections for central station air handling units shall be factory installed within the unit. Air blenders shall be fixed devices with suitable clearances up and down stream of the blender for proper performance and uniform airflow through downstream components. The air blender shall be fabricated of 0.080 inch (2 mm) aluminum designed to mix the two airstreams to within ±6°F (3°C) of the theoretical mixed air temperature.

2.5.08 Accessories. Where indicated in the schedules on the drawings as variable volume with inlet vanes, central station air handling units shall be furnished with integral variable inlet vanes complete with a control ring, crank arms, a connecting shaft, and all interconnecting linkages required to provide a complete, properly operating unit.

Central station air handling units indicated or shown to be curb mounted shall be furnished with a roof mounting curb. The curb shall be constructed of 14 gage (1.9 mm) thick zinc-coated steel with a nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply and return air opening as indicated on the drawings. The curb shall be a minimum of 16 inches (400 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.6 COILS. Hydronic coils shall be of the drainable type with plugged vent and drain tappings.

Where indicated in the schedules on the drawings, coils shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.6.01 Hydronic Heating Coils. Heating coils, denoted by the symbol "HC" and an identifying number, shall be McQuay, Trane "Type W", York, or approved equal (installed in air handling equipment) or McQuay, Trane "Type ST", York, or approved equal (installed in ductwork).

Hydronic heating coils shall be extended surface type, arranged in a rectangle to fit the space available. The coils shall be designed for a working pressure of 200 psig (1380 kPa gauge) and shall have been hydrostatically tested and proved watertight at 200 psig (1380 kPa gauge). Coil casings shall be of galvanized or stainless steel and shall be rigidly braced. Coil headers shall be constructed of cast iron or a nonferrous material. Coil tubes shall be at least 0.024 inch (0.61 mm) thick, 5/8 inch

(16 mm) OD seamless copper with at least 0.006 inch (0.15 mm) thick aluminum fins mechanically bonded to the tubes. Seals shall be provided at top, bottom, and intermediate channels to minimize air bypassing the coil surface. Inlet and outlet connections shall be on the same end of the coils. Coils shall be removable from either side of the air handling unit.

The face velocity of a heating coil installed in ductwork shall not exceed 900 feet per minute (4.6 m/s) at maximum airflow.

2.6.02 Direct Expansion Cooling Coils. Direct expansion cooling coils, denoted by the symbol "CC" and an identifying number, shall be manufactured by McQuay, Trane, York, or approved equal.

Direct expansion cooling coils shall be multirow, 1/2 inch (13 mm) or 5/8 inch (16 mm) OD seamless copper tubes of 0.025 inch (0.64 mm) nominal wall thickness mechanically bonded to aluminum fins. Direct expansion cooling coils used in systems with multiple steps or circuits shall have interlaced circuitry. Refrigerant shall be distributed equally to multiple circuits by a pressure type distribution header with minimum pressure drop through the header and tubing. Coils shall be matched with the condensing unit or heat pump and shall be tested at 250 psig (1725 kPa gauge) prior to dehydration. Coils shall be purged and sealed with inert gas prior to shipment.

2.6.03 Hydronic Cooling Coils. Cooling coils, denoted by the symbol "CC" and an identifying number, shall be McQuay, Trane "Type W", York, or approved equal. Hydronic cooling coils shall be extended surface type, arranged in a rectangle to fit the space available. The coils shall be designed for a working pressure of 200 psig (1380 kPa gauge) and shall have been hydrostatically tested and proved watertight at a working pressure of 200 psig (1380 kPa gauge). Coil casings shall be constructed of galvanized steel and shall be rigidly braced. Coil headers shall be constructed of cast iron or nonferrous material. Coil tubes shall be at least 0.024 inch (0.61 mm) thick, 5/8 inch (16 mm) OD seamless copper with at least 0.006 inch (0.15 mm) thick aluminum fins mechanically bonded to the tubes. Cooling coils shall be rated for use with a fouling factor of 0.0005.

2.6.04 Electric Heating Coils. Electric heating coils, denoted by the symbol "HC" and an identifying number, shall be manufactured by Indeeco, Brasch, or approved equal. Electric heating coils shall be of open coil or finned tube zero clearance construction, as required, with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames with flanges suitable for fastening directly to the fan or coil and filter sections.

Bushings for open coils shall be ceramic and terminals shall be stainless steel. Elements for finned tubular coils shall be centered in steel tubes filled with compacted magnesium oxide and copper plated fins brazed to the tube. The assembly shall be finished with high temperature aluminum coating.

A remote electric heating coil control panel shall be furnished and installed where indicated on the drawings. The electric heating coil control panel shall be completely factory wired and shall include disconnecting backup and safety contactors, transformers, fusing, and a disconnect switch. The heating coil terminal box shall include an automatic reset thermal cutout, a manually reset thermal cutout, a differential pressure airflow switch, and a pilot switch. The control panel shall be furnished with double doors.

The contactors shall be rated for 600 volt, 3 pole, UL listed, and shall have a life expectancy for 100,000 operations. The control transformer shall be built-in, industrial dry type, 480/120 volt sized to carry the full control system load. Primary and secondary windings shall be fused, and secondary windings shall have one lead grounded.

The heater shall be furnished with a silicone controlled rectifier (SCR) control unit mounted in the remote electric heating coil control panel. The SCR control unit shall be suitable for operation at temperatures of 32° to 132°F (0° to 55°C) and shall be solid-state, proportioning type, designed to modulate the heater output from 0 to 100 percent. The heater shall be controlled by a thermostat as indicated on the drawings. The SCR controller shall be compatible with the signal from the thermostat.

The electric heating coil output shall be as specified at 460 volts, 60 Hz, 3 phase. The heater elements shall be suitable for operation on 480 volt, 60 Hz, 3 phase power.

2.7 <u>MAKEUP AIR UNITS</u>. Makeup air units, denoted by the symbol "MAU" and an identifying number, shall be Hastings "SBD", Hartzell "GMC", Engineered Air "Series HE", or approved equal for direct fired units and Hastings "Counterflo", Engineered Air "Series DJ", or approved equal for indirect fired units as indicated in the schedules on the drawings. The makeup air units shall be constant volume, gas-fired type, and shall be completely assembled, wired, and flame tested at the factory.

Where indicated in the schedules on the drawings, makeup air units shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.7.01 <u>Construction</u>. The casing of the makeup air unit shall be of sectionalized construction consisting of a fan section, a gas-fired burner section, a filter section, and, when located outdoors, an inlet hood with motorized control damper. The unit housing shall be constructed of heavy gage galvanized paint grip carbon steel or aluminized steel, braced and reinforced with steel framework as needed for the operating pressures. The cabinet and casing shall be provided with the manufacturer's standard enamel finish. Gasketed and hinged doors shall be furnished to provide access to all internal components. An observation port shall be provided on the burner section for viewing the pilot and main flames.

The burner section shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density foil-faced fiberglass blanket insulation securely fastened to the panels. The fan and accessory sections shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density mat-faced cleanable fiberglass blanket insulation securely fastened to the panels. Where the insulation is not installed below the floor, the insulation shall be protected by a metal liner. The insulation shall meet the requirements of NFPA.

Makeup air units installed outdoors shall be of weatherproof construction, with roof panels pitched for drainage. The roof panels shall be constructed with triple-break seams which overlap the side panels on all sides. All exterior joints shall be bolted or screwed with a gasket, or shall be welded, and shall be sealed weather tight.

Makeup air units installed outdoors shall have a stormproof weather hood with birdscreen sized for 100 percent outside air shall be mounted on the unit inlet. The hood shall include a two-positioned motorized control damper which opens when the unit is energized and closes when it is de-energized.

2.7.02 Fan Section. The makeup air units shall be equipped with centrifugal fans with forward-curved blades which shall be dynamically balanced and tested after being installed in the factory assembled fan section. Bearings shall be heavy-duty, self-aligning, grease lubricated type for units with motors greater than 15 horsepower (11.2 kW) and permanently lubricated or grease lubricated for units with 15 horsepower (11.2 kW) motors and smaller. Units with regreasable bearings shall have externally mounted, grease lubricated bearings or lubrication fittings extended to the exterior fan casing with aluminum or copper tubing and grease fittings rigidly attached to the casing.

Static pressure values indicated in the schedules are external to the complete unit. Internal burner or heat exchanger, filter, and fan housing losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for filter losses.

2.7.03 Motor and Drive. Units located outdoors shall have internally mounted motors. Units located indoors shall have fan motors mounted either in or on the fan housing. Internally mounted motors shall be installed on a steel base mounted on internal vibration isolators and coated with the manufacturer's standard protective coating. Where unit is installed in a seismic area, seismic restraints shall be provided. Externally mounted motors shall be installed on integral casing framework on the exterior of the casing. Units with externally mounted motors shall be furnished with vibration isolator units as indicated in the schedules on the drawings. External belts and drive assemblies shall be protected by a belt guard with tachometer opening.

Fan drive motors and controls shall be as specified in the Electrical paragraph.

Makeup air units with smaller than 10 horsepower (7.5 kW) motors shall have V-belt driven fans with adjustable pitch sheaves and units with 10 horsepower (7.5 kW) and larger motors shall have fans with fixed sheaves. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is selected at the mid-position of the sheave range. Fixed sheaves shall be replaced as necessary with sheaves of the proper size during the air system balancing to provide the required fan speed for the specified airflow. Multiple belts shall be provided in matched sets.

2.7.04 Heating Section. The complete fuel burning assembly shall conform to the requirements of UL/ETL, FM, or IRI as required. The burner assembly and gas piping arrangement shall include, but not be limited to, pilot and main burner gas manual shutoff valves, pilot and main gas regulators, pilot and main gas safety shutoff valves, manual pilot adjustment valves, and electric modulating main gas valves. The burner assembly and gas manifold shall be completely piped and tested at the factory prior to shipment.

The unit shall be suitable for use with the gas pressure range as required.

2.7.04.01 Direct Fired. Burners shall be in-line type, suitable for use with natural or propane gas, as required, and shall be complete with stainless steel firing plates, cast iron gas feed, and stainless steel side plates for flame rods and ignition spark rods mounted in ceramic isolated bushings. The profile plates shall be adjustable and shall be sized to maintain the required velocity across the burner. The burners shall be capable of modulating turndown of 20 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff.

2.7.04.02 Indirect Fired. Burners shall be modulating power type suitable for use with natural or propane gas, as required. The burners shall be capable of modulating turndown of at least 8 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff. The heat exchanger shall be of 3 or 4 pass design consisting of 400 series stainless steel primary drum heat exchanger with multitube secondary heat exchanger.

2.7.05 Filter Section. Filter sections for makeup air units shall be of the flat or angular arrangement and shall be selected to limit the filter velocity to 350 feet per minute (1.5 m/s) at design conditions unless otherwise indicated in the schedules on the drawings. Access doors shall be provided for removal of filters from either side of the section. The filters shall be 2 inch (50 mm) pleated type and shall conform to the Air Filters paragraph.

2.7.06 Controls. Each unit shall be furnished with a complete control system consisting of fan starters and overload devices, an airflow proving switch, control circuit fuses, an electronic discharge air temperature sensor and controller, and a disconnect switch. Controls shall be suitable for interfacing with and enacting the control sequence and concept indicated on the drawings. The controls shall include controls to lock out the burner when the outside air temperature is above the controller setpoint.

A remote control station shall be furnished with the makeup air unit and located where indicated on the drawings. The control station shall allow for remote operation of the unit with a fan "On-Off" switch, a "Winter-Summer" switch, a supply temperature setpoint adjustment, and indicating lights for fan, heat, lockout, and dirty filters. Where indicated in the sequence of operations, a room override thermostat shall be mounted on the panel.

Unit mounted panels shall house adequately sized combination starters rated in accordance with NEMA standards, and dead-front 3 lock nonfused disconnect switches.

2.7.07 Accessories. Makeup air units indicated or shown to be curb mounted shall be furnished with a roof mounting curb. The curb shall be constructed of 14 gage (1.9 mm) thickness zinc-coated steel with a nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply air opening as indicated on the drawings. The curb shall be a minimum of 16 inches (400 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.8 FANS. Each fan shall be complete with an electric motor, a drive, and accessories required for satisfactory operation. Belt-driven fans shall be complete with a V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Adjustable pitch sheaves shall be furnished for fans with less than 10 horsepower (7.5 kW) motors and fixed sheaves for 10 horsepower (7.5 kW) and larger motors. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the proper size after the air system balancing if necessary, to provide the required fan speed for the specified airflow.

Fan drive motors and controls shall be as specified in the Electrical paragraph, unless otherwise indicated. Fans shall be suitable for use with the power supply indicated on the drawings.

Fans indicated in the schedules on the drawings to be explosionproof shall be suitable for installation in a NEC Class I, Division 2, Group D environment.

The external static pressure values indicated in the schedules on the drawings are external to the complete unit. Internal fan housing and when furnished, backdraft damper and filter losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for pleated filter losses.

A solid-state variable speed controller shall be provided for each direct-driven fan motor less than 1/2 hp (0.4 kW) to balance the fan airflows to the specified rates. The speed controller shall have a capacity range of approximately 50 through 100 percent of the design airflow rate specified. The speed controller shall be mounted on or in the fan housing unless otherwise indicated.

Where indicated in the schedules on the drawings, fans shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.8.01 Cabinet Fans. Cabinet fans, denoted by the symbol "CF" and an identifying number, shall be Greenheck "Model SP" or "Model CSP", Penn Ventilator, Loren Cook, or approved equal. Cabinet fans shall have steel, forward-curved, squirrel-cage type wheels. The fans shall be statically and dynamically balanced. Motors shall be open dripproof, PSC, with permanently lubricated ball bearings and internal thermal overload protection, and shall be suitable for use with the power supply indicated in the schedules on the drawings. Fan housings shall be fabricated of heavy gage carbon steel with welded seams and shall be acoustically lined and factory primed. Fans shall be installed in the configuration indicated on the drawings. A removable access panel or exhaust grille shall be provided on the bottom of each fan and a factory installed backdraft damper shall be provided on the fan discharge. Vibration isolator units and wall caps shall be provided for each fan as indicated in the schedules on the drawings.

2.8.02 Duct Fans. Duct fans, denoted by the symbol "DF" and an identifying number, shall be Greenheck "SQ", Penn Ventilator, Loren Cook, or approved equal. Duct fans shall be of the centrifugal in-line type, and shall be direct or belt driven, as indicated in the schedules on the drawings. Fan wheels shall be aluminum, backward inclined type, dynamically and statically balanced at the factory.

The fan housing shall be square, constructed of aluminum or heavy gage steel as required, and shall be furnished with duct mounting collars. Access doors or panels shall be provided for servicing internal parts without removing the fan from the ductwork. Vibration isolation units shall be provided for each unit. The interior of the fan housing shall be lined with 1 inch (25 mm) fiberglass duct liner.

Motors and drives shall be isolated from the airstream. The wheel shaft shall be of ground and polished steel, mounted in heavy-duty, permanently sealed pillow block bearings.

Flexible wiring leads shall be provided from the fan motor to an external junction box and disconnect switch which shall be accessible for servicing without disconnecting the field wiring.

2.8.03 Fume Hood Exhaust Fans. Fume hood exhaust fans and exhaust duct stackheads, denoted by the symbol "EF" and an identifying number, shall be manufactured by Kewaunee Scientific Equipment Corporation, or approved equal. Fume hood exhaust fans shall be of the single inlet, multiblade, flat or backward-inclined centrifugal type and shall be statically and dynamically balanced at the factory.

Fans shall be furnished with removable weather covers over the motors, drive shaft, and bearings. Each fan shall be furnished with vertical exhaust duct stackheads, and NEMA Type 3R disconnect switches.

Exhaust fan outlets shall consist of a duct stackhead and a transition section that fits directly onto the outlet of the exhaust fans. The duct stackhead shall be a zero pressure vertical stack weather cap designed to keep water out of the fan housing. Stackheads shall be rigidly supported as indicated on the drawings. The stackheads shall be fabricated of cold rolled steel, coated with a baked, chemical-resistant, synthetic resin finish, or fabricated of AISI Type 316 stainless steel. The exhaust stack shall be fabricated with all seams welded and ground smooth.

The fans shall be sized to fit in the space indicated on the drawings and shall be provided with vibration isolators, threaded 1/4 inch (6 mm) drain connections at the low point of the scrolls, and inlets suitable for attaching flexible connections to the fans.

The exhaust fans shall have welded housings and steel frames with a baked, chemical-resistant finish. Fan wheels shall be of steel and shall be coated with a baked, chemical-resistant finish, "Kem-FP" or approved equal.

2.8.04 Power Roof Ventilators. Power roof ventilators, denoted by the symbol "PRV" and an identifying number, shall be Greenheck "G" or "GB", Penn Ventilator "Domex", Loren Cook, or approved equal.

Power roof ventilators shall be centrifugal or propeller type, as indicated in the schedules on the drawings, and shall be statically and dynamically balanced for quiet, vibration-free operation. Each fan shall be complete with a weather hood, a safety disconnect switch mounted in the hood, a 1/2 inch (13 mm) mesh aluminum bird screen over all openings, and, where indicated in the schedules on the drawings, a backdraft damper. Fan housings shall be constructed of aluminum and shall have an aluminum base of the self-flashing type, suitable for mounting on the curbs indicated on the drawings.

2.8.05 Propeller Fans. Propeller fans, denoted by the symbol "PF" and an identifying number, shall be Greenheck "Model S" or "Model SC" for direct drive and "Model SB" or "Model SBC" for belt drive, Penn Ventilator, Loren Cook, or approved equal.

Propeller fans shall consist of a panel frame, a wire guard, a motor, and fan blades. Fan blades shall be steel or aluminum, as required. Propeller fans shall be statically and dynamically balanced to ensure quiet, vibration-free operation, and be suitable for mounting as indicated.

When indicated in the schedules on the drawings, a wall mounting kit shall be provided. The wall mounting kit shall consist of a wall collar, motor wire guard, backdraft damper, and weather hood with birdscreen.

2.8.06 Utility Fans. Utility fans, denoted by the symbol "UF" and an identifying number, shall be Greenheck "Model SWB", Penn Ventilator, Loren Cook, or approved equal.

Utility fans shall be multiblade, squirrel-cage type, with nonoverloading type blades. The fans shall be statically and dynamically balanced for quiet, vibration-free operation and shall be provided with vibration isolators. Fan inlets and outlets shall be provided with removable angles and bolts for attaching flexible connections. Fan housings shall be heavy gage steel, of all-welded construction and shall be shop coated with universal primer. Fan bearings shall be of the self-aligning, ball type.

2.8.07 Vaneaxial Fans. Vaneaxial fans, denoted by the symbol "VF" and an identifying number, shall be manufactured by Aerovent, Buffalo Forge, or approved equal. Vaneaxial fans shall have heavy gage steel housings with straightening vanes and adjustable blades. Fans shall be direct connected to an electric drive motor suitable for use with the power supply indicated in the schedules on the drawings. The fans shall be furnished with inlet bells, inlet and outlet screens, and support legs for mounting vertically or horizontally, as indicated in the drawings. The support legs shall be constructed of heavy steel plate attached to the fan housing and braced for rigidity. Each fan shall be equipped with access doors for blade adjustment and vibration isolators.

2.8.08 Wall Fans. Wall fans, denoted by the symbol "WF" and an identifying number, shall be Greenheck "Model GW" or "Model GWB", Penn Ventilator, Loren Cook, or approved equal. Wall fans shall be suitable for sidewall installation; shall be direct or belt driven, centrifugal type, with aluminum wheels and housing, and a wheel guard located on the discharge side; and shall be statically and dynamically balanced at the factory. The fan motors shall be of adequate size to prevent overloading when operating at the specified capacity and shall be suitable for use with the power supply indicated in the schedules on the drawings.

2.8.09 FRP Fans. Fans to be used in FRP applications shall be as manufactured by Plasticair, or approved equal.

2.9 ROOF HOODS. Roof hoods, denoted by the symbol "RH" and an identifying number, shall be Greenheck "Model FHI" or "FHR", Penn Ventilator, Loren Cook, or approved equal.

Roof hoods shall be suitable for air intake or exhaust and shall have throat dimensions as indicated in the schedules on the drawings. The roof hood assembly shall be constructed of galvanized steel or aluminum. Each roof hood shall be complete with a weather hood, a 1/2 inch (13 mm) mesh aluminum or galvanized bird screen over all openings, and a mounting base suitable for installation on a curb as indicated on the drawings.

Where indicated in the schedules on the drawings, roof hoods shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.10 AIR TERMINAL UNITS. Air terminal units shall include a sheet metal casing, volume dampers, an air volume sensing device, actuators, acoustical lining, sound baffles and accessory controls. The actuators type shall be as required. The acoustical lining shall conform to UL-181 and NFPA-90A. Enclosures of terminal units shall be constructed of galvanized steel not lighter than 22 gage (0.76 mm) thickness or aluminum sheet not lighter than 18 gage (1.21 mm) thickness. Single or multiple discharge outlets shall be provided as indicated on the drawings.

Terminal units shall be pressure independent and shall maintain a calibrated set or varying airflow rates with varying inlet static pressures. Unit air volume shall be factory preset and shall be readily field adjustable without special tools. Pressure losses through the unit at maximum flow rate shall not exceed the values indicated in the schedules on the drawings.

Acoustic performance of the terminal units shall be based upon units tested in accordance with ARI 880. Certified discharge and radiated sound power data for the units giving dB referenced to 10^{-12} watts in each of the octave bands shall be included with the air terminal unit submittal. Discharge sound power shall be shown for a pressure range from minimum up to the inlet static pressure as required. Radiated sound shall be indicated without allowance for ceiling absorption.

2.10.01 Coils. Heating water coils shall be furnished and installed where indicated on the drawings. The coils shall be fin-and-tube type, constructed of seamless copper tubes with copper or aluminum fins mechanically bonded or soldered to the tubes. Casing and tube support sheets shall be 16 gage (1.52 mm) thickness or 0.0635 inch (1.6 mm), galvanized steel, formed to provide structural strength. Each coil shall be designed for 150 psig (1035 kPa gauge) working pressure and shall be tested at an air pressure not less than 250 psig (1725 kPa gauge).

Electric resistance heating coils shall be duct-mounted type consisting of a nickel-chromium resistor mounted on refractory material and a steel or aluminum frame for attachment to ductwork. Electric duct heaters shall meet UL requirements and shall be provided with a built-in or surface-mounted high-limit thermostat. Electric duct heaters for use with fan-powered air terminal units shall be interlocked electrically so that heaters cannot be energized unless the fan is running.

2.10.02 Controls. Unit operators and controls shall be provided by the temperature controls supplier and shall be factory-installed by the air terminal unit manufacturer. The air terminal units will receive a control signal from the temperature control system and shall be furnished with controls to provide proper system operation. Controls shall include an automatic changeover control when heating and cooling air is supplied to the unit. The signal will modulate the primary air valve and the heating output as described in the sequence of operation.

2.10.03 Air Terminal Units - Single Duct. Single duct air terminal units, denoted by the symbol "ATS" and an identifying number, shall be Price, Environmental Technologies "Model SDR", Titus, or approved equal.

Constant volume, single duct terminal units shall be equipped with a mechanical or pneumatic constant volume regulator. The units shall control air volume within ±5 percent of each air set point volume as determined by the thermostat with variations in inlet pressures from 0.50 to 6 inch wc (0.12 to 1.5 kPa).

Variable volume, single duct, low pressure terminal units shall be provided with a calibrated air volume sensing device, an air valve or damper, an actuator, and accessory relays. External differential pressure taps (separate from the control pressure taps) shall be provided for air flow measurement with a 0 to 1 inch wc (0 to 0.25 kPa) range. Unit volume controller shall be normally open or closed, as required, upon loss of the control signal.

2.10.04 Air Terminal Units - Fan Powered. Fan powered air terminal units, denoted by the symbol "ATF" and an identifying number, shall be Price, Environmental Technologies "Model VVF-II", Titus, or approved equal.

Variable volume, single duct, low pressure, fan-powered terminal units shall be provided with a calibrated air volume sensing device, an air valve or damper, an actuator, a fan and motor, and accessory relays. The units shall control primary air volume to within ±5 percent of each air set point as determined by the thermostat with variations in inlet pressure 0.5 to 6 inches wc (0.12 to 1.5 kPa). The unit fan shall be centrifugal, direct-driven, double-inlet type, with forward curved blades. The fan motor shall be permanently lubricated, permanent split-capacitor type. The fan speed shall be controlled by a solid-state speed controller to balance the fan airflow rate to the specified rates. The fan/motor assembly shall be isolated from the casing to minimize transmission of vibration. The fan control shall be factory furnished and wired into the terminal unit's control system. A factory-mounted pressure switch shall be furnished to operate the unit fan whenever pressure exists at the unit primary air inlet or when the control system fan operates.

2.11 DAMPERS.

2.11.01 Backdraft Dampers. Backdraft dampers, denoted by the symbol "BDD", shall be Arrow United Industries "Type 655", Ruskin "BD6", or approved equal. Backdraft dampers shall be constructed with a 1 by 4 inch by 0.081 inch thick (25 by 100 mm by 2 mm) extruded aluminum frame. Blades shall be of 0.081 inch (2 mm) aluminum, with silicone rubber seals on the edges, and with aluminum shafts and ball bearings.

2.11.02 Control Dampers. Control dampers shall be denoted by the symbol "CD" and an identifying number. Dampers with an area larger than 25 square feet (2.3 m^2) or with any dimension exceeding 48 inches (1200 mm) shall be built in sections. All dampers shall be carefully inspected before and after installation, and any damper having poorly fitted blades, insufficient framed rigidity, or excessive clearance or backlash in moving parts will be rejected and shall be replaced with an acceptable unit.

Two-position dampers shall have parallel operating blades. Modulating dampers shall have opposed operating blades.

Damper blades shall be installed on a steel shaft operating in synthetic bearings suitable for industrial service. Dampers shall be close-fitting and shall be designed to offer minimum resistance to the airflow when in the fully open position. Damper blade linkage shall be concealed in the frame.

Control dampers shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.11.02.01 Duct Mounted Control Dampers. Control dampers and face bypass dampers mounted in ductwork and equipment curbs shall be Arrow United Industries "Type AFD-20", Ruskin "CD-50", or approved equal. The damper frames shall be constructed of 5 inch (125 mm) Type 6063 T5 extruded aluminum. Damper blades shall be constructed of 6 inch (150 mm) wide airfoil-shaped extruded aluminum.

Control dampers denoted on the drawings to be face and bypass dampers shall be vertically arranged. The face damper dimensions shall be coordinated with the heating coil dimensions. The bypass area shall be half the area of the face damper. Face and bypass damper submittals shall indicate coil size, face dimensions, and bypass dimensions.

2.11.02.02 Wall Mounted Control Dampers. Control dampers mounted in walls behind louvers shall be Ruskin "CD-40", Arrow United Industries "Type AFD-20", or approved equal. Control damper frames shall be constructed of 4 by 1 inch (100 by 25 mm) 6063 T5 extruded aluminum. Damper blades shall be constructed of 4 inch (100 mm) wide airfoil-shaped extruded aluminum.

2.11.02.03 Round Control Dampers. Round control dampers shall be Arrow United Industries "Type 70, 75, or 80", or approved equal. The damper frames and blades shall be constructed of the material as required.

2.11.03 Fire Dampers. Fire dampers, denoted by the symbol "FD", installed in partitions having a fire resistance rating of less than 3 hours shall be Air Balance Inc. "Model D19", Ruskin "Model DIBD2", or approved equal. Fire dampers installed in partitions having a fire resistance rating of 3 hours or more shall be Air Balance Inc. "Model D39", Ruskin "Model DIBD23", or approved equal. Fire dampers shall be style "B" for ducted and style "A" for non-ducted applications unless otherwise indicated on the drawings.

Dampers shall have a 5 inch (125 mm) wide galvanized steel channel frame, galvanized steel interlocking blades, stainless steel closure springs and latches, 165°F (74°C) fusible links, and a 20 gage (0.91 mm) thickness galvanized steel housing. Factory fabricated sleeves and mounting angles shall be furnished for each damper for mounting as indicated on the drawings. Fire dampers shall be rated in accordance with UL-555 for use in dynamic systems.

2.11.04 Smoke Dampers. Smoke dampers, denoted by the symbol "SCD" and an identifying number, shall be Air Balance Inc. "Series S", Ruskin, or approved equal. The damper leakage class shall be as required.

Damper frames shall be fabricated of 16 gage (1.52 mm) thickness, 5 inch by 1 inch (125 by 25 mm) galvanized steel channel and shall be sized to fit the ductwork as indicated on the drawings. Blades shall be parallel, 16 gage (1.52 mm) thickness galvanized steel, and shall be furnished with blade and jamb seals. Smoke dampers shall meet all applicable provisions of UL-555S and shall bear the UL label.

Axles and control shafts shall be of 1/2 inch (13 mm) plated steel, with oil impregnated bronze bearings. Linkages shall be concealed and shall be located outside the airstream.

2.11.05 Combination Smoke/Fire Dampers. Combination smoke/fire dampers, denoted by the symbol "SFD" and an identifying number, shall be Air Balance Inc. "Model FS2", Ruskin, or approved equal.

Combination smoke/fire damper frames shall be fabricated of a 16 gage (1.52 mm) thickness, 5-1/2 by 7/8 inch (140 by 22 mm) galvanized steel channel, interlocking 16 gage (1.52 mm) thickness galvanized steel blades, and an 18 gage (1.21 mm) thickness galvanized steel sleeve. The sleeve shall be at least 6 inches (150 mm) longer than the thickness of the wall or floor in which the damper is installed. Bearings shall be oil-impregnated bronze. Blade edge seals shall be high-temperature silicone rubber.

Each damper shall be provided with a matching UL-approved, factory installed electric actuator with 165°F (74°C) thermal disc. The actuator shall be installed for power-open/spring-return (fail closed) operation. The actuator shall be suitable for 120 volt single phase power supply and shall be rated for a temperature of 250°F (121°C).

Combination smoke/fire dampers and actuators shall meet all applicable provisions of UL-555 and shall bear the UL label. Dampers shall be rated 1-1/2 hour, leakage class II, and temperature class of 250°F (121°C).

2.11.06 Volume Control Dampers. Volume control dampers shall be denoted by the symbol "VCD". Volume control dampers in round ductwork shall be Arrow United Industries "Type 200 VCRD", Ruskin "Model MDRS25", or approved equal. Volume control dampers in rectangular ductwork shall be Arrow United Industries "Type 1770", Ruskin "Model MD35", or approved equal.

Rectangular volume control dampers shall be fabricated of 16 gage (1.52 mm) thickness galvanized steel, with a nominal 4 or 5 inch by 1 inch (100 mm or 125 mm by 25 mm) channel frame, and opposed operating blades. Round dampers shall be fabricated of galvanized steel, with a nominal 7 inch (178 mm) long, 22 gage (0.76 mm) thickness frame, and a minimum 20 gage (0.91 mm) thickness circular blade.

The dampers shall be provided with adjustment quadrants and locking devices so arranged that the position of the damper will be indicated and the damper will not move when locked.

2.12 DAMPER OPERATORS. The damper operators shall be direct coupled or linkage type. Where linkage type operators are used, each operator shall be complete with all necessary crank arms, ball joint connectors, push rods, linkages, and mounting brackets.

Each operator shall have sufficient torque to operate the connected control damper area. Each damper operator shall have at least a 50 inch-pound (5.6 N-m) normal running torque. Where the required damper torque exceeds the damper operator running torque rating, multiple operators shall be furnished to produce the normal running torque required to operate the damper. Control dampers shall fail to the closed position unless otherwise indicated on the drawings. Face dampers shall fail to the closed position and bypass dampers to the open position.

Where damper operators are installed in explosionproof rated areas indicated on the drawings, the operators shall be furnished and installed in explosionproof housings suitable for installation in an NEC Class I, Division 2, Group D area. Where damper operators are installed outdoors, the operators shall be furnished and installed in weathertight enclosures.

2.12.01 Electric Damper Operators. The electric damper operators shall be two-position or modulating type, as indicated in the sequence of operation or schedules on the drawings.

2.12.01.01 Modulating Electric Damper Operators. Modulating electric damper operators shall be Honeywell "Model M9185", or approved equal. Modulating electric damper operators in hazardous areas shall be installed in Honeywell "ES-650-118" explosionproof housing, or approved equal.

Modulating electric damper operators shall be housed in a die-cast aluminum case with a mounting flange. Motor and gear train components shall be immersed in oil. Damper operators shall have a 3/8 inch (9.5 mm) square, double-ended drive shaft.

Damper operators shall be electrically operated, reversing, proportional operators with spring return, and internal single pole-double throw auxiliary switch rated 5 amperes at 120 volts ac.

Damper operators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers where required, shall be factory wired to the damper operator and installed in a NEMA Type 1 enclosure fastened to the motor housing.

2.12.01.02 Two-Position Electric Damper Operators. Two-position direct coupled electric damper operators shall be Belimo "NF120-S", Honeywell "ML4195", Johnson Controls, or approved equal. Linkage type electric damper operators shall be Honeywell "Model M4185", Johnson Controls "Model M100", or approved equal. Two-position electric damper operators in hazardous areas shall be installed in explosion proof housings.

Damper operators shall be spring return and shall have one internal spdt auxiliary switch rated 5 amperes at 120 volts ac. Damper operators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers, where required, shall be factory wired to the damper operator and installed in a NEMA Type 1 enclosure fastened to the motor housing.

a. Direct coupled two position electric damper operators shall be housed in a galvanized steel or aluminum case. Operators shall use a "V" shaped bolt and cradle design to eliminate slippage on the damper shaft. Single bolt or set screw type designs are not acceptable. The operators shall be suitable for direct mounting to shafts up to 1 inch (25 mm) and shall be complete with mounting brackets and damper position indicator.

b. Linkage type two-position electric damper operators shall be housed in a die-cast aluminum case with a mounting flange. Motor and gear train components shall be immersed in oil. Damper operators shall have a 3/8 inch (9.5 mm) square, double-ended drive shaft.

2.12.02 Pneumatic Damper Operators. The pneumatic damper operators shall be two-position or modulating type as indicated on the drawings. Each operator shall be provided with factory-mounted pilot positioners.

2.12.02.01 Two-Position Pneumatic Damper Operators. Two-position pneumatic damper operators shall be housed in a die-cast aluminum case with a mounting flange. Pneumatic operators shall be piston type, with a 3/8 inch (9.5 mm) square, double-ended drive shaft.

Pneumatic operators shall have a spring return and shall have one internal spdt auxiliary switch rated 5 amperes at 120 volts ac.

2.12.02.02 Modulating Pneumatic Damper Operators. Modulating pneumatic damper operators shall be housed in a die-cast aluminum case with a mounting flange. Pneumatic operators shall be piston type, with a 3/8 inch (9.5 mm) square, double-ended drive shaft.

Modulating pneumatic damper operators shall be reversing type.

2.13 AIR OUTLET AND INLET DEVICES. Air outlet and inlet devices shall be manufactured by Price, Tuttle & Bailey, Titus, or approved equal. Air outlet and inlet devices shall be furnished and installed where indicated on the drawings.

Air outlet and inlet devices shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.13.01 Linear Diffusers. Linear diffusers shall be constructed of aluminum or steel as indicated in the schedules on the drawings. All linear supply diffusers shall have adjustable air pattern control.

2.13.02 Ceiling Diffusers. Diffusers shall be square or rectangular, constructed of the materials indicated in the schedules on the drawings. Diffusers shall have a key-operated, opposed-blade damper mounted in the neck where indicated in the schedules on the drawings. Size, location, and direction of airflow shall be as indicated on the drawings.

2.13.03 Registers and Grilles. Registers and grilles shall be constructed of aluminum or steel as indicated in the schedules on the drawings. The front blades of adjustable blade models shall be parallel to the short dimension unless otherwise indicated, and the front blades of fixed blade models shall be horizontal unless otherwise indicated. All registers shall be furnished with key-operated opposed blade dampers. The dampers shall be constructed of the same material as the attached grille.

2.14 FLEXIBLE CONNECTIONS. Flexible connections located indoors shall be Ventfabrics "Ventglas", or approved equal. Flexible connections installed outdoors or exposed to sunlight or weather shall be Ventfabrics "Ventlon", or approved equal.

Ductwork connections to the air handling equipment, and where indicated on the drawings, shall be made using fabric connectors with sheet metal collars. The fabric shall be fire resistant, waterproof, mildew-resistant, and airtight. At least 3 inches (76 mm) of fabric shall be exposed. Flexible connections shall be in accordance with the requirements of UL and NFPA.

Fabric for flexible connections protected from sunlight and the weather shall be suitable for a temperature range of -20 to 180°F (-29 to 82°C) and shall weigh at least 27 ounces per square yard (915 g/m^2).

Fabric for flexible connections exposed to sunlight or the weather shall be suitable for a temperature range of -10 to 250°F (-23 to 121°C) and shall weigh at least 24 ounces per square yard (814 g/m^2).

2.15 AIR FILTRATION EQUIPMENT.

2.15.01 Pleated Air Filters. Pleated air filters shall be American Air Filter "AM-AIR 300X", Farr "30/30", or approved equal. Filters shall be disposable type, high-loft blend of cotton and synthetic fiber pleated media. The media shall be rated as Class 1 or Class 2 in accordance with UL 900. A metal support grid shall be bonded to the media. The filter frame shall be constructed of rigid, high-strength, moisture-resistant beverage board. The pleated media pack shall be bonded to the inside of the frame. All filters shall have an average efficiency of 25 to 30 percent based on the ASHRAE 52.1 test method.

One inch (25 mm) filters shall have at least 14 pleats per linear foot (0.3 m) and at least 1.9 square feet of media per square foot of filter area (1.9 square meters per square meter). One inch (25 mm) filters shall have a maximum initial resistance of 0.10 inch wc at 300 feet per minute (0.02 kPa at 1.5 m/s).

Two inch (50 mm) filters shall have at least 12 pleats per linear foot (0.3 m) and at least 4.2 square feet of media per square foot of filter area. (4.2 square meters per square meter). Two inch (50 mm) filters shall have a maximum initial resistance of 0.13 inch wc at 300 feet per minute (0.03 kPa at 1.5 m/s).

2.15.02 Extended Surface Air Filters. Extended surface air filters shall be American Air Filter "VariCel II", Farr "Riga-Flo", or approved equal. Filters shall be of the disposable type with glass fiber or synthetic media pack. The media shall be rated as Class 1 or Class 2 in accordance with UL 900. Extended surface air filters shall have an average efficiency of 60 to 65 percent based on the ASHRAE 52.1 test method. Filters shall have a maximum initial resistance of 0.40 inch wc at 500 feet per minute (0.10 kPa at 2.5 m/s).

2.15.03 Side Access Filter Housings. Side access filter housings shall be American Air Filter "Access Air", Farr "Model 4P Glide/Pack", or approved equal. Side access filter housings shall be single-stage, factory-fabricated of 16 gage (1.52 mm) thickness galvanized steel and shall be equipped with flanges for connection to the ductwork. Access doors shall be 16 gage (1.52 mm) thickness galvanized steel and shall be positioned to allow replacement of filters from either side of the housing. Filter housings and doors shall be insulated and of double-wall construction. Filter tracks shall be provided to accommodate nominal 2 inch (51 mm) thick disposable filters as described herein. Leakage at the rated airflow shall be less than 1 percent at a 3 inch wc (0.75 kPa) differential.

2.16 AIR FILTER MONITORING EQUIPMENT. Air filter monitoring equipment in the form of draft gauges and shaft power monitors shall be installed within all air distribution systems. The Contractor shall be responsible for equipment installation in accordance with the Manufacturers instructions. Furthermore, the Contractor will be responsible for start-up, testing, and operation and maintenance training of the Owner’s personnel.

2.16.01 Draft Gauges. Draft gauges shall be Dwyer Instruments, Inc. "2000 Series Magnehelic Air Filter Gauge", or approved equal.

Diaphragm actuated dial type draft gauges, located for easy readability, shall be installed across all air filters. The gauges shall have a dial of at least 3-1/2 inch (89 mm) diameter, a die cast aluminum housing, an adjustable signal flag, mounting hardware, an ambient temperature range of 20 to 140°F (-7 to 60°C), and a range of 0 to 1.0 inch wc (0.25 kPa), with a full range accuracy of 2 percent. Each gauge shall be furnished with an air filter kit consisting of a mounting panel, two static pressure tips with integral compression fittings, aluminum tubing, and vent valves.

2.16.02 Shaft Power Monitors. Shaft power monitors shall be Emotron “EL-FI M20” or approved equal.

Shaft power monitors shall at minimum include a system that is suitable for installation within the air filter electrical control panel. Shaft power monitors shall provide two (2) programmable alarm outputs for detecting overload and underload conditions. The system will provide user information via an on-board alpha-numeric display, which may be in the form of an LCD or LED. Alarm Status should be displayed. A DIN Rail mounted device is preferable. A panel mount kit should be available as an option. The system shall derive its power supply from the same source as that required for the air filter motor, i.e., the system must not require the provision of low voltage supplies, such as 110 VAC or 24 DC. To facilitate expanded plant wide monitoring and analysis, i.e., a SCADA system, the Air Filter Monitoring and Protection System must provide a self-powered, 2-wire, 4-20mA output signal that is proportional to the load on the air filter.

Shaft power monitors shall be installed no further than 25 radial feet (7.6 m) away from corresponding air units. The unit display shall be visible within the control panel or equipment setting. If multiple air handling units are to be installed, then all output signals and alarms relating to clogged or unclogged status shall be sent to a local PLC. This signal shall also be transferred to the main facility control panel. The system shall provide the user the ability to remotely reset an alarm condition that is initiated by the system. I/O connections shall be made in accordance with Master Specifications Section 17500, Programmable Logic Controllers.

2.17 SHEET METAL WORK. The ductwork, accessories, bracing, and supports shall be constructed of the material as required. Galvanized ductwork located in air conditioned spaces shall be constructed of G-60 or better lockforming quality in accordance with ASTM A653. All other galvanized ductwork shall be constructed of G-90 or better galvanized steel. Accessories, bracing, and supports shall be constructed of similar materials as the ductwork. Ductwork, turning vanes, and other accessories shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Plenums shall be constructed of reinforced 16 gage

(1.52 mm) thickness galvanized sheet metal.

Sheet metal ductwork shall be sealed according to the classifications described in the SMACNA HVAC Duct Construction Standards. Ductwork shall be fabricated, reinforced, supported, and sealed for the operating pressures indicated in the schedules for the connected equipment. All ductwork shall have a pressure classification of at least 1 inch (25 mm).

Sheet metal fan boxes shall be fabricated with 12 gage (2.66 mm) thickness galvanized sheet metal skin and structural steel framing of sufficient strength to support the fan box and the fan mounted on the box. The framing shall be coated with a universal primer. All welds on galvanized metal shall be cleaned and coated with a zinc-rich paint. Drawings of the fan boxes shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Sheet metal ductwork for the laboratory exhaust systems shall be constructed of AISI Type 304 stainless steel with standard mill finish. Longitudinal seams and transverse joints shall be made with continuous welds. The welding procedure shall produce joints with corrosion resistance at least equal to that of the base material. Duct thickness shall be as needed for the welding procedure, but shall not be less than 22 gage (0.76 mm) thickness. Flanged connections shall be provided at all equipment and damper connections, and at intervals not more than 10 feet (3 m) as measured along the centerline of the duct. Flanged joints shall be provided with 1/8 inch (3.2 mm) thick viton gaskets suitable for temperatures up to 250°F (121°C).

All joints, seams, connections, and penetrations in ductwork located outdoors shall be sealed watertight and weatherproof. Transverse joints shall be flanged and shall be provided with a continuous gasket and flange cap.

Where indicated on the drawings, ductwork and accessories shall be given a protective coating resistant to the corrosive atmosphere.

2.18 DUCT INSULATION. Interior duct liner shall be Knauf "Duct Liner E M", CertainTeed "ToughGard R", Schuller "Permacote-Linacoustic", or approved equal.

Interior duct liner shall be 1-1/2 pound per cubic foot (24 kg/m^3) density, spray coated duct liner with an "R" value of at least 3.6 ft^2·hr· °F/BTU (0.63 m^2· C/W) per inch (25 mm) thickness. The insulation shall be suitable for temperatures up to 250°F (121°C) and shall have at least a 0.55 NRC per 1 inch (25 mm) thickness. The insulation shall conform to ASTM C1071.

2.19 FLEXIBLE DUCT AND TAKEOFFS. Flexible duct shall be Flexmaster "Type 9", Flexible Technologies "Thermaflex Type G-KM", or approved equal. Takeoffs shall be Buckley Air Products "Air-Tite Bellmouth BM-D", or approved equal.

Flexible duct shall be a galvanized or vinyl-coated spring steel helix, bonded to a polymer liner, and wrapped with glass fiber insulation suitable for use in heating and cooling systems. The insulation shall provide an "R" value of at least 4.2 $ft^2 \cdot hr \cdot$ °F/BTU (0.74 $m^2 \cdot$ C/W). The outer jacket shall be a vapor barrier of fire retardant polyethelene or polyolefin material. The flexible duct shall be listed under UL 181 as Class 1 flexible air duct and shall comply with the latest edition of NFPA 90A.

Takeoffs for the flexible duct shall be bellmouth type manufactured of galvanized steel with a neoprene gasket and predrilled holes. Each takeoff shall be equipped with a balance damper constructed of 26 gage (0.45 mm) thickness galvanized steel. Scoops or other obstructions in the main duct will not be acceptable.

2.20 ACCESS DOORS. Access doors shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Access doors shall be double skin insulated type for insulated ductwork and single skin type for noninsulated ductwork. Duct-mounted access doors and panels shall be fabricated of the same material as the ductwork, with sealing gaskets and quick-fastening locking devices. Where access doors are insulated, a sheet metal cover shall be installed over the insulation.

2.21 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.22 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2-22.01 Adjustable Frequency Drives. Adjustable frequency drives (AFD) shall be provided as indicated in the schedules on the drawings. Each adjustable frequency drive shall be coordinated with the requirements of the driven equipment. Particular attention shall be directed toward the driven equipment torque requirements.

The equipment supplier shall be responsible for coordinating the AFD with the driven equipment to assure compatibility between the drive and motor. All equipment shall be derated as recommended by the AFD and motor manufacturers for reduced speed operation with an adjustable frequency controller.

Each AFD shall be pulse-width modulated type and shall produce an adjustable ac voltage/frequency output. Each AFD shall maintain a minimum displacement power factor of 0.95 over the entire speed range, and shall be equipped with an output voltage regulator to maintain correct output V/Hz despite incoming voltage variations.

Each AFD shall be equipped with an input line reactor and a full-wave diode bridge rectifier to convert incoming fixed voltage/frequency to a fixed dc voltage.

The AFD inverter output shall be generated by insulated gate bipolar transistors (IGBT) which shall be controlled by six identical base driver circuits. The AFD shall not induce excessive power losses in the motor. The worst case RMS motor line current measured at rated speed, torque, and voltage shall not exceed 1.05 times the rated RMS motor current for pure sine wave operation. Each AFD shall be configurable for automatic and manual reset and shall have an adjustable carrier frequency to at least 16,000 Hz.

2.22.02 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor.

2.22.03 Safety Guards. All belt drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.22.04 Electric Motors. Motors furnished with equipment shall meet the following requirements.

a. A manufacturer's standard motor may be supplied on packaged equipment and fans in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

b. Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

c. Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

d. Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

e. To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

f. Designed for full voltage starting.

g. Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

h. Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

i. Bearings shall be either oil or grease lubricated.

j Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feed and chemical handling

locations.

4. Equipment operating in wet or dust-laden locations.

k. Dripproof motors, or totally enclosed motors at Contractor's option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

l. Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

m. Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase.
Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

n. All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

o. Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

p. Motors to be used with adjustable frequency drives shall be rated for inverted service.

2.23 SHOP TESTING. The equipment furnished under this section shall be tested at the factory according to the standard practice of the manufacturer. Ratings shall be based on tests made in accordance with applicable AMCA, ASHRAE, ARI, NBS, NFPA, and UL Standards.

2.24 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in pounds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

2.25 FRP DUCTWORK.

2.25.01 Material. Fiberglass reinforced polyester resin; complying with ASTM C581. Do not add thixotropic agent to resin.

2.25.02 Corrosion Liner. Consists of one “C” veil and one chopped strand mat (1-1/2 ounces) or one layer of chopped strand prior to filament winding. Provide minimum 30 mil thickness.

2.25.03 Duct Wall Thickness. Minimum 1/4 inch.

2.25.04 Fittings. Provide smooth bends or internal turning vanes at elbows, tees and at other changes in direction.

2.25.05 Suction Inlet. Provide suction inlet with vinyl coated screen; 50 percent free area.

2.25.06 Flanges. Comply with ASTM D4024 and PC15-69, Sections 3.4.7.1 to 3.4.7.5.

2.25.07 Fabrication. Comply with Voluntary Product Standard PS15-69, Sections 3.1.1 to 3.4.9. Fabricate for water drainage.

2.25.07.01 Visual Defects. Comply with ASTM D2563, Level II.

2.25.07.02 Exterior Coating. Comply with PS-15-69, Section 3.3.3.1.

2.25.07.03 Duct Deflection Rectangular Duct. Rectangular Duct: Not to exceed 2 percent of the width of the side at a test vacuum pressure of 6 inch wc.

2.25.07.04 Duct Deflection Round Duct. Not to exceed 2 percent or “S” of duct diameter under an impolsed hoop (point) loading of 550 pounds.

2.25.08 Duct Supports. Provide at least every 5 feet; fabricated of galvanized steel.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01. Field Measurement. Contractor shall be responsible for verifying all field dimensions, and for verifying location of all equipment relative to any existing equipment or structures.

3.2.02 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of topcoats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Air Handling Units. Flexible connections shall not be in tension when the fans are operating.

3.3.02 Coils. Hydronic coils shall be installed level, except for drainable coils which shall be installed with a pitch toward the drain end of the coil. Hydronic coil piping shall be arranged with the supply connection at the bottom of the coil and the return connection on the top. The water supply connection shall be toward the leaving side of the air coil for counterflow arrangement.

A sight glass shall be installed in the liquid line adjacent to each refrigerant coil. Where air handling units are installed on vibration isolators, flexible connectors shall be installed in the coil piping.

3.3.03 Makeup Air Units. Flexible connections shall not be in tension when the fans are operating.

3.3.04 Fans. Flexible connections shall be installed between fan inlet and outlet sheet metal connections. Flexible connections shall not be in tension when the fans are operating. Where fan inlets and outlets are exposed, safety screens shall be installed over the opening. Scroll drains for equipment installed indoors shall be piped to the nearest floor drain.

Power roof ventilators shall be secured with corrosion resistant lag screws to the roof curb.

3.3.05 Roof Hoods. Roof hoods shall be secured with corrosion resistant lag screws to the roof curb.

3.3.06 Air Terminal Units. Each air terminal unit shall be individually supported from the building structure.

3.3.07 Dampers. Fire, smoke, and combination fire/smoke dampers and smoke dampers shall be furnished and installed where indicated on the drawings and as specified by NFPA 90A. All dampers shall be installed in accordance with the manufacturer's UL installation instructions.

Fire dampers shall be installed square and free from racking with blades horizontal. Fire damper frames shall not be compressed or stretched into duct or opening and shall be handled using the sleeve or frame. Where multiple section assemblies are needed, bracing shall be installed to support fire damper weight and to hold assembly against system pressure.

Smoke dampers shall be mounted with the damper blades running horizontal. A duct mounted access door shall be located on the jackshaft side of each damper.

3.3.08 Damper Operators. Damper operators shall be installed on a mounting bracket rigidly attached to the damper frame or duct. Where the bracket attaches to the duct, suitable stiffeners shall be installed on the duct to prevent noticeable deflection of the duct when the damper operates. Damper operators may be installed inside or outside the duct but consideration shall be given to the environment and duct dimensions in which the operators are installed. Where the damper installation inside the duct may or actually prevents the design airflow from being achieved, the damper operator shall be installed outside the duct. Damper operators shall be readily accessible and access doors shall be provided when the operator is installed inside the duct.

3.3.09 Air Outlet and Inlet Devices. Diffusers with balance dampers installed in the flexible duct takeoffs shall not have an opposed blade damper mounted in the throat of the diffuser.

Ceiling mounted air terminals or services weighing 20 pounds (89 N) shall be supported directly from the structure.

3.3.10 Draft Gauges. Draft gauges for filters located more than 8 feet (2.4 m) above the finished floor shall be mounted on the nearest wall, 5.5 feet (1.7 m) above the finished floor. Each gauge shall be installed with vent valves in the connecting tubing adjacent to the gauge for checking and re-zeroing functions.

3.3.11 Sheet Metal Work. Ductwork, turning vanes, and other accessories shall be installed and supported in accordance with the latest SMACNA Duct Construction Standards. The locations, arrangement, and sizes of ductwork shall be as indicated on the drawings. The duct sizes indicated are clear dimensions inside the duct or duct lining. Sheet metal sizes are larger for ductwork with interior linings.

Ductwork shall be constructed and installed in accordance with the drawings. When acceptable to Owner, modifications in the size and location of ductwork may be made where required to avoid interference with the building structure, piping systems, or electrical work. The installation shall be coordinated with other phases of work to establish space and clearance requirements. Unless otherwise indicated by a bottom of duct elevation, all ductwork shall be routed as high as possible, with a minimum height of 8 feet (2.4 m) above the finished floor. Ductwork installed above suspended ceilings shall be installed with at least 8 inch (200 mm) lighting allowance between the ceiling and the bottom of the ductwork.

In vertical ducts with a closed bottom which terminate less than 24 inches (600 mm) above finished floor, the bottom of the ductwork shall be broken and sloped to a 1/2 inch (12.5 mm) drain hole in the bottom of the duct.

Single-thickness turning vanes shall be installed in all turns with 45 degree or greater angles.

3.3.12 Duct Insulation. Insulation shall be terminated at items mounted in ductwork such as thermometers, controls, damper linkages, flexible connections, access doors, etc., to avoid interference with their function and/or replacement.

The duct liner in the corners of the duct sections shall be folded and compressed or shall be cut and fit to ensure overlapping, butted edges. Top and bottom pieces shall overlap the side pieces. Longitudinal seams shall be made only at corners unless duct dimensions and standard liner product dimensions make seams necessary at other locations.

The duct liner shall be held to the duct by a coat of waterproof, fire-retardant adhesive applied over the entire duct surface. Where duct dimensions exceed 8 inches (200 mm) on any side, mechanical fasteners shall be used in addition to the adhesive. All exposed edges of the duct liner shall be tightly butted and coated with adhesive.

The following ducts shall be insulated with a 1 inch (25 mm) thick interior duct liner unless otherwise indicated or indicated on the drawings to be wrapped:

Makeup or outside air ducts.

Air conditioning system supply and return ducts.

Other ducts where indicated on the drawings.

3.3.13 <u>Flexible Duct and Takeoffs</u>. The length of the flexible ductwork shall not exceed 8 feet (2.4 m). All support saddles for flexible duct shall be a minimum of 6 inches (150 mm) wide.

3.3.14 <u>Access Doors</u>. Airtight access doors shall be provided for inspection of all control dampers, fire dampers, smoke dampers, operators, filters, smoke detectors, duct-mounted coils, and at other locations indicated on the drawings. The access doors shall be of a size suitable for the duct dimensions and at least 8 inches (200 mm) square for hand access, 18 inches (450 mm) for shoulder access, or as indicated on the drawings. Each access door shall be installed to open against the pressure in the duct.

Access doors at locations where smoke and fire dampers are installed shall be permanently identified on the exterior by a "Smoke Damper" or "Fire Damper" label with letters not less than 1/2 inches (12.5 mm) in height.

Access doors for fire dampers shall be located as close as possible to the damper, and be located so that the spring catch and fusible links are accessible when the damper is closed. Where the size of the duct permits, the minimum size access door shall be 18 inches by 18 inches (450 mm by 450 mm). For dampers that are too large to access from outside the duct, the door shall be a minimum of 24 inches by 18 inches (600 mm by 450 mm). Where possible, the access shall be located on the underside of the duct.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15890

ODOR CONTROL SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the installation and furnishing of odor control systems Included, but not limited to, are the following concepts; carbon odor control vessels, grease filter/mist eliminators, FRP fans, fan acoustical enclosure units, interconnecting ductwork, anchorage devices, tools and spare parts.

1.2 GENERAL. Contractor shall provide all labor, materials, equipment and incidentals required to furnish and install new odor control system(s) for the wastewater collection and treatment facilities.

1.2.01 Coordination. Contractor shall be responsible for coordination of the design, fabrication, and installation of the odor control system shown on the drawings and specified herein. Contractor shall coordinate the installation of the items to comply with the requirements of the Work specified under this Section.

1.2.02 General Equipment Stipulations.
Obtain all equipment included in this Section from a single carbon odor equipment manufacturer, hereon referred as the Odor Control System Supplier (OCSS), regardless of the component manufacturer. The OCSS shall review and approve or shall prepare all shop Drawings and other submittals for all components furnished under this Section. All components shall be specifically designed for odor control services and shall be integrated into the overall system by the OCSS.

1.2.03 Governing Standards. Comply with the applicable provisions and recommendations of the following, except as otherwise shown or specified:

ASTM A193, Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High Temperature Service.
ASTM A194, Standard Specification for Carbon and Alloy Steel Nuts and Bolts for High-Pressure and High-Temperature Service.
ASTM C581, Chemical Resistance of Thermosetting Resins Used in Glass Fiber Reinforced Structures.
ASTM C582-87, Standard Specification for Contact Molded Reinforced Thermosetting Plastic (RTP) Laminates for Corrosions-Resistant Equipment.
ASTM D2563-87, Standard Practice for Classifying Visual Defects in Glass-Reinforced Plastic Laminate Parts.
ASTM D2583-87, Standard Test method for Indentation Hardness of Rigid Plastics by Means of Barcol Impresser.
ASTM D2584-68, Standard Test Method for Ignition Loss of Cured Reinforced Resins.
ASTM D3299-88, Standard Specification for Filament-Wound Fiberglass

Reinforced Thermoset Resin Chemical Resistant Tanks.
ASTM4097-88, Standard Specification for Contact Molded, Glass Fiber Reinforced Thermoset Resin Chemical Resistant Tanks.
ASTM E84, Standard Test Method for Surface Burning Characteristics for Building Materials.
American Society of Heating, Refrigeration and Air-Conditioning Engineers, Inc. (ASHRAE).
National Electric Code (NEC).
National Electrical Manufactures Association (NEMA).
National Fire Protection Association (NFPA).
Underwriters Laboratories, Inc. (UL).
National Bureau of Standards (NBS) Voluntary Product Standard PS 15-69 Custom Contact Molded Reinforced Polyester Chemical-Resistant Process Equipment.
Society of Plastics Industry (SPI) Standards of Recommended Practices for Shipping and Installation of Fiberglass Reinforced Plastic Pipe, Duct and Tanks.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Manufactures of carbon vessel, fan, fan enclosure, grease filter/mist elimination and ductwork shall have a minimum of 5 years of experience or producing substantially similar equipment, and shall be able to show evidence of at least 5 installations in satisfactory operations for at least 5 years in the United States.

1.3.02 Testing. Odor controls system shall be shop tested in accordance with Master Specifications Section 15990, Testing, Adjusting, and Balancing, unless otherwise specified herein.

1.3.03 Vessel shop test. Provide services of an Independent FRP Testing Inspector to be present at the point of manufacture, upon completion of fabrication and prior to shipment, to perform or witness the following; visual inspection to the requirement of ASTM C582 and ASTM D2563, Barcol Hardness measurements per ASTM D2583-87, acetone sensitivity test for all internal secondary bonds, glass content by ignitions loss on three cutouts per ASTM D2584, and Hydrostatic Leak Test on each vessel by filling to the top of vessel and allowing to stand for 2 hours with no visible leakage.

1.3.04 Fan Shop Test. Perform a shop test on each fan at each operating condition.

Running Test: record volume, static pressure, speed, efficiency, BHP and housing vibration.
Running time at each condition shall be a minimum of one hour
Data shall be continuously recorded

Test shall be conducted with the job motor

Acoustical test: Record octave band sound power levels (LW) IN/dB RE 10-12 W, from 63 to 8000Hz. Convert to sound pressure level dB on "A" weighted scale, at a distance of 5 ft.

Test all fans from a facility in succession.

Motor Shop Test. Each motor shall be given a complete shop test. Ship motor to the fan manufacturer following successful completion of shop tests. Test reports shall provide the following minimum information:

Starting Torque.
Efficiently at ½, ¾ and full load.
Power factor at ½, ¾ and full load.
Percent slip.
No load, running light, full load and locked rotor current.
Current balance check.
Test curves for current, voltage, brake horsepower and power factor.
Full load heat run.
Vibration check.
Temperature rises and results of dielectric tests.
Motor type and frame size.
Bearing type and lubrication medium.
Insulation and enclosure type.
Load sound pressure levels in dB on the A weighted scale at 5 feet from the motor fan end. Sound pressure levels shall be determined in accordance with the procedures of IEEE Standard 85.

1.3.05 Ductwork Shop Test. Provide services of an Independent FRP Testing Inspector to be present at the point of manufacture, upon completion of fabrication and prior to shipment, to perform or witness the following; visual inspection to the requirements of ASTM C582 and ASTM D2563, Level III, Barcol Hardness measurements per ASTM D2583, acetone sensitivity test for all internal secondary bonds and glass content by ignition loss on three counts per ASTM D2584. Repairs deemed Acceptable by Independent FRP Testing Inspector must be approved by Owner.

1.4 SUBMITTALS.

OCSS shall be responsible for preparing and reviewing submittals for all system components as specified in Section 1.3.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project

Submittals. Submit for approval; fabrication, assembly and installation diagrams, manufacturer's literature, illustrations, paint certifications, specifications and engineering data including dimensions, materials, size and weight of all components and complete assembly, setting drawings, templates, and directions, for the installation of anchor bolts and other anchorages, drawings showing plans and sections of the equipment to demonstrate proper coordinates between components, fabrication methods, assembly, accessories, installation details, and wiring diagrams. Description of surface preparation, shop printing and finish painting system and deviations of Contract Documents. Provisions shall be included to adequately ground the carbon bed. Manufacturer shall supply adequate submittal details to demonstrate that the carbon bed will be adequately electrically grounded. Odor Control System data shall include, but not limited to; detail product information on the control and layout drawings including locations of external wiring and piping connections and mounting, and panel wiring and piping diagrams including identification of external wiring connections.

1.4.02 Test Reports. Submit results of the required shop tests and a written field test report giving the results of required field tests.

1.4.03 Record Drawings Submit complete manuals including, copies of all shop drawings, test, reports, maintenance and data and schedules, description of operation, acceptable lubricants, and spare parts information. Operations and Maintenance data shall be submitted in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
Deliver materials to the Site to insure uninterrupted progress of the Work. Deliver anchors bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to insure not to delay Work. Store all materials in a manner that will permit easy access for inspection and identification purposes. Keep steel members off the ground using pallets, platforms and other supports. Protect equipment including packaged materials from corrosion and deterioration. Odor control vessels shall be shipped empty and all interior components shall be shipped separately. Store mechanical equipment in covered storage off the ground to prevent condensation.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. The odor control vessel shall have the following performance specifications: Number of units, Size, Type, Bed depth, Bed velocity flow, Pressure drop, and Maximum head loss at the bed velocity flow per foot depth of packed bed.

2.2 CARBON ADSORPTION UNITS.

2.2.01 Acceptable Manufacturers. Provide odor control equipment as manufactured by one of the following: Calgon Carbon Corporation, U.S. Filter, Norit Americas, Inc., or Approved Equal

2.2.02 Activated Carbon. The activated carbon shall be virgin pelletized activated carbon, derived from bituminous coal. The activated carbon shall be suitable for the vapor phase adsorption of wastewater treatment odors. The activated carbon shall have the following specifications:

Iodine No., mg/g	1000 min
Butane Activity, weight % (per ASTM D 5742)	26 min
Hardness	95 min
Apparent Density, g/cc	0.46 – 0.49
Minimum Particle Density	3.7 mm to 4 mm pellet
H_2S Breakthrough Capacity (g H_2S removed/cc Carbon)*	0.30 min

Ignition Temperature, ^{o}C, minimum (per ASTM D 3466): 350

* The H_2S breakthrough capacity shall be determined using ASTM standard method D6646-01. Prior to testing, the test sample should be completely humidified by exposing the sample to a flow of humid air for at least 12 hours. Testing of 3.5 to 4 mm diameter pellets is accomplished by passing a moist (85% RH) stream of air containing 1 vol. % H_2S and the selected concentration of CO_2 through a 1.5 inch inner diameter tube with a 9" deep bed of closely packed carbon at a rate of 3,262 cc/min and monitoring to a 50 ppm H_2S breakthrough. The results are reported as grams of H_2S adsorbed per cc of carbon.

2.2.03 Odor Control Vessels Construction. Vessels shall either be contact-molded in accordance with ASTM D4097, Grade 1 or Type I, filament-wound in accordance with ASTM D3299-88, Grade 1. Portions of the vessel including joints, heads and nozzles shall be fabricated by contact molding. Contact molded laminates shall be in accordance with ASTM C582, Table 1. All laminate physical properties shall comply with requirements for laminate thickness of 3/8 inch and thicker.

All vessels shall be designed using a minimum structural safety factor of 10 to 1 for pressure and 5 to 1 for vacuum. Vessels shall have bottom knuckle reinforcement and be designed for hydrostatic head load 10-foot above the top of the inlet.

Vessel housing shall be designed for full bottom support and shall be provided with a minimum of four Type 316 stainless steel hold down lugs. All hold down lugs shall be designed to account for all anticipated loads and shall comply with local code requirements. Furnish all anchor bolts, nuts and washers which shall be Type 316 stainless steel.

The support system for carbon beds shall be as recommended by the odor control vessel supplier and approved by the Engineer. The carbon beds shall be individually supported on a polypropylene screen basket resting on each support system. The carbon bed screens and support systems shall be removable through access manways. The support system shall be a system of grating, beams and columns or equal. The support system shall be capable of withstanding a load of not less than 300 lbs./sq.ft with a deflection not greater than 1/4 –inch under any operating condition. All components of the support system shall be constructed of materials resistant to the chemical service conditions specified for corrosion. The carbon bed shall be provided with a molded fiberglass reinforced vinyl ester grating to act as a bed limiter for the lower bed. The grating shall be 1-inch thick by 2-inch by 2-inch square type to achieve a minimum free area of 75 percent. The grating shall cover the entire surface of the lower bed and shall be installed in sections that shall be removable through the access door. Cope bed limiter to match diameter of vessel. A fully seamed polypropylene screen sewn basket shall be provided to hold the activated carbon without fraying. All edges and seams shall have “piping” to reinforce the seams and edges to prevent fraying. The basket shall be of sufficient strength to hold the carbon without tearing.

2.2.04 <u>Resins</u>. Resins used in laminate shall be premium corrosion resistant and fire retardant brominated bisphenol. All vinylester resins are to achieve a 25 or less flame spread rating in accordance with NFPA 91. Provide products of one of the following manufacturers: Ashland Chemical Co. Hetron 992 FR with 3 % antimony trioxide, Dow Chemical Co. DeraKane 510A or 510C with 5 % antimony trioxide, Reichold, Dion 9300 FR with 5 % antimony trioxide, or approved equal.

All cut edges shall be sealed with a resin coating of the same resin as used in the fabrication. The resin shall contain paraffin.

2.2.05 R<u>einforcement</u>. Synthetic surfacing veil shall be Veil-Nexus 1012 (aperture) as manufactured by Burlington Industries. Chopped strand mat shall be Type E glass, minimum 1.5 ounces per square foot, with silane finish and styrene soluble binder. Continuous roving used in chopped gun shall be Type E glass. Woven roving shall be Type E glass, nominal 24 ounces per square yard, with a 4 by 5 weave and a silane type finish. Continuous roving used for filament winding shall be Type E glass with a silane type finish, with a nominal yield of at least 110 strand yards per pound. Glass content for filament wound layers shall be 55%-70%.

2.2.06 <u>Laminates</u>. Laminates shall consist of a corrosion resistant resin-rich inner surface, an interior corrosion barrier, an interior structural layer, and an exterior layer. Composition specified for inner surface and interior corrosion barrier is intended to achieve optimum chemical resistance. Corrosion resistant resin-rich inner surface shall be reinforced using a single aperture Nexus synthetic veil. Minimum resin-rich inner surface thickness shall be 10-20 mils. Thixotropic agents shall not be used for this service. Glass content of resin-rich inner surface shall be 10 % plus or minus 5 % by weight. Interior corrosion barrier shall be a minimum of 100 mils of Type E glass chopped strand mat to a total of 3 oz/sqft. The interior corrosion barrier shall be applied by either the hand laid up technique, filament winding or chopper gun. Chopper gun is only permitted if an automated process is used. Manual operation of chopper gun shall not be permitted. Glass content of interior corrosion barrier shall be 25 % plus or minus 5 % by weight.

Laminate Physical Properties:

Ultimate Tensile Strength (min.PSI) ASTM Method D638:	15,000
Modulus of Elasticity Procedure A of ASTM Method D790	10 x10
Flexural Strength – (min.PSI) ASTM Method D790	22,000
Average Glass content of Completed Tanks by Ignition (%)	45

Interior structural layer shall be of sufficient thickness to meet minimum thickness requirements specified. Glass reinforcements shall be in accordance with the appropriate standards of construction. Interior structural layer shall be fabricated using either the hand lay up, filament wound technique or approved chopper gun technique. Glass content of interior structural layer shall be 60 % plus or minus 5 % by weight. In no case shall total thickness of the interior structural layer be less than 0.50 inches. Exterior layer shall be reinforced using a single “A” glass veil with a layer of surfacing “Nexus” veil followed by a clear resin rich 10 mil thick coating similar to the inner surface. Topcoat shall be pigmented parafinated get-coat with ultraviolet inhibitors. The pigmentations shall be beige. There shall be no glass fibers exposed. Vessel wall shall be reinforced around all openings and connections.

2.2.07 <u>Curing</u>. Each vessel shall be given a BPO-DMA cure system to increase service life. In addition, interior of vessel shall be post-cured. Post cure shall consist of an FRP vessel wall cure temperature of at least 180° F for a minimum of 4 hours. Independent of exterior ambient fabrication shop temperature, the temperature inside the vessel may have to be elevated above 180° F. At no time shall the vessel wall temperature approach 90 % of the thermal distortion temperature for the resin used Barcol readings taken after the post-cure shall not be greater than 4 points less than the resin manufacturers published Barcol readings and in no case less than 35. Where steam is used in the post-cure, no steam shall impinge on the interior surface of the vessel of the inside of any nozzle. A steam sparge pipe projecting at least 12 inches beyond the interior surface of any nozzle and 12 inches away from any wall shall be used. During steam post-curing, the vessel shall be maintained at atmospheric pressure. Alternate curing methods may be submitted for the Engineers approval. Cobalt compounds shall not be used to accelerate curing of the FRP in any way.

2.2.08 Connections. All necessary connections for piping, instrumentation, sampling, and ductwork shall be provided as shown on Drawings or required. Suitable EPDM gaskets shall be provided. Two inch drain assembly with CPVC ball valve and 2 inch over flow drain with threaded coupling and plug. Each carbon bed shall have two 11/2 inch diameter sample probes adjacent to the carbon bed which shall extend a minimum 6 inches into the carbon bed. Probes shall be adequate to provide suitable extraction of carbon samples from the carbon bed and be non-binding. Probes shall extend outside the vessel wall and be blocked off with ball valves. One additional ¾ inch diameter sample probe shall be installed in each discharge stack and shall extend down and adjacent to the other probes. Probes and ball valve shall be of CPVC construction. Carbon adsorption unit manufacturer shall provide factory mounted pipe supports for outlet air sample ports, bottom drain connection, and 3-inch wide baffle ring around the interior circumference of each carbon bed. Flanges of air inlet, air outlet and access doors shall be manufactured by hand lay up method and shall conform to NBS-PS15-69; standard dimensions for bolting, but in no case shall the thickness be less than ¾ inch thick. Flange nozzles for piping connections shall conform to ASTM D3299, all nozzles up to and including 8-inch diameter shall be reinforced with blade type gussets. Flanges for piping connections shall be ANSI 150 lb dimensions. All flanges shall be pre-drilled. Flanges shall be checked for alignment, thickness and mating prior to shipment to field. Area on the back of all flanges around each bold hole shall be the diameter of a standard washer and shall be flat and parallel to flange face. This area shall be spot faced, if necessary, to meet this requirement.

2.2.09 Hatches. Access hatches shall be provided above top and bottom of main carbon bed sections to allow easy inspection, cleaning and maintenance of carbon. Support gratings and lower carbon bed limiter shall be removable through access hatches. All access hatches shall be in easily accessible locations and coordinated with all structural columns, structural wind bracing, ductwork and piping. All access hatches shall be corrosion resistant to acidic and basic cleaning solutions. Access hatches shall be outfitted with clear PVC, removable, corrosion resistant panels, all stainless steel type 316 hardware including nuts, washers, bolts and extruded silicon gaskets. Minimum size of access doors shall be 24-inches high by 30-inches wide by ½ inch thick with not less than 18 bold hold-down assemblies. Blind flanges and access hatch doors shall be same thickness and material as flanges to which they are attached. Tolerances and flatness shall be same as for flanges. Manways shall have word" CAUTION" stenciled on in 3-inch high red block style lettering.

2.2.10 Miscellaneous. Odor control vessels shall contain the following:

A grounding system as submitted under item 1.4, Submittals.

Lifting Lugs that shall be capable of withstanding weight of empty vessel with minimum safety factor of 5 to 1. A minimum of three lugs shall be furnished per vessel. Lifting lugs shall be Type 316 stainless steel and attached to vessel wall with hand lay-up laminate equal to or greater than the vessel wall thickness.

Mounting Lugs that are suitable for mounting electrical junction boxes. Mounting lugs shall be Type 316 stainless steel and attached to the vessel wall with hand lay-up laminate equal to or greater than the vessel wall thickness.

Odor control vessel exhaust stack and any other transition pieces required. These items shall be fiberglass, reinforced vinyl ester and furnished by the odor control vessel manufacturer. All fiberglass reinforced vinyl ester ductwork shall be as specified in this Section.

Carbon Sampling Device. A One grain thief sampling device shall be provided. The device shall be a fisher Scientific Model 14-208, or approved equal.

Hydrogen Sulfide Bed Monitor. Furnish a bed monitoring system to enable plant personnel to check for the presence of hydrogen sulfide at any sample port within the carbon bed. The monitor shall be sensitive to H_2S concentrations from 0.5 ppm to 20 ppm, and visually indicate that concentration range. The hydrogen sulfide bed monitor assembly shall provide means to detect H_2S levels with the carbon bed. The monitor shall include an adjustable flowmeter and lead acetate paper color indicating disk. The monitor shall have a fitting to attach to any carbon bed sampling port. The monitor shall be manufactured by the vessel manufacturer.

Differential Pressure Gage. Provide a photohelic differential pressure gage/switch at each carbon bed (two per vessel) to measure the differential pressure through each carbon bed through the entire vessel. Gages shall be the dial type with die cast aluminum, irridite dipped for corrosion resistance. The range shall be 0 - 20 inches water gage for odor control vessel and accuracy shall be 2 percent of scale. Switches for high and low set point shall be adjustable from knobs on gage face.

Quantity	2 per unit
Type	DPDT, Rated 10A @ 120VAC
Power requirements	120 VAC
Deadband	Maximum 1 percent of full scale
Enclosure	NEMA 4X

Manufacturer: Provide products one of the following, Dwyer Instrument, Incorporated Model 3000 series Photohelic Pressure Switch/Gage or approved equal.

2.3 FIBERGLASS REINFORCED PLASTIC FAN.

2.3.01 Manufacturer. Provide fans as manufactured by one of the following, New York Blower Company, The Ceilcote Company, Hartzell Fan, Inc., or approved equal.

2.3.02 Construction. Provide fiberglass reinforced plastic fire retardant fans with an epoxy coating to protect against ultraviolet degradation. Fans shall be installed, complete with motors, drives, guards and coatings of sufficient capacity for the duty required. Fans shall operate to draw odorous air from the basin and shall exhaust air through the carbon vessel. Fans shall be tested and rated in accordance with ASHRAE 51-75 and fan shall be licensed to bear the AMCA 210 Test Code Seal, and be certified by manufacturer to deliver rated performance. Manufacturer shall provide sound power level ratings outlined in AMCA Standard 301, ratings to be the results of testing in accordance with AMCA Standard 300. For additional details refer to Master Specifications Section 15880, Air Distribution Systems.

Service conditions shall include 1) Specified number of units, 2) CFM: as specified, balanced fan cfm shall not vary from quantity listed above by more than 5 %, OCSS shall co-ordinate fan total static pressure with actual total pressure drop across the carbon material bed, 3) the OCSS shall submit the calculations of static pressure requirements certified by a registered Professional Engineer in Michigan or any other state approved by Engineer, 4) total static pressure as specified, 4), fan rpm shall be as specified, 5) fan static efficiency shall be 64.4%, 6) outlet velocity shall be not be less than specified, 7) brake horsepower shall be as specified, 8) approximate noise level on weighted scale shall be less than 80 db maximum at 5 feet, 9) Sound power levels shall not exceed the following:

Octave bands	1	2	3	4	5	6	7	8	Overall
Total Fan Power Levels	112.3	109.3	103.3	65.3	89.2	87.3	90.3	83.3	114.5

Housing: Fan housing shall be designed so that there is no air leakage through joints and seals. All bolted pieces shall be tightened by putting gasket for air tightness. Fan housing shall be corrosion resistant, fire-retardant, sold fiberglass reinforced plastic design which shall equal or exceed the ASTM En 84 Tunnel Test Rating of 30 or less with construction classification suitable for pressure range. Fan housing shall be constructed of a premium brominated bisphenol-A vinylester resin. All exterior surfaces of the fan shall have a factory applied beige pigmented, paraffinated gel-coat with UV inhibitors. All laminates shall be manufactured in accordance with National Bureau of Standards PS 15-69, ASTM C 582. All interior portions of fan housing in the air stream shall be coated with graphite impregnated resin in accordance with ASTM D 4167.

Fan Wheel: Provide backward inclined fan wheel constructed of Type 316 stainless steel with back pressure vanes adjacent to shaft seal. Surface preparation of the metal surfaces to provide a surface metal profile via degreasing, radiusing and abrasive blasting. Remove all grit or dust particles.

Fan Shaft: Shaft shall be of Type 316 stainless steel designed to operate below first critical speed. Shaft and impeller shall be statically and dynamically balanced at normal operating speed listed in schedule below to allow a maximum vibration peak-to-peak displacement of 2 mils. Provide mechanical or Teflon seal between shaft and housing. The shaft's first critical speed shall be at least 125% of the fan's maximum operating speed.

Shaft Bearings: Heavy duty, grease, lubricated, sealed, self-aligning, pillow block design, frictionless ball bearings having minimum life of 150,000 hours shall be used. Fan bearings shall be visible and accessible for inspection and maintenance. Bearings enclosed within the fan housing where they can be exposed to the corrosive gas stream are not acceptable.

Fan impeller and driving pulley shall be secured to shaft with keys and set screws. Fan housing shall have flanged discharge and inlet drilled connection and companion flanges. Fan shall be separated from ductwork at inlet and outlet by flexible connections. Fan inlet box shall have flanged inlet and outlet connections. The fan inlet box shall be coated with graphite impregnated resin in accordance with ASTM D 4167. Equipment slab shall be unitary base constructed of channel steel as required by the fan manufacturer. The fan and motor shall both mount to the structural steel frame. Fan mounting shall be AMCA Standard Arrangement 1. Fan base shall be bolted directly to the equipment slab and painted as specified in Master Specification Section 09900, Painting. The drive shall be of matched V-belts and adjustable sheave pulleys shall be cast steel. The belt and shaft guard shall be steel construction and galvanized then painted as specified in Master Specification Section 09900, Painting, with tachometer hole, OSHA approved. The access doors shall be raised type, bolted with gasket. Nuts, bolts and fasteners in contact with the gas stream shall by Type 316-stainless steel and encapsulated in FRP. Stainless steel nameplates giving the name of the manufacturer, serial number, model number, rated capacity in cfm, head in inches of water gage, fan rpm, and any other pertinent data shall be permanently affixed with stainless steel hardware to each fan.

Drains: Provide drains at low point of scroll, 1-inch pipe bonded to housing with threaded corrosion resistant plug.

Coatings: Ferrous metal fan part coatings shall as per Steel Structures Painting Council SSPC-SP 5-63 white metal blast cleaning. Ferrous metal fan part coating for baked epoxy phenolic or "cold set" epoxy-phenolic amine cured shall be brushed or sprayed coats as per manufacturer's specifications.

Fans: Fan assembly shall be tested and balanced in accordance with Master Specifications Section 15990, Testing, Adjusting and Balancing. The complete fan assembly shall be inter-radial dynamic machine (IRD) 245 balanced at design RPM with motor sheaves and belts in place to 1.0-mil displacement or less and shall be checked for vibration after installation by the fan manufacturer's personnel trained in such work. A complete report shall be furnished to Engineer. If the amplitude of any vibration exceeds 1.0 mils, the fan shall be dynamically balanced in place and retested.

Differential Pressure Gage/Switch: Provide a photohelic differential pressure gage/switch at the fan inlet and outlet, to measure the fan inlet pressure and the fan outlet pressure. Gage shall be the dial type with die cast aluminum, irridite dipped for corrosion resistance. The range for fan inlet shall be 10 in vacuum to 10 inches water gage and range for fan outlet shall be 0 to 12 inches water gage with accuracy of 2 percent of scale. Switches for high and low set point shall be adjustable from knobs on gage face.

Quantity	2 per unit
Type	DPDT, Rated 10 A @ 120 VAC
Power requirement	120 VAC
DeadBand	Maximum 1 percent of full scale
Enclosure	NEMA 4X

Manufacturer: Provide products of one of the following: Dwyer Instrument, Incorporated Model 3000 series Photohelic Pressure Switch/Gage, or approved equal.

2.3.03 Drive Units. Motors shall be provided with specified maximum horsepower at 1800 RPM constant speed. Motor information specified herein shall be coordinated with Master Specifications Section 16220, General Purpose Induction Motors. TEFC type with premium efficiency suitable for operation (480 volt, 3 phase, 60 Hz power, solid shaft, ball bearing type), mount Fan per manufacturer requirements for outdoor use, and shall be provided with a service factor of 1.15. Provide positive temperature thermistors and a solid state relay. The sealed thermistors shall be installed in the end turns of the stator winding, one per phase. Solid state relay shall detect and protect against open or shorted sensors. Relay shall be mounted in and powered from MCC (120 VAC). Relay shall provide dry contact interlock to shutdown motor on high temperature. Provide thermistors from one of the following manufacturers: Therma Sentry by U.S motors, Reliance Thermistor System by Reliance or approved equal. Provide 120 volt space heaters in motor windings to prevent condensation.

2.3.04 Controls. Odor Control Fan Operation: Furnish a local control panel for each fan, provided by the fan manufacturer, for mounting adjacent to each. Each odor control fan shall have two modes of operation, "Local" and "Remote". Fan shall be placed in "Local" or "Remote" from local control panel. In the "Local" position a fan shall operate by the "start" and "stop" pushbuttons located on the local control panel.

In “Remote” position, a remote signal from the specified control system in the control building shall start and stop the fan.

Safeties/Interlocks: All safeties/interlocks shall be hard wired to the fan MCC starter. All alarm conditions shall be repeated individually at the local panel and at the specified control system. In the “Remote” position, if a fan fails to start when called an alarm shall be signaled. If a fan fails when running, an alarm will be signaled. Low suction pressure shall stop a fan and signal an alarm. High discharge pressure shall stop a fan and signal an alarm. The “Stop” pushbutton shall stop a fan in both “Local” and “Remote” mode of operation.

Local control panel: Local control panel shall be a NEMA 4X enclosure mounted on support framework adjacent to the fan. Panel shall be all Type 316 stainless steel construction with a minimum thickness of 12 gauge for all surfaces (except those areas requiring reinforcement) having a smooth brushed finished. Provide continuous stainless steel piano hinged door with stainless steel screws and clamps on three sides of door. Provide all internal devices mounted on 12 gauge steel sub panel with white enamel finish.

2.4 GREASE FILTERS/MIST ELIMINATOR.

2.4.01 Acceptable Manufacturer. Provide grease filter/mist eliminators as manufactured by one of the following: Calgon Carbon Corporation, U.S. Filters, Munters Corporation, or approved equal.

2.4.02 Construction. Service conditions shall include that at the design gas flow rate, the external demisters shall remove minimum of 99.9% of droplets between 5 microns and 10 microns, and pressure drop through the demisters shall not exceed 1.0 in w.c. at 25,000 cfm.

External demisters shall contain horizontal grease and mist eliminator constructed of PVC with FRP frames. Provide two nested modules suitable for operation at the design gas flow rated 25,000 cfm.

The grease filter/mist eliminator shall be enclosed in FRP housing. The housing shall be of hand lay-up construction with the same resins and reinforcements as specified for the odor control vessel. Minimum thickness of the housing shall be 0.5 inches. The FRP shall be pigmented beige.
The grease filter pad shall be 2 inches thick and constructed of 304L stainless steel.

The mist eliminator pad shall be 4 inches thick and constructed of woven polypropylene. Provide a side mounted module access cover.

Gas inlet and outlet connections shall be circular, flanged connections the same size as the connecting ductwork. Flanges shall be of hand lay-up construction in accordance with NBS PS 15-69 and shall be ANSI 16.5, 150 lb.

Provide a flanged, ¾ inch diameter drain connections at the bottom of the FRP housing.

Differential Pressure Gage/Switch: Provide a magnehelic differential pressure gages at each grease filter /mist eliminator to measure the differential pressure through the grease filter/mist eliminator. Gages shall be the dial type with die cast aluminum, irradiate dipped for corrosion resistance. The range shall be 0 to 15 inches water gage for the grease filter/mist eliminator, accuracy of 2 percent of scale. The accessories used shall be Two 1/8 inch NPT plugs, two 1/8-inch NPT pipe thread to rubber tubing adapters and three flush mounting adapters with screws, 50 linear feet of tygon plastic tubing, two static pressure tips, two plastic vent valves, with integral compression fittings on tips and valves. Mount gages as grease filter/mist eliminator on brackets provided by Contractor. Provide products of one of the following manufacturers: Dwyer Instrument Incorporated Model 2015 Magnehelic Gage, or approved equal.

2.5 <u>FAN ACOUSTICAL ENCLOSURE</u>.

2.5.01 <u>Acceptable Manufacturers</u>. Provide a Fan Enclosure Unit as Manufactured by on of the following: Niess, Industrial Acoustics Company, or approved equal.

2.5.02 <u>Construction</u>. Provide a double wall, insulated, acoustical enclosure for each fan-motor unit suitable for outdoor installation. The enclosure shall be complete with frame walls, roof, observations, windows and air intake and discharge silencers. All panels and components shall be prefabricated and shall not be susceptible to damage form extended to airflow, pressure differentials, vibration, air, temperature, or humidity. The entire enclosure shall be designed by the manufacturer to be self-supporting when any or all of the side panels are removed. The enclosure shall be independent of the fan and ductwork. Enclosure size is shown approximately on the drawings. Final size shall be determined by the Contractor and enclosure manufacturer to suit the face actually furnished.

Enclosure shall have three double-leaf access doors on both long side and one double-leaf access door on the inlet side arranged to permit access to all parts of the fan assembly for services and major maintenance.
All panels shall be not less than 6 inches thick with a solid steel exterior shell with a minimum 16-gauge thickness and a perforated, galvanized steel interior shell with a minimum 22-gauge thickness.

The outer framework shall be constructed of steel with a minimum 11-gauge thickness, and shall be painted a gloss black color.

Each panel assembly shall be completely filled with acoustical/thermal insulating material that is noncombustible, inert, mildew resistant, and vermin-proof. Insulations shall not settle within the panel assembly. No insulating materials shall be used that have a flame spreader greater that 25 or smoke developed greater than 50, as determined by ASTM Standard E 84 (UL-723, NFPA 255).

Each panel shall contain a 1/8 inch thick layer of mineral wool attached to the perforated interior surfaces for vibration damping. The mineral wool layer shall be completely wrapped in 2 mil. Polyethylene for protection.

A layer of 1 inch thick mineral wool shall be placed adjacent to the vibration damping layer. Insert a 2 pound per square foot Septum barrier between the mineral wool and second 1 inch thick layer of mineral wool. The paint color shall be approved by Engineer.

Provide an additional 4 inch thick layer of mineral wool into the fabricated, galvanized steel frame. The exterior color of the panels shall be painted with industrial enamel paint.

Acoustical Performance: The manufacturer shall provide certified testing data from an acoustical laboratory, listing sound absorption and transmission loss characteristics of the panel assembly. Testing data may be for galvanized panels. The Insertion Loss measured at a 1 meter distance form the enclosure and 2 meter above the ground shall be a minimum of 24 dBA. The test shall be performed in accordance with the OSHA measurement standards and the NMTBA (National Machining Tool Builders Association) standards.

Insulating materials used in all prefabricated panel assemblies shall have the following maximum thermal conductivities and nominal thermal resistance (r) at a mean temperature of 75F.
Thermal Conductivity (BTU/HR ft^2-°F) Nominal R Value
4-inch panel construction -.06 BTU/HR ft^2-°F

All perimeter and interior channel members and trim items shall be of steel, not less that 11 gauge. Furnish all anchor bolts, nuts, and washers which shall be Type 316 stainless steel. The enclosure unit shall be bolted directly to the equipment slab.

Where required for acoustical performance, base/channel/floor interface shall be sealed with a caulking sealant. Sufficient sealant shall be used to extrude surplus sealant and give a visual indication of complete coverage in all joints. The sealants shall have sufficient adhesive strength to prevent air leakage through the assembly when a pressure differential exists, but still allow system disassembly without damage to the panel components.

Provide one 18 inch by 24 inch observation window to visually observe the motor. Window shall be constructed of double pane ¼ inch thick safety glass held in place with neoprene acoustical seals and separated by an air space of the same thickness as the panel.

Provide an acoustical air intake silencer and acoustical discharge silencers with an integral fan curb in the enclosure wall so it will admit air for cooling the enclosure with minimizing sound exiting enclosure. The air intake and discharge silencers shall meet the following service conditions and the requirements of Master Specifications Section 01180, Equipment, Materials, Parts, and Tools. Number of Units shall be as specified, CFM shall be as specified, and total Static Pressure in each silencer shall be in w.c.: as specified, for acoustical performance, the insertion loss shall be at a minimum equal the performance of the enclosure walls. The fan of the fan motor may provide primary air movement and cooling inside the enclosure. An auxiliary exhaust fan shall be mounted on the acoustical enclosure to provide air circulation during fan operation.

Auxiliary exhaust fan motors: Service conditions shall include number of units as 1 per enclosure, CFM shall be as specified, and Total Static Pressure each silencer, in w.c.:as specified. Motor information specified herein shall be coordinated with Master Specification Section 16220, General Purpose Induction Motors. The requirements of this article supersede any conflicting requirements in Master Specification Section 16220, General Purpose Induction Motors. The electric motor shall be Dome Type suitable for operation on 480 volt, 3 phase, 60 Hz power, solid shaft, and with ball bearing.

Openings for pipe penetrations and conduits shall be field cut to ensure proper positioning. Provide framing members, collars and fittings as required insuring the openings are sealed against acoustical leakage.

PART 3 – EXECUTION

3.1 INSPECTION. Inspect and verify that structures or surfaces on which the equipment will be installed have no defects, which will adversely effect installation, inspect all equipment prior to installation, and promptly report defects, which may affect Work to the Engineer.

3.2 INSTALLATION. Install equipment in accordance with the Drawings, approved Shop Drawings, the manufacturer's instructions and the supplemental requirements. Connect all piping and instruments as required. Support all piping independent of odor control vessel. Align, adjust, and lubricate equipment in accordance with the manufacturer's instructions, and leave in proper working condition. Provide minimum of one inch of non-shrink grout below all floor stands. Touch up minor scratches and scrapes in painted finishes as specified in Master Specification Section 09900, Painting.

3.2.01 Protection. Field and shop painting shall be provided in accordance with Master Specification Section, 09900, Painting. Paint FRP surfaces of ductwork and grease filter/mist eliminator FRP housing. Prepare FRP surfaces by hand sanding FRP surfaces to be coated with a medium grit sand paper prior to painting. Large areas may be power sanded or brush-off blasted, provided sufficient controls are employed so surface is roughed without removing excess material. Painting shall be provided in accordance with Master Specification Section 09900, Painting.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Test. After Contractor and Engineer have mutually agreed that the equipment installation is complete and ready for continuous operation, Contractor and a qualified field service representative of the manufacturer shall conduct a running test of the odor control system in the presence of Engineer to demonstrate that the mechanism and its controls will function correctly. Make adjustments required to place equipment in proper operating condition. During initial operation and in the presence of manufacturer's representative the Contractor shall set dampers to balance the airflow through the vessel.

3.3.02 Inspection. A manufacturer's factory trained representative shall check and approve the installation before operation. The representative shall operate and test system in the presence of Engineer and verify that the equipment conforms to requirements, and instruct plant personnel on care and maintenance. The representative shall revisit the job site as often as necessary until all deficiencies are corrected. Perform testing, checkout and start-up of the equipment under the technical direction of the manufacturer's factory-trained representative. Do not energize motor operators without authorization from manufacturer's representative. Conduct a leakage test on each odor control vessel by providing a suitable area on site, but not on the basin cover to perform a hydrostatic test on each vessel by:

Filling each vessel to a height of 12' of water.

Allowing to standing for 2 hours to verify no leakage.

Vessel shall be inspected for leakage by manufacturer's representative.

Provide a written report in accordance with Section 1.4

If leakage is determined manufacturer shall submit a corrective action plan for the repair or replacement of the vessel. No corrective action shall be taken without Owner's approval.

If the vessel fails a second hydrostatic test, it shall be replaced.

Contractor shall install the odor control vessel within 24 hours of passing the hydrostatic test.

3.4 TRAINING. Furnish services of a qualified factory trained operations and maintenance serviceman to instruct and train operators in the proper care, operation and maintenance of the equipment. Provide these services for the time period of a minimum of 30 days and in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

3.5 MAINTENANCE. Provide services of factory trained representative of the manufacturer to correct defective work during the one year correction period. Replacement parts of equipment installed during the one-year correction period shall be equal to or better than the original.

End of Section

SECTION 15891

DUCTWORK AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. Furnish, fabricate and install all ductwork, including fittings, accessories, dampers, duct liner, hangers, diffusers, registers, grilles and any incidental work or components required to provide complete air supply, return and exhaust ductwork systems as shown on the Drawings and as specified herein.

In general, ductwork shall consist of any passageway made of sheet metal or other material substantially air-tight, used for the conveying of air, gas or materials. Included are fittings, transitions, bracing, fasteners, sealers, supports and accessories such as access panels, access doors, turning vanes and manual air balancing dampers. All ductwork shall be of size and material as specified herein and as shown on the Drawings. All duct sizes indicated on the Drawings are clear, inside dimensions. Where ductwork is lined with fiberglass, duct sizes shown on the Drawings are clear, inside dimensions to the duct liner material.

Any change in duct sizes, offsets, transitions and fittings required to accommodate job conditions shall be submitted to the Engineer for approval.

All ductwork and equipment shown on the drawings is intended to be approximately correct to scale, but figured dimensions and detailed drawings of the actual equipment furnished shall be followed in every case. The drawings shall be taken in a sense as diagrammatic. Size of ductwork and piping are shown, but it is not the intent to show every offset or fitting, nor every hanger or support, or structural difficulty that may be encountered. To carry out the intent and purpose of the drawings all necessary parts to make a complete working system ready for use shall be furnished without extra charge. The contractor shall be responsible to coordinate the system installation and routing with the work of all trades.

1.2 RELATED REQUIREMENTS. Cutting and patching is included in Division 2 except for items specified herein. Concrete work is included in Division 3 except for required HVAC anchor bolts, sleeves and templates, which shall be furnished under this Section.

Structural steel and miscellaneous metal is included in Division 5 except for supplementary steel required for HVAC hangers, equipment supports, anchors and guides, which shall be furnished under this Section.

Flashing and counter flashing is included in Division 7 except for items specified herein.

Painting is included in Division 9 except for factory finished HVAC equipment, HVAC shop painting and HVAC identification labeling and as required in Paragraph 3.15 below.

Exterior louvers and louver blank-off panels are included in this Section.

Thermal Insulation is included in Section 15290. This Section specifies the insulation type and thickness for the systems specified herein.

Electric duct heaters are specified in Section 15550 and installed under this Section.

Control dampers and duct mounted instruments are specified in Section 15950 and installed under this Section.

For fiberglass ductwork refer to Section 15895.

1.3 SUBMITTALS. Submit, in accordance with Section 01300, the following Drawings and data. Detailed equipment and ductwork drawings at a minimum scale of 1/8-in =1-ft-0-in. Drawings shall locate ductwork accessories including manual, automatic and fire dampers. Ratings of fire dampers shall be shown. Drawings shall also show and dimension maintenance clear spaces for motors, drives, coils, filters and access doors or panels. Indicate ductwork pressure class used for fabrication.

Standard shop and field installation details for transitions, elbows, takeoffs, discharge nozzles, turning vanes, access panels and doors, volume control and splitter dampers, hangers and volume extractors. When SMACNA references are used, the specific methods for the project shall be clearly defined. Where SMACNA has more than one option, the option to be used shall be indicated.

Ductwork materials, joining methods, reinforcing and material gauges. Where options are allowed by SMACNA, the proposed option shall be clearly defined. Indicate proposed materials and methods for ductwork and equipment hangers.

For units that will be shipped exposed, provide a description of the protective packaging that will be used during transit.

All submittals shall contain a statement that Sections 15500, and all other Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal.

In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4 REFERENCE STANDARDS. These standards shall be considered as minimum requirements. This is a general list and not all standards listed are necessarily referenced elsewhere in this Section. Specific requirements of this Section and/or Drawings shall have precedence. The Engineer shall resolve conflicts between published requirements.

Titles and abbreviations of Federal, State and industry standards, technical societies, associations and institutes and other organizations which may be used are as follows:

American Conference of Governmental Industrial Hygienists (ACGIH)

Air Movement and Control Association (AMCA)

American National Standards Institute (ANSI)

Air-conditioning and Refrigeration Institute (ARI)

Air Diffusion Council (ADC)

ADC 1062-R4 - Certification, Rating and Testing Manual.

American Society of Heating, Refrigerating and Air-conditioning Engineers (ASHRAE)

ASHRAE 68 - Laboratory Method of Testing In-Duct Sound Power Measurement Procedure for Fans.

American Society of Mechanical Engineers (ASME)

American Society for Testing and Materials (ASTM)

ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron, Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM D1784 - Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.

ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.

Factory Mutual (FM)

National Institute of Standards and Technology (NBS)

National Fire Protection Association (NFPA)

NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems.

NFPA 102 - Standard for Grandstand, Folding and Telescopic Seating, Tents and Membrane Structures.

NFPA 252 - Standard Methods of Fire Tests of Door Assemblies.

NFPA 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials.

Occupational Safety and Health Administration (OSHA)

Sheet Metal and Air Conditioning Contractors National Association (SMACNA)

Underwriters Laboratories (UL)

UL 181 - UL Standard for Safety Tests for Flame-Propagation of Fabrics and Films.

UL 555 - UL Standard for Safety Fire Dampers.

UL 723 - UL Standard for Safety Test for Surface Burning Characteristics of Building Materials.

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.5 QUALITY ASSURANCE. Inspection by the Engineer’s representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents. The Owner and Engineer reserve the right to check and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements.

1.6 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved shop drawings upon delivery. Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer. All materials shall be stored in a covered dry location off of the ground.

1.7 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts and shall meet the requirements of Sections 01750 and 01760. In addition to special items, the following spare parts shall be provided:

Furnish all special tools required for normal operation and proper servicing of the equipment.

Provide a minimum of 1 or 5 percent of the total units rounded to the next full unit whichever is greater for each size and rating of the following components.

Fire damper fusible links

Thermostats

Thermometers

Pressure gages

Control relays

Damper operators

Control transmitters

Control transformers

Pack spare parts in containers suitable for extended storage without deterioration of the parts. Containers shall be clearly labeled designating contents, pieces of equipment for which intended and equipment identification numbers.

1.8 DEFINITIONS. Particular terminology used under this Section is defined as follows: Traffic Level and Personnel Level - Areas, including process areas, equipment rooms, boiler rooms and other areas where insulation may be damaged by normal activity and local personnel traffic. Area extends vertically to 8-ft above floor, walkways, platforms and stairs, and horizontally 3-ft beyond the edge of walkways, platforms, and stairs.

Exposed Piping and Ductwork - Piping and ductwork visible from the floor level and includes all piping and ductwork in equipment rooms, boiler rooms, etc.

Concealed Piping and Ductwork - Piping and ductwork not visible from the floor level and includes piping and ductwork above hung ceilings and in shaftways.

Supply Air Ductwork - Ductwork carrying air from a fan or air handling unit to the space or spaces to which it will be introduced. This air may have been heated or cooled or in the case of ventilation system the air would be neither heated nor cooled. Supply air ductwork extends from the fan or air handling unit to the registers, grills or diffusers at the end of the ductwork.

Return Air Ductwork - Ductwork carrying air from the space it was supplied to back to a fan or air handling unit. Return air ductwork extends from the registers or grills at the end of the ductwork to the air handling unit or connection with an outdoor air intake duct.

Exhaust Air Ductwork - Ductwork carrying air from a space to a fan and then to be discharged to the outdoors. Exhaust air ductwork extends from the registers or grills at the end of the ductwork to the fan. From the fan the exhaust ductwork extends to the discharge point, exhaust air damper, or exhaust air plenum, whichever comes first.

Relief Air Ductwork - Ductwork carrying air from a space without a fan to be discharged to the outdoors. Relief air ductwork extends from the registers or grills at the end of the ductwork, the discharge point, relief air damper, or relief air plenum, whichever comes first.

Outdoor Air Ductwork - Ductwork carrying untreated air from the outside to a fan or air handling unit. Outdoor air ductwork starts at the intake point, outdoor air damper, or outdoor air plenum, whichever comes last. The outdoor air ductwork extends to the fan, air handling unit, or connection with a return air duct, whichever comes first.

Mixed Air Ductwork - Ductwork that can carry either return air or outdoor air or a combination of both. Mixed air ductwork starts at the connection of the return air and outdoor air ducts and extends to the fan or air handling unit.

Outdoor Air Plenum - A plenum that extends from the opening in the skin of the structure to the outdoor air duct. If the outdoor air damper is directly at the intake or there is no outdoor air damper, the plenum will extend to the first size reduction. If the outdoor air damper is not at the intake, the plenum will extend to the outdoor air damper.

Exhaust Air Plenum - A plenum that extends from the opening in the skin of the structure to the exhaust air duct. If the exhaust air damper is directly at the discharge or there is no exhaust air damper, the plenum will extend from the last size reduction. If the exhaust air damper is not at the discharge, the plenum will extend to the exhaust air damper.

Relief Air Plenum - A plenum that extends from the opening in the skin of the structure to the relief air duct. If the relief air damper is directly at the discharge or there is no relief air damper, the plenum will extend from the last size reduction. If the relief air damper is not at the discharge, the plenum will extend to the relief air damper.

Ventilated Spaces - Areas supplied with outdoor air on a continuous or intermittent basis. The outdoor air may be heated and/or cooled or untreated.

Heated Spaces - Areas where heat is supplied to maintain a minimum temperature during the heating season.

Unheated Spaces - Areas where heat is not applied and there is no minimum temperature during the heating season.

Conditioned Spaces - Areas that are provided with heating and mechanical cooling.

Non-Conditioned Spaces - Areas that are not provided with mechanical cooling.

Thermal Conductivity - The rate of heat flow through unit area of a homogeneous substance under the influence of unit temperature gradient in the direction perpendicular to the area. Units-BTU per (hour)(sq ft)(degrees F temperature difference)(per inch thickness).

Indoor Ductwork - Ductwork within a building that is not exposed to the weather.

Outdoor Ductwork - Ductwork that is not within a building and is exposed to the weather.

Hot Ductwork - Ductwork carrying air with a temperature above the surrounding space temperature.

Cold Ductwork - Ductwork carrying air with a temperature below the surrounding space temperature.

Hot/Cold Ductwork - Ductwork carrying air with a temperature that can be either above or below the surrounding space temperature.

Flues/Stacks/Breeching - Ductwork carrying products of combustion to atmosphere.

1.9 COORDINATION. The Drawings indicate the extent and general arrangement of the systems. If any departures from the drawings or specifications are deemed necessary, details of such departures and the reasons therefore shall be submitted as soon as practical for review. No such departures shall be made without the prior written concurrence of the Engineer.

The Contractor shall coordinate the location and placement of all concrete inserts and welding attachments with the structural engineer.

The Contractor shall assume full responsibility for coordination of the HVAC systems, including; scheduling, and verification that all structures, ducts, piping and the mounting of equipment are compatible.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATION FOR DUCTWORK. Flexible connections for conventional air conditioning systems shall be glass fabric coated with polychloroprene. Fabric must comply with Underwriters Laboratories Standard UL214 and NFPA Bulletin 90A. Connections shall be Ventglas by Ventfabrics or equal.

Flexible connections for process exhaust systems shall be fiberglass fabric coated with Duponts teflon. Fabric must be resistant to Sodium Hypochlorate. Fabric must comply with Underwriters Laboratories Standard UL181 and NFPA Bulletin 102. Connections shall be Ventel by Vent Fabric or equal.

Furnish flexible connectors at each inlet and outlet of fan and in the duct runs where required for expansion, contraction and movement, and where called for on the Drawings. Flexible connections shall be integrally flange molded arch type units constructed of EPDM rubber 1/4-in thick, reinforced with a strong synthetic asbestos-free fabric suitable for corrosive service. The flexible connections shall be designed to minimize the transmission of vibration from the fans to the ductwork at the suction and discharge connections. Expansion or contractor flexible connections shall be designed to allow 1-in movement. Working length or “live” length shall be as designed by the manufacturer to allow up to 1-in of movement.

Ends shall be flanged, with flanges matching duct connection flanges. Corners on rectangular expansion joints shall be molded and free of patches or splices. The flexible connections shall be suitable for outdoor service and temperature ranges from minus 10 up to 125 degrees F, and pressure to 5 psig. Specially fabricated split Type 316 stainless steel retaining back-up bars shall be supplied to prevent damage to the EPDM rubber flanged with Type 316 stainless steel bolts are tightened. Acceptable Manufacturer: Holz Rubber Company, Mercer Rubber, Company, Proco Products Incorporated, or approved equal.

2.2 FLAME AND SMOKE RATINGS. All materials, including adhesives, surface coatings, sealers, assemblies of several materials, insulation, jacketing, finish, etc, shall have flame spread ratings not over 25 (fire resistive) and smoke development ratings not over 50 and fuel contributed rating not over 50, as established by tests conducted in accordance with the Federal Standard 00136B, National Bureau of Standards Radiant Energy Fire Test and the National Fire Code of the NFPA. These requirements apply to all circumstances whether the materials are field applied or applied by a manufacturer in his/her shop, or elsewhere, prior to delivery to the project.

2.3 SOUND CONTROL. The selection of ductwork and accessories shall be such as not to create noise that will exceed the levels of permissible noise exposures for occupational areas as established by the OSHA and other Federal, State and local safety and health standards, codes and ordinances. Acoustical Lining - Internal sound attenuation and insulation (for air conditioning ductwork) shall be 1-in thick bonded fiberglass mat coated with black pigmented fire resistive coating on the air stream side. Liner shall comply with NFPA 90A requirements. Flame spread and smoke development ratings shall be 25 and 50 respectively. Material shall be Owens Corning; Aeroflex or equal.

2.4 HANGERS, SUPPORTS AND ANCHORS. Furnish supports, hangers and other devices necessary to support firmly and substantially the equipment and ductwork described in this Section. Ductwork support systems shall include restrains as required by the applicable building codes to withstand seismic loading. All equipment, ductwork, and supports that are installed outdoors shall be designed and installed to meet wind loadings as required by the International Building Code, all other applicable codes, and the requirements specified herein. Design shall be provided by a professional engineer hired by the Contractor as specified in other sections of the specification. Signed and sealed calculations shall be submitted for record purposes.

Rectangular, Round and Flat-Oval Ductwork - Spacing and size of hangers shall be as called for in the SMACNA standards, except as limited below.

Rectangular ductwork 48-in wide and larger shall be supported by adjustable threaded rod hangers.

Round ductwork 37-in and larger shall be supported by two adjustable threaded rods at each support.

All hangers shall be of same material as ductwork which they serve, e.g., galvanized, aluminum, black steel, etc, except for PVC ductwork which shall be Type 304 stainless steel.

All hanger hardware and fasteners shall be of the same material as the duct they serve or shall be of a material with equal or greater corrosion resistance. Where materials other than the duct material are used, they must be approved by the Engineer before installation.

Perforated band iron or wire for supporting ducts shall not be permitted.

Where C-clamp type hangers are used, furnish with a retainer strap.

Support flexible duct withType 304 stainless steel band hangers, 1-in wide minimum, attached so as not to crush the ductwork. The use of wire to hang flexible ductwork shall not be permitted.

The following methods of hanger attachment to the building structure are NOT allowed. The numbers and letters refer to hanger methods shown in Figure 4-1, 4-2 and 4-3 of the 1985 edition of the HVAC Duct Construction Standards Metal and Flexable as published by SMACNA.

"T"- wrap around strap on open web joist.

"W" - bent over band on open web joist.

"14" - friction clamps.

"17" - bent wire in metal deck.

Design of hangers shall include the effect of all loads applied to the duct as well as the load of the duct. These loads include, but are not limited to wind, snow and internal dirt or liquid buildup.

Hangers shall not be supported from roof decking or bulb tees. Where required, provide supplemental steel to span between the building structures.

2.5 DUCTWORK MATERIAL. Ductwork shall be constructed of the materials specified using the gauges or thicknesses, reinforcing and construction methods in accordance with SMACNA standards. Unless otherwise specified, all components of the duct systems shall be constructed of the same material as the ductwork. This is to include braces and turning vanes.

Galvanized steel ductwork shall be constructed of hot-dip galvanized sheet steel, per ASTM A653.

Stainless steel ductwork shall be constructed of Type 316 stainless steel. Aluminum ductwork.

2.6 DUCTWORK CONSTRUCTION DETERMINANTS. Low pressure ductwork shall be constructed of the following materials and to the SMACNA standards:

The following is to be used as a general guide for duct material select.

Galvanized Steel – shall be used for normal heating, cooling, and ventilation applications where the air handled in surrounding the duct is relatively dry, and there are no corrosives.

Stainless Steel – shall be used in areas that galvanized steel and aluminum are not suitable and as shown on the drawing.

Aluminum – shall be used in areas where shown on drawing.

Design of ductwork shall include all loads applied to the ductwork, in addition to the load of the duct. These loads include but are not limited to wind, snow and internal dirt or liquid build up.

2.7 DUCTWORK CONSTRUCTION. All ductwork shall be substantially built with joints and seams smooth on the inside and given a neat appearance on the outside. Inside surfaces and joints shall be smooth and free from pockets, burrs and projections. All joints shall be substantially airtight with laps made in the direction of air flow and no flanges projecting into the air stream.

2.7.01 Pressure Classes. Pressure classes for determination of sheet metal gauge and reinforcing shall be as defined by the latest issue of the SMACNA - Industrial Duct Construction Standards. For systems with fans with a shut off static pressure higher than 2-in w.g., design pressure shall be as listed in Paragraph 2.06 above. For systems with fans a shut off static pressure 2-in w.g. or less design pressure shall be equal to the maximum pressure indicated for the fans or air handling units on the Schedules and the pressure class shall be the same for the entire length, including branches, of the specific duct system.

2.7.02 Rectangular Ductwork (Sheet Metal). Ductwork shall be constructed as shown on the Drawings in accordance with the specified SMACNA - Construction Standard. Cross-breaking shall conform to SMACNA standard. Cross-breaking shall be applied to the sheet metal between the standing seams or reinforcing angles. The center of the cross-break shall be of the required height to assure rigidity for each panel.

Alternate Construction - Factory fabricated joint systems may be offered as an alternate form of construction. The system offered shall meet all requirements of

SMACNA. Alternate joint systems shall be "Ductmate System" as manufactured by Ductmate Industries, Inc., installed in accordance with the manufacturer's recommendations. The system shall be sealed for zero leakage and angle attachment to the main duct section shall be by tack welding. The use of screws is not allowed.

2.7.03 Round Ductwork (Sheet Metal). Ductwork shall be constructed as shown on the Drawings in accordance with the specified SMACNA - Construction Standard.

Round ductwork longitudinal seams shall be either lock type or continuous welded construction. Slip joints shall be used on ductwork and fittings up to 36-in in diameter and Vanstone flanges shall be used on ducts over 36-in in diameter.

Fittings shall be fabricated with continuous welds. 90 degree elbows shall have a turning radius of 1.5 times the fitting diameter. 90 degree elbows shall be mitered construction with five segments. All fittings in the round duct system shall be of the male and female type. Mechanically fasten the conduits together using sheet metal screws not less than four per fitting 6-in on centers maximum and equally spaced around the circumference of fitting.

Round ductwork and fittings shall be manufactured by United Sheet Metal; SEMCO or equal.

2.7.04 Insulated Round Flexible Ducts. Round flexible ducts shall comply with specified SMACNA - Construction Standards and be constructed of corrugated ductile aluminum that can be bent and rebent by hand and is self-supporting. 1-in insulation shall be applied around the outside and be finished with a vinyl cover.

Thermal conductivity of the insulation shall not exceed 0.27 BTU/hr/sq ft/1 degree F at75 degree mean temperature. Duct shall be Class I, per UL 181.

Maximum length shall be 5-ft. The remainder shall be galvanized sheet metal. Duct run shall be as short and straight as possible to minimize static resistance.

Ducts shall be Bendway as manufactured by Flexaust Company or approved equal.

2.8 VOLUME AND SHUT OFF DAMPERS. Rectangular dampers shall be multiple blade type with channel frame, exterior linkage and position indicator and locking device. Blades shall not exceed 6-in in width.

Round or oval dampers and splitters shall be shop fabricated, single blade type with position indicators and locking device. For galvanized sheet metal systems, material shall be two gauges heavier than ductwork or 18 gauge, whichever is heavier.

Dampers shall be constructed of the same material as the ductwork.

Shut off dampers shall have replaceable neoprene seals. Leakage rates shall not exceed 7 cfm/sq ft at 4-in w.g. for rectangular dampers and 0.15 cfm/in of perimeter at 4-in w.g. for round or oval dampers.

Dampers shall be supplied with locking quadrants. Quadrants in galvanized steel and black steel ductwork shall be galvanized steel. All other duct systems shall have stainless steel locking quadrants. Locking quadrants shall have a positive method of holding the damper in its selected position such as a bolt through both the quadrant and the lever arm. Systems using springs or other devices that can vibrate loose are not acceptable.

All dampers shall be flanged connections unless otherwise noted.

All dampers shall be selected for a rating that equals or exceeds the specified system pressure and velocity. Manufacturer shall be Ruskin or equal.

Balancing and balancing/shut off dampers shall be opposed blade. Shut off dampers shall be parallel blade.

2.9 ACCESS DOORS. Access doors shall be minimum 24-in by 24-in in ducts 26-in and larger. Where the duct size is less than 26-in, the largest door that can be accommodated shall be used. Access doors shall be of the same material as the duct, pan type construction for metal ductwork, with smooth edges and fitted seals, constructed and installed for air-tight fit with ease of opening and closing. Doors shall be substantially butt hinged, with heavy sash locks and substantial door pulls. Door openings and door frames shall be reinforced with bar stock or angle. Where ductwork is installed with duct liner or exterior duct insulation, the access door shall be of the insulated type. Access doors shall be factory fabricated. Where ductwork is constructed of aluminum or stainless steel, access door and hardware shall be of similar material.

Hand hole access panels shall be 12-in by 12-in, constructed of the same material as the ductwork, with peripheral gaskets and sash locks. Provide hinges or chain for attachment to duct.

2.10 FASTENERS. Sheet metal screws, drive cleats, cinch bands and other fasteners shall be fabricated from materials with an equal or greater corrosion resistance than the ductwork in which they are installed. Where a material other than the duct material is used, it shall be approved by the Engineer before installation

2.11 RELIEF DAMPERS. Relief dampers shall be manually operated or automatic gravity-type used for exhaust of air. Dampers shall be constructed of the same material as the ductwork with flanged connection and blades set in parallel-bladed position and gang operated by exterior linkage. Dampers shall have a shop coat of primer or aluminum finish as specified. Relief dampers shall be of size, type and capacity as specified on the Drawings. Adjustable counter-balanced gravity dampers shall be provided where indicated on the Drawings. Manufacturer shall be Ruskin or equal.

2.12 LABELS. The service of each duct along with and arrow indicating direction of flow shall be provided on each duct system. Labels shall be located not more than 26 linear feet apart and shall also be provided at both sides of wall penetrations, at each damper, and each equipment connection.

Labels shall contain the service spelled out, the duct size, and the equipment number of the equipment served. Label locations shall have unobstructed view from normal viewing locations.

Numbers and letters shall be die-cut from 3.5 mil vinyl film and pre-spaced on carrier film. Adhesive and finish shall be protected with one piece removable liners. Colors shall be white letters on black backgrounds.

The system for preparation and application of letters shall be Type B a.s.i./2 by ASI Sign Systems; Architectural Graphics Inc. or equal. Letters shall be 3-in high Optima Bold, upper case using Grid 2 spacing. Direction arrows are to match. The instructions of the manufacturer shall be followed in respect to storage, surface preparation and application of letters.

Each piece of equipment is to be provided with an identification label listing the unit number and the areas served. Labels shall be as specified above.

2.13 DIFFUSERS, REGISTERS AND GRILLES. All diffusers, registers and grilles shall be of the shape, sizes, capacity and type as shown on the Drawings. On all duct openings that do not have a specific diffuser, register, grill or mesh cover provide a wire mesh cover.

Finish - Unless otherwise specified, diffusers, registers and grilles shall have the following finish. All diffusers, registers and grilles located in ceilings shall have a baked white enamel finish except where the ceiling system has an exposed aluminum support grid. Where the ceiling has an exposed aluminum support grid the diffusers, registers and grilles shall have a baked aluminum enamel finish. All diffusers, registers and grilles not located in ceilings shall have baked aluminum enamel finish.

2.13.01 Supply Air Diffusers. General - Diffusers shall be a factory-assembled unit of welded steel construction consisting of a housing with built-in louvers, cones, vanes or other means of directing discharge of air in a particular pattern principally for overhead or ceiling air diffusion. All diffusers shall be equipped with a volume control device. Distribution of air may be adjustable if so specified.

2.13.02 Exposed Duct Mounted Diffusers. Diffusers shall be of the adjustable type for ease of horizontal and vertical adjustment of air pattern. Refer to Drawings for direction of air throw. Each diffuser shall be equipped with an equalizing grid, baffles as required and extended bottom plate flange designed specifically for air diffusion from diffusers mounted on exposed ductwork. Acceptable manufacturers shall be Titus, Krueger and Price.

2.13.03 Supply Air Grilles. In general, grilles shall be a factory-assembled unit consisting of a grille with double deflecting adjustable airfoil vanes to diffuse supply air in the various directional patterns as shown on the Drawings. Grilles shall be of aluminum frame and border with aluminum louver blades. All grilles shall be furnished with a sponge rubber gasket to prevent streaking. Front and rear louver blades shall be individually adjustable. Where wall mounted, front blades shall be vertical and rear blades shall be horizontal. Where ceiling mounted, front blades shall be parallel to long dimension. Grilles shall be Series 272F by Titus Manufacturing Corp.; Krueger and Price.

2.13.04 Supply Air Registers. Registers shall be a factory-assembled unit consisting of a grille with adjustable vanes to diffuse supply air in the various directional patterns as shown on the Drawings and a damper. Grilles shall be of aluminum frame and border with aluminum louver blades. All registers shall be furnished with a sponge rubber gasket to prevent streaking. Supply air registers shall have aluminum opposed-blade dampers. Front and rear louver blades shall be individually adjustable. Where wall mounted, front blades shall be vertical and rear blades shall be horizontal. Where ceiling mounted, front blades shall be parallel to the long dimension.

2.13.05 Exhaust Air Grilles / Registers. Acceptable manufacturer shall be Titus Manufacturing Corp.; Krueger and Price

2.13.06 Return Air Grilles / Registers. Louver-Faced Return Air Grilles. In general, grilles shall be a factory-fabricated unit of aluminum frame border and louver blades. All grilles shall be furnished with a sponge rubber gasket to prevent streaking. Acceptable manufacturer shall be by Titus Manufacturing Corp.; Krueger and Price.

2.13.07 Eggcrate Type Return Air Grilles. Return air grilles shall be of all aluminum construction consisting of 1/2-in thick cores with 1/2-in square grid size. The square grid pattern shall provide maximum free area with minimum "see through." Acceptable Manufacturers shall be: Titus Manufacturing Corp., Price, Krueger Manufacturing Co., Inc., or approved equal.

2.13.08 Wire Mesh Covers. Where wire mesh covers are called for on the Drawings, the wire mesh and support frame shall be the same material as the duct where the cover is installed. Unless otherwise noted the wire mesh shall be 0.5-in mesh. The wire mesh shall be contained in a metal frame. The mesh shall be firmly attached to the frame to prevent it being pulled out of the frame by casual contact. The frame shall be a minimum of 16 gauge sheet metal or the minimum gauge for a flange based on SMACNA, whichever is greater. The frame shall be on both sides of the mesh creating a sandwich with the mesh in the middle. Fastenings shall go through the frame on both sides of the cover.

2.14 ROOF CURBS. Roof curbs shall be furnished for all roof mounted HVAC equipment including fans and relief or intake vents. Roof curbs shall be pre-fabricated type, minimum 12-in height and sized to match the dimensions of the equipment base supported. Roof curbs for fans are specified under Section 15860. Curbs shall be straight sided type of all aluminum welded construction with nominal 2-in thick acoustical/thermal insulation in curb walls. A perforated metal liner shall be provided to protect the insulation. Curbs shall provide a flat top surface regardless of the roof slope. Curb interiors shall be provided with protective coatings when a coating is specified.

2.15 TURNING VANES. Turning vanes shall be shop fabricated and installed in all abrupt rectangular elbows. Single thickness or airfoil type double thickness blades shall be chosen based on SMACNA recommendations.

Vanes shall be fabricated from the same material as the ductwork and manufactured by Elgen; Duro-Dyne; Aero/Dyne or equal.

2.16 VOLUME EXTRACTORS. Volume extractors shall be shop fabricated with synchronized curved extractor blades, heavy side rails and screw operator.

Extractors shall be fabricated from the same material as the ductwork and manufactured by Carnes; Titus or equal.

2.17 FIRE DAMPERS. Fire dampers shall meet local codes and the requirements of the NFPA Pamphlet No. 90A. Dampers in systems constructed of materials other than galvanized steel shall be constructed of Type 316 stainless steel.

Dampers shall be sized so that the free air space is not less than the connected duct free area. Location shall be as shown on the Drawings and required by code. Dampers shall have a minimum 1-1/2 hour standard fire protection rating in accordance with NFPA Pamphlet No. 252 and UL 555. Where the fire protection rating of the partition exceeds 2 hours, multiple dampers in series may be used to provide a rating equal to the partition.

Fusible Links - Dampers shall be arranged to close automatically and remain tightly closed upon the operation of a UL approved fusible link or other approved heat actuated device, located where readily affected by an abnormal rise of temperature in the duct. Fusible links shall have a temperature rating of 50 degrees F above the maximum normal duct operating temperature, but not less than 165 degrees F.

Workmanship - Install dampers in sleeve unless noted otherwise on the Drawings or in the case of dampers listed for installation without sleeves after specific approval from the Engineer. Fire dampers shall be installed to provide a positive barrier to passage of air when in a closed position. Dampers shall be installed so they will be self-supporting in case of duct destruction due to heat. Care shall be exercised that the frame be set so that the closing device will not bind.

Factory fabricated, steel-curtain type, UL approved fire dampers, with damper blades out of the air stream, are acceptable. These fire dampers shall be installed in accordance with the manufacturer's instructions and UL 555.

Access Doors - Tight fitting access doors shall be provided for accessibility to dampers and fusible links for inspection and maintenance.

All fire dampers shall have written approval from local authorities.

PART 3 - EXECUTION

3.1 INSTALLATION OF DUCTWORK. Fabricate and erect all ductwork where shown on the Drawings, as specified herein, and in accordance with SMACNA standards. Rigidly support and secure ductwork.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

Wherever ducts are divided, maintain the cross-sectional area. All such changes must be approved and installed as directed by the Engineer or as approved on shop or erection drawings.

During installation, temporarily close the open ends of ducts to prevent debris and dirt from entering. Install work in accordance with the overall approved progress schedule and in cooperation with all other trades so there will be no delay to other trades.

Install louver blank off panels provided by the louver manufacturer as specified under Section 10200. Provide louver manufacturer the louver blank off panel dimension requirements. Secure blank off panels to the building structure using aluminum angles and rustproof fasteners. Caulk perimeter completely to eliminate water penetration.

Cross-break sheet metal in accordance with SMACNA duct construction standard. Apply cross-breaking to the sheet metal between the standing seams or reinforcing angles. The center of the cross-break shall be of the required height to assure each panel section being rigid.

Cross-break streamlined ducts on top only and adequately brace internally.

Beading as specified in SMACNA will be acceptable in lieu of cross-breaking.

The Drawings of the air ducts and air risers show the general location for installation of the ducts and risers. Should additional offsets or changes in direction be made, these changes must be considered in the original bid and shall be installed at no additional cost to the Owner.

All necessary allowances and provisions shall be made in the installation of the ducts for the structural conditions of the building. Ducts shall be transformed or divided as may be required. Wherever this is necessary, maintain the cross-sectional area. All of these changes, however, must be approved and ducts installed as directed by the Engineer or as approved on shop or erection drawings.

The taper of all transformations shall be not more than 15 degrees.

Secure casing to curbs according to SMACNA "Duct Construction Standards."

Provide baffle plates as required to prevent stratification and to provide proper operation of controls.

Where ducts are constructed of materials other than galvanized steel the reinforcing members shall be of the same material as the ductwork.

The use of button punching or snap locks on ductwork constructed of aluminum shall not be permitted.

Ducts carrying moist air that pass through areas that could cause condensation shall be pitched to facilitate condensate removal. Low points of such ducts shall be provided with drains.

Ductwork connections to units that require corrosion resistant coatings shall be made with flanges. Flanges shall be factory drilled before coating. Resilient washers suitable for the environment shall be used to protect the coating from the bolts in the flange. The use of self-tapping screws or other fastening methods that will damage the coating are not acceptable.

3.2 HANGERS. Rectangular, Round and Flat-Oval Ductwork - Spacing and size of hangers shall be as recommended in the SMACNA standards except as noted in PART 2.

Install hangers plumb and securely suspended from supplementary steel or inserts in concrete slabs. Sufficiently thread lower ends of hanger rods to allow adequate vertical adjustment. Do not use building siding or metal decking to hang ductwork.

Ducts shall not be supported from furring, hung ceilings or from another duct or pipe.

C-clamp type hangers shall be supplied with a retainer strap.

Ductwork shall not come in contact with any of the ceiling construction or any other equipment in the ceiling cavity.

Duct support at flexible connections shall be adjustable for ease of aligning the duct to the piece of equipment.

3.3 SEALING OF DUCTWORK. General - Unless otherwise indicated, seal all ductwork joints and seams using sealant in accordance with the instructions of the sealant manufacturer and this Section. All transverse seams, joints and fitting connections, both shop and field assembled, shall be sealed in accordance with this Section. Longitudinal seams shall be sealed on all duct systems with a design operating pressure greater than 2-in w.g.

Application of Sealant - Thoroughly clean all seams, joints, etc, of dirt, oil, grease, or other coatings which might interfere with the adhesion of the duct sealant before the sealant is applied.

Uncured sealant may be forced into the slotted side of the seam or joint before shop or field assembly and the joint or seam completed while the sealant is still uncured. Excess sealant shall be removed from both the inside and outside of the duct before it sets.

Duct Tape - The use of duct tape alone for sealing ductwork is prohibited. Duct tape may be used primarily for the purpose of retaining the uncured duct sealant in seams and joints until it has cured. Duct tape shall not be applied to the inside of any duct nor shall it be applied to standing type joints at any time. All duct tape used shall be compatible with the sealant. The use of sealant saturated tape is acceptable when part of an integrated sealing system.

Sealant shall be either in liquid form or a mastic with a maximum flame spread of 25 and a maximum rate of fuel contributed and smoke developed of 50 when tested in accordance with ASTM E84, NFPA 255 and UL 723.

Sealing systems shall be suitable for the environment. The following schedule is to be used to select the sealant.

Indoor, dry galvanized round and rectangular duct is to be sealed with Iron Grip 601 or equal.

Indoor, dry, stainless steel, aluminum and PVC coated is to be sealed with FTA 20 adhesive and DT-Tape gypsum or equal.

All other areas unless otherwise noted are to be sealed with FTA 50 adhesive and DT- Tape gypsum or equal.

All sealers listed are manufactured by Hardcast Inc and are to define the type of sealer. Other equal sealants are acceptable.

3.4 DUCTWORK FITTINGS AND ACCESSORY ITEMS. Duct Elbows - Changes in direction and offsets shall be made in a gradual manner to facilitate streamline flow of air. All elbows shall have a centerline radius of not less than 1-1/2 times the width of the duct in the plane of the elbow. For rectangular ductwork where full radius elbows cannot be installed, provide abrupt elbows equipped with shop-installed turning vanes unless noted otherwise on the Drawings.

3.4.01 Flexible Fabric Connectors. Install flexible connectors for vibration isolation at all duct connections to fans, fan units or blowers, air handling units and air conditioning units. Make connections substantially airtight at all seams and joints.

Where the construction of the flexible connection or vibration isolator results in a cross sectional area of the connection which is less than 90 percent of the adjacent ductwork, the size of the connection shall be increased to provide a cross sectional area equal to or greater than 90 percent of the adjacent duct.

Provide flexible duct connections at both the intake and discharge connections for all fans and air handling units except as noted below.

Wall and roof fans that have integral motor/fan wheel isolation.

Air handling units where the fan is isolated from the intake and discharge connections by internal flexible connections or separations, and the unit is mounted without vibration isolators between the unit and the support structure.

Ductwork spacing and alignment for flexible connections shall be aligned to the tolerances of the flexible connection manufacturer, or plus/minus 1/4-in whichever is less. Bolts shall be torqued to the manufacturer's recommendations. Do not over tighten.

Where flexible connections are used as expansion joints, the manufacturer's precompression recommendations must be followed. When the temperature at installation differs from the temperature in the precompression recommendation, a correction shall be made.

3.4.02 Dampers. Install manual volume control dampers wherever it may be necessary to regulate air volume for system air balancing and where shown on the Drawings.

Install splitter dampers, where shown on the Drawings, to regulate air volume for system air balancing.

Install motorized and pneumatic actuated dampers when supplied by other trades.

3.4.03 Volume Extractors. Factory-fabricated volume extractors shall be installed at all main duct takeoffs to supply air diffusers.

3.4.04 Access Doors. Hinged access doors shall be installed where listed below, wherever shown on the Drawings and wherever access may be required for service, maintenance and adjustment.

Provide access doors at the following locations (minimum requirements):

Coils in ducts - both entering and leaving side.
Motorized or pneumatic actuated dampers - linkage side.
Duct mounted temperature controllers.
Freeze-stats.
Smoke detectors.
Plenums.
Fire dampers.
Smoke dampers.
Electric duct heaters.
Filter banks.
Manual dampers and splitters.
Inlet side of centrifugal fans.
Volume extractors.
Inlet and outlet ducts to fans and air handlers.
As necessary or required.

Where access doors are required in ductwork located above ceilings, coordinate the location of the access doors to clear the ceiling support system and to be accessible through the ceiling grid.

3.4.05 Duct Liner. Duct liner shall be shop installed on the interior surfaces of ductwork, where shown on the Drawings or as specified herein. Installation shall be made using a single thickness of duct liner and shall be in accordance with Duct Liner Application Standard by SMACNA. Liner shall be adhered with adhesive having a minimum of 90 percent coverage. Fasteners shall be spaced in accordance with SMACNA. After the duct has been formed the leading edges of the insulation that will be abutting another lined duct shall be spray-coated with fire-resistive adhesive. For ductwork with velocities exceeding 4000 fpm a metal nosing shall be installed at all transverse edges to secure the duct liner.

3.4.06 Blast Gates. Blast Gates shall be installed where shown on the Drawings. After final balancing of the system, drill a hole through both the frame and gate and insert a positive locking device, such as a pop rivet, to prevent moving the gate.

3.5 GRILLES, REGISTERS AND DIFFUSERS. The location of diffusers, registers and grilles shall be as shown on the Reflected Ceiling Plans and as shown on the ductwork drawings. The exact location of these devices shall be determined in the field in cooperation with the other trades. Install all devices in an approved manner in accordance with the manufacturer's recommendation.

3.6 FLEXIBLE DUCTWORK. Make connections, joints and terminations air tight as recommended by the manufacturer. Where joints are made to rigid sheet metal ductwork, apply 3M Company EC-800 sealer and the joint shall be drawn tight with a drawband. Collars shall be 2-in long minimum and sleeves shall be 4-in long minimum. Install flexible ducts with one duct diameter-radius elbows and cut as short as possible. Duct shall not be compressed and the length shall be kept short so minimum hangers or supports are required and static pressure losses are kept to a minimum. Sag in flexible duct shall not exceed 1/2-in/ft between duct supports.

3.7 FILLING IN SPACE AROUND DUCTWORK. To prevent sound passing through the area between the duct and the framed or cut opening in the floors, walls or partitions, pack mineral wool to completely fill the space the full depth of the opening. Whenever a fire-rated wall or floor is penetrated and a fire damper is not required, fill the space around the duct with a locally approved fireproof rope. At penetration, apply escutcheon plates on both faces of the wall to close the gap between the structure and the sides of the insulated or bare duct. Escutcheon plates shall be the same material as the duct for metal ducts and stainless steel for PVC ducts.

3.8 DUCT SUPPORTS AT FLOOR PENETRATION. Where vertical ducts pass through floor openings and a fire damper is not required, rigidly attach supporting angles to the ducts and anchor with expansion bolts to the floor or curb. Angles shall be of the same material as the duct for metal duct and stainless steel for PVC ducts, placed on the two long sides of the duct extending 3-in over edge of opening and shall not be less than the sizes recommended by SMACNA.

Remaining open area in the floor opening shall be sealed with a plate of the same material as the angle.

3.9 SUPPORTING OUTDOOR DUCTS. Roof top ductwork shall be installed using structural steel angles for support. Sizes of angles shall be as shown on the Drawings.

The vertical supporting angles shall be continuous full height of the duct and shall be bolted to same. Intermediate duct supporting angles and bottom plates shall be welded to the vertical angles. Weld all of these angles together to form a stiff continuous supporting unit for the duct. Paint angles with rust inhibitive primer after welding.

Slope ductwork to shed water.

3.10 DUCTWORK TERMINATIONS AT MASONRY OR CONCRETE. Where ducts terminate at masonry or concrete openings, place a continuous 2-1/2-in by 2-1/2-in by 3/16-in angle of the same material as the duct around the ductwork. Use stainless steel angles for PVC ductwork. Bolt the angle to the construction and make airtight by applying caulking compound on the angle before it is drawn down tight to construction.

Fasten plenums to concrete curbs with 3-in by 3-in by 1/4-in continuous angle. Concrete curbs are provided under another Division. Mount angle on a continuous bead of caulking compound and anchor to the curb on 16-in centers. Terminate duct at the curb and bolt to the angle. Seal the duct to the curb with a continuous bead of caulking compound. Apply neoprene filler strip to level curb surface as necessary

3.11 DUCTWORK GENERATED NOISE. All ductwork shall be free from pulsation, chatter, vibration or objectionable noise. After system is in operation, should these defects appear, correct by removing, replacing or reinforcing the work. No discreet tones will be allowed.

3.12 PLENUMS. Seal fresh air inlet and exhaust air plenums watertight at louvers or otherwise subject to water entrainment at all bottom joints and seams and up all vertical seams for a minimum of 12-in. Remove excess sealant before it sets hard. Where possible, pitch fresh air inlet and exhaust air plenums down towards the louver. Where it is not possible to pitch the plenum, provide a 1-in capped drain connection at the low point of the plenum.

3.13 TEST PORTS. Where shown on the Drawings and where required for testing and balancing, provide instrument insertion ports. Size and location of ports shall be coordinated with the Contractor performing air balancing. Seal ports with plastic snap lock plugs. When the ductwork will be insulated, extend the port to the face of the insulation and seal the vapor barrier to the port. When the ductwork is lined, extend the port into the duct to the inner surface of the duct liner.

In round ductwork provide 2 ports 90 degrees on centers. In rectangular ductwork provide ports as required by AABC or NEBB for a full traverse measurement.

As a minimum, ports shall be provided in the following connections:

All duct mains.

All duct branches unless all connections are diffusers, registers, or grilles and the total can be calculated by summing the readings for all of the connections.

All connections to tanks or hoods where there is no other access for taking a measurement.

A main duct is defined as one of the following:

A duct serving five or more outlets.

A duct serving two or more branch ducts.

A duct emanating from a fan or plenum.

All remaining ducts are considered branch ducts.

3.14 ADJUSTMENT. Start-Up and Temporary Operation

Properly maintain and service all equipment and systems until the particular equipment or the system has been accepted by the Owner.

3.15 PAINTING. Paint the outside face of all louver blank off panels and the interiors of unlined plenums and ductwork where connected to louvers. Prime and paint with two coats of flat black exterior paint. Painting shall be performed under this Section and shall be as specified in Division 9.

3.16 CLEANING OF DUCTWORK. Maintain all ductwork, fans, coils, air filters, outlets and other parts of the ductwork systems in a clean condition during installation. Clean complete ductwork systems prior to testing and air balancing. Secure cheese cloth over all openings of the ductwork system for entrapment of dirt during the cleaning operation.

3.17 I NSTALLATION OF DUCTWORK INSULATION. Provide ductwork insulation as specified under Section 15250 and with thickness as specified under this Section.

Ductwork Insulation - Blanket Type (Type I-5)

Hot Ductwork (Heating and Ventilation)

Insulation Thickness - Concealed round and rectangular hot ductwork.

Supply ducts in heated spaces - 1-1/2-in

Supply ducts in unheated spaces - 2-in

Return ducts - 1-1/2-in

Mixed air ducts - 1-1/2-in

Cold and Hot/Cold Ductwork

Insulation Thickness - Concealed round and rectangular cold and hot/cold ductwork and exposed round cold and hot/cold ductwork.

All ducts in non-conditioned spaces 2-in

All ducts in conditioned spaces 1-1/2-in

Outdoor air ducts and plenums 2-in

Exhaust air ducts and plenums between shut-off damper and outdoors 1-1/2-in

Ventilation supply air ducts and plenums between shut-off damper and outdoors 2-in

Ductwork Insulation - Fiberglass Board Type (Type I-6)

Hot Ductwork

Insulation Thickness - Exposed rectangular hot ductwork.

Supply ducts in heated spaces 1-1/2-in

Supply ducts in unheated spaces 2-in Return ducts 1-1/2-in

Mixed air ducts 1-1/2-in

Cold and Hot/Cold Ductwork

Insulation Thickness - Exposed rectangular cold and hot/cold ductwork.

All ducts in non-conditioned spaces 2-in

All ducts in conditioned spaces 1-1/2-in

Outdoor air ducts and plenums 2-in

Exhaust air ducts and plenums between shut-off damper and outdoors 1-1/2-in

Ventilation supply air ducts and plenums between shut-off damper and outdoors 2-in

Ductwork Insulation - Closed Cell Foam Type (Type I-7)

Insulation Thickness - Outdoor mounted round and rectangular hot, cold and hot/cold ductwork.

All air ducts 2-in

Weatherproof all outdoor ductwork.

All ductwork, except as specifically noted below, shall be insulated unless approved in writing by the Engineer.

Exposed supply and return air ductwork located in the area it serves.

Exposed ventilation exhaust and relief ductwork located in the area it serves.

Exposed ventilation and relief ductwork located in areas that are neither heated
nor cooled.

Exposed outdoor air intake ductwork and plenums located in areas that are neither heated nor cooled.

Return air ductwork located in return air ceiling spaces above the area it serves, except where the return ductwork is installed in ceiling spaces with a roof above.

End of Section

SECTION 15950

ELECTRIC AUTOMATIC TEMPERATURE CONTROL SYSTEM

PART 1 - GENERAL

1.1 SCOPE. Furnish and install a complete electric automatic temperature control system as manufactured by Honeywell, Inc., Johnson Controls, Andover Controls or approved equal. The automatic temperature control (ATC) shall be as specified herein and shall perform the functions specified and shown on the Drawings. The control system shall be installed by competent mechanics, technicians and electricians approved by the automatic temperature control manufacturer. The manufacturer shall be fully licensed at the time of bid to do business in the job site area for each type of subsystem. Wholesalers, contractors, franchisers, dealers, or any firm whose principle business is not that of manufacturing and installing DDC controls will not be acceptable. The manufacturer shall provide a system to meet requirements of NFPA-72A, 72B, 72C and 72D, and shall be listed by UL. Each component of the system shall be, where applicable, UL listed for the intended service. All materials and equipment used shall be standard components, regularly manufactured for this and/or other systems, and not custom designed especially for this project. All systems and components shall have been thoroughly tested and proven in actual use.

The control system shall consist of all thermostats, temperature transmitters, flow switches, flow elements, transformers, alarms, flow transmitters, local flow controllers, ionization type smoke detectors, automatic valves and dampers, damper operators, control panels, electric relays, and other accessory equipment along with a complete system of wiring and conduit to fill the intent of the specification to provide for a complete and operable system. All control equipment shall be fully proportioning, except as noted otherwise.

HVAC equipment remote monitoring coordinate with Owner’s ovation facility management system contractor and fire alarm system contractor. Provide necessary equipment to achieve required control operation. Control sequences shall be as shown on the Drawings to be Automatic Temperature Control System. Coordinate with HVAC equipment manufacturers for controls furnished with the equipment.

1.2 RELATED REQUIREMENTS. The following shall be furnished and/or installed, under other sections:

Separable thermometer wells are included under Division 15.

All necessary valve pressure taps, water drain and overflow connections and piping are included under Division 15.

On magnetic starters the necessary auxiliary contacts, with buttons and switches in the required configurations are included under Division 15 and Division 16.

The necessary sheet metal baffle plates to eliminate stratification and provide air volumes specified is included under Division 15. Locate baffles by experimentation and affix and seal permanently in place only after stratification problem has been eliminated.

Access doors or other approved means of access through ducts for service to control equipment is included under other Sections.

The installation of the following shall be under Division 15:

Automatic valves. Section 15950

Automatic dampers. Section 15950

The following are to be furnished and installed under other sections of Division 15, but will be integrated with the work of this Section:

Air Handling Units Section 15855.

Centrifugal Fans Section 15860

Heating Equipment Section 15550.

1.3 SUBMITTALS. Submit, in accordance with Section 01080, shop drawings and product data for the following:

Control drawings with composite wiring diagrams, and description of operation for all systems.

Panel layouts and nameplates lists for all local and central panels.

Valve and damper schedules showing size, configuration, sizing, pressure vs. flow diagrams for the fluid used, capacity, and location of all equipment.

Data sheets for all control system components.

Provide a recommended list of spare parts to be provided.

Sequence of operation descriptions.

Technical specification data sheets of each system component and device with indication of its use.

Complete listing of deviations from the system as specified.

Training manuals for each of the subjects required to be covered in training to include teaching plans, duration of each class, and maximum size of each class are to be submitted for review a minimum of three months prior to starting training. The manuals are to be broken down into the material required for each of the various courses. The submittal shall also include supplemental materials that will be used in the class and copies of overheads or slides if they are not in the preceding material.

All submittals shall contain a statement that Section 15501, and all other Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal. In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4 QUALITY ASSURANCE. The manufacturer must have a branch office facility with 50 miles of the project for at least 5 years, with technical staff and complete spare parts inventory and test and diagnostic equipment to keep systems in operation 24 hours per day 7 days per week. He/She shall have emergency service available in the local area for temperature control systems for which he/she is currently performing on-call emergency service 24 hours per day 7 days per week with a maximum response time of 4 hours. The automatic temperature control contractor shall have in his/her direct employ the personnel capable of detailed engineering, coordination, drafting, procurement, and expediting, scheduling construction, testing, inspection, installation, startup, calibration, and commissioning. The equipment to be furnished under this Section shall be essentially the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Several manufacturers are indicated as acceptable for some items of equipment in these specifications. The contractor shall be responsible for determining that all equipment supplied for this project is suitable for installation and proper operation in the space provided with fully adequate operating and maintenance access space.

The equipment furnished for installation under this Section shall be tested at the factory as standard with the manufacturer of the equipment. Unless otherwise indicated, the controls shall maintain space temperatures within plus or minus 0.5 degrees F, and space relative humidity within plus or minus 5 percent of their set points. Inspection by the Engineer’s representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents. The Owner and Engineer reserve the right to sample and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements. All work to applicable codes and Owner’s standard practice.

1.5 COORDINATION. All coordination responsibility is vested on the General Contractor.

1.6 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved Shop Drawings upon delivery. Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer. All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container. Instructions for servicing and startup of equipment in long term or prolonged storage shall accompany each item. All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.7 ENVIRONMENT. All components, including data processing equipment, shall be suitable for operating in a normal plant environment without requirements for special temperature and humidity control.

1.8 WARRANTY. Provide one gear part and labor warranty after the completion of the project. Meet the requirements of Section 01170.

1.9 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts. In addition to special items, the following spare parts shall be provided:
Furnish all special tools required for normal operation and proper servicing of the equipment.

Spare parts shall include all items on the manufacturer's standard list of spare parts and the following for each unit:

One complete set of gaskets for each sealed unit.

Provide a minimum of 1 or 5 percent of the total units rounded to the next full unit whichever is greater for each size and rating of the following components:

Thermostats

Humidistat

Thermometers

Pressure gages

Control relays

Damper operators

Valve operators

Control transmitters

Control transformers

Photo-electric type smoke detectors

Ionization type smoke detectors

Provide a minimum of 4 or 10% of the total units rounded to the next full unit whichever is greater for each size and rating of the following components:

Panel light bulbs

Fuses

Pack spare parts in containers suitable for extended storage without deterioration of the parts. Containers shall be clearly labeled designating contents, pieces of equipment for which intended and equipment identification numbers. Spare parts shall meet the requirements of Sections 01180.

PART 2 - PRODUCTS

2.1 MATERIALS. All products and materials used in this project shall be new and currently under manufacture and shall have been applied in similar installations for a minimum of two years. This installation shall not be used as a test site for any new products unless explicitly approved in writing. Spare parts shall be guaranteed to be available for a minimum of five years after the completion of the project.

2.2 ATC EQUIPMENT.

2.2.01 Area Classification. Where specific area classifications are called for or shown on the electrical drawings, all equipment and wiring shall be in conformance with the requirements for that classification. Special attention shall be given to hazardous areas specifically "Class I, Group D, Div. 1" and "Class I, Group D, Div. 2" to comply with code requirements for equipment selection and installation procedures. The type of enclosure shall be as specified in Division 16.

2.2.02 Room Thermostats. Temperature sensors shall be provided with concealed adjustment, exposed thermometer for displaying room temperature. All temperature sensors shall have an end to end (element to readout display) accuracy of plus or minus 0.5 degree F. Temperature sensors shall be of the wire-wound resistive element type (RTD) using either nickel or platinum alloy as the resistive element. All temperature sensors shall have an end to end (element to readout display) accuracy of plus or minus 0.5 degree F. Thermostats shall be of the heavy duty all metal type 24 volt, provided with concealed adjustment and exposed thermometer. Provide rugged clear plastic-locking cover and steps of control as required. Room thermostat and temperature sensors mounted on exterior walls shall be provided with insulated mounting plates. All room thermostats and sensors shall be mounted 4-ft-0-in above finish floor except where otherwise indicated on the Drawings or specified herein or as required by code. Electric thermostats in corrosive areas shall be installed in electric boxes with remote stainless steel bulbs.

2.2.03 Low Temperature Duct Mounted Safety Thermostat. Electric low temperature thermostats shall be duct mounted probe type. These thermostats shall be two- position with manual reset.

2.2.04 High Temperature Safety Thermostat. Electric high temperature thermostats shall have a bimetal type sensing element with at least a 10-in insertion length. These thermostats shall be two-position manual reset type.

2.2.05 Static Pressure Sensors. Shall be adjustable, set point proportional type, with adjustable range in inches of water to meet the performance or function specified.

2.2.06 Ionization Type Smoke Detectors (Four Wire Type). Furnish and install ionization type smoke duct detectors downstream of the air filters and ahead of any branch connections in air supply systems wastewater process areas as shown on the Drawings and having a capacity greater than 2,000 cfm. In addition, furnish and install ionization type smoke detectors all exhaust systems serving wastewater process areas as shown on the Drawings and having a capacity greater than 2,000 cfm. Smoke detectors shall also be installed where shown on the Drawings and where called for on the control sequences.

Duct smoke detector shall be suitable for expected air velocity range, temperature range, humidity range, and contaminant range in the airstream as indicated on the associated HVAC Equipment Unit Schedules. The detector housing shall be listed per UL 268A specifically for use in air handling systems. The detector housing shall be equipped with an integral mounting base capable of accommodating either photo electronic or ionization detector heads. It shall be capable of local testing via remote testing station. The duct detector housing shall incorporate an airtight smoke chamber in compliance with UL 268A, Standard for Smoke Detectors for Duct Applications. The housing shall be capable of mounting to either rectangular or round ducts without brackets. An integral filter system shall be included to reduce dust and residue effects on detector and housing, thereby reducing maintenance and service. Detectors shall be provided with two sets of DPDT 10 amp dry contacts in the smoke detector housing to provide smoke alarm signals. One contact is to be used by the ATC systems, and the second is for use by Division 16 for interface to the fire alarm systems.

Remote test switch and alarm indicator stations shall be furnished for all duct smoke detectors as specified above. The installation and wiring of the remote stations will be provided under this Section. The remote test stations shall be wall mounted within the visible location of the smoke detector and easily accessible from the floor.

2.2.07 Motorized Control Dampers. Source Quality Control: Motorized dampers for air intake shall allow a maximum air leakage of 5 cfm per square foot at 4 inches water gage static pressure. Design for maximum 6 inches water gage static pressure differential and 4,000 feet per minute approach velocity.

Type: Parallel Blade similar to Ruskin CD36.

Reference: SMACNA Standards.

Construction:

Tight seal ultra-low leakage construction.

Galvanized steel

Blades

Blade Shafts: 1/2-inch plated steel

All stainless steel construction where shown

Provide thermal blade edge seals for air tight damper closure.

Blade ends shall be sealed with spring loaded continuous strips fastened to frame.

Bearings: Bearings at each end of shaft.

Blades to be designed for minimal resistance to air flow.

Linkage brackets, connecting rods an mounting hardware. Provide bird screen where required.

Approved Manufacturer shall be:

Ruskin

Louvers and Dampers

American Warming

Arrow

or equal

2.2.08 Electronic Damper Actuators. Electronic actuators, less than 600 in-lb of rated torque, shall have ISO 9001 quality certification and be UL listed under standard 873, CSA C22.2 No. 24 and have CE certification. Electronic actuators used on valves shall be designed to directly couple and mount to a stem, shaft or ISO style- mounting pad. Actuator mounting clamps shall be a V-bolt with a toothed V-clamp creating a cold weld, positive grip effect. Single point, bolt or single screw actuator type fastening techniques or direct-coupled actuators requiring field assembly of the universal clamp is not acceptable. Actuators shall be two position as required and be factory or field selectable. Actuators shall have visual position indicators and shall operate in sequence with other devices if required.

Two sets of DPDT switches with fully adjustable set points shall be provided to activate panel indicators and provide signals for equipment operation. Actuator shall have an operating range of minus 22 to 122 degrees F. Proportional actuators shall accept a 0 to 10 VDC or 0-20 mA input signal and provide a 2 to 10 VDC or 4-20 mA (with a load resistor) operating range. Actuators shall be capable of operating on 24, VAC and Class 2 wiring as directed by the application. Power consumption shall not exceed 10 VA for AC, including 120 VAC actuators and 8 watts per actuator for applications. Provide transformer as required. NEMA 2 rated actuators shall be provided with a three foot (minimum), prewired, electrical cable. Actuators requiring removal of the actuator cover for access to wiring terminals, exposing electronics, printed circuit boards to damage, are unacceptable. Actuators shall have electronic overload protection or digital rotation sensing circuitry to prevent actuator damage throughout the entire rotation. End switches to deactivate the actuator at the end of rotation or magnetic clutches are not acceptable.

For power-failure/safety applications, an internal mechanical spring return mechanism shall be built into the actuator housing. Spring return actuators shall be capable of CW or CCW mounting orientation. Spring return models >60 in-lb will be capable of mounting on shafts up to 1.05-in diameter. Spring return actuators with more than 60 in-lb of torque shall have a manual override metal crank. Upon loss of control signal, a proportional actuator shall fail open or closed based on the minimum control signal. Upon loss of power, a non-spring return actuator shall maintain the last position.

Actuators using “on-board” chemical storage systems, capacitors or other “on-board” non-mechanical forms of fail-safe operation are unacceptable.

Actuators shall be capable of being mechanically and electrically paralleled to increase torque if required. Dampers requiring greater torque or higher close off may be assembled with multiple low torque actuators. Dual mounted actuators using additional anti-rotation strap mechanical linkages, or special factory wiring to function are not acceptable. Actuators in a tandem pair must be “off the shelf” standard actuators ready for field wiring. Damper actuators will not produce more than 62 dbA when furnished with a mechanical fail-safe spring. Non-spring return actuators shall conform to a maximum noise rating of 45 dbA with power on or in the running or driving mode. Where special classifications are shown on the electrical drawings damper actuators shall be provided with suitable enclosures. NEMA 4X enclosures shall be as specified in Division 16 and shall have a shaft seal and all electrical connections shall be suitable for the space classification. Enclosure shall be UL listed.

Explosion-proof enclosure shall be suitable for Class I, II and III as specified in Division 16. A suitable shaft seal must be provided. Housing shall be cast copper fill aluminum with stainless steel fasteners and shall be UL listed. Housing shall be suitable for NEMA 4, 7 and 9.

Local Direct Digital Control (DDC) Panels - General: Local DDC panels shall be standalone microprocessor based, multi-tasking, multi-user, real-time digital control processors. Each local DDC panel shall consist of modular hardware with plug-in enclosed processors, communication controllers, power supplies, and input/output modules. A sufficient number of controllers shall be supplied to fully meet the requirements of this specification and the control functions. Local panel shall be capable of communicating with Owner’s Ovation Facility Management system

Hardware Override Switches: As indicated in the control sequences, the operator shall have the ability to manually override automatic or centrally executed commands and reset alarms at the DDC panel via local, point discrete, onboard hand/off/auto operator override switches for binary control points and gradual switches for analog control type points. These override switches shall be operable whether the panel is powered or not.

Local Status Indicator Lamps: The DDC panel shall provide local status indication for each binary input and output for constant, up-to-date verification of all point conditions without the need for an operator I/O device. Indicator lights called for on the control sequence shall be on the face of the panel. Also provide audible alarm where shown.

Integrated On-line Diagnostics: Each DDC panel shall continuously perform self-diagnostics, communication diagnosis and diagnosis of subsidiary equipment. The DDC panel shall provide both local and remote annunciation of any detected component failures, or repeated failure to establish communication. Indication of the diagnostic results shall be provided at each DDC panel, and shall not require the connection of an operator I/O device.

Surge and Transient Protection: Isolation shall be provided at all network terminations, as well as all field point terminations to suppress induced voltage transients consistent with IEEE Standard 587-1980.

Power Failure Restart: In the event of the loss of normal power, there shall be an orderly shutdown of all standalone DDC panels to prevent the loss of database or operating system software. Non-Volatile memory shall be incorporated for all critical controller configuration data, and battery back-up shall be provided to support the real-time clock and all volatile memory for a minimum of 72 hours. Upon restoration of normal power, the DDC panel shall automatically resume full operation without manual intervention.

All panels shall be provided with lugs, brackets or field supplied devices to allow the panel to be firmly fastened to the structure. The lugs, brackets or field supplied devices shall be sized to withstand the expected seismic loads for the area and type of application.

Miscellaneous Devices - Provide all the necessary relays, limit switches, positioners, valves, clocks, transformers, etc, to make a complete and operable system. Locate these devices on local ATC panel unless specified otherwise.

Set points on thermostats, temperature controllers, humidistats, humidity controllers and static pressure controllers shown on the Drawings are indicative only and devices shall be adjustable above and below such set points. If a set point is not stated, the control range of devices shall be suitable for the intended service. Range of devices shall be approximately 50 percent greater in both directions than span of variable, with a minimum of 25 degrees and a maximum of 100 degrees F for air systems. Thermometers - Thermometers shall be flush mounted on local panels. These thermometers shall be of the dial type, minimum 3-in diameter.

Flow Switches and Sensors - Duct air flow elements for modulating control shall be of the multipoint, self-averaging pitot tube, differential pressure type. Each element shall have air straightening vanes. These elements shall be fabricated of heavy-gauge, galvanized steel welded casing with 90 degree connecting flanges in a configuration and size equal to that of the duct it is mounted into. The maximum allowable unrecovered pressure loss through the element shall not exceed 0.065-in w.c. at 1000 fpm. Element accuracy shall be plus or minus 1 percent of actual flow rate over the flow range. Repeatability shall be plus or minus 0.1 percent of the actual flow rate over the flow range. Rangeability shall be guaranteed to meet flows as specified. Flow switches for clean air applications to include supply and makeup air systems shall be adjustable differential pressure type with an adjustment range suitable for the application including pressure range, temperature range, and expected containment range. Switches shall be arranged for sensing system velocity pressure through the use of a pitot tube arrangement. Pitot tubes shall be accessible and removable for inspection and maintenance without disturbing wiring connections or transmitters. Tube shall be stainless steel. Flow switches for general HVAC exhaust applications shall be vane (paddle) type switches suitably selected for the expected duct velocity, pressure range, temperature range, humidity range, and expected contaminants in the air stream. Positioned in the ductwork to be accessible and located so as to avoid nuisance tripping and unreliable operation due to flow turbulence. Vane and vane blocks shall be Type 316 stainless steel.

Switches and control wiring shall be arranged so switch is easily removable from ductwork to permit vane inspection, without disconnecting the wiring.

Thermal dispersion flow sensors shall be set and calibrated after air balancing has been completed. Unless otherwise noted, the set points for high or low shall be plus/minus 10 percent. For high high, or low low shall be plus/minus 15 percent. When the sensor has a varying speed response for start up and shut down, the shorter time response shall be used for the system alarm or shut down signal.

Where specifically called for on the Drawings or in the control sequences, current measuring devices shall be used for flow monitoring. Devices shall measure the actual current for the fan motor and compare it to a predetermined range. The range is to be determined by measurement during system balancing. The use of sensors that only respond to a condition of current or no current are not acceptable.

Electronic Sensors - All mixed air and coil discharge sensors shall utilize industry standard 4-20 mA sensors with averaging elements. Sensing elements shall be a minimum of 25-ft and temperature sensed shall be averaged over the entire length of the element. Thermistor type sensors will not be acceptable for this application. Space type sensors shall have an accuracy of plus/minus .5 degrees over sensed temperature range (20 to 120 degrees F).

Well type sensors used for liquid immersion shall have stainless steel removable wells. Sensing element shall have an accuracy of plus/minus .5 degrees over range (70 to 220 degrees F or 20 to 120 degrees F) of the sensor. Each sensor shall have a suitable electrical box to enclose all wiring connections.

Temperature control wells shall be installed according to manufacturer's recommendations.

2.3 ELECTRIC WIRING. All field wiring (other than power wiring) between control cabinets, control devices, unitary control panel and control terminals in motor control centers shall be furnished under this Section and shall conform to the requirements of Division 16. Wiring to suspended and cabinet unit heaters and their thermostats shall be considered power wiring. All interlocking wiring within MCC shall be done by Division 16. Refer to the electrical drawings for NEMA enclosure types.

Installation of all conduit, wire, sleeves, outlet boxes, insulating bushings, system cabinets, terminal boxes, pull boxes, junction boxes, inserts, anchors, system devices, etc, shall be in accordance with the appropriate requirements of Division 16, and in accordance with sections of the current edition of the local codes for signal systems and electrical systems.

Wiring shall be run in rigid steel conduit except in dry locations above ceilings and wood or metal stud framed partition walls, where EMT may be used. Conduit, boxes and fittings and their installation and testing shall be as specified in Section 16110.

In the event of any conflict among referenced codes, current editions of the applicable local codes shall take precedence for interpretation of "Signal System" installation requirements.

Installation of sensor wiring in finished areas shall be concealed whenever possible. Where concealed wiring is not possible, written approval for exposed work must be obtained from the Engineer prior to installation.

A power supply 115V, single phase, 60 Hz, 20 Amp circuit for ATC, requirements will be taken from local control panel. Power shall not be taken from the control power transformers of the motor control center. All low-voltage wiring shall meet NEC Class 2 requirements. (Low-voltage power circuits shall be subfused when required to meet Class 2 current limit.) All wiring in mechanical, electrical or service rooms or where subject to mechanical damage shall be installed in conduit at levels below 10- ft. Do not install Class 2 wiring in conduit containing Class 1 wiring. Boxes and panels containing high voltage wiring and equipment may not be used for low voltage wiring except for the purpose of interfacing the two (e.g., relays and transformers).

All wire to device connections shall be made at a screw type terminal block or screw type terminal strip. All wire to wire connections shall be at a screw type terminal block. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals. All wiring shall be installed as continuous lengths, with no splices permitted between termination points. Install plenum wiring in sleeves where it passes through walls and floors. Maintain fire rating at all penetrations. Size of conduit and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer's recommendations and code requirements, except as noted elsewhere. Include one pull string in each conduit (1-in) or larger. Use coded conductors throughout with conductors of different colors.

Control and status relays are to be located in designated enclosures only. These enclosures include packaged equipment and control panel enclosures unless they also contain Class 1 starters.

Conceal all conduits, except within mechanical, electrical or service rooms. Install conduits to maintain a clearance of 6-in from high temperature equipment. Secure conduits with conduit clamps fastened to the structure and spaced accordingly to code requirements. Conduits and pull boxes may not be hung on flexible duct strap or tie rods. Conduits may not be run on or attached to ductwork. Comply with Division 16 requirements where conduit crosses building expansion joints. Install insulated bushings on all conduit ends and openings to enclosures. Seal top end of all vertical conduits. The Contractor shall terminate all control and/or interlock wiring and shall maintain updated (as-built) wiring diagrams with terminations identified at the job site. Flexible metal conduits and liquid tight, flexible metal conduits shall not exceed 3-ft in length and shall be supported at each end. Flexible metal conduits less than 1/2-in electrical trade size shall not be used. In areas exposed to moisture, including chiller and boiler rooms, liquid tight, flexible metal conduits shall be used. Conduits must be rigidly installed, adequately supported, properly reamed at both ends and left clean and free of obstructions. Conduit sections shall be joined with couplings (according to code). Terminations must be made with fittings at boxes.

PART 3 - EXECUTION

3.1 INSTALLATION. The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

3.2 INSTRUCTION AND ADJUSTMENT. Upon completion of the project: Completely adjust and calibrate, ready for use, all thermostats, valves, damper operators, relays, thermometers and recorders, etc, provided under this Section.

Furnish four instruction manuals covering the function and operation of the control and automation systems on the project for the use of the Owner's operating personnel. A competent technician shall be provided for a period of 16 hours for instruction purposes.

The system contractor shall provide complete system documentation at acceptance time, as specified herein. Documentation shall be provided in four sets, unless otherwise elsewhere in this Section. Documentation shall include the following:

> All data specified in the Paragraph 1.03 above, in its final as-built approved form.

As-built interconnection wiring diagrams, or wire lists, or list of the complete field installed system with complete, properly identified, ordering number of each system component and device.

3.3 CONTROL SEQUENCES. HVAC equipment will operate with the sequences of operation shown on the drawings. The following will apply to all sequences.

> All sequences are reversible unless otherwise noted.
>
> Manual reset of control functions with manual reset will be at the local control panel unless otherwise noted.
>
> Where required to prevent nuisance shut downs of systems, provide time delay of sensors to allow system start up before the sensors are activated. This would include, but not be limited to low temperature freeze protection on 100 percent outdoor air units.
>
> The ATC contractor shall provide all connections, relays and other devices required to operate the system under the control of the firefighter control panel.

End of Section

SECTION 15955

BUILDING SYSTEM CONTROLS

PART 1 - GENERAL

1.1 SCOPE. This section covers the design, furnishing, and installation of control systems and instrumentation associated with the heating, ventilation, and air conditioning (HVAC) equipment and systems including all associated equipment, devices, and controls necessary for proper operation.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. The control and instrumentation shall be designed and coordinated for proper operation with the controlled equipment and materials furnished under other sections, under other contracts, and with related existing equipment. All controls devices and instruments shall be applied in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the device manufacturer and controlled equipment manufacturer unless exceptions are noted by Engineer.

Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment or instrumentation are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Review of drawings submitted prior to the final determination of related equipment shall not relieve Contractor from supplying systems in full compliance with the specific requirements of the controlled equipment. Controlled equipment and materials may include, but will not be limited to, fans, pumps, actuators, measuring devices, supervisory control equipment, cable, conduit, and piping as described in other sections. Installation drawings shall be prepared for interconnecting wiring and instrument tubing between the controlled equipment and equipment furnished in this section. All interconnecting wiring shall be appropriate for the service and shall result in a properly functioning system. Contractor shall provide coordination with the other contractors and supervision of installation as needed during construction.

Contractor shall coordinate with the Work to make certain that the field wiring associated with the work of this section is completed in accordance with the requirements of the heating, ventilating, and air conditioning equipment furnished and their interconnection. The temperature controls supplier shall design and furnish a complete and functional control system in accordance with the drawings, specifications, and sequence of operation. The control wiring shall be installed so that all HVAC equipment will function as described in the HVAC sequence of operation

Conduit and control wiring for all control circuits needed between all field mounted HVAC controlling and indicating devices, such as, but not limited to, damper and valve actuators, temperature/digital control panels, motor starters, and the HVAC equipment, shall be furnished and installed as specified in the control circuits paragraph. Cable and conduit for all HVAC power circuits shall be as specified in Master Specification Section 16050, Electrical General Requirements.

Motor starters will be provided with terminal blocks for the termination of conductors for operational control and run/off status of the equipment. Refer to the electrical schematics for additional information.

The temperature controls supplier shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on suppliers representatives for temperature controls shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

When indicated by the applicable codes, panel assemblies, materials, and equipment shall be approved, identified, labeled, or listed by Underwriters' Laboratories or other testing organization acceptable to the governing authority.

1.2.04 Power Supply. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise indicated or necessary for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during start-up or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Control Equipment Items	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plateNameplates and tags shall be at least 12 gage thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm).

Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners. Nameplates shall be firmly secured to temperature control panels with stainless steel panhead screws.

1.3.02 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Published descriptive data on each item of equipment and accessories, indicating all specific characteristics and options and identified with the designation used herein and on the drawings.

Schematic control diagrams giving specific data on all settings, ranges, actions, adjustments, and normal positions. Although schematic, these diagrams shall, as closely as possible, represent the actual system with all significant equipment and devices identified and located relative to each other. These diagrams shall also show detailed multiline wiring and instrument piping with all terminals and ports accurately identified. The wiring diagrams shall show the internal connections of the temperature control panels and all field wiring to equipment remote from the control panels, including wiring to Owner-furnished equipment. The wiring diagrams shall be complete, showing all connections necessary to place the temperature control systems in operation. Wiring diagrams shall be detailed to the degree necessary for field construction and shall include all related wiring.

Control valve schedule with each valve identified by the designations used herein and on the drawings and cross-referenced to the manufacturer's equipment data sheet or bulletin. The schedule shall also list complete sizing data for each valve, giving design flow and temperature or pressure, actual pressure drop, normal position, fluid, actual close-off rating, actual capacity index, and any other pertinent data.

Sequence of operation for each system corresponding to the control schematics.

Detailed panel construction drawings, including description of all materials and finishes, complete internal wiring and piping schematics, panel face layout, and complete data on all mounted components.

Space thermostat schedule indicating the types of covers and means of adjustment for each space.

Conduit and wire types.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals with Master Specification Section 01160, Training and Operation & Maintenance Manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manual. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE. The equipment furnished for installation under this section shall be tested according to the manufacturer's standard procedures.

1.5.01 Contractor's Qualification. The entire system shall be designed, coordinated, and supplied by a qualified Contractor who is regularly engaged in the business of designing and building instrument and control systems for heating, ventilating, and air conditioning equipment. The Contractor shall have at least 5 years of documented experience in designing and installation of the products specified and shall be employed by the control manufacturer or be an approved certified installer with full responsibility for proper operation of the control including startup and calibration of each component in the controls system.

1.5.02 Manufacturer Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.5.03 Tolerances. Unless otherwise indicated, the controls shall maintain space temperatures within ± 2°F (1.1°C), and the relative humidity within ± 5 percent of the setpoint.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools .

1.7 EXTRA MATERIALS. Extra materials shall be packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Thermostats: 1 of each type.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. A complete system of automatic temperature controls shall be furnished and installed to accomplish the control described in the sequence of operations. All control equipment shall be compatible for operating with the control system provided.

The control system shall consist of all necessary thermostats, control valves, switches, relays, timers, and gauges in accordance with the sequence of operation indicated on the drawings. Technical engineering services, including but not limited to engineering, programming, installation supervision, commissioning, and troubleshooting shall be provided for a complete and functional system.

2.3 ACCEPTABLE MANUFACTURERS. The temperature control components and systems shall be manufactured by Honeywell; Johnson Controls; Andover Controls; or Siemens Building Technologies, Landis Division. Where manufacturers are not specified, materials and equipment furnished shall meet the performance and design requirements indicated.

2.4 MATERIALS.

2.4.01 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.02 Electric/Electronic Control Systems. Electric/electronic control systems shall be furnished and installed as indicated on the drawings and specified herein.

2.4.03 Thermostats.

Two Position Wall Mounted Thermostats. Two position wall mounted thermostats shall be Honeywell "T631A Airswitch", Penn Controls "A19BAC-1", Siemens Building Technologies, or approved equal.

Two position wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 3.5°F (2°C). The thermostats shall have a spdt switch rated for 1 horsepower (0.746 W).

Two Position Corrosion Resistant Wall Mounted Thermostats. Two position wall mounted thermostats located in wet or corrosive environments shall be Honeywell "T631F", or approved equal.

Two position corrosion resistant wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 3.5°F (2°C). The thermostats shall have a spdt switch rated for 1 horsepower (0.746 kW).

Two Stage Wall Mounted Thermostats. Two stage wall mounted thermostats shall be Honeywell "T631B Airswitch", Penn Controls "A28AA-4", Siemens Building Technologies, or approved equal.

Two stage wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 2°F (1.1°C) for each stage and 3.5°F (1.9°C) between stages.

Low Limit Thermostats. Low limit thermostats shall be Honeywell "L480", or Penn Controls "Model A11A-1", Siemens Building Technologies, or approved equal.

Low limit thermostats used for low temperature cutout shall be capillary, line-voltage type, complete with spst switches. The sensing elements shall be at least 20 feet (6 m) long. The thermostat shall be responsive to the lowest temperature along the measuring element, shall have a range of approximately 35°F to 45°F (2°C to 7°C), and shall be manually reset.

Remote Bulb Thermostats. Remote bulb thermostats shall be Honeywell "T675A", Penn Controls "A19ABC-24", Siemens Building Technologies, or approved equal.

Remote bulb thermostats shall be line voltage, fast response type. The thermostats shall have a range of approximately 0°F to 100°F (-18°C to 38°C) with an adjustable differential of 3°F to 10°F (1.7°C to 5.6°C). The thermostat shall include a capillary holding frame suitable for duct mounting.

Modulating Wall Mounted Thermostats. Modulating, wall mounted thermostats shall be Honeywell "Model T92", Penn Controls "Model T80ABA-1", Siemens Building Technologies, or approved equal.

Modulating, wall mounted thermostats shall be modulating, proportional control, low voltage type. The thermostats shall have an operating range of approximately 63°F to 87°F (17°C to 31°C) with a throttling range of approximately 1.5°F to 6.5°F (0.8°C to 3.6°C).

Modulating Duct Mounted Thermostats. Modulating, duct mounted thermostats shall be Honeywell "Model T991", Penn Controls "Model A80ABA-2", Siemens Building Technologies, or approved equal.

Modulating, duct mounted thermostats shall be modulating, proportional control, low voltage type. The thermostats shall have a range of approximately 10°F to 90°F (-12°C to 32°C) with an adjustable throttling range of approximately 5° F to 24°F (3°C to 13°C), and shall be furnished with a duct mounting kit.

Explosionproof Thermostats. Explosion-proof wall-mounted thermostats controlling explosionproof equipment in Class I, Division 2, Group D areas shall be Honeywell "Model T6051B", Johnson Controls "Model A19BUC-2", Siemens Building Technologies, or approved equal.

Explosionproof wall-mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 45°F to 85°F (7°C to 29°C) with a nonadjustable differential of 1°F (0.6°C). The thermostats shall have a spdt switch rated for 10 amperes at 120 volts ac.

Duct-mounted thermostats controlling explosionproof equipment in Class I, Division 2, Group D areas shall be Indeeco "Model T94A-70", or approved equal.

Non-programmable Wall Mounted Thermostats. Non-programmable, wall mounted thermostats shall be Honeywell "Model T874", Penn Controls, Siemens Building Technologies, or approved equal.

Non-programmable wall mounted thermostats shall be single or multistage as required by the controlled equipment, electromechanical type configurable for use with a conventional or heat pump system. The thermostats shall have a setpoint range of approximately 42°F to 88°F (6°C to 31°C) with the following features:

- Automatic heat/cool changeover
- Auxiliary heat LED
- Tamper-resistant cover with thermometer.

Where an economizer is used, the non-programmable thermostat shall be suitable for interfacing with the economizer control package.

Programmable Wall Mounted Thermostats. Programmable, wall mounted thermostats shall be Honeywell "Model T7300", Penn Controls, Siemens Building Technologies, or approved equal.

Programmable wall mounted thermostats shall be single or multistage as required by the controlled equipment, solid state programmable electronic type configurable for use with a conventional or heat pump system. The thermostats shall have a setpoint range of approximately 45°F to 95°F (7°C to 35°C) with the following features:

- 7 day programming with 2 occupied/unoccupied periods per day.
- Automatic heat/cool changeover.
- Battery backup.
- Digital display.
- Temporary override of setpoints.
- 2 configurable LED's.

Where an economizer is used, the programmable thermostat shall be suitable for interfacing with the economizer control package.

2.4.02.02 Humidistats. Humidistats, denoted by the symbol "H" and an identifying number, shall be Honeywell "H46C", Johnson Controls, Siemens Building Technologies, or approved equal.

Humidistats shall have a nylon element coupled to a spst mercury contact that closes on a rise in relative humidity. Each humidistat shall have an adjustable range of 20 to 80 percent relative humidity and an operating differential of approximately 5 percent relative humidity.

2.4.02.03 Economizer Control System. A complete economizer control system shall be provided for the system as indicated in the sequence of operations on the drawings. The economizer control system shall be Honeywell "Model W6215", or approved equal. The economizer control system shall be electronic solid state type with logic module, temperature and enthalpy sensors as required for the application. The economizer system shall provide temperature, single enthalpy, or differential enthalpy control and shall be suitable for use with the space thermostat. The economizer control system shall be mounted in the temperature control panel associated with the controlled system.

2.4.03 Direct Digital Control Systems.

2.4.03.01 General. The Direct Digital Control (DDC) system shall be furnished and installed as indicated on the drawings and as specified herein. The DDC system shall be capable of integrating multiple HVAC system functions, including data sharing, alarm/event management, scheduling, trending, and device/network management.

The DDC system shall consist of, but shall not be limited to, the following:

Stand-alone system and zone level DDC controllers for control of air handling units, air terminal units, heating water system, and chilled water system.

A network bus for communication between controllers.

A network control unit (NCU), if necessary to accomplish the control strategies described in the Sequence of Operation.

Portable operator interface terminal.

Sensors, transmitters, detectors, and accessories necessary for proper operation of the system and equipment.

Personal computer as necessary for alarm management, configuration, and programming.

The system shall be of modular design, and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, DDC controllers, and operator devices.

The failure of any single component, including the NCU, or network connection shall not interrupt the execution of control strategies at other operational devices. Master controllers shall employ a spare control strategy to ensure control execution is not interrupted.

2.4.03.02 Networking/Communications. The DDC system shall be an integrated network system configured to perform the functions described in the sequence of operation. The system's design shall include provisions to expand or modify the network.

The DDC controllers and NCU shall be capable of full stand-alone operation allowing execution of control strategies with default values when bus communication and global data is not available. In addition, the controllers shall reside on the network so that communications may be executed directly to and between DDC controllers, and shall allow intelligent interface for program changes, command inputs, and output of operating data.

The digital control system shall allow all operator devices, either network resident or connected via dial-up modems, to access all point status and application report data on the network. Access to system data shall not be restricted by the hardware configuration of the DDC system.

When it would be inefficient or impractical to provide multiple sensors, the digital control system shall provide global data sharing or global point broadcasting between DDC controllers.

The network design shall provide:

Data transfer rates for alarm reporting and quick point status from multiple DDC controllers.

Support of any combination of DDC controllers. A minimum of 20 DDC controllers shall be supported on a single local network or control bus. The bus shall be addressable for up to 20 DDC controllers.

Detection of single or multiple failures of DDC controllers or the network media.

Error detection, correction, and re-transmission as necessary to guarantee data integrity.

Commonly available, multiple-sourced, networking components shall be used.

Use of an industry standard protocol, such as Optomux, and IEEE RS-485 communications interface at the network interface level.

Each DDC controller, air terminal unit zone thermostat, and the NCU, if provided, shall include provisions for connection to a portable operator's terminal which will allow the system operator to interface with the control network. The operator's terminal shall be mounted at the digital control panel as required, and shall be available for connecting to remote DDC controllers. The portable operator's terminal shall include a keypad and full English language display. A touchpad, menu-driven display shall also be acceptable. If the Echelon zone communication bus is utilized, then a 50 foot (15 m) operators terminal cable maybe provided in lieu of the room sensor jack connection.

The operator's terminal shall have multiple-level password access protection to allow the user to limit control, display, and data base manipulation capabilities for each user, based upon an assigned password. The passwords shall be exactly the same for all operator devices with a minimum of three levels of access. A minimum of 4 passwords shall be supported at each digital controller. The same passwords shall be used at any controller for the specific user.

Operators will be able to perform only the commands available for their respective passwords. Menu selections displayed at any operator device shall be limited to only the items defined for the access level of the password used to log-on. User-definable, automatic log-off timers of from 1 to 60 minutes shall be provided to prevent operators from inadvertently leaving devices on-line.

The operator interface shall allow the operator to perform commands including, but not limited to, the following:

Start up or shut down selected equipment.

Adjust setpoints.

Add/modify/delete time programming.

Enable/disable process execution.

Enable/disable totalization for each point.

Enter temporary override schedules.

Define holiday schedules.

Change time/date.

Enter/modify analog alarm limits.

Command controller outputs for maintenance/test operations.

View and acknowledge a minimum of the last 50 alarms.

2.4.03.03 System Software Features. All necessary software to form a complete operating system shall be provided as an integral part of the DDC system, and shall not be dependent upon a higher level computer for execution. As a minimum, the software shall include the following:

Equipment Cycling Protection: Control software shall include a provision for limiting the number of times each piece of equipment may be cycled within any one-hour period.

Energy Management Applications: The DDC system shall be able to perform any or all of the following energy management routines:

- Time of Day Scheduling
- Calendar Based Scheduling
- Holiday Scheduling
- Optimal Start
- Optimal Stop
- Heating/Cooling Interlock
- Demand Limiting
- Load Rolling

All programs shall be executed automatically without the need for operator intervention, and shall be flexible enough to allow user customization. The programs shall be applied to building equipment described in the Sequence of Operations.

Programming Capability: The DDC system shall be able to execute configured processes defined by the user to automatically perform calculations and control routines.

Process Inputs and Variables: It shall be possible to use any of the following in a configured process:

- Any system-measured point data or status
- Any calculated data
- Any results from other processes
- Boolean logic operators (and, or)

Process Triggers: Configured processes may be triggered based on any combination of the following:

- Time of day
- Calendar date
- Other processes
- Events (e.g., point alarms)

Data Access: A single process shall be able to incorporate measured or calculated data from any DDC controller and shall be able to issue commands to points in any and all other DDC controllers on the local network.

Alarm Management: Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. Each DDC controller and the NCU, if necessary, shall perform distributed, independent alarm analysis and filtering to minimize operator interruptions due to non-critical alarms, minimize network traffic, and prevent alarms from being lost. Alarms shall be displayed and acknowledged via the portable operator's terminal or other device provided by the System Supplier.

The DDC system's ability to report alarms shall be affected neither by operator activity at the local I/O device, nor by communications with other DDC controllers on the network.

Point Change Report Description: All alarm or point change reports shall include a verbal description of the point and the time and date of occurrence.

Prioritizing: The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of three priority levels shall be provided. Users shall have the ability to manually inhibit alarm reporting for each point.

The user shall be able to identify the conditions under which point changes need to be acknowledged by an operator, and/or logged for analysis at a later date.

Alarm Messages: In addition to the point description and the time and date, the user shall be able to display or store an alarm message to more fully describe the alarm condition or direct operator response. Each DDC controller shall be capable of storing at least 20 alarm messages. Each message may be assignable to any number of points in the panel.

2.4.03.04 DDC Controllers. Each DDC controller shall operate as a stand-alone controller capable of performing its specified control strategies independently of other controllers in the network. Each DDC controller shall be a microprocessor-based, multi-tasking, real-time digital control processor.

Each DDC controller shall have sufficient memory to support its own operating system and data bases, including the following:

Control processes.

Energy management applications.

Operator I/O (portable service terminal).

The operator interface to any DDC controller point data or programs shall be through the portable operator's terminal connected to any DDC controller on the network. In addition, a communication bus shall be provided for connection to an Owner furnished personal computer. A software package and necessary interface card shall be furnished and installed on the computer to allow communication in text format with the DDC system.

DDC controllers shall directly support the temporary use of a portable service terminal that can be connected to the DDC controller via an input jack located on the zone temperature sensor or the controller. If the Eschelon Lonworks Bus is utilized at the terminal unit controller level, a portable bus control/display operator's terminal shall be provided. The capabilities of the portable service terminal shall include, but not be limited to, the following:

Display temperatures.

Display status.

Display setpoints.

Display control parameters.

Override binary output control.

Override analog setpoints.

Modification of gain and offset constants.

All system setpoints, proportional bands, control algorithms, and any other programmable parameters shall be stored such that a power failure of any duration does not necessitate reprogramming the DDC controller.

Each controlled device or function shall be a separate output of the DDC controller.

2.4.03.04.01 Air Terminal Unit Controllers. Air terminal unit controllers shall be configured to support single duct cooling with hot water coil and remote hot water convective heating. The air terminal unit controllers shall support the following types of point inputs and outputs:

Cooling outputs (proportional).

Box heating outputs (proportional).

Air terminal unit controllers shall support the following library of control strategies to address the requirements of the sequences described in the sequence of operation and for future expansion:

Daily schedules.

Occupied/unoccupied mode.

Morning warm-up mode.

Temporary override mode.

Temporary comfort mode.

Boost (occupant warmer/cooler control).

The controller interface to the zone temperature sensor shall allow an optional momentary switch to change the mode of the controller from unoccupied to occupied mode.

The controller interface to the zone temperature sensor shall allow an optional momentary switch or setpoint pot to override the controller's output to full heating or cooling as necessary. This command shall be active for a preset amount of time to anticipate a substantial change in the room's heating or cooling load via set-point adjustment.

Continuous Zone Temperature Histories: Each air terminal unit controller shall automatically and continuously maintain a history of the associated zone temperature. This allows users to quickly analyze space comfort and equipment performance for the past 24 hours. A minimum of two temperature samples per hour shall be stored.

Alarm Management: Each air terminal unit controller shall perform its own limit and status monitoring and analysis to maximize network performance by reducing unnecessary communications.

Direct digital control (DDC) panels associated with the air terminal units are not shown on the drawings but shall be located at the respective volume control unit location.

2.4.03.04.02 Air Handling Unit (AHU) Controllers. The AHU controllers shall support, but not be limited to, the following configurations of systems to address current requirements as described in the sequence of operation, and for future expansion:

Mixed air-single path.

VAV system, including supply and return fan speed control.

Heating and cooling control.

System economizer.

Low temperature safeties/shutdown sequence.

Smoke detection/purge/vent protection.

Supply and return airflow measurement.

User defined points alarming for:

a. High filter pressure loss.

b. High/low duct static pressure.

c. Freeze detection.

d. Smoke alarms.

AHU controllers shall support all the necessary point inputs and outputs to perform the specified control sequences in a totally stand-alone fashion.

AHU controllers shall have a library of control routines and program logic to perform the sequence of operation.

Each AHU controller shall automatically and continuously maintain a history of the associated zone temperature and air system temperatures to allow users to quickly analyze space comfort and equipment performance for the past 24 hours. A minimum of two samples per hour shall be stored.

Each AHU controller shall perform its own limit and status monitoring and analysis to maximize network performance by reducing unnecessary communications.

2.4.03.04.03 Heating Water System Controller. The heating water system controller shall support, but not be limited to, the following configurations of systems to address current requirements as described in the sequence of operation and for future expansion:

Boiler sequencing.

Boiler firing rate.

Boiler blending valve control.

Primary heating water loop temperature control.

Secondary heating water loop temperature control.

Heating water pump control.

User defined points alarming for:

a. High/low water temperature.

b. Low water flow.

The heating water system controller shall support all the necessary point inputs and outputs to perform the specified control sequences in a totally stand-alone fashion.

The controller shall have a library of control routines and program logic to perform the sequence of operation.

The controller shall automatically and continuously maintain a history of the associated loop supply and return heating water temperature to allow users to quickly analyze equipment performance for the past 24 hours. A minimum of two samples per hour shall be stored.

The controller shall perform its own limit and status monitoring and analysis to maximize network performance by reducing unnecessary communications.

2.4.03.05 Sensors and Controllers.

Wall-Mounted Temperature Sensors. Space temperature sensors shall use a precision type accurate to ± 0.5°F (0.3°C) over a temperature range of 40°F to 90°F (5°C to 32°C). The assembly shall be installed within a ventilated off white enclosure suitable for wall mounting. The output shall be compatible with the controller it serves. Where manual overrides are indicated, the sensor shall include push button override capability, thermometer or temperature indication, sliding warmer/ cooler mechanism for adjusting the temperature setpoint, and latching cover.

Duct-Mounted Temperature Sensors. Duct-mounted temperature sensors installed in ducts smaller than 10 square feet (0.92 square meters) shall be a single point type. Duct-mounted temperature sensors installed in ducts greater than 10 square feet (0.92 square meters) or subject to temperature stratification shall be averaging type. Sensors shall be a general purpose type with an operating range as needed for the application and an accuracy of ± 1 percent over the full range. The output shall be compatible with the controller it serves.

Pipe Insertion Temperature Sensors. Pipe insertion temperature sensors shall contain a sensing element with an operating range as needed for the application and an accuracy of ± 1 percent over the full range. The sensors shall be installed in brass or stainless steel thermal wells of sufficient size with a minimum insertion length of 2-1/2 inches (65 mm). The output shall be compatible with the controller it serves.

Wall-Mounted Humidity Sensors. Wall-mounted humidity sensors shall be capable of providing continuous measurement of percent relative humidity with an accuracy of ± 5 percent over the range of 10 to 80 percent RH. The assembly shall be installed within a enclosure matching the wall thermostat cover. The output shall be compatible with the controller it serves.

Duct-Mounted Humidity Sensors. Duct-mounted humidity sensors shall be capable of providing continuous measurement of percent relative humidity with an accuracy of ± 3 percent over the range 20 to 90 percent RH. Sensors located outdoors shall be installed in a weather enclosure. The output shall be compatible with the controller it serves.

Pressure Sensors. Pressure sensors shall be suitable for air or water service. Accuracy shall be ± 1 percent of full scale. The unit shall have temperature compensation so that thermal effects are no more than ± 0.5 percent of the full scale from 32 to 100°F. The transmitter shall be suitable for the media and pressure measured.

2.4.04 Temperature Control Panels. Temperature control panels, denoted by the symbol "TCP" and an identifying number, shall be NEMA Type 12 designed for wall mounting and shall be completely prewired and checked. Temperature control panel enclosures shall be manufactured by Hoffman Engineering, Integration Technology Systems Inc, or Par Metal Products Inc.

All controllers, selector relays, switching relays, interlock relays, manual switches, timers, alarm and indicating lights, and other devices indicated to be panel mounted shall be mounted in or on the respective control panel.

Accessories such as indicating lights and selector switches shall be mounted on the hinged front covers of the panels. The accessories and panels shall be identified with an identification plate as described in the Equipment Identification paragraph. The identification plates shall be fastened to the panels with corrosion resistant pan head screws.

Each temperature control panel shall supply power to all associated control system field control components, including but not limited to, damper operators, thermostats, sensors, smoke detectors, and valves. The controls shall include all necessary relays, interlocks, and control devices to enable the control panel to function as described in the sequence of operations on the drawings.

All interconnecting wiring and wiring to terminals for exterior connection shall be stranded copper, insulated for not less than 600 volts, with a moisture and flame-resistant covering rated for at least 90°C. Power distribution wiring on the line side of panel fuses shall be at least 12 AWG. Secondary power distribution wiring, wiring for control circuits, and annunciator and indicating light circuits shall be at least 14 AWG. Wiring shall be color coded in accordance with the color coding legend on the panel wiring diagrams.

Selector Switches. Selector switches shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Selector switches shall be heavy-duty oiltight type with gloved-hand or wing lever operators. Position legends shall be engraved on switch faceplate. Switches for electric circuits shall have silver butting or sliding contacts, rated 10 amperes continuous at 120 volts ac. Contact configuration shall be as indicated on the drawings or as necessary for the application. Switches used in electronic signal circuits shall have contacts suitable for that duty.

Push Buttons. Push buttons shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Push buttons shall be heavy-duty, oiltight type, with legends engraved on the faceplate. Contacts shall be rated 10 amperes continuous at 120 volts ac.

Indicating Lights. Indicating lights shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Alarm, indicator, and running status lights shall be furnished with bulbs. Indicating lights shall be heavy-duty, push-to-test, oiltight type with low voltage bulbs and built-in transformers. Legends shall be engraved on the lens or on a legend faceplate. Bulbs shall be easily replaceable from the front of the device.

Alarm Horns. Alarm horns shall be Federal Signal "Model 350", or approved equal. Alarm horns shall have a sound output of 100 dB at 10 feet (3 m) and shall be rated for 120 volts ac. Horns shall be furnished with mounting hardware suitable for flush mounting.

Relays. Relays shall be Eagle Signal "Series 22, 80"; Potter & Brumfield "Series KRP, CB"; Struthers-Dunn "Series A3, A4", or approved equal. Relays shall be of the plug-in socket base type, with dustproof plastic enclosures unless noted otherwise. Relays shall be UL recognized and shall have not less than double-pole, double-throw contacts. Control circuit relays shall have silver-cadmium oxide contacts rated 10 amperes at 120 volts ac. Electronic switching-duty relays shall have gold-plated or gold alloy contacts suitable for use with low level signals. Relays used for alarm input or indicating light service shall have contacts rated at least 3 amperes. Time-delay relays shall have dials or engraved switch settings marked in seconds and shall have timing repeatability of ± 2 percent of setting. Latching and special purpose relays shall be as needed for the specific application.

Terminal Blocks and Panel Wiring. Terminal blocks for external connections shall be suitable for 12 AWG wire and shall be rated 30 amperes at not less than 300 volts. Terminal blocks shall be fabricated, shall be complete with marking strip, covers, and pressure connectors, and shall be labeled to agree with the identification on the temperature control manufacturer's submittal drawings.

Control Power Transformers. Where 24 volt ac control power is necessary for the temperature control components, 120/24 volt transformers shall be furnished and mounted in the respective temperature control panel. Control power transformers shall be sized by the manufacturer based on the equipment load of the panel, shall be copper wound, vacuum impregnated with solid polyester varnish, and shall be 100 percent tested in strict compliance with ANSI, CSA, and UL codes. Control power transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded. The control power transformers shall be sized by the manufacturer based on the equipment load of the panel.

Terminals. A terminal shall be provided for each conductor of external circuits, plus one ground cable. At least 8 inches (203 mm) of clearance shall be provided between the terminal strips and the base of vertical panels for conduit and wiring space. At least 25 percent spare terminals shall be provided.

All wiring shall be grouped or cabled and firmly supported inside the panel. Wiring shall be bundled in groups and bound with nylon cable ties or shall be routed in Panduit or similar nonmetallic slotted ducts. Ducts shall be readily accessible within the panel, with removable covers, and shall have a space of at least 40 percent of their depth remaining for future use after completion of installation and field wiring. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables.

Painting. Interior and exterior surfaces of all panels shall be thoroughly cleaned and painted with universal primer. The panel interior shall be painted white with the manufacturer's standard coating. All pits and blemishes in the exterior surfaces shall be filled before the surface is painted with one or more finish coats of the manufacturer's standard coating. Finish coats shall have a dry film thickness of at least 4 mils (100 μm). One quart (0.95 L) of paint shall be furnished with the panels for future touchup painting.

2.4.05 Temperature Indicators.

2.4.05.01 Dial Thermometers. A dial thermometer shall be supplied and installed at each remote bulb sensor for calibration and calibration checks. The range of the dial thermometers shall be -40°F to 120°F (-40°C to 49°C).

In ducted systems containing hydronic coils or electric duct heaters, a dial thermometer shall be furnished and installed on the downstream side of the coil or heater. Thermometers shall be complete with averaging type elements.

2.4.05.02 Electronic Temperature Transmitters. Electronic temperature transmitters shall be furnished to transmit an electronic signal to a controller as indicated in the sequence of operation. The signal shall be compatible with the controller. Sensors shall be calibrated at the temperature control manufacturer's factory. Field adjustable sensors shall be used, with a dial thermometer installed adjacent to each sensor for calibration checks. The sensors shall have a temperature range of at least -20°F to 75°F (-7°C to 24°C).

2.4.06 Smoke Detectors. Smoke detectors, denoted by the symbol "SMD" and an identifying number, shall be System Sensor "DH100", Simplex, Grinnell, or approved equal.

Detectors shall be designed to detect combustion gases, fire, and smoke in air conditioning and ventilating duct systems in compliance with the NFPA 90A and shall contain a detector and air sampling chamber which serves as a reference point to help stabilize the detector against the effects of changes in temperature, humidity, and pressure.

Smoke detectors shall be duct-mounted photoelectric type and shall be completely self-contained, including integral power supply, supervisory and control circuitry and three sets of isolated contacts. The alarm contact shall be spst normally open; the auxiliary alarm contact shall be spdt, and the trouble contact shall be spdt and shall indicate detector malfunction. The alarm and trouble contacts shall be rated 2 amperes at 30 volts dc. The auxiliary alarm contact shall be rated 10 amperes at 120 volts ac. Pilot lights shall be provided for visual indication of alarm and power supply status on the front of the unit. A remote key-operated test station with alarm light and power supply status shall also be furnished and installed where indicated on the drawings. Detectors shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply.

Detectors shall be provided with sampling tubes extending the width of the air duct.

2.4.07 Pressure Differential Switches. The pressure differential switches, denoted by the symbol "PDS" and an identifying number, shall be furnished and installed as indicated on the drawings and the sequence of operation. Each pressure switch operating range shall be selected so that the setpoint is between 25 and 75 percent of the scale range. Initial setpoints shall be as indicated on the drawings. Differential switches shall be UL listed.

Where indicated on the drawings, pressure differential switches shall be provided with an explosionproof housing suitable for a NEC Class 1, Division 2, Group D environment. Where pressure differential switches are located outdoors, a NEMA 4 rated weather enclosure shall be provided.

2.4.07.01 Differential Airflow Switches. Pressure differential airflow switches shall be Dwyer Instruments, Inc. "Series 1800", or approved equal.

Pressure differential switches for airflow service shall be diaphragm operated by differential air pressure between duct and atmosphere or across a filter. The switch shall be spst, shall be rated 5 amperes at 120 volts ac and for a temperature range of -20°F to 125° F (-29° C to 52°C), and shall be provided with corrosion resistant mounting brackets. Pressure differential switches located across filters shall be initially set at the following setpoints.

Filter Type	Setpoint
1 inch (25 mm) pleated	0.75 inch wc (186 Pa)
2 inch (50 mm) pleated	1.0 inch wc (250 Pa)

Extended Surface	1.2 inch wc (300 Pa)

2.4.07.02 Differential Water Flow Switches. Pressure differential water flow switches shall be Mercoid "Series DP", or approved equal.

Differential pressure switches for water service shall be diaphragm operated by differential pressure. The switches shall be single pole double throw, bellows operated, suitable for 100 psig (690 kPa) working pressure, and shall be rated 15 amperes at 120 volts ac.

2.4.08 Water Flow Switches. Water flow switches, denoted by the symbol "FS" and an identification number, shall be furnished and installed as indicated on the drawings. Switches shall be W.E. Andersen "Model V4-2-U", or approved equal.

Water flow switches shall be spdt, operated by vane motion through a magnetic link. The flow switch body shall be brass with Type 316 stainless steel vane. The flow switch shall be rated for 275°F (135°C) and 150 psig (1034 kPa) service. Piping connection shall be 1-1/2 inch (40 mm) NPT. Switch contacts shall be rated at 5 amperes at 120 volts ac. The water flow switches shall be suitable for mounting in the hydronic system piping as indicated on the drawings.

2.4.09 Control Stations. Control stations for high rate ventilation fans shall include a two position selector switch with nameplate labeled "High Rate Ventilation On/Off". Control stations shall also include two indicating lights for "On/Off" indication. Indicating lights and selector switches shall be heavy duty oiltight NEMA Type 13. The control station enclosure shall be NEMA Type 4. Control stations shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.4.10 Emergency Ventilations Shutoff Switches. Emergency ventilation shutoff switches shall be furnished and installed where indicated on the drawings. The switches shall be Square D, Emergency Break-glass Operator "9001K15", or approved equal. Each break-glass switch for HVAC emergency shutoff shall be furnished with a NEMA Type 4 stainless steel enclosure with hammer, hammer clip, and chain. Each switch shall have one normally open and one normally closed contact block. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position to de-energize the equipment. Nameplates shall be provided as indicated on the on-line diagrams. The switches shall be provided with phenolic nameplates identifying the switches as 'VENTILATION SYSTEM EMERGENCY SHUTOFF."

2.4.11 Control Valves. Modulating control valves shall be sized for a pressure drop of at least 5 psig (35 kPa) and not more than 10 psig (69 kPa) at design flow. Control valves shall be modulating two-way or three-way as indicated in the schedule and on the drawings. Two inch (5.08 cm) and smaller valves shall have bronze bodies and threaded connections. Two and a half inch (6.35 cm) and larger valves shall have cast iron bodies and flanged ends.

Modulating valves shall be equipped with throttling plugs and removable discs and electric actuators or shall be refrigerant pressure actuated as specified herein and as indicated on the drawings. Refrigerant pressure actuated valves shall be suitable for use with the chiller refrigerant.

Modulating electric valve actuators shall be equipped with a proportional, reversing motor which shall produce a linear relationship between valve lift and valve flow at constant pressure drop. Each actuator shall have an internal spdt auxiliary switch rated 5 amperes at 120 volts ac. Actuators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers, where needed shall be factory wired to the actuator and installed in a NEMA Type 3R enclosure secured to the motor housing.

Valves shall be furnished with linkage bolted directly to the bonnet and motor flange.

2.4.12 Accessory Components. All additional control components, including, but not limited to, electric relays, temperature sensors and transmitters, humidity sensors and transmitters, controllers, and position switches, shall be furnished where necessary to ensure a complete, properly operating installation. All components shall be products of the temperature control manufacturer. Accessory components not mounted inside the temperature control panels shall be furnished with equipment enclosures. Relays shall be provided with 120 volt coils and at least 10 ampere contacts.

2.5 CONSTRUCTION.

2.5.01 Shop Painting. Unless otherwise indicated, shop painting shall be as specified in the General Equipment Stipulations. Surface finish damaged during installation shall be repaired to the satisfaction of the Engineer. Field painting shall conform to the requirements of Master Specification Section 09900, Painting.

2.5.02 Control Circuits. Control wiring shall be in accordance with the National Electrical Code (NEC). Conduit for all HVAC control circuits shall be EMT, except in areas designated on the electrical drawings as Area Type 1A, Area Type 4, or Area Type 12. In areas designated Type 1A conduit shall be exposed rigid PVC non-metallic conduit with PVC fittings, boxes, and accessories. In areas designated Type 4 and Type 12, conduit shall be IMC with gasketed enclosures and fittings. All conduit and conduit installation shall be in accordance with the requirements of Master Specification Section 16050, Electrical General Requirements and the NEC.

2.6 CABLE AND RACEWAYS.

2.6.01 Cable. Cable used in the temperature control system shall be multi-conductor cable, at least 18 AWG size, specifically designed for industrial systems and UL listed for indoor/outdoor installations. All cable necessary for the system, except 120 volt ac power, shall be furnished by the System Supplier.

2.6.02 Raceways. All cable shall be installed in conduit furnished under this section. All conduit shall conform to the applicable paragraphs of Master Specification Section 16050, Electrical General Requirements.

2.7 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

Typical schematics on the drawings indicate electrical control items and functions necessary for most of the equipment; however, actual motor sizes shall comply with Master Specification Section 16220, General Purpose Induction Motors.

2.8 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories needed for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.9 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Contractor shall be responsible for determining that all equipment supplied is suitable for installation in the space indicated on the drawings. Control equipment shall be installed with adequate operating and maintenance access space.

3.2.01 Temperature Control Panels. The panels shall be mounted so that selector switches and indicating lights on the panel are located approximately 5 feet (1.5 m) above the finished floor.

3.2.02 Thermostats. Wall-mounted thermostats shall be mounted above the finished floors as indicated in Master Specification Section 16050, Electrical General Requirements. Insulating spacers shall be provided for thermostats mounted on exterior building walls. The spacers shall be installed between the thermostat and its mounting surface, so that the thermostat will not be affected by surface temperatures.

Wall-mounted thermostats in nonairconditioned areas shall be furnished and installed with a cast aluminum or wire guard.

3.2.03 Damper Operators. The number of operators furnished for each damper shall provide the torque necessary to operate the damper. Unless otherwise indicated, control dampers shall fail to the closed position, face dampers shall fail to the closed position, and bypass dampers to the open position.

3.2.04 Device Tag Numbering System. All devices shall be provided with permanent identification tags numbered to agree with the manufacturer's equipment drawings. All field-mounted control devices shall bear securely fastened identification tags. Hand-lettered labels or tape will not be acceptable.

Phenolic nameplates shall be provided and permanently attached to the wall at each control device to indicate the equipment controlled. The letters used shall be the same as the equipment designations indicated herein and on the drawings. Nameplates shall have white letters on black backgrounds.

3.2.05 Control Valves. Three-way hot water valves shall fail open to the heating coil unless otherwise indicated. Three-way chilled water valves shall fail open to the bypass unless otherwise indicated.

3.2.06 Cable. Cable shall be installed in conduit as described in the cable installation paragraphs in Master Specification Section 16050, Electrical General Requirements. The system conductors shall be installed in conduits or junction boxes separate from conductors of other systems. Conduit fill shall meet applicable NEC requirements.

3.2.07 Raceways. Conduit shall be installed as described in the conduit installation paragraphs in Master Specification Section 16050, Electrical General Requirements.

3.3 FIELD QUALITY CONTROL.

3.3.01 Installation Check. An experienced, competent, and authorized representative of the temperature controls supplier shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3.02 Field Testing. After the installation of the equipment and systems has been completed, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.4 ADJUSTING. The building system controls supplier shall provide initial startup and adjustment of the control systems, instruction of operating personnel, and set point maintenance for one year.

The building system controls supplier shall be responsible for establishing the final control system settings necessary for proper operation of the equipment and systems. These settings and calibration shall have the concurrence of the equipment manufacturer's representative.

The building system controls supplier shall demonstrate to Owner the complete and correct functioning of all control systems and equipment, and shall make all necessary repairs, replacements, or adjustments to items which fail to perform to the satisfaction of the Owner.

3.5 CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to the Owner.

3.6 OPERATOR INSTRUCTION AND TRAINING. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as needed.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

End of Section

SECTION 15990

TESTING, ADJUSTING, AND BALANCING

PART 1 - GENERAL

1.1 SCOPE. This section covers the cleaning, testing, adjusting, and balancing of the air and water systems associated with the heating, ventilating, and air conditioning (HVAC), emergency gas treatment system and odor control systems, as indicated in the Contract Documents.

1.2 GENERAL. Equipment and systems shall be cleaned, tested, adjusted, and balanced in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that all components and devices necessary for a properly functioning system have been provided. Prior to cleaning, testing, adjusting, and balancing, Contractor shall verify that each air or hydronic system has been installed properly and is operating as specified. Equipment bearings shall be lubricated in accordance with the manufacturer's recommendations.

Air systems shall be complete and operating, with dampers, filters, ductwork, air outlet and inlet devices, duct mounted equipment, and control components.

Hydronic systems shall be complete and operating, with valves, coils, pumps, piping, and control components, and shall be cleaned, filled, and vented. All strainers shall be checked for installation of the appropriate basket and shall be cleaned.

1.2.02 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with the latest edition of AABC, NEBB, or SMACNA standard manuals for testing, adjusting, and balancing of air and hydronic systems.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete apparatus report sheets for all air or hydronic systems shall be accurately and completely filled out in accordance with the Standard's manual. Copies of the final test readings and report sheets shall be submitted in accordance with the Master Specification Section 01080, Project

Submittals. As indicated in the Contract Documents, a description of the standard procedures used during testing, adjusting, and balancing shall be included in the submittal. The submittal shall include a reduced set of drawings, with the air outlet devices, air inlet devices, and equipment identified to correspond with the report sheets.

The apparatus report sheets shall include the following information:

1. Title Page:
   a. Company name.
   b. Company address.
   c. Company telephone number.
   d. Project name.
   e. Project location.
   f. Project Engineer.
   g. Project Contractor.
   h. Project altitude.
2. Instrument List:
   a. Instrument.
   b. Manufacturer.
   c. Model.
   d. Serial number.
   e. Range.
   f. Calibration date.
3. Air Moving Equipment:
   a. Location.
   b. Manufacturer.

c. Model.

d. Airflow, specified and actual.

e. Return airflow, specified and actual.

f. Outside airflow, specified and actual.

g. Total static pressure (total external), specified and actual.

h. Inlet pressure.

i. Discharge pressure.

j. Fan RPM.

4. Return Air/Outside Air Data:

a. Identification/location.

b. Design airflow.

c. Actual airflow.

d. Design return airflow.

e. Actual return airflow.

f. Design outside airflow.

g. Actual outside airflow.

h. Return air temperature.

i. Outside air temperature.

j. Required mixed air temperature.

k. Actual mixed air temperature.

l. Design outside/return air ratio.

m. Actual outside/return air ratio.

5. Electric Motors:

a. Manufacturer.

b. HP/BHP.

c. Phase, voltage, amperage; nameplate, actual, no load.

d. RPM.

e. Service factor.

f. Starter size, rating, heater elements.

6. V-Belt Drive:

a. Identification/location.

b. Required driven RPM.

c. Driven sheave, diameter, and RPM.

d. Belt, size, and quantity.

e. Motor sheave, diameter, and RPM.

f. Center to center distance, maximum, minimum, and actual.

7. Duct Traverse:

a. System zone/branch.

b. Duct size.

c. Area.

d. Design velocity.

e. Design airflow.

f. Test velocity.

g. Test airflow.

h. Duct static pressure.

i. Air temperature.

j. Air correction factor.

8. Air Distribution Test Sheet:

a. Air terminal number.

b. Room number/location.

c. Terminal type.

d. Terminal size.

e. Area factor.

f. Design velocity.

g. Design air flow.

h. Test (final) velocity.

i. Test (final) airflow.

j. Percent of design airflow.

9. Air Terminal Unit Data:

a. Manufacturer.

b. Type, constant, variable, single.

c. Identification/number.

d. Location.

e. Model.

f. Size.

g. Minimum static pressure.

h. Minimum design airflow.

i. Maximum design airflow.

j. Maximum actual airflow.

k. Inlet static pressure.

10. Electric Duct Heater:

a. Manufacturer.

b. Identification/number.

c. Location.

d. Model.

e. Design kW.

f. Number of stages.

g. Phase, voltage, amperage.

h. Test voltage (each phase).

i. Test amperage (each phase).

j. Airflow, specified and actual.

k. Temperature rise, specified and actual.

11. Pump Data:

a. Identification/number.

b. Manufacturer.

c. Size/model.

d. Impeller.

e. Service.

f. Design flow rate, pressure drop, BHP.

g. Actual flow rate, pressure drop, BHP.

h. Discharge pressure.

i. Suction pressure.

j. Total operating head pressure.

k. Shut off, discharge and suction pressures.

l. Shut off, total head pressure.

12. Chillers:

a. Identification/number.

b. Manufacturer.

c. Capacity.

d. Model.

e. Evaporator entering water temperature, design and actual.

f. Evaporator leaving water temperature, design and actual.

g. Evaporator pressure drop, design and actual.

h. Evaporator water flow rate, design and actual.

i. Condenser entering water temperature, design and actual.

j. Condenser leaving water temperature, design and actual.

k. Condenser pressure drop, design and actual.

l. Condenser water flow rate, design and actual.

13. Air Cooled Condenser:

a. Identification/number.

b. Location.

c. Manufacturer.

d. Model.

e. Entering DB air temperature, design and actual.

f. Leaving DB air temperature, design and actual.

g. Number of compressors.

14. Heat Exchanger:

a. Identification/number.

b. Location.

c. Service.

d. Manufacturer.

e. Model.

f. Primary water entering temperature, design and actual.

g. Primary water leaving temperature, design and actual.

h. Primary water flow, design and actual.

i. Primary water pressure drop, design and actual.

j. Secondary water entering temperature, design and actual.

k. Secondary water leaving temperature, design and actual.

l. Secondary water flow, design and actual.

m. Secondary water pressure drop, design and actual.

15. Coil Data:

a. Identification/number.

b. Location.

c. Service.

d. Manufacturer.

e. Airflow, design and actual.

f. Entering air DB temperature, design and actual.

g. Entering air WB temperature, design and actual.

h. Leaving air DB temperature, design and actual.

i. Leaving air WB temperature, design and actual.

j. Water flow, design and actual.

k. Water pressure drop, design and actual.

l. Entering water temperature, design and actual.

m. Leaving water temperature, design and actual.

n. Air pressure drop, design and actual.

16. Sound Level Report:

a. Location.

b. Octave bands - equipment off.

c. Octave bands - equipment on.

17. Combustion Test:

a. Boiler manufacturer.

b. Model.

c. Firing rate.

d. Overfire draft.

e. Gas pressure at meter outlet.

f. Gas flow rate.

g. Heat input.

h. Burner manifold gas pressure.

i. Percent carbon monoxide (CO).

j. Percent carbon dioxide (CO_2).

k. Percent oxygen (O_2).

l. Percent excess air.

m. Flue gas temperature at outlet.

n. Ambient temperature.

o. Net stack temperature.

p. Percent stack loss.

q. Percent combustion efficiency.

r. Heat output.

Product data indicating cleaning materials and treatment, chemicals, and reports on the analysis of system water after cleaning and after treatment, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals.

1.4 QUALITY ASSURANCE. Contractor shall provide the services of a licensed independent contractor, certified by AABC or NEBB and with proven experience on at least three similar projects, to perform operational testing, adjusting, and balancing of the air or hydronic systems. The total system balance shall be performed in accordance with AABC, SMACNA, or NEBB Procedural Standards for the work.

1.5 MAINTENANCE. Contractor shall provide the services of a company specializing in water analysis and chemical treatment with at least 3 years of documented experience. The company shall have local representation with water analysis laboratories and full-time service personnel.

The water treatment company shall provide laboratory services and technical assistance for one year from the date of substantial completion of the project. At the completion of the service period, the water treatment company shall conduct a 4 hour training course to instruct facility operating personnel in system maintenance, testing methods, and chemical water treatment procedures.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be adjusted or balanced to meet the specified conditions and to operate at the elevation indicated in the Contract Documents.

2.2 CONSTRUCTION.

2.2.01 Painting. Surface finish damaged during cleaning, testing, adjusting, and balancing of equipment shall be repaired to the satisfaction of Engineer. Field coatings shall be as specified in Master Specification Section 09900, Painting.

2.3 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

PART 3 - EXECUTION

3.1 INSPECTION. Before testing and balancing the air system, doors and windows surrounding the area served by the system shall be closed. Fans shall be checked for correct rotation and rotative speed. Fire and smoke dampers shall be open and access doors and panels shall be closed during the testing and balancing. A resistance shall be placed at all filter locations to simulate dirty filter conditions. The filter resistance shall be as follows:

Filter Type	Simulated Loss
1 inch (25 mm) pleated	0.15 inch water column (37 Pa)
2 inch (50 mm) pleated	0.35 inch water column (87 Pa)
Extended surface	0.80 inch water column (200 Pa)

Before starting the hydronic system testing and balancing, all valves and control components shall be opened or set to direct flow through the heat transfer element. The pumps shall be checked for correct rotation and rotative speed.

3.2 STARTUP REQUIREMENTS. System equipment shall be subject to preliminary field tests as indicated.

3.3 FIELD PERFORMANCE TESTING. Field performance tests shall be conducted for each system to demonstrate each is functioning as specified and to the satisfaction of Engineer. All tests shall be conducted in a manner acceptable to Engineer and shall be repeated as many times as necessary to secure Engineer's acceptance of each system. If inspection or tests indicate defects, the defective item or material shall be replaced, and the inspection and tests shall be repeated. All repairs to piping shall be made with new materials. Caulking of threaded joints or holes will not be acceptable.

Air filters which are subject to a pressure loss exceeding the dirty filter values shall be removed and replaced. The spare air filters furnished with equipment shall not be used as the replacement filters. Dirty filter values shall be as follows:

Filter Type	Dirty Filter Conditions
1 inch (25 mm) pleated	0.75 inch water column (186 Pa)
2 inch (50 mm) pleated	1.0 inch water column (250 Pa)
Extended surface	1.2 inch water column (300 Pa)

3.3.01 Hydronic Piping. The hydronic piping systems shall be hydrostatically tested in accordance with ANSI/ASME B31.9.

All equipment or accessories which are connected to the piping systems, and which would be damaged if subjected to the specified test pressure, shall be disconnected and the ends of the branch lines shall be plugged or capped as needed during the testing procedure.

All hydronic piping shall be hydrostatically tested at a test pressure not less than 1.5 times the working pressure, and not less than 50 psi (345 kPa).

3.3.02 Refrigerant Piping. The refrigerant piping system shall be tested in accordance with ANSI/ASME B31.5.

After testing of the refrigerant piping system is completed, the system shall be charged with the proper refrigerant and placed in operation.

The completed refrigerant system shall be guaranteed to be sufficiently free from leaks for 1 year from the date of acceptance. The loss of refrigerant shall not exceed 5 percent.

3.4 CLEANING. At the completion of the testing, all parts of the installation shall be thoroughly cleaned. All equipment, ductwork, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

3.4.01 Piping. Piping shall be cleaned with a liquid alkaline compound consisting of emulsifying agents and detergents conforming to applicable codes governing the addition of nonpotable chemicals to the buildings' mechanical systems and their discharge to public sewerage systems. All terminal control valves shall be placed in the open position during cleaning. The cleaning agent shall be added to the closed hydronic systems at the concentrations recommended by the cleaner manufacturer.

After piping systems have been cleaned, they shall be flushed with a neutralizing agent recommended by the cleaner manufacturer. All strainer screens in the piping systems shall be removed, cleaned, and replaced.

After the completion of the flushing and neutralizing, the piping systems shall be inspected and any remaining sludge shall be removed. This inspection shall include disassembly of components if necessary.

3.4.01.01 Heating Water System. While the cleaning solution is circulating in the system, it shall be slowly heated to 160°F (71°C) and maintained at that temperature for at least 12 hours. The heating shall then be stopped and the temperature of the circulating solution shall be allowed to drop to 100°F (38°C). The system shall then be drained as rapidly as possible and shall be refilled with clean water. The clean water shall be circulated for 6 hours at design temperatures and then drained. The system shall again be filled with clean water and the procedure repeated until all cleaning solution is removed.

3.4.01.02 Chilled and Condenser Water Systems. The cleaning solution shall be circulated in the system for 48 hours, and then drained as rapidly as possible. The system shall then be filled with clean water, which shall be circulated for 24 hours, and drained. The sequence of rinsing with clean water shall be repeated until all cleaning solution is removed.

3.4.02 Hydronic Systems. After the hydronic system has been cleaned, it shall be filled with clean potable water and immediately treated with the appropriate chemicals. The treatment chemicals shall be suitable for use at the system operating temperature and shall be compatible with the system construction materials of steel, cast iron, stainless steel, and copper alloys.

The water treatment chemicals shall conform to applicable codes governing the addition of nonpotable chemicals to the buildings' mechanical systems and their discharge to public sewerage systems. Sufficient treatment chemicals shall be furnished for the duration of the services period.

Chemical treatment of the hydronic system shall consist of applying corrosion inhibitors, conductivity enhancers, and sequestering agents to reduce deposits and adjust pH.

3.5 ADJUSTING & BALANCING. After completion of the hydronic system chemical treatment, the air and hydronic systems shall be adjusted and balanced.

All instrumentation shall be calibrated within 6 months of use and shall be checked for accuracy before testing, adjusting, and balancing the air and hydronic systems. The accuracy of the instrumentation shall be not less than specified by the testing, adjusting, and balancing standard manual or the instrument manufacturer.

All data, including system deficiencies encountered and corrective measures taken, shall be recorded. If a system cannot be adjusted to meet the design requirements, Contractor shall notify Engineer in writing as soon as practicable.

Following final acceptance of the certified balancing reports, the testing and balancing contractor shall permanently mark the settings of all adjustment devices, including valves and dampers, and shall lock the memory stops.

All ceiling tiles, belt guards, panels, and doors removed during testing, adjusting, and balancing shall be reinstalled.

3.5.01 Air Systems. Air systems shall be adjusted to the design airflows indicated on the drawings. Airflows shall be adjusted to maintain a net positive (supply airflow greater than exhaust airflow) or negative (exhaust airflow greater than supply airflow) pressure as indicated on the drawings. Dampers located behind air outlet and inlet devices shall be used to adjust the airflow only to the extent that the adjustments do not create objectionable air movement or noise.

Dampers with operators shall be checked for tight shutoff when in the closed position.

3.5.02 Hydronic Systems. The hydronic systems shall be adjusted to the design flow rates indicated on the drawings. Equipment or system shutoff valves shall not be used for flow rate adjustment.

DIVISION 15 - MECHANICAL

PAGE NO.

VOLUME IV

VOLUME V

SECTION 15005

MECHANICAL DEMOLITION

PART 1 – GENERAL

1.1 SCOPE. Perform all HVAC, demolition required for removal of systems and equipment made obsolete by project as indicated on the drawings and as specified herein.

Work Included:

Non-destructive and selective removal of systems, materials, and equipment for reuse or salvage as directed by the Owner and as requested by the Engineer.

Removal and legal disposal of all debris.

Removal of all obsolete materials and equipment for a clean and finished installation, unless noted otherwise on the drawings.

Removal of existing heating and ventilating (H&V) equipment and piping as shown on contract documents and as required in field if not shown on contract documents.

The existing heating and ventilating (H&V) demolition work shall include demolition of controls, exhaust fans, louvers, ductwork, existing steam/condensate piping as shown on plans and as specified here. This, therefore, will require selective removal/demolition and capping at the mains.

The Contractor shall cap existing piping that is not being reused as shown on plans or as required.

The HVAC Contractor to remove existing thermostats and conduits as required and patch openings. Match finish with existing finish.

The HVAC Contractor shall perform demolition of respective systems and all cutting/patching of holes and restoration of all surfaces (floors, walls, ceilings, roof, etc.) to match with existing adjacent surfaces as clearly as possible as to texture and finish.

The cutting/patching shall be done by craftsman skilled in particular trade affected by demolition.

Insulation or materials shall be identified before attempting any demolition. Contractor shall comply with the requirements of EPA regulations, National Emissions Standards, and the OSHA regulations, as well as applicable State laws and City Codes and Ordinances.

1.2 GENERAL. Drawings and general provisions of the Contract, including General and Special Conditions and Division 1 Specification Sections, apply to this Section.

1.3 JOB CONDITIONS.

1.3.01 Coordination. Adjacent buildings will be required to remain in operation and utility services will be required to be maintained for operations in those buildings.

1.3.02 Phasing. Prior to commencing demolition in any area of the work, notify the Owner/Architect seven days in advance to ensure that no adjacent occupied buildings will be disrupted. All shutdowns, if required, shall be scheduled with the utility companies. Where shutdowns are not permitted during weekdays/working hours, the Contractor shall do such work on the weekends or after working hours. All such costs for premium time shall be included in the bid. Refer to phasing plans in the bidding documents before starting work.

Demolition phasing must be approved by the Owner prior to commencement of the operations.

Removal of debris and construction traffic will be limited to specified areas.

Demolition and installation phasing shall be worked out by the Contractor to maintain existing services to other buildings on site.

1.3.03 Codes. In addition to complying with all pertinent codes and regulations, comply with the requirements of those insurance carriers providing coverage for this work.

1.3.04 Burning. On site burning shall not be permitted.

During the execution of the work, primary consideration shall be given to the protection from damage to the structure, furnishings, finishes, and the like that are not specifically indicated to be removed and disposed.

Provide and maintain temporary partitions or dust barriers adequate to keep dirt, dust, noise, and other particles from being transferred to adjacent areas.

Existing items or surfaces to remain that are damaged as a result of this work shall be refinished, repaired, or replaced to the satisfaction of the Owner at no additional cost.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Patching. All materials used for patching shall be in conformance with the applicable sections of the specifications. Where materials are not specifically described, but require for proper completion of the work, they shall be as selected by the Contractor subject to approval by the Owner.

PART 3 - EXECUTION

3.1 DEMOLITION.

3.1.01 Site Inspection. The drawings do not show all materials or equipment existing on the project that will require demolition.

Before commencing the work of this section, the Contractor shall check with the Owner about materials, and equipment to be removed and those to be preserved. All those items requiring demolition shall be hauled away from site.

3.1.02 Scheduling. Schedule all work with all necessary considerations for public and adjacent areas.

Avoid interference with the use of and passage to and from adjacent areas.

Schedule all work so as not to interfere with nor disrupt Owners continuous operation of other areas of the facility.

All piping/ductwork that are partly removed and are required for making connections to new piping and ductwork shall be temporarily capped until new connections are made.

3.1.03 Abandoned Materials and Equipment. Items so indicated on drawings to be removed and not indicated or specified to be saved or retained shall be demolished, removed, demounted, or disconnected in the best possible manner to ensure that no damage will result to other adjacent items or surface to remain.

3.1.04 Salvage. During removal of items so indicated, caution shall be used to eliminate damage to any equipment having salvage value.

All material being removed shall become the property of the Contractor for disposal unless otherwise noted or directed. Deliver any such item retained by the Owner to any location on the project site as indicated by the project manager.

3.1.05 Disposal and Clean Up. Areas in which demolition and salvage work is being done shall be cleaned daily.

All dirt, dust, debris, unsalvageable and unreusable items and the like shall be totally removed from the project site on a daily basis. Under no circumstances shall such refuse be allowed to collect for longer periods.

Refuse shall not be allowed to block, or otherwise impair circulation in sidewalks or other traffic areas.

SECTION 15006

MECHANICAL IDENTIFICATION

PART 1 - GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of mechanical identification materials for the mechanical equipment, piping and ducts as indicated in the contract documents:

Equipment nameplates.

Equipment markers.

Equipment signs.

Access panel and door markers.

Pipe markers.

Duct markers.

Valve tags.

1.2 SUBMITTALS. Submit a shop drawing of each type of product indicated above for engineer's approval.

Submit a typewritten valve schedule for each piping system, reproduced on 8 1/2 inch by 11 inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on tag), location of valve (room or space), and variations for identification (if any). Mark valves which are intended for emergency shut-off and similar special uses, by special "flags", in the schedule margin.

Submit samples of each color, lettering style, and other graphic representation required for each identification material or system. Provide a mock-up type sample installation.

1.3 QUALITY ASSURANCE.

1.3.01 ASME Compliance. Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

PART 2 - PRODUCTS

2.1 EQUIPMENT IDENTIFICATION DEVICES.

2.1.01 Equipment Nameplates. Metal, with data engraved or stamped, for permanent attachment on equipment.

Data:

Manufacturer, product name, model number, and serial number.

Capacity, operating and power characteristics, and essential data.

Labels of tested compliances.

Location:

Accessible and visible.

Fasteners:

As required to mount on equipment.

2.1.02 Equipment Markers. Engraved, color-coded laminated plastic. Include contact-type, permanent adhesive.

Terminology:

Match schedules as closely as possible.

Data:

Name and plan number.

Equipment service.

Design capacity.

Other design parameters such as pressure drop, entering and leaving conditions, and speed.

Size:

2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.

2.1.03 Equipment Signs. ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.

Data:

Instructions for operation of equipment and for safety procedures.

Engraving:

Manufacturer's standard letter style, of sizes and with terms to match equipment identification.

Thickness:

1/8 inch, unless otherwise indicated.

Fasteners:

Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.1.04 Access Panel and Door Markers. 1/16-inch- thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.

Fasteners:

Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.2 PIPING IDENTIFICATION DEVICES.

2.2.01 Manufactured Pipe Markers, General. Preprinted, color-coded, with lettering indicating service, and showing direction of flow.

Colors:

Comply with ASME A13.1, unless otherwise indicated.

Lettering:

Use piping system terms indicated and abbreviate only as necessary for each application length.

Pipes with OD, Including Insulation, Less Than 6 Inches:

Full-band pipe markers extending 360 degrees around pipe at each location.

Pipes with OD, Including Insulation, 6 Inches and Larger:

Either full-band or strip-type pipe markers at least three times letter height and of length required for label.

Arrows:

Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

2.2.02 Pre-tensioned Pipe Markers. Pre-coiled semi-rigid plastic formed to cover full circumference of pipe and to attach to pipe without adhesive.

2.2.03 Shaped Pipe Markers. Preformed semi-rigid plastic formed to partially cover circumference of pipe and to attach to pipe with mechanical fasteners that do not penetrate insulation vapor barrier.

2.2.04 Self-Adhesive Pipe Markers. Plastic with pressure-sensitive, permanent-type, self-adhesive back.

2.2.05 Plastic Tape. Continuously printed, vinyl tape at least 3 mils thick with pressure-sensitive, permanent-type, self-adhesive back.

Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.

Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

2.3 DUCT IDENTIFICATION DEVICES.

2.3.01 Duct Markers. Engraved, color-coded laminated plastic. Include direction and quantity of airflow and duct service (such as supply, return, and exhaust). Include contact-type, permanent adhesive.

2.4 VALVE TAGS.

2.4.01 Valve Tags. Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers, with numbering scheme. Provide 5/32-inch hole for fastener.

Material: 0.032-inch- thick brass.

Valve-Tag Fasteners: Brass wire-link or beaded chain; or S-hook.

2.5 ACCEPTABLE MANUFACTURERS. Identification materials shall be manufactured by All Systems, Inc., Brady (W.H.) Co., Marking Services, Inc., Seton Name Plate Corp., or equal.

PART 3 – EXECUTION

3.1 APPLICATIONS, GENERAL. Products specified are for applications referenced in other Division 15 Sections. If more than single-type material, device, or label is specified for listed applications, selection is installer's option.

3.2 EQUIPMENT IDENTIFICATION.

3.2.01 Equipment Nameplates. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:

Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.

Pumps, compressors, chillers, condensers, and similar motor-driven units.

Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

Fans, blowers, primary balancing dampers, and mixing boxes.

Heating and ventilation central-station and zone-type units.

3.2.02 Equipment Markers. Install equipment markers with permanent adhesive on or near each major item of mechanical equipment. Data required for markers may be included on signs, and markers may be omitted if both are indicated.

Letter Size:

Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

Data:

Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.

Location:

Locate markers where accessible and visible. Include markers for the following general categories of equipment:

Main control and operating valves, including safety devices and hazardous units such as gas outlets.

Meters, gages, thermometers, and similar units.

Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.

Pumps, compressors, chillers, condensers, and similar motor-driven units.

Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

Fans, blowers, primary balancing dampers, and mixing boxes.

Heating and ventilation central-station and zone-type units.

Tanks and pressure vessels.

Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

3.2.03 Equipment Signs. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.

Color:

Identify mechanical equipment with equipment markers in the following color codes:

Green: For cooling equipment and components.

Yellow: For heating equipment and components.

Green and Yellow: For combination cooling and heating equipment and components.

Brown: For energy-reclamation equipment and components.

Letter Size:

Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

Data:

Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.

Include signs for the following general categories of equipment:

Main control and operating valves, including safety devices and hazardous units such as gas outlets.

Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.

Pumps, compressors, chillers, condensers, and similar motor-driven units.

Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

Fans, blowers, primary balancing dampers, and mixing boxes.

Heating and ventilation central-station and zone-type units.

Tanks and pressure vessels.

Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

3.2.04 Access Panel Markers. Install access panel markers with screws on equipment access panels.

3.3 PIPING IDENTIFICATION.

3.3.01 Manufactured Pipe Markers. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

Pipes with OD, Including Insulation, Less Than 6 Inches: Pre-tensioned pipe markers. Use size to ensure a tight fit.

Pipes with OD, Including Insulation, Less Than 6 Inches: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 3/4 inch wide, lapped at least 1-1/2 inches at both ends of pipe marker, and covering full circumference of pipe.

Pipes with OD, Including Insulation, 6 Inches and Larger: Shaped pipe markers. Use size to match pipe and secure with fasteners.

Pipes with OD, Including Insulation, 6 Inches and Larger: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 1-1/2 inches wide, lapped at least 3 inches at both ends of pipe marker, and covering full circumference of pipe.

Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior non-concealed locations as follows:

> Near each valve and control device.
>
> Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
>
> Near penetrations through walls, floors, ceilings, and non-accessible enclosures.
>
> At access doors, manholes, and similar access points that permit view of concealed piping.
>
> Near major equipment items and other points of origination and termination.

Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.

On piping above removable acoustical ceilings. Omit intermediately spaced markers.

3.4 DUCT IDENTIFICATION.

3.4.01 Duct Markers. Install duct markers with permanent adhesive on air ducts in the following color codes:

Color:

Green: For cold-air supply ducts.

Yellow: For hot-air supply ducts.

Blue: For exhaust-, outside-, relief-, return-, and mixed-air ducts.

Letter Size:

Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.5 VALVE-TAG INSTALLATION. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; plumbing fixture supply stops; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

3.5.01 Valve-Tag Application Schedule. Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following:

Valve-Tag Size and Shape:

Cold Water: 1-1/2 inches, round.

Hot Water: 1-1/2 inches, round.

Steam & Condensate: 1-1/2 inches, round.

Valve-Tag Color:

Cold Water: Blue

Hot Water: Red

Letter Color:

Cold Water: Black.

Hot Water: Black.

3.6 ADJUSTING AND CLEANING. Relocate mechanical identification materials and devices that have become visually blocked by other work.

Clean faces of mechanical identification devices and glass frames of valve schedules.

End of Section

SECTION 15010

VALVE INSTALLATION

PART 1 - GENERAL

1.1 SCOPE. This section covers the installation of new valves and actuators purchased by Contractor as part of this Work, or purchased by others under the procurement specifications. The equipment to be furnished by others for installation by Contractor is identified in the applicable valve schedules.

Cleaning, disinfection, pressure and leakage testing, insulation, and pipe supports are covered in other sections.

1.2 GENERAL. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Any valves and actuators that are identified as being provided by others will be furnished complete for installation by Contractor. Technical specifications under which the equipment will be purchased are available.

Contractor shall determine the number of handwheel turns to close each manual valve and shall provide a type 316 stainless steel nameplate, attached to the operator, to indicate the required turns. Contractor shall also submit to Engineer, a table, indicating the number of turns required for each manual valve provided.

1.2.01 Coordination. When manufacturer's field services or installation check services are provided by the equipment manufacturer, Contractor shall coordinate the services with the equipment manufacturer. Contractor shall give Engineer written notice at least 30 days prior to the need for manufacturer's field services.

Submittals for equipment that will be furnished by others under each procurement contract will be furnished to Contractor upon completion of review by Engineer. Contractor shall review equipment submittals and coordinate with the requirements of the Work and the Contract Documents. Contractor accepts sole responsibility for determining and verifying all quantities, dimensions, and field construction criteria.

Flanged connections to valves including the bolts, nuts, and gaskets are covered in the appropriate pipe specification section.

1.3 DELIVERY, STORAGE, AND HANDLING.

1.3.01 Storage. Upon delivery, all equipment and materials shall immediately be stored and protected by Contractor in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and the manufacturer's instructions until installed in the Work. Stored equipment shall be protected by Contractor against damage and exposure from the elements. At no time shall the equipment be stored on earth or grass surfaces or come into contact with earth or grass. Contractor shall keep the equipment dry at all times.

PART 2 - PRODUCTS

Not Applicable.

PART 3 - EXECUTION

3.1 INSPECTION. All valves and accessories shall be inspected for damage and cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by Contractor. Such material shall be segregated from the clean material and shall be inspected and approved by Owner or his representative before its use.

3.2 INSTALLATION.

3.2.01 General. Valves shall be installed with sufficient clearance for proper operation of any external mechanisms, and with sufficient clearance to dismantle the valve for in-place maintenance. Installation shall be in accordance with the valve manufacturer's recommendations.

Unless otherwise indicated on the drawings, all valves installed in horizontal runs of pipe having centerline elevations 4 feet 6 inches (1.3 m) or less above the finish floor shall be installed with their operating stems vertical. Valves installed in horizontal runs of piping having centerline elevations between 4 feet 6 inches (1.3 m) and 6 feet 9 inches (2 m) above the finish floor shall be installed with their operating stems horizontal. If adjacent piping prohibits this, the stems and operating handwheel shall be installed above the valve horizontal centerline as close to horizontal as possible. Valves installed in vertical runs of pipe shall have their operating stems oriented to facilitate the most practicable operation, as reviewed by Engineer.

3.2.02 Installation Checks. When specified in Master Specification Section 15010, Valve Installation, installation checks will be provided by a manufacturer's representative in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Such services shall be furnished at no charge to Contractor for the extent indicated in the valve procurement sections. Any additional services in connection with the installation the equipment which are required by reason of Contractor's progress shall be paid for by Contractor.

Contractor shall perform no Work related to the installation or operation of materials or equipment furnished by others without direct observation and guidance of the field representative, unless Engineer and manufacturer furnishing such materials concur otherwise.

3.2.03 Butterfly Valves. Butterfly valves shall be installed with the shaft horizontal unless otherwise necessary for proper operation or as acceptable to Engineer.

Whenever an actuator must be removed to permit installation of a valve, the actuator shall be promptly reinstalled and shall be inspected and readjusted by a representative of the valve manufacturer.

3.2.04 Check Valves.

3.2.04.01 Lift Check Valves. Horizontal lift checks shall be installed in a level horizontal position so that the internal parts rise and fall vertically, unless the valve is spring loaded. Angle pattern lift checks shall be installed in vertical pipe with flow upward from beneath the disc.

3.2.04.02 Swing Check Valves. Install valves oriented for the correct flow direction. Only valves designed for vertical installation shall be installed in vertical piping.

3.2.05 Eccentric Plug Valves. Eccentric plug valves shall be installed with the shaft horizontal and the plug in the upper half of the valve body. Valves in wastewater, sludge, or scum lines shall be installed with the seat on the upstream end.

3.2.06 Resilient Seated Gate Valves. Valves shall be handled and installed in accordance with the recommendations set forth in the Appendix to ANSI/AWWA C509 and with the recommendations of the manufacturer.

3.2.07 Double Disc Gate Valves. Valves shall be handled and installed in accordance with the recommendations set forth in the Appendix to AWWA C500 and with the recommendations of the manufacturer.

3.2.08 Air Release and Combination Air Valves. The exhaust from each valve shall be piped to a suitable point acceptable to Engineer. Air release valve exhaust piping leading to a trapped floor drain shall terminate at least 6 inches (150 mm) above the floor.

3.2.09 Valve Boxes. Valve boxes shall be set plumb. Each valve box shall be placed directly over the valve it serves, with the top of the box brought flush with the finished grade. After each valve box is placed in proper position, earth fill shall be placed and thoroughly tamped around the box.

3.2.10 Yard Hydrants. A concrete slab 18 inches (450 mm) square and 4 inches (100 mm) thick shall be provided around the top of each 3/4 inch (19 mm) and 1-1/2 inch (38 mm) yard hydrant. Hydrants shall be installed plumb. Hydrant drainage shall be provided by installing below each hydrant at least 1 cubic foot (0.03 m^3) of gravel or crushed stone.

Each 4 inch (100 mm) yard hydrant shall be set on a concrete foundation at least 18 inches (450 mm) square and 6 inches (150 mm) thick. Each hydrant shall be anchored in place or adequately blocked to prevent the hydrant from blowing off the supply connection. Hydrant drainage shall be provided by installing at least 7 cu. ft (0.20 m^3) of gravel or crushed stone around the hydrant and below the top of the hydrant supply pipe.

An operating wrench shall be provided for each yard hydrant.

3.3 VALVE ACTUATORS. Valve actuators and accessories will be furnished by others and shall be installed in accordance with the equipment manufacturer's recommendations.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. After installation, all valves 12” and above shall be tested in conjunction with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.4.01.01 Pressure Tests. Pressure testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.4.01.02 Leakage Tests. All valves shall be free from leaks. Each leak that is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor. Leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.5 ADJUSTING. After installation, the opening and closing time shall be adjusted as needed for each pneumatic, hydraulic and electric actuated valve.

End of Section

SECTION 15020

MISCELLANEOUS PIPING AND ACCESSORIES INSTALLATION

PART 1 - GENERAL

1.1 SCOPE. This section covers the installation of miscellaneous piping, cast iron soil pipe, copper tubing, and accessories as indicated on the drawings. Contractor shall furnish all necessary jointing materials, coatings, and accessories that are specified herein.

Pipe supports and anchors shall be furnished by Contractor, and are covered in Master Specification Section 15140, Pipe Supports. Pipe trenching and backfilling are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

1.2 GENERAL.

1.2.01 Coordination. Materials installed under this section shall be installed in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the manufacturer, unless exceptions are noted by Engineer.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Chlorine tank car unloading connection.

Cleaning procedure for metal chlorine piping.

Watertight/dusttight pipe sleeves.

1.3.02 Welder Certification. Prior to the start of the work, Contractor shall submit a list of the welders he proposes using and the type of welding for which each has been qualified. Copy of certification and identification stamp shall be submitted for each welder. Qualification tests may be waived if evidence of prior qualification is deemed suitable by Engineer.

1.3.03 Spool Drawings. Spool drawings indicating the complete line, showing all welded and assembly items, except for insulation shoes or nonstress-relieved lines shall be developed and submitted.

1.4 QUALITY ASSURANCE.

1.4.01 Welding and Brazing Qualifications. All welding and brazing procedures and operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of Section IX of the ASME Code. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.4.02 Tolerances. These tolerances apply to in-line items and connections for other lines.

The general dimension, such as face-to-face, face on end-to-end, face- or end-to center and center-to-center shall be 1/8 inch [3 mm].

The inclination of flange face from true in any direction shall be 3/64 inch per foot [4 mm per meter].

Rotation of flange bolt holes shall not exceed 1/16 inch [1.5 mm].

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

Plastic pipe, tubing, and fittings shall be stored between 40°F and 90°F (4°C and 32°C).

1.5.01 Coated Pipe. Handling methods and equipment used shall prevent damage to the protective coating and shall include the use of end hooks, padded calipers, and nylon or similar fabric slings with spreader bars. Bare cables, chains, or metal bars shall not be used. Coated pipe shall be stored off the ground on wide, padded skids. Plastic-coated pipe shall be covered or otherwise protected from exposure to sunlight.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Pipe, tubing, and fittings covered herein shall be installed in the services indicatedin the Contract Documents.

2.2 MATERIALS.

Solder	Solid wire, ASTM B32, Alloy Grade Sb5, (95-5).
Soldering Flux	Paste type, Fed Spec O-F-506, Type I, Form A.
Brazing Filler Metal	AWS A5.8, BCuP-5; Engelhard "Silvaloy 15", Goldsmith "GB-15", or Handy & Harman "Sil-Fos".
Brazing Flux	Paste type, Fed Spec O-F-499, Type B.
Insulating Fittings	
Threaded	Dielectric steel pipe nipple, ASTM A53, Schedule 40, polypropylene lined, zinc plated; Perfection Corp. "Clearflow Fittings".
Flanged	Epco "Dielectric Flange Unions" or Central Plastics "Insulating Flange Unions".
Pipe Insulation	See Section 15250.
Watertight/Dusttight Pipe Sleeves	O-Z Electrical Manufacturing "Thruwall" and "Floor Seals", or Thunderline "Link-Seals"; with modular rubber sealing elements, nonmetallic pressure plates, and galvanized bolts.
Pipe Sleeve Sealant	Polysulfide or urethane, as specified in the caulking section.
Anti-Seize Thread Lubricant	Jet-Lube "Nikal", John Crane "Thred Gard Nickel", Never-Seez "Pure Nickel Special", or Permatex "Nickel Anti-Seize".
Teflon Thread Sealer	Paste type; Hercules "Real-tuff", John Crane "JC-30", or Permatex "Thread Sealant with Teflon".

Teflon Thread Tape	Hercules "Tape Dope" or John Crane "Thred-Tape".
Solvent Cement	
PVC Systems	ASTM D2564.
CPVC Systems	ASTM F493.
Sodium Hypochlorite, Sodium Hydroxide, and Sodium Bisulfite Service	IPS Corporation "Weld-On 724"
Primer	ASTM F656.
Protective Coatings	
Tape Wrap	ANSI/AWWA C209, except single ply tape thickness shall not be less than 30 mils [760 μm]; Protecto Wrap "200" or Tapecoat "CT".
Primer	As recommended by the tape manufacturer.
Medium Consistency Coal Tar	Carboline "Bitumastic Super Service Black" or Tnemec "46-465 H.B. Tnemecol".
Chlorine Tank Car Unloading Connection	Special flanged hose assembly conforming to materials and details on Drawing No. 135, The Chlorine Institute, Inc.

PART 3 - EXECUTION

3.1 INSPECTION. All piping components shall be inspected for damage and cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and recleaned to the original requirements by Contractor. Such material shall be segregated from the clean material and shall be inspected and approved by Owner or his representative before its use.

3.2 PREPARATION.

3.2.01 Field Measurement. Pipe shall be cut to measurements taken at the site, not from the drawings. All necessary provisions shall be made in laying out piping to allow for expansion and contraction. Piping shall not obstruct openings or passageways. Pipes shall be held free of contact with building construction to avoid transmission of noise resulting from expansion.

3.3 INSTALLATION.

3.3.01 General. All instruments and specialty items shall be installed in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and with sufficient clearance and access for ease of operation and maintenance.

Flat faced wrenches and vises shall be used for copper tubing systems. Pipe wrenches and vises with toothed jaws will damage copper materials and shall not be used. Bends in soft temper tubing shall be shaped with bending tools.

3.3.02 Pipe Sleeves. Piping passing through concrete or masonry shall be installed through sleeves that have been installed before the concrete is placed or when masonry is laid. Pipe sleeves installed through floors with a special finish, such as ceramic or vinyl composition tile, shall be flush with the finished floor surface and shall be provided with nickel or chromium plated floor plates. Unless otherwise indicated on the drawings, in all other locations where pipes pass through floors, pipe sleeves shall project not less than 1 inch (25 mm) nor more than 2 inches [50 mm] above the floor surface, with the projections uniform within each area. In the case of insulated pipes, the insulation shall extend through pipe sleeves. Where the drawings indicate future installation of pipe, sleeves fitted with suitable plastic caps or plugs shall be provided.

Holes drilled with a suitable rotary drill will be considered instead of sleeves for piping which passes through interior walls and through floors with a special finish.

Unless otherwise indicated on the drawings, all pipes passing through walls or slabs which have one side in contact with earth or exposed to the weather shall be sealed watertight with special rubber-gasketed sleeve and joint assemblies, or with sleeves and modular rubber sealing elements.

Piping passing through locations shall be made dusttight and gastight with special rubber-gasketed sleeve and joint assemblies; with sleeves sealed with modular rubber sealing elements; or by caulking with oakum and polysulfide or urethane sealant.

3.3.03 Pipe Joints. Pipe joints shall be carefully and neatly made in accordance with the indicated requirements.

3.3.03.01 Threaded. Pipe threads shall conform to ANSI/ASME B1.20.1, NPT, and shall be fully and cleanly cut with sharp dies. Not more than three threads at each pipe connection shall remain exposed after installation. Ends of pipe shall be reamed after threading and before assembly to remove all burrs.

Threaded joints in plastic piping shall be made up with teflon thread tape applied to all male threads. Threaded joints in stainless steel piping shall be made up with teflon thread sealer and teflon thread tape applied to all male threads.

Threaded joints in steel piping for chlorine service shall be made up with teflon thread tape or litharge and glycerine paste applied to all male threads.

Threaded joints for diesel fuel oil and fuel oil piping shall be seal welded.

At the option of Contractor, threaded joints in other piping may be made up with teflon thread tape, thread sealer, or a suitable joint compound.

Seal welds shall cover all exposed threads. Thread tape and joint compound or sealers shall not be used in threaded joints which are to be seal welded. Seal welding of threaded joints that have failed a pressure test shall not be made until all thread compound and teflon tape have been removed.

3.3.03.02 Compression. Ends of tubing shall be cut square and all burrs shall be removed. The tubing end shall be fully inserted into the compression fitting and the nut shall be tightened not less than 1-1/4 turns and not more than 1-1/2 turns past fingertight, or as recommended by the fitting manufacturer, to produce a leaktight, torque-free connection.

3.3.03.03 Flared. Ends of annealed copper tubing shall be cut square, and all burrs shall be removed prior to flaring. Ends shall be uniformly flared without scratches or grooves. Fittings shall be tightened as needed to produce leaktight connections.

3.3.03.04 Soldered and Brazed. Where solder fittings are specified for lines smaller than 2 inches [50 mm], joints may be soldered or brazed at the option of Contractor. Joints in 2 inch [50 mm] and larger copper tubing shall be brazed. Joints in copper chlorine tubing and refrigerant piping shall be brazed; solder will not be acceptable. Brazing alloy shall contain no tin.

Surfaces to be joined shall be thoroughly cleaned with flint paper and coated with a thin film of flux. At each joint, tubing shall enter to the full depth of the fitting socket.

Care shall be taken to avoid overheating the metal or flux. Each joint shall be uniformly heated to the extent that filler metal will melt on contact. While the joint is still hot, surplus filler metal and flux shall be removed with a rag or brush.

3.3.03.05 Solvent Welded. Solvent welded connections shall only be used for PVC or CPVC pipe. All joint preparation, cutting, and jointing procedures shall comply with the pipe manufacturer's recommendations and ASTM D2855. Pipe ends shall be beveled or chamfered to the dimensions recommended by the manufacturer. Newly assembled joints shall be suitably blocked or restrained to prevent movement during the setting time recommended by the manufacturer. Pressure testing of solvent welded piping systems shall not be performed until the applicable curing time, as set forth in Table X2.1 of ASTM D2855, has elapsed.

3.3.03.06 Epoxy and Adhesive Bonded. Epoxy and adhesive bonded joints shall only be used for FRP pipe. All joint preparation, cutting, and jointing procedures shall comply with the pipe manufacturer's recommendations. Adhesive shall be mixed and applied in accordance with the manufacturer's recommendations. After joining, either the pipe or the fitting shall be rotated approximately one-half turn to uniformly distribute adhesive. A slight fillet of adhesive at the bond line is desirable, but all excess adhesive shall be wiped off immediately. Newly assembled joints shall be suitably blocked or restrained to prevent movement during the curing period recommended by the manufacturer.

3.3.03.07 Heat Fusion Bonded Joints. All joint preparation, cutting, jointing equipment, and jointing procedures shall comply with the pipe manufacturer's recommendations. The heating time, temperature, pressure applied to the joint during bonding, and cooling time shall consistently produce leaktight joints as strong as the pipe being joined.

3.3.03.08 Flanged. Flange bolts shall be tightened sufficiently to slightly compress the gasket and effect a seal, but shall not be torqued less than the minimum value required by the gasket manufacturer. Flange bolts shall not be so tight as to fracture or distort the flanges. A plain washer shall be installed under the head and nut of bolts connecting plastic pipe flanges. Anti-seize thread lubricant shall be applied to the threaded portion of all stainless steel bolts during assembly.

Flange bolt holes shall be oriented as follows, unless otherwise indicated on the spool drawings:

Vertical flange face:	Bolt holes to straddle the vertical centerlines.
Horizontal flange face:	Bolt holes to straddle plant north-south centerlines.

Pipe sealants, thread compounds, or other coatings shall not be applied to flange gaskets unless recommended by the gasket manufacturer for the specified service and approved by Engineer.

Welds at orifice flanges shall have internal surfaces ground smooth to the pipe wall.

Slip-on flanges shall be welded inside and outside. There shall be a distance of approximately 1/16 to 1/8 inch [1.5 to 3 mm] between the edge of the fillet weld and the face of the flange. The seal weld shall be applied so that the flange face shall be free of weld spatter and does not require refacing.

Flat-faced flanges shall be used when mating to Class 125 flanges. Full-face gaskets shall be used with flat-faced flanges and ring gaskets shall be used with raised faced flanges.

Weld neck flanges shall be used with butt-weld fittings. The bore of weld neck flanges shall match the pipe wall thickness.

Insulating joints connecting submerged (buried) piping to exposed piping shall be installed above the maximum water surface elevation and before the first pipe support not having coated anchor bolts or adhesive-bonded concrete anchors. All submerged (buried) metallic piping shall be isolated from the concrete reinforcement. Insulating flanges shall be tested for electrical isolation after installation and bolt-up but prior to introduction of conducting fluid.

3.3.03.09 Welded. Welding shall conform to the specifications and recommendations contained in the ANSI B31.1 Code for Pressure Piping.

Weld cross-sections shall be equal to or greater than the pipe wall thickness. Welds shall be smooth and continuous and shall have interior projections no greater than 1/16-inch [1.5 mm]. Backing strips or rings shall not be used except with specific prior review by Engineer as to use, material, and design. Root gap inserts that are completely melted and consumed in the weld bead are acceptable only when reviewed in advance by Engineer.

Stainless steel welding shall be inert gas tungsten arc (TIG) or the direct current, straight polarity, inert gas metal arc process (MIG).

Carbon steel welding shall be made by the shielded metal arc process.

3.3.03.10 Grooved Couplings. Grooves for grooved couplings shall be cut with a specially designed grooving tool. Grooves cut in steel pipe shall conform to flexible grooving dimensions, as set forth in AWWA C606, and shall be clean and sharp without burrs or check marks.

3.3.03.11 Push-on. Gasket installation and other jointing procedures shall be in accordance with the recommendations of the manufacturer. Each spigot end shall be suitably beveled to facilitate assembly. All joint surfaces shall be lubricated with a heavy vegetable soap solution immediately before the joint is completed. Lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean.

3.3.03.12 Rubber-Gasketed. Rubber-gasketed joints for hub and spigot type cast iron soil pipe shall have plain spigot ends, without beads. Cut ends of all pipe shall be cut square, beveled, and all burrs shall be removed. Spigot ends shall be coated with a lubricant recommended by the gasket manufacturer and fully seated in the gasket. Clamps for hubless cast iron soil pipe shall be installed in accordance with the manufacturer's recommendations.

3.3.03.13 Other Pipe Joints. Coupled joints in tempered glass pipe, plastic joints in vitrified clay pipe, and other proprietary type joints shall be made in accordance with the manufacturer's recommendations and to the satisfaction of Engineer.

3.3.04 Pipe. Pipe shall be installed as specified, as indicated on the drawings, or, in the absence of detail piping arrangement, in a manner acceptable to Engineer.

Piping shall be installed without springing or forcing the pipe in a manner which would induce stresses in the pipe, valves, or connecting equipment.

Piping shall be supported in conformance with Master Specification Section 15140, Pipe Supports.

Piping shall be connected to equipment by flanges or unions as specified in the pipe procurement sections. Piping connecting to equipment shall be supported by a pipe support and not by the equipment.

Water, gas, and air supply piping shall be provided with a shutoff valve and union at each fixture or unit of equipment, whether or not indicated on the drawings, to permit isolation and disconnection of each item without disturbing the remainder of the system. Air supply piping shall be provided with sectionalizing valves and valved air inlet connections as needed for isolation of portions of the system for periodic testing. Gas supply lines to buildings shall be provided with a shutoff valve and union located above grade immediately outside the building. A capped drip leg shall be provided at the bottom of the vertical riser of gas supply piping adjacent to gas-fired appliances.

A union shall be provided within 2 feet [600 mm] of each threaded-end valve unless there are other connections which will permit easy removal of the valve. Unions shall also be provided in piping adjacent to devices or equipment which may require removal in the future and where required by the drawings or the specifications.

All air piping shall be graded to points of drainage collection where drip legs and drain valves shall be provided. Air piping shall be sized for the service conditions, with the indicated minimum sizes:

Service	Minimum Size
Air signal	1/4 inch OD [6 mm OD]
Power air	1/2 inch OD [13 mm OD]
Air supply	1/2 inch OD [13 mm OD]
Bubbler drop pipes	3/4 inch [19 mm]
Buried piping	3/4 inch [19 mm]

Water supply piping within structures shall be arranged, and facilities provided, for complete drainage. All piping serving metering equipment shall be uniformly graded so that air traps are eliminated and complete venting is provided.

All digester gas piping shall be graded to points of drainage collection where drip legs and drip traps shall be provided.

Stuffing box leakage from water sealed pumps shall be piped to the nearest point of drainage collection.

Taps for pressure gauge connections on the suction and discharge of pumping units shall be provided with a nipple and a ball type shutoff valve.

Drilling and tapping of pipe walls for installation of pressure gauges or switches will not be permitted.

In all piping except air and gas piping, insulating fittings shall be provided to prevent contact of dissimilar metals, including but not limited to, contact of copper, brass, or bronze pipe, tubing, fittings, valves, or appurtenances, or stainless steel pipe, tubing, fittings, valves, or appurtenances with iron or steel pipe, fittings, valves, or appurtenances. Insulating fittings shall also be provided to prevent contact of copper, brass, or bronze pipe, tubing, fittings, valves or appurtenances with stainless steel pipe, tubing, fittings, valves, or appurtenances.

Branch connections in horizontal runs of steam, air, and gas piping shall be made from the top of the pipe.

Buried PVC piping shall be "snaked" in the trench and shall be kept as cool as possible during installation. PVC pipe shall be kept shaded and shall be covered with backfill immediately after installation.

All chemical piping shall be installed so that lines are readily accessible for cleaning. Tees shall be provided at regular intervals in all chemical piping except chlorine piping, with extra openings plugged, to facilitate cleaning. Teflon thread tape or teflon thread sealer shall be applied to the threads of the plugs so that they can be easily removed. At each point where hose or reinforced plastic tubing is connected to rigid piping, a quick-disconnect coupling shall be provided.

Anhydrous ammonia, chlorine and sulfur dioxide gas and vent piping shall be installed so that liquid traps are avoided. The open end of each vent line shall elbow down and shall be provided with a corrosion-resistant insect screen.

Double-contained chemical feed piping shall be installed according to the manufacturer's recommendations. Joints shall be solvent cemented. Splitting and rewelding of fittings will not be acceptable. Suitable drains and vents shall be provided to permit complete drainage of both the primary and secondary containment piping. Interstitial supporting devices shall be designed to allow continuous drainage in the annular space to the drain ports. Drain fittings shall be designed to allow a valve attachment to be made so that the secondary containment compartment can be readily drained and manually inspected for leaks.

Polyethylene piping shall be installed in accordance with the manufacturer's recommendations. A continuous 12 AWG THHN insulated copper tracer wire shall be placed 6 inches (150 mm) above all portions of the buried pipe, but no more than 18 inches (450 mm) below the ground surface. Where the pipe extends above grade, a 2 foot (0.6 m) length of wire shall be coiled and attached to the pipe.

Piping adjacent to flow sensors shall be installed in accordance with the requirements of the manufacturer of the flow sensor and commonly accepted design practices of the appropriate straight pipe runs both upstream and downstream.

Drains required for operation are shown on the drawings. However, vents at all high points and drains at all low points in the piping that are required for complete draining for pressure test may not be shown on these drawings. Contractor shall add such items as found to be necessary during detail piping design and/or piping installation.

3.3.05 Reducers. Eccentric reducers shall be installed flat on the bottom for steam, condensate return and digester gas services.

3.3.06 Valves. Prior to soldering or brazing valves, teflon and elastomer seats and seals shall be removed to prevent damage.

Isolation valves provided with equipment and instruments shall be located in a manner which will allow ease of access and removal of the items to be isolated.

3.4 PIPING ASSEMBLY.

3.4.01 General. Contractor shall employ only labor that has been qualified by training and experience to capably perform the specified activities required to accomplish the work in a satisfactory manner.

Contractor shall designate a quality assurance inspector who is acceptable to the Owner to inspect the installation, cleaning, and testing of the piping systems. The inspector shall also be responsible to maintain records for all spools and appurtenances for inspection and approval by the Owner's designated representative.

The specification and qualification of weld joints and welders shall be in accordance with ASME Boiler Pressure Vessel Code, Section IX, Welding and Brazing.

Weld procedure specifications (WPS) and procedure qualification reports (PQR) shall be submitted to Engineer for review and validation of joint design, efficiencies and strength before fabrication begins.

The supervision of quality control and quality assurance programs for shop-fabricated piping and skid-mounted equipment for both direct and sub-contracted work shall be by Contractor.

Inspection techniques and acceptance criteria shall be in accordance with Section VI, Inspection, Examination, and Testing of the Piping Codes and ASME Boiler and Pressure Vessel Code Section V, Nondestructive Examination.

Contractor shall have a quality control/quality assurance program to do the following minimum level of nondestructive examination (NDE) for steam and condensate systems:

> 100 percent visual examination of welds by a qualified examiner (per B31.1).
>
> 20 percent random sampling for material's compliance with fitting, pipe, valves and flange requirements. Materials are considered acceptable if the examiner can visually identify foundry markings or mill marking and the ASTM markings comply with engineering specifications.
>
> 10 percent of the flanges will be torqued with a calibrated torque wrench. Acceptance criteria for bolt torque will be identified in the QC Program Manual. Bolts and nuts will be checked for foundry markings and compared to the Specifications.
>
> 100 percent of the piping supports that use guides, anchors, spring hangers, and stops will be examined.

Contractor shall have a quality control/quality assurance program to do the following minimum level of nondestructive examination (NDE) for all other systems:

5 percent random sampling of 100 percent radiographic testing (RT) or ultrasonic testing (UT) or in-process visual weld examination.

15 percent random sampling for material's compliance with fitting, pipe, valve and flange requirements. Materials are considered acceptable if the examiner can visually identify the foundry markings or mill marking and the ASTM markings comply with engineering specifications.

10 percent of the flanges will be torqued with a calibrated torque wrench. Bolts and nuts will be checked for foundry markings and compared to the Specifications.

100 percent of the piping supports that use guides, anchors and stops will be examined.

If Contractor has developed alternative techniques or intends to apply alternative methods considered equivalent to those indicated herein, a proposal on such techniques or methods shall be submitted in writing to Engineer for review and approval at least 14 days before intended date of use.

If there is a conflict between the mechanical drawings and piping and instrumentation drawings (P&IDs), the P&ID shall take precedence.

Any deviations from the Specifications and piping locations shown on the Drawings require prior review and approval by Engineer.

Welding shall not begin until weld joint and welder qualification submittals have been reviewed and approved.

3.5 PROTECTIVE COATING. Standard weight black steel pipe in buried locations will have exterior surfaces protected with a shop applied plastic coating.

Extra strong black steel pipe in buried locations shall have exterior surfaces protected as specified herein.

The exterior surfaces of all fittings, couplings, specials, and other portions of buried piping not protected with plastic coating shall be tape-wrapped in the field. All surfaces to be tape-wrapped shall be thoroughly cleaned and primed in accordance with the tape manufacturer's recommendations immediately before wrapping. The tape shall be applied by two-ply (half-lap) wrapping or as needed to provide a total installed tape thickness of at least 60 mils [1.5 mm]. Joints in plastic-coated pipe shall be cleaned, primed, and tape-wrapped after installation.

Joints in galvanized steel piping in underground locations shall be field painted with two coats of coal tar coating.

3.5.01 Inspection. All shop-applied plastic coatings and tape wrap on pipe or fittings shall be inspected for holidays and other defects after receipt of the pipe or fitting on the job and immediately before installation. All field-applied tape wrap on pipe, joints, fittings, and valves shall be inspected for holidays and other defects following completion of wrapping. Inspection of plastic coatings after installation of the pipe or fitting in the trench shall be made where, in the opinion of Engineer, the coating may have been damaged during installation. Holidays and defects disclosed by inspection shall be repaired in accordance with the recommendations of the coating or tape wrap manufacturer, as applicable.

The inspection shall be made using an electrical holiday detector. The detector and inspection procedures shall conform to the requirements of Section 4.4 of ANSI/AWWA C209.

3.6 PRESSURE AND LEAKAGE TESTING. All specified tests shall be made by and at the expense of Contractor in the presence, and to the satisfaction of Engineer. Each piping system shall be tested for at least 1 hour with no loss of pressure. Piping shall be tested at the indicated pressures:

Service	Test Pressure	Test Medium
Water supply	1-1/2 times working pressure but not less than 120 psi [828 kPa]	Water
Gas supply	1-1/2 times working pressure but not less than 60 psi [414 kPa]	Compressed air
Air supply and signal	1-1/2 times working pressure but not less than 50 psi [345 kPa]	Zero humidity air or nitrogen
Liquid chlorine and anhydrous ammonia, chlorine and sulfur dioxide gas pressure piping	300 psi [2068 kPa]	Zero humidity air or nitrogen
Chlorine and sulfur dioxide gas	15 inches [51 kPa] of mercury vacuum	Atmospheric air

vacuum piping		
Other piping	1-1/2 times working pressure but not less than 50 psi [345 kPa]	Suitable fluid or gas; for distilled water piping, distilled water or filtered oil-free compressed air may be used

Compressed air or pressurized gas shall not be used for testing plastic piping unless specifically recommended by the pipe manufacturer.

Leakage may be determined by loss-of-pressure, soap solution, chemical indicator, or positive and accurate method acceptable to Engineer. All fixtures, devices, or accessories which are to be connected to the lines and which would be damaged if subjected to the specified test pressure shall be disconnected and the ends of the branch lines plugged or capped as needed during the testing.

After completion of the specified pressure tests, all anhydrous ammonia, chlorine and sulfur dioxide gas piping shall be tested for leakage using the appropriate gas chemical at operating pressures. Piping shall be thoroughly cleaned and dried before admitting gas chemical into the system. Gas chemical shall be slowly admitted to the piping system.

For chlorine gas piping, leakage shall be checked by waving a swab soaked in aqua ammonia solution near each fitting. Ammonia solution shall not be applied directly to the fittings. Formation of white fumes will indicate the presence of leaks. All chlorine gas shall be purged from the line before leaks are repaired.

Unless otherwise required by the applicable codes, drainage and venting systems shall be water or air tested, as required. For water testing, the drainage and venting system shall be filled with water to the level of the highest vent stack. For air testing, the system shall be charged with air to a minimum pressure of 5 psig [35 kPa]. Openings shall be plugged as necessary for either type of test. To be considered free of leaks, the system shall hold the water or air for 30 minutes without any drop in the water level or air pressure.

All necessary testing equipment and materials, including tools, appliances and devices, shall be furnished and all tests shall be made by and at the expense of Contractor and at the time directed by Engineer.

All joints in piping shall be tight and free of leaks. All joints which are found to leak, by observation or during any specified test, shall be repaired, and the tests repeated.

3.6 CLEANING. The interior of all pipe, valves, and fittings shall be smooth, clean, and free of blisters, loose mill scale, sand, dirt, and other foreign matter when installed. Before being placed in service, the interior of all lines shall be thoroughly cleaned, to the satisfaction of Engineer.

Metal anhydrous ammonia, chlorine and sulfur dioxide piping shall be cleaned as recommended by the gas chemical feed system supplier. All surfaces which may come into contact with gas chemical shall be thoroughly dry and free of oil or grease before being placed in service. The recommended cleaning procedures shall be submitted for review in accordance with Master Specification Section 01080, Project Submittals.

Tin-lined copper tubing for distribution of distilled water shall be flushed and cleaned with distilled water in accordance with the tubing manufacturer's recommendations.

3.7 ACCEPTANCE. Owner reserves the right to have any section of the piping system which he suspects may be faulty cut out of the system by Contractor for inspection and testing. Should the joint prove to be sound, Owner will reimburse Contractor on a time-and-material basis as specified in the Contract. Should the joint prove to be faulty, the destructive test will continue joint by joint in all directions until sound joints are found. Costs for replacement of faulty work and/or materials shall be the responsibility of Contractor.

End of Section

SECTION 15060

MISCELLANEOUS PIPING AND PIPE ASSEMBLIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous piping and pipe assemblies for the services as indicated in the Contract Documents. This section includes the following types of pipe:

Regular Weight Brass Pipe
Extra Strong Brass Pipe
Polyethylene Hose
Tempered Glass Pipe
Nickel Alloy Pipe

Miscellaneous piping shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. Complete specifications, data and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but shall not be limited to, the following:

Chemical resistant waste pipe and fittings.

Hose couplings.

Name of Manufacturer

Type and model

Construction materials, thickness, and finishes,

Pressure and temperature ratings

1.3 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Miscellaneous piping materials shall be as indicated.

Material Classification	BR-1
Regular Weight Brass Pipe	
Pipe	ASTM B43, red brass, seamless, regular weight.
Fittings	ANSI/ASME B16.15, Class 125.
Material Classification	BR-2
Extra Strong Brass Pipe	
Pipe	ASTM B43, red brass, seamless, extra strong.
Fittings	ANSI/ASME B16.15, Class 125.
Material Classification	HS-1
Hose With Insert Type Couplings	
Hose	ID not smaller than nominal size.
	Boston " Crosslinked Polyethylene Hose" or Gates "Renegade", "Mustang 45 HW" or "Stallion" acid-chemical hose. To be selected for resistance to the service chemical.
Couplings	Rigid PVC or other material suitable for service conditions, with band type stainless steel clamps.
Material Classification	HS-2
Hose With Quick Disconnect Couplings	

Hose	ID not smaller than nominal size. Boston " Crosslinked Polyethylene Hose" or Gates "Renegade", "Mustang 45 HW" or "Stallion" acid-chemical hose. To be selected for resistance to the service chemical.
Couplings	OPW "Quick Coupler" or PT Coupling "Quick Connect/Disconnect Coupling"; polypropylene or other material suitable for service conditions.
Material Classification	TG-1
Tempered Glass Pipe	
Pipe	Borosilicate glass, ASTM C 1053. Schott "Kimax", or equal.
Fittings	Borosilicate glass, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard drainline coupling with compression liner, seal ring, and stainless steel band and bolt. Joints shall be "bead-to-bead" or "bead-to-plain end" type.
Material Classification	CRP-1
Carpenter 20-Cb3	
Welded	ASTM B464 - UNS NO8020.
Seamless	ASTM B729 - UNS NO8020.
Fittings	ASTM B462 - UNS NO8020. The use of flanged fittings shall be limited to equipment connections.

2.1.02 Accessories. Accessories for miscellaneous piping systems shall be as indicated.

Unions For Brass pipe	Fed Spec WW-U-516, Class 125.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15061

DUCTILE IRON PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of ductile iron pipe, except ductile iron pipe used for buried water main service. Ductile iron pipe shall be furnished complete with all fittings, jointing materials, pipe hangers and supports, anchors, blocking, encasement, and other appurtenances.

Piping furnished hereunder shall be complete with all joint gaskets, bolts, and nuts required for installation of any valves and equipment furnished by others for installation under this contract.

Pipe hangers and supports are covered in Master Specification Section 15140, Pipe Supports. Pressure and leakage testing is covered in Master Specification Section 15020, Miscellaneous Piping and Accessories Installation. Cleaning and disinfection are covered in Master Specification Section 02675, Disinfection of Water Distribution System. Cast iron soil pipe is covered in Master Specification Section 15069, Cast Iron Soil Pipe and Accessories.

Ductlie iron pipe for buried water main service is covered in Master Specification Section 02620, Water Main Services and Gate Valves. Pipe trenching, bedding, and backfill are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

1.1.02 Pipe Manufacturer’s Experience and Field Services. All ductile iron pipe, fittings, and specials shall be fabricated, lined, and coated by the pipe manufacturer. Minimum required experience qualifications shall include manufacture of a pipeline at least 1 mile (1.6 km) in length, of equal or larger diameter than the pipe to be provided, with joints, lining, and coating suitable for the same or greater pressure rating, which has performed satisfactorily for the past 5 years.

An experienced, competent, and authorized field service representative shall be provided by the pipe manufacturer to perform all pipe manufacturer’s field services specified herein. The field service representative's minimum required experience qualifications shall include 5 years of practical knowledge and experience installing ductile iron pipe with joints, lining, and coating of the pipe to be provided. The pipe manufacturer’s field service representative shall be acceptable to Owner. A resume of the proposed pipe manufacturer’s field service representative shall be submitted for review. The resume shall include the field service representative’s experience record which meets the specified minimum required experience qualifications.

All ductile iron pipe shall be installed in accordance with the pipe manufacturer's recommendations. The pipe manufacturer's field service representative shall visit the site and inspect, check, instruct, guide, and direct Contractor's procedures for pipe handling, laying, and jointing at the start of pipe installation for each crew. The pipe manufacturer's field service representative shall coordinate his services with Contractor.

Each joint, including restrained joints, shall be checked by Contractor as instructed by the pipe manufacturer's field service representative to determine that the joint and the restraints are installed properly.

The pipe manufacturer's field service representative shall furnish to Owner, through Engineer, a written report certifying that Contractor's installation personnel have been properly instructed and have demonstrated the proper pipe handling and installation procedures. The pipe manufacturer's field service representative shall also furnish to Owner, through Engineer, a written report of each site visit.

All costs for these services shall be included in the Contract Price.

1.1.03 <u>Emergency Repair Manual</u>. Contractor shall submit an emergency repair manual prepared and furnished by the pipe manufacturer. The emergency repair manual shall include procedures for handling emergency calls and repairs; a list of stock replacement pipe sections, closures, and other parts needed for emergency repairs; names and emergency telephone numbers of pipe manufacturer's engineering staff and factory-trained field service representatives who can be contacted day or night during an emergency; response and delivery times; and installation instructions for the materials and methods used in making repairs. The pipe manufacturer shall provide emergency assistance that may be required, during the construction and warranty period, at no additional cost to Owner.

1.2 <u>SUBMITTALS</u>. Drawings, details, specifications, and installation schedules covering all ductile iron pipe and accessories shall be submitted in accordance with the procedure set forth in Master Specification Section 01080, Project Submittals. The drawings and data shall include, but shall not be limited to, the following:

> Certification by manufacturer for each item furnished in accordance with the ANSI/AWWA Standards.
>
> Certification of gaskets.
>
> Certification of proof-of-design tests for joints.
>
> Certification of proof-of-design tests for welded-on outlets.

Laying schedule complete with an explanation of all abbreviations used in the schedule.

Two samples of the polyethylene encasement, each sample clearly indicating all identification required by the Governing Standard.

Submittal data shall clearly indicate the country of origin of pipe, fittings, restraining devices, and accessories. Certified copies of physical and chemical test results as outlined in AWWA C151 shall be submitted for the materials to be provided.

Contractor shall obtain and submit a written statement from the gasket material manufacturer certifying that the gasket materials are compatible with the joints specified herein and are recommended for the specified field test pressures and service conditions.

1.3 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Pipe, fittings, and accessories shall be handled in a manner that will ensure installation in sound, undamaged condition. Equipment, tools, and methods used in handling and installing pipe and fittings shall not damage the pipe and fittings. Hooks inserted in ends of pipe shall have broad, well-padded contact surfaces. Unpadded hooks, wire brushes or other abrasive tools shall not be permitted to come into contact with polyethylene lining when it is specified.

Contractor furnished pipe and fittings in which the lining has been damaged shall be replaced by and at the expense of Contractor. With the concurrence of Engineer, small and readily accessible damaged areas may be repaired.

If the lining of Owner furnished pipe or fittings is damaged by Contractor during unloading or handling, the damaged pipe or fittings shall be replaced by and at the expense of Contractor. Where the damaged areas are small and readily accessible, Contractor may be permitted to repair the lining.

Contractor shall repair any damage to pipe coatings before the pipe is installed.

PART 2 - PRODUCTS

2.1 PIPE CLASS. The class of ductile iron pipe shall be as indicated in the Ductile Iron Pipe Schedule 15061-S01 or as indicated in the Contract Documents. The specified class includes corrosion allowance and casting allowance.

Pipe wall thickness for grooved and threaded pipe shall be increased if necessary to comply with the following minimum thickness:

Pipe Size		Minimum Class	
Inches	mm	Threaded Ends (1)	Grooved Ends (2)
4-16	100-400	53	53
18	450	53	54
20	500	53	55
24	600	53	56
30-54	750-1400	53	--
60 & 64	1500-1600	350	--

(1) Complies with ANSI/AWWA C115/A21.15 for minimum pipe wall thickness for threaded flanges.

(2) Grooved couplings are cataloged through 24 inch (600 mm); larger sizes require cast-on or threaded-on shoulders.

2.2 MATERIALS. All materials in contact with potable water shall have NSF 61 certification.

Pipe	Ductile iron, ANSI/AWWA C151/A21.51, Table 1 or Table 3.
Gaskets – All Joint Types	Gaskets shall be synthetic rubber. Natural rubber will not be acceptable. For potable water service, gaskets shall be certified as suitable for chlorinated and chloraminated potable water; a certificate of gasket suitability shall be submitted.
Fittings	Ductile iron, ANSI/AWWA C110/A21.1 (except shorter laying lengths will be acceptable for U.S. Pipe), or ANSI/AWWA C153/A21.53, minimum working pressure rating as follows, unless indicated otherwise on the drawings.

Fitting Size in (mm)	Material	Type	Min. Working Pressure Rating, psi (kPa)
4 to 24 (100 to 600)	DI	Mechanical and Push-on joints	350 (2400)
4 to 24 (100 to 600)	DI	Flanged joints	250 (1700)
30 to 48 (750 to 1200)	DI	All joints	250 (1700)
54 to 64 (1350 to 1600)	DI	All joints	150 (1000)

All fittings shall be ductile iron and suitable for a test pressure of 1.5 times rated working pressure without leakage or damage.

Push-on Joints	ANSI/AWWA C111/A21.11.
Restrained Push-on Joints, gaskets with stainless steel gripping segments, as required (4 inch through 12 inch) (100 mm through 300 mm).	US.Pipe "Field Lok Gasket", or American "Fast Grip".
Restrained Push-on Joints, locking wedge type, as required (4 inch through 20 inch) (100 mm through 500 mm).	EBAA Iron "Megalug" Series 1700, without exception.
Restrained Push-on Joints, positive locking segments and/or rings, as required (4 inch through 64 inch) (100 mm through 1600 mm).	American "Flex-Ring," or "Lok-Ring"; Clow "Super-Lock"; U.S. Pipe "TR Flex"; or Griffin "Snap-Lok".
Flanged Joints	ANSI/AWWA C115/A21.5.
Flanges	
Class 250	Ductile iron, flat faced, with ANSI/ASME B16.1, Class 250 diameter and drilling.

All Others	Ductile iron, ANSI/AWWA C115/A21.15.
Flanges	All flanges shall be suitable for test pressure of 1.5 times rated pressure without leakage or damage.
Bolts	ASTM A307, chamfered or rounded ends projecting 1/4 to 1/2 inch (6.3 to 12.7 mm) beyond outer face of nut.
Nuts	ASTM A307, hexagonal, ANSI/ASME B18.2.2, heavy semi-finished pattern.
Gaskets	ASTM D1330, Grade I rubber, full face type, 1/8 inch (3 mm) thick.
Insulated Flanges	
Flanges	As specified herein, except bolt holes shall be enlarged as needed to accept bolt insulating sleeves.
Insulation Kits	As manufactured by Central Plastics or PSI Industries.
Insulating Gaskets	Type E, pyrox 1E glass reinforced epoxy, 1/8 inch (3 mm) thick, with Buna-N sealing element.
Bolt Insulating Sleeves	Mylar, 1/32 inch (0.79 mm) thick.
Insulating Washers	Phenolic laminate, 1/8 inch (3 mm) thick, one for each flange bolt.
Backing Washers	Steel, 1/8 inch (3 mm) thick, two for each flange bolt.
Mechanical Joints	ANSI/AWWA C111/A21.11.
Restrained Mechanical Joints (Factory prepared spigot), as required (4 inch through 48 inch) (100 mm through 1200 mm).	American "MJ coupled Joints", or Griffin "Mech-Lok".

Restrained Mechanical Joints, (field cut spigot), as required (4 inch through 20 inch) (100 mm through 500 mm).	EBAA Iron "Megalug" Series 1100, without exception.
Wall Castings	Mechanical joint with water stop and tapped holes; single casting or fabricated ductile iron. All holes shall be sized in accordance with the details on the drawings and shall be provided with removable plugs.
Mechanical Joints with Tie Rods	See standard details.
Tie Rods	ASTM A307.
Steel Pipe	ASTM A53, standard weight.
Washers	ANSI B18.22.1, plain steel.
Threaded Connections	ANSI/ASME B1.20.1, NPT; provide boss or tapping saddle wherever wall thickness minus the foundry tolerance at the tapped connection is less than that required for 4-thread engagement as set forth in Table A.1, Appendix A, of ANSI/AWWA C151/A21.51.
Mechanical Couplings	
Couplings	Dresser "Style 38," Smith-Blair "441 or 411 Flexible Coupling," or Romac "Style 501"; without pipe stop.
Gaskets	Oil-resistant synthetic rubber.
Grooved Couplings	AWWA C606.
Pipe Ends (rigid joints), as required.	Grooved, with dimensions conforming to AWWA C606, Table 3.
Pipe Ends (flexible joints), as required	Shouldered, with dimensions conforming to AWWA C606, Table 4.

Couplings (non-shouldered pipe)	Grinnell "Figure 7001," or Victaulic "Style 31."
Couplings (shouldered pipe)	Victaulic "Style 41" or "Style 44".
Flanged Coupling Adapters	Smith-Blair "Type 912" or Romac "Style FCA501", with anchor studs for 12 inches (300 mm) and smaller, as required; Smith-Blair "Type 913" or Romac "Style FC400", 14 inches (350 mm) and larger.
Tapping Saddles	Ductile iron, with steel straps and rubber sealing gasket, 250 psi (1700 kPa)) pressure rating.
Shop Coating and Lining	
Cement Mortar Lining	ANSI/AWWA C104/A21.4.
Polyethylene Lining	ASTM D1248, Class C, heat bonded, 40 mil (1000 μm) nominal thickness, except min thickness shall be at least 30 mils (750 μm). Thickness may taper to not less than 10 mils (250 μm))beginning 4 inches (100 mm) from the end of pipe or fitting.
Ceramic Epoxy Lining	Induron "Protecto 401 Ceramic Epoxy".
Calcium Aluminate Lining	La Farge "SewperCoat".
Glass Lining	Two-coat system applied over blast-cleaned surface; ground and finish coats separately fired; finished lining thickness at least 8 mils (200 μm), Mohs' Hardness 5 to 6 density (2500 to 3000 kg/m^3) as determined by ASTM D792; Ceramic Coating "Non-Stick Glass Lining" or Victo "SG-14 Glass Lined Pipe."
Universal Primer	Manufacturer's standard.
Asphaltic Coating	Manufacturer's standard.
Coal Tar Epoxy	Manufacturer's standard.

Liquid Epoxy	ANSI/AWWA C210.
Medium Consistency Coal Tar	Carboline "Bitumastic Super Service Black" or Tnemec "46-465 H.B. Tnemecol."
Polyethylene Encasement	Seamless, ANSI/AWWA C105/A21.5; LLD-8 mil (200 μm) or HDCL-4 mil (100 μm).

2.3 SHOP COATING AND LINING. The interior of all pipe and fittings for water or water treatment service shall be cement mortar lined. The interior of all pipe for gravity sewers shall be lined with the material as specified herein. The interior of all pipe for other services, except air, shall be cement mortar lined. The interior of all air piping shall be unlined and uncoated.

Glass-lined pipe or other lining, as specified, shall be provided for the following wastewater facilities services:

Scum piping.

All sludge piping except piping conveying activated sludge from final settling basins.

Sludge holding tank overflow piping.

Sludge holding tank supernatant drawoff piping.

Where buried or embedded in concrete, glass-lined pipe shall be ductile iron with mechanical or push-on joints; glass-lined pipe installed in interior locations may be flanged ductile iron with flanged cast or ductile iron fittings.

The exterior surfaces of all pipe and fittings which will be exposed in interior locations shall be shop primed. Flange faces shall be coated with a suitable rust-preventive compound. Exterior surfaces of all other pipe and fittings shall be coated with asphaltic coating.

PART 3 - EXECUTION

3.1 INSPECTION. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation; spigot ends shall be examined with particular care. All defective pipe and fittings shall be removed from the site of the work.

3.2 PREPARATION. The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter prior to installation. Before jointing, all joint contact surfaces shall be wire brushed if necessary, wiped clean, and kept clean until jointing is completed.

Precautions shall be taken to prevent foreign material from entering the pipe during installation. Debris, tools, clothing, or other objects shall not be placed in or allowed to enter the pipe.

3.3 CUTTING PIPE. Cutting shall be done in a neat manner, without damage to the pipe or the lining. Cuts shall be smooth, straight, and at right angles to the pipe axis. After cutting, the ends of the pipe shall be dressed with a file or power grinder to remove all roughness and sharp edges. The cut ends of push-on joint pipe shall be suitably beveled.

All field cutting of existing gray cast iron pipe shall be done with mechanical pipe cutters, except where the use of mechanical cutters would be difficult or impracticable.

Ends of ductile iron pipe shall be cut with a portable guillotine saw, abrasive wheel, saw, milling cutter, or oxyacetylene torch. The use of hydraulic squeeze type cutters will not be permitted. Field-cut holes for saddles shall be cut with mechanical cutters; oxyacetylene cutting will not be permitted.

3.4 ALIGNMENT. Piping shall be laid to the lines and grades indicated on the drawings. Pipelines or runs intended to be straight shall be laid straight. Deflections form a straight line or grade shall not exceed the values stipulated in Table 4 or Table 5 of AWWA C600, unless specially designed bells and spigots are provided.

Either shorter pipe sections or fittings shall be installed where needed to conform to the alignment or grade indicated on the drawings.

Batter boards, laser beam equipment, or surveying instruments shall be used to maintain alignment and grade.

If batter boards are used to determine and check pipe subgrades, they shall be erected at intervals of not more than 25 feet (8 m). At least three batter boards shall always be maintained in proper position when trench grading is in progress.

If laser beam equipment is used, periodic elevation measurements shall be made with surveying instruments to verify accuracy of grades. If such measurements indicate thermal deflection of the laser beam due to differences between the ground temperature and the air temperature within the pipe, precautions shall be taken to prevent or minimize further thermal deflections.

3.5 LAYING PIPE. Buried pipe shall be protected from lateral displacement by placing the specified pipe embedment material. Under no circumstances shall pipe be laid in water, and no pipe shall be laid under unsuitable weather or trench conditions.

Whenever pipe laying is stopped, the open end of the pipe shall be sealed with a watertight plug, which will prevent trench water from entering the pipe.

Pipe shall be laid with the bell ends facing the direction of laying, except when reverse laying is specifically authorized by Engineer.

3.6 FIELD JOINTS. Joints in buried locations shall be mechanical or push-on type unless otherwise indicated on the drawings. Bells on wall castings and wall sleeves shall be mechanical joint type, with tapped holes for tie rods or stud bolts. All other joints shall be flanged unless otherwise indicated on the drawings.

Certification of joint design shall be provided in accordance with ANSI/AWWA C111/A21.11-90, Section 4.5, Performance Requirements, as modified herein. The joint test pressure shall be not less than 2 times the working pressure or 1-1/2 times the test pressure of the pipeline, whichever is higher. The same certification and testing shall also be provided for restrained joints. For restrained joints, the piping shall not be blocked to prevent separation and the joint shall not leak or show evidence of failure. It is not necessary that such tests be made on pipe manufactured specifically for this project. Certified reports covering tests made on other pipe of the same size and design as specified herein and manufactured from materials of equivalent type and quality may be accepted as adequate proof of design.

Where acceptable to Engineer, as required, grooved couplings may be used instead of flanges, provided that rigid grooving is used to preclude longitudinal pipe movement and angular deflection at joints. Fittings, valves, and equipment installed using grooved couplings shall be adequately supported and blocked or restrained to prevent rotation.

3.7 MECHANICAL JOINTS. Mechanical joints shall be carefully assembled in accordance with the manufacturer's recommendations. If effective sealing is not obtained, the joint shall be disassembled, thoroughly cleaned, and reassembled. Bolts shall be uniformly tightened to the torque values listed in Appendix A of ANSI/AWWA C111/A21.11. Overtightening of bolts to compensate for poor installation practice will not be permitted.

The holes in mechanical joints with tie rods shall be carefully aligned to permit installation of the tie rods. In flange and mechanical joint pieces, holes in the mechanical joint bells and the flanges shall straddle the top (or side for vertical piping) center line. The top (or side) center line shall be marked on each flange and mechanical joint piece at the foundry.

3.8 PUSH-ON JOINTS. The pipe manufacturer's instructions and recommendations for proper jointing procedures shall be followed. All joint surfaces shall be lubricated with heavy vegetable soap solution immediately before the joint is completed. Lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean. Each spigot end shall be suitably beveled to facilitate assembly.

Pipe ends for restrained joint pipe shall be prepared in accordance with the pipe manufacturer's recommendations.

3.9 FLANGED JOINTS. Pipe shall extend completely through screwed-on flanges. The pipe end and flange face shall be finish machined in a single operation. Flange faces shall be flat and perpendicular to the pipe center line.

When bolting flanged joints, care shall be taken to avoid restraint on the opposite end of the pipe or fitting which would prevent uniform gasket compression or would cause unnecessary stress in the flanges. One flange shall be free to move in any direction while the flange bolts are being tightened. Bolts shall be tightened gradually and at a uniform rate, to ensure uniform compression of the gasket.

Special care shall be taken when connecting piping to any pumping equipment to ensure that piping stresses are not transmitted to the pump flanges. All connecting piping shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before any bolts are installed in the flanges. In addition, pump connection piping shall be free to move parallel to its longitudinal center line while the bolts are being tightened. Each pump shall be leveled, aligned, and wedged into position, which will fit the connecting piping, but shall not be grouted until the initial fitting and alignment of the pipe, so that the pump may be shifted on its foundation if necessary to properly install the connecting piping. Each pump shall, however, be grouted before final bolting of the connecting piping. After final alignment and bolting, the pump connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the pump or opening of the pump connection joints. If any movement is observed, the piping shall be loosened and re-aligned as needed and then the flanges bolted back together. The flange bolts shall then be loosened and the process repeated until no movement is observed.

3.10 FLANGED COUPLING ADAPTERS. Flanged coupling adapters shall be installed in strict accordance with the coupling manufacturer's recommendations. After the pipe is in place and bolted tight, the proper locations of holes for the anchor studs shall be determined and the pipe shall be field-drilled. Holes for anchor studs shall be drilled completely through the pipe wall. Hole diameter shall be not more than 1/8 inch (3 mm) larger than the diameter of the stud projection.

The inner surfaces of couplings shall be prepared for coating in accordance with instructions of the coating manufacturer and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining surfaces, except flange mating surfaces, shall be cleaned and shop primed with universal primer.

3.11 MECHANICAL COUPLINGS. Mechanical couplings shall be carefully installed in accordance with the manufacturer's recommendations. A space of at least 1/4 inch (6 mm), but not more than 1 inch (25 mm), shall be left between the pipe ends. Pipe and coupling surfaces in contact with gaskets shall be clean and free from dirt and other foreign matter during assembly. All assembly bolts shall be uniformly tightened so that the coupling is free from leaks, and all parts of the coupling are square and symmetrical with the pipe. Following installation of the coupling, damaged areas of shop coatings on the pipe and coupling shall be repaired to the satisfaction of Engineer.

The interior surfaces of the middle rings shall be prepared for coating in accordance with instructions of the coating manufacturer and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining components shall be cleaned and shop primed with universal primer.

3.12 GROOVED END JOINTS. Grooved couplings with rigid type grooving shall be installed in accordance with the coupling manufacturer's recommendations. Completed joints shall be rigid and shall not allow angular deflection or longitudinal movement. Except for closure pieces, field grooving of pipe will not be permitted.

Special care shall be taken when connecting to pumping equipment to avoid transmitting pipe stresses to the pump flanges. Piping shall be permanently supported to obtain accurate matching of piping and abutting pump flanges before bolts are installed in the flanges.

3.13 POLYETHYLENE ENCASEMENT. All buried ductile iron pipe, including all straight pipe, bends, tees, adapters, closure pieces, and other fittings or specials, and all valves shall be provided with a minimum of one wrap of polyethylene encasement. Locations where ductile iron pipe shall be double wrapped with polyethylene encasement are indicated in the Contract Documents.

Polyethylene tube protection shall be installed in accordance with AWWA C105, Method A. Preparation of the pipe shall include, but is not limited to, removing lumps of clay, mud, cinders, etc., prior to installation.

Where ductile iron pipe is also embedded or encased in concrete, the polyethylene tube shall be installed over the pipe for 5 feet (1.5 m) either side of each end of the concrete encasement.

The terms "polyethylene tube protection" and "polyethylene encasement" are interchangeable and shall have the same meaning in these Contract Documents.

3.14 OUTLETS. Where a 12 inch (300 mm) or smaller branch outlet is indicated and the diameter of the line pipe is at least twice the diameter of the branch, a tee, a factory welded-on boss, or a tapping saddle will be acceptable.

Where a 4 inch (100 mm) or larger branch outlet is indicated on the drawings and the diameter of the branch pipe for a given diameter of parent pipe is less than equal to the maximum diameter listed herein, a factory welded-on outlet fabricated from centrifugally cast ductile iron pipe will be acceptable.

Parent Pipe Diameter Versus Maximum Branch Pipe
Diameter for Welded-On Outlets

Parent Pipe Dia inches (mm)	Max Branch Pipe Dia inches (mm)	Parent Pipe Dia inches (mm)	Max Branch Pipe Dia inches (mm)
8 ((200))	4 ((100))	30 ((750))	20 ((500))
10 ((250))	6 ((150))	36 ((900))	24 ((600))
12 ((300))	8 (200))	42 (1050))	30 (750))
14 ((350))	8 ((200))	48 (1200))	30 (750))
16 ((400))	10 ((250))	54 ((1350))	30 ((750))
18 ((450))	12 ((300))	60 ((1500))	30 ((750))
20 ((500))	14 ((350))	64 ((1600))	30 ((750))
24 ((600))	16 ((400))		

All welded-on outlets shall be rated for a working pressure of 250 psi (1700 kPa))and shall have a minimum factor of safety of 2.0. The pipe manufacturer shall provide test data and certification of proof of design. It is not necessary that these tests be performed on pipe manufactured specifically for this project. Certified reports covering tests made on other pipe of the same size and design as specified herein and manufactured from materials of equivalent type and quality may be accepted as adequate proof of design. Welded-on outlets may be provided as a radial (tee)

outlet, a tangential outlet, or a lateral outlet fabricated at a specific angle to the parent pipe (in 15° (0.262 rad)) increments between
45° and 90° (0.785 to 1.570 rad)) from the axis of the parent pipe), as indicated on the drawings. The fillet weld dimensions for welded-on outlets shall be as specified herein. Parent pipe and branch pipe shall meet hydrostatic test requirements in accordance with AWWA C151, Sec. 51-9, prior to fabrication.

Welded-on Outlet Fillet Weld Dimensions for Specified Outlet Configurations

Radial and Lateral Outlets			Tangential Outlets		
Parent Pipe Dia inches (mm)	Branch Pipe Dia inches (mm)	Weld Fillet Size inches (mm)	Parent Pipe Dia inches (mm)	Branch Pipe Dia inches (mm)	Weld Fillet Size inches (mm)
24 (600) and smaller	24 (600) and smaller	1 x 1 (25 x 25)	8-30 (200-750)	24 (600) and smaller	1-1/4 x 1-1/4 (32 x 32)
30-48 (750-1200)	24 (600) and smaller	1-1/4 x 1-1/4 (32 x 32)	36-54 (900-1350)	24 (600) and smaller	1-1/2 x 1-1/2 (38 x 38)
54-64 (1350-1600)	24 (600) and smaller	2-1/4 x 2-1/2 (57 x 64)	60-64 (1500-1600)	24 (600) and smaller	2-1/2 x 2-1/2 (64 x 64)
42-54 (1050-1350)	30 (750)	2-1/2 x 2-1/2 (64 x 64)	42-54 (1050-1350)	30 (750)	2-1/2 x 2-1/2 (64 x 64)
60-64 (1500-1600)	30 (750)	2-3/4 x 2-3/4 (70 x 70)	60-64 (1500-1600)	30 (750)	2-3/4 x 2-3/4 (70 x 70)

All joints on welded-on branch outlets shall be made in accordance with the latest revision of ANSI/AWWA C111/A21.11 and/or ANSI/AWWA C115/A21.15, as applicable. All outlets shall be fabricated from centrifugally cast ductile iron pipe designed in accordance with ANSI/AWWA C150/A21.50 and manufactured and tested in accordance with ANSI/AWWA C151/A21.51. Ni-Rod FC 55® electrodes manufactured by International Nickel Corporation (or an electrode with equivalent properties) shall be used in the manufacture of the fillet welds. Carbon steel electrodes will not be acceptable. Special Thickness Class 53 pipe shall be used for all branch pipe and parent pipe in 4 to 54 inch (100 to 1400 mm) sizes. Pressure Class 350 pipe shall be used for 60 inch and 64 inch (1500 and 1600 mm) parent pipe. After welding, each fabricated outlet shall be subjected to a 15 psi (100 kPa) air test. A soap and water solution shall be applied during the testing procedure to inspect the weld for leakage. Any welds that show air seepage shall be refabricated and retested.

Welded-on outlets shall be fabricated by the pipe manufacturer at its production facilities. Manufacturers of welded-on outlets shall have at least 5 years of satisfactory experience in the manufacture and performance of these products. The manufacturer shall have a documented welding quality assurance system and shall maintain resident quality assurance records based on ANSI/AWS D11.2, the Guide for Welding Iron Castings. The manufacturer shall also maintain appropriate welding procedure specifications (WPS), procedure qualification (PQR), and welder performance qualification test (WPQR) records.

The type of pipe end for the branch outlet shall be as specified or indicated on the drawings. The maximum size and laying length of the welded-on branch outlet shall be as recommended by the pipe manufacturer and shall be acceptable to Engineer for the field conditions and the connecting pipe or valve. Pipe embedment material and trench backfill shall be placed and compacted under and around each side of the outlet to hold the pipe in proper position and alignment during the subsequent pipe jointing, embedment, and backfilling.

At locations acceptable to Engineer, drilling and tapping of the pipe wall for 2 inch (50 mm) and smaller pipe connections will also be acceptable, provided that the wall thickness, minus the casting allowance, at the point of connection equals or exceeds the wall thickness required for 4-thread engagement in accordance with Table A.1, Appendix A of ANSI/AWWA C151/A21.51.

3.15 WALL CASTINGS. Wall castings shall be provided where ductile iron pipes pass through concrete walls, unless otherwise indicated on the drawings.

Where a flange and mechanical joint piece is to connect to a mechanical joint wall casting, the bolt holes in the bell of the wall casting shall straddle the top (or the side for vertical piping) center line of the casting and shall align with the bolt holes in the flange and mechanical joint piece. The top center line shall be marked on the wall casting at the foundry.

3.16 REDUCERS. Reducers shall be eccentric or concentric as indicated on the drawings. Reducers of eccentric pattern shall be installed with the straight side on top, so that no air traps are formed.

3.17 CONNECTIONS WITH EXISTING PIPING. Connections between new work and existing piping shall be made using fittings suitable for the conditions encountered. Each connection with an existing pipe shall be made at a time and under conditions which will least interfere with service to customers, and as authorized by Owner. Facilities shall be provided for proper dewatering and for disposal of all water removed from dewatered lines and excavations without damage to adjacent property.

Special care shall be taken to prevent contamination when dewatering, cutting into, and making connections with existing potable water piping. Trench water, mud, or other contaminating substances shall not be permitted to enter the lines. The interior of all pipe, fittings, and valves installed in such connections shall be thoroughly cleaned and then swabbed with, or dipped in, a 200 mg/L chlorine solution.

3.18 INSULATED FLANGED JOINTS. Insulated flanged joints shall be installed where indicated on the drawings. In addition to one full-faced insulated gasket, each flange insulating assembly shall consist of one full-length sleeve, one insulating washer, and two backing washers for each flange bolt. The insulating gasket ID shall be 1/8 inch (3 mm) less than the ID of the flange in which it is installed. The insulated flanged joint accessories shall be installed in accordance with the instructions and recommendations of the manufacturer.

3.19 CONCRETE ENCASEMENT. Concrete encasement shall be installed where indicated on the drawings. A pipe joint shall be provided within 12 inches (300 mm) of each end of the concrete encasement. Concrete and reinforcing steel shall be as specified in Master Specification Section 03300, Cast-In-Place Concrete and Master Specification Section 03200, Concrete Reinforcement. All pipe to be encased shall be suitably supported and blocked in proper position, and shall be anchored to prevent flotation.

3.20 REACTION ANCHORAGE AND BLOCKING. Concrete blocking shall be installed where indicated on the drawings and shall extend from the fitting to solid, undisturbed earth and shall be installed so that all joints are accessible for repair. The dimensions of concrete reaction blocking shall be as indicated on the drawings. If adequate support against undisturbed ground cannot be obtained, restrained joints shall be installed to provide the necessary support. If the lack of suitable solid vertical excavation face is due to improper trench excavation, restrained joints shall be furnished and installed by and at the expense of Contractor.

Reaction blocking, anchorages, or other supports for fittings installed in fills or other unstable ground, installed above grade, or exposed within structures, shall be provided as required and as indicated on the drawings.

Coatings for appurtenances listed below shall be in accordance with Master Specification Section 09900, Painting, or in accordance with the following paragraph as indicated in the Contract Documents.

All ferrous metal clamps, rods, bolts, and other components of tapping saddles, reaction anchorages, or joint harness, subject to submergence or contact with earth or other fill material and not encased in concrete, shall be protected from corrosion by two coats of medium consistency coal tar applied in the field to clean, dry metal surfaces. The first coat shall be dry and hard before the second coat is applied.

Metal surfaces exposed above grade or within structures shall be given one prime coat and two finish coats of a coating acceptable to Engineer.

3.21 LEAKAGE AND PRESSURE TESTS. Pipe and fittings shall be subjected to a leakage test and a pressure test, as specified herein.

3.21.01 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

Contractor shall provide all necessary pumping equipment; piping connections between the piping and the nearest available source of test water; pressure gauges; and other equipment, materials, and facilities necessary for the tests.

All pipe, fittings, valves, pipe joints, and other materials which are found to be defective shall be removed and replaced with new and acceptable materials, and the affected portion of the piping shall be retested by and at the expense of Contractor.

3.21.02 Visual Leakage Inspection. When a leakage test is not conducted, all joints shall be watertight and free from visible leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.22 CLEANING. The interior of all pipe and fittings shall be kept clean of any foreign matter until the work has been accepted.

3.23 SCHEDULE. See Ductile Iron Pipe Schedule 15061-S01.

End of Section

SECTION 15062

STEEL PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of steel pipe 6 inches (150 mm) in diameter and larger, together with fittings, specials, and appurtenances primarily to be used for plant applications. For steel watermain transmission piping, consult Master Specification Section 02626.

Steel pipe smaller than 6 inches (150 mm) in diameter, light wall steel pipe, miscellaneous small piping, pipe supports, concurrent cathodic protection, pressure and leakage tests, and cleaning and disinfection are covered in other sections.

Pipe trenching, bedding, and backfill are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

The size, service, and locations of steel pipelines, and the pipe material alternatives are as indicated in the Contract Documents, or in the Steel Pipe Schedule 15062-S01.

Steel piping shall be furnished and installed complete with all fittings, specials, jointing materials, appurtenances, and accessories indicated on the drawings or otherwise required for proper installation and functioning of the piping.

Piping furnished hereunder shall be complete with all jointing materials required for installation of any valves and equipment furnished by others for installation under this contract.

1.2 GOVERNING STANDARDS. Except as modified or supplemented herein, all steel pipe, fittings, and specials shall conform to the applicable requirements of the following standards:

ANSI/AWWA Standards	Title
C200	Steel Water Pipe 6 Inches (150 mm) and Larger
C203	Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape - Hot Applied

C205	Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4 Inch and Larger - Shop Applied
C206	Field Welding of Steel Water Pipe
C207	Steel Pipe Flanges for Waterworks Service - Sizes 4 Inches Through 144 Inches (100 mm through 3600 mm)
C208	Dimensions for Steel Water Pipe Fittings.
C209	Cold Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines
C210	Liquid Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines
C214	Tape Coating Systems for the Exterior of Steel Water Pipelines
C602	Cement-Mortar Lining of Water Pipelines in Place
C606	Grooved and Shouldered Type Joints

ANSI Standard

B18.2.1	Square and Hex Bolts and Screws

ANSI/ASME Standards

B1.1	Unified Inch Screw Threads
B18.2.2	Square and Hex Nuts
B36.10	Welded and Seamless Wrought Steel Pipe

1.3 SUBMITTALS. Drawings, specifications, installation schedules, welding procedures and welder qualifications, and other data showing complete details of the fabrication, construction, weld locations, joint details and certification, and installation of pipe, fittings, specials, and connections, together with complete data covering all materials proposed for use, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Submittals shall indicate the ASTM designation for the material from which each class of pipe is fabricated.

In addition to the markings, as specified under the governing standard, Contractor's drawings shall include a complete laying schedule with piece description to show where each numbered pipe, fitting, or special is to be installed. The numbers indicated on the drawings shall correspond with those painted on the pipe.

If the flange gasket materials to be provided are other than those specified herein, Contractor shall obtain and submit a written statement from the gasket material manufacturer certifying that the gasket materials are compatible with the flanged joints specified herein and are suitable for the specified field test pressure.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Pipe, fittings, specials, and appurtenances shall at all times be handled and stored in a manner that will ensure installation in sound, undamaged condition.

PART 2 - PRODUCTS

2.1 BASIS OF DESIGN. Steel pipe, fittings, and specials may be either fabricated or mill type. In either case, all items shall be fabricated to the sizes, dimensions, and shapes indicated on the drawings or specified herein.

The specified size of fabricated pipe, fittings, and specials shall be the nominal inside diameter, in inches (mm), where 12 inches (300 mm) and smaller, and the actual inside diameter of pipe lining or the outside diameter, as specified herein, where 14 inches (350 mm) and larger. Where stab joint pipe is permitted and two or more wall thicknesses are required for pipe of the same size, pipe size may be adjusted slightly to allow the different classes of pipe to be stabbed together.

The specified size of mill pipe, fittings, and specials shall be the nominal pipe size as set forth in ANSI/ASME B36.10.

Pipe design shall be performed by Engineer or the pipe fabricator, as specified herein.

In addition to the pipe markings required by ANSI/AWWA C200, each pipe section, fitting, and special shall be clearly marked to indicate the service, wall thickness, or minimum yield strength of the pipe material.

2.1.01 Pipe Wall Thickness. When pipe design is by Engineer, the minimum wall thickness shall be as indicated in the Steel Pipe Schedule 15062-S01.

When the fabricator is required to design the pipe, the wall thickness shall be determined by the following formula, except that the minimum wall thickness and the maximum diameter to thickness ratio shall be as indicated in the Steel Pipe Schedule 15062-S01. Pipe shall be designed for all conditions indicated in the Steel Pipe Schedule 15062-S01.

$$t = (PD)/(2s),$$

where

t = the pipe wall thickness in inches (mm).

s = the allowable fiber stress in psi, (Pa) which shall not exceed 50 percent of the yield strength of the steel plate at working pressure or 75 percent of the yield strength at shop test pressure.

P = the pipe working pressure or shop test pressure in psi (Pa).

D = the pipe outside diameter, in inches (mm), or straight pipe sections or the larger outside diameter or tapered sections.

2.1.02 Fitting Dimensions. The dimensions of steel pipe fittings shall conform to ANSI/AWWA C208, as specified herein.

2.1.03 Reinforcement of Fittings and Specials. All bends, fittings, branch connections, reducers, and special sections shall be reinforced, or the pipe wall thickness shall be increased, so that the combined stresses due to internal pressure (circumferential and longitudinal) and bending will not exceed 67 percent of the yield strength of the pipe material.

Whether or not indicated on the drawings, reinforcements or additional wall thickness shall be provided as necessary to ensure that the combined stresses do not exceed the specified maximum. Unless otherwise indicated or directed, the internal pressure shall be the specified shop or field test pressure as indicated in the Steel Pipe Schedule 15062-S01 for the piping adjacent to the item in question, and the external load as indicated in the Steel Pipe Schedule 15062-S01 shall be equal to the pipe full of water.

In addition to the above and where in trench, the design of reinforcement or wall thickness shall take into consideration an external load as indicated in the Steel Pipe Schedule 15062-S01.

Wall thicknesses of reducing sections shall be not less than the required thicknesses for the larger ends.

2.1.04 Joints. Acceptable joints of the type indicated on the drawings and as specified herein shall be provided for all pipe installations in the locations indicated or accepted by Engineer. To facilitate installation, additional field-welded or mechanically coupled joints may be provided, but shall be kept to a minimum, and their locations shall be acceptable to Engineer. Field-welded joints shall not be used in pipe smaller than 27 inches (675 mm), except in locations where the interior coating can be satisfactorily repaired and inspected.

2.2 MATERIALS.

Pipe, Fittings, and Specials	ANSI/AWWA C200. All steel shall be fully killed and made to a fine austenitic grain size practice.
Flanged Joints	
Flanges	ANSI/AWWA C207, slip-on, except where otherwise permitted or required.
Dimensions and Drilling	ANSI/AWWA C207, as indicated on the drawings.
Blind Flanges	ANSI/AWWA C207, unless otherwise indicated on the drawings or specified.
Gaskets	ANSI/AWWA C207, full face type, John Crane "Style 999" neoprene, 1/8 inch (3 mm) thick, for field test pressures up to 250 psi (1700 kPa); ring type, John Crane "Style 4160" compressed aramid fiber sheet, 1/16 inch (1.5 mm) thick, for field test pressures above 250 psi (1700 kPa). The products of other manufacturers and other products of the manufacturer named herein will not be acceptable unless a certificate of product suitability is submitted as set forth in the Submittals paragraph herein.

Insulated Flanges

Flanges	As specified herein, except bolt holes shall be enlarged as needed to accept bolt insulating sleeves.
Insulation Kits	As manufactured by Central Plastics or PSI Industries.
Insulating Gaskets	Type E, pyrox 1E glass reinforced epoxy, 1/8 inch (3 mm) thick, with Buna-N sealing element.
Bolt Insulating Sleeves	Mylar, 1/32 inch (0.7 mm) thick.
Insulating Washers	Phenolic laminate, 1/8 inch (3 mm)thick, one for each flange bolt.
Backing Washers	Steel, 1/8 inch (3 mm) thick, two for each flange bolt.

Flange Bolting

Material	ANSI/AWWA C207.
Type	Bolt and nut; bolt-stud and two nuts permitted for 1 inch (25 mm) and larger.
Bolts and Bolt-Studs	
Length	Such that ends project 1/4 to 1/2 inch (6 to 12.7 mm) beyond surface of nuts.
Ends	Chamfered or rounded.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2A fit. Bolt-studs may be threaded full length.
Bolt Head Dimensions	ANSI B18.2.1; regular pattern for square, heavy pattern for hexagonal.
Nuts	Hexagonal.
Dimensions	ANSI/ASME B18.2.2, heavy,

	semifinished pattern.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2B fit.
Stab Joints	Bell-and-spigot, with rubber gasket as sole element depended upon for watertightness.
Bells and Spigots	Rolled groove, Carnegie shape, or fabricated type, as needed or permitted.
Rubber Gaskets	Continuous O-ring; ANSI/AWWA C200, Section 3.6, except basic polymer shall be synthetic rubber. Natural rubber will not be acceptable.
Mechanical Couplings	
Insulating	Baker "Series 216", Dresser "Style 39", or Smith-Blair "416"; without pipe stop.
Reducing	Baker "Series 220", Dresser "Style 62", or Smith-Blair "413" and "415"; without pipe stop.
All Others	Baker "Series 200", Dresser "Style 38", or Smith-Blair "411 Flexible Coupling"; without pipe stop.
Restrained Joints	Of the type indicated on the drawings or as specified herein.
Lugs or Collars	ASTM A283, Grade B or C; or ASTM A36.
Tie Bolts	ASTM A193, Grade B7.
Threading	ANSI/ASME B1.1, Class 2A fit, coarse thread series for 7/8 inch (22 mm) and smaller, and 8-thread series for 1 inch (25 mm) and larger.
Ends	Chamfered or rounded.
Nuts	Hexagonal, ASTM A194, Grade 2H or better.

Threading	As specified for tie bolts, except Class 2B fit.
Dimensions	ANSI/ASME B18.2.2, heavy semifinished pattern.
Flat Washers	Hardened steel, ASTM A325.
Flanged Coupling Adapters	Dresser "Style 128" or Smith-Blair "913"; with anchor studs of sufficient size and number to withstand test pressure.
Grooved Couplings (when joint movement and deflection is not acceptable)	ANSI/AWWA C606; Gustin-Bacon "No. 120 Rigid" or Victaulic "07 Zero-Flex".
Grooved Couplings (when joint movement and deflection is acceptable)	ANSI/AWWA C606; Gustin-Bacon "No. 100 Standard" or Victaulic "Style 22" or "Style 77", as needed.
Small Branch Connections	
Pipe Nipples	Seamless black steel pipe, ASTM A53, standard weight (Schedule 40).
Welding Fittings	
Threaded Outlets	Bonney "Thredolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Welded Outlets	Bonney "Weldolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Coatings and Linings	
Coal Tar Enamel	ANSI/AWWA C203.
Liquid Epoxy	ANSI/AWWA C210.
Tape Coating	ANSI/AWWA C209 and C214.
Cement Mortar	ANSI/AWWA C205 and C602.
Cement	ASTM C150, Type II.
Sand	ANSI/AWWA C205, Section 4.2.3,

	except sand for field-applied lining shall pass a No. 16 (1.18 mm) sieve.
Epoxy Bonding Agent	ASTM C881, Type II, moisture insensitive and suitable for service conditions.
Latex Admixture	Euclid "Euco Flex-Con" or Sika "SikaLatex".
Medium Consistency Coal Tar	Carboline "Bitumastic Super Service Black" or Tnemec "46-465 H.B. Tnemecol".
Bituminous Filler for Wall Fittings	Plastic asphalt roof cement, asbestos-free, ASTM D4586, Type II.
Watertight Pipe Sleeves	Thunderline Corporation "Link-Seal", insulating type with modular rubber sealing elements, nonmetallic pressure plates, and galvanized bolts and nuts.
Anchor Bolts	ASTM A307.

2.3 ENDS OF SECTIONS.

2.3.01 For Field Welding. Ends of pipe, fittings, and specials for joints butt-welded in the field shall have the ends beveled for butt welding in accordance with the governing standards.

Ends of pipe, fittings, and specials for field-welded lap joints shall have both the bell and the spigot expanded by pressing (not rolling) to obtain the required shape and welding tolerances.

2.3.02 For Fitting with Flanges. Ends to be fitted with slip-on flanges shall be prepared to accommodate the flanges in accordance with the governing standards.

2.3.03 For Stab Joints. Stab joints shall be designed so that the gasket will maintain a watertight joint under all conditions of service, including expansion, contraction, and earth settlement. The gasket shall not support the entire weight of the pipe. Spigot ends shall have a groove to retain the gasket. Pipe ends shall be self-centering without the aid of the gasket.

2.3.04 For Mechanical Couplings. Ends to be joined by mechanical couplings shall be plain end type in accordance with the governing standard. In addition, pipe seam welds on ends to be joined by mechanical couplings shall be ground flush to permit slipping the coupling in at least one direction to clear the pipe joint.

2.3.05 For Grooved Couplings. Ends to be joined by grooved couplings shall be of the cut grooved or shouldered type as specified herein, conforming to the governing standard and as recommended by the coupling manufacturer for the size and wall thickness of the pipe, fitting, or special being coupled, and for the maximum test or working pressure to which the couplings will be subjected.

2.3.06 For Flanged Coupling Adapters. Ends to be fitted with flanged coupling adapters shall be plain end type in accordance with the governing standard for mechanical couplings. Welds shall be ground flush to permit installation of the coupling, and holes shall be field drilled at the proper location for anchor studs.

2.3.07 For Connection to Dissimilar Pipe Materials. Steel pipe connections to buried or submerged concrete pipe or cast iron pipe shall be made with insulated flanges.

2.4 SEAMS. Except for seamless mill-type pipe, all piping shall be made from steel plates rolled into cylinders or sections thereof with the longitudinal seams butt-welded, or shall be spirally formed and butt-welded. There shall be not more than two longitudinal seams. Girth seams shall be butt-welded and shall be spaced not closer than 10 feet (3 m) apart except in specials and fittings.

2.5 PIPE LENGTHS. Straight pipe section lengths shall be as specified herein, unless otherwise indicated on the drawings.

All pipe to be connected with mechanical couplings shall be fabricated so that the space between pipe ends within the couplings will not exceed the amount recommended by the coupling manufacturer, but will be at least 1/2 inch (12 mm).

2.6 SMALL BRANCH CONNECTIONS. Branch connections 2-1/2 inches (63 mm) and smaller shall be made with welding fittings with threaded outlets. Where the exact outlet size desired is in doubt, but is known to be less than 1 inch (25 mm), a 1 inch (25 mm) outlet shall be provided and reducing bushings used as needed.

Branch connections sized 3 through 12 inches (75 through 300 mm) shall be made with pipe nipples or with welding fittings with welded outlets. Pipe nipples and welding fittings shall be welded to the pipe shell and reinforced as needed to meet design and testing requirements.

Small branch connections shall be so located that they will not interfere with joints, supports, or other details, and shall be provided with caps or plugs to protect the threads during shipping and handling.

2.7 ACCESS MANHOLES. Access manholes shall be provided in the locations indicated on the drawings. The type of manholes shall also be indicated on the drawings. An access manhole marker post shall be furnished and installed adjacent to each buried access manhole as indicated on the drawings.

2.7.01 Type I Manhole. A Type I manhole shall consist of a 24 inch (600 mm) flanged outlet with a blind flange cover. Covers shall be fabricated from steel plate with thickness as indicated on the drawings, and shall have two handles fabricated from 1 inch (25 mm) diameter rod.

At the option of Contractor and subject to acceptance by Engineer, reinforced or dished covers of lighter weight and equal strength may be provided.

2.7.02 Type 2 Manhole. A Type 2 manhole shall be bolted or hinged type, conforming to Figure 13-26 of AWWA M11 and shall be suitable for a pressure as indicated on the drawings.

Covers. Manhole covers shall be fabricated from steel plate with thickness as indicated on the drawings.

Reinforcing Pads. Reinforcing pads shall be provided as indicated on the drawings.

2.7.03 Type 3 Manholes. A Type 3 manhole shall provide an elliptical clear opening at least 14 by 18 inches (350 by 450 mm) and shall be of self-sealing construction, with two steel yokes and a lifting handle on the cover. Each cover shall be hinged from the outside and designed to swing in. The manholes shall withstand, without leaking, the test pressure specified for the pipe in which they are to be installed. The design shall be in accordance with the ASME Code for Unfired Pressure Vessels. Access manholes shall be designed and installed so that flow in the pipe is not obstructed.

2.8 DRAINS AND VENTS. Drains and vents shall be provided at the locations and in the sizes indicated on the drawings. Pipe used for drain and vent piping shall be ASTM A53 standard weight, black steel pipe. Drain valves shall be hose valves. Vent valves shall be resilient seat globe valves. Drain and vent valves shall comply with the requirements of Master Specification Section 15100, Miscellaneous Valves.

2.9 FLANGED JOINTS. Flange faces of flanged joints shall be normal to the pipe axis. Angular deflection (layback) of the flange faces shall not exceed the allowable set forth in Section 4.3 of ANSI/AWWA C207. All flanges shall be refaced after welding to the pipe, if necessary to prevent distortion of connecting valve bodies from excessive flange bolt tightening and to prevent leakage at the joint.

Pipe lengths and dimensions and drillings of flanges shall be coordinated with the lengths and flanges for valves, pumps, and other equipment to be installed in the piping. All mating flanges shall have the same diameter and drilling and shall be suitable for the pressures to which they will be subjected.

Flanges shall be of the slip-on type, except that welding-neck or slip-on flanges welded to short lengths of pipe shall be used where installation of flanges in the field is permitted or required.

2.10 STAB JOINTS. Rubber-gasketed bell-and-spigot (stab type) steel pipe shall be furnished where indicated or specified. The design of the rubber-gasketed bell-and-spigot joints shall be subject to review and acceptance by Engineer.

The difference in circumferential measurements between the outside of the spigot end and the inside of the bell shall be not more than 0.12 inch (3 mm). For pipe with a wall thickness greater than 11/32 inch (8.7 mm), and for 60 inch (1500 mm) and larger pipe, a bar type fabricated spigot shall be furnished. Bends in the pipe wall forming each bell shall have a radius of at least 15 times the pipe wall thickness.

Contractor shall obtain from the fabricator and shall submit certification that the pipe joints will withstand working pressures and test pressures equal to those specified, and documentation that joints of the type proposed have performed satisfactorily under similar conditions.

2.11 MECHANICAL COUPLINGS. The middle ring of mechanical couplings shall have a thickness at least equal to the wall thickness specified herein for the size of pipe on which the coupling is to be used. If the manufacturer's standard thickness is less, that thickness may be used unless allowable pressures are exceeded. The length of each middle ring shall be not less than 10 inches (250 mm) for 36 inch (900 mm) and larger pipe and not less than 7 inches (175 mm) for pipe smaller than 36 inches (900 mm).

When required, the middle rings shall be shop galvanized and the remaining components shall be cleaned and shop primed with 2 mils (50 μm) of a universal primer.

When required, middle rings shall be prepared for coating in accordance with the coating manufacturer's instructions and shall then be coated with 5 mils (125 μm) of liquid epoxy in accordance with ANSI/AWWA C210. The remaining components shall be cleaned and shop primed with 2 mils (50 μm) of a universal type primer.

2.12 GROOVED COUPLINGS. Grooved couplings shall be provided where indicated on the drawings and shall be sized for proper installation on the pipe ends provided. The couplings shall have movement and deflection requirements as needed.

After fabrication, all housing clamps forming the coupling shall be cleaned and primed (as specified for the pipe) by the coupling manufacturer.

2.13 RESTRAINED JOINTS. Restrained joints shall be shall be flanged, welded, flanged coupling adapters with anchor studs, or harnessed, as required, and as specified or indicated on the drawings.

Where indicated on the drawings, mechanically coupled, grooved coupling, or stab type joints shall be restrained with harness bolts and lugs or collars. Joint harnesses shall conform to the details indicated on the drawings. Lugs or collars shall be shop welded to the pipe and coated as specified for the adjacent pipe.

2.14 PROTECTIVE COATINGS AND LININGS. All steel pipe, fittings, specials, wall fittings, and accessories shall be lined, coated, or wrapped as specified herein.

2.14.01 Type of Coating and Lining. Surface preparation shall be in accordance with the coating or lining manufacturer's instructions. Types of protective coating and lining shall be as follows:

Exterior Surfaces in Interior Locations	Shop-applied universal primer. Field painting is covered in Master Specification Section 09900,Painting.
Exterior Surfaces Underground, Including those Encased in Concrete	Coal tar enamel, ANSI/AWWA C203, cement mortar, ANSI/AWWA C205, liquid epoxy, ANSI/AWWA C210, or tape coating, ANSI/AWWA C214, as specified herein. The governing standards shall be as modified herein.
Exterior Surfaces in Contact with Potable Water or Submerged in Water Treatment Process Waters	Cement mortar, ANSI/AWWA C205, or liquid epoxy, ANSI/AWWA C210, as specified herein.
Interior Surfaces	Coal tar enamel, ANSI/AWWA C203, cement mortar - shop applied, ANSI/AWWA C205, liquid epoxy, ANSI/AWWA C210, or cement mortar - field applied, ANSI/ AWWA C602, as specified herein. The governing standards shall be as modified herein.
Pipe Joints	

Couplings	Shop coating as specified for each type of coupling. Field coating as specified for ends of sections.
Ends of Sections	As specified herein.
Machined Surfaces	Rust-preventive compound.

2.14.02 Modifications to the Governing Standards.

2.14.02.01 Coal Tar Enamel Coating. Except as modified or supplemented herein, all materials and their application shall be in accordance with ANSI/AWWA C203, and the appendix thereto when specified herein.

Exterior surfaces of all steel pipe, fittings, and specials which are to be installed underground or which are to be encased in concrete shall be blast cleaned, primed, and coated in the shop with hot-applied coal tar enamel followed by a single layer of outerwrap consisting of glass-fiber felt, polyethylene-kraft paper, or polyethylene-elastomer laminate. The outerwrap shall be coated with shop-applied whitewash or a single layer of kraft paper.

The application of coal tar enamel coating materials, including the preparation of surfaces; priming; and lining and coating of the pipe, fittings, and specials, shall be done in the shop by an established pipe lining and coating company acceptable to the manufacturer of the coal tar enamel materials and to Engineer. Exterior coating shall not be applied until after the specified interior cement mortar lining (if required) has been applied and cured. Repairs of any damage to the shop coating and the field coating of ends where coatings have been held back shall be done by experienced and qualified personnel.

The pipe lining and coating company shall submit an affidavit of compliance indicating that all instructions and requirements of the coating materials manufacturer will be followed and that the company is acceptable to the materials manufacturer.

2.14.02.02 Shop-Applied Cement Mortar Lining. Unless otherwise acceptable to Engineer, cement mortar lining for all 36 inch (900 mm) and smaller steel pipe shall be shop applied. For pipe larger than 36 inches (900 mm), the lining shall be shop applied, or Contractor shall have the option of shop or field applied lining as specified herein. Except as modified herein, shop-applied mortar linings shall comply with ANSI/AWWA C205.

Specials. Wire fabric reinforcement shall be used in the lining of fittings and specials in accordance with Section 4.4.5 of ANSI/AWWA C205.

Adjacent to Valves. If the specified nominal pipe size is the actual outside diameter, cement mortar lining installed in steel pipe adjacent to butterfly valves shall be tapered so that the lining material will not interfere with the valve disc during valve operation.

2.14.02.03 Shop-Applied Tape Coat. Except as modified or supplemented herein, shop-applied tape coating shall comply with ANSI/AWWA C214. The tape coating system shall consist of a primer layer, an inner layer of tape for corrosion protection, and two outer layers of tape for mechanical protection. The total thickness of the tape coating system shall be at least 80 mils (2 mm). The outer layer of tape shall be white.

2.15 SHOP INSPECTION AND TESTING. Except as otherwise indicated or acceptable to Engineer, all materials and work shall be inspected and tested by the pipe manufacturer in accordance with ANSI/AWWA C200. All costs in connection with such inspection and testing shall be borne by Contractor.

Copies of all test reports shall be submitted as set forth in Master Specification Section 01080, Project Submittals.

Owner reserves the right to sample and test any pipe after delivery and to reject all pipe represented by any sample which fails to comply with the specified requirements.

2.15.01 Owner's Inspection at the Shop. If Owner elects to inspect any work or materials, as permitted under Section 1.4 of ANSI/AWWA C200, all costs in connection with the services of Owner's inspector will be paid for by Owner. Additional weld test specimens shall be furnished to Owner's inspector for testing by an independent testing laboratory whenever, in the judgment of Owner's inspector, a satisfactory weld is not being made. Test specimens shall also be furnished when Owner's inspector desires. The entire cost of obtaining, inspecting, and testing of such additional specimen plates, welds, or materials will be borne by Owner. If any specimen is found not to conform to the specified requirements, the materials represented by the specimen will be rejected. The expense of all subsequent tests due to failure of original specimens to comply with the specifications shall be the responsibility of Contractor.

Work to be performed by Owner's inspector at the fabricating shop will include checking of flange alignment after welding to the pipe and tolerances of stab joints, when applicable.

In addition to making or witnessing all specified tests and submitting any required reports to Engineer and Owner, Owner's inspector will submit written reports to Contractor concerning all materials rejected, noting the reason for each rejection.

Inspection by Owner's inspector, or failure to provide inspections, shall not relieve Contractor of his responsibility to provide materials and to perform the work in accordance with the Contract Documents.

2.15.02 Welding Procedures, Welder Qualifications, and Testing. When additional welding requirements are required, they shall be as specified in this paragraph.

All welding procedures, welders, welding operators, and tackers shall be qualified in accordance with AWS D1.1 and as defined in ANSI/AWWA C200. All qualifications shall be in accordance with all-position pipe tests as defined in Section 5 of AWS D1.1.

All shop welds on steel pipe and fittings shall be ultrasonically tested by qualified and certified operators employed by the fabricator. Shop ultrasonic weld tests shall be in accordance with Section 9 of API 5L, 37th Edition. All costs for ultrasonic shop testing shall be paid by Contractor. Contractor and Engineer shall each be furnished a copy of all ultrasonic test reports.

Personnel performing visual inspection of welds shall be qualified and currently certified as Certified Welding Inspectors (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing ultrasonic and radiographic tests shall be qualified and certified according to the requirements of SNT-TC-1A.

Nondestructive examination procedures shall be submitted in accordance with Master Specification Section 01080, Project Submittals at the time welding procedures are submitted. Records of inspection, nondestructive examination, and material certification shall be furnished to Engineer.

All costs for inspection of shop welds shall be paid by Contractor.

PART 3 - EXECUTION

3.1 FIELD INSPECTION. All shop-applied exterior coal tar enamel or tape coatings on pipe, fittings, or specials shall be electrically inspected for holidays and other defects, and repaired if necessary. All electrical inspection shall be made in accordance with Section 6 of ANSI/AWWA C203.

Inspection and repair of exterior coatings shall be performed by and at the expense of Contractor, after receipt of the pipe, fittings, or specials on the job and before installation. Electrical inspection of exterior coal tar enamel or tape coatings after installation of the pipe, fitting, or special in the trench shall be made where, in the opinion of Engineer, the coating may have been damaged by handling during installation.

3.2 PROTECTION AND CLEANING. The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted.

Precautions shall be taken to ensure that foreign matter does not enter the pipe during jointing, lining repair, or inspection operations.

3.3 ALIGNMENT AND GRADE. Pipe shall be laid to the lines and grades indicated on the drawings. Pipelines or runs intended to be straight shall be laid straight. Curves in stab joint pipe may be formed by opening the joint. Maximum joint openings and deflections shall be as recommended by the pipe manufacturer. In welded pipe, deflections up to 4-1/2 degrees (0.079 rad) may be made by shop-mitering one end of one pipe. Deflections up to 22-1/2 degrees (0.393 rad) may be made by shop-mitering the ends of two adjacent sections of pipe by equal amounts. Deflections greater than 22-1/2 degrees (0.393 rad) shall be made by use of fabricated bends.

High points which allow air to collect in pipelines will not be permitted unless an air release valve is indicated on the drawings at that location.

When pipelines must be closely controlled, laser beam equipment, surveying instruments, or other suitable means shall be used to maintain alignment and grade. At least one elevation reading shall be taken on each length of pipe. If laser beam equipment is used, periodic elevation measurements shall be made with surveying instruments to verify accuracy of grades. If such measurements indicate thermal deflection of the laser beam due to differences between the ground temperature and the air temperature within the pipe, precautions shall be taken to prevent or minimize further thermal deflections.

3.4 INSTALLATION.

3.4.01 Buried Piping. For buried piping, all trenching, embedment, and backfilling shall conform to Master Specification Section 02221, Trenching, Backfilling, and Compacting and the details indicated on the drawings.

Whenever pipe laying is stopped, the open end of the line shall be sealed with a watertight plug. All water in the trench shall be removed prior to removing the plug.

Pipe embedment and backfilling shall closely follow the installation and jointing of steel pipe in the trench to prevent flotation of the pipe by water and longitudinal movement caused by thermal expansion or contraction of the pipe.

For restrained joint pipe, not more than 160 feet (48 m) of pipe shall ever be exposed ahead of the backfilling in any section of trench. The backfill adjacent to field joints may be temporarily omitted to provide adequate space for field coating the joints. Closure welds on restrained joint pipe shall be made during the cool part of the day.

3.4.02 Out-of-Round Pipe. Pipe which deviates from a true circle by more than 1 percent shall be laid with its larger diameter vertical, or by using struts or jacks on continuous head and sill timbers to correct the vertical diameter where permitted by Engineer. Struts or jacks shall be left in place until the joints at each end have been completed and embedment and backfill for the section have been placed to at least 12 inches (300 mm) above the top of the pipe. Final inspection, repair, and checking of interior lining shall be performed after the struts or jacks have been removed.

3.4.03 Elongating Vertical Diameter. When required, the vertical diameter of all buried pipe with minimum cover depth as required or so indicated on the drawings, shall be elongated (before backfilling of the trench) by an amount equal to 2 percent of the nominal diameter.

The vertical diameter may be elongated by controlled placement of pipe embedment material or by struts or jacks installed between continuous head and sill timbers padded to protect the lining. Struts or jacks shall be left in place until the joints at each end have been completed and the embedment and backfill for the section have been placed to at least 12 inches (300 mm) above the top of the pipe. Final inspection, repair, and checking of interior lining shall be performed after the struts or jacks have been removed.

3.4.04 Pipe Deflection. After completion of backfilling and before acceptance of the Work, all pipe larger than 30 inches (750 mm) in diameter shall be tested for excessive deflection by measuring the actual inside vertical diameter. Deflection measurements will be made by Engineer. Pipe with diametral deflection exceeding 2 percent of the nominal inside diameter shall be uncovered and the bedding and backfill replaced as needed to prevent excessive deflection. After replacing bedding and backfill, the pipe shall be retested.

3.4.05 Flanged Joints. Care shall be taken in bolting flanged joints to avoid restraint on the opposite end of the piece, which would prevent pressure from being evenly and uniformly applied upon the gasket. The pipe or fitting must be free to move in any direction during installation of bolts. Bolts shall be gradually tightened in a crisscross pattern, to ensure a uniform rate of gasket compression around the entire flange.

Special care shall be taken when connecting piping to pumping equipment to ensure that piping stresses are not transmitted to the pump flanges. All connecting piping shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before any bolts are installed in the flanges. In addition, pump connection piping shall be free to move parallel to its longitudinal center line while the bolts are being tightened. Each pump shall be leveled, aligned, and wedged into position which will fit the connecting piping, but shall not be grouted until the initial fitting and alignment of the pipe so that the pump may be shifted on its foundation if necessary to properly install the connecting piping. Each pump shall, however, be grouted before final bolting of the connecting piping. After final alignment and bolting, the pump connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the pump or opening of the pump connection joints. If any movement is observed, the piping shall be loosened and re-aligned as needed and then the flanges bolted back together. The flange bolts then shall be loosened and the process repeated until no movement is observed.

3.4.06 Couplings. Surfaces of pipe ends and couplings in contact with the sealing gasket shall be clean and free from foreign material when the coupling is installed on the pipe. Wrenches used in bolting couplings shall be of a type and size recommended by the coupling manufacturer. All bolts shall be tightened by approximately the same amount, with all parts of the coupling square and symmetrical with the pipe. Following installation, the exterior coating of each coupling shall be touched up or reprimed.

3.4.07 Insulated Flanged Joints. Insulated flanged joints shall be installed where indicated on the drawings. In addition to one full-faced insulating gasket, each flange insulating assembly shall consist of one full-length sleeve, one insulating washer, and two backing washers for each flange bolt. The insulating gasket ID shall be 1/8 inch (3 mm) less than the ID of the flange in which it is installed. The insulated flanged joint accessories shall be installed in accordance with the instructions and recommendations of the manufacturer.

3.4.08 Stab Joints. Gasket installation and other jointing procedures shall conform to the instructions and recommendations of the pipe manufacturer. All joint surfaces shall be lubricated with heavy vegetable soap solution immediately before making the joint. The lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean. Measurements shall be taken at the joints after installation to ensure that the specified clearances have not been exceeded.

3.4.09 Welded Joints. All welds shall be sound and free from embedded scale or slag, shall have tensile strength across the weld not less than that of the thinner of the connected sections, and shall be watertight. Butt welds shall be used for all welded joints in pipe assemblies and in the fabrication of bends and other specials. Field-welded joints, where permitted, shall be either butt-welded or lap-welded.

Field welding of joints shall conform to ANSI/AWWA C206. Single field-welded butt joints with outside backing rings may be used for pipe larger than 27 inches

(675 mm) in diameter. Backing rings will not be permitted for 27 inch (675 mm) and smaller pipe. Butt straps shall be welded on both the inside and outside of the pipe and at each end of the pipe and strap to avoid stress multiplication.

Field-welded lap joints shall have fillet welds both inside and outside to avoid stress multiplication. The outside weld may be a seal weld.

Testing of welded joints shall be standard, or special procedure, as specified herein.

3.4.09.01 Standard Inspection and Testing. When specified herein, standard shop inspection and testing shall be in accordance with the shop inspection and testing provisions herein.

Field weld test specimens shall be furnished to Engineer for testing by an independent testing laboratory whenever, in the judgment of Engineer, a satisfactory weld is not being made. Test specimens shall also be furnished when Engineer desires. All costs for this testing will be paid by Owner.

3.4.09.02 Special Procedure Inspection and Testing. When specified herein, special procedure shop inspection and testing shall be in accordance with the shop inspection and testing provisions specified herein. Field welding procedures, welders, welding operators, and tackers shall be qualified in accordance with AWS D1.1 and as defined in Section 3 of ANSI/AWWA C206 or ANSI/AWWA C200, as applicable. All qualifications shall be in accordance with all-position pipe tests as defined in Section 5 of AWS D1.1.

The welder qualification testing for field welding shall be conducted at the project site. Results of previous qualification tests will not be accepted. Contractor shall provide the services of an independent testing laboratory to perform the welder qualification. Copies of all test data and certifications shall be submitted to Engineer. All costs of welder qualification testing shall be paid by Contractor.

Upon completion of each field-welded joint, the welding operator shall mark his regular identification number and the last two digits of the year the work was completed, or Contractor may have a records system that traces a welder's work. Steel stamping directly on piping will not be permitted unless "low stress" die stamps, such as interrupted dot or round-nose types, are used.

Field welds will be randomly inspected and tested by an independent testing laboratory as directed by Engineer. Field lap welds will be inspected by magnetic particle or dye penetration methods. Field butt welds will be inspected by the radiographic method and in accordance with the acceptance criteria of API 1104. Contractor shall inform Engineer before welded joints are to be backfilled so that the joint may be inspected. Contractor shall assume all costs of exposing joints that were backfilled before inspection.

Personnel performing visual inspection of welds shall be qualified and currently certified as Certified Welding Inspectors (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing nondestructive tests shall be qualified and certified to the requirements of SNT-TC-1A.

Engineer may also order nondestructive testing by an independent testing laboratory in addition to any testing specified herein.

Except as otherwise specified herein, all costs for inspection and testing of field welds by the independent testing laboratory will be paid by Owner. If the weld is defective, the inspection costs shall be paid by Contractor. Defective welds shall be repaired and retested at Contractor's expense.

Test reports of all laboratory tests shall be submitted as provided for in Master Specification Section 01060, Quality Control.

3.4.10 Flanged Coupling Adapters. Flanged coupling adapters shall be provided where indicated on the drawings and shall be installed in accordance with the coupling manufacturer's recommendations. After the pipe is in place and all bolts have been properly tightened, the location of holes for the anchor studs shall be determined and field drilled. Hole diameter shall be not more than 1/8 inch (3 mm) larger than the diameter of the stud projection. Anchor stud holes shall extend completely through the pipe wall and lining material.

The inner surfaces of the coupling shall be prepared for painting in accordance with the paint manufacturer's instructions and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining surfaces, except flange mating surfaces, shall be cleaned and shop primed with a universal primer.

3.5 WALL SLEEVES. Wall sleeves shall be provided where indicated on the drawings and shall be provided where steel pipe passes through concrete or masonry walls, unless otherwise noted. Where harness lugs are attached to wall sleeves, the sleeves shall be carefully aligned to permit installation of the tie rods. In flange and mechanical joint wall sleeves, holes in the mechanical joint bells and flanges shall straddle the top (or side for vertical piping) center line. The top (or side) center line shall be marked on each flange and mechanical joint piece at the fabricating shop.

3.6 PIPE ANCHORS, BLOCKING, ENCASEMENT, HANGERS, AND SUPPORTS. Pipe anchors, blocking, hangers, and supports shall be installed where and as indicated on drawings and shall be fabricated in accordance with Master Specification Section 15140, Pipe Supports and the details indicated on the drawings, and shall be furnished and installed complete with all concrete bases, anchor bolts and nuts, plates, rods, and other accessories required for proper support of the piping. All piping shall be rigidly supported and anchored so that there is no movement or visible sagging between supports. Where the details must be modified to fit the piping and structures, all such modifications shall be subject to acceptance by Engineer. Unless otherwise permitted, lugs for lateral or longitudinal anchorage shall be shop welded to the pipe.

Concrete reaction anchorage, blocking, encasements, and supports shall be provided as indicated on the drawings or as permitted by Engineer. Concrete and reinforcing steel for anchorages, blocking, encasements, and supports shall conform to Master Specification Section 03300, Cast In Place Concrete and Master Specification Section 03200 Concrete Reinforcement. All pipe to be encased shall be suitably supported and blocked in proper position, and shall be anchored to prevent flotation.

3.7 PROTECTIVE COATINGS AND LININGS.

3.7.01 Field Coating and Repair. Entry into the pipe or pipeline for application of interior linings to unlined ends shall be from open ends or through access manholes, except as otherwise permitted by Engineer. Pour holes shall be permitted as specified herein, and shall consist of 4 inch (100 mm) standard weight black steel pipe welded to the pipe to be lined and covered with a bolted blind flange*.*

Field repair of shop-applied exterior coatings and interior linings shall conform to the following:

For Field-Welded Joints

Coal Tar Enamel	Hold back coating and lining 4 inches (100 mm) from joint. Field repair in accordance with ANSI/AWWA C203.
Cement Mortar	Hold back coating and lining 4 inches (100 mm) from joint. Field repair in accordance with Section 4.6 of ANSI/AWWA C205 as modified herein.
Liquid Epoxy	Hold back coating 4 inches (100 mm) from joint. Field repair in accordance with ANSI/AWWA C210.
Tape Coating	Hold back at least 4 inches (100 mm) from joint. Field repair in accordance with ANSI/AWWA C209, except the total applied tape thickness shall be not

	less than 80 mils (2 mm).
For Flanged Joints	Extend lining to ends of pipe. The coating of exterior surfaces is covered in Master Specification Section 09900, Painting.
For Stab Joints	
Coal Tar Enamel	Hold back the coating on spigots and the lining in bells from joints in accordance with ANSI/AWWA C203. Field repair exterior coating with 20 mils (500 µm) of medium consistency coal tar. Repair lining in accordance with ANSI/AWWA C203.
Cement Mortar	Hold back the coating on spigots and the lining in bells from joints as specified for coal tar enamel coatings in ANSI/AWWA C203. Field repair in accordance with Section 4.6 of ANSI/AWWA C205 as modified herein.
Liquid Epoxy	Hold back the coating on spigots and the lining in bells from joints, and field repair in accordance with ANSI/AWWA C210.
Tape Coating	Hold back the coating on spigots as specified for coal tar enamel in ANSI/AWWA C203. Field repair in accordance with ANSI/AWWA C209.
For Mechanically Coupled Joints	
Coal Tar Enamel	Hold back coating 16 inches (400 mm) from joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Lining shall extend to end of pipe. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.

Cement Mortar	Hold back coating 16 inches (400 mm) from joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Lining shall extend to end of pipe. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Liquid Epoxy	Shop coat in accordance with ANSI/AWWA C210. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Tape Coating	Hold back coating 16 inches (400 mm) from joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.

For Grooved Coupled Joints

Coal Tar Enamel	Hold back coating 6 inches (150 mm) at joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Lining shall extend to end of pipe. Field repair exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Cement Mortar	Hold back coating 6 inches (150 mm) at joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with

	ANSI/AWWA C203. Lining shall extend to end of pipe. Field repair exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Liquid Epoxy	Shop coat in accordance with ANSI/AWWA C210. Field repair exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Tape Coating	Hold back coating 12 inches (300 mm) at joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.

3.7.02 Modifications to the Governing Standards.

3.7.02.01 Field Repair of Shop-Applied Cement Mortar Lining. Field repair of interior joint surfaces shall be done in accordance with Section 4.6.2 of ANSI/AWWA C205, except that an epoxy bonding agent and latex admixture shall be used in conjunction with the sand and cement mortar. The addition of lime or pozzolan will not be permitted.

The exposed steel shall be thoroughly cleaned and all grease shall be removed. A coat of epoxy bonding agent shall be applied over the area to be lined in accordance with the manufacturer's recommendations. A soupy mixture of cement and water shall be applied over the epoxy after it becomes tacky. Cement mortar to which the latex admixture has been added shall then be packed into the area to be patched and screeded off level with the adjacent cement mortar lining. The patched area shall be given an initial floating with a wood float, followed by a steel trowel finish.

Defective or damaged shop-applied cement mortar linings shall be removed, the surfaces cleaned, and the lining repaired as specified above for joint repair.

3.7.02.02 Field-Applied Cement Mortar Lining. Except as modified herein, field-applied mortar linings shall comply with ANSI/AWWA C602.

Specials. Wire fabric reinforcement shall be used in the lining of fittings and specials in conformance with Section 4.4.5 of ANSI/AWWA C205.

Field Repair. Defective or damaged field-applied cement mortar linings shall be removed, the surfaces cleaned, and the lining repaired as specified for shop-applied cement mortar linings.

3.8 CONNECTIONS WITH EXISTING PIPING. Connections between new work and existing piping shall be made with suitable fittings for the conditions encountered. Each connection with an existing pipe shall be made at a time and under conditions which will least interfere with service to customers, and as authorized by Owner.

Facilities shall be provided for dewatering and for disposal of the water removed from the dewatered lines and excavations without damage to adjacent property.

For pipelines which will convey potable water, special care shall be taken to prevent contamination when dewatering, cutting into, and making connections with potable water piping. Trench water, mud, or other contaminating substances shall not be permitted to enter the lines. The interior of all pipe, fittings, and valves installed in such connections shall be thoroughly cleaned and then swabbed with or dipped in a 200 mg/L chlorine solution.

3.9 PROVISIONS FOR CATHODIC PROTECTION. Provisions shall be made for cathodic protection of underground steel pipelines. An insulated type joint shall be provided at each connection to a steel water tank, each branch connection to an existing or future water line, each connection between concrete pipe or ductile iron pipe and steel pipe, each connection through a structure wall, and where indicated on the drawings. An electrical bond shall be provided across all other gasketed pipeline joints. Test lead stations for monitoring electrical currents on the pipeline shall be provided at locations indicated on the drawings.

3.9.01 Insulated Joints. Insulated flange type joints shall be provided where indicated on the drawings or specified. After installation, protective coatings shall be provided around the joint as specified herein.

3.9.02 Electrical Bond Across Rubber-Gasketed Joints. Two electrical bonding cables shall be provided to and across each mechanical coupling and across each rubber-gasketed stab joint. Before the field joint coating is applied to mechanical couplings, two small areas of metal shall be exposed on the pipe surface each side of the coupling, on the middle ring, and on each follower ring. Before the field joint coating is applied to stab joints, two small areas of metal shall be exposed on each side of the joint. Each area shall be thoroughly cleaned, and two cathodic protection cables shall be bonded to the pipe, one on either side of the joint, and to the middle ring and follower rings for mechanically coupled joints. Each cable shall be bonded by the thermite process. The completed connections and exposed metal surfaces shall be coated as specified for field repair of coatings.

3.9.03 Electrical Bond Across Valves and Flanges. Two electrical bonding cables shall be provided across valves and flanged connections other than insulated flanges. The electrical bond shall be provided as specified for bond across rubber-gasketed joints.

3.9.04 Bonding Cables. Bonding cable and test lead wires shall be not less than 6 AWG (16 mm^2), Type CP copper cathodic protection cable, with low density, high molecular weight polyethylene insulation.

3.9.05 Test Lead Stations. Test lead stations shall be provided where specified or indicated. The test lead stations shall be as specified herein. The test lead wires shall be terminated on the ground surface in a standard connection box at a protected location acceptable to Engineer. Standard connection boxes for test lead stations shall be C.P. Test Services "NM-7" plastic terminal boxes, 18 inches (450 mm) long, with 5 inch (125 mm) inside diameter, a locking cast iron lid, a terminal block with seven terminals, and the inscription "CP TEST" cast into its cover.

3.10 LEAKAGE AND PRESSURE TESTS. After installation, steel piping shall be subjected to a leakage and pressure test.

3.10.01 Leakage. All steel piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.10.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.11 DISINFECTION. The steel piping shall be disinfected after installation as specified herein. The disinfection is to be as specified in Master Specification Section 02675, Disinfection of Water Distribution System.

End of Section

SECTION 15063

LIGHT WALL STEEL PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of light wall steel pipe, fittings, specials, and appurtenances.

Miscellaneous small piping and pipe supports are covered in Master Specification Section 15065, Miscellaneous Steel Pipe, Tubing, and Accessories and Master Specification Section 15140, Pipe Supports .

Light wall steel piping shall be furnished and installed complete with all fittings, specials, flanges, couplings, joint harnesses, anchors, anchor bolts, anchor inserts in concrete, expansion anchors, flange gaskets, flange bolts and nuts, pipe supports and hangers, wall fittings, blind flanges, connections, appurtenances, and accessories, as indicated on the drawings, or otherwise specified herein for proper installation and functioning of the piping.

Piping furnished shall be complete with all jointing materials required for installation of any valves and equipment furnished by others for installation under this contract.

1.2 GOVERNING STANDARDS. Except as modified or supplemented herein, all light wall steel pipe, fittings, and specials shall conform to the applicable requirements of the following standards:

ANSI/AWWA Standards	Title
C200	Steel Water Pipe 6 Inches [150 mm] and Larger
C206	Field Welding of Steel Water Pipe
C208	Dimensions for Steel Water Pipe Fittings

1.3 SUBMITTALS. Drawings, specifications, and other data showing complete details of the fabrication, construction, weld locations, and installation of pipe, fittings, specials, and connections, together with complete data covering all materials proposed for use, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Pipe, fittings, specials, and appurtenances shall at all times be handled and stored in a manner that will ensure installation in sound, undamaged condition. Handling methods and equipment used shall prevent damage to the coating and shall include the use of wide canvas slings and wide padded skids. Bare cables, chains, hooks, metal bars, or narrow skids shall not be used.

All pipes shall be carefully supported during shipment on padded saddles not less than 12 inches (300 mm) wide. Each end of each length of pipe, fitting, or special shall be laterally supported and braced as needed to ensure that it will maintain a true circular shape. Pipe, fittings, and specials shall be separated so that they do not bear against each other, and the whole load shall be securely fastened to prevent movement in transit.

Any pipe section, fitting, or special, which shows dents, kinks, abrupt changes of curvature other than specified, or other injuries, will be rejected. Contractor shall, at his expense, replace or recondition each rejected section. Reconditioning procedures shall be acceptable to Engineer. Coatings removed in reconditioning pipe, fittings, or specials shall be replaced as specified for the original coating.

PART 2 - PRODUCTS

2.1 BASIS OF DESIGN. Light wall steel pipe, fittings, and specials may be either fabricated or mill type. In either case, all items shall be fabricated to the sizes, dimensions, and shapes indicated on the drawings. Elbows shall be long radius, with the centerline to face dimensions equal to 1.5 times the pipe diameter unless otherwise indicated.

The ratio of pipe diameter to wall thickness shall not exceed 200. Unless otherwise indicated in the Light Wall Steel Pipe Schedule 15063-S01, the wall thickness shall be not less than 0.134 inch (10 gage) (3.42 mm).

Specified nominal pipe size for 14 inch (350 mm) and larger pipe, fittings, and specials shall be the actual outside diameter, in inches (mm).

The outside diameter of 12 inch (300 mm) and smaller pipe shall conform to the dimensions set forth in ANSI/ASME B36.10 for standard weight steel pipe.

Bends, fittings, branch connections, and special sections shall be reinforced or shall have their shell thickness increased so that the combined stresses due to internal pressure and bending will not exceed 50 percent of the yield strength of the material. Contractor shall determine and provide reinforcements or additional shell thickness as needed to keep the combined stresses within the specified maximum. Unless otherwise indicated on the drawings or directed, the internal working pressure for design purposes shall be as indicated in the Light Wall Steel Pipe Schedule 15063-S01. The dead load shall be equal to the weight of the pipe.

2.2 MATERIALS. Unless otherwise required by the drawings, field joints shall be either flanged or mechanically coupled.

Pipe	ANSI/AWWA C200, ASTM A139.
Fittings and Specials	ANSI/AWWA C200.
Dimensions	AWWA C208.
Flanged Joints	
Flanges	Flat faced when connecting to flat faced flanges; otherwise, raised face. Steel plate of the following thickness:

Nominal Pipe Size	Flange Thickness
inches [mm]	inches [mm]
6 [150]	1/4 [6]
8,10 [200, 250]	5/16 [7.8]
12 [300]	3/8 [9.3]
14-20 [350 - 500]	7/16 [10.9]
24 [600]	1/2 [12.7]
30, 36 [750, 900]	5/8 [15.6]
42, 48 [1200]	3/4 [19]

Material	ASTM A36.
Diameter and Drilling	ANSI/ASME B16.1, Class 25.

Flange Bolting

Material	ASTM A307.
Type	Bolt and nut; bolt-stud and two nuts permitted for 1 inch and larger.
Bolts and Bolt-Studs	
Length	Such that ends project 1/4 to 1/2 inch [6 to 12.7 mm] beyond surface of nuts.
Ends	Chamfered or rounded.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2A fit. Bolt-studs may be threaded full length. Studs for tapped holes shall be threaded to match threading in holes.
Bolt Heads	
Shape	Hexagonal or square.
Dimensions	ANSI/ASME B18.2.2; regular pattern for square, heavy pattern for hexagonal.
Nuts	Hexagonal.
Dimensions	ANSI/ASME B18.2.2, heavy, semifinished pattern.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2B fit.

Gaskets

For Aeration/Backwash Air Service

Raised Face Flanges	Non-asbestos inorganic fiber with EPDM binder; dimensions to suit flange contact fact, 1/16 inch [1 mm] minimum thickness for plain finished surfaces, 3/32 inch [2 mm] minimum thickness for serrated surfaces, rated for 275°F [135°C] service; Garlock "IFG 5507".

Flat Faced Flanges	Premium Grade, EPDM, ring type, 1/8 inch (3 mm) thick, rated for 275°F (135°C) service, Garlock "8314".
Insulating Fittings	
Threaded	Dielectric steel pipe nipple, ASTM A53, Schedule 40, polypropylene lined, zinc plated; Perfection Corp. "Clearflow Fittings".
Flanged	Epco "Dielectric Flange Unions" or Central Plastics "Insulating Flange Unions".
Coupled Joints	
Mechanical Couplings	Dresser "Style 38 Light Pattern Couplings" or Smith-Blair "411 Flexible Coupling", without pipe stop. Elastomers for air piping shall be rated at 275°F (135°C).
Joint Harness	
Bolts	ASTM A193, Grade B7, or Ryerson "Stress-Proof". Minimum yield point 100,000 psi (689 Mpa).
Threading	ANSI/ASME B1.1, Class 2A fit, coarse thread series.
Ends	Chamfered or rounded.
Nuts	Hexagonal, ASTM A307.
Threading	As specified for bolts except Class 2B fit.
Dimensions	ANSI/ASME B18.2.2, heavy, semifinished pattern.
Flat Washers	Steel, ANSI B18.22.1.
Grooved Couplings	ANSI/AWWA C606, Gustin-Bacon "Gruvagrip Series 100" or Victaulic "Style 77", as needed.
Small Branch Connections	

Pipe Nipples	Seamless black steel pipe, ASTM A53, standard weight (Schedule 40).
Welding Fittings	
Threaded Outlets	Bonney "Thredolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Welded Outlets	Bonney "Weldolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Expansion Joints	Mercer "Style 450N" or Redflex "No. J-1", single arch, spool type with elastomeric body rated for 300°F [149°C], split steel retaining rings, and control rods, unless otherwise indicated.
Watertight/Dusttight Pipe Sleeves and Sealing Elements	O-Z Electrical Manufacturing "Thruwall" and Floor Seals",or Thunderline Corporation "Link-Seal", with modular rubber sealing elements with galvanized bolts.
Pipe Sleeve Sealant	Polysulfide or urethane, as specified in Master Specification Section 07600, Caulking and Sealers.
Insulation	
Hot Pipe	ASTM C547, Class 1 (to 450 F), 1 inch (25 mm) thick; glass fiber, one-piece molded with vapor barrier, flame-retardant all service jacket and self-sealing tabs; CertainTeed "500 Snap-On" or Owens-Corning "Fiberglas 25 ASJ/SSL".
Jacket	Aluminum, ASTM B209, Alclad 3004, 0.020 inch (0.051 mm) thick, machine rolled, with asphalt and kraft paper vapor barrier.
Cold Piping	Fed Spec HH-I-573, tubular, closed cell elastomeric, at least 3/4 inch (19 mm) thick.
Fittings, Flanges, and	ASTM C547, Class 1 (to 450°F (232°C)),

Valves	1 inch (25 mm) thick, factory molded glass fiber fitting insulation; CertainTeed "Snap Form" or Poncho "Poncho Preformed".
Anchor Bolts	Carbon steel, as specified in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

2.3 ENDS OF SECTIONS.

2.3.01 For Field Welding. Ends of pipe, fittings, and specials for field butt welding shall be outside beveled to an angle of 35 degrees, plus or minus 2-1/2 degrees, with the plane of the pipe end, with an average flat at the end of the pipe of 1/16 inch (1.5 mm) plus or minus 1/32 inch (0.75 mm).

2.3.02 For Fitting with Flanges. Ends to be fitted with flanges shall have the longitudinal or spiral welds ground flush as needed to accommodate the type of flanges provided.

2.3.03 For Mechanical Couplings. Ends to be joined by mechanical couplings shall be plain end type. In addition, the welds on ends to be joined by couplings without pipe stops shall be ground flush to permit slipping the coupling in at least one direction to clear the pipe joint. Outside diameter and out-of-round tolerances shall be within the limits specified by the coupling manufacturer.

2.3.04 For Grooved Couplings. Ends to be joined by grooved couplings shall be of the roll grooved type as recommended by the coupling manufacturer.

2.4 PIPE LENGTH TOLERANCE. Standard and special sections shall be within 1/8 inch (plus or minus) of the specified or theoretical lengths. All pipe to be connected with mechanical couplings shall be fabricated so that space between pipe ends within the couplings will not exceed the allowable, as recommended by the coupling manufacturer, but will be at least 1/8 inch (3 mm).

2.5 SPECIAL SECTIONS. All fittings and specials shall be provided with ends as specified, and shall be fabricated to the shapes, sizes, and dimensions indicated on the drawings.

2.6 SMALL BRANCH CONNECTIONS. Small branch connections 2 inches and smaller shall be made using welding fittings with threaded outlets. Where there is some doubt as to the exact outlet size required, but it is known that the size will be less than 1 inch, a 1 inch (25 mm) outlet shall be provided, and reducers used as needed.

Branch connections 2-1/2 inches (63 mm) and larger shall be made using pipe nipples or welding fittings. Pipe nipples and welding fittings shall be welded to the pipe shell and reinforced as required to meet design and test requirements.

Small branch connections shall be located so as not to interfere with joints, supports, or other details.

2.7 DRAINS. Drains shall be provided at the locations indicated on the drawings. Drain valves shall be hose gate valves. Drain valves shall comply with the requirements of the Master Specification Section 15100, Miscellaneous Valves.

Pipe used for drain piping shall be standard weight, galvanized steel pipe.

2.8 FIELD JOINTS. Flanged, welded, and mechanically coupled joints shall be provided at the locations indicated on the drawings. To facilitate installation, additional field welded and mechanically coupled joints may be provided when required. These field joints shall be kept to a minimum, and their location shall be acceptable to Engineer.

2.9 FLANGED JOINTS. Flanged joint faces shall be normal to the pipe axis, with a maximum tolerance of 0.005 inch per foot (0.125 mm/300 mm) of flange diameter. Angular deflection (or layback) of the flange face shall not exceed 0.75 degree from a plane surface and shall be uniform within 0.010 inch (2.5 mm). All flanges, after welding to the pipe, shall be measured and shall be refaced, if necessary, to bring them within the specified tolerances.

Contractor shall coordinate diameter and drilling of flanges furnished in the piping with the flanges for any valves, blowers, vacuum pumps, and other equipment to be installed in the piping.

Blind flanges shall conform in diameter, drilling, and thickness to the flanges to which they attach and shall be reinforced as needed to produce an airtight joint.

2.10 MECHANICAL COUPLINGS.

2.10.01 Couplings. Unless otherwise shown on the drawings, the middle ring of each mechanical couplings shall have a thickness at least equal to that specified for the size pipe on which the coupling is to be used and shall be not less than 7 inches (175 mm) long. The pipe stop shall be omitted from the inner surface of the middle rings of all couplings. The couplings shall be cleaned and shop primed with the manufacturer's standard universal primer.

2.10.02 Joint Harnesses. Where noted or indicated on the drawings, mechanically coupled joints shall be restrained with harness bolts and lugs. Joint harnesses shall conform to the details on the drawings. Lugs shall be shop welded to the pipe and coated as specified for the adjacent pipe.

2.10.03 Grooved Couplings. Grooved couplings shall be sized for proper installation on the grooved pipe provided.

After fabrication, all housing clamps forming the coupling shall be cleaned and primed by the coupling manufacturer as specified for the pipe.

2.11 WELDED JOINTS. All welds shall be sound and free from embedded scale or slag, shall have tensile strength across the weld not less than that of the thinner of the connected sections, and shall be airtight. Butt welds shall be used for all welded joints in line pipe assemblies and in the fabrication of bends and other specials. Fillet welds shall be used for flange attachment. Welding of field joints shall conform to ANSI/AWWA C206.

2.12 PIPE SUPPORTS, ANCHORS, AND HANGERS. Pipe supports, anchors, and hangers shall be fabricated in accordance with the requirements of Master Specification Section 15140, Pipe Supports, or the details indicated on the drawings. Pipe supports, anchors, and hangers shall be furnished and installed complete with all concrete bases, anchor bolts and nuts, plates, rods, and other accessories required for proper installation. Where the details must be modified to fit the piping and structures, all such modifications shall be subject to review and acceptance by Engineer. Lugs required for lateral or longitudinal anchorage shall be shop welded to the pipe.

2.13 PIPE SLEEVES. Piping passing through concrete or masonry shall be installed through sleeves installed before the concrete is placed or when masonry is laid. Pipe sleeves installed through floors provided with a special finish, such as ceramic or vinyl-composition tile, shall be flush with the finished floor surface and shall be provided with nickel or chromium plated floor plates. In all other locations where pipes pass through floors, pipe sleeves shall project not less than 1 inch (25 mm) nor more than 2 inches (50 mm) above the floor surface, with the projection uniform in each floor area. In the case of insulated pipes, the insulation shall extend through pipe sleeves. Where the drawings indicate future installation of pipe, sleeves shall be provided and the ends sealed with suitable plastic caps or plugs.

Holes drilled with a suitable rotary drill will be considered in lieu of sleeves for piping which passes through interior walls and through floors having a special finish.

Unless otherwise indicated on the drawings, all pipes passing through walls or slabs which have one side in contact with earth or exposed to the weather shall be sealed watertight with special rubber-gasketed sleeve and joint assemblies or with sleeves and modular rubber sealing elements.

Piping passing through walls and floors shall be made dusttight and gastight when specified herein, with special rubber-gasketed sleeve and joint assemblies, with sleeves sealed with modular rubber sealing elements, or by caulking with oakum and sealing each end with polysulfide or urethane sealant.

2.14 PROTECTIVE COATINGS. All steel pipe, fittings, specials, and wall fittings shall be prepared and prime coated as specified herein.

2.14.01 Type of Coating. The type of protective coating to be used shall be as follows:

Exterior Surfaces in Interior and Exterior Locations. Exterior surfaces, except machined surfaces, of all pipe, fittings, specials, flanges, anchors, and pipe supports exposed in interior locations and in manholes shall be thoroughly blast cleaned and given a coat of universal primer.

Field painting shall be as specified in the Master Specification Section 9900, Painting.

Interior Surfaces. The interior surfaces of all steel pipe, fittings, and specials shall not be coated.

Machined Surfaces. All machined surfaces shall be shop coated with rust-preventive compound.

2.15 INSULATION. The following systems shall be insulated:

Hot piping	Explosed blower discharge piping less than 8 feet (2.4 m) above finished floor or grade.
Cold Piping	Blower suction piping.

2.16 INSPECTION AND TESTING. Inspection and testing by an independent laboratory will not be required at the fabricating or coating shop; however, the pipe manufacturer shall furnish an affidavit of compliance certifying that all materials used and work performed comply with the specified requirements. Seven copies of the affidavit shall be furnished.

PART 3 - EXECUTION

3.1 INSTALLATION. All piping shall be installed in the location and arrangement indicated on the drawings.

Taps for pressure gauge connections on the suction and discharge of blowers shall be provided with a nipple and a ball type shutoff valve.

Drilling and tapping of pipe walls for installation of pressure gauges or switches will not be permitted.

In all piping, insulating fittings shall be provided to prevent contact of dissimilar metals, including but not limited to, contact of copper, brass, or bronze pipe, tubing, fittings, valves, or appurtenances, or stainless steel pipe, tubing, fittings, valves, or appurtenances with iron or steel pipe, fittings, valves, or appurtenances. Insulating fittings shall also be provided to prevent contact of copper, brass, or bronze pipe, tubing, fittings, valves, or appurtenances with stainless steel pipe, tubing, fittings, valves, or appurtenances.

Branch connections in horizontal runs of steam, air, and gas piping shall be made from the top of the pipe.

3.1.01 Concrete. Concrete reaction anchorage and supports shall be provided where and as indicated on the drawings.

3.1.02 Flanged Joints. Care shall be taken in bolting flanged joints so that there is no restraint on the opposite end of the piece which would prevent pressure from being evenly and uniformly applied to the gasket. The pipe or fitting must be free to move in any direction during installation of bolts. Bolts shall be gradually tightened, each in turn, at a uniform rate of gasket compression around the entire flange.

Special care shall be taken when connecting to equipment to ensure that piping stresses are not transmitted to the equipment flanges by the connected piping. All such piping shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before installation of any bolts in those flanges. In addition, equipment connection piping shall be free to move parallel to its longitudinal center line while the bolts are tightened. Equipment shall be leveled, aligned, and wedged in position to fit the connecting piping. Equipment shall not be grouted until the initial fitting and alignment of the pipe so that the equipment may be shifted on its foundation if necessary to properly install the connecting piping. Each piece of equipment shall be grouted before final bolting of the connecting piping. After final alignment and bolting, the equipment connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the equipment or opening of the equipment connection joints.

3.1.03 Couplings. The ends of the pipe on which couplings are to be placed, and the couplings themselves, shall be clean and free from any dirt or foreign material, especially those surfaces of the pipe and coupling that contact the gaskets. Gaskets shall be kept clean with no foreign matter between them and the packing surfaces. Wrenches used in bolting couplings shall be of a type and size recommended by the coupling manufacturer. All bolts shall be tightened approximately the same amount, with all parts of the coupling square and symmetrical with the pipe. After installation, couplings shall be carefully touched up or reprimed.

3.1.04 Insulation. Pipe insulation shall be provided where indicated on the drawing and shall be neatly installed in accordance with the manufacturer's recommendations. Piping shall be clean and dry and shall have been tested, when testing is required, before insulation is applied.

End and longitudinal joints shall be tightly butted and sealed with lap and butt strips of self-sealing jacket material.

Fittings, flanges, and valves shall be insulated with molded insulation and all service, one-piece jackets installed in accordance with the manufacturer's recommendations. Fitting insulation shall overlap adjacent pipe insulation at least 1 inch (25 mm). Valves shall be insulated up to the gland only.

Pipe hangers shall permit insulation to pass through and suitable saddles shall be provided to prevent the weight of the piping from being supported by the insulation.

3.2 CLEANING. All pipelines shall be clean and free of dirt, rocks, debris, or other foreign material of any kind when placed in service.

The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted.

3.3 PRESSURE AND LEAKAGE TESTING. All specified tests shall be made by and at the expense of Contractor in the presence, and to the satisfaction, of Engineer. Each piping system shall be tested for at least 1 hour with no loss of pressure. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation. Air piping shall be tested using compressed air.

Leakage may be determined by loss-of-pressure, soap solution, chemical indicator, or positive and accurate method acceptable to Engineer. All fixtures, devices, or accessories which are to be connected to the lines and which would be damaged if subjected to the specified test pressure shall be disconnected and the ends of the branch lines plugged or capped during the testing.

All necessary testing equipment and materials, including tools, appliances and devices, shall be furnished and all tests shall be made by and at the expense of Contractor and at the time directed by Engineer.

All joints in piping shall be tight and free of leaks. All joints which are found to leak, by observation or during any specified test, shall be repaired, and the tests repeated.

End of Section

SECTION 15064

STAINLESS STEEL PIPE, TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of stainless steel pipe, tubing and accessories for the services as indicated in the Contract Documents. Pipe and tubing shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Flange gaskets.

Insulating couplings.

Pipe sleeves.

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Stainless steel pipe materials shall be as indicated.

Material Classification	SS-1
Schedule 10S Stainless Steel With Buttwelded Fittings	
Pipe	ASTM A312, Grade TP304L
Fittings	ASTM A774, wrought stainless steel, grade equivalent to pipe, with beveled ends and Schedule 10S wall thickness.
Material Classification	SS-2
Schedule 10S Stainless Steel With Flanged Fittings	
Pipe	ASTM A312 or ASTM A778, Grade TP304L or TP316L.
Fittings	ASTM A774, wrought stainless steel, grade equivalent to pipe, with angle face rings and stainless steel backing flanges.
Material Classification	SS-3
Schedule 40S Stainless Steel With Threaded Fittings	
Pipe	ASTM A312, Grade TP304 or TP316.
Fittings	AISI Type 304 or 316 to match pipe, Class 150, dimensions conforming to ANSI/ASME B16.3.

Material Classification	SS-4
Schedule 40S Stainless Steel With Socket Welded Fittings	
Pipe	ASTM A312, Grade TP304L or TP316L.
Fittings	ASTM A182, F304L or F316L to match pipe, and ANSI B16.11, Class 3000.
Material Classification	SS-5
Schedule 40S Stainless Steel With Buttwelded Fittings	
Pipe	ASTM A312, Grade TP304L or TP316L.
Fittings	ASTM A403, WP304L or WP316L to match pipe, and ANSI/ASME B16.9, Schedule 40S.
Material Classification	SS-6
Stainless Steel Tubing With Compression Fittings	
Tubing	ASTM A269, seamless, Grade TP304 or TP316, annealed, max hardness Rockwell B80; with the following min wall thicknesses:

Tube OD inches (mm)	Wall Thickness inches (mm)
1/4 to 3/8 (6 to 9)	0.065 (1.65)
1/2 to 7/8 (13 to 22)	0.083 (2.11)
1 to 2 (25 to 50)	0.109 (2.77)

Fittings	Compression type, AISI Type 316 stainless steel; Crawford "Swagelok", or Parker Hannifin "CPI" or "Ferulok".
Material Classification	SS-7

Schedule 10S Stainless Steel
With Buttwelded Fittings

Pipe	ASTM A312, Grade TP304L.
Buttwelded Fittings	ASTM A403, WP304L, and ANSI B16.9, Schedule 10S.

2.1.02 Accessory Materials. Accessory materials for the stainless steel pipe systems shall be as indicated.

Material Classification SS-1 and SS-2

Backing Flanges: Stainless steel plate, AISI Type 304 or 316 to match fittings, with ANSI/ASME B16.5, Class 150 diameter and drilling; with the following thicknesses:

Nominal Pipe Size inches (mm)	Flange Thickness inches (mm)
1/2-8 (13-200)	1/2 (13)
10-14 (250-350)	5/8 (16)
16-18 (400-450)	3/4 (19)
20-30 (500-750)	1 (25)
36 (900)	1-1/4 (32)

Flange Bolts and Nuts: ASTM A307, galvanized, length such that, after installation, bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of nut.

Flange Gaskets: Flexitalic "Style CG", spiral wound, AISI Type 304 stainless steel, non-asbestos filler, 3/16 inch (5 mm) nominal thickness, with compression ring 1/8 inch (3 mm) thick to match required flange dimensions.

Material Classification SS-7

Flanges	ANSI B16.5, Class150, flat face, AISI Type 304.
Flange Bolts	ASTM A193, AISI Type 304, ANSI B18.2.1 heavy hex head, length such that, after installation, bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of nut.
Nuts	ASTM A194, AISI Type 304, ANSI B18.2.2 heavy hex pattern.
Flange Gaskets	Flexitalic "Style CG", spiral wound, AISI Type 304 stainless steel, non-asbestos filler, 3/16 inch (5 mm) nominal thickness, with compression ring 1/8 inch (3 mm) thick to match required flange dimensions.
Material Classification	SS-3, SS-4, and SS-5
Flanges	ANSI/ASME B16.5, Class 150, flat faced, AISI Type 304, 304L, 316, or 316L, to match piping.
Flange Bolts	ASTM A193, AISI Type 304, ANSI B18.2.1, heavy hex head, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
Flange Nuts	ASTM A194, AISI Type 304, ANSI/ASME B18.2.2, heavy hex pattern.
Flange Gaskets	ASTM D1330, Grade I, red rubber, ring type, 1/8 inch (3 mm) thick.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation .

3.2 LEAKAGE AND PRESSURE TESTS. After installation, stainless steel piping shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All stainless steel piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15065

MISCELLANEOUS STEEL PIPE, TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous steel pipe, tubing and accessories that is less than 24 inches (600 mm) in diameter for the services as specified herein. Pipe and tubing shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Expansion joints.

Flange gaskets.

Glass lined pipe and fittings.

Grooved and mechanical couplings.

Insulating (dielectric) couplings, threaded and flanged.

Name of Manufacturer.

Type and Model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

1.4.01 Coated Pipe. Handling methods and equipment used shall prevent damage to the protective coating and shall include the use of end hooks, padded calipers, and nylon or similar fabric slings with spreader bars. Bare cables, chains, or metal bars shall not be used. Coated pipe shall be stored off the ground on wide, padded skids. Plastic coated pipe shall be covered or otherwise protected from exposure to sunlight.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Miscellaneous steel pipe materials shall be as indicated.

Material Classification	CSG-1
Standard Weight Galvanized Steel With Threaded Cast Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade A or B; or ASTM A106, of equivalent thickness.
Fittings	Threaded type, ANSI/ASME B16.4, Class 125.
Material Classification	CSG-2
Standard Weight Galvanized Steel With Threaded Malleable Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade A or B; or ASTM A106, of equivalent thickness.

Fittings	Threaded type, ANSI/ASME B16.3, Class 150, or Fed Spec WW-P-521, Type II.
Material Classification	CSG-3
Standard Weight Galvanized Steel With Flanged Cast Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade A or B; or ASTM A106, of equivalent thickness.
Fittings	Flanged type, ANSI/ASME B16.1, Class 125.
Material Classification	CS-1
Standard Weight Steel With Threaded Malleable Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI/ASME B16.3, Class 150, or Fed Spec WW-P-521, Type I.
Material Classificaion	CS-2
Standard Weight Steel With Forged Steel Socket Welded Fittings	
Pipe	ASTM A53, Type S, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI B16.11, Class 3000; Bonney, Crane, Ladish, or Vogt.
Material Classification	CS-3
Standard Weight Steel With Buttwelded Fittings	

Pipe	ASTM A53, Type S, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI/ASME B16.9; standard weight.
Material Classification	CS-4
Extra Strong Steel With Forged Steel Threaded Fittings	
Pipe	ASTM A53, Type S, extra strong, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI B16.11, Class 2000 or 3000; Bonney, Crane, Ladish, or Vogt.
Material Classification	CS-5
Extra Strong Steel With Forged Steel Socket Welded Fittings	
Pipe	ASTM A53, Type S, extra strong, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI B16.11, Class 3000; Bonney, Crane, Ladish, or Vogt.
Material Classification	CS-6
Extra Strong Steel With Buttwelded Fittings	
Pipe	ASTM A53, Type E, extra strong, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI/ASME B16.9; extra strong.
Material Classification	CS-7
Standard Weight Steel With Threaded Cast Iron Fittings	

Pipe	ASTM A53, Type S, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	Threaded type, ANSI/ASME B16.4, Class 125. When used for lime slurry piping service, fittings and flanges for disassembly and cleaning shall be provided only at the locations indicated on the drawings. Changes in alignment at other locations shall be accomplished by bending the pipe. All bends shall have a radius of at least 3 feet [0.9 m].
Material Classification	CS-8
Steel Hydraulic Tubing With Compression Fittings	
Tubing	ASTM A179, seamless, soft annealed, wall thickness as required.
Fittings	Steel, compression type, Crawford "Swagelok" or Parker Hannifin "CPI".
Material Classification	CS-9
PP Lined Steel Pipe	
Pipe and Lining	ASTM F429.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-10
PVD Lined Steel Pipe	
Pipe and Lining	ASTM F491.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-11
FEP Lined Steel Pipe	

Pipe and Lining	ASTM F546.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-12
PTFE Lined Steel Pipe	
Pipe and Lining	ASTM F423.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-13
Glass Lined Steel Pipe	
Pipe	Standard weight steel pipe with flanged ends and Ceramic Coating "Non-Stick Glass Lining" or Vitco "SG-14 Glass Lined Pipe".
Fittings	Ductile iron, as specified in Master Specification Section 15061, Ductile Iron Pipe, with Ceramic Coating "Non-Stick Glass Lining" or Vitco "SG-14 Glass Lined Pipe".
Material Classification	CS-14
Double-Wall Secondary Containment Pipe	Perma Pipe/Ricwil Type "Ultra FS".
Carrier Pipe	Black steel pipe, ASTM A53, Type S, Grade B, Schedule 80.
Containment Pipe	Black steel pipe, ASTM A53, Type S, Grade B, Schedule 40 with FRP filament wound outer covering bonded to steel containment pipe, minimum 0.100 inch [2.5 mm] thick.
Fittings	Factory prefabricated, of the same materials and thickness as the specified pipe.

Leak Detection	Stainless steel leak detection guide tube and stainless steel cable pull wire to allow pulling of the leak detection cable into the containment pipe, both during and after piping installation.

2.1.02 Accessory Materials. Accessory materials for the miscellaneous steel pipe and tubing systems shall be as indicated.

Nipples	ASTM A733, seamless, extra strong (Schedule 80); "close" nipples will be permitted only by special authorization in each case.
Unions (Malleable Iron)	Fed Spec WW-U-53l, Class 2; Type B (galvanized) for galvanized pipe or Type A (black) for ungalvanized pipe.
Flanges	
For Standard Weight Pipe	ANSI/ASME B16.5, Class 150, flat faced when connected to flat faced flanges; otherwise, raised face.
For Extra Strong Pipe	
Chemical Gas Piping	ASTM A105, forged steel, tongue and groove flanged union type, with nonmetallic gasket; rated for a working pressure of 1,500 psi [10.3 MPa].
Digester Gas Piping	ANSI/ASME B16.5, Class 150, flat faced.
Other Services	ANSI/ASME B16.5, Class 300, raised face.
For Plastic Lined Pipe	Steel, forged or cast, diameter and drilling in accordance with ANSI/ASME B16.5, Class 150 or 300 as required.
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch [3 to 10 mm] beyond outer face of the nut.

Flange Gaskets

For Aeration/Backwash Air Service	
Raised Face Flanges	Non-asbestos inorganic fiber with EPDM binder; dimensions to suit flange contact face, 1/16 inch [1.5 mm] minimum thickness for plain finished surfaces, 3/32 inch [2 mm] minimum thickness for serrated surfaces, rated for 275°F [135°C] service; Garlock "IFG 5507".
Flat Faced Flanges	Premium Grade, EPDM, ring type, 1/8 inch (3 mm) thick, rated for 275°F (135°C) service; Garlock "8314".
For Boiler Exhaust Service	Garlock "Blue-Gard, Style 3000".
For Oil Service	Non-asbestos filler with neoprene or nitrile binder; dimensions to suit flange contact face; 1/16 inch (1.5 mm) minimum thickness for plain finished surfaces, 3/32 inch (2 mm) minimum thickness for serrated surfaces.
For Heating Water Service	Non-asbestos inorganic fiber with nitrile binder; dimensions to suit flange contact face, 1/16 inch (1.5 mm)minimum thickness for plain finished surfaces, 3/32 inch (2 mm) minimum thickness for serrated surfaces; Garlock "IFG 5500".
For Water Service	ASTM D1330, Grade I, red rubber, ring type, 1/8 inch (3 mm) thick.
For Other Services	
Flat Faced Flanges	Non-asbestos filler with neoprene or nitrile binder; dimensions to suit flange contact face; 1/16 inch (1.5 mm) minimum thickness for plain finished surfaces, 3/32 inch (2 mm) minimum thickness for serrated surfaces.

Raised Face Flanges	Continuous stainless steel ribbon wound into a spiral with non- asbestos filler between adjacent coils with a carbon steel gauge ring. Compressed gasket thickness shall be 0.095 inch +/- 0.005 inch (2.4 mm +/- 0.13 mm).
Grooved Couplings	
Rigid	AWWA C606; Gustin-Bacon "No. 120 Rigid" or Victaulic "07 Zero-Flex".
Standard	AWWA C606; Gustin-Bacon "No. 100 Standard" or Victaulic "Style 77".
Mechanical Couplings	Dresser "Style 38" or Smith-Blair "Type 411 Flexible Coupling"; without pipe stop.
Expansion Joints	Flexonics "Model H Expansion Compensators" for 3 inch (75 mm) or smaller; Flexonics "Free Flexing Expansion Joints" with flanged ends and stainless steel bellows for 4 inch (100 mm) or larger.
Material Classification	CS-11
Joining	Carrier pipe shall be joined by socket welding. Containment pipe shall be joined by split sleeve of the same diameter as containment pipe with minimum 60 mil (1.5 mm) thick polyethylene jacket.
End Seal	End seals shall be furnished at all terminal ends. The end seal shall be sealed to the containment pipe.
Leak Detection	Microprocessor based monitoring unit, for continuous monitoring by cable of a single line for water and hydrocarbon.
Control Panel	Modified NEMA Type 12 enclosure, with status and alarm data Model "PAL-AT20C". Power supply to the unit will

	be 120 volt, 1 phase, 60 Hz. Unit shall be UL listed with alarm horn and shall locate leaks and not depend on battery back-up functions. System conditions shall be stored in memory in the event of power failure and shall automatically resume monitoring without reset once power is available. Monitoring unit shall be able to differentiate between water left in pipe during installation and an actual growing leak. Panel shall also be able to detect a break in sensor cable and its location.
Cable	Cable shall be located in the interstitial space between the carrier and containment pipe, shall detect both water and hydrocarbon, and shall be capable of being dried in place without being replaced after exposure to any fluid Type "AGW-Gold". Coaxial cable shall interface monitoring control panel with sensor cable by utilizing waterproof junction box for protecting connection.

2.1.03 Coatings and Linings. Standard weight steel pipe in buried locations shall have exterior surfaces protected with a shop applied plastic coating.

Extra strong steel pipe in buried locations shall have exterior surfaces protected with a shop applied plastic coating, a shop applied tape wrap, or will be coated by others in the field.

All surfaces to be tape-wrapped shall be thoroughly cleaned and primed in accordance with the tape manufacturer's recommendations immediately before wrapping. The tape shall be applied by two-ply (half-lap) wrapping or as needed to provide a total installed tape thickness of at least 60 mils (1.5 mm).

Coatings and linings shall be as indicated.

External Coatings

Plastic	Chevron Chemical Co. "Plexco Plexguard Coating" or Encoat/Lukens "Encoat Extruded Coating". The

	products of other manufacturers will not be acceptable.
Tape Wrap	ANSI/AWWA C209, except single ply tape thickness shall not be less than 30 mils (760 μm); Protecto Wrap "200" or Tapecoat "CT".
Internal Linings	
PP Lining	ASTM F492.
PVDF Lining	ASTM F491.
FEP Lining	ASTM F546.
PTFE Lining	ASTM F423.
Glass Lining	Two-coat system applied over blast-cleaned surface; ground and finish coats separately fired; finished lining thickness at least 8 mils (200 μm), Mohs' Hardness 5 to 6, density 2500 to 3000 kg/m^3 as determined by ASTM D792.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation .

3.2 LEAKAGE AND PRESSURE TESTS. After installation, steel piping shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All steel piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15066

FIBERGLASS REINFORCED PLASTIC PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installation of low pressure fiberglass reinforced plastic pipe for exhaust air systems as indicated in the Contract Documents. Piping shall furnished complete with all fittings, transitions, jointing materials, expansion joints, and other necessary appurtenances.

Pipe supports are covered in Master Specification Section 15140, Pipe Supports. Anchors are covered in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

Pipe trenching, bedding, and backfill are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

1.2 GENERAL.

1.2.01 Coordination. Contractor shall verify that each component of the system furnished is compatible with all other parts of the system, that all piping and materials are appropriate for the expected services, and that all devices necessary for a properly functioning system have been provided.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.2.03 Pipe Identification. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data and catalog cuts, and shop assembled layout drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications shall include, but shall not be limited to, the following:

Pipe

Manufacturer’s name.

Brand designation.

Type of resin.

Pressure, vacuum, and temperature rating of pipe.

Certification of compliance with referenced standards.

Layouts and dimensions of subassemblies to be shipped.

Where the pipe sizes needed for the project are larger than the named manufacturer's standard pipe sizes, the following information shall be submitted for the pipe and fittings that are being provided:

Manufacturer's name.

Certified statement that covers construction and test methods.

Material sources.

Material types.

Average reinforced wall thickness for each pipe size.

Minimum reinforced wall thickness for each pipe size.

Average outside diameter for each pipe size.

Liner material.

Nominal liner thickness for each pipe size.

Expansion Joints

Name of manufacturer.

Type and model.

Materials of construction.

Force required for expansion and contraction.

Contractor shall submit procedures and results of all shop and field testing.

1.4 <u>QUALITY ASSURANCE</u>.

1.4.01 <u>Manufacturer's Field Services</u>. When indicated in the Contract Documents, the pipe manufacturer shall provide hands-on training for the installation contractor's employees in the proper assembly of butt joints. The pipe manufacturer's representative shall be on-site for at least one 8-hour day, during which they shall observe the assembly of at least three butt joints. The pipe manufacturer shall provide hands-on training for the installation contractor's employees in the proper assembly of butt joints. The pipe manufacturer shall submit written certification that the installation contractor's employees have satisfactorily completed all training and instruction and can perform the jointing required for this project in accordance with the pipe manufacturer's recommendations and as specified herein. All field butt joints shall be made by representatives of the pipe manufacturer or by employees of the installation contractor who have been trained and certified by the pipe manufacturer.

All fitters who fabricate and install piping with butt joints shall be qualified for this project. Training and qualification shall be provided by an authorized representative of the pipe manufacturer. Qualified fitters shall carry and have visible at all times a certificate of qualification issued by the pipe manufacturer. Contractor shall arrange the qualifying training.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Pipe and fittings shall be properly supported to avoid damage caused by flexural strains. Pipe and fittings shall not be thrown or dropped.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Fiberglass reinforced pipe will be used in the service conditions as indicated in the Contract Documents.

Pipe and appurtenances used in ventilation exhaust air or odor control systems will be continuously exposed to a humid environment containing hydrogen sulfide gas. Pipe and appurtenances used in emergency gas treatment exhaust systems will be exposed to chlorine gas.

2.2 DESIGN REQUIREMENTS.

2.2.01 Minimum Pipe Wall Stiffness. The minimum pipe wall stiffness, at 5 percent deflection, determined in accordance with ASTM D2412 and Section 3 of AWWA C950, shall be not less than the following:

Nominal Pipe Diameter		Pipe Stiffness	
inches	(mm)	psi	(kPa)
1-8	(25-200)	36	(250)

10	(250)	18	(125)
12-16	(300-400)	9	(62)
18 and larger, buried	(450 and larger, buried)	10 or greater as required	(70)
18 and larger, other locations	(450 and larger, other locations)	5	(35)

2.2.02 Temperature. All pipe, fittings, and appurtenances shall be suitable for the temperature conditions as indicated in the Contract Documents.

2.2 ACCEPTABLE MANUFACTURERS. The fiberglass reinforced plastic pipe, fittings and specials provided under this section shall be from the manufacturer as specified herein without exception.

2.3 MATERIALS.

Epoxy Pipe

Centrifugally Cast, 14 inches (350 mm) and smaller	ASTM D2997, RTRP-21C, centrifugally cast, reinforced epoxy resin pipe with 30 mil (750 µm) liner; Fibercast "Centricast III EP"; without exception.

Filament-Wound

16 inches (400 mm) and smaller	ASTM D2996, RTRP-11FE-111, RTRP-11FF-312, and RTRP-11FQ-311, with at least a 20 mil (500 µm) reinforced liner; Ameron "Bondstrand Series 2000"; Conley "Schedule 20E"; or Smith Fiberglass Products "Green Thread"; without exception.
18 through 20 inches (450 through 500 mm)	ASTM D2310, RTRP-11FQ, with at least a 20 mil (500 µm) reinforced liner; Conley "Schedule 20E"; without exception.

Vinyl Ester Pipe

16 inches (400 mm) and smaller	ASTM D2996, RTRP-12ED-101, RTRP-12EF-311, RTRP-12EQ-311, or RTRP-12EU-311, with vinyl ester resin and at least a 20 mil (500 µm) reinforced liner;

	Ameron "Bondstrand Series 5000"; Conley "Schedule 20V"; Fibercast "F-Chem 1222" or "F-Chem-V"; or Smith Fiberglass Products "Poly Thread"; without exception.
18 inches (450 mm) and larger	ASTM D2310, RTRP-12ED, -11EQ, or -12EU, with vinyl ester resin and at least a 20 mil (500 µm) reinforced liner; Ameron "Bondstran Series 5000"; Conley "Schedule 20V"; Fibercast "F-Chem-V"; or Smith Fiberglass Products "Big Thread LVV"; without exception.
Fittings	Manufacturer's standard, glass fiber reinforced, compatible with the pipe and with chemical resistance equal to or greater than the pipe.
Flanges	ASTM D3982
Flange Bolts or Studs	ASTM A307, Grade B, galvanized or ASTM F593, Type 304 stainless steel as required; length such that, after installation, bolts will project 1/8 to 3/8 inch (3 to 9 mm) beyond the outer face of the nut.
Nuts	ASTM A307, Grade B, galvanized or ASTM F594, Type 304 stainless steel.
Flat Washers	ANSI B18.22.1, plain, galvanized or ANSI B18.22.1, Type 304 stainless steel.
Flange Gaskets	Full face, ASTM D2240, Type A durometer 50-70; at least 1/8 inch (3 mm) thick, neoprene, viton, or nitrile material.
Bell-and-Spigot Joints	Matched tapered bell-and-spigot ends bonded with adhesive.
Butt Joints	Butt and wrap, resin bonded, PS-15, with pressure rating equal to the pipe.
Expansion Joints	As specified herein.
Adhesive	Pipe manufacturer's standard.

All pipe, fittings and appurtenances shall contain ultraviolet (UV) inhibitors. Resins used in the piping system laminates shall have a flame spread rating of 25 or less when tested in accordance with ASTM E84.

2.4 FABRICATION.

2.4.01 Jointing Method. Unless otherwise specified, 14 inch (350 mm) and smaller pipe shall have coupled adhesive bonded joints. Sixteen inch (400 mm) and larger pipe shall have bell-and-spigot or butt joints. Shop fabricated assemblies should be provided to the maximum extent possible, to minimize the number of field joints.

Flanged joints shall be provided at each damper and item of equipment to facilitate disassembly, at each change in material, and where indicated on the drawings. Bolts, nuts, washers, and gaskets shall be provided for all flanged connections in the piping system, including connections to equipment.

Field butt joints shall be located at least 12 inches (300 mm) from any increasing or decreasing cross-section of pipe where the pipe to be jointed has the same diameter.

2.4.02 Butt Joints. Butt joints shall be provided in accordance with the manufacturer's recommendations and as specified herein. Twenty inch (500 mm) and larger pipe shall be overlaid both inside (when accessible) and outside. Eighteen inch (450 mm) and smaller pipe shall be overlaid on the outside only. The minimum width of the overlay shall be as specified in the following table. Inside overlaps shall be made to seal the joint but shall not be considered in meeting the strength requirements.

Pipe Size		Minimum Total Width of Overlay	
Inches	(mm)	Inches	(mm)
18-20	(450-500)	14	(350)
24-36	(600-900)	18	(450)
42-54	(1050-1350)	24	(600)
60-72	(1500-1825)	26	(650)

Finished joints shall be built up in successive layers, shall be as strong as the pieces being joined, and shall be as crevice-free as is commercially practicable, in accordance with ASTM D2563. The width of the first layer shall be at least 4 inches (100 mm). Successive layers shall be increased uniformly to provide the specified minimum total width of overlay which shall be centered on the joint. Crevices between jointed pieces shall be filled with resin, leaving a smooth inner surface. The interior of joints shall also be sealed by covering with not less than 0.1 inch (2 mm) of liner of the same material as the pipe.

2.4.03 Transitions. Fiberglass reinforced plastic transition sections shall be furnished for connecting round pipe to rectangular openings on equipment. Transitions shall have a pressure rating and wall stiffness equal to those of the pipe. Internal lining shall be of the same type of material and thickness as specified for the pipe. Transitions shall have flanged end connections compatible with the connecting pipe and equipment.

2.4.04 Expansion Joints. Expansion joints shall be furnished at the locations indicated on the drawings and at other locations required for proper pipe installation. Expansion joints shall be resistant to ultraviolet light and shall be suitable for the service conditions.

Expansion joints shall be slip-on or flange type. The slip-on type shall be sized to fit tightly on the outside circumference of the pipe and shall be secured in place by adjustable, corrosion-resistant band type clamps. Flange type expansion joints shall have split steel retaining rings and shall have diameter and drilling to match the pipe flanges.

Expansion joints shall be designed to compress 1 inch (25 mm) and to elongate 1 inch (25 mm) with a maximum force to cause movement of 100 lbs (445 N) or less. The joints shall also allow lateral deflections of up to 1 inch (25 mm).

PART 3 - EXECUTION

3.1 INSPECTION. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation. Any pipe that is damaged or shows evidence of contamination shall not be installed in the piping system.

3.2 PREPARATION.

3.2.01 Field Measurement. Pipe shall be cut to measurements taken at the site, not from the drawings. All necessary provisions shall be made in laying out piping to allow for expansion and contraction. Piping shall not obstruct openings or passageways. Pipes shall be held free of contact with building construction to avoid transmission of noise resulting from expansion.

3.3 INSTALLATION. Pipe shall be installed as specified and as indicated on the drawings. All necessary provisions shall be taken in the fabrication and installation of piping to provide for expansion and contraction. Expansion joints shall be installed.

The piping shall be supported as indicated on the drawings and in accordance with the requirements of Master Specification Section 15140, Pipe Supports.

The inside of pipe, fittings, and transitions shall be smooth, clean, and free from blisters, when installed.

3.3.01 Pipe Sleeves. Piping passing through concrete or masonry shall be installed through sleeves installed before the concrete is placed or when masonry is laid.

3.3.02 Pipe Joints. Pipe joints shall be carefully and neatly made in accordance with the following specified requirements.

3.3.02.01 Adhesive Bonded Joints. All joint preparation, cutting, and jointing for adhesive bonded joints shall comply with the pipe manufacturer's recommendations. Adhesive shall be mixed and applied in accordance with the manufacturer's recommendations. Newly assembled joints shall be suitably blocked or restrained to prevent movement during the recommended curing period.

3.3.02.02 Flanged Joints. Flange bolts shall be tightened sufficiently to slightly compress the gasket and make a good seal, but not so tight as to distort the flanges. A flat washer shall be installed under each nut and bolt head.

3.3.02.03 Butt Joints. Butt joints shall be made in accordance with the manufacturer's recommendations and as specified herein.

The inner surface shall be free of cracks and crazing, with a smooth finish, and with an average of not more than two pits per square foot (21 pits per square meter), provided the pits are less than 1/8 inch (3 mm) in diameter, not more than 1/32 inch (0.7 mm) deep, and covered with sufficient resin to avoid exposure of inner surface fabric. Some waviness is permissible as long as the surface is smooth and free of pits. Such surfaces may be reinforced with glass surfacing mat, synthetic fibers, or other suitable material.

3.3.03 Alignment. Piping installed below grade shall be laid to the lines and grades indicated on the drawings. Batter boards, laser beam equipment, or surveying instruments shall be used to maintain alignment and grade.

Batter boards, if used, shall be erected at intervals of not more than 25 feet (7 m). Batter boards shall be used to determine and check pipe subgrades. At least three batter boards shall be maintained in proper position at all times when trench grading is in progress.

If laser beam equipment is used, periodic elevation measurements shall be made with surveying instruments to verify accuracy of grades. If such measurements indicate thermal deflection of the laser beam due to differences between the ground temperature and the air temperature within the pipe, precautions shall be taken to prevent or minimize further thermal deflections.

3.3.04 Laying Pipe. Pipe installed below grade shall be protected from lateral displacement by placing the specified pipe embedment material. Pipe shall not be laid in water or under unsuitable weather or trench conditions.

Pipe laying shall begin at the lowest elevation with bell ends facing the direction of laying, except when reverse laying is permitted by Engineer.

Whenever pipe laying is stopped, the open end of the pipe shall be closed with an end board closely fitting the end of the pipe, to keep sand and earth out of the pipe. The end board shall have several small holes near the center to permit water to enter the pipe and to prevent flotation in the event of flooding of the trench.

3.4 FIELD QUALITY CONTROL.

3.4.01 Butt Joint Procedure Training. When training isindicated in the Contract Documents , the pipe manufacturer shall submit written certification that the installation contractor's employees have satisfactorily completed all training and instruction and can perform the jointing required for this project in accordance with the pipe manufacturer's recommendations and as specified herein.

3.4.02 Field Testing. All necessary testing equipment and materials, including tools, appliances, and devices, shall be furnished by Contractor. All tests shall be made by and at the expense of Contractor and at such time as directed by Engineer. All tests shall be conducted in a manner acceptable to Engineer and shall be repeated as many times as necessary to demonstrate compliance with specified requirements. Engineer shall be present during all testing. The piping system shall be tested at 0.75 psi (5 kPa) pressure with air for at least 1 hour, and shall not leak. All joints which are found to leak, by observation or during testing, shall be repaired by Contractor, and tests repeated.

Leakage may be determined by loss of pressure or other method acceptable to Engineer. All equipment or other accessories which would be damaged if subjected to the specified test pressure shall be disconnected, and ends of branch lines plugged or capped, as required, during the testing procedures.

End of Section

SECTION 15067

MISCELLANEOUS PLASTIC PIPE, TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous plastic pipe, tubing and accessories for the services as indicated in the Contract Documents. Pipe and tubing shall be furnished complete with all fittings, flanges, unions, jointing materials and other necessary appurtenances.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Chemical resistant waste pipe and fittings.

Expansion joints.

Flange gaskets.

FRP double wall pipe and fittings.

Gas pipe and fittings.

Pipe sleeves.

Polyethylene pipe and fittings.

Polypropylene pipe and fittings.

PVC pipe and fittings.

CPVC pipe and fittings.

PVDF pipe and fittings

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

Pipe, tubing, and fittings shall be stored between 40°F and 90°F (4°C and 32°C).

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Miscellaneous plastic pipe materials shall be for the services as indicated in Miscellaneous Plastic Pipe, Tubing and Accessories Schedule 15067-S01.

Material Classification	FRP-1
FRP Pipe	
Pipe	ASTM D2996, filament-wound, glass fiber reinforced, vinyl ester resin pipe with 20 mil (500 μm) reinforced resin-rich liner; Fibercast "F-Chem 1222" or Smith Fiberglass Products "Poly Thread".
Fittings and Flanges	Glass fiber reinforced, compatible with the specified pipe, with ratings and chemical resistance equal to or greater than the specified pipe.

Material Classification	PVC-1
Schedule 40 PVC Pipe With Solvent Welded Joints	
Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Fittings	ASTM D2466, Cell Classification 12454-B, bearing NSF seal.
Material Classification	PVC-2
Schedule 80 PVC Pipe With Solvent Welded Joints	
Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Fittings	ASTM D2467, Cell Classification 12454-B, bearing NSF seal.
	Flanges or unions shall be provided where needed to facilitate disassembly of equipment or valves. Flanges or unions shall be joined to the pipe by a solvent weld.
	When acceptable to Engineer, threaded joints may be used instead of solvent welded joints in exposed interior locations for the purpose of facilitating assembly. The use of threaded joints in this system shall be held to a minimum.
Material Classification	PVC-3
Schedule 80 PVC Pipe With Threaded Joints	
Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Fittings	ASTM D2464, Cell Classification 12454-B, bearing NSF seal.

Material Classification	PVC-4
PVC DWV Pipe (Single Wall) With Solvent Welded Joints	
Pipe	ASTM D1785, cell classification 12454-B, bearing NSF seal.
Fittings	ASTM D2665 and ASTM D3311, cell classification 12454-B, bearing NSF seal.
Material Classification	PVC-5
PVC DWV Pipe (Double Wall Containment) With Solvent Welded Joints	
Pipe	Sloan "GSR Contain-it"; with manufacturer's standard spacers, fittings, and suitable chemical service solvent or equal.
Fittings	ASTM D2665 and ASTM D3311, cell classification 12454-B, bearing NSF seal.
Material Classification	PVC-6
PVC Underdrain Pipe and Fittings	
Pipe	ASTM F758, solid or perforated wall, as specified herein, Cell Classification 12454-C or 12364-C, Type PS 46, with solvent welded or elastomeric gasket joints, as specified herein.
Fittings	ASTM D3034, Cell Classification 12454-B or 12454-C, wall thickness SDR 35, with solvent welded or elastomeric gasket joints, as specified herein.
Material Classification	PVC-7

Double-Contained Chemical Feed Pipe	
System	Prefabricated system consisting of primary pipe supported within a Schedule 80 PVC secondary containment housing. Primary pipe material and fittings shall be as specified for single-contained piping for the respective chemical.
Containment Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Interstitial Supporting Devices	Polypropylene spider clips or C-type, within the secondary containment pipe.
Material Classification	CPVC-1
Schedule 80 CPVC Pipe With Solvent Welded Joints	
Pipe	ASTM F441, Schedule 80, Cell Classification 23447-B, bearing NSF seal.
Fittings	ASTM F439, Cell Classification 23447-B, bearing NSF seal.
	Flanges or unions shall be provided where needed to facilitate disassembly of equipment or valves. Flanges or unions shall be joined to the pipe by a solvent weld.
	When acceptable to Engineer, threaded joints may be used instead of solvent welded joints in exposed interior locations for the purpose of facilitating assembly. The use of threaded joints in this system shall be held to a minimum.
Material Classification	PE-1

PE Pipe (4 inch [100 mm] and smaller) With Socket Fusion Fittings	
Pipe	ASTM D3350, Cell Classification PE345434C.
	ASTM D2513, IPS, SDR11; Chevron Chemical Co. "Plexco Yellow-stripe PE3408 Gas Pipe".
Fittings	ASTM D1248, Type III, Class C, Grade P34.
	ASTM D2683, socket type, with wall thickness same as for pipe.
Material Classification	PE-2
PE Pipe (6 inch [150 mm] and larger) With Butt Fusion Fittings	
Pipe	ASTM D3350, Cell Classification PE345434C.
	ASTM D2513, IPS, SDR11; Chevron Chemical Co. "Plexco Yellow-stripe PE3408 Gas Pipe".
Fittings	ASTM D1248, Type III, Class C, Grade P34.
	ASTM D3261, butt heat fusion type, with wall thickness same as for pipe.
Material Classification	PE-3
PE Tubing With Compression Fittings	
Tubing	1/8 through 5/8 inch [3 through 16 mm] OD, 1/16 inch [1 mm] wall thickness, 130°F [54°C] max operating temperature.

Fittings	As recommended by the chlorine feed system manufacturer.
Material Classification	PE-4
PE Pipe	
Pipe	ASTM D3350, Cell Classification PE334434C.
	ASTM F714, DR as specified herein, Phillips "Driscopipe 1000", "Driscopipe 8600", or Plexco "PE 3408", as specified herein.
Fittings	Molded or manufactured from pipe; cell classification of material and pressure rating same as for pipe.
Material Classification	PE-5
Corrugated PE Drainage Tubing and Fittings	AASHTO M252 and ASTM F405, with solid or slotted wall, as specified herein.
Material Classification	PE-6
Polyethylene Tubing and Fittings	1/8 through 3/4 inch [3 through 19 mm] OD, 1/16-inch wall thickness, 130°F maximum operating temperature with compression fittings.
Material Classification	PP-1
Schedule 40 PP Pipe With Socket Fusion Fittings	
Pipe	ASTM D4101, Class 1, virgin, unpigmented homopolymer without additives or UV stabilizer; Enfield or Orion.
	Dimensions in accordance with ASTM D2447.

Fittings	Same material as pipe. Socket fusion type compatible with the pipe; Enfield or Orion.
Material Classification	PP-2
PP DWV Pipe With Heat Fused Joints	
Pipe	Schedule 40, ASTM D4101. Orion "Brownline" for standard type or "Blueline" for flame retardant type, Enfield, or R&G Sloan.
Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard heat fused socket joint. Solvent weld joints not permitted.
Material Classification	PP-3
PP DWV Pipe With Mechanical Joints	
Pipe	Schedule 40, ASTM D4101. Orion "Brownline" for standard type or "Blueline" for flame retardant type, Enfield, or R&G Sloan.
Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard.
Material Classification	PVDF-1
PVDF DWV Pipe With Heat Fused Joints	
Pipe	Schedule 40, UL 94-VO, non-combustible. Orion or equal.

Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard heat fused socket joint. Solvent weld joints not permitted.
Material Classification	PVDF-2
PVDF DWV Pipe With Mechanical Joints	
Pipe	Schedule 40, UL 94-VO, non-combustible. Orion or equal.
Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard.
Material Classification	PVDF-3
Schedule 80 PVDF With Socket Type Heat Fusion Welded Joints	
Pipe	ASTM D3222 for Type 1 homopolymers. Manufactured to wall thicknesses specified in ASTM D1785 for Schedule 80 Pipe.
Fittings	ASTM D2467.
	Flanges or unions shall be provided where needed to facilitate disassembly of equipment or valves. Flanges or unions shall be joined to the pipe by a heat fusion weld.
	When acceptable to the Engineer, threaded joints may be used instead of solvent welded joints for the purpose of facilitating disassembly. The use of threaded joints in this system shall be held to a minimum.

Material Classification	PVDF-4
Schedule 80 PVDF With Threaded Joints	
Pipe	ASTM D3222 for Type 1 homopolymers manufactured to wall thicknesses specified in ASTM D1785 for Schedule 80 Pipe.
Fittings	ASTM D2464.
Material Classification	RPT-1
Reinforced Plastic Tubing	Wire reinforced PVC hose; Cobon Plastics Corp. "Cobovin Type S" or NewAge Industries Inc. "Vardex".

2.1.02 Accessory Materials. Accessory materials for the miscellaneous plastic pipe systems shall be as indicated.

Material Classification	FRP-1
Flanges	Diameter and drilling shall conform to ANSI/ASME B16.5, Class 150.
Flange Bolts and Nuts	ASTM A307, Grade B, galvanized, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
Flat Washers	ANSI B18.22.1, plain, galvanized.
Flange Gaskets	Full face, 1/8 inch (3 mm) thick, chemical-resistant elastomeric material suitable for the specified service.
Expansion Joints	Edlon "Thermo-molded TFE" or Resistoflex "Style R6905" molded expansion joint.
Material Classification	PVC-1 through PVC-7, and PVDF-1 through PVDF-4
Flanges	Diameter and drilling shall conform to

	ANSI/ASME B16.5, Class 150.
	Schedule 80 for DWV systems.
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
	Stainless steel for DWV and sulfuric acid feed systems, galvanized steel for all other systems.
Flat Washers	ANSI B18.22.1, plain.
	Stainless steel for DWV and sulfuric acid feed systems, galvanized steel for all other systems.
Flange Gaskets	Full face, 1/8 inch (3 mm) thick, chemical-resistant elastomeric material suitable for the specified service.
Expansion Joints	Edlon "Thermo-molded TFE" or Resistoflex "Style R6905" molded expansion joint.
Material Classification	CPVC-1
Flanges	Diameter and drilling shall conform to ANSI/ASME B16.5, Class 150.
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
	Stainless steel for chemical feed systems, galvanized steel for all other systems.
Flat Washers	ANSI B18.22.1, plain.
	Stainless steel for chemical feed systems, galvanized steel for all other systems.

Flange Gaskets	Full face, 1/8 inch (3 mm) thick, chemical-resistant elastomeric material suitable for the specified service.
Expansion Joints	Edlon "Thermo-molded TFE" or Resistoflex "Style R6905" molded expansion joint.
Material Classification	PE-1 through PE-6
Flanges	Schedule 80 PVC; diameter and drilling shall conform to ANSI/ASME B16.5, Class 150.
Flange Bolts and Nuts	ANSI B18.2.1, ASTM A193, AISI Type 304, heavy hex head, length such that after installation the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut. ASTM A194, AISI Type, ANSI/ASME B18.2.2, heavy hex pattern.
Fittings and Flange Adapters	Molded or manufactured from the pipe; cell classification of material and pressure rating same as for pipe.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation.

3.2 LEAKAGE AND PRESSURE TESTS. After installation, plastic piping shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All plastic piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.3 SCHEDULE. See Miscellaneous Plastic Pipe, Tubing and Accessories Schedule 15067-S01.

End of Section

SECTION 15069

CAST IRON SOIL PIPE AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of cast iron soil pipe and accessories for the services as indicated in the Contract Documents. Cast iron soil pipe shall be furnished complete with all fittings and other accessories specified herein.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. Complete specifications, data and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but shall not be limited to, the following:

Gaskets.

Sleeves.

Name of Manufacturer.

Type and Model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.3 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Cast iron soil pipe materials shall be as indicated.

Material Classification	CI - 1
Bell and Spigot	
Pipe and Fittings	Bell and spigot type, ASTM A74.
Jointing Material	Rubber gaskets, ASTM C564.
Material Classification	CI - 2
Hubless	
Pipe and Fittings	Hubless type, CIPSI 301.
Jointing Material	Rubber sleeves, CIPSI 310.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation.
3.2 LEAKAGE AND PRESSURE TESTS. After installation, cast iron soil pipe shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All cast iron soil piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15070

COPPER TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of copper tubing and accessories for the services as indicated in the Contract Documents. Copper tubing shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. Complete specifications, data and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but shall not be limited to, the following:

Expansion joints.

Flange gaskets.

Insulating (dielectric) couplings, threaded and flanged.

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.3 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Copper tubing materials shall be as indicated.

Material Classification	CU-1
Water Tubing With Flared Fittings	
Tubing	Soft annealed copper tubing, ASTM B88, Type K.
Fittings	Flared, ANSI/ASME B16.26.
Material Classification	CU-2
Water Tubing With Flanged Fittings	
Tubing	Hard drawn copper tubing, ASTM B88, Type L.
Fittings	Flanges, ANSI B16.24, Class 150, cast bronze, brazed joint.
Material Classification	CU-3
Water Tubing With Solder Joints	
Tubing	Hard drawn copper tubing, ASTM B88, Type L.
Fittings	Solder joint, ANSI B16.18, or ANSI/ASME B16.22.
Material Classification	CU-4
Chemical Feed Tubing With Union Fittings	
Tubing	Soft annealed copper tubing, ASTM B88, Type K, cadmium plated for chlorine services.

Fittings	Union type with nonmetallic gasket or chemical lead alloy gasket containing 2-4 percent antimony. Fittings will be brazed to tubing.
Material Classification	CU-5
Instrument Tubing With Compression Fittings	
Tubing	Soft annealed copper tubing, ASTM B280. Dimensions shall be in accordance with ASTM B280.
Fittings	Compression type, brass, Crawford "Swagelok" or Parker Hannifin "CPI".
Material Classification	CU-6
ACR Tubing With Brazed Fittings	
Tubing	Hard drawn ACR copper tubing, ASTM B280. Dimensions shall be in accordance with ASTM B280.
Fittings	Brazed.
Material Classification	CU-7
Copper Hydraulic Tubing With Compression Fittings	
Tubing	ASTM B75, seamless, soft annealed, wall thickness as specified herein.
Fittings	Compression type, brass, Crawford "Swagelok" or Parker Hannifin "CPI".

2.1.02 Accessory Materials. Accessory materials for the copper tubing systems shall be as indicated.

Insulating Fittings

Threaded	Dielectric steel pipe nipple, ASTM A53, Schedule 40, polypropylene-lined, zinc plated; Perfection Corp. "Clearflow Fittings".
Flanged	Epco "Dielectric Flange Unions" or Central Plastics "Insulating Flange Unions".
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm beyond outer face of the nut.
Flange Gaskets	ASTM D1330, Grade I, red rubber, ring type, 1/8 inch (3 mm) thick.
Expansion Joints	Tempflex "Model HB Expansion Compensators" with copper tube ends.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation.

3.2 LEAKAGE AND PRESSURE TESTS. After installation, copper tubing shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All copper tubing shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15080

ROLLER GATES

PART 1 – GENERAL

1.1 SCOPE**.** This section includes the furnishing, installation, and testing of rising or non-rising stem sluice gates with or without motor operated floor stands and wall thimbles.

The gates shall conform to the current edition of AWWA Standard C-501 except as otherwise specified in the Contract Documents.

The gates shall be designed for indoor or outdoor operation in hazardous or non-hazardous locations in sewage, as scheduled on the Drawings, and may or may not be designed for modulating service.

If the gates shall be equipped with control equipment suitable for remote operation from a remote control panel and/or a remote computer signal, refer to the Master Specifications in Divisions 16 and 17 for installation and connection of controls.

1.2 GENERAL.

1.2.01 Governing Standards.

ANSI A 21.6 (AWWA C106) – Specification for Cast Iron Pipe Centrifugally Cast in Metal Molds for Water and Other Liquids.

ANSI A 21.8 (AWWA C108) Specification for Cast Iron Pipe Centrifugally Cast in Sand Molds for Water and other Liquids.

ANSI A 21.51 (AWWA C151), Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand Lined Molds for Water or Other Liquids.

ANSI B 1.1- Specification for Unified Screw Threads," Course Thread Series, Class 2 Fit, for Tapped Holes.

ANSI B 1.1, "Screw Threads," Course Thread Series, Class 2.

ANSI B 16.1, "Cast Iron Pipe Flanges and Flanged Fittings,' Class 125.

ANSI B 16.2 – Specification for Cast Iron Pipe Flanges and Flanged Fittings," Class 250.

ASTM A126 (American Society for Testing and Materials) – Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings, “Class B”.

ASTM A167 – Specification for Corrosion-Resisting Chromium-Nickel Steel Plate, Sheet and Strips. Grade 3

ASTM A276 – Specification for Cold Finished, Stainless, and Heat Resisting Steel Bars. Type 316.

ASTM A536 – Specification for Ductile Iron Castings,” Grade 70-50-05.

ASTM A653 - Specification for Steel Sheet, Zinc – Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.”
DWSD Specification S-102-1, “Cast Iron Pipe,” revised October 1973.

ASTM B98 – Specification for Copper-Silicon Alloy Rod, Bar, and Shapes.

ASTM B584 – Specification for Copper Alloy Sand Castings for General Applications.

ASTM B21, “Naval Brass Rod, Bar, and Shapes.”

ASTM B144, “High Leaded Tin-Bronze Sand Castings,” Alloy 3A.

ASTM F104, (F112600M7) – Classification System for Nonmetallic Gasket Materials.

AWWA C501 – Cast Iron Sluice Gates.

DWSD Specification S-658-2, “Ductile Iron Pipe, January 1973.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit detailed Shop Drawings showing sluice gate installation dimensions and details and materials of construction of all sluice gate components as called for in Master Specification Section 1180, Submittals. Complete wiring and control diagrams shall be submitted per Master Specification Division 16000, Electrical and Division 12000, Instrumentation and Controls.

1.4 DELIVERY STORAGE AND HANDLING. Sluice gates are provided with locking plates to hold the disc firmly in place in the guides during shipping and installation. Gates can be lifted by a chain or sling through the stem hole in the disc only when locking plates are in place. When lifting gates, take special care to protect machined surfaces and wedges. Locking plates must be removed before opening gate.

Equipment should be stored in a clean, dry area on planks or timbers over an even surface to keep them off the ground and to prevent distortion. Equipment should also be covered to protect seat facings and other machined surfaces from foreign matter. Sluice gates should not be stacked more than three high, and then, only with heavy timber blocking placed between the gates to prevent damage to gates.

To prevent bending when lifting, handling and storing, stems should be supported over their full length. The threaded portion of the stem is protected by a heavy fiber cover, which should not be removed until the stem is ready for installation. Couplings and thrust nuts are shipped in place on the stems and should be removed prior to installation. Stop collars are normally shipped in a bag or box accompanying the floor stands. Operating mechanisms should be handled and treated as precision machinery and protected accordingly.

1.5 WARRANTY. The manufacturer shall furnish to the Owner the warranty as specified in the Master Specification Section 01170, Warranties and Bonds, for the equipment and materials installed under this section of the specifications. Upon receipt of notice from the Owner of failure of any part of the guaranteed materials or equipment during the warranty period, new replacement part or parts shall be furnished and installed promptly by the Contractor at no additional cost to the Owner.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Sluice gates shall be as manufactured by Rodney Hunt Company, Hydro Gate Corporation, Watermain Industries or equal.

2.2 MATERIALS.

2.2.01 Sluice Gate. Sluice gates shall be ductile iron, bronze mounted heavy duty, flanged frame, with or without flush bottom closure as scheduled on the Drawings. Each gate shall be equipped with an adjustable side and top wedge system and designed for a maximum seating or unseating head of 40 (12.2 m) feet of water unless otherwise scheduled on the Drawings.

2.2.02 Wall Thimble. A separate ductile iron wall thimble, Type F, 18 inches (45.7 cm) in depth shall be furnished by the manufacturer for each sluice gate. Thimbles shall be cast in one piece with integral flanged wall ribs and grout holes and shall be of such dimensions and design as approved by the Engineer.

Wall thickness shall not be less than AWWA, Class D; and the flange thickness shall be not less than ANSI, Class 125. The thimble flange faces shall be faced, drilled, and tapped for flange studs as required.

2.2.03 Stem. The top of the stem shall project at least 1 inch (2.54cm) above the operating lift nut when gate is in closed position. The stem diameter shall be selected to limit the l/r ratio between supports to no more than 120, And the Stem couplings, if required, shall be made of bronze and shall be internally threaded and provided with pins of the required size. Note that, the stem shall be made of Type 316 stainless steel and the operating threads shall be Acme Standard or equal accurately rolled or cut in a lathe.

2.2.04 Guides. The sluice gate guides shall be made of ductile iron and shall be of such length that at least one-half the height of the leaf shall be supported by the guides when the gate is in the fully open position. The extension of the gate guides shall be securely anchored to the concrete by means of Type 316 stainless steel anchor bolts, nuts, and pipe spacers. The anchor bolts shall be embedded in the concrete not less than 8 inches (20.3 cm), and the guide slots shall be machined and lined for the full length of the guides with bronze linings. The guide linings shall provide not more than 1/6 inch (1.6 mm) clearance with the tongues on the sides of the leaf. In the case, where the guides are not integrally cast, they shall be doweled and bolted to the gate frame, and the brackets in contact with the wedges on the leaf shall be heavily ribbed to withstand the thrust due to water pressure and wedging action of the leaf wedges, and shall be machined and fitted with bronze wedge facings, which shall be machined on all bearing surfaces to make accurate contact with the wedges.

2.2.05 Stem Guides. Stem guides if required shall be split bronze bushings.
Their brackets shall be made of cast iron with heavily ribbed sections and shall be mounted to the wall with stainless steel anchor bolts and nuts. The distance from the wall to the centerline of the stem shall be readily adjustable. The bushings shall be mounted to the bracket and doweled in such a manner that the stem may be removed without disturbing the alignment of the guide bracket and bushings, where all bolts and nuts shall be made of stainless steel 316, and the bracket and anchor bolts shall be of sufficient strength to withstand all possible stress from operation of the gate.

2.2.06 Wedges. The gate leaves shall be equipped with adjustable bronze wedges of approved design to provide uniform distribution of the seating and unseating pressure. Each leaf shall have machined pads for the wedges. The number, arrangement, location, and method of adjustment of the wedges shall ensure that any leakage occurring shall be 0.1 gallon per minute per linear foot of the surface perimeter. The wedges shall be held in place and adjusted by means of bronze studs, nuts, and washers and shall be machined on all bearing surfaces and shall make accurate contact with the wedge seats attached to the frame.

2.2.07 Gaskets. All gaskets necessary for a complete installation shall be furnished and shall be one piece, where applicable, and shall be 1/16 of an inch (1.6 mm) full face, 3000, manufactured by Garlock or Anchor Packing Superheat 490C, or equal.

2.2.08 Painting. All iron and steel surfaces except machined surfaces, submerged or non-submerged, shall be surface prepared and shop painted as defined in Master Specification Section 09900, Painting, Paragraph 2.2 Materials using National Sanitation Foundation Standard 61 certified products.

2.2.09 Gray and Ductile Gray Cast Iron. All cast iron castings shall be made from cast iron which shall be in conformity with the current ASTM A126, Class B (31,000 psi (213,714 kPa) minimum tensile strength) or equal, and shall be clean, smooth, free from blow or sand holes, porosity, cold shuts, cracks, or other physical defects and shall be tough and close grained. All ductile iron casting shall comply in similar fashion with ASTM A536. Note that, plugging, patching, or welding of defective castings will not be permitted except that minor repairs may be made with prior approval of the Engineer.

2.2.10 Steel. Steel used in the manufacture of the sluice gate and its appurtenances shall be of the best quality open hearth or electric furnace steel having an ultimate tensile strength of not less than 36,000 psi (248,184 kPa), and shall be hot-dipped galvanized after fabrication.

2.2.11 Stainless Steel. The stainless steel for operating stem, bolts, nuts and studs shall be in conformity with the current ASTM A276, Type 316, or approved equal.

2.2.12 Bronze. All bronze parts shall be of uniform composition and quality, shall be free from surface cracks or other defects, and shall conform accurately to the required dimensions, where all defective parts and parts not in conformity with these specifications shall be rejected. The bronze for the stem nut, couplings, thrust nuts, wedges, wedge seats, and gate seats shall be in conformity with the current ASTM B147, Alloy 8B, or approved equal. Seat facing applied by forging shall be in conformity with the current ASTM B21.The bronze for stem guide bushings shall be in conformity with the current ASTM B144, Alloy 3A, or approved equal. Bronze bolts, studs, nuts, anchor bolts, and coupling pins shall be in conformity with the current ASTM B98.

2.2.13 Crank and Hand Wheel – Operated Floor Stands. The geared floor stand shall have a weatherproof, housing, with a bronze operating nut, mounted on a high strength pedestal. Tapered roller bearings shall be located above and below bronze operating nut to support the output thrust of the floor stand. The gearing shall be accurately cut and of proper design to support the load conditions without undue stress. The shaft shall be mounted to provide low friction operation and to resist axial and radial thrusts. Mechanical seals shall be provided around the operating nut and the pinion shaft to prevent lubrication from leaving the unit and moisture from entering the sealed housing. The reduction gear case shall be precision machined and equipped with roller or needle bearings sealed about the reduction shafts. Lubrication fittings shall be provided for all bearings. Crank operated floor stands will be selected so that no more than 40 lb (18.12 Kg) effort shall be needed on the crank to open or close the sluice gate or slide gate. And gear ratio shall be identified by drawings or Engineer. Crank handles and handwheels shall be worked with the direction of rotation to open the valve (usually counterclockwise). Each crank handle or handwheel shall have cast thereon the word “Open” and an arrow indicating the direction to open. The number of turns required to close the gate shall be worked in an appropriate and visible location.

2.2.14 Electric Operators. Electric operators shall be per Master Specification Section 15180, Valve and Gate Actuators.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Installation of the sluice gates, guides, stem supports, and operators shall be in accordance with the manufacturer’s detailed instructions.
Prior to the pouring of concrete for the wall containing the sluice gate, the wall thimble shall be accurately placed in the wall forms in accordance with the manufacturer’s instruction. Each wall thimble shall be internally braced and bolted to the forms to prevent any distortion during installation operations. Each operator shall be accurately set and plumbed and shall be in proper alignment with the gate and stem before it is installed in place. Operating stems shall be installed in proper alignment and shall not bind in the lift nut or stem guides.

3.2 FIELD QUALITY CONTROL. If inspection or tests disclose defects or non-compliance with the provisions of these specifications, such defects or improperly installed work shall be replaced or adjusted and the tests repeated until compliance with these specifications is obtained.

3.2.01 Field Testing. Following the completion of each roller gate installation, the gate shall be operated through at least two complete open-close cycles, the gate shall be readjusted and re-operated as necessary, and left in a condition acceptable to the Engineer. A field leakage test shall be performed by the Contractor after installation of the gates. Maximum permissible leakage shall be in accordance with AWWA C560. The manufacturer shall be notified of the test in sufficient time to enable him to have a representative present at the test site. After all adjustments have been made and the mechanisms properly lubricated, each gate slide shall be operated through one complete cycle as a final check on proper operation before starting the leakage test.

Complete operation and maintenance requirements shall be including complete manufacturers product data in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals.

3.2.02 Inspection. A representative of the manufacturer shall be present during installation and shall instruct the Contractor's personnel in proper installation procedures and supervise the installation. He shall approve the installation and witness the test.

3.3 MAINTENANCE. Complete training, operation and maintenance requirements shall be provided including complete manufacturers product data in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals. The manufacturer's representative shall instruct the Owner's personnel in the proper operation and maintenance of the Sluice Gates.

End of Section

SECTION 15082

CAST-IRON SLIDE GATES

PART 1 – GENERAL

1.1 SCOPE. This section includes the furnishing, installation, and testing of rising stem slide gates with or without motor operated floor stands and wall thimbles.

The gates shall conform to the current edition of AWWA Standard C-560 except as otherwise specified in the Contract Documents.

The gates shall be designed for indoor or outdoor operation in hazardous or non-hazardous locations in sewage, as scheduled on the Drawings, and may or may not be designed for modulating service.

If the gates shall be equipped with control equipment suitable for remote operation, Contractor shall conform to the Master Specifications, Divisions 16, Electrical and Division 17, Instrumentation and Controls for installation and connection of the control systems.

1.2 GENERAL.

1.2.01 Governing Standards.

AWWA – American Water Works Associtaion: C560 - Cast-Iron Slide Gates

AWWA/ANSI – American National Standard Institute: C540 - Power Actuating Devices for Valves and Slide Gates

AISI – American Iron and Steel Institute: 1117 - Standard for Resulfured Carbon Steel

AISI – 4140 - Standard for Alloy Steel

AISI – 8620 - Standard for Alloy Steel

ANSI/ASME – American Society of Mechanical Engineers: B16.1 - Standard for Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800

ANSI/ASME: B46.1 - Standard for Surface Textures (Surface Roughness, Waviness, and Lay)

ANSI/ASTM – American Society for Testing and Materials: D471 - Standard Test Method for Rubber Property - Effect of Liquids

ASTM – A36/A36M - Standard Specification for Carbon Structural Steel

ASTM – A48 - Standard Specifications for Gray Iron Castings

ASTM – A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings

ASTM – A276 - Standard Specification for Stainless Steel Bars and Shapes

ASTM – A582/A582M - Standard Specification for Free-Machining Stainless Steel Bars, Hot-Rolled or Cold-Finished

ASTM – B21 - Standard Specification for Naval Brass Rod, Bar, and Shapes

ASTM – B98 - Standard Specification for Copper-Silicon Alloy Rod, Bar, and Shapes

ASTM – B138 - Standard Specification for Manganese Bronze Rod, Bar, and Shapes

ASTM – B139/B139M - Standard Specification for Phosphor Bronze Rod, Bar, and Shapes

ASTM – B148 - Standard Specification for Aluminum-Bronze Sand Castings

ASTM – B505 - Standard Specification for Copper-Base Alloy Continuous Castings

ASTM – B584 - Standard Specification for Copper Alloy Sand Castings for General Applications

ASTM – D1149 - Standard Test Method for Rubber Deterioration-Surface Ozone Cracking in a Chamber

ASTM – D2000 - Standard Classification System for Rubber Products in Automotive Applications

ASTM – F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs

ASTM – F594 - Standard Specification for Stainless Steel Nuts

CDA Copper Alloy Numbers (Note: CA precedes alloy numbers defined by CDA)

SSPC – SP6 - Commercial Blast Cleaning

SSPC – SP10 - Near-White Blast Cleaning

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit detailed Shop Drawings showing slide gate installation dimensions and details and materials of construction of all slide gate components as called for in Master Specification, Section 1180, Submittals. Complete wiring and control diagrams shall be submitted in accordance with Master Specification, Division 16000, Electrical and Division 17000, Instrumentation and Controls.

1.4 DELIVERY STORAGE AND HANDLING. Slide gates are provided with locking plates to hold the disc firmly in place in the guides during shipping and installation. Gates can be lifted by a chain or sling through the stem hole in the disc only when locking plates are in place. When lifting gates, take special care to protect machined surfaces and wedges. Locking plates must be removed before opening gate.

Equipment should be stored in a clean, dry area on planks or timbers over an even surface to keep them off the ground and to prevent distortion. Equipment should also be covered to protect seat facings and other machined surfaces from foreign matter. Slide gates should not be stacked more than three high, and then, only with heavy timber blocking placed between the gates to prevent damage to gates.

To prevent bending when lifting, handling and storing, stems should be supported over their full length. The threaded portion of the stem is protected by a heavy fiber cover, which should not be removed until the stem is ready for installation. Couplings and thrust nuts are shipped in place on the stems and should be removed prior to installation. Stop collars are normally shipped in a bag or box accompanying the floor stands. Operating mechanisms should be handled and treated as precision machinery and protected accordingly.

1.5 WARRANTY. The manufacturer shall furnish to the Owner the warranty as specified in the Master Specification Section 01170, Warranties and Bonds, for the equipment and materials installed under this section of the specifications. Upon receipt of notice from the Owner of failure of any part of the guaranteed materials or equipment during the warranty period, new replacement part or parts shall be furnished and installed promptly by the Contractor at no additional cost to the Owner.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Slide gates shall be as manufactured by Rodney Hunt Company, Hydro Gate Corporation, Watermain Industries or equal.

2.2 MATERIALS. Materials shall conform to the following specifications, however, the materials subject to dezincification or dealuminization shall not be used. The manufacturer/supplier shall make a declaration to this effect.

Thimble, frame, guides, slide, stem guides, and gear housing	Cast-iron – ASTM A126, class B; or ASTM A48, class 30.
Yoke and pedestal	Cast-iron – ASTM A126, Class B; or ASTM A48, class 30; or steel - ASTM A36.
Gears	Steel – AISI 8620, AISI 4140, or AISI 1117; bronze – ASTM B148 (CA 952, CA 954, or CA 958), ASTM B584 (CA 865 or CA 867).
Bearings	Bronze – ASTM B148 (CA 954).
Wedges	Bronze – ASTM B584 (CA 836, CA 865, CA 863, or CA 873).
Stem couplings	Bronze – ASTM B584 (CA 865, CA 863, or CA 873 stainless steel - ASTM A582, type 303; or ASTM A276, type 302 or 304.
Thrust nut and gate actuator lift nut	Bronze – ASTM B584 (AC 865, CA 863, or CA 873), ASTM B505 (C95800).
Seating faces and stem guide	Bronze – ASTM B21 (CA 464 or CA 482), ASTM B138 (CA 675), ASTM B98 (CA 651 or CA 655), ASTM B139 (CA 510); or ASTM B584 (CA 836, CA 865, CA 863 or CA 873); stainless steel - ASTM A276, type 302 or 304.
Stem guide bushings	Bronze – ASTM B584 (CA 932 or CA 873), ASTM B98 (CA 651 or CA 655), or ASTM B139 (CA 510).
Stems	Stainless steel ASTM A582, type 303; or ASTM A276, types 302 or 304.
Anchor bolts and fasteners	Stainless steel ASTM F593 or ASTM F594, alloy group 1 or group 2; or bronze - ASTM B98 (CA 651 or CA 655).
Flush-bottom seal	Elastomeric materials - ASTM D2000.
Flush-bottom retainer bar	Cast-iron – ASTM A126, class B; stainless steel - ASTM A276, type 302 or 304; ASTM A582, type 303; bronze - ASTM B98 (CA 651 or CA 655); or ASTM B138 (CA 675).

2.2.01 Slide Gate. Cast iron slide gate shall have frame and slide. The frame and slide shall have embedded bronze seating strips, which shall be pressed together by the attached wedging devices when the gate is closed.

Slide gates shall be cast-iron, bronze mounted heavy duty, flanged frame, with or without flush bottom closure as scheduled on the Drawings. Each gate shall be equipped with an adjustable side and top wedge system and designed for a maximum seating or unseating head of water as scheduled on the Drawings.

The gate slide shall be made of cast iron faces and be of one-piece construction, with strengthening ribs where required; and a reinforced section to receive the seating faces. The slide shall be square or rectangular in shape with integrally cast vertical and horizontal reinforcing ribs. A heavy reinforcing rib along each side shall be provided to ensure rigidity between side wedges. The slide shall be designed to operate under maximum specified differential head with the minimum safety factory of five (5). Guide tongues along each side of the slide shall be machined accurately on contact surfaces. A nut pocket shall be cast on the vertical centerline of the gate and shall be provided with a threaded block for attaching the stem to the slide. Pads for side wedges and top and bottom wedges, when required shall be integrally cast on the slide and machined to receive the adjustable wedges. The maximum allowable clearance between the slide and the slide guide shall be 1/16 in (1.6 mm).

2.2.02 Frame. The gate frame shall be cast iron and be of ample section and cast in one-piece. The frame shall be designed for the seating and unseating head indicated on the drawings with a minimum safety factor of five (5). All surfaces forming joints or bearings shall be machined. The frame shall be machined on the rear face to bolt directly to the machined face of the wall.

2.2.03 Frame Guides. The slide gate guides shall be made of cast iron and bolted to the frame or cast integrally with it. Guides shall be machined on all bearing and contact faces. Guides shall be designed for the design head indicated with a minimum safety factor of five (5). The guides shall be of such length so as to support at least one-half the vertical height of the slide when the slide is in the open position.

The extension of the gate guides shall be securely anchored to the concrete by means of Type 316 stainless steel anchor bolts, nuts, and pipe spacers. The anchor bolts shall be embedded in the concrete not less than 8 inches (20.3 cm), and the guide slots shall be machined and lined for the full length of the guides with bronze linings. In the case, where the guides are not integrally cast, they shall be doweled and bolted to the gate frame, and the brackets in contact with the wedges on the slide shall be heavily ribbed to withstand the thrust due to water pressure and wedging action of the slide wedges, and shall be machined and fitted with bronze wedge facings, which shall be machined on all bearing surfaces to make accurate contact with the wedges. Guide grooves shall be machined on all contact faces.

Overall clearances with slide tongue shall be not more than 1/8 in (3.2 mm). Faces for mounting of wedging devices shall be fully machined. Frames shall be self-contained (S/C) as listed in the “Gate Schedule.”

Round opening gates shall have a circular flange cast as part of the frame for mounting to a wall or pipe flange. All wall thimble-mounted gates shall have a square or rectangular flanged-back frame. The frame shall be fully machined and drilled to match the wall thimble. Gates mounted on pipe flanges shall be furnished with partial drilling per manufacturer’s recommendations.

2.2.04 Yoke. Self-contained gates shall be provided with a cast-iron or structural-steel yoke designed to withstand the thrust of the floorstand or hoist when a 40 lbf (178 N) effort is placed on the handwheel or crank with a safety factor of five (5). The top of the yoke shall be machined to receive the operating mechanism. The pads on the yoke that contact those on the top of the guides shall be machined on contact faces and bolted to the guides.

2.2.05 Wall Thimble. The wall thimble shall be made of cast iron and shall be provided by gate manufacturer. A pipe flange or F-shaped or E-shaped, shall be provided with a suitable end for attaching to the connecting opening as specified on the Gate Schedule. The front or mounting flange, shall be machined and shall be drilled and tapped to the same template used for its particular gate frame. A ring shall be cast on the periphery of the wall thimble to form a water stop and anchor ring in the concrete. Thimbles shall be of such dimensions and design as approved by the Engineer. The gate shall be attached to the wall thimble with bolts or studs to withstand the design forces with a safety factor of five (5). For gate mounting to thimbles, an adequate number of holes shall be provided in the flange on the back of the gate to prevent leakage under the design heads and to resist the shearing action caused by closing and opening forces.

2.2.06 Stem. The top of the stem shall project at least 1 inch (2.54cm) above the operating lift nut when gate is in closed position. Stems shall be manufactured from stainless steel sized to withstand the axial compressive and tensile forces created during gate operation under the specified differential heads and to transmit in compression at least two (2) times the rated output of the lift with a 40 lbf (178 N) effort on the crank or handwheel, or (1.25) times the stall thrust of the electric actuator. Threading on stems shall be rolled with double-lead threads of the Acme type. Cut threads will not be allowed. The contact surfaces of the threads shall have a maximum 16 micro-inch (406 micro-mm) finish. Stem couplings shall have internal threads for transmitting the full thrust of the stem and shall be held in place on the stem with a key, simultaneously engaging the coupling and both stems. The Stem couplings, if required, shall be made of bronze.

2.2.07 Stem Guides. Stem guides shall be fully adjustable, heavy duty castings, with 2 piece cast bronze removable collars. The stem guides shall be properly spaced to support the stem as a long column, with maximum spacing not to exceed a l/r (length/radius of gyration) of 200.

2.2.08 Wedges. The gate slides shall be equipped with adjustable bronze wedges of approved design to provide uniform distribution of the seating and unseating pressure. Each slide shall have machined pads for the wedges. The number, arrangement, location, and method of adjustment of the wedges shall ensure that any leakage occurring shall be 0.1 gallon per minute per linear foot (0.378 L/min per 30.5 cm) of the surface perimeter. The wedges shall be held in place and adjusted by means of bronze studs, nuts, and washers and shall be machined on all bearing surfaces and shall make accurate contact with the wedge seats attached to the frame.

2.2.09 Seals. Resilient seals for flush-bottom gates shall be extruded or molded natural or synthetic rubber. Reclaimed rubber shall not be used. Flush-bottom gates shall be provided with a frame-mounted flush-bottom seal. The solid bulb resilient rubber seal shall be firmly held in place using stainless steel retainers and corrosion-resistant fasteners. The full length of the bottom edge of the slide shall be machined for making uniform contact with the seal when it is mounted on the frame. The differential pressure on the rubber seal shall be variable by adjustment of wedges on the gate. The seal shall be designed to provide for the minimum leakage as specified.

2.2.10 Painting. All iron and steel surfaces except machined surfaces, submerged or non-submerged, shall be surface prepared and shop painted as defined in Master Specification Section 09900, Painting, Paragraph 2.2 Materials using National Sanitation Foundation Standard 61 certified products.

2.2.11 Manual Lifting Devices. The manual lift mechanism shall have either a direct drive handwheel without reduction gearing, or shall be crank-actuated with either single or double-reduction gearing, as necessary to meet lifting capacity required. The lift mechanism shall be sized to permit slide operation with an effort of not more than 40 lbf (178 N) pull on the handwheel/handcrank or 50 lbf-ft (68 N-m) torque on the lift nut or input shaft, depending on the lift type. Maximum pull or torque to start the slide in motion must not exceed one and one-half times this amount. All components of the lift mechanism shall be designed to withstand these input efforts or torque’s with a minimum safety factor of five (5). The floor stand shall have a weatherproof, housing, with a bronze-operating nut, mounted on a high strength pedestal. Tapered roller bearings shall be located above and below the flange on the lift bronze operating nut to support the output thrust of the floor stand.
The gearing shall be accurately cut and be of proper design to support the load conditions without undue stress. The shaft shall be mounted to provide low friction operation and to resist axial and radial thrusts.

Mechanical seals shall be provided around the operating nut and the pinion shaft to prevent lubrication from leaving the unit and moisture from entering the sealed housing. The reduction gear case shall be precision machined and equipped with roller or needle bearings sealed about the reduction shafts. Lubrication fittings shall be provided for all bearings. Crank operated floor stands will be selected so that no more than 40 lbf (178 N) effort shall be needed on the crank to open or close the slide gate. Crank handles and handwheels shall be worked with the direction of rotation to open the valve (usually counterclockwise). Each crank handle or handwheel shall have cast there on the word “Open” and an arrow indicating the direction to open. The number of turns required to close the gate shall be worked in an appropriate and visible location.

2.2.12 Electric Operators. Electric operators shall be as per AWWA standard C-540 and Master Specification, Section 15180, Valve and Gate Actuators.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Installation of the slide gates, guides, stem supports, and operators shall be in accordance with the manufacturer’s detailed instructions.
Prior to the pouring of concrete for the wall containing the slide gate, the wall thimble shall be accurately placed in the wall forms in accordance with the manufacturer’s instruction. Each wall thimble shall be internally braced and bolted to the forms to prevent any distortion during installation operations. Each operator shall be accurately set and plumbed and shall be in proper alignment with the gate and stem before it is installed in place. Operating stems shall be installed in proper alignment and shall not bind in the lift nut or stem guides.

3.2 FIELD QUALITY CONTROL. If inspection or tests disclose defects or non-compliance with the provisions of these specifications, such defects or improperly installed work shall be replaced or adjusted and the tests repeated until compliance with these specifications is obtained.

3.2.01 Field Testing. The slide gate shall be tested by being completely operated from open to closed positions in the presence of the Engineer with the head on the gate at maximum elevation as directed by the Engineer. Under these conditions, the gates shall move freely in their guides without binding, and the stems shall be truly vertical with no perceptible side play, and stand shall be tested for mechanical operation. All slide gates shall be tested for leakage. The wedges shall be adjusted to ensure that any leakage, which occurs, does not exceed the amount permitted by AWWA C-501. The Contractor shall make all arrangements; provide all necessary labor, materials, or equipment; and make all adjustments necessary for the performance of operating test which must be conducted in the presence of the Engineer.

3.2.02 Inspection. A representative of the manufacturer shall be present during installation and shall instruct the Contractor's personnel in proper installation procedures and supervise the installation. He shall approve the installation and witness the test.

3.3 MAINTENANCE. Complete training, operation and maintenance requirements shall be provided including complete manufacturers product data in accordance with Master Specification, Section 01160, Training and Operations & Maintenance Manuals. The manufacturer's representative shall instruct the Owner's personnel in the proper operation and maintenance of the Slide Gates.

End of Section

SECTION 15084

STOP LOGS

PART 1 – GENERAL

1.1 SCOPE. This section covers stop logs which shall be furnished complete with guides, seals, relevant hardware and appurtenances.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Contractor and subsequently approved by the Engineer. Stop logs shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest products of a manufacturer regularly engaged in the production of stop logs. Each stop log shall be provided with a number plate. Numerals shall be at least 1 inch high and shall be black backed enamel on anodized aluminum plate. The location of number plates and the method of attachment shall be acceptable to the Contractor. The number assigned to each stop log shall be as determined by the Contractor. Log shall be such that the flexural stresses do not exceed 1/5 of ultimate strength or 1/3 of yield strength. Design flexural stress of aluminum shall not exceed 7,000 psi (335 kPa). Log and lifting beam design shall be such that the flexural stresses do not exceed 1/5 of ultimate strength or 1/3 of yield strength. Design flexural stress of aluminum shall not exceed 7,000 psi (335 kPa).

1.3 SUBMITTALS. Complete drawings, construction details, and specifications covering the stop logs and appurtenances shall be submitted in accordance with the submittal section. Each drawing shall be identified with the stop log designation as relevant to the Work.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide stop logs and related furnishings as manufactured by Rodney Hunt Company, Fontaine, Waterman, Hydrogate, or approved equal.

2.2 MATERIALS.

Stop Logs	Aluminum B308 6061-T6 or Stainless Steel Type 316L

Lifting Lugs	Aluminum B308 6061-T6 or Stainless Steel Type 316L
Guides	Aluminum B308 6061-T6 or Stainless Steel Type 316L
Seals	
1. Sides	Lip Seal–ASTM D2000, Grade 2BC 615, Extruded Neoprene, Durometer 50
2. Bottom	Flush Lip Seal-ASTM D2000, Grade 2BC 515, Extruded Neoprene, Durometer 50

2.3 FABRICATION. Stop logs shall be of one piece extruded aluminum, or fabricated stainless steel. Stop log panels shall be of height indicated and in height increments set by the manufacturer. Panels made of two or more extrusions shall be securely welded together to form a unit and joints shall be made watertight with neoprene seals or seal welding. All welding shall be in accordance with latest applicable codes of the American Welding Society (D1.2 for aluminum and D1.3 for stainless steel). The stop logs shall be fabricated in separate panels such that the largest panel is no greater than 8 feet (2.4 m) in height. Each panel shall have two stainless steel hooks to engage the lifting device. Adequate drainage and rapid release of air shall be provided for each log. The bottom of the log shall be extruded in a way to accept a specially extruded resilient seal to provide a flush bottom closure. The shape of the lip seal shall provide a seating surface having a minimum width of 1 inch (2.4 cm). The vertical face of the seal shall be in contact with the seating surface of the guide or seal located on the frame to provide a proper seal at the corners. Stop logs shall be of sufficient weight to be submerged under their own weight.

2.4 GUIDES. The guides shall be of extruded aluminum or stainless steel, whichever material is the same as chosen for the logs, and shall be structural shapes or formed plates. The guides shall be designed for maximum rigidity and will be provided with a strap on the back of the guides for the embedded type to lock it into the concrete, or with a side angle for surfacing mounting using anchor bolts. The invert of the frame shall be an angle or channel welded to the lower ends of the guides to form a seating surface for the resilient seal mounted on the stop log.

2.5 SEALS. The seals shall be located along the bottom of the log section, between each stop log panel and along both sides of the log. Seals shall be mechanically attached to the log. Adhesives alone are not an acceptable mounting method. Seals shall be mounted in a manner that allows for easy replacement in the event of damage. Lip type seals shall be attached to the frame to restrict leakage. Under the condition which the log will be subjected to flow in both directions, the log and guide shall be provided with seals in both directions.

2.6 HARDWARE. All necessary attaching bolts and anchor bolts shall be stainless steel and furnished by the stop log manufacturer.

2.7 LIFTING DEVICE. Lifting device shall be suitable for inserting, retrieving and handling stop log panels. One (1) lifting device shall be provided for each stop log width. The lifting device shall be equipped with a suitable eyebolt for crane operation. The device shall be guided by the slot of the guide extrusion, and shall be capable of securing and releasing the stop logs panels with the use of a lanyard from the operating floor. The device shall be furnished with non-metallic wheels to guide the device in the slot. The lifting device may, at the manufacturer's option, be adjustable in widths to accommodate several widths of stop log openings.

2.8 PAINTING. All aluminum in contact with concrete shall have a heavy shop coat of bitumastic paint.

PART 3 – EXECUTION

3.1 INSTALLATION. The installation of all parts shall be done in a workmanlike manner and in accordance with detailed technical installation procedures supplied by the manufacturer.

3.2 TESTING. Upon completion of the installation, the contractor shall be required to make performance tests of the stop logs in the field, under the direction of the Engineer. Tests shall be performed in accordance with the requirements of Master Specification Section 01180, Equipment, Material, Parts and Tools.

3.3 FIELD QUALITY CONTROL. It shall be the Contractor's responsibility to handle, store, and install the stop logs in. strict accordance with manufacturer's drawings and recommendations. All stop logs of the same dimension shall be interchangeable from one slot to another and shall be tested for such interchangeability by actually installing each stop log in each slot in the field. Any maladjustment shall be corrected to the satisfaction of the Engineer.

End of Section

SECTION 15090

ANGLE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated angle valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Nameplates shall have black baked enamel letters at least 3/4 inch (19 mm) high on anodized aluminum plate.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Angle valves shall be suitable for use as throttling valves.

2.1.01 Valves VA-1.

Rating	Class 125
Code	MSS SP-80, Type 1
Body/Bonnet	ASTM B62, bronze, threaded bonnet, threaded packing nut, rising stem
Trim	
Seat	Integral to body
Disc	ASTM B62, bronze
Stem	ASTM B62, bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	-20 to 150°F (-29 to 66°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "504", or approved equal

2.1.02 Valves VA-2.

Rating	Class 150
Code	MSS SP-80, Type 2
Body/Bonnet	ASTM B62, bronze, union bonnet, threaded packing nut, rising stem
Trim	
Seat	Integral to body

Disc	PTFE
Stem	ASTM B62, bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	-20 to 150°F (-29 to 66°C)
Valve Operator	Handwheel
Manufacturers	Stockham "B-222T", Walworth "Fig 3096", or approved equal

2.1.03 Valves VA-3.

Rating	Class 125
Code	MSS SP-85, Type II
Body/Bonnet	ASTM A126, Class B, cast iron, bolted bonnet, OS&Y, rising stem
Trim	
Seat	ASTM B62, bronze, renewable
Disc	ASTM B62, bronze, renewable
Stem	ASTM B16, brass
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Flanged, flat faced
Temperature Limitations	-20 to 150°F (-29 to 66°C)
Valve Operator	Handwheel
Manufacturers	Powell "Fig 1254", or approved equal

2.1.04 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.05 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.06 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials	
Asphalt Varnish	Fed Spec TT-C-494.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.
Surfaces To Be Coated	
Unfinished Surfaces	
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.
All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1. INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15091

MISCELLANEOUS BALL VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of 4 inch and smaller, manually operated or remote activated, two position (open-close) ball valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

Ball valves larger than 4 inch are covered in Master Specification Section 15103, AWWA Ball Valves.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VB-1.

Rating	500 psi (3.4 MPa]) nonshock cold WOG
Code	MSS SP-110
Type	In-line, two piece, end entry, regular port
Body/Bonnet	ASTM B584–C84400 bronze or ASTM B194, Grade 377, brass
Trim	
Seat	Reinforced Teflon
Ball	Brass, or chrome plated brass
Stem	Brass
Thrust Washer	Reinforced Teflon
Stem Seal	Teflon or Viton
End Connection	Threaded
Temp. Limitations	-20 to 400°F (-29 to 204°C])
Manufacturers	Conbraco Industries "Apollo 70-100 Series"; Powell "Fig 4210T", or approved equal

2.1.02 Valves VB-2.

Rating	800 psi (5.5 MPa) nonshock cold WOG

Code	MSS SP-110
Type	In-line, two piece, end entry, regular port
Body/Bonnet	ASTM A3512-CF8M stainless steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A276-316, stainless steel
Stem	ASTM A276-316, stainless steel
Thrust Washer	Reinforced Teflon
Stem Seal	Teflon or Viton
End Connection	Threaded
Temp. Limitations	-20 to 400°F (-29 to 204°C])
Manufacturers	Conbraco Industries "Apollo 76-100 Series"; Neles-Jamesbury "Series 300", or approved equal

2.1.03 Valves VB-3.

Rating	1000 psi (6.5 MPa) nonshock cold WOG
Code	MSS SP-110, NACE MR-01-75
Type	In-line, three piece, bolted body, regular port
Body/Bonnet	ASTM A351-CF8M, stainless steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A276-316, stainless steel
Stem	ASTM A276-316, stainless steel

Thrust Washer	Reinforced Teflon
Stem Seal	Reinforced Teflon
End Connection	Socketwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Conbraco Industries "Apollo 85-200 Series"; Neles-Jamesbury "Series 4000", or approved equal

2.1.04 Valves VB-4.

Rating	Class 150
Code	MSS SP-72
Type	In-line, split body, full port
Body/Bonnet	ASTM A216-WCB, cast steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A216-WCB, steel, chrome plated
Stem	ASTM A108-CS
Thrust Washer	Reinforced Teflon
Stem Packing	Manufacturer’s standard
End Connection	Flanged, ASME B16.5, Class 150, raised face
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Conbraco Industries "Apollo 88-200 Series", or approved equal

2.1.05 Valves VB-5.

Rating	Class 150
Code	MSS SP-72
Type	In-line, end entry, regular port
Body/Bonnet	ASTM A216-WCB, cast steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A216-WCB, steel, chrome plated
Stem	ASTM A108-CS
Thrust Washer	Reinforced Teflon
Stem Seal	Manufacturer’s standard
Body Seal	Reinforced Teflon
End Connection	Flanged, ASME B16.5, Class 150, raised face
Temp. Limitations	-20 to 400°F [-29 to 204°C]
Manufacturers	Conbraco Industries "Apollo 88-100 Series"; Neles-Jamesbury "Series 5000"; Powell "Fig 4224T", or approved equal

2.1.06 Valves VB-6.

Rating	800 psi [5.5 MPa] nonshock cold WOG
Code	ASME B16.34
Type	In-line, three piece, bolted body, full port
Body/Bonnet	ASTM A216-WCB, cast steel or ASTM A105, forged steel

Trim	
Seat	Reinforced Teflon
Ball	ASTM A108-CS, chrome plated
Stem	ASTM A108-CS
Thrust Washer	Reinforced Teflon
Stem Seal	Reinforced Teflon
End Connection	Socketwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Conbraco Industries "Apollo 83-200 Series", Contromatics "C-1122-BB-DL", Neles-Jamesbury "4000 Series", or approved equal

2.1.07 Valves VB-7.

Rating	800 psi 95.5 MPa) nonshock cold WOG
Code	ASME B16.34
Type	In-line, three piece, bolted body, regular port
Body/Bonnet	ASTM A105, forged steel or ASTM A216-WCB, cast steel
Trim	
Seat	Reinforced Teflon
Ball	Nickel or hard chrome plated carbon steel
Stem	Nickel or hard chrome plated carbon steel
Thrust Washer	Reinforced Teflon

Stem Seal	Reinforced Teflon
End Connection	Buttwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Contromatics "C-1133-BB-DL", or approved equal

2.1.08 Valves VB-8.

Rating	Class 600
Code	ASME B16.34
Type	In-line, three piece, bolted body, firesafe, regular port
Body/Bonnet	ASTM A105, forged steel
Trim	
Seat	Reinforced Teflon primary, metal secondary
Ball	Stainless steel
Stem	Hard chrome plated carbon steel
Thrust Washer	Reinforced Teflon
Stem Seal	Reinforced Teflon
End Connection	Socketwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Contromatics "C-1122-BB-FS"; Neles-Jamesbury "4C2236TT-1", or approved equal

2.1.09 Valves VB-9.

Rating	150 psig [1.0 MPa] nonshock cold WOG

Code	MSS SP-122
Type	In-line, true union, full port (Schedule 80)
Body/Bonnet	PVC or CPVC
Trim	
Seat	Teflon
Ball	PVC or CPVC
Stem	PVC or CPVC
Thrust Washer	Teflon
Stem Seal	Viton O-ring
End Connection	Socket
Temp. Limitations	0 to 140°F (-18 to 60°C])
Manufacturers	Nibco "Chemtrol TU Series Tru-Bloc Ball Valve"; Hayward Plastic Products "True Union Ball Valve", or approved equal

2.1.10 Valves VB-10.

Rating	150 psig [1.0 MPa] nonshock cold WOG
Code	MSS SP-122
Type	In-line, true union, full port (Schedule 80)
Body/Bonnet	PVC or CPVC
Trim	
Seat	Teflon
Ball	PVC or CPVC

Stem	PVC or CPVC
Thrust Washer	Teflon
Stem Seal	Viton O-ring
End Connection	Flanged
Temp. Limitations	0 to 140°F (-18 to 60°C)
Manufacturers	Nibco "Chemtrol TU Series Tru-Bloc Ball Valve"; Hayward Plastic Products "True Union Ball Valve", or approved equal

2.1.11 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.12 Rotation. The direction of rotation of the lever or handwheel to open the valve shall be to the left (counterclockwise).

2.1.13 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated	
Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the Miscellaneous Ball Valve Schedule 15091-S01.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15092

INDUSTRIAL BUTTERFLY VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated two position (open-close) industrial type butterfly valves for low-pressure air service, chemical and odor control service, hot water heating system service, and other applications where AWWA type butterfly valves are not indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Valve discs shall seat at 90 degrees with the pipe axis.

Flanged end valves shall be of the short-body type. Where mechanical joint ends are indicated in the Contract Documents, either mechanical joint or push-on ends conforming to ANSI/AWWA C111/A21.11 will be acceptable. For buried or submerged service, shaft seals shall be O-ring type.

2.1.01 Valves VBF-1.

Rating	Class 150
Code	MSS SP-67
Body	ASTM A395, GR 60/40/18, ductile iron
Trim	
Seat	EPDM
Disc	ASTM B148, Alloy 952, aluminum bronze
Stem	ASTM A276, Grade 316 or 304, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Upper and lower bearings or two upper bearings, bronze or reinforced teflon
Shaft Seal	Synthetic rubber O-rings
End Connection	Wafer
Temperature Limitations	-20° to 250°F (-29° to 121°C)
Manufacturers	Keystone “AR1”, or approved equal

2.1.02 Valves VBF-2.

Rating	Class 150
Code	MSS SP-67
Body	ASTM A395, GR 60/40/18, ductile iron
Trim	
Seat	EPDM
Disc	ASTM B148, Alloy 952, aluminum bronze
Stem	ASTM A276, Grade 316 or 304, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Upper and lower bearings or two upper bearings, bronze or reinforced teflon
Shaft Seal	Synthetic rubber O-rings
End Connection	Lug flanged, ASME B16.5, Class 150 diameter and drilling
Temperature Limitations	-20° to 250°F (-29° to 121°C)
Manufacturers	Keystone “AR2”, or approved equal

2.1.03 Valves VBF-3.

Rating	Class 150
Body	PVC
Trim	
Seat	FPM (Viton) or EPDM
Disc	PVC or polypropylene

Stem	AISI Type 316 stainless steel
Stem Seal	Synthetic O-rings
Shaft Bearings	Upper and lower bearings, reinforced teflon
End Connection	Flanged, ASME B16.5, Class 150 diameter and drilling
Temperature Limitations	40° to 140°F (4° to 60°C)
Manufacturers	Chemtrol “Model B”, or approved equal

2.1.04 Valves VBF-4.

Rating	Class 150
Code	MSS SP-67
Body	ASTM A395 or A536, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM A296, CF8M, stainless steel
Stem	ASTM A296, CF8M, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Acetal
End Connection	Wafer
Temperature Limitations	0° to 212°F (-18° to 100°C)
Manufacturers	ABZ “Figure 090”, or approved equal

2.1.05 Valves VBF-5.

Rating	Class 150

Code	MSS SP-67
Body	ASTM A395 or A536, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM A296, CF8M, stainless steel
Stem	ASTM A296, CF8M, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Acetal
End Connection	Lug flanged, ASME B16.5, Class 150 diameter and drilling
Temperature Limitations	0° to 212°F (-18° to 100°C)
-Manufacturers	ABZ “Figure 090”, or approved equal

2.1.06 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.07 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.08 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials	
Asphalt Varnish	Fed Spec TT-C-494.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.

Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the Industrial Butterfly Valve Schedule 15092-S01.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Torque Tubes. Requirements for torque tubes shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.06 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15093

CHECK VALVES

PART 1 - GENERAL

1.1. SCOPE. This section covers the furnishing of check valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VC-1.

Rating	Class 150
Code	API-594
Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze
Springs/Hinge Pins/Stops	Stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 150, flat faced flanges
Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A125HZNSF", Stockham "WG-970", Mission "Duo-Chek II Figure 12HMP", Valve and Primer "9000AR1F", or approved equal

2.1.02 Valves VC-2.

Rating	Class 150
Code	API-594

Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze
Springs/Hinge Pins/Stops	Stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 150, flat faced flanges
Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A125HZNSF", Stockham "WG-970", Mission "Duo-Chek II Figure 12HMP", Valve and Primer "9000AR1F", or approved equal

2.1.03 Valves VC-3.

Rating	Class 300
Code	API-594
Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze

Springs/Hinge Pins/Stops	AISI Type 316 stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 300, raised faced flanges
Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A250HZNSR", Stockham "WG-970", Mission "Duo-Chek II Figure 25HMF", Valve and Primer "9200AR1R", or approved equal

2.1.04 Valves VC-4.

Rating	140 psig
Code	API-594
Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze or ductile iron with bronze trim
Springs, Hinge Pins & Stops	AISI Type 316 stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 300, raised faced flanges

Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A250HZNSR", Mission "Duo-Chek II Figure 25HMF", Valve and Primer "9200AR1R", or approved equal

2.1.05 Valves VC-5.

Rating	Class 125
Code	MSS SP-71, Type III, AWWA C508
Type	Horizontal swing, bolted bonnet
Body/Bonnet	ASTM A126 Class B cast iron
Trim	
Seat Ring	ASTM B763 Alloy 8440 bronze
Disc	ASTM A126, Class B, cast iron
Hinge Pins	Stainless steel
Bearings	Bronze bushings
Cover Gasket	Manufacturer’s standard
End Connection	Flanged, ASME B16.1, Class 125, flat faced
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	External spring
Manufacturers	American Flow Control "52 SC", M&H "Style 259-02", Mueller "A2600-6-02", or approved equal.

2.1.06 Valves VC-6.

Rating	Class 125

Code	MSS SP-71, Type I
Type	Horizontal swing, bolted bonnet
Body/Bonnet	ASTM A126, Class B, cast iron
Trim	
Seat Ring	Bronze
Disc	Bronze
Hinge Pins	Bronze or brass
Bushings	Bronze
Cover Gasket	Manufacturer’s standard
End Connection	Flanged, ASME B16.1 Class 125, flat faced
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	None
Manufacturers	Milwaukee "F-2974", Stockham "G-931", or approved equal

2.1.07 <u>Valves VC-7</u>.

Rating	Class 125
Code	MSS SP-80, Type III
Type	Horizontal swing, threaded bonnet
Body/Bonnet	ASTM B62 bronze
Trim	
Seat	Bronze, regrinding
Disc	Bronze
Hinge Pins	Manufacturer’s standard

End Connection	Threaded
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	None
Manufacturers	Stockham "B-321", Walworth "Fig 3406", or approved equal

2.1.08 Valves VC-8.

Rating	Class 125
Code	MSS SP-80, Type III
Type	Horizontal swing, threaded bonnet
Body/Bonnet	ASTM B62 bronze
Trim	
Seat	Bronze, regrinding
Disc	Bronze
Hinge Pins	Manufacturer’s standard
End Connection	Soldered
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	None
Manufacturers	Nibco "S-413-B", Walworth "Fig 3046SJ", or approved equal

2.1.09 Valves VC-9.

Rating	Class 125
Code	API-594
Type	Dual disc wafer
Body	ASTM A126, Class B, cast iron

Trim	
Seat	EPDM
Disc	Aluminum
Hinge Pins	Aluminum
Springs	Stainless steel
Bushings	Manufacturer’s standard
End Connection	Plain, installed between ASME B16.1, Class 125, flat faced flanges
Temp. Limitations	-20° to 300°F (-29° to 149°C)
Valve Operator	None
Manufacturers	Techno Corporation "Technocheck Silent Seatless Check Valves", Hoffman "Air Check Valves", Lamson "Check Valves", or approved equal

2.1.10 Valves VC-10.

Rating	3000
Type	Poppet
Body	Stainless steel
Trim	
Poppet	Stainless steel
O-ring	Viton
Spring	Stainless steel
End Connection	Threaded
Temp. Limitations	-10 to 375°F [-23 to 191°C]
Valve Operator	None

Manufacturers	Circle Seal "224B" or Nupro "Series C", or approved equal.

2.1.11 Valves VC-11.

Rating	150 psig [1 MPa] nonshock
Type	Ball check, true union
Body	PVC or CPVC
Trim	
Ball	PVC or CPVC
Seat	Viton or EPDM
Seals	Viton or EPDM
End Connection	Socket
Temp. Limitations	0° to 140°F (-18 to 60°C)
Valve Operator	None
Manufacturers	Hayward Plastics Products "Ball Check Valve", Nibco "Chemtrol True Union Ball Check Valve", or approved equal.

2.1.12 Valves VC-12.

Rating	150 psig (1 MPa) nonshock
Type	Ball check, true union
Body/Bonnet	PVC or CPVC
Trim	
Ball	PVC or CPVC
Seat	Viton or EPDM
Seals	Viton or EPDM

End Connection	Flanged, ASME B16.5, Class 150, raised face
Temp. Limitations	0° to 140°F (-18° to 60°C)
Valve Operator	None
Manufacturers	Hayward Plastics Products "Ball Check Valve", Nibco "Chemtrol True Union Ball Check Valve", or approved equal.

2.1.13 Valves VC-13.

Rating	100 psig (690 kPa) nonshock
Type	Diaphragm, two piece
Body	PVC
Trim	
Diaphragm	Buna-N
End Connection	Threaded
Temp. Limitations	0° to 140°F (-18° to 60°C)
Valve Operator	None
Manufacturers	Plast-O-Matic "Series CK Check Valves" or "Series VB Vacuum Breakers", or approved equal

2.1.14 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.15 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15094

BACKFLOW PREVENTERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of backflow preventers and associated appurtenances.

Piping, pipe supports, insulation, and accessories that are not an integral part of the backflow preventers or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each backflow preventer covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the device in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication and assembly drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications for each unit shall include, but shall not be limited to the following:

Name of manufacturer.

Type and model.

Net weight.

Unit dimensions.

Performance curves indicating flow capacity versus pressure drop.

Manufacturer shall submit certification that each backflow preventer and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of backflow preventer.

Contractor shall submit results of all pressure and leakage testing.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. Backflow preventers shall be designed to meet the requirements as indicated herein and on the backflow preventer scheduleand as indicated in the Contract Documents.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and specific products are listed in the Design and Construction paragraph.

2.3 DESIGN AND CONSTRUCTION. Backflow prevention device type shall be as indicated in the backflow preventer schedule and as indicated in the Contract Documents.

2.3.01 Reduced Pressure Zone Backflow Preventers. Reduced pressure zone (RPZ) backflow preventers shall consist of isolation valves, two independent check valves, and differential relief valve. The assembly shall automatically reduce the pressure in the zone between the check valves. In the event that the reduced pressure is not maintained, the differential relief valve shall open, maintaining the proper zone differential. RPZ backflow preventers shall comply with AWWA C511-92 and ASSE Standard 1013 requirements and shall be suitable for horizontal installation. Each RPZ backflow preventer shall be provided with a relief valve air-gap drain fitting.

RPZ backflow preventers in 2 inch (50 mm) and smaller sizes shall be provided with bronze bodies and with a threaded bronze bodied ball valve on each end of the device. Two inch (50 mm) and smaller RPZ backflow preventers shall be Febco “Model 860”, Cla-Val Company “Model RP6L”, Watts Regulator “Series 909”, or approved equal.

RPZ backflow preventers in 2-1/2 inch (63 mm) and larger sizes shall be provided with ductile iron bodies, epoxy-coated interior and exterior, and a flanged, resilient-seated gate valve on each end of the device. Flange diameter and drilling shall conform to ANSI/ASME B16.1, Class 125. 2-1/2 inch (63 mm) and larger RPZ backflow preventers shall be Febco "Model 860", Cla-Val Company "Model RP7L", Watts Regulator Company "Series 909", or approved equal.

2.3.02 Hose Connection Vacuum Breakers. Hose connection vacuum breakers shall be provided with 3/4 inch (19 mm) hose thread ends, brass or bronze bodies, stainless steel stem, rubber seat, and rubber disc. Hose connection vacuum breakers shall be of tamper-resistant design to prevent removal, and shall comply with ASSE Standard 1011 requirements. Hose connection vacuum breakers shall be Watts Regulator Company "Series 8", or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15095

SOLENOID VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of solenoid operated valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Solenoid valves shall have packless construction without packing box or sliding seal.

Solenoid coils for ac service shall have voltage and frequency as indicated in the Contract Documents, encapsulated, Class F, for continuous duty at rated voltage plus or minus 10 percent and 40°C ambient, in a NEMA Type 1 or 4 enclosure, as required, with a conduit knockout.

Solenoid coils for dc service shall have dc voltage as indicated in the Contract Documents, Class H, for continuous duty at rated voltage plus or minus 10 percent and 40°C ambient, in a NEMA Type 1 or 4 enclosure as required, with a conduit knockout.

2.1.01 Valves VSOL-1.

Type	2-way, pilot operated
Body/Bonnet	Brass or bronze
Trim	
Seals	Buna-N or teflon
Disc	Buna-N or teflon
Stem	Manufacturer’s standard
Bonnet Gasket	Manufacturer’s standard
Spring	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	32° to 104°F (0 to 40°C)
Valve Operator	Integral
Manufacturers	ASCO "8210 Series", or approved equal

2.1.02 Valves VSOL-2.

Type	3-way, pilot operated
Body/Bonnet	Brass or bronze
Trim	
Seals	Buna-N or teflon
Disc	Buna-N or teflon
Stem	Manufacturer's standard
Bonnet Gasket	Manufacturer's standard
Spring	Manufacturer's standard
End Connection	Threaded
Temp. Limitations	32° to 104°F (0° to 40°C)
Valve Operator	Integral
Manufacturers	ASCO "8316 Series", or approved equal

2.1.03 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.04 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid	Ameron "Amerlock 400 High-Solids

service)	Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 ACCESSORIES.

2.2.01 Manual Operators. Requirements for manual operators, to allow valve operation when electrical power is off, shall be as indicated in the Solenoid Valve Schedule 15095-S01.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15096

GLOBE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated, two position (open-close) globe valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VGL-1.

Rating	Class 200
Code	MSS SP-80
Type	In-line, union or threaded bonnet, rising stem, needle
Body/Bonnet	Bronze or brass
Trim	
Seat	Manufacturer’s standard
Stem	Bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	0° to 400°F (-18° to 204°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "600", Powell "Fig 180", Stockham "B-64", or approved equal.

2.1.02 Valves VGL-2.

Rating	Class 125
Code	MSS SP-80, Type 1

Type	In-line, metal disc, threaded bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Bronze
Stem	Bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	0° to 350°F (-18° to 177°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "502", Stockham "B-16", Walworth "Fig 3058", or approved equal

2.1.03 Valves VGL-3.

Rating	Class 125
Code	MSS SP-80, Type 1
Type	In-line, metal disc, threaded bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Bronze

Stem	Bronze
Bonnet Gasket	Manufacturer's standard
Stem Packing	Manufacturer's standard
End Connection	Soldered
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "1502", Stockham "B-17", or approved equal

2.1.04 Valves VGL-4.

Rating	Class 150
Code	MSS SP-80, Type 2
Type	In-line, composition disc, union bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Teflon
Stem	Bronze
Bonnet Gasket	Manufacturer's standard
Stem Packing	Manufacturer's standard
End Connection	Threaded
Temp. Limitations	0° to 350°F (-18° to 177°C)
Valve Operator	Handwheel

Manufacturers	Milwaukee "590", Stockham "B-22T", Walworth "Fig 3095", or approved equal

2.1.05 Valves VGL-5.

Rating	Class 150
Code	MSS SP-80, Type 2
Type	In-line, composition disc, union bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Teflon
Stem	ASTM B62, bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Teflon impregnated
End Connection	Soldered
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "1590", or approved equal

2.1.06 Valves VGL-6.

Rating	Class 150
Code	MSS SP-85, Type I
Type	In-line, bolted bonnet, OS&Y rising stem

Body/Bonnet	ASTM A126 Class B, cast iron
Trim	
Seat Ring	ASTM B62, bronze
Disc	ASTM B62, bronze
Stem	Brass or silicone bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Flanged, ASME B16.1, Class 125, flat faced
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "F2981", Powell "Fig 1253", Walworth "8096F", or approved equal

2.1.07 Valves VGL-7.

Rating	Class 250
Code	MSS SP-85 Type 1
Type	In-line, single seated, top guided, bolted bonnet
Body/Bonnet	Cast iron
Trim	
Plug	316 stainless steel
Seat Ring	316 stainless steel
Stem	Manufacturer’s standard

Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Electric
Manufacturers	Dezurik “Series 1400”, or approved equal

2.1.08 Valves VGL-8.

Rating	Class 125
Code	MSS SP-85, Type 1
Type	In-line, single seated, cage, bolted bonnet
Body/Bonnet	Cast iron
Trim	
Plug	17-4 PH stainless steel
Seat Ring	17-4 PH stainless steel
Stem	Manufacturer’s standard
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Flanged, ASME B16.1, Class 125, flat faced
Temp. Limitations	0° to 350°F (-18° to 177°C)
Valve Operator	Electric
Manufacturers	Dezurik “Series 9100”, or approved

equal

2.1.09 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.10 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.11 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Coating Materials	
Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated	
Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged,	Asphalt varnish.

or Installed in Manholes or Valve Vaults	
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coatedwith the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15097

PINCH VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated, two position (open-close) pinch valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves. Pinch valves shall be of full body construction, with flexible sleeve liner, and 100 percent port area of the joining pipe at the valve ends. The valve area shall be 100 percent of the full pipe area through the entire length of the valve. All metal parts are to be completely protected from the process fluid by a flexible elastomer liner. Each valve shall be throttled and fully closed with compressed air that constricts the sleeve at the center of the valve. Each valve body shall be drilled and tapped for a pressure connection on top and bottom of the housing.

The elastomer liners shall be manufactured from elastomer with polyester reinforcement ply and with flanges. Metal reinforcements in valves sized 6 inches (150 mm) and larger shall be molded into the liner flanges. The elastomer liner shall be pre-pinched and shall be field replaceable. Two piece liners shall be identical and shall lock into position without separate gaskets or adhesives. The metal body shall consist of two identical halves.

The calculated bursting pressure of the elastomer liner shall be four times the rated working pressure of the valve. The valve shall be able to handle surge pressures of 150 percent of the working line pressure without breakage.

Rating	Class 150
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Liner	Buna-N
End Connection	Flanged, ASME B16.5, Class 150, flat faced
Temp. Limitations	40 to 225°F (4 to 107°C)
Valve Operator	Integral, pneumatic
Manufacturers	Fowler “Delta Series”, or approved equal

2.1.02 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.03 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15098

PLUG VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated, two position (open-close) plug valves for the services as indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Manufacturers	Key Port “Fig 425-RS51”, or approved equal

2.1.03 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.04 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.05 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	Epoxy.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coatedwith the manufacturer’s standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15099

PRESSURE REDUCING VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of pressure reducing valves for gas, air, and water service as indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories which are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication and assembly drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications for each unit shall include, but shall not be limited to, the following:

Name of manufacturer.

Type and model.

Unit dimensions.

Performance curves indicating flow capacity versus pressure drop.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. Pressure reducing valves shall be designed to meet the requirements as indicated herein and on the Pressure Reducing Value Schedule 15099-S01 and as indicated in the Contract Documents.

Each pressure reducing valve shall be designed to provide tight shutoff under conditions of no flow and shall not "hunt" under ordinary flow conditions. Pressure reducing valves shall be selected and sized as recommended by the valve manufacturer. Valve pressure setpoint shall be adjustable to at least 20 percent above and below the reduced pressure setpoint.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and specific products are listed in the Construction paragraph.

2.3 MATERIALS. Valve materials shall be as indicated below and in the Construction paragraph.

Shop Coatings

Epoxy Enamel (NSF certified)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", approved equal; immersion service.
Epoxy Enamel (Natural Gas Service)	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series N69 Hi-Build Epoxoline II", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.

2.4 CONSTRUCTION.

2.4.01 Water Service. Pressure reducing valves for water service shall be direct-acting or pilot-operated type as indicated in the Pressure Reducing Valve Schedule.

Direct-acting valves shall be globe type with threaded connections and union assembly. The valves shall be provided with bronze body and cover, stainless steel trim, reinforced neoprene diaphragm, Buna-N disc, and stainless steel strainer. Direct-acting pressure reducing valves shall be Cla-Val “Model 990”, Cash-Acme, Watts, or approved equal.

Pilot-operated valves shall be globe type with flanged ends. The valves shall be provided with epoxy coated ductile iron body, bronze trim, and Buna-N rubber diaphragm and disc. The pilot regulating valve shall be bronze with stainless steel trim. Pilot-operated pressure reducing valves shall be Cla-Val “Model 990”, Cash-Acme, Watts, or approved equal.

When indicated in the schedules, pilot-operated valves shall be equipped with a low flow bypass. The low flow bypass shall consist of a direct-acting pressure reducing valve in parallel with the pilot-operated valve. The valves and required piping assembly shall be factory assembled and shall be Cla-Val “Model 90-48”, or approved equal.

2.4.02 Gas Service. Pressure reducing valves for natural gas and propane gas service shall be suitable for gases with specific gravities of 0.6 and 1.5, respectively. Natural gas and propane gas pressure reducing valves shall be direct-acting type with cast iron or cast steel bodies, threaded ends, aluminum trim, and a nitrile diaphragm and disc. Valves shall be Fisher Controls "S-102/S-201 Series", or approved equal.

Pressure reducing valves for digester gas service shall be suitable for gas with specific gravity of 0.8 to 0.9. Digester gas pressure reducing valves shall be pilot-operated type with stainless steel bodies, stainless steel trim, viton diaphragm, and stainless steel pilot. Valves shall be Fisher Controls "1098-EGR Series", or approved equal.

2.4.03 Air Service. Pressure reducing valves for air service shall have a cast iron or steel body with stainless steel trim and a composition disc. Pressure reducing valves shall be furnished with integral or line mounted inlet filters/strainers and discharge pressure gauges. Valves shall be as manufactured by Fisher Controls; Jordan Valve Div., Richards Industries; O. C. Keckley Co.; Leslie Controls, Inc.; Spirax Sarco, Inc; or approved equal.

2.5 SHOP COATING. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

<u>Surfaces to be Coated</u>

Interior Surfaces	
Liquid Service	Epoxy (NSF certified).
Fuel Gas and digester Gas Service	Epoxy.
Exterior Surfaces	Universal primer.

PART 3 - EXECUTION

3.1 <u>INSTALLATION</u>. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15100

MISCELLANEOUS VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous valves as indicated in the Contract Documents. This section includes the following types of valves:

Hose faucets
Wall hydrants
Wall hydrants with vacuum breaker
Yard hydrants
Post type yard hydrants
Curb stops

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment , Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications, covering the valves and their appurtenances shall be submitted in accordance Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180,Equipment , Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.02 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.03 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces

Interior Surfaces

Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 HOSE VALVES AND HYDRANTS.

2.2.01 Hose Faucets, VHF-1.

Type	Faucet, threaded bonnet
Body/Bonnet	Brass
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, male NPT x male HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	T-handle
Manufacturers	Chicago Faucets "No. 7T", Tanner "1235", or approved equal

2.2.02 Wall Hydrants, VHF-2.

Type	Freeze proof
Body/Bonnet	Brass or bronze
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, NPT x male HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	Removable key
Manufacturers	Josam "71200", Smith "5610", Wade "W-8604", Woodford "60", Zurn "Z-1315", or approved equal

2.2.03 Wall Hydrants with Vacuum Breaker, VHF-3.

Type	Freeze proof, with vacuum breaker
Body	Brass or bronze
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, NPT x male HPT
Temp. Limitations	32° to 212°F (0° to 100°C)

Valve Operator	Removable key
Manufacturers	Josam "71050", Smith "5609", Wade "W-8620", Woodford "65", Zurn "Z-1310", or approved equal

2.2.04 Yard Hydrants, VHF-4.

Type	Non-freeze, box type
Body	Brass or bronze
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
Box, Cover, Casing	Bronze
End Connection	Threaded, NPT x HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	Removable key
Manufacturers	Josam "Series 71600", Smith "5810/5813", Wade W-8610", Zurn "Z-1360/1365", or approved equal

2.2.05 Post Type Yard Hydrants, VHF-5.

Type	Non-freeze, post type
Body	Brass or bronze
Trim	
Seat	Manufacturer’s standard

Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, NPT x HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	Removable key
Manufacturers	Josam "Series 71701", Smith "5910/5913", Wade "W-8604", Woodford "60", Zurn "Z-1385/1390", or approved equal

2.3 CURB STOPS.

2.3.01 Curb Stops, VCS-1.

Code	AWWA C800
Type	Straight-through
Body	Brass or bronze
Trim	
Seat	Manufacturer's standard
Plug/Ball	Manufacturer's standard
Stem	Manufacturer's standard
Stem Seal	Manufacturer's standard
End Connection	Threaded
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	T-handle
Manufacturers	Ford Meter Box "Ford Ball Valve", Hays "Nuseal Curb Stop", Mueller

"Mark II Oriseal", or approved equal

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5 ACCESSORIES.

2.5.01 Extension Stems. Requirements for extension stems and stem guides shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.03 Floor Boxes. Requirements for floor boxes shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.04 Operating Stands. Requirements for operating stands shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. When specified herein, an experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section01180, Equipment, Materials, Parts, and Tools and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated, as in accurate alignment, is free from any undue stress imposed by connecting piping and appurtenances, and has been operated under full load conditions and that is operated satisfactory.

3.2 SCHEDULE. See Schedules 15100-S01 and 15100-S02.

End of Section

SECTION 15101

AWWA BUTTERFLY VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of AWWA butterfly valves for cold water service as indicated in the Contract Documents and AWWA Butterfly Valve Schedule 15101-S01. All other butterfly valves are covered in Master Specification Section 15092, Industrial Butterfly Valves.

AWWA butterfly valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all butterfly valves and manual actuators shall conform to the applicable requirements of ANSI/AWWA C504.

1.2.03 Marking. Supplementing the requirements of Section 6.1 of the governing standard, the country of origin of all castings and an identifying serial number shall be stamped on a corrosion-resistant plate attached to the valve body.

1.2.04 Temporary Number Plates. Each butterfly valve shall be tagged or marked in the factory with the identifying number listed in the AWWA Butterfly Valve Schedule 15101-S01.

1.2.05 Permanent Number Plates. All butterfly valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall

be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Certified copies of test results as specified herein by Section 5 of ANSI/AWWA C504, with an affidavit of compliance as indicated in Section 1.7 of C504, shall be submitted to Engineer before the valves are shipped. Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS. Butterfly valves shall be limited to the manufacturers as specified herein. Sizes and styles for the manufacturers shall be limited as indicated, without exception:

Manufacturer	Acceptable Sizes and Styles
Rodney Hunt	All
Val-Matic	All
Milliken	All
DeZurik	All

Pratt	All
M&H	All

2.2 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of butterfly valves shall conform to the requirements of ANSI/AWWA C504.

Acceptable shop coatings are listed in the following table.

Asphalt Varnish	Fed. Spec. TT-C-494.
Epoxy Enamel (NSF certified systems)	Ameron “Amerlock 400 High-Solids Epoxy Coating”, Carboline “Carbogard 891”, Tnemec “Series N140 Pota-Pox Plus”, or approved equal, immersion service.
Epoxy Enamel (non-NSF certified)	Ameron “Amercoat 385 Epoxy”, Carboline “Carbogard 890”, Tnemec “Series 69 Hi-Build Epoxoline II”, or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Bodies. Valves shall be ductile iron, short-body type except where wafer type is specified in the AWWA Butterfly Valve Schedule 15101-S01. The use of a stop or lug cast integrally with or mechanically secured to the body for the purpose of limiting disc travel by means of direct contact or interference with the valve disc (in either the open or closed position) will not be acceptable.

The valve disc shall be a single casting made of ductile iron with a dome shape.

2.3.02 Flanges. Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch (125 µm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.002 inch per foot (0.017 percent) of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2.3.03 Mechanical Joint Ends. Mechanical joint ends shall be either mechanical joint or push-on ends conforming to ANSI/AWWA C111/A21.11.

2.3.04 Valve Shafts. Valve shafts shall be fabricated of AISI Type 17-4PH stainless steel. The use of shafts having a hexagonal cross section will not be acceptable. Shafts shall be provided with a permanent indicating mark to identify disc position when the actuator is removed or reinstalled.

The connection between the shaft and the disc shall be mechanically secured by means of solid, smooth sided, stainless steel or monel taper pins or dowel pins. Each taper pin or dowel pin shall extend through or shall wedge against the side of the shaft and shall be mechanically secured in place. The use of set screws, knurled or fluted dowel pins, expansion pins, roll pins, tension pins, spring pins, or other devices instead of the pins specified herein will not be acceptable.

2.3.05 Valve Seats. Acceptable seating surfaces mating with rubber are AISI Type 316 stainless steel, or monel for all valves; bronze for 20 inch (500 mm) and smaller valves.

Seats shall be located on the valve body or disc as required. Valve seat configurations which rely on the mating pipe flange to hold the seat in position in the valve body will not be acceptable.

The valve seat shall be natural rubber or Buna-N that is certified compliant with NSF 61.

2.3.06 Shaft Seals. The valve shall be provided with a ductile iron stuffing box at the projection of the valve shaft from the valve body. Stuffing boxes for rectangular section packing shall be bushed in an approved manner with bushings made of cast bronze or type 316 stainless steel. Stuffing boxes for “vee” type packing shall be fitted with a cast bronze or type 316 stainless steel bottoming ring.

The stuffing box gland and follower, gland studs and nuts shall be manufactured of cast bronze bronze or type 316 stainless steel. The follower shall be of split construction.

The stuffing box shall be packed with graphited, non-asbestos, rectangular packing or Engineer approved “vee” type packing.

2.3.07 Thrust Bearings. Each valve shall be provided with one or more thrust bearings in accordance with the governing standard. Thrust bearings which are directly exposed to line liquid and which consist of a metal bearing surface in rubbing contact with an opposing metal bearing surface will not be acceptable.

2.3.08 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified herein, as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the AWWA Butterfly Valve Schedule 15101-S01.

All 8 inch (200 mm) and larger valves shall have geared actuators.

If valves with an AWWA class designation higher than indicated in the schedule are furnished, actuator torque capabilities shall be increased accordingly and be acceptable to Engineer.

2.4.01 Actuator Sizing. The valve manufacturer shall size the actuator in accordance with AWWA C504, the operating conditions and requirements indicated in the AWWA Butterfly Valve Schedule 15101-S01, and the valve manufacturer's requirements.

For valves 20 inch (500 mm) and smaller, the actuator torque shall be at least 70 percent of the AWWA C504 Table 4 torque for Class 150B. For valves 24 inch (600 mm) and larger, the actuator torque shall be at least 50 percent of the Table 4 torque for the AWWA class valve being provided.

For valves with actuator torque requirements not indicated shall have an actuator torque based on a maximum differential pressure across the valve equal to the valve class and a maximum velocity through the valve of 16 feet per second (4.9 m/s).

Valves with operating stands shall have actuator torques increased by 25 percent. Actuator torques determined by the above requirements shall be increased by any safety factors required by AWWA C504, paragraphs 3.8.6.1 and 3.8.7 or indicated or specified herein.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces, except finished surfaces, bearing surfaces, and stainless steel components, of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting. Coal tar shall not be an acceptable coating.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy enamel.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	
Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy enamel.

Interior coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy Enamel	10 mils (250 µm)
Universal Primer	3 mils (75 µm)

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.05 Torque Tubes. Requirements for torque tubes shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.06 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

2.7 SHOP TESTING. Except as modified herein, AWWA butterfly valves shall be tested in accordance with Section 5 of AWWA C504. Each valve shall be performance tested in accordance with Section 5.2.1 and shall be given a leakage test and a hydrostatic test as described in Sections 5.2.2 and 5.2.3.
Each valve shall be leaktight in both directions when closed by the actuator with the maximum pressure applied to the valve.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.
3.2 SCHEDULE. See the Butterfly Valve Schedule 15101-S01.

End of Section

SECTION 15102

ECCENTRIC PLUG VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of eccentric plug valves as indicated in the Contract Documents and Eccentric Plug Valve Schedule 15102-S01.

Plug valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Marking. Each valve shall be marked with the manufacturer's name, valve size, and pressure rating, and the country of origin of the body casting. All markings shall be cast on the exterior surface of the valve body. An identifying serial number shall be stamped on a corrosion-resistant plate attached to the valve body.

1.2.03 Temporary Number Plates. Each eccentric plug valve shall be tagged or marked in the factory with the identifying number listed in the Eccentric Plug Valve Schedule 15102-S01.

1.2.04 Permanent Number Plates. All plug valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate oras indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance withMaster

Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Certified copies of reports covering proof-of-design testing of valves as set forth in Section 5.2 of ANSI/AWWA C504, with an affidavit of compliance as indicated in Section 1.7 of C504, shall be submitted to Engineer before the valves are shipped. Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS. Eccentric plug valves furnished under this section shall be manufactured by DeZurik, Pratt, Milliken, Val-Matic, Clow, or Victaulic, without exception.

2.2 MATERIALS. Materials used in the manufacture of eccentric plug valves shall be as indicated:

Body	Ductile iron, ASTM A536, Grade 65-45-12.
Plug	Ductile iron, ASTM A536, Grade 65-45-12.
Plug Facing	Neoprene or Buna-N, 70 Type A durometer hardness in accordance with ASTM D2240.
Body Seat	Welded nickel overlay.
Upper and Lower Trunnion Bearings	Sleeve type; type 316 stainless steel or bronze.
Upper Thrust Bearing	TFE, Nylatron, or Delrin.

Stem Seal	V-type packing or U-cups, Buna-N or TFE.

Acceptable shop coatings are listed in the following table. Whenindicated on the Contract Documents, epoxy for liquid service shall be as specified in Master Specification Section 09900, Painting rather than as indicated below.

Asphalt Varnish	Fed Spec TT-C-494.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Epoxy	
For Gas Service	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", Plasite "Plasguard 7122", or approved equal.
For Liquid Service	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Body. The valve port area of each valve shall be at least 80 percent of the cross section of the connecting piping for 20 inch (500 mm) and smaller valves and 70 percent for 24 inch (600 mm) and larger valves. Valves shall provide tight shutoff at the rated pressure from either direction. An adjustable closed position plug stop shall be provided.

Each valve body shall be plainly marked to indicate the seat end. The actual length of 10 inch (250 mm) and smaller valves shall be within plus or minus 1/16 inch (1.6 mm) of the theoretical length. The actual length of 12 inch (300 mm) and larger valves shall be within plus or minus 1/8 inch (3 mm) of the theoretical length.

Valve ends shall be compatible with connecting piping. All valves shall have flanged, grooved or mechanical joint ends as indicated in the Eccentric Plug Valve Schedule 15102-S01. Flange diameter and drilling shall be spot faced and conform to ANSI B16.1, Class 125. Flanges shall be flat faced and finished to true plane surfaces within a tolerance limit of 0.005 inch (0.12 mm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of

0.002 inch per foot (0.16 mm per meter) of flange diameter. The degree of smoothness of the flange faces shall be 125 RMS.

Grooved end dimensions shall conform to AWWA C606, Table 5, for rigid joints. When grooved end valves are to be installed in flanged piping, two flange adapters compatible with the connecting piping shall be provided with each valve. Mechanical joint ends shall conform to ANSI/AWWA C111/A21.11.

Valve bodies shall be rated for a working pressure as indicated on the Eccentric Plug Valve Schedule 15102-S01.

2.3.02 Plug. The plug shall be of one-piece construction and shall have a cylindrical or spherical seating surface eccentrically offset from the center of the plug shaft. The interference between the plug face and the body seat, with the plug in the closed position, shall be externally adjustable in the field with the valve in the line under pressure. Plug surfaces shall be faced with a resilient material.

2.3.03 Seats. Seats shall be cast in the body and shall have raised, welded-in nickel overlay not less than 0.050 inch (1.30 mm) thick on all surfaces in contact with the plug face. The overlay shall be at least 90 percent nickel and have a Brinell hardness of 200 or greater.

2.3.04 Stem Seals. The valve shaft shall be sealed by U-cups or by at least four self-adjusting chevron type packing rings.

2.3.05 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified herein, as specified in Master Specification Section 15180, Valve and Gate Actuators and as indicated in the Eccentric Plug Valve Schedule 15102-S01.

Geared actuators shall be used for manually operated valves in the following applications:

1. For all 4 inch (100 mm) and larger buried valves.

2. For all 8 inch (200 mm) and larger valves.

3. For all 6 inch (150 mm) valves in throttling or free discharge applications.

4. For all 6 inch (150 mm) valves where the unseating pressure exceeds

25 psi (170 kPa).

5. For all chainwheel operated valves.

6. For all valves in gas service.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces, except bearing and finished surfaces and stainless steel components of valves and accessories, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	
For Liquid Service	Epoxy.
For Gas Service	Epoxy.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

When specified herein, interior epoxy coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

2.7 TESTING. Except as modified herein, eccentric plug valves shall be tested in accordance with Section 5 of AWWA C504. Each valve shall be performance tested in accordance with Section 5.2.1 and shall be given a leakage test and a hydrostatic test as described in Sections 5.2.2 and 5.2.3. The leakage test shall be applied to the seating face of the plug (tending to unseat the plug) at the rated pressure of the valve.

Each valve shall be leaktight in both directions when closed by the actuator with the maximum differential pressure applied to the plug as specified in the Eccentric Plug Valve Schedule 15102-S01.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.2 SCHEDULE. See the Eccentric Plug Valve Schedule 15102-S01.

End of Section

SECTION 15103

AWWA BALL VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of 6 inch (150 mm) and larger AWWA ball valves as indicated in the Contract Documents and AWWA Ball Valve Schedule 15103-S01. Four inch (100 mm) and smaller ball valves are covered in Master Specification Section 15091, Miscellaneous Ball Valves.

AWWA ball valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all ball valves and manual actuators shall conform to the applicable requirements of ANSI/AWWA C507.

1.2.03 Temporary Number Plates. Each ball valve shall be tagged or marked in the factory with the identifying number listed in the AWWA Ball Valve Schedule 15103-S01.

1.2.04 Permanent Number Plates. All ball valves shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall be at least 1 inch [25 mm] high and shall be black baked enamel on anodized aluminum plate or shall be asindicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Certified copies of reports covering proof-of-design testing of valves as set forth in Section 5.2.4.3 of ANSI/AWWA C504, with an affidavit of compliance as indicated in Section 1.3 of C507, shall be submitted to Engineer before the valves are shipped. Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS. Ball valves shall be as manufactured by APCO/Williamette, Valve Technologies, or approved equal.

2.2 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of ball valves shall conform to ANSI/AWWA C507.

Shop Coatings

Epoxy (NSF certified systems.	Ameron "Amerlock 400 High-Solids Epoxy Coating"; Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox plus", or approved equal; immersion service.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Body. Each valve body shall be ductile iron and provided with flanged ends. Flanges shall be flat faced and finished to true plane surfaces within a tolerance of 0.005 inch (0.12 mm). Each flange face shall be perpendicular to the longitudinal axis of the valve, within a maximum angular variation tolerance of 0.002 inch per foot (0.16 mm/m) of flange diameter. Flange faces shall have concentric or spiral serrated finish.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125.

Actual length of valves shall be within plus or minus 1/16 inch (1.6 mm)of the theoretical length.

2.3.02 Ball. Each ball shall be designed so that there will be flow between the ball and body when the ball is in a throttled position and so that substantially all flow is through the ball when in the fully open position.

2.3.03 Seats. The type of seats shall be metal to metal, as specified herein.
For metal-to-metal seated valves, a type 316 stainless steel seat shall be provided on the ball and a monel seat on the valve body. The ball shall be fitted with a type 316 stainless steel sleeve and the ball seat shall be attached to this sleeve by a threaded connection. Valve seats shall be located as specified herein. The seats and the type 316 stainless steel sleeve shall be securely anchored in place.

Contact pressure between seats shall not exceed 1,000 psi (6895 kPa) at an unbalanced head equal to the specified working pressure.

2.3.04 Operating Mechanism. Unless otherwise specified, the basic operating mechanism for each valve shall be of the traveling-nut type and shall consist of (1) a traveling crosshead which will move transversely to the valve shaft, (2) a threaded lead screw engaging corresponding threads in the crosshead, which will move the crosshead when turned by the valve drive unit for manual or electric motor operated valves, and a piston rod with the crosshead directly attached thereto for cylinder operated valves, and (3) a rotator lever, linked to the crosshead, which will impart a rotary motion to the valve shaft. Worm gear type operating mechanisms will also be acceptable for electric motor operated valves. The operator shall have manual stops.

2.3.05 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the AWWA Ball Valve Schedule 15103-S01.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy (NSF 61 certified).
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the AWWA Ball Valve Schedule 15103-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the AWWA Ball Valve Schedule 15103-S01, and as specified in Section Master Specification 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the AWWA Ball Valve Schedule 15103-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators

2.7 PROOF-OF-DESIGN TESTING. Except as modified or supplemented herein, ball valves shall be subject to proof-of-design testing in accordance with Section 5.2.4.3 of ANSI/AWWA C504 titled Rubber-Seated Butterfly Valves. Upon completion of the cycle test, seat leakage of metal-seated valves shall not exceed the rate set forth in Section 5.2.2.1 of ANSI/AWWA C507, and resilient-seated valves shall be droptight.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.
3.2 SCHEDULE. See AWWA Ball Valve Schedule 15103-S01.

End of Section

SECTION 15104

RESILIENT-SEATED GATE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of resilient-seated AWWA gate valves for water service as indicated in the Contract Documents and Resilient-Seated Gate Valve Schedule 15104-S01.

Resilient-seated gate valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all resilient-seated gate valves shall conform to the applicable requirements of ANSI/AWWA C509.

1.2.03 Marking. Supplementing the requirements of Section 7.1 of the governing standard, the name of the country where the valve body was manufactured shall be cast on the exterior of the body. The name of the country where the gate was manufactured shall be molded into the resilient seat material.

1.2.04 Temporary Number Plates. Each resilient-seated gate valve shall be tagged or marked in the factory with the identifying number listed in the Resilient Seated Gate Valve Schedule 15104-S01.

1.2.05 Permanent Number Plates. All gate valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall

be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

All valves shall be tested in accordance with Section 6 of ANSI/AWWA C509. Certified copies of the results of all tests, together with an affidavit of compliance as indicated in Section 1.5, shall be submitted to Engineer before the valves are shipped.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of resilient-seated gate valves shall conform to the requirements of ANSI/AWWA C509.

2.1.01 Bronze Components. All bronze valve components in contact with liquid shall contain less than 15 percent zinc. All aluminum bronze components in contact with liquid shall be heat treated in accordance with Section 2.2 of ANSI/AWWA C504 to inhibit dealuminization.

2.1.02 Gaskets. Gaskets shall be free of asbestos and corrosive ingredients.

2.1.03 Shop Coatings.

Asphalt Varnish Fed Spec TT-C-494.

Epoxy (NSF Certified)	Manufacturer's standard fusion-bonded or liquid epoxy.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.2 VALVE CONSTRUCTION.

2.2.01 Body. Valve shall be fabricated of ductile iron.

2.2.02 Ends. Valve ends shall be compatible with connecting piping and as indicated in the Resilient Seated Gate Valve Schedule 15104-S01. Except as modified or supplemented herein, the ends shall conform to the applicable requirements of ANSI/AWWA C509.

Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch (125 μm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.001 inch per inch (1 μm/mm) of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2.2.03 Stem Seals. Stuffing box stem seals shall be provided for all gate valves with rising stems (outside screw-and-yoke type). O-ring stem seals shall be provided for all buried gate valves, and for all gate valves with non-rising stems. The type of stem shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01.

2.2.04 Rotation. The direction of rotation of the handwheel or the wrench nut to open the valve shall be to the left (counterclockwise).

2.2.05. Shop Coating. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. Except as specified below, the valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be coated as follows:

Interior surfaces	Epoxy (NSF certified)
Exterior surfaces of all other valves.	Universal primer.
Polished or machined surfaces.	Rust-preventive compound.

The protective epoxy coating on the interior surfaces of each valve shall be applied in three coats, with a minimum total dry film thickness of 13 mils (325 μm). Alternatively, the manufacturer's standard coating may be used and the interior surfaces of each valve shall be subjected to a nondestructive holiday test in accordance with ASTM G62, Method A, and shall be electrically void-free.

Interior coatings shall comply with AWWA C550. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils (250 μm) or 13 mils (325 μm)where specified herein.
Universal Primer	3 mils (75 μm)

2.3 VALVE ACTUATORS. Requirements for valve actuators shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4 ACCESSORIES.

2.4.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.02 Floor Boxes. Requirements for floor boxes shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.03 Operating Stands. Requirements for operating stands shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.04 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves shall be handled and installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.2. SCHEDULE. See the Resilient-Seated Gate Valve Schedule 15104-S01.

End of Section

SECTION 15105

DOUBLE DISC GATE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of 3 inch (75 mm) and larger double disc, parallel seat gate valves for water service as indicated in the Contract Documents and Double Disc Gate Valve Schedule 15105-S01.

Double disc gate valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production and valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all double disc gate valves shall conform to the applicable requirements of AWWA C500.

1.2.03 Marking. Supplementing the requirements of Section 6.1 of the governing standard, each gate valve shall be marked with the maximum working pressure for which the valve is designed. In addition, the name of the country where the valve body was manufactured shall be cast on the exterior of the body.

1.2.04 Temporary Number Plates. Each double disc gate valve shall be tagged or marked in the factory with the identifying number listed in the Double Disc Gate Valve Schedule 15105-S01.

1.2.05 Permanent Number Plates. All gate valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall

be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

All valves shall be tested in accordance with Section 5.2 of AWWA C500. Certified copies of the results of all tests, together with an affidavit of compliance as indicated in Section 1.4, shall be submitted to Engineer before the valves are shipped. Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of double disc gate valves shall conform to the requirements of ANSI/AWWA C500.

2.1.01 Bronze Components. All bronze valve components in contact with liquid shall contain less than 15 percent zinc. All aluminum bronze components in contact with liquid shall be heat treated in accordance with Section 2.2 of ANSI/AWWA C504 to inhibit dealuminization.

2.1.02 Gaskets. Gaskets shall be free of asbestos and corrosive ingredients.

2.1.03 Shop Coatings.

Epoxy Enamel (NSF certified)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal; immersion service.

Epoxy Enamel (non-NSF certified)	Ameron "Amerlock 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.2 VALVE CONSTRUCTION.

2.2.01 Body. Valve shall be fabricated of ductile iron.

2.2.02 Ends. Valve ends shall be compatible with connecting piping and as indicated in the Double Disc Gate Valve Schedule 15105-S01. Except as modified or supplemented herein, the ends shall conform to the applicable requirements of ANSI/AWWA C500.

Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch (125 µm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.002 inch per foot (165 µm/m) of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2.2.03 Stem Seals. Stuffing box stem seals shall be provided for all gate valves with rising stems (outside screw-and-yoke type). O-ring stem seals shall be provided for all buried gate valves, and for all gate valves with non-rising stems. The type of stem shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01.

2.2.04 Rotation. The direction of rotation of the handwheel or wrench nut to open the valve shall be to the right (clockwise).

2.2.05 Bypasses. All 16 inch (400 mm) and larger gate valves shall be provided with a bypass and a bypass valve. Bypasses and bypass valves shall comply with Section 3.20 and Table 8 of the governing standard.

2.2.06 Gearing. All 16 inch (400 mm) and larger gate valves shall be provided with gears and gear cases as indicated in the Double Disc Gate Valve Schedule 15105-

S01. Gears and gear cases shall comply with Sections 3.17 and 3.18 and Table 7 of the governing standard.

2.2.07 Internal Rollers and Tracks. All 16 inch (400 mm) and larger valves installed in horizontal piping with the stem oriented horizontally shall be equipped with internal rollers and tracks, as indicated in the Double Disc Gate Valve Schedule 15105-S01.

2.2.08 Shop Coating. All interior and exterior ferrous metal surfaces, except finished surfaces, bearing surfaces, and stainless steel components, of valves and accessories shall be shop painted for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be coated as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy enamel (NSF certified for potable water service).
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	
Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy enamel.
Actuators and Accessories	Universal primer.

Interior coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness

Epoxy Enamel	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.3 VALVE ACTUATORS. Requirements for valve actuators shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4 ACCESSORIES.

2.4.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.02 Floor Boxes. Requirements for floor boxes shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.03 Operating Stands. Requirements for operating stands shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.04 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.2 SCHEDULE. See the Double Disc Gate Valve Schedule 15105-S01.

End of Section

SECTION 15106

CONE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of cone valves for the services indicated in the Contract Documents and Cone Valve Schedule 15106-S01.

Cone valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Temporary Number Plates. Each cone valve shall be tagged or marked in the factory with the identifying number listed in the Cone Valve Schedule 15106-S01.

1.2.03 Permanent Number Plates. All cone valves shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Fluid diagrams for all hydraulic systems shall be submitted. Diagrams shall be drawn using fluid power symbols approved by the American National Standards Institute, Inc., or the manufacturer's standard set of symbols if these symbols adequately and clearly explain the operation of the various components.

In addition, the following drawings shall be submitted before fabrication of the valve control equipment for the pump check valves:

> Curve plotting "Area of Opening in Percent of Full Opening" versus "Plug Rotation in Degrees".
>
> Curve plotting "Area of Opening in Percent of Full Opening" versus "Time of Valve Closure" for normal closing.
>
> Curve plotting "Area of Opening in Percent of Full Opening" versus "Time of Valve Closure" for emergency closing.

When requested by the Engineer, certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components. Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 <u>ACCEPTABLE PRODUCTS</u>. Cone valves shall be manufactured by Rodney Hunt, American Valve (Pennsylvania), or approved equal.

2.2 <u>MATERIALS</u>. Materials used in the manufacture of the cone valve as furnished, and of all valve accessories, appurtenances, and control equipment and devices, shall be new and the best and most suitable for the purpose intended in each case, the selection of each such material being based on strength, ductility, durability, and other basic properties in accordance with the best current engineering practice. Materials shall conform to the latest applicable standards of the American Society for Testing and Materials.

Materials used in the manufacture of the cone valve shall be as follows:

Body	Ductile iron, ASTM A536 Grade 65-45-12.
Plug	Ductile iron, ASTM A536, Grade 65-45-12.
Body Seats	Monel.
Plug Seats	Monel.
Bearings	Bronze.
Plug Shaft	Stainless steel, AISI Type 17-4PH w/minimum tensile strength of 80,000 psi.
Operating Mechanism	Cast steel, ASTM A27; or ductile iron, ASTM A536.
Shaft Packing	Graphite packing with split lantern ring/gland. Provide special tools necessary for packing replacement.
Shop Coatings	
Epoxy Enamel	NSF certified systems; Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", or Tnemec "Series N140 Pota-Pox Plus"; immersion service.
Universal Primer	Universal Rust-Inhibitive Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 888 Primer," or Tnemec Series N27 S.T. Typoxy.
Rust-Preventive Compound	Houghton "Rust Veto 344".

All materials subject to rubbing contact shall be of different hardness to prevent galling. Difference in hardness between the two surfaces shall be at least 125 Brinell.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Body. The body of the valve shall be ductile iron and shall have flanged inlet and outlet waterway openings and a flanged opening for insertion or removal of the valve plug.

Both inlet and outlet ends of the valve body shall be provided with seat rings fused into the body metal, with the seat faces raised above adjacent body surfaces by a sufficient amount to assure free operation of the valve plug regardless of any encrustations on interior body surfaces.

Each valve shall be provided with four NPT taps with solid brass plugs, two located on each side of the valve. The size of the taps shall be determined by the Owner based on the size of the valve.

2-3.02 Flanges. The valve shall be provided with end flanges conforming to ANSI/ASME B16.1, Class 250.

Flanges shall be flat faced and finished to true plane surfaces within a tolerance limit of 0.005 inch. Each finished face shall be perpendicular to the longitudinal axis of the valve within a maximum angular variation tolerance of 0.002 inch per foot of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2-3.03 Plug. The plug shall be in the form of a frustrum of a cone, with a clear circular-section waterway. The plug shall rotate on large diameter end trunnions made of magnesium bronze with a tensile strength of 70,000 psi, and shall be provided with bronze bearing sleeves operating in bronze-bushed bearings in both valve body and valve-head cover. The clearances between bearing sleeves and the bearings shall not exceed 0.008 inches. The maximum allowable unit bearing stress shall not exceed 3,000 psi. The valve operating shaft shall be provided with either a hard bronze sleeve or a chrome overlay where it passes through the valve-head cover stuffing box.

The plug shall be provided with four seat rings fused into the plug metal, one each around the inlet and the outlet plug openings, and the other two placed at right angles thereon so as to cut off the flow when the valve is in a closed position. The plug and seats shall be designed for only an axial motion for unwedging the seated pair of the plug seats from the body seats and of a rotary motion for turning the plug 90 degrees and aligning the second pair of seats in the plug with the body seats, followed only by axial motion during seating. Seats shall not be in contact with any part of the valve at any time during rotation of the plug. Body seats and their mating plug seats shall be machined to close tolerances, so as to fully mate to reduce wear and minimize leakage when the cone pump check valve is fully opened or closed.

The plug seats shall have a minimum thickness of 0.090 inches after fusing and machining.

2.3.04 Valve-Head Cover. The valve shall be provided with a valve-head cover casting which will (a) close the flanged head opening in the valve body, (b) support the outer plug trunnion and attached shaft, and (c) support the valve operating mechanism and mechanism housing. The valve head cover shall be arched in the center to allow water from the packing gland or other external source to drain freely off the valve. The valve-head cover shall make a registered connection with the valve body and shall be provided with a bronze-bushed bearing, shaft stuffing box, split bronze packing gland, suitable graphite packing, and four jacking bolts equally spaced around the perimeter for removal. Head bolts, studs, and nuts shall be of silicon bronze. Reference match marks shall be provided on both body and valve-head cover to ensure proper assembly.

The stuffing box shall have sufficient depth for the graphite packing and to contain a portion of the gland. The packing shall be replaceable without removing the valve actuator. The gland shall be bronze, split, drilled, threaded and pinned. It shall be easily accessible, adjustable via bronze studs and double nuts with one nut being a locking nut. The valve actuator shall not be used to retain the shaft seal.

2.3.05 Operating Mechanisms. The basic valve operating mechanism shall consist of (a) crosshead which will move in a straight line between parallel guide rods transversely to the plug shaft, (b) a piston rod which will transmit an operating force from the drive unit to the crosshead, (c) a lift lever which will impart a rotary motion to the plug shaft. The operating mechanism shall provide for axial adjustment of the plug to compensate for any wear that may develop. The plug operating shaft shall be of sufficient strength to withstand any stresses to which it may be subjected under the most adverse operating conditions. Pipe stops are required in the open position.

Valve operation shall be such that 10 percent opening area of the plug waterway will be obtained when the crosshead travels between 45 and 55 percent of its total linear movement.

Crosshead, lift nut and other parts of the operating mechanism shall be greasable from the outside of the mechanism housing.

The valve operating mechanism shall be totally enclosed in a suitable housing with a removable cover which will permit inspection, adjustment, and repair of the operating mechanism.

2.3.06 Valve Position Indicators. An indicating pointer, attached to a plug shaft extension through and operating over an indicator plate mounted on the operating mechanism housing cover, shall be provided to indicate the position of the plug opening relative to the body seat openings. The indicating pointer shall be both bolted and pinned to the plug shaft extension to ensure alignment.

Indicator plates shall be graduated to show percentages of both projected port area and plug rotation.

2.3.07 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.3.08 Valve Base. Cone valves shall be provided with a base or pedestal for support. Cone valves shall be supported upon a steel bearing plate anchored into a concrete support as indicated on the Drawings. Contact surfaces of valve body and bearing plate shall have milled finishes, and the valve shall be free to move upon the bearing plate. Bolting of the valve to base will not be acceptable.

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the Cone Valve Schedule 15106-S01.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in Master Specification Section 09900, Painting.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

Interior coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy Enamel	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

PART 3 - EXECUTION

3.1 HYDROSTATIC TESTS. Each valve shall be fully assembled in the shop prior to testing. Test heads shall be bolted to each waterway flange and, with the plug in a partially open position, each valve shall be tested hydrostatically at a test pressure equal to 150 psi greater than the valve working pressure. This test pressure shall be maintained for 30 minutes, and the valve shall show no evidence of structural failure, seeps, or leakage at any point.

The valve shall also be tested for leakage, with one test head removed and the plug closed. A test pressure equal to the valve working pressure shall be applied and maintained for 15 minutes, during which time the leakage through the valve shall not exceed 0.15 ounce per minute per inch of valve waterway diameter. The test should then be repeated with the pressure applied to the opposite side of the valve.

After complete assembly, the valve shall be opened and closed at least twice.

Cone valve operator controls shall be shop tested for proper operation prior to shipment.

3-1.01 Witness Testing. Representatives from both the Owner and the Engineer will witness shop tests of all cone valves.

All testing equipment used will be inspected. The Contractor shall notify the Engineer at least 14 days in advance of the time that the shop test will be conducted. All valves to be tested shall be tested during one trip to the factory of a duration acceptable to the Engineer.

3.2 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.3 SCHEDULE. See Cone Valve Schedule 15106-S01.

End of Section

SECTION 15108

AIR RELEASE AND COMBINATION AIR VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of air release and combination air valves as indicated in the Contract Documents and Air Release and Combination Air Valve Schedule 15108-S01.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all valves furnished under this section shall conform to the applicable requirements of AWWA C512.

1.2.03 Permanent Number Plates. Each valve shall be provided with a number plate, with at least 1 inch (25 mm) high black baked enamel numerals on anodized aluminum plate. The location of number plates and the method of attachment shall be acceptable to Engineer.

1.3 SUBMITTALS. Complete assembly drawings, together with detailed specifications and data covering materials used and accessories forming a part of the valves furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS.

Air release valves with operating pressures of 150 psi (1000 kPa) or less shall be Apco/Valve and Primer "No. 200", GA Industries "Figure 920m", Multiplex "Crispin Type N", Val-Matic "No. 38", or approved equal.

Air release valves with operating pressures greater than 150 psi (1000 kPa) shall be Apco/Valve and Primer "No. 200A", GA Industries "Figure 920H", Multiplex "Crispin Type N", Val-Matic "No. 38", or approved equal.

Three inch (75 mm) and smaller combination air valves shall be of the integral type with a valve assembly which functions as both an air and vacuum valve and an air release valve. The valves shall be Apco/Valve and Primer "Single Body Combination Air Valves", Multiplex "Crispin Universal Air Release Valves", Val-Matic "Combination Air Valves", or approved equal.

Four inch (100 mm) and larger combination air valves shall consist of an air and vacuum valve with an externally mounted air release valve. The valves shall be Apco/Valve and Primer "Custom Combination Air Valves", GA Industries "Figure 950 Kinetic Custom Combination Air Valves", Multiplex "Crispin Dual Air Valves", Val-Matic "Dual Body Combination Air Valves", or approved equal.

Three inch (75 mm) and smaller air release and vacuum relief valves for vertical diffusion vane pumps shall be of the kinetic energy type with a valve assembly which functions as both an air release and a vacuum relief valve. The exhaust from the valve shall be provided with a throttling device for field adjusting the air flow rate. The valves shall be Apco/Valve and Primer "Series 140DAT Air Valves for Vertical Turbine Pumps", GA Industries "Figure 933 Kinetic Air/Vacuum Valve", Multiplex "Crispin Deep Well Air Valve", or approved equal. The discharge from the valve shall be provided with a threaded NPT connection.

Four inch (100 mm) and larger air release and vacuum relief valves for vertical diffusion vane pumps shall be of the kinetic energy type with a valve assembly which functions as both an air release and a vacuum relief valve. The valve shall be provided with a surge check valve on the valve inlet. The valves shall be Apco/Valve and Primer "Series 1900 Air Valves for Vertical Turbine Pumps", GA Industries "Figure 931 Slow-Closing Kinetic Air/Vacuum Valve", Multiplex "Crispin Air & Vacuum Valve with Surge Check Valve", or approved equal. The discharge from the valve shall be provided with a flanged connection.

2.2 MATERIALS. Except as modified or supplemented herein, materials of construction shall comply with the governing standard. The use of stressed thermoplastic components will not be acceptable.

Valve Trim	Bronze or type 316 stainless steel.

Float	Type 316 stainless steel.
Shop Coatings	
Epoxy (NSF Certified)	Carboline "Carboguard 891" Tnemec "Series N140 Pota-Pox Plus, or approved equal."
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.3 SHOP COATING. All interior and exterior ferrous metal surfaces, except stainless steel components, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified inMaster Specification Section 09900, Painting.

Surfaces shall be painted as indicated:

Interior Surfaces	Epoxy.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

Interior epoxy coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.4 SHUTOFF VALVES. A shutoff valve shall be provided in the piping leading to each air release valve and combination air valve. Each 4 inch (100 mm) and larger combination air valve shall be provided with a shutoff valve between the air and vacuum valve and the air release valve.

PART 3 - EXECUTION

3.1 INSTALLATION. Air release and combination air valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.2 SCHEDULE. See Air Release and Combination Air Valve Schedule 15108-S01.

End of Section

SECTION 15130

INDICATING DEVICES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of line-mounted, local indicating devices and accessories.

Remote indicating devices or transmitters are covered in Master Specification Section 17500, Instrumentation General Requirements. Temperature wells (thermowells) are covered in Master Specification Section 15020, Miscellaneous Piping and Accessories Installation. Devices to be furnished by an equipment supplier, either with an item of equipment or as a component of an equipment package, are covered in the applicable equipment section.

Cleaning, disinfection, pressure and leakage testing, insulation, and pipe supports are covered in other sections.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the Engineer.

1.2.01 Coordination. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all pressure gauges shall conform to the requirements of ANSI/ASME B40.1.

1.2.04 Temporary Number Plates. Each device shall be factory tagged or marked to identify the device by type and number, as indicated.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete drawings or catalog cuts, together with detailed specifications and data covering materials used, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance withMaster Specification Section 01160, Training and Operation & Maintenance Manuals.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with therequirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the specified conditions as indicated in the Contract Documents.

2.2 CONSTRUCTION.

2.2.01 Pressure Indicators. Pressure indicators shall be dial type with rotary geared movement and adjustable pointer.

The dial shall be white background with black markings. The units of measurement shall be indicated on the dial face. Subdivisions of the scale shall conform to the requirements of the governing standard. Pointer travel shall be not less than 200 degrees (3.5 rad) nor more than 270 degrees (4.7 rad) or arc.

Pressure indicators shall be as manufactured by 3D Instruments, or approved equal.

2.2.02 Temperature Indicators.

2.2.02.01 Bi-Metal. Bi-metal temperature indicators shall be hermetically sealed type with external zero adjustment. Indicators shall be furnished with angularly adjustable frame to permit positioning of the dial to accommodate easy viewing.

2.2.02.02 Filled Temperature Indicators. Gas-filled temperature indicators shall be furnished complete with dial indicator, armored capillary tubing and bulb or temperature sensor. Direct mounted indicators shall have an angularly adjustable frame to permit positioning of the dial to accommodate easy viewing.

2.2.03 Sight Flow Indicators. Sight flow indicators shall be provided as indicated in the Contract Documents to provide a visual indication of flow within a pipe. Sight flow indicators shall be of the double window type.

2.2.04 Rotameters. Rotameters (variable area flow meters) shall be provided as indicated in the Contract Documents. Bypass rotameters shall be furnished complete with both a line orifice plate and a range orifice. The range orifice shall be designed to limit flow through the rotameter to within the range of the rotameter.

2.2.05 Orifice Plates and Flanges. Orifice plates shall be ISA standard plates with concentric bore to the nearest 1/8 inch (3 mm) for the flow range specified. Flanges for the orifice plate will be furnished with jackscrews for installing and removing the orifice plate. Tab or coupon shall be provided that indicates the size of the orifice plate.

2.3 ACCESSORIES.

2.3.01 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 INSPECTION. All equipment and accessories shall be inspected for damage and cleanliness before being installed. Any items damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by the Contractor. Such equipment shall be segregated from the undamaged/clean items and shall be inspected and approved by the Owner or his representative before its use.

3.2 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

All indicating devices shall be installed so they can be easily read from floor/platform level and are readily accessible for maintenance and service.

3.2.01 Pressure Indicators. All pressure indicators installed in steam and any other elevated temperature service shall be protected with a thermal isolator (pigtail). Angle style pigtails shall be used for gauges connected to vertical surfaces. Straight-style pigtails shall be used for gauges connected to horizontal surfaces. Pigtails are not to be insulated.

An isolation valve shall be installed at each pipe branch to a pressure indictor except where in-line, flow-through diaphragm seal gauge isolators are utilized. The valve shall be suitable for the line pressure and temperature and shall allow removal of the indicator while the monitored line is in operation.

3.2.02 Temperature Indicators. All temperature indicators shall be installed in temperature wells (thermowells). Filled system indicator dials shall be mounted on a column or floor support approximately 5 feet (1.5 m) above the viewing floor level. Spare capillary shall be neatly coiled and tied.

3.2.03 Sight Flow Indicators. Flapper type sight flow indicators in horizontal piping shall be installed with the flapper hinge at the top of the pipe.

3.2.04 Rotameters. Rotameters shall be installed between 3 and 6 feet (0.9 and 1.8 m) above the viewing floor level. Rotameters shall be installed with flow vertical upwards

Isolation valves shall be installed in the rotameter inlet and outlet piping near the orifice flanges for bypass rotameters. The isolation valves shall allow removal of the rotameter while the monitored line remains in operation. Unions or flanges shall be provided within 2 feet (0.6 m) of the rotameter to facilitate removal.

3.2.05 Orifice Plates and Flanges. Orifice flanges in horizontal piping runs shall be installed so that the orifice taps are located on the vertical centerline at the top of the pipe for gas service and on the horizontal centerline for liquid and steam service.

Orifice plates and flanges shall be installed with the minimum upstream and downstream lengths of unobstructed pipe as indicated on the drawings.

End of Section

SECTION 15140

PIPE SUPPORTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of pipe hangers, brackets, and supports. Pipe supports shall be furnished complete with all necessary inserts, bolts, nuts, rods, washers, and other accessories. This section also covers the spacing of expansion joints in piping systems. Expansion joint products and materials are covered in the respective piping sections.

Concrete and fabricated steel supports shall be as indicated in the Contract Documents.

1.2 GENERAL. In certain locations, pipe supports, anchors, and expansion joints have been indicated on the drawings, but no attempt has been made to indicate every pipe support, anchor, and expansion joint. It shall be Contractor's responsibility to provide a complete system of pipe supports, to provide expansion joints, and to anchor all piping, in accordance with the requirements specified herein. Additional pipe supports may be required adjacent to expansion joints, couplings, or valves.

All piping shall be rigidly supported and anchored so that there is no movement or visible sagging between supports.

Pipe supports and expansion joints are not required in buried piping, but concrete blocking or other suitable anchorage shall be provided as indicated in theContract Documents.

Piping support system components shall comply with specified piping code requirements.

1.2.01 Abbreviations. Reference to standards and organizations in this section shall be as indicated by the following designations.

AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
ASTM	American Society of Testing and Materials
MSS	Manufacturers Standardization Society of Value and Fitting

Industry

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.3 SUBMITTALS. Complete data and catalog cuts or drawings covering fabricated pipe supports, fabricated inserts, and stainless steel, galvanized, and copper- and plastic-coated pipe supports shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Data shall include a listing of the intended use and general location of each item submitted.

PART 2 - PRODUCTS

2.1 MATERIALS. Unless otherwise indicated, all pipe supports shall comply with ANSI/MSS SP-58 and MSS SP-69. Materials of construction for fabricated steel supports are covered in the structural and miscellaneous metals section. All pipe support materials shall be packaged as necessary to ensure delivery in satisfactory condition.

Unless otherwise specified or indicated on the drawings, pipe supports shall be fabricated of manufacturer's standard materials and provided with manufacturer's standard finish.

Design loads for inserts, brackets, clamps, and other support items shall not exceed the manufacturer's recommended loads.

Pipe supports shall be manufactured for the sizes and types of pipe to which they are applied. Strap hangers will not be acceptable. Threaded rods shall have sufficient threading to permit the maximum adjustment available in the support item. Continuously threaded rod is not acceptable for hanger rods over 12 inches (300 mm) in length.

Unless otherwise acceptable to Engineer, the use of supports which rely on stressed thermoplastic components to support the pipe will not be acceptable.

Contact between dissimilar metals, including contact between stainless steel and carbon steel, shall be prevented. Supports for brass or copper pipe or tubing shall be copper plated. Portions of pipe supports which come into contact with other metals that are dissimilar shall be rubber or vinyl coated.

Stainless steel supports shall be furnished, and shall be AISI Type 304 or 316 stainless steel. Stainless steel supports fabricated by welding shall be AISI Type 304L or 316L.

Hot-dip galvanized supports shall be furnished and shall be in accordance with ASTM A153 and A385.

Pipe support types and application shall comply with Table 1.

PART 3 - EXECUTION

3.1 APPLICATION. Concrete inserts or anchor bolts shall be used to support piping from new cast-in-place concrete. Expansion anchors shall be used to fasten supports to existing concrete and masonry.

Anchorage shall be provided to resist thrust due to temperature changes, changes in diameter or direction, or dead-ending. Anchors shall be located as specified to force expansion and contraction movement to occur at expansion joints, loops, or elbows, and as needed to prevent excessive bending stresses and opening of mechanical couplings. Anchorage for temperature changes shall be centered between elbows and mechanical joints used as expansion joints. Anchorage for bellows type expansion joints may be located adjacent to the joint.

When expansion joints are necessary, pipe guides shall be provided adjacent to bellows type expansion joints. Guides will not be required where mechanical couplings are permitted as expansion joints. Guides shall be located on both sides of expansion joints, except where anchors are adjacent to the joint. Unless otherwise indicated on the drawings, one guide shall be within four pipe diameters from the joint and a second guide within 14 pipe diameters from the first guide. Pipe supports shall allow adequate movement; pipe guides shall not be used for support. Pipe guides shall be provided at locations as recommended by the manufacturer.

Pipe supports for insulated cold piping systems shall be sized for the outside diameter of the insulated pipe, and an insulation protection shield shall be installed between the support and the insulation. Rigid insulation inserts shall be installed between the pipe and the insulation shields for piping larger than 2 inches (50 mm) or when needed to prevent crushing of the insulation. Inserts shall be of the same thickness as the adjacent insulation and shall be vapor sealed.

Insulated hot piping systems shall be supported by clevises, clamps, support saddles, or rollers. Pipe clamps shall be attached directly to the pipe. Support saddles and rollers shall be sized for the outside diameter of the insulated pipe, and an insulation protection saddle shall be installed at the support.

When supports for the FRP piping systems are in contact with less than 180 degrees of the pipe surface or when the width of the support is less than one-third the nominal pipe diameter (4 inches (100 mm] minimum), an FRP or steel saddle, shaped to the outside diameter of the pipe, shall be bonded to at least the bottom 120 degrees of the pipe.

3.2 TYPES OF SUPPORTS. The specific products for pipe supports shall be as indicated in Table 1 for the specified type and size of support.

TABLE 1 - TYPES OF SUPPORTS		
Description and Service	Type	
	MSS SP 69 (Note 1)	Other
Hangers		
2-1/2 inch (63 mm) and smaller pipe		
For hot and cold insulating piping		
Clevis	1	B-Line "B3100" or Grinnell "260"
Other services		
J-style	5	B-Line "B3690", Grinnell "67", or Unistrut "J Hanger".
Clevis	1	B-Line "B3104" or Grinnell "65"
3 Through 10 inch (75 through 250 mm) pipe		
For hot insulated piping

Table 1 Notes:

1. MSS SP-69 supports and hangers are illustrated on Figure 1-15140.
2. Pipe clamps or other devices which rely on the application of a clamping force to the supported pipe in order to maintain the clamp position or location in a prefabricated channel or track will not be acceptable for use with nonmetallic pipe or tubing.

3.3 <u>SUPPORT SPACINGS</u>. Pipe supports and expansion joints shall be spaced in accordance with Tables 2, 3, 4, and 5. The types of pipes to be supported are as indicatbed. Table 2 covers spacings for the standard operating conditions specified for each pipe material. Tables 3 and 4 cover PVC and FRP pipe spacings where operating conditions are in excess of the temperature and specific gravity requirements covered in Table 2. Table 5 covers PVC and FRP pipe which carries air or liquids with a specific gravity other than 1.0.

Table 2 Notes:

1. Unless otherwise acceptable to Engineer, an expansion joint shall be provided in each straight run of pipe having an overall length between loops or bends exceeding the maximum run specified herein.

2. Unless otherwise acceptable to Engineer, the spacing between expansion joints in any straight pipe run shall not exceed the maximum spacing specified herein.

3. Expansion joint fittings are specified in the respective piping procurement sections.

4. At least two properly padded supports for each pipe section.

5. At least one support for each pipe section.

6. Expansion joints shall be mechanical couplings.

7. No expansion joints are required.

8. Supports for 5 and 10 foot (1.5 and 3 m) long pipe sections shall be located within 18 inches (460 mm) of each joint. Supports shall be positioned to maintain the piping alignment and to prevent the piping from sagging.

3.3.01 Temperature Adjustments for PVC Pipe. PVC pipe at a temperature above 100°F (38°C) shall have maximum support spacings in accordance with the following table. For insulated lines, reduce the support spacing to 70 percent of the listed values.

TABLE 3 - MAXIMUM PIPE SUPPORT SPACINGS FOR PVC PIPE AT NON-STANDARD TEMPERATURES

12 (300)	13 (3.9)	8 (2.4)	6 (1.8)

3.3.03 Specific Gravity Adjustments for PVC and FRP Pipe. PVC and FRP pipe shall have the maximum spacing indicated in Tables 2, 3, and 4 adjusted in accordance with the following table when the specific gravity of the liquid is greater than 1.0. Table 5 shall not apply to PVC pipe containing alum solution, caustic soda solution, ferric chloride solution, and hypochlorite solution, as these services are specifically covered in Table 2.

3.4 INSTALLATION.

3.4.01 General. All piping shall be supported in a manner which will prevent undue stress on any valve, fitting, or piece of equipment. In addition, pipe supports shall be provided at changes in direction or elevation, adjacent to flexible couplings, and where otherwise shown. Pipe supports and hangers shall not be installed in equipment access areas.

Where horizontal piping is arranged with two or more parallel lines, trapeze hangers may be used in lieu of individual hangers. Trapeze assembly shall consist of structure attachments as previously specified with rod size dependent upon total weight supported. Spacing of assemblies shall be determined by the minimum pipe size included in the group supported. Trapeze horizontal assemblies shall be structural angle or channel section of sufficient size to prevent measurable sag between rods. All lines shall be attached to the horizontal with intermediate pipe guides and U-bolts or one-hole clamps. Pre-engineered support equipment may be used when selected and installed in accordance with the manufacturer's recommendations.

No copper pipe shall contact a pipe support or hanger of dissimilar metal. Hangers and supports for copper pipe shall be copper-plated, plastic coated, or copper pipe shall be galvanically isolated using Neoprene strips or other material as approved.

No piping shall be supported from the pipe above.

Horizontal piping hanger support rods shall attach to steel beams with center-loading I-clamps, or welded beam clips. Hanger support rods shall attach to concrete slabs or beams with inserts.

Anchorage shall be provided to resist both lateral and longitudinal seismic forces. Seismic forces shall be calculated assuming the pipes are full.

3.4.02 Inserts. Reference building structural concrete drawings for concrete inserts. When not provided as part of the building concrete structure, provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.

Where concrete slabs form finished ceilings, provide inserts flush with the slab surface.

Where inserts are omitted, drill through concrete slab from below and provide thru-bolt with recessed square steel plate and nut recessed into and grouted flush with slab. X-ray locate existing reinforcing rods before drilling.

3.4.03 Pipe Hangers and Supports. Hanger rod sizing for copper pipe and plastic pipe shall be same as for steel pipe. Install hangers to provide a minimum 1/2 inch (13 mm) space between finished covering and adjacent work.

A hanger shall be placed with 18 inches (450 mm) of each horizontal elbow, and on both sides of all piping accessories and valves weighing 20 pounds (9 kg) or more.

Hangers shall have 1-1/2 inches (38 mm) minimum vertical adjustment.

Support horizontal cast iron and no-hub piping systems adjacent to each joint.

Support vertical piping at every floor using riser clamps.

Support riser piping independently or connected horizontal piping.

Hanger and hanger components shall be sized specifically for the pipe size it is to be used on.

3.5 PLACEMENT. Unless closer spacing is indicated on the drawings, the maximum spacing for pipe supports and expansion joints shall be as indicated in Tables 2, 3, 4, and 5.

Rubber hose and flexible tubing shall be provided with continuous angle or channel support.

Unless otherwise indicated on the drawings or acceptable to Engineer, piping shall be supported approximately 1-1/2 inches (38 mm) out from the face of walls and at least 3 inches (75 mm) below ceilings.

End of Section

SECTION 15150

WATER METERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of water meters and associated appurtenances at the locations indicated on the drawings.

Pipe materials, valves, insulation, and pipe supports which are not an integral part of the fixture or piece of equipment and are not specified herein are covered in other Master Specification sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts. and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Power Supply. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.03 Number Plates. Each water meter which has been assigned a number on the drawings shall be provided with a number plate mounted on or adjacent to the device in a manner acceptable to the Engineer. Nameplates shall have black baked enamel letters at least 3/4 inch (19 mm) high on anodized aluminum plate. .

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication, assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications to be submitted for each unit shall include, but shall not be limited to, the following:

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Performance curves indicating flow capacity versus pressure drop.

Accuracy.

Pressure and temperature ratings.

Overall dimensions.

Piping connection sizes and locations.

Power requirements.

Net weight.

Wiring diagrams.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance withMaster Specification Section 01160, Training, and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Construction. Water meters shall be constructed in accordance with the following standards:

Displacement Water Meters	AWWA C700
Turbine Water Meters	AWWA C701
Compound Water Meters	AWWA C702
Propeller Water Meters	AWWA C704

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts. and Tools .

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Water meters shall be designed and selected to meet the specified conditions as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Water meters shall be designed to meet the performance and design conditions indicated in the Contract Documents, and on the water meter schedule.

Each meter shall measure the actual flow within the accuracy specified over the indicated flow range with a water temperature range of 32°F (0°C) to 120°F (50°C). The accuracy shall be expressed as a percentage of the actual flow and not as a percent of maximum flow.

Meter assemblies shall have performance capabilities of continuous operation up to the rated maximum flows without affecting long-term accuracy or causing any undue component wear. All meter assemblies shall also have a 25 percent flow capacity in excess of the maximum flows as indicated in the Contract Documents for intermittent flow demands.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 DESIGN AND CONSTRUCTION.

2.4.01 Displacement Meters. Displacement meters shall be nutating or oscillating disc type with bronze or synthetic polymer housing as indicated in the schedules, thermoplastic plastic chamber and hard rubber disc. Accuracy shall be ±1.5 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Each meter shall be provided with threaded union type spud end connections.

Meter registers shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Displacement type meters shall be Badger Meter Inc., "Recordall Disc Meter", ABB Water Meters, Inc, or approved equal.

2.4.02. Turbine Meters. Turbine meters shall be moving rotor type with bronze, cast iron, or 316 stainless steel housing as indicated in the schedules, thermoplastic rotor, ceramic bearings, stainless steel straightening vanes, Buna N "O" ring, and Nitrile head gasket. Accuracy shall be ±1.5 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Meters in 2 inch and smaller sizes shall be provided with threaded union type spud end connections. Meters in larger than 2 inch sizes shall be provided with ANSI Class 125 flanged end connections.

Meter registers shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Turbine type meters shall be Badger Meter Inc., "Recordall Turbo Meter", ABB Water Meters, Inc, or approved equal.

2.4.03 Compound Meters. Compound meters shall incorporate a positive displacement chamber for measuring low flows, a turbine chamber for measuring high flows, and a valve for diverting flow to the respective chamber. Compound meters shall be provided with a single housing or may be provided with independent housings factory piped with a single inlet and outlet connection. Meters shall be provided with bronze housings and piping, thermoplastic rotor, valve casing, and disc chamber, and stainless steel straightening vanes. Accuracy shall be ±1.5 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Meters shall be provided with ANSI Class 125 flanged end connections.

Meter registers shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Compound type meters shall be Badger Meter Inc., "Recordall Compound Meter", ABB Water Meters, Inc, or approved equal.

2.4.04 Propeller Meters. Propeller meters shall be rotating propeller type with cast iron housing, copper stabilized polypropylene propeller, graphite/stainless steel propeller bearing, graphite/carbide thrust bearing, and stainless steel straightening vanes. Accuracy shall be ±2 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Meters shall be provided with ANSI Class 125 flanged end connections.

Meter register shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Propeller type meters shall be Badger Meter Inc., "Series MFLT Propeller Meter", Sparling Instruments, Inc, or approved equal.

2.5 PAINTING AND COATINGS.

2.5.01 Surface Preparation. All iron and steel surfaces shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint or coating manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.5.02 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Coatings located in water passages shall comply with AWWA requirements for use with potable water and shall be NSF certified. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall conform to the requirements of the Master Specification Section 09900, Painting.

2.6 ELECTRICAL. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 INSTALLATION. Materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Meters shall be installed with the required upstream and downstream straight pipe lengths as recommended by the manufacturer.

3.3 FIELD QUALITY CONTROL.

3.3.01 Installation Check. Unless indicated otherwise, an experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.4 ADJUSTING. Meters shall be calibrated and adjusted according to manufacturer’s written instructions after installation. Meter faces shall be adjusted to proper angle for best visibility.

3.5 PROTECTION. Meters and appurtenances shall be protected from damage immediately after installation. Scratched, cracked or broken components shall be replaced. Meters shall not be used during the construction.

3.6 CLEANING. After completion of testing and immediately before the final inspection, meters shall be thoroughly cleaned. Cleaning materials and methods shall be as recommended by the manufacturer.

End of Section

SECTION 15180

VALVE AND GATE ACTUATORS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manual and powered valve and gate actuators and accessories.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valve and gate actuators shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of actuators.

1.2.01 General Equipment Requirements. The General Equipment Stipulations Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to the equipment and materials furnished under this section.

1.2.02 Governing Standards. Except as modified or supplemented herein, all powered actuators shall conform to applicable requirements of ANSI/AWWA C540.

Except as modified or supplemented herein for butterfly and eccentric plug valves, all manual and cylinder actuators shall conform to the applicable requirements of ANSI/AWWA C504.

Except as modified or supplemented herein for ball valves, all manual actuators shall conform to the applicable requirements of ANSI/AWWA C507.

Except as modified or supplemented herein, all sluice and slide gate, manual actuators shall conform to the applicable requirements of AWWA C501.

1.2.03 Power Supply. Power supply to electric actuators will be as indicated on the valve or gate schedule.

1.2.04 Marking. Each actuator shall be marked with the manufacturer's name, model number, and the country of origin. An identifying serial number shall be stamped on a corrosion-resistant plate attached to the actuator.

1.2.05 Temporary Number Plates. Each actuator shall be factory tagged or marked to identify the actuator and the applicable valve or gate by number or service as indicated in the valve or gate schedule.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the actuators and their appurtenances shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of each actuator and its components.

When requested by Engineer, certified copies of physical and chemical test results shall be submitted for the materials of construction for the actuator components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled actuator and the electrical control equipment. Each actuator drawing shall be identified with the respective valve number or name.

Certified copies of reports covering proof-of-design testing of each electrically operated or controlled actuator, as set forth in Section 6 of ANSI/AWWA C540 together with an affidavit of compliance, as indicated in Section 1.7 of ANSI/AWWA C540 shall be submitted to Engineer before the actuators are shipped.

1.4 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS.

2.1.01 General. Valve and gate actuators and appurtenances shall be designed for the conditions and requirements as indicated in the respective Master Specification valve and gate sections.

Liberal factors of safety shall be used throughout the design, especially in the design of parts subject to intermittent or alternating stresses. In general, working stresses shall not exceed one-third of the yield point or one-fifth of the ultimate strength of each material.

2.1.02 Valve Actuators. Each actuator shall be designed to open or close the valve under all operating conditions. Actuators shall be designed for the maximum pressure differential across the valve and maximum velocities through the valve where indicated in the respective valve and gate section schedules.

Valve actuators shall be provided and adjusted by the valve manufacturer. Actuator mounting arrangements and handwheel or chainwheel positions shall facilitate operation and maintenance and shall be determined by the valve manufacturer unless indicated otherwise on the drawings or directed by Engineer.

2.1.03 Gate Actuators. Actuators, regardless of type, shall be sized to produce the torque or thrust required to operate the applicable gate when the gate is subject to the seating and unseating operating heads as indicated in the respective gate section schedules.

Both the design head and the operating head shall be measured from the surface of the liquid to the center line of the gate.

2.1.04 Limit Switches. When manual or cylinder operated valves or gates require limit switches for instrumentation or controls, the limit switches shall be provided as required in their respective valve and gate schedules.

Each limit switch shall be heavy duty type, with a cast NEMA Type 4 enclosure, a spring return roller lever, and four isolated contacts (two normally open and two normally closed) rated 10 amperes at 120 to 480 volts ac and 5 amperes at 125 volts dc. The switches shall be Allen Bradley "802T" or Square D "9007 Type C".

2.1.05 Sealing. When valves are to be buried, submerged, or installed in vaults, the actuators and accessories shall be sealed to prevent the entrance of water. The design water depth shall be as indicated in the respective schedules but not less than 20 feet (6.1 m).

2.2 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of actuators shall conform to the requirements of ANSI/AWWA C504 and C540.

2.3 VALVE MANUAL ACTUATORS.

2.3.01 General. Manual actuators of the types listed in the Valve Schedules shall be provided by the valve manufacturer.

All valves, except those which are equipped with power actuators or are designed for automatic operation, shall be provided with manual actuators. Unless otherwise indicated or specified, each geared manual actuator shall be equipped with an operating handwheel.

Unless otherwise required by Owner, the direction of rotation of the wheel, wrench nut, or lever to open the valve shall be to the left (counterclockwise). Each valve body or actuator shall have cast thereon the word "Open" and an arrow indicating the direction to open. The direction of rotation of the wheel or wrench nut to open gate valves shall be to the right (clockwise).

The housing of traveling-nut type actuators shall be fitted with a removable cover which shall permit inspection and maintenance of the operating mechanism without removing the actuator from the valve. Travel limiting devices shall be provided inside the actuator for the open and closed positions. Travel limiting stop nuts or collars installed on the reach rod of traveling-nut type operating mechanisms shall be field adjustable and shall be locked in position by means of a removable roll pin, cotter pin, or other positive locking device. The use of stop nuts or adjustable shaft collars which rely on clamping force or setscrews to prevent rotation of the nut or collar on the reach rod will not be acceptable.

Each valve actuator shall be designed so that shaft seal leakage cannot enter the actuator housing.

Valves for throttling service shall be equipped with an infinitely variable locking device or a totally enclosed gear actuator. Other lever actuators shall be designed so that the valve can be readily locked open, closed, or in at least five intermediate positions.

Geared actuators for plug valves not listed in the Eccentric Plug Valve Schedule shall be rated for a differential pressure across the valve, on the seating side of 100 psi (680 kPa) for 8 inch (200 mm) and smaller valves, 50 psi (340 kPa) for 10 inch (250 mm) and larger valves, and 25 psi (170 kPa) for gas service valves.

Manual actuators shall produce the required torque with a maximum pull of 80 pounds (356 N) on the lever or handwheel. Actuator components shall withstand, without damage, a pull of 200 pounds (890 N) on the handwheel or chainwheel or an input of 300 foot-pounds (407 J) on the operating nut.

2.3.02 Handwheels. Handwheel diameters shall be at least 8 inches (150 mm) but not more than 24 inches (600 mm) for 30 inch (750 mm) and smaller valves and not more than 30 inches (750 mm) for 36 inch (900 mm) and larger valves.

2.3.03 Chainwheels. Unless specifically required to be equipped with other types of actuators in the respective valve schedules, all valves with center lines more than 7'-6" (2.3 m) above the floor shall be provided with chainwheels and operating chains. Each chainwheel operated valve shall be equipped with a chain guide which will permit rapid handling of the operating chain without "gagging" of the wheel and will also permit reasonable side pull on the chain. Suitable extensions shall be provided, if necessary, to prevent interference of the chain with adjacent piping or equipment. Operating chains shall be hot-dip galvanized carbon steel and shall be looped to extend to within 4 feet (1.2 m) of the floor below the valve.

2.3.04 Lever Actuators. Lever actuators shall be designed to produce the specified torque with a maximum pull of 80 pounds (350 N). Levers on valves for throttling service shall have an infinitely variable locking device, and levers for other valves shall be capable of being locked in at least five intermediate positions between fully open and fully closed. In any building or structure containing lever operated valves, at least two operating levers shall be provided for each size and type of lever operated valve.

2.3.05 Chain Levers. Chain lever actuators shall be designed to produce the specified torque with a maximum pull of 80 pounds (350 N) on the chain. Suitable actuator extensions shall be provided, if necessary, to prevent interference of the chain with adjacent piping or equipment. Operating chains shall be hot-dip galvanized carbon steel and shall be looped to extend to within 4 feet (1200 mm) of the floor below the valve.

2.3.06 Wrench Nuts. Wrench nuts shall be provided on all buried valves, on all valves that are to be operated through floor boxes, and where indicated on the drawings. Unless otherwise directed by Owner, all wrench nuts shall comply with Section 3.16 of AWWA C500. At least two operating keys shall be furnished for operation of the wrench nut operated valves.

2.3.07 Operating Stands. Operating stands shall be provided in the locations indicated on the drawings. Operating stands shall support the handwheel approximately 36 inches (900 mm) above the floor. A sleeve made from standard weight galvanized steel pipe shall be provided for the opening in the floor beneath each operating stand. When stems are 10 feet (3 m) or longer, a suitable thrust bearing shall be provided in each operating stand to carry the weight of the extension stem. Operating stands in exterior locations shall be cast iron. Operating stands in interior locations shall be cast iron or fabricated steel as indicated in the Contract Documents.

2.3.08 Wall Brackets. Wall brackets shall be provided to support manual actuators in the locations indicated on the drawings or indicated in the respective gate schedules. The horizontal face of the bracket shall be predrilled to accept the actuator and the stem without modification. The top of the bracket shall extend sufficiently to bear on and transfer thrust loads to the top of the supporting structure.

2.4 GATE MANUAL ACTUATORS.

2.4.01 General. Manual actuators of the types as required for each gate in the Gate Schedules shall be provided by the gate manufacturer.

All bearings and gears shall be totally enclosed in a weathertight housing having a sufficient number of fittings to permit periodic lubrication of all internal moving components without partial or total disassembly of the mechanism. The pinion shaft of crank-operated mechanisms shall be supported by roller bearings or needle bearings.

All manual actuators shall conform to the requirements of Section 3.14 of AWWA C501, or each manual actuator shall be designed to operate the gate when a 40 pound (178 N) effort is applied to the crank or the handwheel and shall be able to withstand, without damage, an effort of 200 pounds (890 N), as required.

When specified, manual actuators for rising stem self-contained gates shall be designed for mounting directly on the frame yoke.

When a portable electric actuator will be furnished, all crank-operated geared manual actuators shall be suitable for operation with the portable electric actuator specified herein. A suitable adapter coupling shall be furnished with each manual actuator when required to couple the portable actuator to the actuator pinion shaft.

2.4.02 Floorstands. Floorstands shall be designed to transfer operating thrusts to the supporting structure. Each floorstand shall be designed to position the crank or the handwheel approximately 36 inches (900 mm) above the frame yoke, supporting surface, or adjacent operating floor or platform.

2.4.03 Wall Brackets. Wall brackets shall be provided to support manual actuators in the locations indicated on the drawings or indicated in the respective gate schedules. The horizontal face of the bracket shall be predrilled to accept the actuator and the stem without modification. The top of the bracket shall extend sufficiently to bear on and transfer thrust loads to the top of the supporting structure.

2.4.04 Dual Actuators. Dual actuators shall be provided for the gates so indicated in the respective gate schedules. Dual actuators shall be interconnected by a cross shaft complete with required couplings so both stems move at the same rate. Each cross shaft shall be protected by a full length removable aluminum or stainless steel cover attached to the yoke beam or actuator.

2.4.05 Remote Actuators. Gates as indicated in the respective gate schedules, to be provided with a remote actuator, shall be operated by a frame-mounted handwheel and chain drive. An extension shaft suitable for connection to the pinion shaft of the benchstand shall be provided complete with a roller chain, shaft couplings, support bearings, and a roller chain sprocket keyed or bolted to the end of the shaft. A handwheel with bearing housing and sprocket shall be bolted to the side frame approximately 48 inches (1200 mm) above the operating floor. Removable aluminum or stainless steel weathertight covers shall be provided to protect the extension shaft, drive chain, and sprockets. Handwheel and sprocket diameters shall be selected to operate the gate under the maximum specified seating pressure with an effort of not more than 40 pounds (178 N) applied to the rim of the handwheel. Handwheels and sprockets shall be able to withstand a 100 pound (445 N) effort without damage.

2.4.06 Stem Covers. Unless otherwise specified, each rising stem manual actuator shall be provided with a stem cover. Stem covers shall conform to Section 3.4 of AWWA C501.

2.4.06.01 Plastic Covers. When specified in the respective gate schedule, stem covers shall be constructed of transparent plastic pipe and shall be furnished with an end cap, condensation vents, and a clear mylar position-indicating marking tape. The marking tape shall be adhesive backed and shall be permanently marked and calibrated in feet and inches [meters and millimeters]. The tape shall be applied to the stem cover after the gate has been installed and shall be so positioned that the height of the slide will be indicated by reference to the top of the stem.

2.4.06.02 Steel Covers. When specified in the respective gate schedule, stem covers shall be constructed from steel pipe and shall be furnished complete with a threaded end cap. All steel components of each cover shall be hot-dip galvanized following fabrication.

2.4.06.03 Slide Position Indicators. Each sluice gate operating mechanism with a steel stem cover shall be furnished with a digital or dial type mechanical position indicator. The indicator mechanism shall be installed inside a weatherproof housing and shall be clearly visible through a transparent, weatherproof window.

2.5 ELECTRIC ACTUATORS.

2.5.01 General. Electric actuators as listed in the Valve and Gate Schedules shall be provided by the valve or gate manufacturer.

Electric actuators for 12 inch (300 mm) and smaller butterfly valves and eccentric plug valves shall be quarter-turn type and shall be Auma "SG05.1" through "SG12.1", EIM Series HQ, Limitorque "QX", or Rotork "IQT", without exception.

All other electric actuators shall be multiturn type and shall be Auma "SA07.2" through "SA48.1", EIM "Series M2CP", Limitorque "L120" with "B320" bevel gearbox operator, or Rotork "IQ3" with "Type MTW" or "Type IWS" worm gear operator, without exception.

Electric actuators produced by other manufacturers are not acceptable.
Each electric actuator shall be furnished complete with a motor, gearing, handwheel, limit switches and torque sensors, lubricants, heating elements, wiring, and terminals. Each actuator shall be constructed as a self-contained unit with a cast

iron, weatherproof, submersible, or explosionproof housing, as specified herein, and shall be integrally assembled on the applicable valve or gate by the valve or gate manufacturer. Housings for quarter-turn actuators may be cast iron or die-cast aluminum alloy.

Actuators for valves and gates shall be designed to cycle the valve or gate from the fully open to the fully closed position or the reverse in approximately 60 seconds or as required.

Actuator motors may be mounted horizontally adjacent or vertically above the reduction gearing. All gearing shall be either oil bath or grease lubricated. When grease lubrication is used, in no case shall motors be mounted vertically below the gearing.

2.5.02 Motors. Motors shall be totally enclosed, high torque design made expressly for valve actuator service, capable of operating the valve under full differential pressure for a complete open-close and reverse cycle of travel at least twice in immediate succession without overheating. Motors shall be designed in accordance with NEMA standards and shall operate successfully at any voltage within 10 percent above or below rated voltage. Motor bearings shall be permanently lubricated.

2.5.03 Power Gearing. Power gearing shall consist of hardened steel spur or helical gears and alloy bronze or hardened steel worm gear, all suitably lubricated, designed for 100 percent overload, and effectively sealed against entrance of foreign matter. Steel gears shall be hardened to at least 350 Brinell. Planetary or cycloidal gearing or aluminum, mild steel, or nonmetallic gears will not be acceptable. Gearing shall be designed to be self-locking so that actuation of a torque switch by a torque overload condition will not allow the actuator to restart until the torque overload has been eliminated. If a secondary gear box is required, it shall be designed to withstand the locked rotor torque of the actuator.

2.5.04 Handwheel Mechanism. The handwheel shall not rotate during motor operation. During handwheel operation the motor shall not affect the actuator operation. The actuator shall be responsive to electrical power and control at all times and, when under electrical control, shall instantly disengage the handwheel. Unless otherwise required by Owner, the handwheel shall rotate counterclockwise to open the valve. An arrow indicating the opening direction and the word "Open" shall be cast on the handwheel. The force required to operate the handwheel shall not exceed 80 pounds (350 N).

2.5.05 Torque Sensing. Torque and thrust loads in both closing and opening directions shall be limited by a torque sensing device. Each torque sensing device shall be provided with an adjustment setting indicator. The adjustment shall permit a variation of approximately 40 percent in torque setting. Switches shall have a rating of not less than 6 amperes at 120 volts ac and 0.5 ampere at 115 volts dc.

2.5.06 Limit Switches. Each electric actuator shall be designed to be readily field adaptable for four limit switch assemblies. Each switch assembly shall consist of at least three separate limit switches, shall be operated by the driving mechanism, and shall be independently adjustable to trip at any point at and between the fully open and fully closed valve positions. All switches shall have an inductive contact rating of not less than 6 amperes at 120 volts ac, 3 amperes at 240 volts ac, 1.5 amperes at 480 volts ac, and 0.5 ampere at 115 volts dc.

Each quarter-turn actuator shall be provided with end-of-travel limit switches in addition to four spdt switches, each independently adjustable at any point of valve travel.

2.5.07 Position Transmitter. When specified, valves shall be provided with an electronic type position transmitter. The transmitter output shall be an isolated 4-20 mA dc capable of driving an external load of 0 to 500 ohms. Accuracy of the transmitted signal shall be plus or minus 2.0 percent of span. Repeatability and hysteresis shall be within 1.0 percent. The transmitter shall transmit to a remote position indicator which is specified in the instrumentation section.

2.5.08 Heating Elements. Space heating elements shall be provided to prevent condensation in the motor and limit switch housing. Heating elements shall be rated 120 volts ac. Heaters shall be continuously energized.

2.5.09 Terminal Facilities. Terminal facilities for connection to motor leads, switches, position transmitter, and heating elements shall be provided in readily accessible terminal compartments. Each terminal compartment shall have at least two openings for external electrical conduits, one sized at least 3/4 inch (19 mm) and the other at least 1-1/4 inches (31 mm). Each terminal compartment shall be large enough to allow easy routing and termination of fifteen 12 AWG (4 mm^2) conductors.

2.5.10 Controller. Each valve shall be furnished with a reversing controller located either inside the actuator housing or mounted on the housing in a NEMA Type 4 or stainless steel enclosure as required. The controller shall be equipped with:

A motor overload protective device in each phase or solid state motor protection.

A space heater element, rated 120 volts ac, sized to be continuously energized for prevention of condensation within the controller enclosure.

A fused control power circuit taken from one power lead on the load side of the breaker and line side of the reversing starter to ground. If power supply is greater than 120 volts ac, a control power transformer with fused secondary, with volt-ampere capacity suitable for starter control plus continuous service to space heater elements in motor housing, limit switch compartment, and controller enclosure.

A terminal block with connectors for all external controls. All leads from the actuator motor and limit switch assembly shall be routed to terminal connections in the controller for external connections to all other control devices.

Reversing controllers shall be both mechanically and electrically interlocked and provided with the necessary direct-operated auxiliary contacts for required interlocking and control.

Valve controllers shall be expressly selected for long life and reliable, low maintenance service under rugged service conditions.

2.5.11 Control Module. Valves listed for modulating service in the Butterfly Valve Schedule shall be provided with a control module for position modulating type service. The control module shall be mounted within the valve actuator limit switch housing. The module shall accept a standard 4-20 mA dc analog input signal with a load impedance of not greater than 400 ohms. The control module shall contain adjustments for span, zero, gain, and deadband.

The actuator shall have a slide-wire type position feedback potentiometer which provides a position feedback signal to the control module.

A "Manual-Automatic" selector switch shall be provided. When specified herein, the actuators shall have "Open-Close" momentary contact push buttons for local electric operation in the manual mode.

2.5.11.01 Control Performance. For any operating torque within the specified range of the valve actuator, the valve and actuator shall perform within these specified limits:

Linearity	Linearity of actual valve position as compared to demand signal shall be within plus or minus 4.0 percent of span over the entire operating range.
Repeatability	For any repeated demand signal to the valve

	actuator, the actual valve position shall be repeated
Deadband	Deadband of the valve actuator shall be adjustable from 1.0 to 10 percent of span.
Hysteresis	For any repeated demand signal to the valve actuator, from either an increasing or a decreasing direction, the actual valve position shall be repeated within 1 degree of valve shaft rotation.

2.6 HYDRAULIC CYLINDER ACTUATORS.

2.6.01 General. Hydraulic cylinder actuators as listed in the Valve or Gate Schedules shall be provided by the valve or gate manufacturer.

2.6.02 Hydraulic Cylinder Actuators. Hydraulic cylinder actuators of the double acting type shall be provided by the valve manufacturer. Cylinders shall be of tie-rod or bolted-flange construction; shall be sized to provide the safety factors stipulated in Table 6 in Section 3.8 of ANSI/AWWA C504; and shall be designed to provide satisfactory operation with either water or oil as required. Operating pressure range shall be as required. Cylinders shall be shop tested at 300 psig [2070 kPa gauge]. Actuators with nonmetallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

The valve actuator mechanism coupled to the cylinder shall be totally enclosed. The cylinder shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rod shall be enclosed in the mechanism housing and shall not be exposed to view.

2.6.03 Control Devices. When specified in the respective valve schedule, a 4-way solenoid valve, with manual actuator when specified herein, shall be provided to control the operation of each hydraulic cylinder operated valve. Each solenoid valve shall be heavy-duty, single solenoid, two-position type rated for a differential operating hydraulic pressure of 125 psig (860 kPa gauge). Each valve shall be designed and constructed for exceptionally long life, with forged brass body; poppet type seats and discs; continuous duty, molded, Class F coil; NEMA Type 4 solenoid enclosure; and 1/2 inch (12.7 mm) threaded conduit connection. Solenoid valves shall be rated for use with a power supply, as specified herein, and shall be ASCO "Model No. 8344G70MO 4-Way Pilot Operated Solenoid Valves" with manual override features as manufactured by Automatic Switch Co.

Each hydraulic connection on each cylinder shall be equipped with an adjustable flow control valve. The flow control valves and connecting piping shall be arranged to permit control of the flow rate of exhaust fluid from the cylinder and to permit the independent adjustment and control of valve opening and closing speeds. Control valves shall be sized so that the time required for the cylinder piston to complete its stroke can be adjusted from 30 to 120 seconds with fluid supply pressure as specified herein. Flow control valves shall be manufactured from brass or stainless steel and shall be Parker Hannifin "Colorflow F Series" or Mead "Dyla-Trol".

An oil reservoir shall be provided in the oil piping connecting the two flow control valves on each oil hydraulic cylinder.

2.7 AIR CYLINDER ACTUATORS.

2.7.01 General. Air cylinder actuators as listed in the Valve or Gate Schedules shall be provided by the valve or gate manufacturer.

2.7.02 Air Cylinder Actuators. Air cylinder actuators of the double acting type shall be provided by the valve manufacturer. Cylinders shall be sized to provide the safety factors stipulated in Table 6 in Section 3.8 of ANSI/AWWA C504, except as specified herein, and shall be designed to provide satisfactory operation using air, or when specified herein, dry, oil-free instrument air at 80 psig (550 kPa gauge) pressure and shall be shop tested at 240 psig (1650 kPa gauge).

Actuators with nonmetallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

The valve actuator mechanism coupled to the cylinder shall be totally enclosed. The cylinder shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rod shall be enclosed in the mechanism housing and shall not be exposed to view.

2.7.03 Control Devices. When specified in the respective valve schedule, a 4-way solenoid valve with manual actuator, when required, shall be provided to control the operation of each air cylinder operated valve. Each solenoid valve shall be heavy-duty, single solenoid, two-position type rated for a differential operating air pressure of 125 psig (860 kPa gauge). Each valve shall be designed and constructed for exceptionally long life, with forged brass body; poppet type seats and discs; continuous duty, molded, Class F coil; NEMA Type 4 solenoid enclosure; and 1/2 inch (12.7 mm) threaded conduit connection. Solenoid valves shall be rated for use with a power supply, as required, and shall be ASCO "Model No. 8344G70MO 4-Way Pilot Operated Solenoid Valves" with manual override features as manufactured by Automatic Switch Co.

Each air connection on each cylinder shall be equipped with an adjustable flow control valve. The flow control valves and connecting piping shall be arranged to permit control of the flow rate of exhaust air from the cylinder and to permit independent adjustment and control of valve opening and closing speeds. Control valves shall be sized so that the time required for the air cylinder piston to complete its stroke is adjustable between 20 and 60 seconds, with an air supply pressure of 80 psig (550 kPa gauge). Flow control valves shall be manufactured from brass or stainless steel and shall be Parker Hannifin "Colorflow F Series" or Mead "Dyla-Trol".

2.7.04 Single Acting-Spring Return Air Cylinder Actuators. When specified in the respective valve schedules, air cylinder actuators of the single acting-spring return type shall be provided by the valve manufacturer. Cylinders shall provide satisfactory operation for air of the specified quality and shall be shop tested at 240 psig (1650 kPa gauge). Actuators with non-metallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

The valve actuator mechanism coupled to the cylinder shall be totally enclosed. The cylinder shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rod shall be enclosed in the mechanism housing and shall not be exposed to view. The actuator shall be configured such that on power failure, the spring shall drive the valve open or closed. Each actuator shall be furnished with a 3-way solenoid valve. A flow control valve shall be furnished and installed in the solenoid valve vent.

2.8 AIR-OIL CYLINDER ACTUATORS.

2.8.01 General. Air-oil cylinder actuators as listed in the Valve or Gate Schedules shall be provided by the valve or gate manufacturer.

2.8.02 Air-Oil Cylinder Actuators. Air-oil cylinder actuators may be of the double acting or opposed cylinder type.

For eccentric plug valves, cylinders shall be of tie-rod or bolted-flange construction and shall be sized to provide the safety factors stipulated in Table 6 in Section 3.8 of ANSI/AWWA C504.

Each cylinder unit shall consist of an air cylinder driving an oil hydraulic cylinder of the same diameter, mounted together as a single assembly. Cylinders shall be of the tie-rod or bolted-flange construction. The air cylinder shall operate the valve, and the oil cylinder shall regulate the opening and closing speeds. Each unit shall be provided with an oil reservoir and two flow control valves on the oil cylinder.

The valve actuator mechanism coupled to the cylinders shall be totally enclosed. The cylinders shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rods shall be enclosed in the mechanism housing and shall not be exposed to view.

The air cylinder shall be designed to provide satisfactory operation using air, or when specified herein, dry, oil-free instrument air at 80 psig (550 kPa gauge) pressure. The oil cylinder shall be designed to operate at an internal pressure not to exceed 80 psig (550 kPa gauge).

For AWWA butterfly valves; actuators with nonmetallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

2.8.03 Control Devices. When specified in the respective valve schedule, a 4-way solenoid valve shall be provided to control the operation of each air-oil cylinder operated valve. Each solenoid valve shall be heavy-duty, single solenoid, two-position type rated for a differential operating air pressure of 125 psig (860 kPa gauge). Each valve shall be designed and constructed for exceptionally long life, with forged brass body; poppet type seats and discs; continuous duty, molded, Class F coil; NEMA Type 4 solenoid enclosure; and 1/2 inch (12.7 mm) threaded conduit connection. Solenoid valves shall be ASCO "Model No. 8344G70MO 4-Way Pilot Operated Solenoid Valves" with manual override features as manufactured by Automatic Switch Co.

Each oil connection on the oil cylinder shall be equipped with an adjustable flow control valve. The flow control valves and connecting oil piping shall be arranged to permit control of the flow rate of exhaust oil from the cylinder and to permit independent adjustment and control of valve opening and closing speeds. Control valves shall be sized so that the time required for the air cylinder piston to complete its stroke is adjustable between 30 and 300 seconds. Flow control valves shall be manufactured from brass or stainless steel and shall be Parker Hannifin "Colorflow F Series" or Mead "Dyla-Trol". An oil reservoir shall be provided in the oil piping connecting the two flow control valves.

2.9 PORTABLE ELECTRIC ACTUATOR. Contractor shall furnish the number of portable, electric motor driven actuators, as specified herein, with adjustable fabricated steel tripod suitable for operation of all crank-operated gates specified in Master Specification Section 02546, Sluice Gates. When indicated in the Contract Documents the portable electric actuators shall be suitable for operating all existing manual sluice and slide gate actuators.

When indicated in the Contract Documents, the actuator shall be reversible and shall be equipped with an overload release clutch for protection of the operated equipment. The clutch shall be adjustable, spring-loaded, drive-pawl type which releases instantly at a preset, predetermined torque. Disc friction clutches or shear pins will not be acceptable.

The actuator shall be suitable for operation with 120 volt, 60 Hz, single phase power, or as specified herein. A three-conductor, heavy-duty, neoprene jacketed, portable cord, with 12 AWG (4 mm^2) copper conductors and a standard grounding type plug, of a length as specified herein, shall be provided with the actuator.

Coordination of the portable actuator with the all new and existing manual actuators shall be the responsibility of Contractor.

2.10 PORTABLE HYDRAULIC ACTUATOR. Contractor shall furnish the number of portable, hydraulic driven actuators, as indicated in the Contract Documents, suitable for operation of all crank-operated sluice gates specified in Master Specification Section02546, Sluice Gates. When indicated in the Contract Documents the portable hydraulic actuators shall be suitable for operating all existing manual sluice gate actuators.

When indicated in the Contract Documents, the actuator shall be reversible and shall be equipped with an overload release clutch for protection of the operated equipment. The clutch shall be adjustable, spring-loaded, drive-pawl type which releases instantly at a preset, predetermined torque. Disc friction clutches or shear pins will not be acceptable.

The portable hydraulic actuator shall be mounted on a lightweight structural steel frame with two wheels for ease of movement. The unit shall consist of a four-cycle gasoline engine with a recoil starter driving a hydraulic pump. The unit shall include all necessary hoses, a hydraulic motor, oil reservoir and four way valve.

2.11 ACTUATOR ACCESSORIES.

2.11.01 EXTENSION STEMS. Extension stems and stem guides shall be furnished when indicated on the respective valve schedule, indicated on the drawings, or otherwise required for proper valve or gate operation. Extension stems shall be of solid steel and shall be not smaller in diameter than the stem of the valve actuator shaft. Extension stems shall be connected to the actuator with a single Lovejoy "Type D" universal joint with grease-filled protective boot. All stem connections shall be pinned.

At least two stem guides shall be furnished with each extension stem, except for buried valves. Stem guides shall be of cast iron, bronze bushed, and adjustable in two directions. Stem guide spacing shall not exceed 100 times the stem diameter or 10 feet (3 m), whichever is smaller. The top stem guide shall be designed to carry the weight of the extension stem. The extension stem shall be provided with a collar pinned to the stem and bearing against the stem thrust guide.

Extension stems for buried valves actuators shall extend to within 6 inches (150 mm) of the ground surface, shall be centered in the valve box using spacers, and shall be equipped with a wrench nut.

When indicated in the Contract Documents, extension stems for buried valve actuators shall be provided with position indicators.

2.11.02 POSITION INDICATORS. Unless otherwise specified, each valve actuator shall be provided with a position indicator to display the position of the plug or disc relative to the body seat opening.

For quarter turn plug, ball, or cone type valves installed in interior locations, the indicating pointer shall be mounted on the outer end of the valve operating shaft extension and shall operate over an indicating scale on the operating mechanism cover. Where the shaft passes through the cover, a suitable stuffing box or other seal shall be provided to prevent the entrance of water.

Each actuator for butterfly valves, except actuators that are located in manholes, buried, or submerged, shall have a valve disc position indicator mounted on the end of the valve shaft. A disc position indicator shall also be provided on each operating stand or the actuator mounted thereon.

2.11.02.01 Position Indicators for Buried Actuators. When specified in the respective valve schedule, each buried valve actuator shall be equipped with a position indicator. Position indicators shall be Indico "Model 179 Valve Position Indicators" manufactured by the Mills Engineering Company, Needham Heights, Massachusetts, or "Diviner" ground level position indicator manufactured by the Henry Pratt Company, Aurora, Illinois. Each indicator assembly shall be designed for installation on the extension stem connected to the operating stem of the buried actuator mechanism and shall be mounted in the top section of the valve box beneath the valve box cover. Each indicator shall be equipped with a wrench nut. Internal gearing shall be sealed and protected from the elements.

2.11.03 FLOOR BOXES. Openings through concrete slabs provided for key operation of valves shall be provided with a cast iron floor box complete with cover. The floor box shall be of the depth indicated on the drawings. Where the operating nut is in the slab, the stem shall have a guide to maintain the nut in the center of the box; where the nut is below the slab, the opening in the bottom of the box shall accommodate the operating key.

Each floor box and cover shall be shop coated with manufacturer’s standard coating.

2.11.04 TORQUE TUBES. Torque tube shall utilize pipe rather than solid shafting between the valve input shaft and the output shaft of the valve floorstand operator. An adjustment of 2 inches shall be provided in the torque tub installation. Torque tube shall be coated with the same material as the submerged valve.

2.12 SHOP COATING. All ferrous metal surfaces, except bearing and finished surfaces and stainless steel components of valve actuators and accessories, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field painting in Master Specification Section 09900, Painting.

The following surfaces shall be painted:

Polished or Machined Surfaces	Rust-preventive compound.
Other Surfaces	Epoxy enamel.
Actuators and Accessories	Universal primer.

PART 3 - EXECUTION

3.1 INSTALLATION. Actuators will be installed on the valves in accordance with Master Specification Section 15010, Valve Installation and Master Specification Section 02546, Sluice Gates.

End of Section

SECTION 15190

NATURAL GAS PIPING

PART 1 - GENERAL

1.1 SCOPE. This Section includes fuel gas piping within the building. Products include the following:

Pipe, tube, fittings, and joining materials.

Protective pipe and fitting coating.

Piping specialties

1.2 PROJECT CONDITIONS.

Gas System Pressure: One pressure range. More than 0.5 psig (3.45 kPa) but not more than 5.0 psig (34.5 kPa).

1.3 SUBMITTALS

1.3.01 Product Data. Submit product data for each type of product indicated.

1.3.02 Shop Drawings. Submit shop drawings for fuel gas piping. Include plans and attachments to other work. Show different pressure zones and indicate pressure for each zone.

1.3.03 Field Quality-Control Test Reports. Submit field quality control test report results.

1.3.04 Operation And Maintenance Data. Submit operation and maintenance data for each type of product indicated.

1.4 QUALITY ASSURANCE.

Electrical Components, Devices, and Accessories. Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

NFPA Standard. Comply with NFPA 54, "National Fuel Gas Code."

1.5 WARRANTY. In the event that the equipment or components fail to perform satisfactorily at any time within the Defects Liability period the Contractor shall replace it with one capable of operating as specified and shall comply with the requirements in Division 1.

The Contractor shall be responsible for all cost incurred in furnishing and installing the replacement equipment.

1.6 SPARE PARTS. Spare parts shall meet the requirements of Sections 01750 and 01760.

PART 2 - PRODUCTS

2.1 MANUFACTURERS. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 PIPING MATERIALS. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

Corrugated, Stainless-Steel Tubing Systems. Comply with AGA LC 1 and include the following:

Tubing: Corrugated stainless steel with plastic jacket or coating.

Fittings: Copper alloy with ends made to fit corrugated tubing. Include ends with threads according to ASME B1.20.1 if connection to threaded pipe or fittings is required.

Striker Plates: Steel, designed to protect tubing from penetrations.

Steel Pipe. ASTM A 53/A 53M; Type E or S; Grade B; Schedule 80; black. Wall thickness of wrought-steel pipe shall comply with ASME B36.10M.

Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, with threaded ends according to ASME B1.20.1.

Steel Threaded Fittings: ASME B16.11, forged steel with threaded ends according to ASME B1.20.1.

Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends according to ASME B1.20.1 or butt-welded joints.

Cast-Iron Flanges and Flanged Fittings: ASME B16.1, Class 125.

Joint Compound and Tape: Suitable for natural gas.

Soft Copper Tube. ASTM B 88, Type L (ASTM B 88M, Type B), annealed temper.

Copper Fittings: ASME B16.22, wrought copper, streamlined pattern.

Brazing Filler Metals: AWS A5.8, Silver Classification BAg-1. Filler metal containing phosphorus is prohibited.

2.3 PROTECTIVE COATING. Furnish pipe and fittings with factory-applied, corrosion-resistant polyethylene coating for use in contact with materials that may corrode the pipe.

2.4 PIPING SPECIALTIES.

Flexible Connectors. ANSI Z21.24, copper alloy.

Quick-Disconnect Devices: ANSI Z21.41, convenience outlets and matching plug connector.

PART 3 - EXECUTION

3.1 PREPARATION. Close equipment shutoff valves before turning off fuel gas to premises or section of piping. Perform leakage test as specified in "Field Quality Control" Article to determine that all equipment is turned off in affected piping section.

3.2 PIPING APPLICATIONS. Use flanges, unions, transition, and special fittings in applications below, unless otherwise indicated.

Fuel Gas Piping, 5 psig (34.5 kPa) or less:

NPS 1/2 (DN 15) and Smaller: NPS 3/4 (DN 20) steel pipe, malleable-iron threaded fittings, and threaded joints, Soft copper tube, copper fittings, and brazed joints and Corrugated, stainless-steel tubing system and threaded joints.

NPS 3/4 and NPS 1 (DN 20 and DN 25): Steel pipe, malleable-iron threaded fittings, and threaded joints, Soft copper tube, copper fittings, and brazed joints, Corrugated, stainless-steel tubing system and threaded joints.

NPS 1-1/4 to NPS 3 (DN 32 to DN 70): Steel pipe, malleable-iron threaded fittings, and threaded joints.

NPS 4 and larger. (DN 100) Steel, malleable-iron threaded fittings and butt-welded joints.

3.3 VALVE APPLICATIONS.

Appliance Shutoff Valves for Pressure 0.5 psig (3.45 kPa) or Less: Appliance connector valve or gas stop.

Appliance Shutoff Valves for Pressure 0.5 to 2 psig (3.45 to 13.8 kPa): Gas stop or gas valve.

Piping Line Valves, NPS 2 (DN 50) and Smaller: Gas valve.

Valves at Service Meter, NPS 2 (DN 50) and Smaller: Gas valve.

3.4 INSTALLATION. Basic piping installation requirements and piping joint construction are specified in Division 15 Section 15051 "Piping- General Requirements."

Install pressure gage, upstream and downstream from each service pressure regulator. Pressure gages are specified in Division 15 Section "Piping Specialties."

Concealed Locations: Except as specified below, install concealed gas piping in airtight conduit constructed of Schedule 40, seamless, black steel pipe with welded joints. Vent conduit to outside and terminate with screened vent cap.

Above-Ceiling Locations: Gas piping without conduit may be installed in accessible spaces, subject to approval of authorities having jurisdiction, whether or not such spaces are used as plenums. Do not locate valves above ceilings.

In Walls: Gas piping with welded joints and protective wrapping specified in Part 2 "Protective Coating" Article may be installed in masonry walls, subject to approval of authorities having jurisdiction.

Underground Locations: Locate buried pipe a maximum depth as required by code to prevent damage. Low points and drip trap legs to be located inside of building.

Prohibited Locations: Do not install gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts.

<u>Drips and Sediment Traps</u>: Install drips at points where condensate may collect. Include outlets of service meters. Locate where readily accessible for cleaning and emptying. Do not install where condensate would be subject to freezing.

> Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches (75 mm) long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap.

Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings unless specifically shown to be exposed to view.

Install fuel gas piping at uniform grade of 0.1 percent slope upward toward risers.

Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

Connect branch piping from top or side of horizontal piping.

Install unions in pipes NPS 2 (DN 50) and smaller, adjacent to each valve, at final connection to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

Install corrugated, stainless-steel tubing system according to manufacturer's written instructions. Include striker plates to protect tubing from puncture where tubing is restrained and cannot move.

Install strainer on inlet of each line pressure regulator and automatic and electrically operated valve.

Install pressure gage, upstream and downstream from each line pressure regulator. Pressure gages are specified in Division 15 Section 15120 "Piping Specialties."

Install flanges on valves, specialties, and equipment having NPS 2-1/2 (DN 65) and larger connections.

Install vent piping for gas pressure regulators and gas trains, extend outside building, and vent to atmosphere. Terminate vents with turned-down, reducing-elbow fittings with corrosion-resistant insect screens in large end.

3.5 <u>HANGER AND SUPPORT INSTALLATION</u>. Pipe hanger and support devices are specified in Section 15140 - "Pipe Hangers and Supports."

Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:

NPS 1 (DN 25) and Smaller: Maximum span, 96 inches (2438 mm); minimum rod size, 3/8 inch (10 mm).

NPS 1-1/4 (DN 32): Maximum span, 108 inches (2743 mm); minimum rod size, 3/8 inch (10 mm).

NPS 1-1/2 and NPS 2 (DN 40 and DN 50): Maximum span, 108 inches (2743 mm); minimum rod size, 3/8 inch (10 mm).

NPS 2-1/2 and NPS 4 (DN 80 and DN 100): Maximum span

Install hangers for horizontal corrugated, stainless-steel tubing with the following maximum spacing and minimum rod sizes:

NPS 3/8 and NPS 1/2 (DN 10 and DN 15): Maximum span, 48 inches (1219 mm); minimum rod size, 3/8 inch (10 mm).

NPS 3/4 and NPS 1 (DN 20 and DN 25): Maximum span, 72 inches (1829 mm); minimum rod size, 3/8 inch (10 mm).

Option: Support tubing from structure according to manufacturer's written instructions.

3.6 <u>CONNECTIONS</u>. Install piping adjacent to appliances to allow service and maintenance. Connect piping to appliances using gas with shutoff valves and unions. Install valve upstream from and within 72 inches (1800 mm) of each appliance. Install union downstream from valve.

3.7 <u>FIELD QUALITY CONTROL</u>. Test, inspect, and purge piping according to NFPA 54 and requirements of authorities having jurisdiction. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.

End of Section

SECTION 15200

STEAM AND CONDENSATE PIPING

PART 1 - GENERAL

1.1 SCOPE. this Section covers the installation of Low Pressure steam (less than 15 psig) and condensate steel piping together with fittings, specials and appurtenances for the services as indicated in the contract documents. Pipe and tubing shall be furnished complete with all fittings, flanges, unions and other accessories specified herein.

Pipe supports, anchors and expansion joints shall be furnished by Contractor, and are covered in Master Specifications Section 15140, Pipe Supports.

1.2 PERFORMANCE REQUIREMENTS. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures:

LP Steam Piping: 15 psig

Condensate Piping: Gravity at 250 deg F.

Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.

Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

1.3 SUBMITTALS.

1.3.01 Product Data. For each type of the following:

Pressure-reducing and safety valves.

Steam traps.

Thermostatic air vents and vacuum breakers.

Steam and Condensate piping.

Strainers, fittings, and valves.

1.3.02 Shop Drawings. Submittal of pipe anchors, hangers, pipe, multiple pipes, alignment guides, and expansion joints and loops and their attachment to the building structure. Detail locations of anchors, alignment guides, and expansion joints and loops.

1.3.03 Reports. Field quality-control test reports.

1.3.04 O & M. Operation and maintenance data.

1.4 QUALITY ASSURANCE.

1.4.01 ASME Compliance. Comply with ASME B31.9, "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS.

2.1.01 Steel Pipe. ASTM A 53/A 53M, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.

2.1.02 Cast-Iron Threaded Fittings. ASME B16.4; Classes 125, 150, and 300 as indicated in Part 3 piping applications articles.

2.1.03 Malleable-Iron Threaded Fittings. ASME B16.3; Classes 150 and 300 as indicated in Part 3 piping applications articles.

2.1.04 Malleable-Iron Unions. ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 piping applications articles.

2.1.05 Cast-Iron Threaded Flanges and Flanged Fittings. ASME B16.1, Classes 125 and 250 as indicated in Part 3 piping applications articles; raised ground face, and bolt holes spot faced.

2.1.06 Stainless-Steel Bellows, Flexible Connectors.

Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforced, protective jacket.

End Connections: Threaded or flanged to match equipment connected.

Performance: Capable of 3/4-inch misalignment.

CWP Rating: 150 psig.

Maximum Operating Temperature: 250 deg F.

2.2 JOINING MATERIALS.

2.2.01 Pipe-Flange Gasket Materials. Suitable for chemical and thermal conditions of piping system contents.

ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.

Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

2.2.02 Flange Bolts and Nuts. ASME B18.2.1, carbon steel, unless otherwise indicated.

2.2.03 Solder Filler Metals. ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

2.2.04 Brazing Filler Metals. AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

2.3 DIELECTRIC FITTINGS.

2.3.01 Description. Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

2.3.02 Insulating Material. Suitable for system fluid, pressure, and temperature.

2.3.03 Dielectric Unions.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Capitol Manufacturing Company.
Central Plastics Company.
Hart Industries, International Inc.
Watts Water Technologies, Inc.
Zurn Plumbing Products Group.
Or acceptable equal.

Factory-fabricated union assembly, for 250-psig minimum working pressure at 180 deg F.

2.4 VALVES.

2.1.01 Gate, Globe, Check, Ball, and Butterfly Valves. Comply with requirements specified in Division 15, Valve Sections 15091, 15092, 15093 & 15096.

2.5 STRAINERS.

2.5.01 Y-Pattern Strainers.

Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.

End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.

Strainer Screen: Stainless-steel, 20 mesh strainer, and perforated stainless-steel basket with 50 percent free area.

Tapped blow-off plug.

CWP Rating: 250-psig working steam pressure.

2.6 SAFETY VALVES.

2.6.01 Bronze or Brass Safety Valves.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Armstrong International, Inc.
Kunkle Valve; a Tyco International Ltd. Company.
Spirax Sarco, Inc.
Watts Water Technologies, Inc.
Or acceptable equal.

Disc Material: Forged copper alloy.

End Connections: Threaded inlet and outlet.

Spring: Fully enclosed steel spring with adjustable pressure range and positive shutoff, factory set and sealed.

Pressure Class: 250.

Drip-Pan Elbow: Cast iron and having threaded inlet and outlet with threads complying with ASME B1.20.1.

Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

2.6.02 Cast-Iron Safety Valves.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Armstrong International, Inc.
Kunkle Valve; a Tyco International Ltd. Company.
Spirax Sarco, Inc.
Watts Water Technologies, Inc.
Or acceptable equal.

Disc Material: Forged copper alloy with bronze nozzle.

End Connections: Raised-face flanged inlet and threaded or flanged outlet connections.

Spring: Fully enclosed cadmium-plated steel spring with adjustable pressure range and positive shutoff, factory set and sealed.

Pressure Class: 250.

Drip-Pan Elbow: Cast iron and having threaded inlet, outlet, and drain, with threads complying with ASME B1.20.1.

Exhaust Head: Cast iron and having threaded inlet and drain, with threads complying with ASME B1.20.1.

Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

2.7 PRESSURE-REDUCING VALVES.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Armstrong International, Inc.
Hoffman Specialty; Division of ITT Industries.
Leslie Controls, Inc.
Spence Engineering Company, Inc.
Spirax Sarco, Inc.
Or acceptable equal.

Size, Capacity, and Pressure Rating: Factory set for inlet and outlet pressures indicated.

Description: Pilot-actuated, diaphragm type, with adjustable pressure range and positive shutoff.

Body: Cast iron.

End Connections: Threaded connections for valves NPS 2 and smaller and flanged connections for valves NPS 2-1/2 and larger.

Trim: Hardened stainless steel.

Head and Seat: Replaceable, main head stem guide fitted with flushing and pressure-arresting device cover over pilot diaphragm.

Gaskets: Non-asbestos materials.

2.8 STEAM TRAPS.

2.8.01 Inverted Bucket Traps.

Basis-of-Design Product: Subject to compliance with requirements, provide Armstrong TVS-2011S, stainless steel inverted bucket trap with integral isolation valves, strainer and test valve, or a comparable product by one of the following:

Armstrong International, Inc.
Barnes & Jones, Inc.
Dunham-Bush, Inc.
Hoffman Specialty; Division of ITT Industries.
Spirax Sarco Inc.
Or approved equal

Body and Cap: Stainless steel ASTM A240 Grade 304L.

Connection size: 3/4” NPT

Orifice size: 5/32” NPT

End Connections: Threaded.

Head and Seat: Stainless steel.

Valve Retainer, Lever, and Guide Pin Assembly: Stainless steel.

Bucket: Stainless steel.

Strainer: Integral stainless-steel inlet strainer within the trap body.

Air Vent: Stainless-steel thermostatic vent.

Pressure Rating: 400 psig.

2.9 THERMOSTATIC AIR VENTS AND VACUUM BREAKERS.

2.9.01 Thermostatic Air Vent/Vacuum Breaker.

Basis-of-Design Product: Subject to compliance with requirements, provide Armstrong TVAB-3, stainless steel combination Thermostatic Air Vent/Vacuum Breaker, or a comparable product by one of the following:

Armstrong International, Inc.
Barnes & Jones, Inc.
Dunham-Bush, Inc.
Hoffman Specialty; Division of ITT Industries.
Spirax Sarco, Inc.
Or acceptable equal.

Body: 304-L Stainless steel

End Connections: Threaded 304 stainless steel

Thermostatic Air Vent: 3/4” NPT

Vacuum Breaker: 3/8” NPT

Valve: Stainless steel

Spring: T302 stainless steel

“O” Ring: EPDM
Screen: Stainless steel

Thermostatic Element: Phosphor-bronze bellows in a stainless-steel cage

Vacuum Breaker Body: T303 stainless steel

Maximum Allowable Pressure: 300 psig @ 365°F

Maximum Operating Pressure: 150 psig

Discharge Orifice Size: 3/16”

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS.

3.1.01 Low Pressure Steam Piping. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.1.02 Condensate Piping above Grade. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.1.03 Condensate Piping below Grade. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.2 ANCILLARY PIPING APPLICATIONS

3.2.01 Air-Vent Piping.

Inlet: Same as service where installed.

Outlet: Type K annealed-temper copper tubing with soldered or flared joints.

3.2.02 Vacuum-Breaker Piping: Outlet, same as service where installed.

3.2.03 Safety-Valve-Inlet and -Outlet Piping. Same materials and joining methods as for piping specified for the service in which safety valve is installed.

3.3 VALVE APPLICATIONS. Install shutoff duty valves at branch connections to steam supply mains, at steam supply connections to equipment, and at the outlet of steam traps.

Install safety valves on pressure-reducing stations and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install safety-valve discharge piping, without valves, to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

3.4 PIPING INSTALLATION. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Use indicated piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

Install piping to permit valve servicing.

Install piping free of sags and bends.

Install fittings for changes in direction and branch connections.

Install piping to allow application of insulation.

Select system components with pressure rating equal to or greater than system operating pressure.

Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

Install drains, consisting of a tee fitting, NPS 3/4 full port-ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

Install steam supply piping at a minimum uniform grade of 0.2 percent downward in direction of steam flow.

Install condensate return piping at a minimum uniform grade of 0.4 percent downward in direction of condensate flow.

Reduce pipe sizes using eccentric reducer fitting installed with level side down.

Install branch connections to mains using mechanically formed tee fittings in main pipe, with the branch connected to top of main pipe.

Install valves according to Division 15 Section "Valves."

Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections

of equipment, and elsewhere as indicated.
Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 nipple and full port ball valve in blow-down connection of strainers NPS 2 and larger. Match size of strainer blow-off connection for strainers smaller than NPS 2.

Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 15, “Sections 15065 & 15140."

Identify piping as specified in Division 15, Section 15200 – Mechanical Identification.

Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, and control valves.

> On straight runs with no natural drainage points, install drip legs at intervals not exceeding 500 feet, if possible.
>
> Size drip legs same size as main. In steam mains NPS 6 and larger, drip leg size can be reduced, but to no less than NPS 4.

3.5 STEAM-TRAP INSTALLATION. Install steam traps in accessible locations as close as possible to connected equipment.

Install full-port ball valve, strainer, and union upstream from trap; install union, check valve, and full-port ball valve downstream from trap unless otherwise indicated.

3.6 PRESSURE-REDUCING VALVE INSTALLATION. Install pressure-reducing valves in accessible location for maintenance and inspection.

Install bypass piping around pressure-reducing valves, with globe valve equal in size to area of pressure-reducing valve seat ring, unless otherwise indicated.

Install gate valves on both sides of pressure-reducing valves.

Install unions or flanges on both sides of pressure-reducing valves having threaded- or flanged-end connections respectively.

Install pressure gages on low-pressure side of pressure-reducing valves after the bypass connection according to Division 15, “Section 15130."

Install strainers upstream for pressure-reducing valve.

Install safety valve downstream from pressure-reducing valve station.

3.7 SAFETY VALVE INSTALLATION. Install safety valves according to ASME B31.9, "Building Services Piping."

Pipe safety-valve discharge without valves to atmosphere outside the building. Install drip-pan elbow fitting adjacent to safety valve and pipe drain connection to nearest floor drain.

Install exhaust head with drain to waste, on vents equal to or larger than NPS 2-1/2.

3.8 HANGERS AND SUPPORTS. Install hangers and supports according to Division 15 “Section 15140 - Pipe Supports. Comply with requirements below for maximum spacing.

3.9 PIPE JOINT CONSTRUCTION. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems.

Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube ends. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube," using copper-phosphorus brazing filler metal complying with AWS A5.8.

Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

> Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
>
> Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.10 TERMINAL EQUIPMENT CONNECTIONS. Size for supply and return piping connections shall be the same as or larger than equipment connections.

Install traps and control valves in accessible locations close to connected equipment.

Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.

Install vacuum breakers downstream from control valve, close to coil inlet connection.

Install a drip leg at coil outlet.

3.11 FIELD QUALITY CONTROL. Prepare steam and condensate piping according to ASME B31.9, "Building Services Piping," and as follows:

Leave joints, including welds, un-insulated and exposed for examination during test.

Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.

Flush system with clean water. Clean strainers.

Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.

Perform the following tests on steam and condensate piping:

Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.

Subject piping system to hydrostatic test pressure that is not less than 1.5 times the working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength.

After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components and repeat hydrostatic test until there are no leaks.

Prepare written report of testing.

End of Section

SECTION 15245

VIBRATION ISOLATION

PART 1 - GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of vibration isolation requirements associated with mechanical equipment. Schedules and notes on drawings indicate specific types of isolators required for each equipment.

1.2 GENERAL.

1.2.01 Governing Standards.

ASHRAE (HVACA) – ASHRAE Handbook – HVAC Applications

ASHRAE Refrigeration Handbook

ASTM A 36/A 36 M – Standard Specification for Carbon Structural Steel

1.3 SUBMITTALS.

1.3.01 Shop Drawings. Submit shop drawings for each type of vibration isolator for Engineer's review.

1.3.02 Product Data. Submit product data for vibration isolators indicating the following:

Equipment requiring isolation.

Spring outside diameters.

Free, operating, and solid heights.

1.4 QUALITY ASSURANCE. Isolation materials manufacturer shall be responsible for proper selection of spring rates to accomplish scheduled minimum static deflections, for all spring and pad type isolators, based on weight distribution of equipment requiring isolation.

Refer to Equipment Schedules.

Isolation materials manufacturer shall be responsible for structural design of steel beam bases and concrete inertia bases to support mechanical equipment scheduled to receive supplementary base.

Complete set of reviewed shop drawings of all mechanical equipment to receive vibration isolation devices shall be furnished to vibration isolation materials manufacturer, upon which selection of vibration isolators and design of supplementary bases will be completed.

1.5 WARRANTY. Manufacturer's standard warranty unless noted otherwise.

PART 2 - PRODUCTS

2.1 MANUFACTURED UNITS.

2.1.01 Selection Criteria. Select vibration isolators for actual load imposed, and in accordance with Table, Selection Guide for Vibration Isolation, in the Sound and Vibration Control chapter of the ASHRAE HVACA.

Scheduled or specified static deflection requirements relate to actual static deflection of individual mounts under their particular loads.

Unacceptable vibration isolator mounts include:

> Vibration isolator mounts selected on the basis of cataloged, nominal static, deflection, while ignoring decrease in isolation efficiency due to loadings to less than those of nominal rating.
>
> Isolator mounts loaded in excess of their rated load capacity.
>
> Isolators selected by equally dividing total weight of equipment by proposed number of isolators. Except where supported equipment is symmetrical about its vertical axis.

Isolator springs shall have ratio of horizontal to vertical spring constants of not less than 0.8, be horizontally unrestrained, of diameter not less than 80 percent of height at rated load and allow reserve travel of 50 percent of rated deflection from height at rated load to shorted turns condition.

Elastic limit of springs shall not be exceeded at shorted turns conditions.

Equip isolator mounts having steel springs with means for leveling suspended equipment.

2.1.02 Floor Mounts. Equip with leveling bolts and locknuts.

Select for convenient bolting of base plates to building structure.

2.1.03 Hanger Mounts. Furnish positioning type hanger isolators that allow installation of equipment and piping at a fixed elevation independent of load changes and subsequent transfer of suspension load to springs.

Option, preloaded hanger isolators may be furnished with preloading devices being backed off after installation.

2.1.04 Coating. Dip coat steel elements of outdoor isolators with weather resistant paint.

2.1.05 Equipment Bases and Rails.

Type A, Concrete Inertia Block Mount.

Concrete inertia block base with steel springs mounted in series with ribbed neoprene pads.

Form concrete sub-bases from prefabricated steel pouring form frames with 1 inch by 1 inch by 1/8 inch angle stiffeners crossed in both directions on 9 inch centers and welded to sides of steel frames, templates to fit equipment anchor bolts, outboard height saver brackets, and spring isolators.

Depth of steel frame shall be not less than 1/12 of its longest span, but not less than 8 inches.

Concrete: 4000 psi, reinforcing steel #4 bars, 12 inches on center each way.

Acceptable Manufacturers:

Korfund Dynamics, Type RCPF with WS mounts.

Mason Industries, Type KSL with SLFH mounts.

Kinetics, Model CIB-H with FDS bolt down mounts.

Vibration Eliminator, Type SN with OST or OSK mounts.

Vibration Mountings and Controls, Type SPF with AEH mounts.

Type B, Structural Steel Base Mounting.

Structural steel base with steel springs mounted in series with elastomer pads or mounts.

Acceptable Manufacturers:

Korfund Dynamics, Spring-Isolated Structural Base with Type WS mounts.

Mason Industries, Type MSL with Type SLFH mounts.

Kinetics, Model SFB with FDS bolt down mounts.

Vibration Eliminator, Type OSK with OST or OSK mounts.

Vibration Mountings and Controls, Type WFB with Type AWH mounts.

Type C, Structural Steel Base Mount.

Structural steel base with double deflection neoprene-in-shear mounts.

Acceptable Manufacturers:

Korfund Dynamics, Structural Base with Type F or H mounts.

Mason Industries, Type MND with ND mounts.

Kinetics, Model SFB with Model RD mounts.

Vibration Eliminator, Type C or D.

Vibration Mountings and Controls, Type WFB with Type RD mounts.

2.1.06 Vibration Isolator Mountings.

Type D, Spring Floor Mount.

Individual steel spring mounts supported on elastomer pads.

Acceptable Manufacturers:

Korfund Dynamics, Type WS Bolt Down Design.

Mason Industries, Type SLFH.

Kinetics, Model FDS Bolt Down Mounts.

Vibration Eliminator, Type OST.

Vibration Mountings and Controls, Type AWH.

Type E, Double Spring Floor Mounts with Lift Restraint.

Double, side-by-side spring mounts with lift restraints, and supported on elastomer pads.

Acceptable Manufacturers:

Korfund Dynamics, Type WSCL.

Mason Industries, Type SLR.

Kinetics, Model FLS.

Vibration Eliminator, Type KW.

Vibration Mountings and Controls, Type AWR.

Type F, Neoprene-In-Shear Floor Mount.

Individual double deflection neoprene-in-shear mounts.

Acceptable Manufacturers:

Korfund Dynamics, Type F.

Mason Industries, Type ND.

Kinetics, Model RD.

Vibration Eliminator, No. 140 or No. 240.

Vibration Mountings and Controls, Type RD.

Type G, Neoprene Pad Floor Mount.

Ribbed or waffle pattern neoprene pads, single or multilayered as required for equipment's static deflection.

Acceptable Manufacturers:

Korfund Dynamics, Korpad.

Mason Industries, Type WSW or Super W.

Kinetics,Model NP or NG.

Vibration Eliminator, Type 100N.

Vibration Mountings and Controls, Shear-Flex.

Type H, Combination Spring and Neoprene-In-Shear Hanger Mount.

Hanger isolators with steel springs mounted in series with elastomer elements.

Acceptable Manufacturers:

Korfund Dynamics, Type VSPL.

Mason Industries, Type PC30N.

Kinetics,Model SRHPL.

Vibration Eliminator, Type PCSR.

Vibration Mountings and Controls, Series RSHP.

Type J, Neoprene-in-Shear Hanger Mount.

Hanger isolators with elastomer elements.

Acceptable Manufacturers:

Korfund Dynamics, Type H.

Mason Industries, Type HD.

Kinetics, Model RH.

Vibration Eliminator, C Series.

Vibration Mountings and Controls, Series RHDC.

Type K, Thrust Restraint.

Thrust restraint, having spring with elastomer element mounted in series, housing, rods, brackets, and means for presetting thrust force.

Acceptable Manufacturers:

Korfund Dynamics, Thrust Restraints.

Mason Industries, Type WB.

Kinetics, Thrust Restrainer.

Vibration Eliminator, Thrust Restraints.

Vibration Mountings and Controls, SH-27.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.1 General. Install vibration isolation materials and equipment bases in accordance with manufacturer's written instructions.

Remove debris trapped between equipment bases and floor.

Level mountings so each mount carries assigned load.

Mounts showing evidence of insufficient or excessive loading, buckling, squirming, totally collapsed springs, making permanent contact with _lift or sag restraints, or shorted springs and elastomer elements will not be accepted.

Install hanger type isolators so no shorting will occur via contact between upper and lower hanger rods or via contact between lower hanger rods and isolator boxes.

Locate floor vibration isolator mounts so base plates are supported in horizontal position by floor slabs, beams, or other structural elements.

Isolator placements resulting in overhanging or tilted base plates or in bending stresses in steel plate or bar grate flooring are unacceptable.

Bolt base plates to supporting structure.

Prepare pouring forms of inertia bases for concrete placement in accordance with manufacturer's instructions.

Make provisions for bond breaking between concrete fill and floor structure.

Vibrate concrete in place to ensure uniform filling.

Carefully remove spilled concrete.

Remove shipping bolts and blocks from isolator mounts.

Jack spring leveling bolts to obtain full floating equipment suspension.

Level vibration isolator mounts and bases, to attain fully floating equipment suspension under loading conditions of actual operation and adjust restraints.

Adjust or replace defective elements as required.

After installation of isolation materials and before start-up of equipment, clear debris from areas surrounding and beneath isolated equipment.

No rigid connections between equipment and building structure shall be made that degrades noise and vibration isolation system.
Electrical conduit connections to isolated equipment shall be installed with slack to allow free motion of isolated equipment.

3.2 APPLICATION OF MOUNTING TYPES.

Mountings: Types scheduled on Drawings.

Static deflection requirements: Where not indicated, defined in ASHRAE HVAC Systems and Applications Handbook.

Ductwork located within 50 feet of connections to air handling units: Support with Type H vibration isolators selected for a static deflection of 0.75 inch.

Fans and air handling units: At flexible connections install Type K thrust restraints, where developed aerodynamic thrust exceeds 10 percent of weight, and where fan static pressure exceeds 5 inches water gauge.

End of Section

SECTION 15250

MECHANICAL INSULATION

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of insulation, jackets accessories for mechanical piping, ductwork and equipment. Building insulation materials are specified in other sections. Insulation for mechanical equipment which is to be applied at the factory prior to shipment is specified in the individual equipment sections.

1.2 GENERAL. Materials furnished and installed under this section shall be in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall be responsible for coordinating the installation of insulation with the installation of the piping, ductwork, and equipment to be insulated. The piping, ductwork, and equipment shall be tested and accepted by Engineer before installation of the insulation materials.

Contractor shall verify that each component of the insulation systems is compatible with all other parts of the system; that all insulation materials are appropriate for the intended applications; and that all necessary devices and accessories have been provided.

All insulation of the same class shall be the product of a single manufacturer; however, all the insulation types need not be the products of one manufacturer.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL, NFPA, and ASTM safety requirements.

1.2.04 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.05 Surface Burning Characteristics. Insulation, jackets, tapes, and adhesives to be used indoors shall have a composite flame spread rating not to exceed 25 and a composite smoke developed rating of 50 when tested by UL 723, NFPA 255, or ASTM E84. All testing shall be done on materials of the same densities and installed thicknesses as the materials being installed. Insulation materials which have been treated with a flame retardant additive to meet the required flame spread and smoke developed ratings are not acceptable.

1.2.06 Painting and Identification. Field painting and identification shall be as specified inMaster Specification Section 09900, Painting.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. A complete list of materials and catalog cuts, together with detailed specifications, materials performance data, installation instructions, parts, devices, and accessories furnished, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Information shall include certified test results to show compliance with UL, NFPA, and ASTM safety requirements.

1.4 QUALITY ASSURANCE.

1.4.01 Manufacturer Experience. A manufacturer shall have furnished material of the type specified which has been in successful operation for not less than the past 5 years.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance withMaster Specification Section 01180, Equipment, Materials, Parts, and Tools .

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.2 MATERIALS.

2.2.01 Pipe Insulation.

2.2.01.01 Type PMF1 Insulation. Type PMF1 mineral fiber pipe insulation shall be Schuller "Micro-Lok", Knauf "Pipe Insulation" Owens/Corning, or approved equal.

Type PMF1 pipe insulation shall be a one-piece molded glass fiber material with all-purpose jacket. The all-purpose jacket shall be factory-applied, fiberglass reinforced vapor barrier type, with white kraft bonded to aluminum foil and self sealing adhesive lap. The insulation shall be suitable for a temperature range of 0°F to 850°F (-18°C to 454°C), shall have a maximum thermal conductivity (k) of 0.24 BTU in/hr ft^2 °F at 75°F (0.035 W/m °C at 24°C), and shall conform to ASTM C547.

2.2.01.02 Type PMF2 Insulation. Type PMF2 high temperature mineral fiber pipe insulation shall be Fibrex "Epitherm 1200", or approved equal.

Type PMF2 pipe insulation shall be a high temperature, sectional or segmented mineral fiber forms with thermosetting binder suitable for temperatures up to 1200°F (649°C), and shall be provided in multiple layers. Fittings and valves shall be insulated with factory-made molded fiber fittings or built-up sections of pipe covering. The insulation shall conform to ASTM C547.

2.2.01.03 Type PFC1 Insulation. Type PFC1 flexible cellular elastomeric pipe insulation shall be Armstrong "Armaflex", Rubatex "R-180-FS", or approved equal. Flexible cellular polyolefin foam insulation shall be IMCOA "Imcolock" or “Imcoshield", or approved equal.

Type PFC1 pipe insulation shall be one-piece, molded elastomeric or polyolefin foam insulation suitable for a temperature range of -40°F to 210°F (-40°C to 99°C), and shall have a maximum thermal conductivity (k) of 0.28 BTU in/hr ft^2 °F at 75°F (0.040 W/m °C at 24°C). The insulation shall be suitable for exposure to weather and direct sunlight or, where not indicated to be jacketed, shall be given two coats of an ultraviolet-resistant finish recommended by the manufacturer. The insulation shall conform to ASTM C534.

2.2.02 Duct Insulation.

2.2.02.01 Type DMF1 Insulation. Type DMF1 semi-rigid type duct insulation shall be Schuller "800 Series Spin-Glas", Knauf "Insulation Board", Owens/Corning, or approved equal.

Type DMF1 exterior insulation for rectangular ductwork shall be a semirigid, 3 pound per cubic foot (48 kg/m^3) density fiberglass material with a factory-applied all service jacket. The insulation shall conform to ASTM C612.

2.2.02.02 Type DMF2 Insulation. Type DMF2 flexible type duct insulation shall be Schuller "Microlite", Knauf "Duct Wrap", Owens/Corning, or approved equal.

Type DMF2 exterior insulation for round ductwork shall be 1 pound per cubic foot (16 kg/m^3) density flexible fiberglass duct wrap with factory-applied foil-scrim-kraft facing. The insulation shall conform to ASTM C553.

2.2.03 Equipment Insulation.

2.2.03.01 Type EMF1 Insulation. Type EMF1 equipment insulation shall be Schuller "800 Series Spin-Glas", Knauf "Insulation Board", Owens/Corning, or approved equal.

Type EMF1 equipment insulation shall be rigid mineral fiber insulation board with a density of 6 pounds per cubic foot (96 kg/m^3) and a factory-applied foil-scrim-kraft facing. The insulation shall conform to ASTM C612.

2.2.03.02 Type EMF2 Insulation. Type EMF2 equipment insulation shall be Fibrex "Mineral Fiber Blanket", or approved equal.

Type EMF2 equipment insulation shall be high temperature mineral fiber blanket with a thermosetting binder suitable for temperatures up to 1200°F (649°C) and shall have a density of 8 pounds per cubic foot (128 kg/m^3). The insulation shall conform to ASTM C592.

2.3 ACCESSORIES.

2.3.01 PVC Insulation Jackets. PVC insulation jackets for piping systems shall be furnished and installed as specified herein and indicated on the drawings.

All fittings in piping systems insulated with mineral fiber shall be jacketed with a polyvinyl chloride (PVC) jacketing material. Piping systems where indicated to have PVC jackets shall be jacketed with the same PVC jacketing material. Jackets for fittings shall be one piece, factory molded to the contour of the fitting. The PVC jacket and fitting covers shall have a minimum thickness of 0.02 inches (0.51 mm) when installed indoors and 0.03 inches (0.76 mm) when installed outdoors. PVC jacketing shall be Schuller "Zeston 2000 Series", or approved equal.

2.3.02 Aluminum Insulation Jackets. Aluminum insulation jackets for insulated piping systems shall be furnished and installed as required and indicated on the drawings.

Fittings in insulated piping systems and equipment where indicated in the insulation schedule shall be provided with aluminum jackets of the same aluminum jacketing material as the piping systems. The aluminum jacket shall be Alclad 3004, or approved equal complying with ASTM B209. The jacket shall have a nominal thickness as indicated, with an embossed finish. A factory-applied asphalt and kraft paper vapor barrier or polyethylene film and kraft paper vapor barrier shall extend the full width of the jacket.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 General. Contractor shall install all insulation materials as specified herein for the piping systems, ductwork, and equipment, as required, that are not factory insulated. Insulation materials shall be installed in accordance with the manufacturer's written instructions and recommendations. Surfaces to be insulated shall be cleaned and dried. Insulation shall be kept clean and dry and shall remain in the factory container until it is installed. Packages or factory containers shall bear the manufacturer's stamp or label with the name of the manufacturer and description of materials.

Seams of exposed insulation and jackets shall be in the least visible location.

3.1.02 Piping Insulation.

3.1.02.01 Type PMF1 Insulation. Pipe insulation shall be installed to cover all piping, fittings, and appurtenances. Insulation shall be full length of the factory unit using a single cut piece to complete the run. Abutting cut pieces or scraps shall not be used. End joints and longitudinal seams shall be tightly butted. Insulation for fittings shall be of the same thickness and conductivity as the adjoining pipe insulation.

Insulated piping conveying fluids at lower than ambient temperatures shall be jacketed with a continuous vapor barrier. The insulation shall be continuous through hangers and penetrations, except at firewall penetrations, and shall be sealed with vapor barrier coating. The vapor barrier coating shall be applied at intervals not exceeding 15 feet (4.6 m) for straight runs and not more that 6 inches (150 mm) from fittings. Fibrous insulation laps and butt strips that are not self-sealing shall be secured with adhesive and stapled. Staples and seams shall be coated with vapor barrier material.

On piping 2 inches (50 mm) and larger where the insulation is continuous through the hanger, an insert shall be installed between the support shield and piping. The insert shall be of the same thickness and contour as the adjacent insulation and installed to maintain a continuous vapor barrier through the support. The insert shall be constructed of wood or heavy density insulating material suitable for the system operating temperatures.

3.1.02.02 Type PMF2 Insulation. The insulation shall be installed in layers as required to obtain the specified thickness. Joints and seams between insulation sections or segments shall be tight and shall be staggered between layers. The insulation shall be shall be fastened with stainless steel wire loops on 6 inch

(150 mm) centers embedded into the outer layer. All cracks, voids, and depressions shall be filled with insulating cement suitable for the system operating temperatures. The surfaces to receive outer coverings shall be smooth and uniform. Flanges and expansion joints in exhaust piping shall not be insulated.

3.1.03 Duct Insulation. Insulation for ducts indicated on the drawings as wrapped shall be installed as specified herein and indicated on the drawings. Duct insulation shall be continuous through hangers and penetrations, except firewall penetrations but shall be interrupted at thermometers, controls, damper linkages, flexible connections, access doors, etc., to avoid interference with their functioning and/or replacement. Insulation jackets shall be continuous across seams, reinforcement, and projections.

Insulation on ducts conveying air at temperatures below 60°F (16°C) shall be installed with a continuous vapor barrier seal. Staples and joints shall be sealed with a vapor barrier coating.

3.1.03.01 Type DMF1 Insulation. Type DMF1 semirigid insulation shall be secured to all four sides of the duct with mechanical fasteners, spaced not more than 12 inches (305 mm) apart and not more than 3 inches (76 mm) from the edges of the insulation joints. At least two rows of fasteners shall be provided for each side of 12 inch (305 mm) and larger ducts, and one row for each side of ducts smaller than 12 inches (305 mm). All joints in the insulation shall be sealed with 3 inch (76 mm) wide joint sealing tape or 4 inch (102 mm) wide strips of jacket material secured with adhesive and staples.

3.1.03.02 Type DMF2 Insulation. Type DMF2 flexible insulation shall be installed with waterproof, fire-retardant adhesive. Insulation jackets shall overlap at least 2 inches (51 mm) and shall be secured under the overlap with adhesive and stapled on 4 inch (102 mm) centers.

3.1.04 Equipment Insulation. Insulation for equipment shall be installed as specified herein and indicated on the drawings. Equipment insulation shall be installed and fastened as recommended by the manufacturer.

Equipment insulation shall be installed in as closest contact possible with the equipment surface and shall be secured with studs, pins, clips, adhesives, wires, or bands. Pumps may be insulated by forming a box around the pump housing. Seams shall be sealed with joint sealing tape. A smooth coat of insulation cement shall be applied over the insulation except at removable sections. On equipment with surface temperatures lower than 60°F (16°C), two coats of vapor barrier coating shall be applied.

Equipment insulation shall be applied with interruptions for access to manholes, flanges, and other openings without disturbing the insulation. Boxouts with beveled and sealed edges shall be provided around code stamping symbols and nameplates.

3.1.05 PVC Jacketing. PVC jacketing for piping systems shall be installed as specified herein and indicated on the drawings. End joints and longitudinal seams on piping systems conveying fluids at lower than ambient temperatures shall be vapor-sealed, and covered with vapor-barrier tape to ensure a continuous vapor seal. Fittings shall be insulated with glass fiber material.

3.1.06 Aluminum Jacketing. Aluminum jacketing for piping systems shall be installed as specified herein and indicated on the drawings. Jacketing shall be held in place with stainless steel securing bands uniformly spaced at not more than 18 inches (457 mm) to produce tight joints without "bulging". The jacket shall overlap at least 2 inches (51 mm) at longitudinal and circumferential joints. Joints shall be overlapped and sealed with caulk to prevent moisture penetration, and longitudinal joints shall be placed to shed water. Exposed ends of pipe insulation shall be provided with covers constructed of the same material as the jacketing.

Elbows shall be jacketed with spirally wrapped aluminum strips or individual mitered segments or gores cut to fit the insulation.

3.2 INSULATION SCHEDULE.

INSULATION SCHEDULE				
Service	Size Inches (mm)	Mechanical Insulation		Notes
		Type	Thickness Inches (mm)	
PIPING - INDOOR (CONCEALED OR EXPOSED)				
Chilled Water	All	PMF1	1 (25)	(3)

Heating Water Pumps	All	EMF1	1-1/2 (40)	

Mechanical Insulation Types: FC - Flexible Cellular
MF - Mineral Fiber

Notes:

(1) PVC jacket.

(2) Aluminum jacket.

(3) PVC jackets shall be provided on exposed portions of insulated piping located less than 8 feet (2.4 m) above finished floor. On all other portions of the insulated piping system PVC jackets shall be provided only for fittings.

(4) Insulation shall be provided for portions of the piping system which pass through space above finished ceilings or is exposed above equipment, electrical panels, or cabinets.

(5) Insulation shall be provided for exposed portions of the piping system located less than 8 feet (2.4 m) above the finished floor or grade.

(6) Insulation shall be provided for outside air plenums and ducts with heating coils which are located upstream of the heating coil or pass through unheated spaces after the heating coil, unless indicated to be internally lined.

(7) Insulation shall be provided for air conditioning supply ducts, air

conditioning return ducts, and dehumidifier reactivation air discharge ducts, unless indicated to be internally lined.

(8) Insulation thickness shall be sufficient to provide a cold face temperature not to exceed 150°F (66°C).

(9) The underside of all roof drains shall be insulated to a 1 foot (300 mm) radius from the center of the drain. All roof drain piping within 4 feet (1.2 m) of the drain shall be insulated.

Unless otherwise indicated in the insulation schedule, all mechanical piping, ductwork, equipment, and accessories with an operating temperature in excess of 140°F (60°C) and below 60°F (15°C) shall be insulated.

End of Section

SECTION 15300

FIRE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of materials, equipment, and appurtenances associated with wet-pipe and dry-pipe fire sprinkler systems. All labor, materials, tools, equipment, service and supervision required to design, install, test, and place the fire sprinkler systems in service shall be provided.

Fire sprinkler systems shall meet the design conditions and features as specified and as indicated on the drawings.

1.2 GENERAL.

1.2.01 Coordination. Piping, equipment, and appurtenances furnished and installed under this section shall be designed, fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations furnished by the manufacturer unless exceptions are noted by Engineer.

Contractor shall verify that each component of the fire sprinkler system is compatible with all other parts of the system; that all piping, equipment, and appurtenances are appropriate for the intended function; and that all devices necessary for a properly functioning system have been provided.

Equipment and appurtenances furnished under this section shall be the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the products of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Contractor shall become familiar with details of the work, shall verify dimensions in the field, and notify Engineer of any discrepancy before performing the work.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with the applicable national, state, and local codes and ordinances, laws, regulations, and NFPA Standards which pertain to such work. In case of a conflict between these specifications and any applicable national, state, or local code, ordinance, law, regulation, or NFPA Standard, the latter shall govern.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete design calculations; assembly, and installation drawings; together with complete engineering data covering the materials used and the parts, devices, and accessories forming a part of the equipment and appurtenances furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

The data and specifications submitted shall include, but not be limited to, the following:

Design Documents

Complete working plans, hydraulic calculations, water supply data, and information required by NFPA Standards.

Equipment, Piping, and Appurtenances

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Capacities.

Pressure and temperature ratings.

Overall dimensions.

Piping connection type, size, and location.

Wiring diagrams.

Pressure loss data.

Net weight.

Test Reports

Test reports and certificates as described in NFPA Standard No 13.

1.3.02 Operation and Maintenance Manuals. Operation and maintenance instructions shall be provided for the equipment and appurtenances furnished under this section.

1.4 QUALITY ASSURANCE. All materials and work shall conform to the requirements of the National Fire Protection Association (NFPA), Factory Mutual (FM), and Underwriters' Laboratories (UL).

Manufacturer's providing equipment and appurtenances shall be listed by product name and manufacturer in the UL Fire Protection Equipment Directory and FM Approval Guide.

Fire sprinkler system materials shall be permanently stamped or labeled with the Listing and Approval Agency's identification.

Materials, installation, inspection, and testing of the fire sprinkler system shall comply with the requirements of the local authorities having jurisdiction and Owner's insurance underwriter.

The sprinkler system drawings and calculations shall be performed by an individual with National Institute for Certification of Engineering Technologies (NICET) III certification and signed and sealed by a registered professional engineer licensed in the state of Michigan.

The fire sprinkler system shall be installed by a firm having previously installed a minimum of five systems similar in size and scope to this project.

1.5 PERFORMANCE AND DESIGN REQUIREMENTS. All piping, equipment, and appurtenances shall be designed to meet the performance and design conditions as specified herein and on the drawings. The system shall be designed as an automatic wet-pipe or automatic dry-pipe sprinkler system as indicated in Schedule 13930-S01. The system type, zoning, hazard classification, sprinkler density, and design area of operation shall be as indicated on the drawings, or on schedules, as indicated.

The design area represents the minimum area to be considered for hydraulic calculations. The system shall be designed to discharge the sprinkler density over the most hydraulically demanding design area. The area required to be sprinkled may be larger than the design area.

Water allowances shall be made for inside or outside hose streams as required. Hose stream flow rates shall be as specified by NFPA Standards.

1.5.01 Flow Test. Sprinkler system design shall be performed using either data from a test performed by Contractor, or data supplied by Engineer.

When indicated, Contractor shall perform a water flow test to verify that adequate pressure is available at the required flow before the system is designed. Water supply information provided on the data sheet is based on estimates and shall be verified by flow test prior to designing the sprinkler system. The verification flow test and data shall be the responsibility of Contractor. If it is not possible to perform a flow test prior to designing the system, the test may be performed later, however, Contractor shall accept responsibility for any modifications required in the event that the flow tests indicate a lower available water supply than that on which the calculations were based.

1.5.02 Pipe Sizing. The sprinkler system shall be hydraulically calculated, and shall include a safety factor as indicated at the required flow.

Pipe and accessory sizes indicated on the drawings are the minimum allowed, and shall be increased if determined necessary by hydraulic calculations. The water velocity in piping systems shall not exceed 20 fps (6.1 m/s) at design flow.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.7 EXTRA MATERIALS. A supply of spare sprinklers shall be provided in accordance with NFPA Standard No 13. The sprinklers shall be stored in a suitable metal container and shall be representative of the number of each type and each temperature rating of the sprinklers installed.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment identification, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All components of the fire sprinkler system shall be designed to meet the specified conditions indicated in the Contract Documents.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as indicated in the respective product description paragraphs.

2.3 MATERIALS. All piping systems and related components shall be rated for at least 175 psig (1207 kPa) working pressure.

2.3.01 Anchor Bolts and Expansion Anchors. All anchor bolts, expansion anchors, nuts and washers shall comply with UL, FM, and NFPA requirements. Powder-driven anchor assemblies shall not be used.

2.3.02 Piping Systems. Piping on the supply side of the backflow prevention device shall be as specified in other sections for potable water use. Piping on the sprinkler side of the backflow prevention device shall be black or galvanized steel pipe as follows:

Standard Weight ASTM A53 with Threaded Malleable or Cast Iron Fittings.

All 2 inch (51 mm) and smaller piping.

Standard Weight ASTM A53 with Flanged Fittings.

All 2-1/2 inch (63 mm) and larger piping.

Standard Weight ASTM A53 with Grooved-End Fittings.

All 2-1/2 inch (63 mm) and larger piping on the sprinkler side of the backflow preventer. (Optional)

Schedule 10 ASTM A135 with Roll-Grooved Fittings.

All 2-1/2 inch (63 mm) and larger piping on the sprinkler side of the backflow preventer. (Optional)

Galvanized steel pipe shall be used for sprinkler piping in the systems and locations as required. Pipe shall be furnished complete with all fittings, jointing materials, supports and anchors, and other accessories required for a complete system.

Plain-end fittings with mechanical devices which grip into the pipe, and saddle type branch fittings shall not be used.

2.3.03 Pipe Supports. Pipe supports shall be suitable for the application, construction, and type and size of pipe used.

"C" type clamps shall be provided with retaining clips and shall not be used for piping larger than 1 inch (25 mm) size.

Galvanized hanger assemblies shall be used for the support of galvanized steel piping systems.

2.3.04 Service Valves. Service valves shall be UL-listed and FM approved, with 175 psig (1207 kPa) non-shock minimum working pressure rating.

2.3.04.01 Gate Valves. Gate valves in 2 inch (51 mm) and smaller sizes shall be cast-bronze with threaded ends, solid wedge disc, outside screw and yoke, and rising stem.

Gate valves in 2-1/2 inch (63 mm) and larger sizes shall be iron body, bronze mounted, with tapered solid wedge disc, outside screw and yoke, and rising stem. Valves shall be provided with replaceable bronze disc facing rings and flanged ends.

Gate valves in 4 inch (102 mm) and larger sizes for use with indicator posts shall be iron body, bronze mounted, with solid wedge disc, non-rising stem, operating nut, replaceable bronze disc facing rings, and bonnet cap for indicator post. Gate valves for use with wall indicator posts shall be provided with flanged ends. Gate valves for use with vertical indicator posts shall be provided with flanged or mechanical joint ends.

Indicator posts shall be wall type or vertical type, as indicated. When indicated, the indicator post shall be provided with a supervisory switch to alarm when the valve is not in the full open position.

Wall type indicator posts shall be with cast-iron body, windows for target plates that indicate valve position, extension rod and coupling, locking device, hand wheel operator, wall flange, and red enamel finish.

Vertical type indicator posts shall be with cast-iron body, ductile iron barrel, windows for target plates that indicate valve position, extension rod and coupling, locking device, operating wrench, and red enamel finish. The indicator post shall be of suitable length for the water main bury depth, with the operating handle located approximately 3 feet (900 mm) above finish grade.

2.3.04.02 Butterfly Valves. Butterfly valves in 3 inch (76 mm) and larger sizes shall be provided with cast iron body, iron or aluminum/bronze disc, BUNA-N or EPDM seat sleeve. Valve body shall be lug or grooved type as determined by the piping system. Butterfly valves shall be provided with an integral indicator to show disc position. The indicator shall include a pre-wired single-circuit supervisory switch rated for 10 amperes ac.

2.3.04.03 Ball Valves. Ball valves in 2 inch (51 mm) and smaller sizes shall be brass ball and body with reinforced Teflon seat and threaded ends.

2.3.04.04 Check Valves. Swing check valves 2-1/2 inch (63 mm) and larger shall be cast-iron body with bolted cap, bronze disc or cast-iron disc with bronze disc ring, and flanged ends.

2.3.05 Specialty Valves. Specialty valves shall be UL-listed and FM approved, with 175 psig (1207 kPa) non-shock minimum working pressure rating.

2.3.05.01 Alarm Check Valve. When an alarm check valve is indicated, it shall be provided with variable pressure trim and standard accessories including pressure gauges; alarm switch with contacts rated for 120 volts, 10 amperes; testing bypass;

drain cup; retarding chamber; and all necessary pipe, fittings, and accessories required for a complete trimming installation in accordance with NFPA No. 13. The valve shall be provided with flanged inlet and outlet, bronze grooved seat with O-ring seals, and single hinge pin and latch design. The alarm switch shall be wired to the fire alarm system.

2.3.05.02 Dry-Pipe Valve. When a dry-pipe valve is indicated, it shall be a latching differential valve and shall be provided with standard accessories including drip check valve; drain cup; reset bar; alarm test shut-off valve; pressure gauges; alarm switch with contacts rated for 120 volts, 10 amperes; testing bypass; and all necessary pipe, fittings, and accessories required for a complete trimming installation in accordance with NFPA No. 13. The valve shall be provided with flanged inlet and outlet, bronze grooved seat with O-ring seals, and single hinge pin and latch design. The alarm switch shall be wired to the fire alarm system.

An accelerator, anti-flood device, and associated trim package shall be provided with each dry-pipe valve.

2.3.05.03 Deluge Valve. The system deluge control valve shall be a listed indicating type valve. The control valve shall be UL listed and Factory Mutual (FM) approved for fire protection installations. The system control valve shall be rated for normal system pressure but in no case less than 175 psi. Acceptable manufacturers shall be Viking, Victaulic or approved equal.

The system valve shall be cast-iron body, hydraulically operated, differential-pressure type. Include bronze seat with O-ring seals, trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, drip cup assembly piped without valves and separate from drain line, fill-line attachment with strainer, and push-rod chamber supply connection.

Water Control Valve: The deluge system shall utilize a 90° pattern or straight type of deluge valve shall be externally resettable by hydraulic means. The deluge valve shall employ a positive vent on the priming line to ensure that the deluge valve will not prematurely reset. The inlet and outlet connections of deluge valve can be flanged by flanged, flanged by grooved or grooved by grooved, respectively. The deluge valve shall be capable of installation in the vertical or horizontal position. The deluge valve shall be UL Listed and Factory Mutual Approved. The deluge valve shall have a working pressure of 250 PSI. The valve trim shall be compatible and shall be installed following the manufacturer’s specifications. The Deluge Valve manufacturer shall be Viking E-1 or F-1 series or approved equal.

Water Control Valve Trim: The deluge valve trim shall incorporate a pressure operated relief valve (PORV) of the same manufacturer as the deluge valve, to provide a hydraulic means to positively vent the priming water chamber. All deluge valve trim piping and devices shall be listed for use as deluge system. The deluge valve trim shall be galvanized and rated for 250 PSI working pressure. The Deluge Valve Trim shall be compatible with Viking E-1 or F-1 deluge valve, or approved equal.

Water Control Valve Release Panel: The deluge valve release panel shall be 120 VAC or 220 VAC powered with a 24 hour D/C backup power supply. The deluge valve release panel shall be capable of accepting cross-zoned detection as the means of system release. The deluge valve release control panel shall conform to NFPA 70, NFPA 72 and all other applicable codes. The deluge valve release control panel shall be listed for use with a Viking Model E-1 or F-1 deluge valve. The Deluge Release Panel shall be a Simplex-Grinnell, Viking, or approved equal.

Solenoid Valve: An electric solenoid valve shall be utilized to release the priming chamber water pressure. The solenoid valve shall be 24 VAC and conform to NFPA 70. The Solenoid shall be listed for the use with Viking Model E-1 or F-1deluge valve, or approved equal.

Discharge Devices: Nominal 1/2-inch orifice for “Ordinary” temperature classification rating, unless otherwise indicated or required by application.

Open Sprinklers: UL 199, without heat-responsive element.

Orifice: 1/2-inch, with discharge coefficient K between 5.3 and 5.8.

Orifice: 17/32-inch, with discharge coefficient K between 7.4 and 8.2.

Supplemental Detection System: Electrical devices utilized in the supplemental detection system shall be compatible with the release control panel. Installation of electrical supplemental detection system shall be in accordance with N.F.P.A. 70, NFPA 72 and local installation requirements. The detection system shall be inspected, tested and maintained in accordance with all applicable standards and codes.

System Piping: System piping shall conform to NFPA 13, Standards for Installation of Sprinkler Systems. System piping shall be listed for the maximum system pressure it is to be exposed to. All system piping shall be metallic and shall be protected against corrosion of corrosive exist.

Hangers: Deluge sprinkler system hangers shall conform to NFPA 13, Standards for Installation of Sprinkler Systems. The system piping shall be substantially supported to prevent sway or thrust. The hanging of no-system components from the sprinkler piping shall be strictly prohibited. The use of non-metallic hanger materials shall be prohibited unless expressed otherwise.

Fittings: Pipe fittings installed on the deluge sprinkler system shall be in conformance with NFPA 13, Standards for Installation of Sprinkler Systems. The fittings shall be listed for use at the system pressures to be encountered. Fittings shall be corrosion resistant if they are to be installed in a corrosive atmosphere.

2.3.05.04 Air Maintenance Device. An air maintenance device shall be provided for each dry-pipe system. The air maintenance device shall be furnished as a complete assembly, including pressure regulator, pressure relief valve, strainer, shut-off valves, bypass valve, check valve, restriction device, and associated piping. The pressure reducing valve and pressure relief valve settings shall be suitable for the water system supply pressure.

2.3.05.05 Ball Drip Valves. Ball drip valves shall be automatic drain type, 3/4 inch (19 mm) body size, with spring-loaded ball check device and threaded ends.

2.3.05.06 Backflow Preventer. The sprinkler system backflow preventer shall be a double check, double check detector, reduced pressure principle, or reduced pressure detector type as required. The unit shall be epoxy-coated cast iron, with bronze seat and stainless steel trim. Gate valves with flanged ends, outside screw and yoke, rising stem, and resilient seats shall be factory installed at each end of the unit. Each gate valve shall be provided with a supervisory switch to alarm in the event that the valve is not in the full open position.

Detector type backflow preventers shall have a bypass consisting of a bronze displacement type water meter in series with a bronze backflow preventer with ball valves on the bypass line. The backflow preventer on the bypass line shall be double check or reduced pressure principle type as needed to match the primary unit. Backflow preventers shall be as manufactured by Febco, Watts Industries, Inc., or approved equal.

2.3.06 Automatic Sprinklers. Sprinklers shall be furnished and installed in accordance with their listed spacing limitations. Automatic sprinklers shall be provided with heat responsive elements conforming to UL 199. Sprinkler types and categories shall be as indicated in Schedule 13930-S01 or other location as required. Sprinklers shall be provided with nominal 1/2-inch orifice and 165°F (74°C) temperature rating unless otherwise indicated or required by application. Sprinklers located in the vicinity of heaters shall be provided with intermediate or high temperature ratings as specified by NFPA 13.

Sprinklers shall be furnished and installed with all required escutcheons for a complete installation. Escutcheons shall permit sprinkler head adjustment as needed for a proper installation.

Sprinkler cabinets shall be finished steel with hinged cover, space for minimum of 6 spare sprinklers plus sprinkler wrench, and shall be suitable for wall mounting.

Include number of sprinklers required by NFPA 13 and 1 wrench for sprinklers. A separate cabinet with sprinklers and wrench shall be provided for each style of sprinkler head on this project.

When indicated in Schedule 15300-S01, wire-cage type sprinkler guards shall be provided with fastening device for attaching to sprinkler.

2.3.07 Fire Department Connection. A sprinkler system fire department Siamese connection shall be provided when indicated on drawings. The location of the connection shall be as indicated on the drawings or as approved by Engineer and the local Fire Department. The type of siamese connections shall be wall-type or freestanding type as required.

Wall-type fire department connections shall be flush or a projecting type, as required, with cast-brass body; polished chrome plated finish; NH-standard thread inlets according to NFPA 1963 and matching local fire department threads; and threaded NPS outlet. Connection shall include lugged cap, gasket, and chain; lugged swivel connection and drop clappers for each hose connection inlet; and round wall escutcheon plate with marking "AUTO SPKR". The connection shall be provided with two 2-1/2 inch (65 mm) inlets and one 4 inch (100 mm) back outlet.

Freestanding type fire department connections shall be cast-brass or polished brass, as required, with angle body, polished brass cover sleeve, NH-standard thread inlets according to NFPA 1963 and matching local fire department threads, and threaded NPS outlet. Connection shall include lugged cap, gasket, and chain; lugged swivel connection and drop clappers for each hose connection inlet, and cast brass identification nameplate with marking "AUTO SPKR". The connection shall be provided with two or three 2-1/2 inch (65 mm) inlets and one 4 inch (100 mm) or one 6 inch (150 mm) outlet, as required.

2.3.08 Alarm Devices. Alarm devices shall be provided as indicated. Alarm device type and size shall be as needed to match piping and equipment connections.

Water flow indicators shall be electrical supervision vane type, rated to 250 psig (1724 kPa gauge), and shall comply with UL 346. The indicators shall be furnished with a pipe saddle and cast aluminum housing, and shall be suitable for horizontal or vertical installation. Two spdt circuit switches shall be provided with isolated alarm and auxiliary contacts. Contacts shall be rated for 7 ampere, 125 V ac and 0.25 ampere, 24 V ac. Water flow indicators shall be complete with factory-set, field-adjustable, instantly recycling pneumatic retard element to prevent false signals, and tamper-proof cover that alarms when cover is removed.

Pressure switches shall be electrical supervision type, with spdt contacts, and shall comply with UL 753. The pressure switches shall be designed to signal water flow based on rising pressure.

Supervisory (tamper) switches shall comply with UL 753, and shall be electrical supervision type, with spdt normally closed contacts. The switches shall be designed to signal when the controlled valve is in other than full open position and if switch is removed or dismantled.

The sprinkler water flow alarm shall be water motor or electric type.

Water motor alarms shall be hydraulically operated outdoor alarm type. The water motor alarm shall be provided with an aluminum alloy alarm gong at least 5 inches in diameter, energy-efficient impeller, and bearings which do not require lubrication. A Y-strainer shall be installed in the alarm pipeline. The alarm shall be initiated by flow from the alarm check valve retarding chamber, dry-pipe valve, or deluge valve as required.

Electric water flow alarms shall be outdoor alarm bell type, with an aluminum alloy alarm gong at least 6 inches in diameter. The alarm bell shall be weatherproof, and shall be suitable for a 120 V ac power supply. The alarm shall be initiated by flow through the alarm check valve retarding chamber, dry-pipe valve, deluge valve, or flow switch.

2.3.09 Air Compressor. The system air compressor shall be oil-less, permanently lubricated, direct drive, with filtered air inlet and safety relief valve, and suitable for pipeline mounting. System pressure and compressor capacity shall be as required or as specified by NFPA based on the volume of the system, whichever is more stringent. The compressor motor shall be suitable for the power supply. An individual compressor shall be provided for each dry pipe system.

2.3.10 Pressure Gauges. Pressure gauges shall comply with UL 393, and shall be provided with 3-1/2 inch (89 mm) to 4-1/2 inch (114 mm) diameter dial, and a dial range of 0-250 psig (0-1724 kPa gauge).

2.3.11 Emergency Break Glass Switch. Each break-glass switch for fire sprinkler system shall be furnished with a NEMA enclosure as specified herein with hammer, hammer clip, and chain. Each switch shall be Square D "Type 9001K15", Cutler Hammer 10250T Series, or approved equal, with one normally open and one normally closed contact block, or equal. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position.

2.4 CONSTRUCTION.

2.4.01 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

PART 3 - EXECUTION

3.1 INSPECTION. Contractor shall field verify all existing conditions prior to designing the system.

3.2 INSTALLATION. Piping, equipment, and appurtenances furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.2.01 Sprinkler Piping and Accessories. Deviations from approved "working plans" for sprinkler piping require recalculation and approval by authority with jurisdiction. Written approval shall be obtained from Engineer prior to deviating from approved "working plans".

Approved fittings shall be used to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes. Unions shall be installed adjacent to each valve in pipes 2 inch (51 mm) and smaller. All piping shall be hidden from view in areas with finished ceilings and other areas, as indicated, unless accepted by Engineer to be exposed.

"Inspector's Test Connections" shall be installed in sprinkler piping, complete with shutoff valve, sized and located according to NFPA 13.

The sprinkler piping shall be installed with drains for complete system drainage. Ball drip valves shall be installed to drain piping between fire department connections and check valves, and where indicated. Route drain to outside the building unless otherwise indicated on the drawings.

The sprinkler head riser drop lengths shall be determined in the field and shall be coordinated with all ductwork, electrical conduit, piping systems, process equipment, and tanks. If the sprinkler system piping is installed before all ductwork or other building system construction is finished and if any sprinkler head risers need to be relocated to meet the code requirements, Contractor shall extend or relocate the risers and sprinkler heads at his expense.

Hanger and support spacing and locations for steel piping joined with grooved mechanical couplings shall be in accordance with the manufacturer's written instructions for rigid systems.

Metal roof decking shall not be used for the support of equipment or piping.

Pressure gauges shall be installed at each sprinkler test connection and at top of each riser. Pressure gauges shall be provided with connections not less than 1/4 inch (7 mm) and with soft metal seated globe valve arranged for draining pipe between gage and valve. Gauges shall be installed to permit removal and shall not be installed where subject to freezing.

All alarm devices shall be connected to the fire alarm, plant control, or other system as required.

When they are specified, the water motor alarm bell or electric alarm bell shall be mounted outside on an exterior wall of the building at a location suitable to Engineer so personnel in the area will notified when an alarm is sounded.

3.2.02 Sprinkler Valves. Fire sprinkler valves shall be installed with all trim, fittings, controls, and specialties according to NFPA 13, manufacturer's written instructions, and the authority having jurisdiction.

Service valves shall be supervised-open, and located to control sources of water supply except from fire department connections. Provide permanently marked identification signs indicating portion of system controlled by each valve.

Alarm check valves shall be installed in the vertical position for proper direction of flow, including bypass check valve and retard chamber drain line connection.

All double-check detector assembly backflow preventers shall be installed with bypass water meter, gate valves on each side of meter, and check valve downstream from the meter.

All reduced pressure detector assembly backflow preventers shall be installed with bypass water meter, gate valves on each side of meter, and reduced pressure backflow preventer downstream from the meter.

3.3 FIELD TESTING. Field testing of the fire sprinkler systems shall conform to the requirements of NFPA 13 "System Acceptance" Chapter and to the requirements of the local Fire Department.

Engineer and a representative of the local Fire Department will witness all tests. Contractor shall arrange the testing schedule with the Fire Department and Engineer; with at least 7 days' advance notice.

Contractor shall replace piping and components that do not pass the test procedures specified, and then retest to demonstrate compliance. The procedure shall be repeated until satisfactory results are obtained at no additional cost to Owner. Three copies of test reports shall be submitted in writing to Engineer and to the Fire Department.

Test certificates shall be executed and submitted prior to final inspection and acceptance in accordance with the requirements of NFPA No. 13. Three copies of each test certificate shall be furnished to Engineer and the Fire Department.

After installation and testing of the fire suppression system, complete drawings, conforming to installation records, including location of sprinkler heads, control valves, water supply connections, and wiring diagrams shall be submitted to Engineer prior to final acceptance.

3.4 ADJUSTING. All alarm devices shall be adjusted for proper operation. All drains shall be checked for proper operation.

3.5 CLEANING. Immediately prior to the final inspection, equipment, piping and appurtenances shall be thoroughly cleaned. Dirt and debris shall be cleaned from sprinklers. Sprinklers having paint other than factory finish shall be replaced with new sprinklers. Cleaning and reuse of painted sprinklers is prohibited.

3.6 FINAL INSPECTION AND ACCEPTANCE. A decision shall be reached during the inspection concerning the resolution of discrepancies and changes as recommended by the authorities having jurisdiction. All work determined to be the responsibility of Contractor, and included within the scope of the specifications, shall be promptly completed at no expense to Owner.

The final acceptance of the fire sprinkler system shall be made after the completion of the corrective work resulting from the final testing and inspection and after receipt of a formal letter of acceptance from the local Fire Department.

End of Section

SECTION 15310

CLEAN AGENT FIRE SUPPRESSION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of materials, equipment, controls, wiring, and appurtenances associated with the clean agent fire suppression system as indicated herein and on the drawings.

The Work shall include furnishing all labor, materials, tools, equipment, service and supervision required to design, install, test, and place into service the fire suppression system throughout the rooms and buildings as indicated in the Contract Documents.

1.2 GENERAL.

1.2.01 Coordination. Piping, equipment, controls, wiring, and appurtenances furnished under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

Contractor shall verify that each component of the fire suppression system is compatible with all other parts of the system; that all piping, equipment, wiring, and appurtenances are appropriate for the intended function; and that all devices necessary for a properly functioning system have been provided.

Equipment and appurtenances furnished under this section shall be the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Contractor shall become familiar with details of the work, shall verify dimensions in the field, and notify Engineer of any discrepancy before performing the work.

1.2.02. General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with the applicable national, state, and local codes and ordinances, laws, regulations, and National Fire Protection Association (NFPA) Standards which pertain to such work. In case of a conflict between this section and any applicable national, state, or local code, ordinance, law, regulation, or NFPA Standard, the latter shall govern.

NFPA standards to be followed shall include, but not limited to:

NFPA 2001	Clean Agent Fire Extinguishing System
NFPA 70	National Electrical Code
NFPA 72	National Fire Alarm Code

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, working plans, flow calculations, wiring and schematic diagrams, together with detailed specifications and data covering materials used, parts, devices and other accessories forming a part of the equipment and appurtenances furnished, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Device tag numbers indicated on the contract drawings shall be referenced on the submittals where applicable. The submittal to Engineer shall be made after the local authorities having jurisdiction have approved the design. The data and specifications shall include, but not be limited to, the following:

Design Documents

Complete working plans and flow calculations with information as specified by NFPA Standard No 2001.

Fire Suppression Agent

Complete description of suppression agent including physical characteristics, limitations on use, handling procedures and safety precautions.

Equipment, Piping, and Appurtenances

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Capacities.

Pressure and temperature ratings.

ASTM specification for pipe and fittings.

Overall dimensions.

Pressure loss data

Net weight.

Control, Detection, Alarm, and Actuation System

Name of manufacturer.

Type and model.

Control panel face layout.

Sequence of Operation.

Wiring diagrams.

Power requirements.

Test Reports

Test reports indicating successful completion of tests specified herein and as specified by NFPA Standard No. 2001.

1.3.02 Operation and Maintenance Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE. All materials and work shall conform to the requirements of NFPA and Underwriters' Laboratories (UL), and shall be permanently stamped or labeled with the Listing Agency's identification.

Materials, installation, inspection, and testing of the fire suppression system shall comply with the requirements of the local authorities having jurisdiction and Owner's insurance underwriter.

Materials and equipment shall be the standard products of manufacturers regularly engaged in the production of clean agent fire extinguishing systems. All products shall be new and of the latest manufacture. Equipment shall be supported by a service organization that is, in the opinion of Engineer, reasonably convenient to the site.

The suppression system drawings and calculations shall be performed by an individual who is certified Level II or greater by The National Institute for Certification in Engineering Technologies (NICET) in the subfield of Fire Protection Engineering Technology, Special Hazards System Layout. When indicated, the work shall be supervised and the drawings signed and sealed by a registered professional engineer licensed in the state of Michigan.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The system shall cover only the interior locations of the building as herein specified; and shall be suitable for the building construction type, room temperature range, and contents. The contents and temperature range of the area to be protected shall be as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The clean agent fire suppression system shall be designed as a single-shot, automatic-manual, total flooding system. The suppression system shall be listed as a pre-engineered system. The system shall be provided with primary suppression agent cylinders in the quantity and location as indicated on the drawings. Reserve cylinders shall be provided as indicated in the Contract Documents.

The fire extinguishing system shall provide a concentration of fire extinguishing agent to create an atmosphere that will not support combustion when discharged in the protected areas. The discharge time for halocarbon agents shall not exceed 10 seconds. The discharge time for inert gas agents shall not exceed 60 seconds. The system design shall include the capacity to automatically maintain the design concentration for a minimum of 10 minutes, or as specified by NFPA, whichever is more stringent. A suitable allowance in agent quantity shall be made for normal leakage of agent from the spaces due to agent expansion.

2.2.01 Elevation. All components of the fire suppression system shall be designed to operate at the elevation indicated in the Contract Documents.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable agents include heptafluoropropane (FM-200) as manufactured by Great Lakes Chemical Corporation, FE-13 as manufactured by DuPont Chemicals, and INERGEN as manufactured by ANSUL Fire Protection, or approved equal.

2.4 CONSTRUCTION.

2.4.01 General. Materials and equipment shall be as specified below and as shown and shall be suitable for the service intended. Materials and equipment shall satisfy the requirements of NFPA 2001. Devices and equipment used for the same or similar services shall be of the same make and type and shall be interchangeable when of the same rating.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

All anchor bolts, expansion anchors, nuts and washers shall comply with UL, FM, and NFPA requirements. Powder-driven anchor assemblies shall not be used.

2.4.03 Piping Systems. Distribution piping shall be black or galvanized steel, either ASTM A53 seamless or electric welded, Grade A or B or ASTM A-106, Grade A, B, or C. Cast-iron pipe, steel pipe conforming to ASTM A 120, or nonmetallic pipe shall not be used. Pipe shall be furnished complete with all fittings, jointing materials, supports and anchors, and other accessories required for a complete system.

2.4.04 Pipe Fittings. Pipe fittings for FM-200 and FE-13 agents shall have a minimum working pressure of 620 psi (4280 kPa). Pipe fittings for INERGEN agent shall have a minimum working pressure downstream of the pressure reducer of 1,000 psi (6900 kPa). Cast iron and Class 150 lb steel fittings shall not be used.

2.4.05 Pipe Supports. Pipe supports shall be suitable for the application, construction, and type and size of pipe involved. "C" type clamps shall not be used for larger than 1 inch (25 mm) diameter piping, and shall be provided with retaining clips. Galvanized hanger assemblies shall be used for the support of galvanized steel piping systems.

2.4.06 Storage Containers. Agent containers shall meet the requirements of NFPA 2001. Containers shall be fitted with a resilient pressure seat type forged brass valve and shall have a threaded steel anti-recoil protective cap for handling and shipment.

Storage containers and any pressurized release containers shall be equipped with pressure switches that shall initiate a supervisory signal when cylinder pressure in a container drops to 90 percent of the system working pressure. A portable direct reading beam scale shall be provided for weighing FM-200 and FE-13 containers in place by loosening cylinder clamps and disconnecting the discharge heads. It shall not be necessary to disconnect any control components. Liquid level indicators may be provided in lieu of the portable direct reading beam scale. The containers shall be arranged to allow a service aisle for cylinder removal and cylinder weighing.

Container racks shall be provided at all installations. Racks shall be designed to rigidly secure all containers in place.

2.4.07 Discharge Valve. Each cylinder shall be fitted with a pressure operated discharge valve. Each valve shall include an integral safety relief device which serves to protect cylinder against excessive internal pressure. The cylinder valve shall have a forged brass body with external connections for actuation devices. Each valve shall be provided with a removable pressure gauge or solenoid valve with gauge for pressure reading. When more than one cylinder is connected to a common manifold, a check valve shall be provided with each cylinder. Check valves that utilize "O" ring seats shall not be used as they can be dislodged during discharge.

2.4.08 Discharge Nozzles. Nozzles shall be supplied in quantities sufficient to properly cover the areas being protected in accordance with NFPA 2001. Nozzles shall be of corrosion resistant construction and shall be designed specifically for clean agent application. Nozzles shall be permanently marked as to type and orifice size.

2.4.09 Caution/Advisory Signs. The fire suppression system contractor shall provide signs as specified by NFPA 2001 and as recommended by the clean agent manufacturer. As a minimum, the following signs shall be provided:

> A caution sign on the outside of each exterior door of the protected area. Sign shall be Fike Corporation 02-3646.
>
> A manual discharge sign at the manual discharge station. Sign shall be Fike Corporation 02-3644.
>
> A flashing light sign over each exit from the protected area. Sign shall be Fike Corporation 02-3645.

2.4.10 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of a universal primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall conform to the requirements of Master Specification Section 09900, Painting.

2.4.11 Equipment Bases. Unless otherwise indicated or specified, agent cylinders shall be installed on concrete bases at least 6 inches (150 mm) high.

2.4.12 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 CONTROLS.

2.5.01 Control Panel. The clean agent system shall be provided with a single control panel that shall be capable of all functions necessary to operate the system, including detection, actuation, and any auxiliary functions specified herein or otherwise required. The control panel shall be located where indicated on the drawings, and shall be provided with the following:

NEMA 12 enclosure with a hinged and lockable door.

Integral battery standby power supply.

Rechargeable batteries and battery charger.

Audible and visual alarms.

Auxiliary contacts for:

Trouble alarm

System alarm

Pre-discharge alarm

Discharge alarm

Ventilation shutdown

Door closures

0 to 60 second field adjustable time delay.

Container disable switch.

Class A wiring of detection and release circuits.

System inhibit (abort) switch.

Parallel wired agent release modules.

The control panel will be provided with a 120 volt, 60 Hz, single phase power supply.

2.5.02 Detectors. A minimum of two detectors shall be provided in each room. One half of the detectors in the room shall be ionization type, and the remainder shall be of the rate compensation thermal type. The temperature setpoint of thermal type detectors shall be as required, unless otherwise required by application.

2.5.03 Manual Release Switch. The manual release switch shall provide a means to discharge the container, and shall bypass all abort and time delay functions, and shall activate all alarm and shutdown devices the same as if they had been activated automatically. The manual release switch shall be located at the control panel.

2.5.04 Audible and Visual Alarms. Two audible and one visual alarm shall be provided in each protected room. One audible and one visual alarm shall be provided on the exterior of the building at the entrance to each protected room. One audible shall be the horn type, and the other audible alarm shall be the siren type. The visual alarm shall be the strobe type. Alarms located on the exterior of the building shall be suitable for wet locations.

2.5.05 Emergency Break Glass Switch. Each break-glass switch for fire suppression system shall be furnished with a NEMA enclosure as specified herein with hammer, hammer clip, and chain. Each switch shall be Square D "Type 9001K15", Cutler Hammer 10250T Series, or approved equal, with one normally open and one normally closed contact block, or equal. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position.

PART 3 - EXECUTION

3.1 INSPECTION. Contractor shall field verify all existing conditions prior to submitting a bid proposal.

3.2 INSTALLATION. The installation of the complete clean agent suppression system shall be performed by the system manufacturer or an approved representative of the manufacturer. The fire suppression system shall be installed by a firm having previously installed a minimum of 5 systems similar in size and scope to this project. Personnel involved in the installation of the suppression system shall be fully experienced in installing fire detection and clean agent suppression systems. The installation of the work described herein shall be performed to avoid interference with the structure and all other equipment, wiring, piping, and ductwork located in the spaces.

Piping, wiring, equipment, and appurtenances furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer. The installation shall be in accordance with the NFPA 70, NFPA 72, and NFPA 2001.

All conduit, junction boxes, conduit supports and hangers shall be concealed in finished areas and may be exposed in unfinished areas. Smoke detectors shall not be installed prior to the system programming and test period. If construction is ongoing during this period, measures shall be taken to protect smoke detectors from contamination and physical damage. All fire detection and alarm system devices, control panels and remote annunciators shall be flush mounted when located in finished areas and may be surface mounted when located in unfinished areas.

3.2.01 Wiring. The fire suppression system contractor shall be responsible for the wiring of all devices associated with the clean agent suppression system, including but not limited to, detection devices, actuation devices, and audible and visual alarms. A 120 volt single phase power supply to the suppression system control panel will be provided by others. Wiring from the control panel to any automatic door closers will be provided as indicated in the Contract Documents. Wiring from the control panel to any ventilation systems will be provided as indicated in the Contract Documents. Any automatic door closers will as indicated in the Contract Documents. Wiring shall be in accordance with NFPA 70, NFPA 72, and Master Specification Section 16050, Electrical General Requirements.

3.3 CONTROL. The clean agent suppression system shall be capable of completely automatic operation as described herein and as specified by NFPA.

Upon the activation of the first detector, the following shall occur:

An "ALARM" lamp on the control panel shall be illuminated.

An audible alarm (horn) and visual alarm (strobe) shall be energized in the protected room.

The ventilation system shall shut down.

The door closers shall be activated.

Upon the activation of any second detector, the following shall occur:

A "PRE-DISCHARGE" lamp on the control panel shall be illuminated.

An audible alarm (siren) shall be energized in the protected room.

The agent discharge time delay sequence shall be initiated.

Upon completion of the time delay sequence, the following shall occur:

The extinguishing agent shall be released from the cylinder.

A "SYSTEM DISCHARGE" lamp on the control panel shall be energized.

A visual alarm (strobe) on the exterior of the building shall be energized.

3.4 CLEANING. Immediately prior to the final inspection, equipment, piping controls, and appurtenances shall be thoroughly cleaned. Dirt and debris shall be cleaned from discharge nozzles. Nozzles having paint other than factory finish shall be replaced with new nozzles.

3.5 ACCEPTANCE TESTS.

3.5.01 Tests. The fire suppression system shall be tested for correct operation and function. The tests shall be as specified by the local fire department and the following procedures performed in accordance with NFPA 2001:

Review of mechanical components.

Review of enclosure integrity.

Review of electrical components

Functional testing.

The tests shall be supervised by a competent, factory-trained engineer or technician authorized by the manufacturer of the equipment.

3.5.02 Enclosure Integrity Test. When indicated, an enclosure integrity test shall be performed by Contractor to ensure that the required agent concentration can be maintained. Prior to performing the test, the fire suppression system contractor shall inspect the rooms to be protected, and shall advise Owner in writing of any probable areas where excessive leakage from the space may cause the test to fail. The test shall not be performed until Contractor is advised by Owner to proceed. All test instruments shall have been recently calibrated by an independent testing agency. Contractor shall be responsible for providing all materials and labor required to perform the test. The test shall be repeated until a successful test is obtained. In the event that the test fails due to excessive leakage from the space, Owner shall be advised of the areas needing repair, and Contractor will be reimbursed a predetermined sum for repeating the test.

3.5.03 Test Report. A report of test results shall be submitted prior to final inspection and acceptance. Three copies of the report shall be furnished to Engineer and the Fire Department.

3.5.04 Final Drawings. After installation and testing of the fire suppression system, complete drawings, conforming to installation records, including location of discharge nozzles, controls, and wiring diagrams shall be submitted prior to final acceptance.

3.5.05 Final Inspection. A representative of the local fire department and Engineer will make a final inspection of the Work. At the final inspection a factory trained representative of the manufacturer of the major equipment shall demonstrate that all portions of the fire suppression system functions properly. Contractor shall arrange for the final inspection with the fire department and Engineer.

3.5.06 Final Acceptance. The final acceptance of the fire suppression system as specified shall be made after the completion of the Work resulting from the final inspection and after receipt of a formal letter of acceptance from the local fire department.

Deviations from approved "working drawings" for the suppression system require recalculation and approval by authority with jurisdiction. Written approval shall be obtained from Engineer prior to deviating from approved "working plans."

3.6 OPERATOR INSTRUCTION AND TRAINING. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the suppression system manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as needed.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

End of Section

SECTION 15360

CARBON DIOXIDE FIRE SUPPRESSION SYSTEM

PART 1 - GENERAL

1.1 SCOPE OF WORK. Furnish and install a complete engineered, fixed pipe, automatic total flooding low pressure carbon dioxide fire suppression system for each of the areas indicated on the Drawings.

Each system shall be specifically engineered and installed to protect the hazard. The design and engineering shall include a thorough review of the proposed rooms for anticipated air tightness. If anticipated leakage appears unreasonably high, it shall be called to the attention of the Program Manager immediately for possible corrective action.

Each system shall be designed, installed and tested in conformance with current Standards as stipulated in item 1.05 hereinafter and the requirements of local authorities having jurisdiction and Insurance Underwriters.

All piping, and equipment shown on the Drawings is intended to be approximately correct to scale, but figured dimensions and detailed drawings of the actual equipment furnished shall be followed in every case. The Drawings shall be taken in a sense as diagrammatic. Size of ductwork and piping is shown, but it is not the intent to show every offset or fitting, nor every hanger or support, or structural difficulty that may be encountered. To carry out the intent and purpose of the Drawings all necessary parts to make a complete working system ready for use shall be furnished without extra charge. The Subcontractor shall be responsible to coordinate the system installation and routing with the work of all trades.

1.2 RELATED WORK.

Division 16, Electrical

1.3 ENGINEERING SERVICES. The Subcontractor shall retain the services of a specialty subcontractor to design and install the CO2 system. The specialty subcontractor shall employ a licensed professional engineer (in the State of Michigan) specializing in the design and installation of CO2 fire suppression systems to perform the work. The engineer shall be licensed at the time the work is done. If the state issues discipline specific licenses, the engineer shall be licensed in the applicable discipline. In addition, the engineer shall be experienced in the type of work being provided.

All work is to be done according to the applicable regulations for professional engineers, to include signing, sealing and dating documents. When submittals are required by a professional engineer, in addition to state required signing and sealing, a copy of the current wallet card or wall certificate indicating the date of expiration shall be included with the submittal.

1.4 SUBMITTALS. Submit shop drawings, product data and calculations to the city of Detroit Fire Marshall for approval. Submit proof of approval to the Program Manager.

All submittals shall contain a statement that Section 01080 and all other referenced Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual one for each party involved, and shall be included with every submittal and resubmittal.

In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Subcontractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Subcontractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4.01 Shop Drawings. Submit shop drawings under provision of Section 01080.

Submit shop drawings indicating detailed layout of system, locating each component. Include control diagrams, wiring diagrams, and written sequence of operation.

Detailed layout drawings of piping in mechanical rooms and other congested areas shall be provided. Drawings shall show the locations of piping appurtenances, specialties, and all valve banks.

1.4.02 Product Data. Submit product data under provisions of Section 01080.

Submit product data for each piece of equipment comprising the system including storage unit, control valves, control panels, nozzles, manual releases detectors, alarm bells or horns and enunciators.

1.4.03 Calculations. For local application and total flood hazards, submit design calculation derived from computer programs developed specifically for low pressure CO_2 flow calculations. Analysis shall include calculation to verify system terminal pressures, nozzle flow rate, orifice code number, piping pressure loses, component flow data, and pipe sizes considering actual and equivalent lengths of pipe and elevation changes.

1.4.04 Test Reports. Submit test reports indicating successful completion of test to the Program Manager.

1.4.05 Installation Instructions. Submit manufacturer's installation instruction under provisions of section 01080.

1.4.06 Operating and Maintenance Data.

Operating and Maintenance Manual - Submit to the Program Manager as provided in Section 01160, Operating and Maintenance Manuals. The following information shall be considered a minimum. Where applicable, provide information required for specific pieces of equipment.

Personnel familiar with the operation and maintenance of the specific information shall prepare manuals.

Equipment shall be identified with the Owner's Equipment Numbers and Identification as described in the specifications and as shown on the Drawings.

Provide information in three ring binders. All sheets shall have reinforced punches. Tabbed dividers shall separate all sections. Drawings will be bound in the manual, or contained in envelopes bound into the manual.

Contents - Each volume shall contain the following minimum contents:

Installation including instructions for unpacking, installing, aligning, checking and testing. Foundation data, allowable piping loads, and electrical design shall be included.

Operating Instructions to provide pre-operational checks, start up and shut down, and description of all control modes. Include emergency procedures for all fault conditions and actions to be taken for all alarms. Procedures for long term storage shall be included.

Maintenance shall include preventive, and corrective. Schedules for test of other functions are to be included. Provide a list of tools required to service the equipment. Trouble shooting instructions to include a trouble-shooting guide shall be included.

Spare Parts List

Shop Drawing Data to include performance curves, data sheets, flow diagrams, wiring diagrams, and descriptive drawings.

1.5 REFERENCE STANDARDS.

ANSI/ASME B16.3 – malleable iron threaded fittings Class 300.

ANSI/ASME B16.9 – factory made wrought steel butt welding fittings.

ANSI/ASME B31.1 – power piping.

ANSI/ASME B31.1 – pressure vessels.

ANSI/ASME Section 8 – welding and brazing qualifications.

ANSI/WAS D1.1 – Standard Welding Code.

ANSI/NFPA 12 Carbon Dioxide Extinguishing Systems.

ANSI/NFPA 70 – National Electric Code.

NFPA 72 – National Fire Alarm Code.

ASTM–A53 – pipe, steel, black and hot dipped zinc coated, welded and seamless.

ASTM-A106 – seamless carbon steel pipe for high temperature service.

FM – Factory Mutual Engineering.

NEMA – enclosures for control panels.

IRI – Industrial Risk Insurers.

UL – Underwriters Laboratory.

Codes, Ordinances, Permits and Regulations.

Comply with all the laws, ordinances, codes, rules and regulations of the State or local authorities having jurisdiction over any of the work specified herein, and apply for, and pay for, all necessary permits.

If any part of this Section conflicts with the laws and codes, call it to the Program Manager's attention prior to commencing work. If a conflict exists, follow the more strict code or law as approved by the Program Manager.

All materials and equipment where applicable shall be type listed in current edition of FM approved guide.

Requirements set forth in this Section shall be followed when in excess of the required or minimum regulations.

1.6 QUALITY ASSURANCE. All equipment of a given type included in this Section shall be furnished by or through a single manufacturer or as specified on the schedules

Inspection by the Program Manager or his representative or failure to inspect shall not relieve the Subcontractor of responsibility to provide materials and perform the work in accordance with the documents.

The piping manufacturer shall furnish an affidavit of compliance certifying that all materials used and work performed shall comply with the specified requirements. The Subcontractor shall provide copies of mill test confirming the type of material used in the various components.

The Owner and Program Manager reserve the right to sample and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements.

An authorized representative of the manufacturer shall perform the initial startup of the equipment. The Owner and Program Manager shall witness startup. The use of local sales representatives to perform this work is not acceptable, unless the manufacturer provides documented evidence that the sales representative has been specifically trained for this work.

All rotating parts of equipment shall be statically and dynamically balanced at the factory.

1.7 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved shop drawings upon delivery.

Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner or Program Manager by the manufacturer.

All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container.

All equipment shipped that is exposed such as on a flat bed truck shall be protected during transit. The equipment shall be protected from moisture, road salt, dirt and stones or other materials thrown up from other vehicles. Electrical components shall be protected as above, but with special attention to moisture. The method of shipment protection shall be defined in the submittals.

Instructions for the servicing and startup of equipment in long term or prolonged storage shall accompany each item.

All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.8 DESIGN CRITERIA. The system shall be designed in accordance with the requirements and recommendations of NFPA standards noted above and shall totally flood the hazard volumes with carbon dioxide. Refer to tables in NFPA 12 for design concentrations or as noted on the fire protection systems schedule. Refer to the architectural drawings to obtain dimensions pertinent to determine the volume of the rooms or spaces to be protected.

The system shall be designed to operate automatically or by manual operation. The release of the agent shall be by an electrical signal from the control panel to the solenoid operated releasing devices.

System design shall provide for fire protection of the local application and/or total flooding type with low pressure CO2 and it covers a purging system utilizing the same low pressure CO2 to suppress or prevent fire. The system shall be fixed installation where equipment is designed and installed to provide fire suppression capability for hazards which most likely be in the form of electric heat buildup that will result in fire or explosion conditions. Total flooding shall be done with a calculated CO2 design concentration, volume of space in abnormal temperatures. All space openings shall be sealed against any air movement. Space shall be tested prior to CO2 activation test. Design, fabrication and installation of system and its components shall be in compliance with requirements and recommendations of ANSI/NFPA-12.

Interface system with plant main security room fire alarm and plant annunciation system. Signals that will be monitored shall consist of:

> Any Open Doors (greater than ½ hour) - (Trouble).
>
> Any malfunction in the Detectors/annunciation devices/CO2 local panel/CO2 tank/CO2 pressure system and any of the interposing relays in the building - (Warning).
>
> CO2 ready to discharge after a set time interval (selected by the CO2 vendor) – Alarm).
>
> CO2 activation and Discharge - (Alarm with horn).
>
> Individual alarms shall be included also in the building local panel to provide a

warning alarm during a time delay period prior to the automatic discharge of carbon dioxide. Refer to the system design in Part -2.

Refer to the electrical drawings to determine Class I, Divisions I and II, Hazard Classification of each room or space. Provide all system components to comply and be suitable for use with the hazard classification.

1.9 PERFORMANCE REQUIREMENTS.

1.9.01 Activation.

Electric: An alarm condition from any detector or operation of a manual release station (electric) shall start the pre-discharge sequence. At this time the control panel shall activate begin the pre-discharge timer(s), start all audible and visual alarm devices, shutdown exhaust air handling fans, close all dampers, release door holders, shutdown fuel and power to process equipment (if any exist inside the space) and actuate the building fire alarm system. The pre-discharge period shall be of sufficient duration for personnel to evacuate the area. The alarm devices shall continue to operate until the control panel is reset.

Pneumatic: A pneumatic time delay and pneumatic sirens are required for all total flood hazards that are normally occupied. Further, a pneumatic time delay and pneumatic sirens are required for local application systems which serve normally occupied enclosures where the discharge will expose personnel to hazardous concentrations of CO_2. The pneumatic siren(s) shall sound during the evacuation and discharge period.

Mechanical: Each master/selector valve shall be provided with an emergency manual override operator.

1.9.02 Volume. The volume of carbon dioxide for the specified concentrations shall be determined using inside area dimensions. The volume of the room space displaced by the equipment shall not be considered to reduce the requirement of carbon dioxide.

1.9.03 Tank Supervisory Alarms. System control power failure, refrigeration motor power failure and refrigeration alarm power failure shall produce a "trouble" alarm and shall be enunciated at the system control panel.

- and/or -

A refrigeration "high-low" pressure signal shall be activated by a pressure operated switch at the storage tank.

PART 2 - PRODUCTS

2.1 MATERIALS. All materials and equipment shall be new and shall be FM approved or UL listed.

2.2 MANUFACTURERS. Systems shall be as designed and manufactured by:

Kidde Fenwal Inc.

The Ansul Co.

Fire Systems Division of Chemetron Corp.

2.3 SYSTEM COMPONENTS.

2.3.01 Pipe and Piping Specifications. The following specifications set forth minimum standards for installation. If the requirements of local codes or the authority having jurisdiction are more stringent these more stringent requirement shall govern the installation.

2.3.02 Type of pipe.

Piping shall be black or galvanized ASTM grade A53 seamless or Electric welded grade A or B or A106 grade A, B or C.

Installation shall be performed in workmanlike manner according to the highest standards of modern practice.

All pipe and fittings shall be new and of recent manufacture.

All pipes shall be reamed after cutting so that all burrs and sharp edges are removed.

All pipes must be thoroughly cleaned before installation. A wire flue brush should be pulled through the length several times followed by clean cloth rags treated for the purpose. All foreign matter and oil must be removed by this process.

All pipes and fittings installed out of doors or in corrosive areas must be galvanized or treated with a proper protective coating.

Pipe Dope: All screwed pipe shall be coated with Teflon tape or an approved pipe joint compound. When tape or pipe joint compound is used coating of the threads must start at least two threads back from the pipe end.

Welding:

All welding must be performed by a certified welder.

All welded pipe 3/4" and smaller shall be welded using a gas welding or other approved method.

All welds shall be pounded to loosen scale and weld beads and then cleaned of the same.

No backing ring chill rings are permitted.

Welded Pipe Reductions: Reductions in welded pipe shall be by one of the following devices.

Butt weld concentric reducers.

Swaged nipples.

Weld o-lets

Where socket weld fittings are permitted see below, a socket weld reducing coupling can be used only for a one size reduction. All other reductions in socket weld pipe shall be made using the above permitted methods.

When methods B, C, or D are used, it is imperative that these fittings be installed in strict accordance with the manufacturer's installation instructions, in each case they must be installed so as to permit full flow. All entrance holes from the main pipe run to the fitting must be of proper size and free of sharp edges, ridges or burrs.

Threaded Pipe Reductions: Reduction in screwed pipe shall be by means of screwed concentric reducing fittings or swaged nipples. Flush bushings shall not be used. Hex bushings, 3000 lb. forged steel may be used for reduction in one pipe size only.

Flanges and Unions:

No unions over 2" size are permitted.

All flanges must be 300 pounds. ANSI class forged steel.

All weld neck flanges used with schedule 80 pipe must have extra heavy pipe wall bore schedule 80. All weld neck flanges used with schedule 40 pipe must have standard weight pipe wall bore schedule 40.

Where flanged pipe connections are used, they shall be gasketed with 1/16" thick compressed type gasket materials.

High grade steel bolts grade 8 or studs with graded nuts shall be used on all flanged connections. All nuts shall have full engagement on the bolt or stud. Use grade 8 or better.

All connectors, that is, bolts, and nuts shall be torqued to the required number or foot pounds as recommended in the standard piping handbooks. Required torque valves for installation of flanged pressure operated valves shall be the same as the Preferred CO2 Systems installed for the Chlor/Dechlor building of the GLWA WRRF.

Pipe take-Offs: All pipe take offs shall be from the side or bottom of the header. Where a take off involves a reduction of several pipe sizes, a bottom take off should be provided.

2.3.03 Tank Header. The tank header is under continuous pressure and therefore it shall be constructed of schedule 80 black steel pipe with extra heavy welding fittings and ANSI 300 pound class flanges.

The tank header can be fabricated using one of the following procedures or by a combination of these procedures.

By the use of extra heavy butt welding fittings.

By the use of extra heavy weld o-lets or thread-o-lets or equivalent.

All welds must allow full flow. No miter weld fittings shall be used. Backing rings, chill rings shall not be used.

2.3.04 Actuation Line. All piping shall be either1/2", threaded steel pipe or stainless steel tubing.

When pipe is used, the following applies:

The pipe shall be a minimum of schedule 40 and where it is installed outdoors or other corrosive environments, galvanized pipe shall be used. (Industrial Risk Insurers requires all piping to be schedule 40 galvanized or schedule 80 black.)

All threaded pipe connections shall be treated with a suitable pipe sealant (i.e., Swak by Cajun Part No. MS PTS-50: Rector seal or equivalent is acceptable). The use of Teflon tape on actuation line piping is not allowed.

All pipe fittings shall be 300 lb. malleable or ductile iron. A 300 lb. steel union shall be installed near the termination of all piping. The use of 150 lb. fittings is not allowed.

Whenever tubing is used, the following applies:

All steel tubing shall be 1/2" X .035 wall and shall be painted to provide corrosion protection. All tubing installed outdoors or in corrosive atmosphere shall be stainless steel 1/2" X .035.

All tubing fittings shall be of the same material as the tubing and shall be of the compression type. All tubing to pipe fittings shall be treated with a pipe sealant as described in 2.B above.

All tubing shall be properly supported.

A filter supplied by CO2 equipment supplier shall be installed at the actuation line termination into each valve, (as shown on design drawings).

Whenever a hose reel bleeder valve is used, a 1/4" pressure regulator may be installed directly on top of the sub-header piping upstream of the selector valve or bleeder. The location of these regulators shall be as shown on the system design drawings.

The actuation line shall be provided with an approved pressure regulator to maintain 100 PSI pressure on the actuation line.

The actuation line shall be provided with an approved two level supervisory switch to provide notification at the control panel when pressure in the actuation line drops to 90 PSI and 80 PSI respectively.

2.3.05 Master Valve Piping. All piping downstream of master valve between master valve and selector valves or between valve and hose reels shall be either

Schedule 40 black steel pipe welded with welded fittings, or,

Schedule 40 steel pipe with listed grooved type couplings and fittings.

When method (A) is used, the following can be used.

Standard weight socket weld fittings are acceptable with exception that no reducing coupling can be used only for a one size reduction. All other reductions shall be made using a butt welding concentric reducer.

Standard weight butt-welding fittings. Backing rings, (chill rings) shall not be used.

1000 pound forged steel screwed fittings, back welded.

When method (B) is used, the following applies:

Where grooved couplings and fittings are used, they shall be listed/approved for use with low pressure carbon dioxide fire systems.

Pipe preparation must be in strict accordance with the manufacturers recommended procedure. Installation must be exactly as per the manufacturing specifications in all aspects.

Grooved couplings shall be installed so as the allow contraction of the pipe (pipe ends butted together).

Grooved couplings must be approved in advance by the system designer with approval obtained prior to start of design.

2.3.06 Discharge Piping. Piping downstream of selector valves, that is piping which is open to atmosphere, shall be schedule 40. Screwed pipe joints are always permitted and in most installations, approved grooved pipe connections may be used. Grooved fittings must be approved for use with carbon dioxide. Approval of fittings must be sought prior to the start of installation.

Screwed Joints: Threaded pipe fittings shall be class 300 pound malleable iron or ductile iron for pipe through 3" 1000 pound ductile iron forged steel shall be used in all larger sizes.

Grooved Joints:

Where grooved couplings and fittings are used, they shall be listed/approved for use with low pressure carbon dioxide fire systems.

Pipe preparation must be in strict accordance with the manufacturer's recommended procedure. Installation must be exactly as per the manufacturer's specification in all respects.

Grooved couplings shall be installed so as to allow contraction of the pipe (pipe ends butted together).

2.3.07 Pressure Relief Piping and Fittings. Piping to pressure reliefs shall be as specified above for discharge piping. All takeoffs for pressure relief piping shall be from the top of the discharge piping.

2.3.08 Dirt Trap. A dirt trap consisting of a tee with capped nipple shall be installed at the end of each run. The nipple shall be at least 2" long. A longer nipple up to approximately 18" is preferred where space permits.

Note: Dirt traps for schedule 40 welded headers are to be formed by welding a schedule 80 nipple to the end of the line. The schedule 80 nipple is threaded at the open end for connection of a screwed pipe cap.

2.3.09 Underground Piping. Underground piping is to be avoided - if unavoidable, a piping configuration layout for underground piping should be submitted, a layout for underground piping should be submitted for approval to system designer prior to the start of system design. The following general requirements shall apply to underground piping:

Trench depth for underground piping shall be a minimum of 3 feet or below frost line whichever is deeper.

Underground pipe shall be schedule 80 black steel with welded joints as specified for the type of run involved.

A protective, insulate covering will be required of all underground pipe. Approval of system designer is required.

Underground piping shall be welded when possible. The only exception would be in a hazardous location where welding is not permitted. In this case, flanged connection shall be used. All underground pipe joints shall be tested for leaks at 300 PSI before the insulation and protective coating is applied.

2.3.10 Pipe Sleeves. All piping through building walls, partitions, floors slabs, roof slabs and the like, shall be sleeved.

Sleeves shall be schedule 40 pipe at least two sizes larger that the pipe being sleeved. One inch pipe is the minimum size to be used as a sleeve.

Sleeves shall be packed with an approved sealing material so as to be dust light.

Sleeves through floor slabs must extend at least 2 above the floor. A greater extension may be used if required by local building codes.

Sleeves extending through roof slabs must extend above the roof and be flashed in accordance with local building codes.

2.3.11 Expansion Joints. Contraction of steel piping during discharge is based on 1" of contraction per 100 feet of steel pipe.

Allowance must be made for this contraction by using either a joint which permits movement, a piping system which contains natural swing joints, fabricated circular type "U" type bends or, in cases where space is limited, an approved manufactured expansion joint.

In piping which utilized grooved type couplings, these couplings shall be installed to permit contraction of the piping.

In straight runs using welded or screwed joints, an expansion joint must be installed within approximately 100 feet of continuous run and each approximate 100 feet of run thereafter. For runs using grooved pipe, a representative of the manufacturer should be contacted to determine the location and number of expansion joints in long runs.

Pipe anchors shall be capable of with standing any contraction thrusts that may be imposed by the piping while permitting movement intended in the design of the piping system to relieve stress. This will required rigid anchoring of certain points in the piping system while leaving other points of the pipe free to move longitudinally so as to relieve stress.

2.3.12 Inspection for Mechanical Integrity. All testing and inspections shall be done in the presence and under the supervision of the equipment manufacturer's test representative.

All pipe and fittings that are under constant tank pressure ball shall be bubble tight. Bubble tests shall be made using leak-tec, or approved equal, under full tank pressure.

Concealed pipe joints such as those in walls, ceilings, trenches and the like shall be tested at 300 PSI before the joint is concealed.

Pipelines not under constant pressure shall not exhibit any visible or audible leak, but bubble tightness is generally not required.

Under no conditions shall water be used to test piping or other CO2 equipment. Either dry nitrogen or CO2 shall be used for testing.

2.3.13 Painting. nPainting requirements shall be similar to the painting used for the Chlorination/De-chlorination buildings of GLWA WRRF and shall be of the moisture resistant/proof type and suitable for indoor and outdoor use.

2.3.14 Pipe Hangers and Supports. All pipe hangers and supports shall conform to the provisions outlined in ANSI B31.1, latest edition, except as modified and supplemented by this specification. All pipes must be solidly anchored to structural members where longitudinal or lateral movement is possible.

Rigid hangers are required wherever a change of direction or a change in the elevation of the piping system occurs. For long straight runs and as a minimum, every other hanger shall be rigid. All hangers shall be fabricated of steel and installed in a workmanlike manner.

All piping shall be attached to rigid hangers by means of u-bolts locked double nuts. The pipe shall be free to move longitudinally within the u-bolt except where the piping design requires it to be anchored.

Hangers and pipe shall be designed to prevent stress from being induced into piping during the temperature change caused by a system discharge.

All piping supports shall be fabricated and installed so that they will not be disengaged by the movement of supported pipe

Pipe shall not be hung using one pipeline as a support for another.

Piping supports shall be arranged so that no excessive bending stresses are induced into the piping from concentrated loads between supports.

The maximum spacing between pipe supports for screwed or welded pipes is given in table 1 below:

Table #1
Maximum Spacing between Supports for Screwed or Welding Pipe:

Nominal Pipe Size (Inches)	Maximum Span (Feet)
1/4	5
1/2	5
3/4	6
1	7
1 1/4	8
1 1/2	9
2	10
2 1/2	11
3	12
4	14
5	16
6	17
8	19

Maximum spacing between pipe supports is given in table 2 below for systems utilizing the grooved coupling method for system discharge piping.

Table #2
Minimum Spacing between Supports for Pipe with Grooved Joints:

Nominal Pipe Size (Inches)	Maximum Span (Feet)
3/4	7
1	7
1 1/4	7
2	7
3	10
4	10
5	12
6	12

2.4 Carbon Dioxide System Component Requirements. The components of the carbon dioxide systems shall be provided in accordance with the following requirements.

2.4.01 Storage Unit. The storage tank shall be built to ASME standards, and bear the ASME label. It shall be installed for all the electrical buildings specified under item 1.01A with flexible hoses to the CO2 piping system to provide flexibility of movement and protect for any unexpected differential settlement of the concrete pad which may exceed 1.5”. The installation of such hoses shall meet the requirements of NFPA 12.

The storage tank is to have a baked white aluminum housing to protect the insulation and should be riveted and sealed at all joints, to prevent water damage to the insulation.

The storage tank shall be supported by two saddles of heavy steel construction welded and cross braced to the vessel for adequate support.

The storage vessel shall be provided with two top lifting lugs.

Tank pressure gauge shall be 6 inch dial type with a rated accuracy of 1/2 of 1%.

The tank liquid level gauge shall read contents in thousand of pounds of liquid CO2 at 0 degrees Fahrenheit. The gauge divisions shall be in two hundred pound increments.

The liquid level gauge shall be equipped with one set of electrical contacts which may be used to enunciate a low liquid level in the storage unit.

The storage unit shall be equipped with two independent alarm pressure switches for annunciation of high or low tank pressure. These switches shall operate at 315

PSIG and 250 PSIG respectively.

The storage unit shall be equipped with the required ASME safety relief. This relief shall be set at 350 PSIG.

A high pressure bleeder valve set at 330 PSIG shall be included with the storage unit assembly.

•The refrigeration system shall operate on a power supply of 208 or 460 volts, 60Hz. For the power service to the refrigeration system, a disconnect switch shall be provided by the CO2 vendor and shall be installed by the electrical contractor.

2.4.02 Valves. All valves shall meet the requirements set forth in the current edition of the NFPA Standard 12, and shall be F.M. approved for carbon dioxide extinguishing systems.

Tank Shut-Off Valves

A manually operated tank shut-off valve shall be provided. Valves are sized 3" through 8" and shall be equipped with a geared hand wheel operator and carry a 300 pound rating. The flanges mounted either side of the valve must have inside diameter chamfered 1/4" deep 45 degree angle for the valve clearance.

The tank shut-off valve shall be equipped with a DPDT limit switch to permit remote annunciation if the valve is other than fully opened. The contacts shall be provided on the tank shut-off valve to indicate fully closed position.

Master/Selector Valves

Valves in sizes 1/2" to and including 2" shall be ball type approved for low pressure carbon dioxide service. Valves in sizes 3" and larger shall be high performance butterfly style suitable for low pressure carbon dioxide service.

The master valve and selector valve shall not fail open. The master or selector valve shall not open automatically in the event of any electric or pneumatic failure.

Master/selector valves shall be provided with spring return pneumatic actuators. An override device shall be mounted on the valve actuator or within the Automatic Time Delay Cabinet for emergency manual operation.

Isolation Valves

Valves in sizes 1/2" to and including 2" shall be ball type approved for low pressure carbon dioxide service. Valves in sizes 3" and larger shall be high performance butterfly style suitable for low pressure carbon dioxide service.

The isolation valve shall be fitted with an electrical status switch.

The isolation valve shall have device to accommodate a lock.

2.4.03 Actuation Line Supervision. Actuation line serving all master/selector valves shall be supervised.

Actuation line to be provided with a supervisory pressure switch to provide annunciation at 80 PSI.

Actuation line to be provided with a pressure regulator to maintain 100 PSI on the line.

2.4.04 Nozzles. Nozzles shall be supplied in quantities sufficient to properly cover the areas being protected in accordance with NFPA-12.

Nozzles shall be permanently marked as to type and orifice.

2.4.05 Electrical. The electric service to the storage tank shall be provided with a fused disconnect supplied by the CO2 vendor and sized per the electrical requirements of the tank compressor.

CO2 System Control Panel and electrical devices shall be designed to operate on 24 VDC service.

All field electrical devices shall be supervised for electrical integrity.

All master/selector valve solenoid circuits shall incorporate maintenance lock-out switch to disable the solenoid during maintenance.

2.4.06 Control Panel. Provide an AUTOPULSE IQ-636X control panel or equivalent and to be located as shown on the drawings to electrically activate the carbon dioxide system. The control panel shall be modular and serve as many zones as required.

The control panel shall be FM approved for fire alarm and releasing service.

The control panel shall provide visual indication on the panel face for the following:

Each initiating circuit alarm and circuit trouble.

Each carbon dioxide release circuit alarm and circuit trouble.

Primary power source failure for each zone.

The control panel shall operate on the single zone concept. Any single activated detector shall be processed by the control panel as an alarm condition. The discharge circuit shall be energized in the affected area and the red "Release" LED on the panel will illuminate.

Alarm, trouble and AC power failure output contacts for each zone shall actuate the local alarm and common building fire alarm system.

Provide SPDT dry contacts for the following output signals to the Building Fire alarm panel:

General alarm condition, discharge notification.

General trouble condition, operational problem notification.

Loss of primary power source to the control panel.

Discharge disabled mechanically or electrically.

Storage unit refrigeration unit power failure.

Storage tank "high-low" pressure trouble.

The control panel shall have battery backup to support the entire system for 24 hours and then perform an alarm sequence for 10 minutes in the event of a primary power failure, but in no case shall be less than 8 AH. A charger shall be provided to recover the batteries in 48 hours from a fully discharged condition. Standby batteries shall be of the sealed, gel-type or lead calcium type. Batteries shall be supervised and provided a trouble signal upon low voltage, open or shorted cell.

The control panel shall be UL listed, FM approved and comply with the requirements as set forth in NFPA 72.

The control panel shall have Class “B” parallel wiring of the all the detection circuits.

The control panel shall utilize series supervised solenoid devices as the method of discharging the extinguishing agent. The solenoids shall be energized directly from the control panel when system discharge is required. Systems which employ devices external to the control panel to either supervise releasing devices or provide energy for discharge will not be accepted.

The control panel shall be equipped with a supervised service disconnect switch. Operation of this switch shall generate a trouble signal, activate a LED and electrically isolate all releasing devices from receiving a discharge signal. With the switch in the "disconnected" position, it shall be possible to simulate any alarm condition and observe proper operation of all detection and signaling circuits without causing agent discharge.

The control panel shall be equipped with auxiliary relays for shutdown operations. The control panel shall be capable of programming relays independently to operate on either, trouble, alarm, pre discharge, or discharge modes.

The control panel, in addition to its yellow system trouble LED, shall further break down a trouble condition with the use of diagnostic LED's. These LED's shall indicate the following trouble conditions:

Open condition, pressure supervisory circuit (separate diagnostic LED).

Alarm audible circuit reverse polarity, open or short circuit.

Pre discharge/discharge audible circuit reverse polarity, short or open.

Detection circuit (separate LED for each detection circuit).

Releasing circuit open circuit.

Manual release circuit open circuit.

AC power loss.

Ground fault.

System alarm audible circuit reverse polarity, short or open.

Microprocessor failure flashing indicator.

The control panel shall have a common control board, which provides common alarm and trouble indications as well as alarm silence and reset switches. A common Class "B" wired general alarm circuit shall be provided for common area signaling as well as separate form "C" dry contacts for general alarm and trouble. A signal switch shall be provided that will silence all active signals. Silencing of audible alarms shall be controlled by "resound" logic, whereby any subsequent new alarm conditions will reactivate audible circuits. A "lamp test" switch shall be provided which will illuminate all alarm and diagnostic LED's.

Control panel shall have a solid state, high speed switching power supply with 24 VDC output capable of responding instantly to voltage and current surges on the input and output sides to protect the system from malfunction and damage. A supervised battery charging circuit and ground fault sensing circuitry shall be an integral part of the power supply. Battery standby power shall be "on line" such that batteries will supply power to the system in the event of AC power loss without a power transfer relay.

One board shall be provided for each protected area. The unit shall provide Class "A" wired detection and series supervised release circuits, Class "B", different distinct audible and visual indications for alarm, pre- discharge, and discharge conditions. Supervised manual release circuits shall be provided.

Each control panel shall have alarm output contacts (dry) for "system operation" and "system trouble," that shall:

Be direct hard wired into the HVAC control systems serving the building ventilation shut them down in the event of an alarm.

Be connected to the plant process control system to alert the operators of a problem.

See paragraph 3.03B below.

2.4.07 Alarm Devices. Electrically actuated fire alarm horns and strobe lights shall be furnished and installed. Each fire alarm horn strobe shall be actuated and receive operating power from the control panel. Terminals for this purpose shall be provided in the system control cabinet. Each device shall be approved or listed.

The contractor shall furnish and install adequate fire alarm horns and strobes (orange color) to notify plant personnel located in the protected areas. Additionally, horn/strobes shall be provided outside the entrance(s) to the protected area. The output for the audible and visible devices shall be adequate for the conditions encountered.

2.4.08 Thermal Detectors. Compact, stainless steel cover, hermetically sealed assembly, rate of rise compensating type. The setting shall be in accordance with NFPA 72E recommendations.

2.4.09 Manual Release Stations. The Manual release stations shall be located at major points of egress and as shown on Drawings. The manual release station shall provide a means of manually discharging the automatic fire extinguishing system when used in conjunction with the control panel. The manual release switch shall be the "dual action" type, to prevent accidental operation. The switch shall remain in the operated position until reset.

2.4.10 Tank Final Inspection and Test. After all live testing is done on an area or an electrical room, the tank/s shall be recharged when done at the contractor's/vendor's expense before sign off.

2.5 SYSTEM DESIGN TOTAL FLOODING SYSTEMS. Design of the carbon dioxide system shall be based upon the enclosure being sufficiently tight against agent leakage with all ventilation automatically shut down and/or fire dampers to provide for static air condition upon discharge, or shall be appropriately designed to compensate for openings that cannot be closed. Refer to Paragraph 1.01B above.

All appropriate doors, windows, vents and dampers shall be automatically closed before discharge of carbon dioxide. Devices for this purpose shall include pressure operated trips or switches where appropriate.

Agent quantity calculations shall be determined from dimensions furnished on contract drawings for a design concentration percentage at a minimum anticipated hazard temperature.

Pre discharge alarms and mechanical discharge delays shall be provided. They shall be of sufficient duration to warn personnel of an impending discharge of carbon dioxide and allow for hazard area evacuation and preparation.

Electronic Time (discharge) delays will not be permitted or acceptable.

Warning signs shall be provided at each entrance doors to the buildings. The warning signs shall be 18" high by 30" wide with a baked enamel finish. Lettering shall warn the personnel of the presence of a CO2 fire suppression system.

The minimum discharge period shall be within 1 minute. The discharge period shall be lengthened as appropriate by considerations such as deep seated type fires.

Discharge nozzles, detectors and auxiliary equipment shall be located so as not to interfere with the hazard operation and/or maintenance.

PART 3 - EXECUTION

3.1 INSTALLATION. The Subcontractor shall not install any equipment or materials until the Program Manager and DESIGN SUBCONSULTANT had approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Subcontractor's risk.

Provide all labor and material required to set up, mount and connect all system equipment in accordance with NFPA standards. The system shall be installed in strict accordance with the manufacturer's recommendations.

All piping and fittings shall be thoroughly cleaned as assembled. All welded joints to be pounded to loosen scale and weld beads and then use the following procedure. Pull wire flue brush through each length several times. Pull clean cloth rags (not burlap or similar) treated with carbon tetrachloride, or a solution of 50 percent carbon tetrachloride and 50 percent Stoddard's solvent through each pipe length.

The system shall be wired in accordance with the manufacturers diagrams and requirements and the regulations of the Detroit Fire Department. All wiring shall be installed in conduit.

All wiring shall be in accordance with the NEC and local codes, the NFPA Standards No. 72, 72E, 72G, 72H, or the local authority having jurisdiction.

The Subcontractor shall start up each piece of equipment and system and shall make all adjustments so that the system is placed in proper operating condition.

3.2 <u>INSTRUCTIONS</u>. The system shall include permanent nameplates and instruction plates to identify the system and instruct its use under emergency conditions. In addition, provide three copies of an operation and maintenance manual which shall include system mechanical and electrical drawings, a written description of the system design and operation referenced to the system drawings, technical bulletins describing each piece of equipment in the system and inspection and maintenance directions.

3.3 <u>SEQUENCE OF OPERATION</u>. The system shall be designed and installed such that it is actuated by any one of the detectors located in the substation rooms.

Actuation of any detector or manual station shall:

> Provide steady alarm electronic sounder signal associated with the area in which the detector was actuated.
>
> Annunciate to Owner's monitoring equipment at the plant central security room.
>
> Perform necessary control functions such as HVAC equipment shutdown and dampers closure.
>
> Shut down and/or keep all emergency generators from starting.
>
> Close all doors leading into protected area.
>
> Discharge agent.

The system shall be capable of being actuated by manual discharge switches for each protected area. Operation of a manual discharge switch shall cause alarm and shutdown devices to operate the same as if the system had operated automatically and shall cause immediate discharge after the time delay period.

Upon entering the alarm mode, audible indication shall be supplied by the steady sounding of an alarm electronic sounder. This unit shall be polarized for full supervision and UL listed. It shall have an output of 82 to 99 dBA at 24 VDC. The sounder shall be provided with a red finish. All field wiring connections shall be made to terminal strips or wire leads on the device.

3.4 ACCEPTANCE TESTS. Perform a complete approval test in the presence of the Owner's representative and governing authorities.

All test procedures shall be performed in accordance with NFPA 12, Section 1 7.3.

Tests shall demonstrate that the entire system functions as intended. All circuits shall be tested: Automatic discharge, manual discharge equipment shutdown and alarm devices. In addition, supervision of each circuit shall be tested. Each detection device shall be tested according to the manufacturer's recommended procedures and NFPA 72E.

Discharge tests shall be conducted. Tests shall be conducted with the equipment manufacturer or equipment manufacturer's representative in the presence of the Owner's representative. Such tests shall be made only after the control system has tested satisfactorily. Carbon dioxide shall be used as the test agent.

Test containers shall be filled to the designed weight. The amount of gas shall be certified by the Subcontractor.

Provide all necessary test apparatus and instrumentation including gas to be expended.

Gas analyzers capable of automatically monitoring three sampling points simultaneously shall be provided. Concentration measurements shall be recorded every 5 seconds on separate strip charts. Sampling probes shall be placed at three different heights in different sections of the protected area. In no case will a probe be placed higher than the highest anticipated combustible hazard. In large buildings, additional test points may be required. The number of points shall be determined by the Program Manager.

Correct all defects and make additional tests, at no additional cost to the Program Manager or Owner, until the system complies with all contract requirements.
Upon acceptance by the Program Manager and the authority having jurisdiction, the complete system shall be reconditioned, tanks refilled and the system placed in full

operation with proper tags.

As a condition of final acceptance, provide operational training to the Owner's personnel. The training sessions shall include emergency procedures, system control panel operation, trouble procedures and safety requirements. Refer to item 4.03 below.

A maintenance agreement shall be submitted to the Owner for consideration only.

As part of the acceptance test, the contractor shall prepare and submit all the ‘As-built” drawings, and tables to the Program Manager.

PART 4 - SPECIAL REQUIREMENTS

4.1 FACTORY TESTING AND WITNESSING. Factory testing is required on the individual devices and equipment of the complete CO2 system and as specified under this specification. All factory testing documentation and written reports shall be properly dated and made available to the owner representative on site.

At least 2 weeks before the proposed field testing for acceptance of the complete CO2 system, contractor shall notify the engineer of the expected testing date for witnessing. The contractor shall submit a report from the CO2 vendor and equipment manufacturer detailing the proposed performance testing of the system.

4.2 SPARE PARTS AND MAINTENANCE TOOLS. Spare parts, maintenance and tools shall conform to the requirements of specification Section 01180. The CO2 vendor can submit a recommended spare parts list for all equipment supplied to allow DWSD decide and select from the list and also allow the plant to enlarge list if is found necessary to do that.

4.3 TRAINING. The CO2 vendor shall provide a training program to the owner. The program shall include all timing, materials, classes and any required certification for the plant personnel to assume responsibility of maintaining the CO2 system with the help of CO2 specialists.

The CO2 contractor shall present to the owner a document outlining the procedure to incorporate the training indicated in (A) above.

4.4 WARRANTIES. The products shall be warranted against any defects in material or workmanship per Section 01180.

The manufacturer of the equipment shall describe the maintenance to be performed during the warranty period to maintain warranty conditions.
In addition to the above, the following special warranty provisions shall apply:

The Subcontractor shall obtain an extended warranty for 3 years for the equipment furnished under this specification.

The extended warranty shall cover all equipment furnished under this specification from the time it is placed into operation (which can be any time during the construction period) until one year after final acceptance.

The extended warranty can be in the form of:

A maintenance agreement that should be included in this contract shall cover any equipment installations/replacements, repair, recharging system, corrective and preventive maintenance, calibration of gauges and monitoring devices (if any installed in the system) and inspection and testing. In addition to that, the agreement shall allow DWSD to get specs, PMs, and equipment info into their CMMS and get DWSD personnel trained to all of that. In addition to above, the agreement can include an O&M contract in place with the right training, certifications, and licensing to do all of this as recommended by the CO2 supplier.

End of Section

SECTION 15400

PLUMBING

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of materials, appliances, fixtures, equipment, and appurtenances associated with the plumbing systems as specified herein and as indicated in the Contract Documents. Additional requirements for plumbing systems shall be as indicated in the schedules on the drawings. Suitable connections shall be provided for each fixture, piece of equipment, and appurtenance.

Pipe materials, valves, thermal insulation, and pipe supports which are not an integral part of the fixture or piece of equipment and are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the plumbing system is compatible with all other parts of the system; that all piping, fixtures, and appurtenances are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall conform to the requirements of AGA, ASTM, NFPA, and UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as specified in the schedules. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thicknesses and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All plumbing equipment, piping, and valves denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Metal nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-

1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Plumbing equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080 Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications to be submitted for each unit shall include, but shall not be limited to, the following:

Equipment, Piping Accessories, and Appurtenances

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Capacities.

Pressure and temperature ratings.

Overall dimensions.

Piping connection sizes and locations.

Horsepower (kW).

Power requirements.

Net weight.

Wiring diagrams.

Plumbing Fixtures

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Water consumption data.

Overall dimensions.

Rough-in dimensions.

Piping connection sizes and locations.

Net weight.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated in the Contract Documents.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Qualification. The plumbing system installer shall be licensed as stipulated by the authority having jurisdiction.

1.5.03 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.5.04 Construction. Plumbing fixtures shall be constructed in accordance with the following standards:

Enameled Cast Iron	ANSI/ASME A112.19.1M
Vitreous China	ANSI/ASME A112.19.2M
Stainless Steel	ANSI/ASME A112.19.3M

Enameled Steel	ANSI/ASME A112.19.4M
Emergency/Safety Fixtures	ANSI Z358.1

Electric water coolers shall be UL listed and certified in accordance with the Air Conditioning and Refrigeration Institute (ARI) Standard 1010. All materials in contact with water shall comply with the Safe Drinking Water Act of 1986, and the Lead Contamination Control Act of 1988.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.7 EXTRA MATERIALS. Extra materials shall be furnished for each type and size of plumbing fixture or equipment as indicated in the Contract Documents, in the quantities indicated below.

Part	Number Required
Flushometer valve repair kits	1 per 5 fixtures
Tank type water closet ballcocks, flush valves, and floats	1 per 5 fixtures
Water closet seats	1 per 10 fixtures
Faucet washer and O-ring kits	1 per 5 fixtures
Faucet cartridge and O-ring kits	1 per 5 fixtures
Electric water heater elements	1 per heater
Water heater relief valves	1 per heater

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All plumbing fixtures and equipment shall be designed and selected to meet the specified conditions indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. All fixtures and equipment shall be designed to meet the performance and design conditions specified herein and indicated on the drawings.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated on the drawings.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

2.4.02 Surface Preparation. All iron and steel surfaces, except motors and speed reducers, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.03 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall conform to the requirements of Master Specification Section 09900, Painting.

2.4.04 Equipment Bases. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.05 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.06 Piping Systems. Unless otherwise specified herein, piping system materials shall conform to Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies and Master Specification Section 15061, Ductile Iron Pipe.

2.4.07 Valves. Unless otherwise specified herein, valves indicated to be a part of the plumbing systems shall conform to the Master Specification Section 15100, Miscellaneous Valves and Master Specification Section 15104, Resilient-Seated Gate Valves.

2.5 WATER SUPPLY PIPING ACCESSORIES.

2.5.01 Water Hammer Arrestors. Water hammer arrestors shall be either bellows or piston type. Bellows type arrestors shall consist of a stainless steel shell, a factory charged and sealed compression chamber, a stainless steel or elastomer bellows, and a stainless steel threaded adapter. Piston type arrestors shall consist of a seamless Type L copper shell, a seamlessly spun and factory charged air chamber, a factory lubricated double or triple O-ring sealed piston, and a threaded copper adapter. Water hammer arrestors shall be tested and certified in accordance with American Society of Sanitary Engineering (ASSE) Standard 1010. Arrestors shall be rated for a maximum working pressure of 350 psig (2400 kPa gauge) and a temperature range of 33° F to 250° F (1° C to 120° C). Water hammer arrestors shall be Smith "Hydrotrol", Josam "75000 Series Absorbotron", Wade "Shokstop", Sioux Chief "Hydra-Rester", or approved equal.

2.5.02 Trap Primers. Trap primer valves shall be flow activated, pressure activated, or tailpiece type as indicated in the Contract Documents.

2.5.02.01 Flow Activated Trap Primers. Flow activated trap primer valves shall be the automatic type activated by water flow in a pipeline. The primer valve shall consist of a bronze body with removable operating parts, an integral vacuum breaker, and a gasketed access cover. Connections shall be 1/2 inch (13 mm) NPT. Trap primer valves shall be tested and certified in accordance with American Society of Sanitary Engineering (ASSE) Standard 1018. Trap primer valves shall be Smith "2699", Josam "Series 88250", Wade "W-2400", or approved equal.

2.5.02.02 Pressure Activated Trap Primers. Pressure activated trap primer valves shall be the automatic type activated by pressure drop in a pipeline. The primer valve shall consist of a brass body with removable operating parts and an integral air gap. A distribution unit shall be provided when a single primer valve serves multiple traps. The trap primer shall be self-adjusting to line pressure and shall not require field adjustment. Connections shall be 1/2 inch (13 mm) NPT. Trap primer valves shall be tested and certified in accordance with American Society of Sanitary Engineering (ASSE) Standard 1018. Trap primer valves shall be Precision Plumbing Products "Prime-Rite PR-500", or approved equal.

2.5.02.03 Tailpiece Trap Primers. Trap primers installed in a flush valve water closet supply or lavatory drain shall consist of a chrome plated brass plumbing fixture tailpiece with a 1/2 inch (13 mm) OD diverter pipe and compression connection for copper tubing.

2.5.02.04 Thermostatic Mixing Valves. Thermostatic mixing valves shall comply with ASSE 1017, shall be bronze or brass body, with stainless steel flow control components, threaded end connections, rotating handle adjustment, lockable setpoint, and hot and cold check stops. Valves shall be suitable for flow ranges and have temperature adjustment ranges as indicated in the schedules. Accuracy shall within 3° F (2° C) of setpoint. Thermostatic mixing valves shall be manufactured by Symmons, Leonard, Powers, or approved equal.

2.6 DRAINAGE AND VENT PIPING ACCESSORIES.

2.6.01 Cleanouts. Cleanouts shall be provided where indicated on the drawings and required by the referenced codes.

Floor cleanouts shall consist of a two piece body, a threaded plug, an adjustable head, and a cover. Cleanouts installed in floors that include a waterproofing membrane shall be provided with a flashing flange and membrane clamp. Cleanouts installed in partition walls shall be provided with an access cover and frame with a securing screw installed over the cleanout plug. Wall cleanouts shall be stainless steel or nickel bronze, as indicated. Cleanouts installed in exposed piping shall consist of a ferrule or threaded adapter and a cast brass or bronze plug installed in a T-pattern, 90 degree drainage fitting.

Cast iron cleanouts shall be manufactured by Smith, Josam, Wade, or approved equal. Polypropylene cleanouts shall be manufactured by Orion, Enfield, or approved equal. PVC cleanouts shall be manufactured by Sioux Chief, or approved equal.

2.6.02 Bell-Up Drains. Unless otherwise indicated, bell-up drains shall consist of a drainage pipe hub extended to 1 inch (25 mm) above the finished floor. For chemical-resistant waste systems, bell-up drains shall consist of a plain end section of pipe, with a coupling extended 1 inch (25 mm) above the finished floor.

2.6.03 Funnel Receptors. Funnel receptors shall consist of cast iron funnels with cast iron dome type bottom strainers. Funnel receptors shall be provided with waterstop flange and threaded or no-hub outlet connections suitable for connection to the waste piping. Funnel receptors connected to chemical resistant waste systems shall be furnished with a factory applied chemical resistant interior coating. Unless otherwise indicated, funnel receptors shall be installed 1 inch (25 mm) above the finished floor.

Funnel receptors shall be Smith “Series 3800”, Josam, Wade, or approved equal.

2.6.04 Floor Drains. Floor drains shall be of the types specified herein and indicated on the drawings. Floor drains shall have a two-piece body, a flashing collar, an adjustable head, and a grate. A trap primer connection shall be provided when indicated on the drawings. Floor drains installed in floors that include a waterproofing membrane shall be provided with a flashing flange and membrane clamp.

Cast-iron floor drains shall be manufactured by Smith, Josam, Wade, or approved equal. Polypropylene floor drains shall be manufactured by Orion, Enfield, or approved equal. PVC loor drains shall be manufactured by Sioux Chief, or approved equal.

2.6.05 Roof Drains and Overflow Roof Drains. Roof drains and overflow roof drains shall be of the types specified herein and indicated on the drawings. Roof drains shall consist of a cast iron dome, a cast iron body, a sump receiver, an integral flange, and an extension for insulation thickness, where applicable. Drains for aggregate-surfaced roofing shall be provided with gravel stops. For other than cast-in-place locations, roof drains shall be provided with underdeck clamps. When indicated on the drawings, overflow roof drains shall be provided with interior extension rings. Roof drains and overflow roof drains shall be manufactured by Smith, Josam, Wade, or approved equal.

2.6.06 Downspout Nozzles. Downspout nozzles shall be cast brass or bronze, and shall be provided with a threaded inlet and a mounting flange. The mounting flange shall be provided with drilled fastening lugs. Downspout nozzles shall be Smith

"Model 1770", Josam, Wade, or approved equal.

2.6.07 Modular Trench Drain System. Modular trench drain systems shall be of the types specified herein and indicated on the drawings. The modular trench drain system shall include pre-sloped channel drain sections, end caps, outlet connections, grating, and all other components and accessories required for a complete installation. Drainage channels and related components shall be constructed of corrosion resistant polymer concrete. The grating shall be suitable for extra heavy traffic. The modular trench drain system shall be manufactured by Smith ACO, ABT Polydrain, or approved equal.

2.6.08 Floor Sinks. Floor sinks shall consist of a cast iron body with acid resistant interior finish, and a nickel-bronze grate. The grate shall be of the type indicated on the drawings shall be easily removable for cleaning. Floor sink grates and outlets shall be sized as indicated on the drawings. Floor sinks shall be manufactured by Smith, Josam, Wade, or approved equal.

2.6.09 Backwater Valves. Backwater valves shall be of the types as specified herein and indicated on the drawings. In-line backwater valves shall be provided with a hinged flapper valve and a bolted top access cover or a knife gate valve as indicated on the drawings. Knife gate valves shall be provided with a bronze gate and removable wheel handle. When indicated on the drawings, the access cover or handwheel operator shall be extended to finish floor or grade.

Terminal backwater valves shall be provided with a hinged flapper valve and an inlet hub connection. The flapper valve shall be factory set to be fully closed in the normal position.

Ball-float backwater valves shall be provided with cast-iron body, removable bronze seat ring, neoprene seat and ball-float. Ball float backwater valves shall be provided with threaded inlet connection and threaded or no-hub outlet connection as appropriate for the piping system.

Cast-iron backwater valves shall be manufactured by Smith, Josam, Wade, or approved equal. PVC backwater valves shall be manufactured by NDS, Plastic Oddities, Inc, or approved equal.

2.6.10 Vent Flashings. Plumbing vent flashings shall be furnished and installed as indicated on the drawings.

2.7 PLUMBING FIXTURES AND ACCESSORIES.

2.7.01 General. Plumbing fixtures shall be provided with all required supports, fasteners, supply and drain fittings, gaskets, and escutcheons required for a complete installation.

2.7.02 Water Closets. Water closets shall be of vitreous china, with an elongated bowl and siphon jet flushing action. The type and water use of water closets shall be as indicated on the drawings. All water closets shall be provided with anchor bolt caps. Flush valve type water closets shall be provided with top spud connections for flushometer valves. Flush tank type water closets shall be provided with factory installed tank liners. Field installed liner kits will not be acceptable. Water closets shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.02.01 Seats. Water closet seats shall be white, solid plastic, contoured, elongated open front type without cover, with concealed check and stainless steel hinges. The seats shall be manufactured by Kohler, American Standard, Eljer, Church, or approved equal.

2.7.02.02 Flush Valves. Flush valves for top spud type water closets shall be exposed type, with a chrome plated brass body, an externally adjustable diaphragm, an angle stop, a renewable valve seat, a tailpiece, a vacuum breaker, a wall flange, a spud nut and flange, and a 1 inch (25 mm) NPT water supply connection. Flush valves shall be Sloan "Royal" Delaney, or approved equal.

2.7.02.03 Supply Set. A supply set consisting of a 1/2 inch (13 mm) NPT brass angle loose key stop valve, a copper supply tube, and an escutcheon plate shall be furnished for each tank type water closet. All supply components shall be polished chrome.

2.7.02.04 Chair Carriers. Wall-mounted water closets shall be provided with adjustable chair carriers. The carriers shall be suitable for the chase depth and piping arrangement and shall consist of a heavy-duty cast iron body, complete with a drainage fitting, pylon feet, a drainage nipple, fitting and fixture gaskets, a positioning frame or template, and mounting hardware. Chair carriers shall be manufactured by Smith, Josam, Wade, or approved equal.

2.7.03 Urinals. Urinals shall be of the type and water use as indicated on the drawings. Urinals shall be of vitreous china, wall mounted, with an elongated rim and washout flushing action, and shall be provided with a top spud connection for a flushometer valve. Urinals shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.03.01 Flush Valves. Flush valves shall be exposed type, of chrome plated brass with an externally adjustable diaphragm, an angle stop, a renewable valve seat, a tailpiece, a vacuum breaker, a wall flange, a spud nut and flange, and a 3/4 inch (19 mm) NPT water supply connections. Flush valves shall supply a maximum of 1.0 gallon (3.8 L) per flush, and shall be Sloan "Royal 186-1", Delaney, or approved equal.

2.7.03.02 Supports. A fixture support system, including support legs, upper and lower bearing plates, and bearing studs shall be provided for urinals mounted on all walls other than masonry. Urinals mounted on masonry walls shall be provided with suitable anchor bolts. Urinal supports shall be manufactured by Smith, Josam, Wade, or approved equal.

2.7.04 Lavatories. Lavatory types, dimensions, and water use shall be as indicated on the drawings. Lavatories shall be of vitreous china, constructed with overflow drains and soap depressions. Countertop lavatories shall be self-rimming, and shall be provided with suitable adhesive and/or fastening clamps. Wall-mounted lavatories shall be drilled for a concealed arm carrier. Faucet drillings shall be 4 inches (100 mm) on center unless otherwise indicated. Lavatories shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.04.01 Faucets and Trim. Lavatory faucets shall be 4 inches (100 mm) on center, of polished chrome, with a vandal-resistant single-lever handle and all-brass or copper waterways. Each faucet shall be provided with a flow restrictor, a cast brass grid strainer or pop-up drain, and a 1-1/4 inch (32 mm) cast brass tailpiece. Supply sets consisting of 1/2 inch (12.5 mm) NPT brass angle loose key stop valves, copper supply tubes, and escutcheon plates shall be furnished for each lavatory faucet. All supply components shall be polished chrome. Where indicated to be ADA-compliant and exposed to human contact, lavatory supplies shall be insulated. Lavatory faucets and supply sets shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.04.02 Traps. Lavatory traps shall be at least 1-1/4 inches (32 mm) in diameter, cast brass with polished chrome finish, with an escutcheon flange and a cleanout plug. Where indicated to be ADA-compliant and if exposed to human contact, lavatory traps shall be offset, insulated type.

When insulation is needed, lavatory supplies and traps may be pre-insulated or furnished with an insulation kit for field installation. Insulating material shall be flame retardant closed cell vinyl. The supply insulating kit shall be snap form type or shall be provided with ties. The trap insulation material shall not require the use of ties or mechanical fasteners to be held in place. Pre-insulated traps and supply insulation kits shall be McGuire Products "ProWrap", or approved equal. Trap and supply insulation kits shall be as manufactured by TRUEBRO Inc, or approved equal.

2.7.04.03 Supports. Wall-hung lavatories shall be provided with a complete fixture support system, including support legs, bearing plates, concealed arms, and anchor bolts. The support legs shall be mounted within the partition wall. For lavatories mounted on masonry walls, support legs may be omitted. Lavatory supports shall be manufactured by Smith, Josam, Wade, or approved equal.

2.7.05 Showers. Shower type, dimensions, and water use shall be as indicated on the drawings.

2.7.05.01 Built-up Shower Stalls. Each built-up shower stall shall be provided with a pressure-balanced single lever mixing valve, a shower head, an arm, and a flange. The shower valve shall include integral service stops and an adjustable stop screw. The shower head shall be of adjustable spray pattern type, with volume control, a swivel ball joint, and an integral flow control device. All exposed components shall be polished chrome.

2.7.05.02 Prefabricated Shower Modules, ADA Compliant. Prefabricated shower modules shall be complete units, and shall meet ADA requirements. Each unit shall consist of a one-piece reinforced acrylic enclosure with stainless steel grab bars on two sides, a folding slatted wood or nylon seat, a 1 inch (25 mm) diameter curtain rod, a 10 ounce/yd^2 (339 g/m^2) shower curtain with hooks, and a 2 inch (51 mm) chrome plated cast brass outlet drain. Each module shall be predrilled for a shower valve, a shower support rod, and a dome light. A pressure-balanced single-lever mixing valve, a hand-held shower head with swivel fitting, a 69 inch (1.7 m) stainless steel flexible hose, a support rod, an in-line vacuum breaker, and a 120 volt dome light shall be provided with each unit. Prefabricated shower modules shall be manufactured by Crane, Kohler, or approved equal.

2.7.05.03 Prefabricated Shower Modules. Prefabricated shower modules shall be provided as complete units. Each unit shall consist of a one-piece reinforced acrylic enclosure with a 1 inch (25 mm) diameter curtain rod, a 10 ounce/yd^2 (339 g/m^2) shower curtain with hooks, and a 2 inch (50 mm) chrome plated cast brass outlet drain. Each module shall be predrilled for a shower valve and dome light. A pressure-balanced single-lever mixing valve and a 120 volt dome light shall be provided with each unit. Prefabricated shower modules shall be manufactured by Crane, Kohler, or approved equal.

2.7.06 Stainless Steel Sinks. Sink dimensions, hole punching, material, metal gage, manufacturer and model shall be as indicated in the schedules.

Stainless steel sinks shall be seamless stainless steel, with smooth radius interior corners. Countertop mounted sinks shall be self-rimming with compartment and faucet deck recessed below the outer edge of the sink. All exposed surfaces of sinks shall be machine polished to a bright finish and the underside shall be fully undercoated. Sinks shall be provided with mounting clips, support legs, and all other hardware as indicated in the schedules. Stainless steel sinks shall be manufactured by Advance Tabco, Elkay, or approved equal.

2.7.06.01 Faucets. Sink faucets shall be polished chrome, with a vandal-resistant single-lever handle. All waterways shall be constructed of brass or copper. Faucets shall be provided with a brass spout, an aerator, and a flow restrictor. Supply sets consisting of 1/2 inch (12.5 mm) NPT brass angle loose key stop valves, copper supply tubes, and escutcheon plates shall be provided. All supply components shall be polished chrome. Sink faucets and supply sets shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.06.02 Drain Assembly. All required drainage accessories, including strainers, tailpieces, and traps, shall be provided. Basket strainers shall be heavy gage stainless steel, with a removable conical strainer plate and a neoprene stopper. Tailpieces shall be chrome plated brass. Sink traps shall be at least 1-1/2 inches (38 mm) in diameter, cast brass, with polished chrome finish, an escutcheon flange, and a cleanout plug.

2.7.07 Mop Sinks and Service Sinks. Mop sink and service sink types, dimensions, manufacturers, and models shall be as indicated in the schedules.

Mop sinks shall be floor mounted, corner type, with a diagonal front, constructed of pearl gray terrazzo. Mop sinks shall be provided with an integral 20 gage (0.91 mm) thick stainless steel threshold cap, a 6 inch (150 mm) drop at threshold, and a shoulder at least 1-1/4 inches (32 mm) wide. A 3 inch (75 mm) cast brass drain and stainless steel strainer, and where indicated, a 20 gage (0.91 mm) thick stainless steel splash panel shall be provided for each sink. Mop sinks shall be manufactured by Stern-Williams, Fiat, or approved equal.

Service sinks shall be wall mounted, and shall consist of a 10 inch (254 mm) deep cast iron bowl coated with acid resistant enamel, a stainless steel rim guard, a plain or drilled back as indicated on the drawings, and a heavy gage metal wall bracket. Service sinks shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.07.01 Faucets. Sink faucets shall be rough plated brass, with lever handles, a threaded spout, a vacuum breaker, a wall brace, and a pail hook. The distance from the wall to the center of the spout outlet shall measure approximately 7-1/2 inches (190 mm). Sink faucets shall be as manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.07.02 Drain Assembly. Mop sinks shall be provided with a 3 inch (75 mm) cast brass drain and a stainless steel strainer. Service sinks shall be provided with a 3 inch (75 mm) cast iron P-type trap standard, with a stainless steel strainer, a cleanout plug, and a threaded outlet.

2.7.08 Emergency Fixtures. Emergency fixtures, including showers, eye/face washes, and combination shower/eye/face wash units shall be furnished and installed where indicated on the drawings. Emergency eyewash shall meet the ANSI Z358.1 Standard and shall provide a minimum tempered water flow of 0.4 gpm at a minimum of 30 psi. Fixture type, manufacturer, and model shall be as indicated in the schedules. Emergency fixtures shall be manufactured by Haws, Guardian, Encon, or approved equal.

Pedestal eyewash shall have a stainless steel receptor, ABS plastic heads, a stay-open ball valve, a push plate actuator, a chrome plated trap, and a universal emergency sigh. All necessary accessories required for a complete installation shall be provided.

Indoor emergency eyewash fixtures shall be wall mounted with a wall bracket, a stainless steel receptor, ABS plastic heads, a stay-open ball valve, a push plate actuator, a chrome plated trap, and a universal emergency sign. All necessary accessories required for a complete installation shall be provided.

Faucet mounted eyewash shall have a chrome plated brass finish, pull handle with graphics, aerated sprays, and up to 2" thick counter thickness. The unit shall have a dedicated tepid water supply, and shall be manufactured by Speakman, or approved equal.

Indoor ceiling-mounted emergency shower fixtures shall be suitable for vertical supply pipe and flush ceiling mounting, with a pipe support bracket, a chrome plated brass shower head, a stay-open ball valve, a stainless steel pull-rod actuator, and a universal emergency sign. The ball valve shall be located above the ceiling. All necessary piping, support brackets, escutcheons, and accessories required for a complete installation shall be provided.

Combination emergency shower/eye/face wash fixtures shall be pedestal mounted, with a stanchion, a floor flange, a deluge showers, an aerated eye/face wash, an eye/face wash dust cover, stay-open ball valves, interconnecting piping, and a universal emergency sign. The shower shall be stainless steel or ABS plastic with a stainless steel pull rod actuator. The eye/face wash receptor shall be stainless steel with push plate and foot pedal actuators.

Freezeproof emergency eye wash fixtures shall be wall mounted with a wall bracket, a stainless steel receptor, ABS plastic heads, a stay-open ball valve, a push plate actuator, and a universal emergency sign. The ball valve shall be located indoors, with an extension stem extending through the exterior wall to the push plate actuator. All necessary drain and bleed piping, wall sleeves, and accessories required for a complete installation shall be provided.

Freezeproof emergency shower fixtures shall be wall mounted, suitable for a horizontal supply pipe, with a pipe support bracket, a stainless steel or ABS shower head, a stay-open ball valve, and a universal emergency sign. The ball valve shall be located indoors, with an actuator extending through the exterior wall. All drain and bleed piping, wall sleeves, and accessories required for a complete installation shall be provided.

Freezeproof combination emergency shower/eyewash fixtures shall be pedestal mounted, with a stanchion, a floor flange, a deluge shower, an aerated eye/face washes, freezeproof stay-open valves, interconnecting piping, and a universal emergency sign. The shower and eye/face wash shall be stainless steel or ABS plastic with a stainless steel actuator. The entire unit shall be provided with self-regulating heating cable and shall be insulated with polyethylene foam insulation. The insulation shall be provided with a removable, UV resistant, ABS plastic jacket with gasketing and removable fasteners. Electric heating cable shall be suitable for the outdoor temperature and power supply indicated on the drawings.

An audible and visual alarm system shall be provided when indicated on the drawings. The alarm system shall activate based on water flow when either the emergency shower or eyewash fixture is operated. The water flow switch shall be provided with double-pole double-throw contacts rated 5 amperes at 125 volts, suitable for remote alarm annunciation. The audible alarm shall provide an intermittent signal rated at 90 dB at 10 feet. The alarm light shall be amber, flashing type. The alarm system shall be pre-wired and shall be furnished with all necessary junction boxes, conduit, wire, and accessories for a complete installation. The alarm system shall be suitable for a 120 volt power supply.

2.7.09 Wash Fountains. Wash fountain type, size, and finish shall be as indicated in the schedules. Wash fountains shall be precast terrazzo with a 9 inch (229 mm) deep bowl, a pedestal support, and stainless steel scuff plates and panels, and shall be suitable for wall or floor type water and waste connections, and a rear or centrally rising vent. Wash fountains shall be complete with a polished chrome liquid or powdered soap dispenser, a thermostatic mixing valve, combination stop/strainer check valves, and all other components required for proper operation. A foot, hand, or infrared control system shall be provided as indicated on the drawings. Infrared control systems shall include transformers as needed for operation on a 120 volt power supply. Wash fountains shall be manufactured by Bradley Corporation, or approved equal.

2.7.10 Electric Water Coolers. Electric water cooler type, capacity, manufacturer, and model shall be as indicated in the schedules. Water coolers shall be wall mounted, mechanically refrigerated type, and shall deliver 50°F (10°C) water at the specified rate, based on 80°F (27°C) inlet water temperature and a room temperature of 90°F (32°C). The water coolers shall consist of a heavy gage steel cabinet, an insulated cooling tank, a stainless steel receptor, copper water lines, a water pressure regulating valve, an adjustable thermostat, and a 3-wire power cord with a polarized plug. The refrigeration unit shall consist of a hermetically sealed spring mounted compressor and an air-cooled condenser. Electric water coolers shall be suitable for a 120 volt, 60 Hz, single phase power supply, shall be UL and ARI listed, and shall be manufactured by Elkay, Oasis, Halsey Taylor, or approved equal.

2.7.11 Food Waste Disposers. Food waste disposer motor size, power supply, and model shall be as indicated on the drawings. Disposers shall consist of stainless steel grinding chamber, grinding elements, impellers, and stopper. Disposers shall be provided with permanently lubricated bearings, a motor overload protector, a tailpiece, a 5 foot (1.5 m) 3-wire power cord with a polarized plug, and a service wrench. Disposers shall be UL listed and shall be manufactured by In-Sink-Erator, or approved equal.

2.8 PLUMBING EQUIPMENT.

2.8.01 General. Plumbing equipment shall be provided with all supports, fasteners, fittings, and escutcheons required for a complete installation.

2.8.02 Water Heaters and Accessories. Water heaters shall be furnished and installed where indicated on the drawings. Heater type, storage capacity, recovery rate, energy input, power supply requirements, manufacturer, and model shall be as indicated in the schedules.

2.8.02.01 Commercial Grade Electric Storage Water Heaters. Electric storage water heaters shall be commercial type, with a glass-lined tank and one or more heating elements. The heater shall be provided with a cold water inlet tube, a magnesium anode, polyurethane foam insulation, a drain valve, and adjustable thermostats. Heating elements shall be immersion type, incoloy sheathed, low or medium watt density, and shall be field replaceable. Heater tanks shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). Heater tanks larger than 70 gallons (265 L) shall be provided with an inspection port. Each heater shall be equipped with an ASME rated pressure-temperature relief valve of suitable capacity. Heaters shall be UL and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. Electric storage water heaters shall be manufactured by State Industries Inc., A. O. Smith, Lockinvar, or approved equal.

2.8.02.02 Industrial Grade Electric Storage Water Heaters. Electric storage water heaters shall be industrial type, with a nickel-lined tank and one or more heating elements. Heaters shall be provided with a cold water inlet tube, high density fiberglass insulation, a drain valve, and adjustable thermostats. Heating elements shall be immersion type, incoloy sheathed, low or medium watt density, and shall be field replaceable. Heater tank shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). The heater tanks shall be provided with an inspection port at least 12 inches (300 mm) in diameter. An ASME rated pressure-temperature relief valve of suitable capacity shall be provided with each heater. Heater shall be UL and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. The electric storage water heaters shall be manufactured by PVI Industries Inc, or approved equal.

2.8.02.03 Electric Instantaneous Water Heaters. Instantaneous water heaters shall be tankless type and shall heat water on demand as determined by an integral flow switch. Heaters shall be suitable for operating water pressures of 25 to 150 psig (14 to 1034 kPa gauge), and shall be provided with compression type tubing connections. Heater elements shall be constructed of stainless steel or glass reinforced plastic, and shall be replaceable. If required by applicable codes, each heater shall be provided with a temperature and pressure relief valve. Heaters shall be provided with thermostatic control. Electric instantaneous water heaters shall be UL listed and shall be manufactured by Chronomite Laboratories Inc., Eemax, or approved equal.

2.8.02.04 Commercial Grade Gas Fired Water Heaters. Gas fired water heaters shall be commercial, storage type, with a glass-lined tank and a natural or propane gas burner as indicated on the drawings. Heaters shall be provided with a cold water inlet tube, a magnesium anode, high density fiberglass insulation, a drain valve, a flue damper, and an adjustable thermostat. The heater burner shall be atmospheric type, constructed of aluminized steel, and shall be suitable for a minimum gas supply pressure as indicated on the drawings. The burner shall be provided with a gas pressure regulator, a manual reset safety shutoff, and an intermittent electronic ignition control system. Burner operation shall be interlocked with the flue damper to prevent burner and pilot ignition until the flue damper is proven open. Heater tanks shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). Heater tanks larger than 70 gallons (265 L) shall be provided with an inspection port. An ASME rated pressure-temperature relief valve of suitable capacity shall be provided with each heater. Heaters shall be UL, AGA, and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. Gas fired storage water heaters shall be manufactured by State Industries, A. O. Smith, Lockinvar, or approved equal.

2.8.02.05 Industrial Grade Gas Fired Water Heaters. Gas fired water heaters shall be industrial, storage type, with a nickel-lined tank and a natural or propane gas burner as indicated on the drawings. Heaters shall be provided with a cold water inlet tube, a magnesium anode, high density fiberglass insulation, a drain valve, and an adjustable thermostat. The heater burner shall be forced draft type constructed of cast aluminum, and shall be suitable for a minimum gas supply pressure as indicated on the drawings. The burner shall be provided with a gas pressure regulator, an automatically reset safety shutoff device, and an intermittent electronic ignition control system. The burner combustion chamber shall be submerged, utilizing a minimum of two passes. Heater tank shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). The heater tanks shall be provided with an inspection port at least 12 inches (300 mm) in diameter. An ASME rated pressure-temperature relief valve of suitable capacity shall be provided with each heater. Heaters shall be UL, AGA, and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. Gas fired storage water heaters shall be manufactured by PVI Industries, Inc, or approved equal.

2.8.02.06 Water Heater Flues. A complete flue system shall be provided for each gas fired water heater. Unless otherwise required to maintain the listing of the heater, water heaters utilizing atmospheric burners or fan assisted heaters which operate under a negative flue pressure shall be provided with a Type 'B' flue system. Water heaters utilizing forced draft burners which pressurize the flue shall be provided with a pressurized flue system. Flues shall be as specified in Master Specification Section 15500, Heating, Ventilating and Air Conditioning.

2.8.02.07 Circulating Pump. A circulating pump shall be furnished and installed where indicated on the drawings. Pump capacity, power requirements, manufacturer, and model shall be as indicated on the drawings.

The circulating pump shall be an in-line unit with a bronze body, bronze fitted, mechanical seals, a stainless steel or ceramic shaft, and at least 1/2 inch (13 mm) NPT connections. The circulating pump shall be controlled by a 7-day time clock provided with the pump. The time clock shall be suitable for a 120 volt single phase power supply, and shall have contacts rated for 10 amperes ac. The circulating pump shall be manufactured by Bell & Gossett, Thrush, Taco, or approved equal.

2.8.02.08 Thermometers. Thermometers shall be Weksler Instruments "Adjust Angle", Ashcroft "Series EI Everyangle", or approved equal.

Thermometers shall be bimetal type and shall have a dial at least 4-1/2 inch (114 mm) diameter, with black markings on a white background. Pointer travel shall span not less than 200 degrees nor more than 270 degrees. Each thermometer shall have a stainless steel case, bezel, fittings, and stem and shall be hermetically sealed, with external pointer adjustment and an acrylic or shatterproof glass window.

Each indicator shall be furnished with an angularly adjustable frame for convenient viewing. Unless otherwise indicated, thermometer range shall be 0 to 200°F (-10 to 110°C).

Each thermometer shall be furnished with a stainless steel thermowell for installation in the piping systems. The thermowells shall have 3/4 inch (20 mm) NPT thread mounts, a minimum pressure rating of 250 psig (1725 kPa gauge), and a nominal 4 inch (100 mm) insertion length.

2.8.03 Neutralization Tanks. Neutralization tanks shall be furnished and installed where indicated on the drawings. Tank volume, connection sizes, manufacturer, and model shall be as indicated in the schedules.

Neutralization tanks shall be of heavy-duty construction, rotomolded in one piece from polyethylene resins and equipped with a bolt-down cover of the same material, fastened with stainless steel bolts and washers. Inlet, outlet, and vent fittings molded from the same resins as the tank shall be triple-welded to the tank body at the locations indicated on the drawings. A full diameter flanged extension constructed of the same material as the tank shall be provided where required to raise the access cover to at or just below the floor level as indicated on the drawings. The tank shall be filled with hard limestone or marble chunks, 2 to 3 inches (50 to 75 mm) in diameter to the level recommended by the manufacturer. Neutralization tanks shall be manufactured by Enfield, Orion, Town & Country Plastic, Inc, or approved equal.

2.8.04 Hose Reels. Hose reels shall be furnished and installed at the locations indicated on the drawings. Hose reel type, capacity, manufacturer, and model shall be as indicated in the schedules.

Each hose reel shall be provided complete with a hose storage drum, a handle crank winding mechanism, a spring-actuated pin lock, and a heavy duty frame suitable for anchoring to concrete or masonry wall or floor supports. When indicated on the drawings, hose reels shall be provided with a water supply swivel joint rated at 600 psig (4,130 kPa gauge). The hose storage drum shall be provided with a brass male hose adapter suitable for use with the specified hose. The hose reels shall be manufactured by Hannay, or approved equal.

2.8.05 Hoses. Hoses shall be furnished at the locations indicated on the drawings. Hose type, diameter, manufacturer, and model shall be as indicated in the schedules.

Unless otherwise indicated, each hose shall be provided with one male swivel type brass hose connector, one female brass hose connector, and one regulating wash-up spray nozzle. Spray nozzles in 1 inch (25 mm) and 1-1/2 inch (38 mm) sizes shall be Potter-Roemer Inc. "Series 2970" with a cast brass body, a rubber bumper, and a female hose thread, or approved equal.

Type 1 hoses shall be non-collapsible, suitable for water service and shall be rated for 150 psig (1030 kPa gauge) working pressure. The hose shall consist of 1-1/2 inch (38 mm) ID heavy-duty ethylene, propylene diene (EPDM) rubber tubing with synthetic, high tensile textile cord reinforcement and an EPDM cover. Type 1 hoses shall be Gates Rubber Company "Dolphin", or approved equal.

Type 2 hoses shall be non-collapsible, suitable for water service and shall be rated for 130 psig (900 kPa gauge) working pressure. The hose shall consist of 3/4 inch (19 mm) or 1 inch (25 mm) ID heavy-duty ethylene, propylene diene (EPDM) rubber tubing with synthetic, high tensile textile cord reinforcement and an EPDM cover. Type 2 hoses shall be Gates Rubber Company "Industrial Wearmaster", or approved equal.

Type 3 hoses shall be non-collapsible, suitable for hot water service and shall be rated for 200 psig (1380 kPa gauge) working pressure. The hose shall consist of 1 inch ID heavy-duty ethylene, propylene diene (EPDM) rubber tubing with synthetic, high tensile textile cord reinforcement and an EPDM cover. The hose shall have an integrated nozzle. The hose end opposite the nozzle shall be furnished with a female thread brass hose connector with swivel. Type 3 hoses shall be Gates Rubber Company "113S", or approved equal.

Type 4 hoses shall be suitable for lay flat water discharge service and shall be rated for 75 psig (500 kPa gauge) working pressure. The hose shall be 1-1/2 inch (38 mm) ID with a heavy-duty polyvinyl chloride (PVC) body and synthetic, high tensile textile cord reinforcement. Type 4 hoses shall be Gates Rubber Company "Masterflex 500", or approved equal.

2.8.06 Oil Interceptor. An oil interceptor shall be furnished and installed where indicated on the drawings. Interceptor capacities, connections, manufacturer, and model shall be as indicated in the schedules.

The oil interceptor shall be of cast iron with an acid resisting coating inside and outside, an adjustable gravity drawoff, a trap with cleanout, 4 inch (102 mm) inlet and outlet connections, vent connections, a removable baffle and sediment bucket, an internal air relief/flow control fitting with access box, and a gasketed cast iron scoriated cover with one bolt securing T-handle. A suitable steel extension shall be provided to raise the access cover to the floor level. The interceptor shall bear the Plumbing and Drainage Institute (PDI) seal of approval and shall be manufactured by Smith, Josam, Wade, or approved equal.

2.8.07 Flammable Waste Interceptor. A flammable waste interceptor suitable for containing oil and other flammable liquids shall be furnished and installed where indicated on the drawings.

The flammable waste interceptor shall consist of a steel or cast iron shell at least 3/16 inch (5 mm) thick, a 4 inch (100 mm) inlet and outlet, and 3 inch (75 mm) vent connections located as indicated on the drawings and as stipulated by the authority having jurisdiction. Steel interceptors shall be coated inside and outside with two coats of black asphaltum.

The interceptor shall maintain a liquid depth of at least 36 inches (0.9 m), and shall have a liquid retention volume of at least 35 cubic feet (1 cubic meter). The inlet piping shall terminate with a 90 degree elbow to 3 inches (75 mm) below the liquid level. The discharge piping shall consist of a 90 degree elbow and pipe terminating 18 inches (450 mm) below the liquid level.

A suitable steel or cast iron extension shall be provided to raise the access cover to the floor level, and a gasketed vaportight steel or cast iron access cover with lifting rings shall also be provided. The cover shall be at least 24 inches (600 mm) in diameter and shall be suitable for a live load of at least 150 psf (7.2 kPa).

2.8.08 Expansion Tanks. Expansion tanks shall be furnished and installed where indicated on the drawings. Tank capacities, connections, manufacturer, and model shall be as indicated in the schedules.

Expansion tanks shall be welded steel diaphragm type, ASME tested and stamped for a working pressure of 125 psig (862 kPa gauge), with a flexible diaphragm and a charging valve. Floor-mounted tanks shall be provided with a suitable mounting base. The tanks shall be suitable for use with potable water and shall be factory pre-charged to the indicated pressure. Expansion tanks shall be manufactured by Amtrol, or approved equal.

2.8.09 Water Storage Tank. The water storage tank shall have the capacity and dimensions as indicated in the schedules. The tank shall be welded steel, glass or thermosetting polymer lined, suitable for use with potable water, and shall be ASME stamped for a working pressure of 125 psig (862 kPa gauge). The tank shall be provided with legs for vertical mounting, a magnesium anode, threaded connections for 2 inch (50 mm) water inlet and outlet, a 1 inch (25 mm) relief valve, and a 3/4 inch (20 mm) drain valve. The outlet and relief valve connections shall be located near the top of the tank; the inlet and drain valve connections shall be located at the bottom of the tank. An ASME rated pressure-temperature relief valve and drain valve shall be provided with the tank. The exterior of the tank shall be thoroughly cleaned, primed, and finished with baked enamel. The water storage tank shall be manufactured by A. O. Smith, PVI, or approved equal.

2.8.10 Automatic Water Softener Unit. An automatic water softener unit shall be furnished and installed where indicated on the drawings. Softener capacities, connections, manufacturer, and model shall be as indicated in the schedules.

The automatic water softener unit shall be furnished with resin tank(s), a brine tank, resin, an electric control system, and all other accessories and appurtenances required for a complete automatic system. The water softening unit shall be manufactured by Culligan, Bruner, or approved equal.

2.8.10.01 Construction. The water softener shall be a factory-assembled, pressure-type consisting of a single unit with resin tank(s) and one brine tank.

Resin tanks shall be constructed of plastic, fiberglass reinforced plastic, or steel with plastic internal liner, and shall be designed for a working pressure of 100 psig (690 kPa gauge). The resin tanks shall be provided with a distribution pipe system to evenly distribute water flow across the media bed and ensure maximum water softening capacity.
The brine tank shall be constructed of high density polyethylene and shall be provided with a cover, a brine fill/discharge valve, an overflow connection, pipe fittings, and required accessories.

2.8.10.02 Media. The softening media shall be high-capacity, sulfonated polystyrene resin that is stable over the entire pH range with good resistance to bead fracture from attrition or shock. The resin shall have a capacity of 30,000 grains of calcium carbonate hardness per cubic foot (66.6 g/L) of resin when regenerated with 15 lbs (6.8 kg) of salt.

2.8.10.03 Controls. The water softening unit shall be provided with a factory installed, automatic, electrically operated control system as indicated on the drawings.

Timer based control systems shall consist of an electric timer which shall initiate regeneration cycles at adjustable time periods.

Timer and flow based control systems shall consist of an electric timer in conjunction with a manually adjustable totalizing flow meter. The system shall initiate regeneration cycles based on water volume or fixed time periods.

Sensor based control systems shall be the solid-state sensor type which initiates regeneration cycles based on sensing water hardness.

Softening units with two resin tanks shall automatically alternate to the standby resin tank at the time of regeneration and shall operate that tank until either the timer or the flow meter senses regeneration of that unit.

All controls shall be capable of manual adjustment and operation. All controls shall be suitable for operation on a 120 volt single phase power supply.

2.9. COLOR Vitreous china, cast iron, enameled steel, and acrylic plumbing fixtures shall be white unless otherwise indicated. Other plumbing fixtures shall be the manufacturers standard color. Plumbing equipment shall have the manufacturer's standard color and finish unless otherwise indicated in the schedules.

2.10 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will prevent dust or other contaminants from getting on freshly painted surfaces. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

3.3 INSTALLATION. Piping, fixtures, equipment, and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Unless otherwise indicated, sleeves shall be provided for all pipe penetrations through concrete and masonry walls. Sleeves and sealing requirements shall be as indicated in Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies and as indicated on the drawings. Piping penetrations through fire-rated floors and walls shall be provided with fire-rated sleeves, sealants, and devices as necessary to maintain the rating of the assembly.

Not all required reducing fittings and unions are indicated. Additional fittings and unions shall be provided as needed to connect all equipment and appurtenances.

Insulating fittings shall be provided to prevent the contact of dissimilar metals in piping systems as specified Master Specification Section 15065, Miscellaneous Steel Pipe, Tubing and Accessories.

Fuel gas pressure regulator vents and fuel train vent valves shall be piped to the exterior of the building.

Piping shall not be routed over or in front of electrical switchboards or panels unless acceptable to Engineer.

3.3.01 Water Supply Piping and Accessories. Water hammer arresters shall be provided in the hot and cold water supply piping at all quick closing valves, at solenoid valves, and at plumbing fixtures. When not indicated on the drawings, arresters shall be located and sized by Contractor in accordance with PDI Standard No. WH201. Contractor shall submit arrester location and sizing plans to Engineer for approval prior to installation. Where possible, water hammer arresters shall be installed in an accessible location.

Water supply piping to hose faucets and hose valves shall be secured with a pipe support within 6 inches (150 mm) of the fixture.

3.3.02 Drainage and Vent Piping and Accessories. Unless otherwise indicated or required by code, horizontal sanitary drainage piping 3 inches (75 mm) in diameter or smaller shall be installed at a uniform slope of 1/4 inch per foot (2 percent); horizontal sanitary drainage piping larger than 3 inches (75 mm) in diameter shall be installed at a uniform slope of 1/8 inch per foot (3 mm/300 mm); horizontal storm drainage piping shall be installed at a uniform slope of 1/8 inch per foot (3 mm/300 mm).

All cast iron, polypropylene, and PVC sanitary and storm drainage piping which is buried beneath floors shall be encased in at least 6 inches (150 mm) of concrete when required. A joint shall be provided in the piping within 12 inches (300 mm) of each end of the encasement.

Drainage fittings shall be installed to convey flow in the piping in the intended direction. To the extent possible, changes in direction shall be made by sweep type fittings. Quarter-bends and sanitary tee fittings shall not be installed for vertical to horizontal or horizontal to horizontal changes of direction.

Plumbing vents through roofs shall be located at least 12 inches (300 mm) from a parapet or from the intersection of a cant with the roof deck, and shall be installed with watertight flashings. Plumbing vents shall be located no closer to operable windows or air intakes than is allowed by the applicable code.

Vents connecting to horizontal sanitary piping shall connect above the centerline of the piping and shall rise at an angle of not less than 45 degrees from the horizontal to a point at least 6 inches (150 mm) above the flood level rim of the fixture served before offsetting horizontally.

Floor drains shall be adjusted to the correct elevation for proper drainage. Floor cleanouts shall be installed flush with the finished floor. Heads of fastening screws shall be flush with the cover or grate surface.

Cleanouts on sanitary and storm piping inside structures shall be located where indicated on the drawings. Additional cleanouts shall be provided where required by the applicable code or authority having jurisdiction. Cleanouts located in sanitary and storm drain risers shall be located 12 inches (300 mm) above the finished floor.

Unless otherwise indicated, floor cleanout size shall equal the line size for 4 inch (100 mm) and smaller drainage piping, and 4 inches (100 mm) in diameter for drains larger than 4 inch (100 mm). Proper clearance shall be provided for access to cleanouts.

Floor drains, trench drains, floor sinks, and bell-up drains indicated to be equipped with traps shall be provided with deep seal "P" traps located as close to the drain as possible.

Roof drains shall be set at the proper level for flashing and drainage and shall be securely attached to the roof decks to prevent movement. Overflow roof drain dams or standpipes shall be set at an elevation 2 inches (50 mm) above the low point of the roof.

3.3.03 Plumbing Fixtures and Accessories. Plumbing fixtures shall be set level and plumb, and shall be securely attached to the floor or wall. Unless otherwise indicated on the drawings, each fixture shall be mounted at the height recommended by the manufacturer. Where required to be in compliance with ADA, fixtures shall be mounted at the heights established by the Federal Government.

Fixtures shall be sealed to the floor or wall with a sealant as specified in Master Specification Section 07600, Caulking and Sealers. The color of sealant shall match the color of the fixture.

Fixture traps shall be easily removable for servicing and cleaning. Escutcheons shall be placed at all locations where fixture supply or drain piping penetrates walls, floors, or ceilings.

Water piping at stop valves, shower heads, and flush valves shall be rigidly secured to blocking. Drop-ear elbows shall be used whenever possible. All water supply piping shall be cleaned and flushed before the plumbing fixtures are installed.

3.3.04 Plumbing Equipment. Plumbing equipment shall be installed in accordance with the manufacturer's recommendations. Adequate clearance shall be provided for access to all components which may require adjustment, servicing, or replacement.

Water heaters shall be installed in accordance with AGA, NSF, NFPA, and UL requirements. Storage type water heaters shall be cleaned and flushed before being connected to the potable water system. Water heater relief valves shall be piped to the nearest drain or as indicated on the drawings, and shall terminate the appropriate air gap distance above the drain.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. Field performance tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer.

Field performance testing of the plumbing piping systems shall conform to Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies.

If inspection or tests indicate defects, the defective work or material shall be replaced, and inspection and tests repeated. All repairs to piping shall be made with new materials. Caulking of threaded joints or holes will not be acceptable.

3.5 ADJUSTING. All flush valves and other devices shall be adjusted for proper flow and quiet operation. Faucet and supply assemblies shall be adjusted or repaired to eliminate leaks. All drains shall be checked for proper operation.

3.6 PROTECTION. Plumbing fixtures, equipment, and appurtenances shall be protected from damage immediately after installation. Plumbing fixtures shall not be used during the construction.

3.7 CLEANING. After completion of testing and immediately before the final inspection, plumbing fixtures, equipment, piping, and appurtenances shall be thoroughly cleaned. Cleaning materials and methods shall be as recommended by the manufacturer. All faucet aerators shall be removed, cleaned, and reinserted.

Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner.

3.8 DISINFECTION. Before the potable water system is placed in operation, it shall be disinfected in accordance with the requirements of the local authority having jurisdiction. In the absence of local requirements, the following disinfection method shall be used:

1. The system shall be purged with clean potable water until all dirt and other substances are flushed from the system.

2. The system shall be filled with a water/chlorine solution containing at least 50 parts per million (50 mg/L) of available chlorine and allowed to stand for 24 hours; or the system shall be filled with a water/chlorine solution containing at least 200 parts per million (200 mg/L) of available chlorine and allowed to stand for 3 hours.

3. The system shall be purged with clean potable water until the chlorine is flushed from the system.

4. The procedure shall be repeated if a bacterial examination indicates that contamination remains present in the system.

3.9 OPERATOR INSTRUCTION AND TRAINING. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as indicated.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

End of Section

SECTION 15430

BACK FLOW PREVENTERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installing of backflow preventers and associated appurtenances.

1.2 RELATED DOCUMENTS. Drawings and general provisions of the Contract, including Division 1 Specification Section, apply to this Section.

1.3 SUBMITALS.

1.3.01 Drawings and Data. Complete fabrication and assembly drawings, together with detail specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Mater Specification Section 01080, The data and specifications for each unit shall include, but shall not be limited to the following:

Name of Manufacturer.

Type and model.

Net weight.

Unit dimensions.

Performance curves indicating flow capacity versus pressure drop.

Manufacturer shall submit certification that each backflow preventer and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of backflow preventer.

Contractor shall submit results of all pressure and leakage testing.

Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manual shall be submitted in accordance with Master Specification section 01160, Training and Operation Manuals.

PART 2 - PRODUCTS

2.1 BACKFLOW PREVENTERS*.* Shall be Febco-860, Watts Regulator Company–909, or as approved.

Provide an air gap fitting between relief valve outlet and drain line. Provide all required drain piping and fittings from the relief valve outlet to the nearest floor drain or other approved outlet.

2.1.01 Reduced Pressure Backflow Preventers. AWWA/ANSI C511; ductile iron body, epoxy coated interior and exterior, and flagged resilient seated gate valve on each end of the device. Flange diameter and drilling shall confirm to ANSI/ ASTM B16.1, Class 125.

2.1.02 Double Check Valve Assemblies. ANSI/ASSE 1012; bronze body with corrosion- resistant internal parts and stainless steel springs; and two independently operating check valves.

PART 3 – EXECUTION

3.1 INSTALLATION. Install in accordance with manufacturer's instructions.

Pipe relief from backflow preventer to nearest drain.

End of Section

SECTION 15480

GENERAL SERVICE COMPRESSED AIR PIPING

PART 1 - GENERAL

1.1 SCOPE. This section covers general service compressed air piping to be installed in the Rack and Grit building indicated in the Contract Documents.

1.2 SUMMARY. This Section includes piping and related specialties for general-service compressed-air systems operating at 100 psig (1380 kPa) and less.

1.3 RELATED SECTIONS. Related Sections include the following:

Division 15 Section 15130- “Indicating Devices” for thermometers and pressure gages.

Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.3 DEFINITIONS.

ABS: Acrylonitrile-butadiene-styrene plastic.

CR: Chlorosulfonated polyethylene synthetic rubber.

EPDM: Ethylene-propylene-diene terpolymer rubber.

FPM: Vinylidene fluoride-hexafluoropropylene copolymer rubber.

HDPE: High-density polyethylene plastic.

Low-Pressure Compressed-Air Piping: System of compressed-air piping and specialties operating at pressures of 125 psig (860 kPa) and less.

1.4 SUBMITTALS. All submittals required in this section shall be provided in accordance with Master Specification Section 01080, Project Submittals, unless otherwise indicated.

1.4.01 Product Data. Submit product data for the following:

Pipes, tubes, and fittings.

Flexible pipe connectors.

Safety valves.

Pressure regulators.

Filters.

Automatic drain valves.

Hose couplings.

Hose assemblies.

1.4.02 Coordination Drawings. For general-service compressed-air systems. Include relationship to other services that serve same work area.

1.4.03 Brazing Certificates. As required by ASME Boiler and Pressure Vessel Code, Section IX, or AWS B2.2.

1.4.04 Welding Certificates. As required by ASME Boiler and Pressure Vessel Code, Section IX.

1.4.05 Field quality-control test reports. Submit reports with results of field quality-control tests.

1.5 QUALITY ASSURANCE.

1.5.01 Brazing. Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications," or AWS B2.2, "Standard for Brazing Procedure and Performance Qualification."

1.5.02 Welding. Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

1.5.03 Standards. Comply with the following:

ASME B31.1, "Power Piping," for high-pressure compressed-air piping.

ASME B31.9, "Building Services Piping," for low-pressure compressed-air piping.

PART 2 - PRODUCTS

2.1 MANUFACTURERS. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection.

2.1.01 Available Manufacturers. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

2.2 PIPING MATERIALS. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.3 PIPES, TUBES, AND FITTINGS.

2.3.01 Schedule 80, Steel Pipe. ASTM A 53/A 53M, Type E or S, Grade A or B, black or hot dip, zinc coated. Provide Type S, Grade B, and hot-dip zinc-coated pipe options if indicated.

2.3.01.01 Steel Nipples. ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106, Schedule 80, galvanized seamless steel pipe. Include ends matching joining method.

2.3.01.02 Malleable-Iron Fittings. ASME B16.3, Class 150 , threaded. Provide Class 300 and galvanized finish if indicated.

2.3.01.03 Malleable-Iron Unions. ASME B16.39, Class 150 , threaded. Provide Class 300 if indicated.

2.3.01.04 Steel-Piping Grooved-End Fittings. ASTM A 47/A 47M, malleable-iron casting; ASTM A 106, steel pipe; or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe; and made by keyed-coupling manufacturer. Provide galvanized finish if indicated. Available Manufacturers:

Central Sprinkler Co.; Central Grooved Piping Products.

Grinnell Corp.

Star Pipe Products, Inc.; Star Fittings Div.

Victaulic Corp. of America.

Ward Manufacturing, Inc.

2.3.02 Transition Couplings for Metal Piping. Metal coupling or other manufactured fitting same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

2.3.03 Flexible Pipe Connectors. Corrugated tubing with wire-braid covering. Available Manufacturers:

ANAMET Inc.

Flex-Hose Co., Inc.

Flexicraft Industries.

Hyspan Precision Products, Inc.

Mercer Rubber Co.

Metraflex, Inc.

Proco Products, Inc.

Unaflex, Inc.

2.3.04 Stainless-Steel-Hose/Steel Pipe Flexible Pipe Connectors. Corrugated-stainless-steel tubing with stainless-steel wire-braid covering and ends welded to inner tubing.

Working-Pressure Rating: 200 psig (1380 kPa) minimum.

End Connections NPS 2 (DN 50) and Smaller: Threaded steel pipe nipple.

End Connections NPS 2-1/2 (DN 65) and Larger: Flanged steel nipple.

Refer to Division 15 Section 15019 "Exposed Piping Installation” for joining materials not in this Section.

2.4 VALVES.

2.4.01 General-Duty Valves. Refer to Division 15 following sections:

Section 15091, “Miscellaneous Ball Valves” "Valves"

Section 15093, “Check Valves”

Section 15096, “Globe Valves”

Section 15100, “Miscellaneous Valves”

2.5 SPECIALTIES.

2.5.01 Safety Valves. ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," construction; National Board certified, labeled, and factory sealed; constructed of bronze body with poppet safety valve for compressed-air service.

Pressure settings to be higher than discharge pressure and same or lower than receiver pressure rating.

2.5.02 Air-Main Pressure Regulators. Bronze body, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 250-psig (1725-kPa) inlet pressure, unless otherwise indicated.

Type: Pilot operated.

2.5.03 Air-Line Pressure Regulators. Aluminum alloy or plastic body, diaphragm operated, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 100-psig minimum inlet pressure, unless otherwise indicated.

2.5.04 Mechanical Filters. Two-stage, mechanical-separation-type, air-line filters in sizes and ratings indicated. Equip with deflector plates, resin-impregnated-ribbon-type filters with edge filtration, and drain cock.

2.5.05 Automatic Drain Valves. Corrosion-resistant metal body and internal parts, rated for 100-psig (1380-kPa) minimum working pressure, capable of automatic discharge of collected condensate.

2.5.06 Hose Couplings. Shall be Chicago Fitting type. Assembly with locking-mechanism feature for connection and disconnection of compressed-air hose.

Available Manufacturers:

Aeroquip Corporation.

Bowes Manufacturing, Inc.

Parker Hannifin Corporation; Fluid Connectors Group; Quick Coupling Div.

Rectus GMBH; Parker Div.

Schrader-Bridgeport; Amflo Div.

Schrader-Bridgeport/Standard Thomson.

Snap-Tite, Inc.

TOMCO Products Inc.

Tuthill Corporation; Hansen Coupling Div.

2.5.07 Hose Assemblies. Compatible hose, clamps, couplings, and splicers suitable for compressed-air service, of nominal diameter indicated, and rated for 200-psig (2070-kPa minimum working pressure, unless otherwise indicated.

Hose: Reinforced single wire-braid, CR-covered hose for compressed-air service.

Hose Clamps: Stainless-steel clamps or bands.

Hose Couplings: Two-piece, straight-through, threaded brass or stainless-steel O-ring or gasket-seal swivel coupling with serrated ends for connecting two sections of hose.

Hose Splicers: One-piece, straight-through brass or stainless-steel fitting with serrated ends for connecting two sections of hose.

2.6 IDENTIFICATION. Refer to Division 15 Section 15825 "Mechanical Identification" for identification of piping, valves, gages, and specialties.

PART 3 - EXECUTION

3.1 PREPARATION.

3.1.01 Interruption of Existing Compressed-Air Service. Do not interrupt compressed-air service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary compressed-air service according to requirements indicated:

Notify Owner not less than 25 days in advance of proposed interruption of compressed-air service.

Do not proceed with interruption of compressed-air service without Owner's written permission.

3.2 PIPING APPLICATIONS. Install nipples, flanges, unions, transition and special fittings, and valves with pressure ratings same as or higher than system pressure rating used in applications below, unless otherwise indicated.

3.2.01 Joining of Dissimilar Metal Piping. Use dielectric fittings. Refer to Division 15 Section 15019 "Exposed Piping Installations" for dielectric fitting types.

NPS 2 (DN 50) and Smaller: Dielectric unions.

NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Dielectric flanges.

3.2.02 Specialty and Equipment Flanged Connections. Use cast-copper-alloy companion flange with gasket and brazed joint for connection to copper tube.

3.2.03 General-Service Compressed-Air Piping Between Air Compressors And Air Receivers. Use metal general-service compressed-air piping between air compressors and air receivers. Use of plastic piping for this application is prohibited.

3.2.04 Low-Pressure Compressed-Air Piping between Air Compressors and Receivers. Use any of the following piping materials for each size range:

NPS 2 (DN 50) and Smaller: Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

3.2.05 Low-Pressure Compressed-Air Distribution Piping. Use any of the following piping materials for each size range:

NPS 2 (DN 50) and Smaller: Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

3.2.06 Receivers. Use the following piping materials for each size range:

NPS 2 (DN 50) and Smaller. Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

NPS 2-1/2 to NPS 4 (DN 65 to DN 100). Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

3.3 VALVE APPLICATIONS.

3.3.01 General-Duty Valves. Refer to Division 15 Section 15010 "Valve Installation" for metal general-duty valves. Use metal valves, unless otherwise indicated.

3.3.01.01 Metal General-Duty Valves. Use valve types specified in the schedule of valves in Division 15 Section 15010 "Valve Installation" according to the following:

Low-Pressure Compressed Air: Valve types specified for low-pressure compressed air.

Equipment Isolation NPS 2 (DN 50) and Smaller: Safety-exhaust copper-alloy ball valve with exhaust vent and pressure rating at least as great as piping system operating pressure.

Grooved-end valves may be used with grooved-end piping and grooved joints.

3.4 PIPING INSTALLATION. Refer to Division 15 Section 15019 "Exposed Piping Installation" for basic piping installation.

Install air and drain piping with 1 percent slope downward in direction of airflow.

Install eccentric reducers where piping is reduced in direction of flow, with bottoms of both pipes and reducer fitting flush.

Install branch connections to compressed-air mains from top of main. Provide drain leg and drain trap at end of each main and branch and at low points.

Install flexible pipe connector on each connection to air compressors.

Install thermometer and pressure gage on discharge piping from each air compressor and on each receiver; install according to Division 15 Section 15130 "Indicating Devices."

Install pipe expansion joints and anchors according to Division 15 Section 15019 "Exposed Piping Installation."

3.5 VALVE INSTALLATION. Refer to Division 15 Section 15019 "Exposed Piping Installation" for basic piping and valve installation.

Install metal general-duty valves according to Division 15 Section 15010 "Valve Installation."

Install plastic valves according to plastic piping manufacturer's written instructions.

Install shutoff valve at each connection to and from general-service compressed-air specialties, equipment, and accessories. Install strainer if indicated.

Install check valves to maintain correct direction of fluid flow to and from compressed-air piping specialties and equipment.

Install safety valves on receivers in quantity and size to relieve at least the capacity of connected air compressors.

Install automatic drain valves on intercoolers, aftercoolers, receivers, and dryers. Discharge condensate over nearest floor drain.

Install safety valves where recommended by specialty manufacturers.

3.6 JOINT CONSTRUCTION. Refer to Division 15 Section 15019 "Exposed Piping Installation" for basic piping joint construction.

Pressure-Seal Joints. Select correct type of O-ring seals. Make joints with fitting manufacturer's tools and according to fitting manufacturer's written instructions.

Grooved Joints. Select correct type of gasket. Assemble joints with keyed-coupling housing, gasket, lubricant, and bolts according to coupling manufacturer's written instructions. Do not apply lubricant to pre-lubricated gaskets.

Copper Tubing Joints. Join copper tubing with brazed joints. Use silver-composition or copper-phosphorus-composition filler metal and comply with CDA's "Copper Tube Handbook," Section VII, "Brazed Joints."

Dissimilar Metal Piping Material Joints. Use dielectric fittings.

3.7 HANGER AND SUPPORT INSTALLATION. Refer to Division 15 Section 15140 "Pipe Supports" for pipe hanger and support devices. Install the following:

Vertical Piping: MSS Type 8 or 42, clamps.

Individual, Straight, Horizontal Piping Runs: According to the following:
100 Feet (30 m) and Less: MSS Type 1, adjustable, steel, clevis hangers.

Longer Than 100 Feet (30 m): MSS Type 43, adjustable, roller hangers.

Longer Than 100 Feet (30 m), if Indicated: MSS Type 49, spring cushion rolls.

Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.

Base of Vertical Piping: MSS Type 52, spring hangers.

Install supports according to Division 15 Section 15140 "Pipe Supports."
Support horizontal piping within 12 inches (300 mm) of each fitting and coupling.

Support vertical piping and tubing at base and at each floor.

Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch (10-mm) minimum rods.

Install hangers for Schedule 80, steel piping with the following maximum horizontal spacing and minimum rod diameters:

NPS 1/4 to NPS 1/2 (DN 8 to DN 15): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.

NPS 3/4 to NPS 1-1/4 (DN 20 to DN 32): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.

NPS 1-1/2 (DN 40): 12 feet (3.7 m) with 3/8-inch (10-mm) rod.

NPS 2 (DN 50): 13 feet (4 m) with 3/8-inch (10-mm) rod.

NPS 2-1/2 (DN 65): 14 feet (4.3 m) with 1/2-inch (13-mm) rod.

NPS 3 (DN 80): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.

NPS 3-1/2 (DN 90): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.

NPS 4 (DN 100): 17 feet (5.2 m) with 5/8-inch (16-mm) rod.

Install supports for vertical, Schedule 80, steel piping every 15 feet (4.6 m).

NPS 3-1/2 (DN 90): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.

NPS 4 (DN 100): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.

NPS 3 (DN 80): 68 inches (1730 mm) with 1/2-inch (13-mm) rod.

NPS 4 (DN 100): 76 inches (1900 mm) with 1/2-inch (13-mm) rod.

All Sizes: Install continuous support for piping with compressed air at normal operating temperature above 100 deg F (38 deg C)

NPS 1/2 (DN 15): 30 inches (760 mm) with 3/8-inch (10-mm) rod.

NPS 3/4 (DN 20): 36 inches (910 mm) with 3/8-inch (10-mm) rod.

NPS 1 (DN 25): 40 inches (1015 mm) with 3/8-inch (10-mm) rod.

NPS 1-1/4 (DN 32): 43 inches (1090 mm) with 3/8-inch (10-mm) rod.

NPS 1-1/2 (DN 40): 49 inches (1245 mm) with 3/8-inch (10-mm) rod.

NPS 2 (DN 50): 55 inches (1400 mm) with 3/8-inch (10-mm) rod.

NPS 3 and NPS 4 (DN 80 and DN 100): 96 inches (2440 mm) with 1/2-inch (13-mm) rod.

3.8 CONNECTIONS. Drawings indicate general arrangement of piping, fittings, and specialties.

Install piping adjacent to specialties and equipment to allow service and maintenance.

Connect piping to air compressors, accessories, and specialties with shutoff valve and union or flanged connection.

3.9 LABELING AND IDENTIFICATION. Install identifying labels and devices for general-service compressed-air piping systems. Refer to Division 15 Section 15825 "Mechanical Identification" for labeling and identification materials.

3.10 FIELD QUALITY CONTROL. Perform the following field tests and inspections and prepare test reports:

Test and adjust piping safety controls. Replace damaged and malfunctioning safety controls.

Piping Leak Tests: Test new and modified parts of existing piping. Cap and fill general-service compressed-air piping with oil-free dry air or gaseous nitrogen to pressure of 50 psig (345 kPa) above system operating pressure, but not less than 150 psig (1035 kPa). Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours with no drop in pressure.

Repair leaks and retest until no leaks exist.

Report results in writing.

End of Section

SECTION 15482

LABORATORY COMPRESSED AIR SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers laboratory compressed air systems to be installed in the locations indicated in the Contract Documents.

The compressed air package shall include a compressor, an electric drive motor, a motor starter, belts, sheaves, safety guards, receiver, air dryer, controls, traps, valves, piping, baseplate, and all accessories and appurtenances specified, indicated on the drawings, or otherwise required for a complete, properly operating installation.

All required interconnecting air piping and valves between package components shall be provided under this section.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Components of the compressed air equipment package shall be the latest standard products of manufacturers who regularly produce equipment of this type.

All components of the compressed air equipment package shall be shop assembled on a common baseplate. The arrangement shall permit access from the front and ends of the package for maintenance of components.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Power Supply. Power supply to the compressors will be 480 volts, 60 Hz, 3 phase. Power supply to the dryer will be 120 volts, 60 Hz, single phase.

1.3 SUBMITTALS. Complete assembly and installation drawings, together with detailed specifications and data covering all equipment and accessories furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Electrical schematics, wiring diagrams, and panel layout drawings for compressor controls shall be included. Data and specifications for each unit shall include, but shall not be limited to, the following:

<u>Baseplate</u>

Overall dimensions.

Number, size, and location of structural members.

Thickness of top plate.

Number, size, and location of grout openings.

Drawings indicating pipe routing, traps, and valve locations.

<u>Compressor</u>

Manufacturer.

Type and model.

Piston speed.

Dimensions.

Weight, including motor.

Performance data at variable discharge pressures.

Bearing data.

<u>Motors</u>

Manufacturer.

Type and model.

Horsepower (kW) rating and service factor.

Temperature rating.

Full load rotative speed.

Type of bearings and lubrication.

Full load current.

Locked rotor current.

Efficiency at nameplate rating and at operating point.

Power factor at nameplate rating.

Receiver

Capacity.

Pressure rating.

Dimensions.

Connection sizes and locations.

Verification of ASME Code stamp.

Air Dryer

Manufacturer.

Model.

Performance data.

Pressure drop.

1.4 OPERATION AND MAINTENANCE MANUALS. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.6 SPARE PARTS. The following spare parts shall be furnished for each compressed air equipment package:

Part Description	Number Required
Intake air filter elements	2

V-belts	2 matched sets
Inlet valve assembly	1
Inlet valve springs	1 set
Discharge valve assembly	1
Discharge valve springs	1 set
Piston rings	1 set for each size piston

Spare parts shall be suitably packaged in accordance Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Spare parts shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The system shall supply compressed air to laboratory outlets only. The air shall be dry and oil free.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The performance and design requirements shall be as indicated.

The approximate elevation of the site will be as indicated on the drawings. All equipment furnished shall be designed to meet all specified conditions and to operate satisfactorily at this elevation.

2.3 CONSTRUCTION.

2.3.01 Compressors. The compressors shall be single or two-stage as indicated, air-cooled reciprocating type and shall deliver oil-free air. Pistons shall be fabricated from materials which do not require oil lubrication. Cylinders and crankcases shall be of cast iron construction. Piston rings shall be teflon. Compressor cylinder valves shall be of the finger, channel, leaf, or ring type and shall be fabricated from corrosion-resistant materials suitable for nonlubricated service. Cylinders and cylinder heads shall be designed so that the compressor sheave provides all required external forced air circulation. The compressors shall be constructed with a distance piece between the compression cylinder and the crankcase lubricant system. The distance piece shall consist of an atmospheric chamber arranged to drain back into the crankcase. Portions of the piston rod in contact with the lower seal shall not enter the upper seal area. A collar shall be provided on the piston rod to prevent oil from traveling along the rod. Piston rod packing shall be teflon or carbon, nonlubricated type.

Each crankshaft shall be cradle-mounted with antifriction roller or ball type main bearings. Connecting rod bearings shall be steel backed, babbitt-lined, insert type plain bearings. Connecting rod and crankshaft bearings shall be lubricated by a force feed positive lubrication system. A lubrication system pressure gauge, of the compressor manufacturer's standard size and range, shall be furnished with each compressor.

Each compressor shall be driven by an electric motor connected to the compressor through a V-belt drive.

2.3.02 Package Receiver. The receiver shall be of all welded construction with semi-ellipsoidal heads and leg supports for vertical mounting on the common baseplate. The receiver shall be designed and constructed in accordance with the ASME Code for Unfired Pressure Vessels and shall bear the code stamp.

The receiver shall be provided with piping connections for inlet, outlet, drain, safety valve, compressor control, receiver vent, and cleanout opening. The receiver shall be hot-dip galvanized and shall have an automatic float-operated condensate drain trap.

2.3.03 Air Dryer. The air dryer shall be of the air-cooled noncycling refrigerant type and shall produce a 33 to 39°F (1 to 4°C) pressure dew point at the heat exchanger exit when operating continuously at the design conditions. The air dryer shall be Hankison Refrigifilter "Model 8025", or approved equal.

The dryer shall consist of a heat exchanger, separators, hermetically sealed refrigeration unit, and self-regulating hot gas bypass valve. The dryer shall be completed with "On-Off" manual motor switch, running light, evaporator performance gauge, intake air thermometer, and automatic float-operated condensate drain trap. The dryer shall include a condenser, integral moisture separator, and a cartridge filter of the acetate fiber type, completely enclosed in an ASME pressure vessel and designed for a pressure of 150 psi (1035 kPa).

2.3.04 Piping. All interconnecting piping and tubing between components of the equipment package shall be shop installed.

Piping from the compressor discharge to the receiver shall be sized not less than the compressor discharge connection size and shall be ASTM A53, seamless, Grade B, Schedule 40 black steel pipe with ANSI B16.11, Class 3000, forged steel socket-welding fittings, or Schedule 80 black steel pipe with Class 3000 forged steel threaded fittings. "Close" nipples will not be acceptable.

Pneumatic control and instrument tubing connected directly to the compressor shall be ASTM A269, Type 304 or 316 stainless steel tubing with Parker Hannifin "CPI", Crawford "Swagelok", or approved equal, Type 316 stainless steel compression fittings. Tubing shall be not less than 1/4 inch (25 mm) OD with a wall thickness of 0.028 inch (0.71 mm).

Piping between the package receiver and the air dryer shall be ASTM B88, Type K, hard drawn copper tubing with ANSI B16.18 or B16.22 solder-joint fittings.

All piping and tubing shall be run in vertical and horizontal planes and shall not contact the baseplate. Piping shall be arranged to ensure that undue stresses from thermal expansion are not transmitted to equipment components. All control and instrument tubing shall be continuously supported.

Compressor discharge piping shall be sloped to drain to the receiver and shall include a drip trap to prevent condensate in the discharge piping from draining back to the compressor.

Drainlines from each compressor, air dryer, and receiver shall be piped to the edge of the baseplate. Receiver and air dryer drainlines shall be combined downstream of the traps.

2.3.05 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) opening galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.3.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of the equipment by Owner. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

2.3.07 Equipment Bases. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes.

The baseplate shall be constructed of heavy steel plate and structural members and shall be designed for not measurable deflection with the equipment mounted thereon and the baseplate supported around its perimeter. The base shall be designed so that all equipment bolted to it can be removed without access to the underside of the plate and with a flat top surface for ease of cleaning. Structural stiffeners shall be located under the compressors at the compressor anchor points. A drip lip will not be required.

2.3.08 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion
Anchors, unless otherwise indicated on the drawings.

2.3.09 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.3.10 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for coating as recommended by the paint manufacturer for the intended service, and then shop coated with one or more coats of the specified primer.

Machined and polished surfaces shall be coated with rust-preventive compound as recommended by the manufacturer.

All iron and steel surfaces, except galvanized surfaces and stainless steel, shall be thoroughly cleaned, sanded, and shop primed with one or more coats of universal primer, followed by two or more finish coats of epoxy enamel.

Galvanized surfaces shall be prepared for coating in accordance with the instructions of the primer manufacturer. Galvanized surfaces shall be shop primed with two or more coats of universal primer, followed by two or more finish coats of epoxy enamel.

Stainless steel, nonferrous metallic, and nonmetallic surfaces shall not be coated.

Epoxy enamel products for NSF certified systems shall be Ameron "Amerlock 400 High Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal. Where NSF certification is not required, the epoxy enamel products shall be Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.

The total paint dry film thickness, including prime coat and finish coats, shall be not less than 5 mils (125 µm). The color shall be safety green in accordance with ANSI Z53.1.

One quart of finish paint shall be provided with the equipment package for field touchup coating.

2.4 ACCESSORIES. Each compressed air equipment package shall be furnished with the following accessory equipment.

2.4.01 Valves.

2.4.01.01 Safety Valves. Safety valves with manual lifting levers shall be installed in the compressor discharge piping and on the receiver as indicated on the drawings. Valves in the compressor discharge piping shall be capable of protecting the compressors from damage when operating against a closed discharge valve and shall be suitable for the maximum compressor discharge air temperature.

The safety valve on the receiver shall be capable of protecting the receiver from excessive pressure.

2.4.01.02 Discharge Check Valves. A line-mounted check valve shall be provided in the discharge piping leading from the compressor. The check valves shall be sized in accordance with the manufacturer's recommendations and shall be suitable for service with reciprocating compressors at the maximum compressor discharge air temperature.

Check valves shall be disc and spring type, designed for installation in the discharge piping from reciprocating compressors, and shall be Hoerbiger "Compact-A-Check" valves, or approved equal. Combination unloading devices/check valves will not be acceptable.

2.4.01.03 Shutoff Valves. All shutoff valves shall be ball valves. Valves in steel piping shall have carbon steel bodies, chrome plated or stainless steel balls, and reinforced teflon seals and seats. Shutoff valves in stainless steel tubing shall be Type 316 stainless steel balls and reinforced teflon seals and seats. Valves in copper tubing shall have bronze bodies; chrome plated, stainless steel, or bronze balls; and reinforced teflon seals and seats. Valves in the compressor discharge piping shall be suitable for the maximum compressor discharge air temperatures.

2.4.01.04 Receiver Vent Valve. A globe type vent valve with bronze body and brass stem shall be provided on the each receiver.

2.4.02 Belts and Sheaves. All required belts and sheaves shall be furnished. Belts and sheaves shall be of the heavy-duty "V" type. Belts for each compressor shall be matched sets.

2.4.03 Intake Filter Silencers. Each compressor shall be provided with a bottom outlet, dry type intake filter silencer supported by the suction pipe and close-coupled to the compressor intake connection. Intake filter silencers shall have an outer cover and a replaceable filter element. Silencers shall be constructed of steel and shall be sized in accordance with the recommendations of the manufacturer. Sound attenuation shall be not less than 20 dB at 1,000 Hz; particle arrestance shall be not less than 99 percent at 25 micron size, and 70 percent at 5 micron size.

2.4.04 Pressure Gauges. Each pressure gauge shall have a phenol case, adjustable pointer, and stainless steel rotary geared movement. Each gauge shall be accurate to within 2 percent of full scale. Gauges shall have a minimum dial size of 4-1/2 inches (115 mm) and a range equal to approximately twice the normal operating pressure at the point of installation. The units of measurement shall be indicated on the dial face.

Panel-mounted gauges shall have a 1/4 inch (6 mm) NPT connection. All other gauges shall have a 1/2 inch (12.7 mm) NPT connection. All gauges shall be provided with a ball valve.

2.4.05 Pressure Switches. Each pressure switch shall have spdt contacts rated 10 amperes at 120 volts ac and shall be completed with shutoff valve. Pressure switches mounted inside the control panel shall have NEMA Type 1 housings.

2.4.06 Thermometers. Thermometers shall be of the remote reading mercury or gas actuated dial type. Thermometers shall have a minimum dial size of 4-1/2 inches (115 mm) and an adjustable pointer, and shall be accurate within 1 percent of full scale. Thermometers shall be furnished complete with a uniformly graduated dial indicator, armored capillary tube, bulb or temperature sensor, and thermowell. Thermometer ranges shall be such that the normal operating reading will be near the midpoint of the range. The units of measurement shall be indicated on the dial face. Spare capillary length shall be neatly coiled and tied.

Air piping shall be increased in size at the thermowell location so that the area between the well and the pipe is not less than the cross-sectional area of the original size piping. The entire sensitive length of the temperature sensor shall be installed within the airflow stream.

2.4.07 Temperature Switches. Temperature switches shall be remote bulb type with spdt contacts rated 10 amperes at 120 volts ac. Temperature switches shall have NEMA Type 1 housings, stainless steel thermowell assemblies, and armored capillaries. Capillary length shall be sufficient for mounting the switch inside the control panel. Spare capillary length shall be neatly coiled and tied.

Air piping shall be increased in size at the thermowell location so that the area between the well and the pipe is not less than the cross-sectional area of the original size piping. The entire sensitive length of the temperature sensor shall be installed within the airflow stream.

2.5 CONTROL EQUIPMENT. All control equipment for the compressor shall be furnished as necessary for a complete installation requiring only field connection of the remote alarm, and electrical power supply supplies. Equipment shall include all control switches, pressure switches, timing relays, auxiliary relays, unloaders, circuit breaker combination magnetic motor starter and other accessories required for control of the compressor. The starter shall include a thermal-magnetic circuit breaker with external operating handle and a control transformer with a 120 volt secondary, one secondary lead fused and the other grounded. Starter overload (one per phase) shall be matched to motor current and shall be provided with a "Reset" push button.

All control equipment for the compressor package, except for the high discharge temperature switches and loading controls, for the compressor, shall be housed in a control panel of NEMA Type 12 construction, mounted on the package.

All system wiring shall be shop installed to terminal blocks in the control panel. Wiring from the panel to system components shall be completely enclosed in liquid-tight flexible conduit.

All pneumatic tubing shall be shop installed to bulkhead fittings at the control panel. All field connections shall be made to the fittings at the panel.

2.5.01 Control Panel. The control panel shall be fabricated from 14 USS gage or heavier steel and shall be equipped with an approximately full-size gasketed door with chromium plated or stainless steel three-point latch and hinges. A screened vent shall be provided in the bottom of the control panel. All control devices shall be rigidly mounted within the enclosure except for breaker handles, selector switches, push buttons, and indicating lights, which shall be mounted on the panel door.

Numbered terminal blocks in the control panel and identical terminal blocks at the equipment shall be provided for those items needing field wiring between the control panel and the compressed air equipment. All items at the compressors shall be wired to terminal blocks.

Numbered bulkhead fittings at the control panel, corresponding to identical numbers at the equipment, shall be provided for all pneumatic tubing requiring field connections between the control panel and equipment. Internal panel tubing shall be run in horizontal and vertical planes and shall be rigidly supported to withstand handling and shipping without damage. Compression type bulkhead fittings shall be provided through the panel for all connections.

Internal panel wiring shall be neatly bundled and tied and shall be identified with suitable wire markers. Terminal blocks for external connections shall be furnished complete with marking strips, coves, and pressure connectors. A terminal shall be provided for each conductor or external circuits. All wiring shall be grouped or cabled and securely attached to the panel. Clearance for field wiring shall be provided between the terminal strips and base.

All panel equipment, wiring, and tubing shall be shop installed.

2.5.02 Compressor Control. The compressed air package shall be furnished with a control system which shall start and stop the compressors as necessary. The control system shall unload the compressors on shutdown and while coming up to speed during startup. Unloading shall be accomplished by inlet valve control.

Each compressor shall be provided with a control switch with "Lead-Off-Lag" positions. Two pressure switches with separately adjustable settings shall be furnished for the compressor, one for "Lead" and one for "Lag" control.

The control system shall start and stop the compressors at the following pressures:

Lead compressor start pressure, psig (kPa gauge)	90 (620)
Lag compressors start pressure, psig (kPa gauge)	100 (690)
Compressors stop pressure, psig (kPa gauge)	120 (830)

2.5.03 Protection Controls. A protection control system shall be provided for each compressor. The control system shall stop the compressor on high discharge air temperature.

2.5.04 Miscellaneous Controls. A dial type thermometer shall be furnished for the compressor air discharge. A package receiver pressure gauge and the compressor air discharge thermometers shall be mounted on a wing projection on top of the control panel.

White indicating lights shall be provided on the control panel to indicate the following alarm conditions:

Compressor motor overload.

High compressor discharge air temperature.

Low receiver pressure.

Indicating lights shall be heavy-duty, oiltight, semiflush type with escutcheon plates to identify the malfunction. A mechanical latching relay circuit with a common "Reset" push button shall be provided so that the alarm lights remain on until manually reset. The latching relays shall have a contact rated 10 amperes at 120 volts, which closes on alarm. An alarm light "Test" push button shall also be provided on the front of the control panel to test the lights simultaneously without actuating the remote alarm.

A normally open contact, which close under alarm conditions, shall be provided for remote alarm. The contact shall close when any alarm occurs. Contact shall be rated 10 amperes at 120 volts, 60 Hz, single phase.

The pressure switch for low receiver pressure shall have adjustable contacts set to close when the receiver pressure falls to 80 psig (550 kPa gauge).

The compressor shall be provided with an elapsed time hour meter mounted on the front of the control panel.

2.6 ELECTRIC MOTORS. Each motor shall be complete with an adjustable baseplate for mounting on the common baseplate. Motors shall be rated at 460 volts, 60 Hz, 3 phase.

Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor. Drive units shall be designed for 24 hour continuous service.

2.7 SHOP TEST. Prior to shipment, the compressor and dryer shall be operated to check alignment; faulty equipment and controls; proper wiring; leaks in piping, seals, or wells; and proper operation of the safety and operating controls. Compressor pressure controls shall be adjusted to the specified pressures. Defective equipment and controls disclosed by such tests shall be replaced and the package placed in the satisfactory operating conditions before shipping. A statement from the package supplier certifying that the specified shop test has been performed shall be submitted to Engineer prior to shipment.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

End of Section

SECTION 15484

LABORATORY VACUUM SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers vacuum equipment serving the laboratory area, including the equipment, piping, valves, fittings, gauges, bases, anchor bolts, and other accessories and appurtenances required for a complete unit.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools, shall apply to all equipment furnished under this section.

1.2.02 Power Supply. The power supply to the equipment shall be as indicated.

1.2.03 Mechanical Identification.

1.2.03.01 Number Plates. Equipment specified herein shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Nameplates shall have black baked enamel letters on anodized aluminum plate. Number plate symbols and numbers shall be capitalized block letters with a minimum height of 3/4 inch (19 mm). Number plate height shall be twice the letter height. Number plates shall be at least 12 gage (2.66 mm) thickness. Number plates shall be installed with corrosion-resistant mechanical fasteners.

1.2.03.02 Equipment Plates. Equipment specified herein shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3 SUBMITTALS. Complete schematic and wiring diagrams, assembly and installation drawings, together with detailed specifications and data covering material used, power drive assembly, motors, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. Performance and design requirements shall be as indicated.

The approximate elevation of the site will be as indicated on the drawings. All equipment furnished shall be designed to meet all specified conditions and to operate satisfactorily at this elevation.

2.2 CONSTRUCTION. The vacuum system shall include, but shall not be limited to, simplex or duplex vacuum pumps as required, vacuum receiver tank, oil reclaimer, combination motor starters, control switches, piping, check valves, gauges and miscellaneous accessories to make a complete packaged unit.

2.2.01 Vacuum Pumps. Each pump shall be air-cooled, lubricated, rotary vane type and shall be driven by an electric motor mounted on the same base as the pump. The pumps and motors shall be factory mounted, wired, and piped on a horizontal receiver tank. The vacuum pumps shall be designed or equipped with a discharge exhaust filter or muffler to minimize discharge of oil to the atmosphere.

2.2.02 Receiver Tank. The receiver tank shall be horizontal type, of welded construction, with semi-ellipsoidal heads and with leg supports suitable for mounting on a concrete base. The tank shall be designed and constructed in accordance with the ASME Code for Unfired Pressure Vessels, shall bear the Code stamp, and the exterior shall be primed and painted with the manufacturers standard process. The tank shall have all necessary openings for inlet, discharge, drain, and gauge piping connections. A drain pipe and shutoff valve shall be provided on the bottom of the tank.

Rubber-in-shear vibration isolators shall be provided for mounting the tank to a concrete base.

2.2.03 Accessories. The unit shall be factory furnished with a vacuum gauge and vacuum switches piped to the tank. Additional vacuum system valves and miscellaneous piping and accessories shall be provided by Contractor as indicated on the drawings.

2.2.04 Controls. The vacuum pump unit shall be provided with a factory wired and installed control panel. The panel shall be rated NEMA Type 1 and shall include motor starters, vacuum switches, alternator, transformer, "TEST-OFF-AUTO" selector switches for each pump, and motor overload reset pushbuttons. The motor starters shall be combination magnetic motor starters with a magnetic motor circuit protector. Overloads shall be matched to the motors. Vacuum switches shall have a cut-out range of 5 to 25 inches Hg (16.9 to 84.6 kPa), and an adjustable differential of 4 to 12 inches Hg (13.5 to 40.6 kPa). Vacuum switch contacts shall be rated for 10 amperes at 120 volts ac.

2.2.05 Sequence of Operation. When the selector switches are placed in the "AUTO" position, the vacuum switches and alternator shall control vacuum pump operation in a start-stop or lead-lag manner, as required.

For start-stop pumps, upon a decrease in vacuum, the pump shall be energized. When the "Pump OFF" vacuum setpoint is reached, the pump shall be de-energized. Initial vacuum switch setpoints shall be as indicated in the following list:

Pump "ON"	17 inches Hg (57.5 kPa)
Pump "OFF"	21 inches Hg (71.1 kPa)

For lead-lag pumps, upon a decrease in vacuum, the lead pump shall be energized. If the vacuum continues to decrease, the lag pump shall also be energized. The lead and lag pumps shall be alternated on each cycle. Initial vacuum switch setpoints shall be as indicated below:

Lead pump "ON"	17 inches Hg (57.5 kPa)
Lag pump "ON"	15 inches Hg (50.8 kPa)
Pumps "OFF"	21 inches Hg (71.1 kPa)

2.2.06 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized.

2.2.07 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of the equipment by Owner. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

2.2.08 Equipment Bases. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Cast iron or welded steel baseplates shall be provided for pumps, compressors, and other equipment. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection.

2.2.09 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.2.10 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.2.11 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.3 CLEANING AND ADJUSTING. Upon completion of the work, all parts of the installation shall be thoroughly cleaned. All equipment, pipe, valves, and fittings shall be thoroughly washed to remove grease, metal cuttings, and dirt particles. Any stoppage or other damage caused by Contractor's failure to clean the piping system properly shall be repaired by Contractor without additional cost to Owner.

End of Section

SECTION 15486

DISTILLED WATER SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers distilled water systems, including required equipment, piping, valves, fittings, gauges, bases, anchor bolts, and other accessories and appurtenances required for a complete unit. The equipment shall be installed in the laboratory as indicated on the drawings.

The distribution piping, recirculation piping, and isolating valves shall be in accordance with the piping and valve sections.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Power Supply. Except as otherwise specified, power supply to the equipment will be 480 volts, 60 Hz, 3 phase.

1.3 SUBMITTALS. Complete schematic and wiring diagrams, assembly and installation drawings, together with detailed specifications and data covering material used, power drive assembly, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted in accordance Master Specification Section 01080, Equipment, Project Submittals.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01060, Training and Operation & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Each distilled water system shall consist of one pretreatment filter, one water still, one storage tank, one circulation/distribution pump, post treatment filters, piping, and accessories normally included as part of a laboratory distilled water system.

2.1.01 Water Still. The unit shall be a classic tin lined copper and bronze still with low water cutoff, double wall evaporator, vented condenser, and a vapor baffle for pyrogen removal. The water still shall produce 5 gallons per hour (5.3 ml/s) distilled water with a minimum resistivity of 3000 Ω-m and shall be Barnstead "Model A 1015-D", or approved equal. The still shall have a fully automatic control system with an adjustable drain timer cycler. Control system shall be Barnstead "Model G2110", or approved equal. The still shall be mounted on a floorstand in the location indicated on the drawings. The still shall operate on 240 volts, 60 Hz, single phase. The solid-state low water cutoff box shall be provided with a separate 120 volt supply. Solid-state low water cutoff box shall supply power to open and close both inlet and outlet solenoid valves, shall provide terminal connections for both valves, LWCO probe, direct acting level monitor, and contactor controls. Reverse acting level monitor shall be powered from the recirculation pump motor starter CPT. The motor starter shall be provided under Master Specification Section 16050, Electrical General Requirements. Contactor for still, solid-state LWCO box, direct and reverse acting level monitors, inlet and outlet solenoid valves, and LWCO probe shall be provided by equipment manufacturer.

2.1.02 Storage Tank. The storage tank shall be copper with tin coating, 100 gallon (379 L) capacity and shall be Barnstead "Model No. B3047", or approved equal. The tank shall be provided with gauge glass, removable cover, tin-coated, draw off faucet, water inlet connection, water outlet connection, drain, pump suction connection, water seal, recirculation return connection, high and low level monitors, "Model H4005" ultraviolet lamp, low water cutoff, and "Model H3111" vent guard. The ultraviolet lamp shall be the immersion type and shall fit inside a transparent inert sheath. The lamp shall be provided with 10 "Model O4141" replacement bulbs. The tank shall be mounted on a floorstand at the location indicated on the drawings. The floorstand shall be fabricated of steel angle iron and shall be Barnstead "Model No. H1003", or approved equal.

2.1.03 Distribution/Recirculation Pump. The distribution/recirculation pump shall be 1-1/2 hp (1.12 kW), 3,450 rpm, horizontal centrifugal and shall be Barnstead Size DD Pump, "Catalog No. H1140", or approved equal, less the bypass piping. The pump shall pump to the distribution line which shall be piped back to the storage tank from the end of the distribution circuit. Pump housing and all wetted parts shall be AISI type 316 stainless steel. The pump shall be sealed with a teflon gasket, Viton O-ring and a John Crane Type 21 Viton/carbon/ceramic mechanical seal, or approved equal. The pump shall operate on 460 volts ac, 60 Hz, 3 phase. The pump shall be driven by a heavy-duty, totally enclosed, split case induction motor with ball bearing shaft supports. Included leads shall be contained in a junction box for connection to the power supply and to a low water cutoff located on the storage tank. Motor starter shall be furnished under Master Specification Section 16050, Electrical General Requirements.

2.1.04 Post Filters. Analytical grade post filters shall be installed at the locations indicated on the drawings. Each filter shall have a remote above counter mounted microprocessor controlled purity monitor and a remote above counter dispenser and shall be Barnstead "Model D4741", or approved equal with a "Model D5025" Type 1 cartridge kit, or approved equal.

Bioresearch grade, pyrogen free, post filters shall be installed at the locations indicated on the drawings. Each filter shall have a remote, above-counter mounted microprocessor controlled purity monitor and a remote above counter dispenser and shall be Barnstead "Model D4751", or approved equal with a "Model D5025" Type 1 cartridge kit, or approved equal.

2.1.05 Accessories. All accessories and appurtenances required to complete the installation of the distilled water package including all pipe, fittings, valves, cocks, gauges, and other accessories and appurtenances required to provide a workable and satisfactory installation shall be as manufactured or as recommended by the Barnstead Company, or approved equal.

2.1.06 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

2.1.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.1.08 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of a universal primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.3 CLEANING AND ADJUSTING. Upon completion of the work, all parts of the installation shall be thoroughly cleaned. All equipment, pipe, valves, and fittings shall be thoroughly washed to remove grease, metal cuttings, and dirt particles.

End of Section

SECTION 15487

FUEL DISPENSING SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installation of fuel dispensing systems an indicated in the Contract Documents.

The fuel shall be for use in service vehicles. The fuel dispensing system shall be furnished and installed in the location and arrangement indicated on the drawings and as required, complete with fuel dispensers and all other accessories necessary for a complete and properly operating installation.

1.2 GENERAL. All equipment for this section shall be furnished by or through a single manufacturer who shall be responsible for the design, coordination, and proper installation and operation of the entire system.

Equipment furnished under this section shall be fabricated and installed in full conformity with Drawings, Specifications, engineering data, instructions, and recommendations of the manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, materials, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Contractor shall properly coordinate the work between the Suppliers of equipment to be used with or connected to the storage tank to ensure that all required provisions for mounting the accessories are included.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Contractor shall, at his own expense, arrange for and obtain all necessary permits, inspections, and approval by the proper authorities in local jurisdiction of such work.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service form other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representative shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to the equipment furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations which pertain to such work. In case of a conflict between these Specifications and any state law or municipal ordinance, the latter shall govern.

All work shall comply with Underwriters' Laboratories (UL) safety requirements.

Equipment furnished under this section shall comply with the applicable requirements of the following:

> ASTM A283 "Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes, and Bars," or ASTM A569 "Steel, Carbon, Hot-Rolled Sheet and Strip, Commercial Quality."
>
> American Petroleum Institute.
>
> National Fire Protection Association.
>
> Applicable local regulations and ordinances.

1.2.03 Power Supply. Power supply to equipment with motors shall be as indicated on the Contract Documents. Power supply for controls shall be as required, unless otherwise required for a properly operating system.

1.2.05 Labels. Each dispenser shall have a conspicuous, easy-to read label showing the manufacturer's name and the rated capacity.

1.2.06 Metal Thickness. Gages specified herein refer to US Standard gage.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication, assembly, and installation drawings, together with detailed specifications and data covering materials used, parts, devices, and other accessories forming a part of the tank and fuel dispensing facilities furnished, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable.

Drawings shall include electrical connection diagrams and schematics identifying all items requiring electrical control or power in the operation of each electrically operated motor driven pump, and complete details and information on the power feed system.

The data shall also indicate the sizes of all major components and full information and details concerning field assembly and installation.

The manufacturer's standard calibration charts shall be submitted.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in Master Specification Section 01060, Training, Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.4.02 Contractor's Qualification. When indicated on the Contract Documents, Contractor shall submit qualifications to do the work.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping ,handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

The tank and component parts shall be adequately protected during all transportation, loading and unloading, storage, installation, and subsequent construction activities. All nozzles shall be properly protected at all times and shall be plugged to prevent contamination of the tank interior. Repairs of minor damage, including scratches and abrasions, may be made where permitted by the Engineer in the manner recommended by the manufacturer. If a tank is damaged beyond reasonable repair, in the opinion of Engineer, it will be rejected and shall be replaced by Contractor with an undamaged unit.

At no time shall a tank be dropped or rolled. All lifting shall be done using the lifting lugs or suitable slings.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The fuel dispensing system shall be suitable for the conditions specified and the locations indicated on the drawings.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The fuel dispensing system shall be designed to supply diesel fuel or unleaded gasoline, as indicated, for refueling vehicles. The system shall be designed as a one or two hose, one or two product, as indicated in the Contract Documents.

2.3 FUEL DISPENSER. The dispenser shall be of the number of hose and product as indicated. Registers shall read on the front of dispenser with 99.9 gallon delivery register and 99,999.9 gallon nonreset totalizer. Meters shall be neutating disc-type with a calibration screw. The dispenser shall be equipped with strainer, replaceable cartridge filter, pump, electrical junction box, 1-1/2 inch suction, float chamber to prevent meter register from operating when tank is empty, and shall bear UL listing. Cabinet finish shall be baked red enamel. The pumped product shall be identified by means of a decal, painted sign, or other label. The dispenser shall be as manufactured by Fill-Rite or approved equal.

All nozzles shall be shockproof, self-closing and automatic type permitting at least three positions of the hold-open clip and shall meet all requirements required by the U.S. Environmental Protection Agency. All hose shall be 1 inch diameter, 12 feet in length, and shall be suitable for direct sunlight and air temperatures up to 100 F. Hose retrieving devices and swivels shall be installed with all hoses.

Pulsers and detect wires shall be factor installed for each hose in each dispenser, suitable to the fuel management system control console.

Fuel dispensers shall be factory wired such that they require only the specified power supply for proper operation.

2.4 FUEL DISPENSER ACCESSORIES. The accessories for each fuel dispenser shall be provided as indicated on the drawings and specified herein.

2.4.01 Pressure Regulating Valves. The inlet pipe on each dispenser shall be equipped with a 1-1/2 inch pressure regulator valve, Tokheim "Model 52", or approved equal. The pressure regulator valve shall be mounted so that the valve and inlet piping are rigidly set in position and shall be furnished with a safety shear section.

2.5 Fuel Management System. A cardless, keyless fuel management system shall be provided, installed, and placed in roper working order. Fuel management system shall be as manufactured by Fill-Rite or approved equal, shall be compatible with the dispensers provided, and with suitable relay for the pump motor. The system shall feature two wire communication, vehicle identification number entry keypad, and data retrieval by remote printer readout.

Fuel management system shall be ETL listed and consist of all items required for proper operation as specified and shall meet all local, state, and national code requirements.

The system shall provide control and access to each fueling dispenser and to store and print out, upon demand, specified data relevant to the fueling transaction. Access to the system shall be through the weatherproof terminal keypad. The terminal shall be mounted on a contractor-supplied pedestal with all required junction boxes and terminal connection clearly marked with correct wiring identification. The fuel management system supplier shall provide all wiring between the fuel management system and fuel dispensers.

The fuel management system shall control all dispensers, each with number of hoses as indicated. User access to obtain fuel shall be gained once the vehicle identification number has been manually entered onto the terminal keypad. The terminal keypad shall also incorporate battery backup to retain information in memory, in the event of a power failure or system shutoff, display operating instructions, and an RS485 port with converter cable for data retrieval.

The fuel management system shall not permit additional fueling transactions once the memory is full. The fuel management system shall be suitable for future upgrading for fleet management to be 100 percent compatible with IBM personal computer.

A parallel port Epson "Model LX300", or approved equal shall be provided to provide a hard copy audit trail of the transactions. The printer shall be located in the building. Sufficient length of interconnecting cable shall be provided to connect the terminal keypad to the printer.

Print out of the fueling transactions shall include, but not to be limited to the following items:

Vehicle Identification Number.

Transaction Termination Code.

Transaction Date.

Transaction Time.

Hose Number.

Total Volume dispensed.

Pulsers and detect wires shall be provided on dispensers. Conduits shall be provided for power and detect wires. Pulser lines may not be run in the same conduit as power lines.

System manufacturer shall warrant the system against defective materials or workmanship for two years from date of startup by factory trained personnel.

Contractor shall provide system startup and operator instruction by factory trained personnel for one day after notification that the system is in pace and ready to operate at no charge to Owner.

System to include locking emergency stop switch shall be provided to shut of the power to the dispensers in the event of an emergency.

2.6 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 INSTALLATION. Each dispenser and accessories shall be installed in accordance with the manufacturer's instructions, specifications, and drawings.

Each dispenser and accessories shall be installed on a concrete base as indicated on the drawings.

Each dispenser shall be mounted securely on a steel pump spill containment box cast in the concrete base. The pump spill containment box shall be provided with opining and an adjustable shear clamp for the inlet pipe. The pump box shall be AMFAB, shall be suitable for the dispenser, and shall be of ample size to contain spillage when maintenance is required on the pump and for piping and electrical connections.

Fuel management system terminal shall be mounted on templates with all conduits running inside template and terminal mounting pole.

3.2 INSTALLATION CHECK. An experienced, competent, and authorized representative of the manufacturer shall visit the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting appurtenances; and has been operated under full load conditions and that it operated satisfactorily.

3.3 FIELD TESTING. All testing required by governing standards shall be performed.

End of Section

SECTION 15490

HVAC GENERAL PROVISIONS

PART 1 - GENERAL

1.1 SCOPE. These Sections and Drawings cover(s) the general requirements of the HVAC work to be performed and shall not void any of the requirements specified under the General Conditions or General Requirements.

Heating Equipment

Flue Stacks, Breechings and Vents

Air Handling Units

Centrifugal Fans

Ductwork and Accessories

Electric Automatic Temperature Control System

HVAC Systems Testing, Adjusting and Balancing

The requirements specified herein shall be modified only if specified otherwise for a particular application in other Divisions. Work to be included under the "Scope of Work" of each HVAC Section listed above shall include all labor, material, equipment, tools and services necessary to furnish, deliver, unload, install, test and place in satisfactory operation the equipment, services and systems as called for under each HVAC Section including any incidental work not shown, or not specified but which can reasonably be inferred as belonging to the various systems and necessary in good practice to provide a complete and satisfactory operating system.

This HVAC specification is incomplete without the information contained on the Drawings and in the Schedules.

Description of the work included in each Section is not intended to in any way limit the above broad statement, but is intended as a more specific mention of the most important items included therein.

Without limiting the scope of work as shown on the Drawings and required in this Section the following specific mention of items of included work is made.

The scope of work shall include: fans, air handlers, make up air units, air-conditioning units, roof mounted units, duct work by material, thermal insulation by system, acoustical insulation by system, piping by system, sting and balancing, space heaters, ductwork accessories, louvers and dampers, automatic controls by type. In addition any item that could be considered unusual shall be included.

The contractor shall coordinate with the equipment manufacturers control and field installation items furnished. The contractor shall field install and wire furnished loose by the equipment manufacturer.

All ductwork, piping, and equipment shown on the Drawings is intended to be approximately correct to scale, but figured dimensions and detailed drawings of the actual equipment furnished shall be followed in every case. The Drawings shall be taken in a sense as diagrammatic. Size of ductwork and piping are shown, but it is not the intent to show every offset or fitting, nor every hanger or support, or structural difficulty that may be encountered. To carry out the intent and purpose of the drawings all necessary parts to make a complete working system ready for use shall be furnished without extra charge. The Contractor shall be responsible to coordinate the system installation and routing with the work of all trades.

1.2 RELATED REQUIREMENTS. Cutting coving and patching, except for items specified herein, is included in Division 1. Temporary heating, electric power and lighting is included in Division 1. Trenching, excavation and backfill except for items specified herein, is included in Division 2. Concrete work except for furnishing of required anchor bolts, sleeves and templates, which shall be furnished with equipment, is included in Division 3. Flashing and counter flashing, except for items specified herein is included in Division 7. Painting except for factory finished equipment, shop painting and identification labeling is included in Division 9. Miscellaneous metal for supplementary steel required for hangers, equipment supports, anchors and guides, which shall be furnished with equipment, is included in Division 15. Exterior louvers including installations are included in Division 10. Plumbing except water and drains in connections to HVAC equipment is included in other Sections of this Division. Electrical field power wiring except for field wiring for automatic temperature controls as specified and as shown on the HVAC Drawings is included in Division 16.

1.3 SUBMITTALS. Submit, in accordance with Section 01080, all shop drawings specified in the individual Sections. Submittals shall include the following:

Catalog data for all motors to include operating efficiency.

Catalog data on vibration isolator, including operating efficiency and layout diagram that locate the isolates on the equipment by model number. Catalog data on bearings and confirmation of bearing life for the service specified.
Information on coatings as specified in the coating section.

Shop Drawing Data to include performance curves, data sheets, flow diagrams, wiring diagrams, and descriptive drawings.

In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

For units that will be shipped exposed, provide a description of the protective packaging that will be used during transit

All submittals shall contain a statement that Section 15501 and all other referenced Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal.

1.3.01 <u>Operation and Maintenance Data and Manuals</u>. Submit to the Engineer as provided in Section 01160, Operating and Maintenance Manuals. The following information shall be considered a minimum. Where applicable, provide information required for specific pieces of equipment.

Contents - Each volume shall contain the following minimum contents:

Operating Instructions to provide pre-operational checks, start up and shut down, and description of all control modes. Include emergency procedures for all fault conditions and actions to be taken for all alarms. Procedures for long term storage shall be included.

Maintenance shall include preventive, and corrective. Schedules for test of other functions are to be included. Provide a list of tools required to service the equipment. Trouble shooting instructions to include a trouble-shooting guide shall be included.

Provide information in three ring binders. All sheets shall have reinforced punches. Tabbed dividers shall separate all sections. Drawings will be bound in the manual, or contained in envelopes bound into the manual. Personnel familiar with the operation and maintenance of the specific information shall prepare manuals.

Equipment shall be identified with the Engineers Equipment Numbers and Identification as shown in the Schedules and on the Drawings.

Installation including instructions for unpacking, installing, aligning, checking and testing. Foundation data, allowable piping loads, and electrical design shall be included.

1.4 REFERENCE STANDARDS. The latest published issue of Standards or Recommendations of the following listed Societies, Associations or Institutes in effect 3 months prior to the date of this Contract are part of this Section. These shall be considered as minimum requirements. Specific requirements of this Section and/or Drawings shall have precedence. In case of conflict between published requirements, the Engineer shall determine which is to be followed.

Abbreviation and the title of Federal, State and industry standards, technical societies, associations and institutes and other organizations used are as follows:

AABC - Associated Air Balance Council

ACGIH - American Conference of Governmental Industrial Hygienists

ADC - Air Diffusion Council

ABMA - American Bearing Manufacturers Association

AMCA - Air Movement and Control Association ANSI - American National Standards Institute ARI - Air-Conditioning and Refrigeration Institute
ASHRAE - American Society of Heating, Refrigerating and Air-Conditioning Engineers

ASME - American Society of Mechanical Engineers

ASTM - American Society for Testing and Materials

CTI - Cooling Tower Institute

FM - Factory Mutual Engineering and Research Corp. IBR - Institute of Boiler and Radiator Manufacturers
1IEEE - Institute of Electrical and Electronics Engineers NIST - National Institute of Standards and Technology NEBB - National Environmental Balancing Bureau
NEC - National Electrical Code

NEMA - National Electrical Manufacturers Association

NFPA - National Fire Protection Association

OSHA - Occupational Safety and Health Administration

SMACNA - Sheet Metal and Air Conditioning Contractors National Association

UL - Underwriters Laboratories

1.5 QUALITY ASSURANCE. All equipment of a given type included in this Section shall be furnished by or through a single manufacturer or as specified on the schedules
Inspection by the Engineer's representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents.

1.6 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved shop drawings upon delivery.

Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer.

All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container.

All equipment shipped that is exposed such as on a flat bed truck shall be protected during transit. The equipment shall be protected from moisture, road salt, dirt and stones or other materials thrown up from other vehicles. Electrical components shall be protected as above, but with special attention to moisture. The method of shipment protection shall be defined in the submittals.

Instructions for the servicing and startup of equipment in long term or prolonged storage shall accompany each item.

All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.7 DEFINITIONS. Particular terminology used under this Division is defined as follows: Air Conditioning - Environmental control of temperature, humidity, cleanliness and air circulation, including the cooling of an enclosed space.

Air Conditioner or Air Conditioning Unit – One or more field-erected or factory-made assemblies, which includes the refrigeration compressor-condenser assembly, for the handling and control of air temperature, humidity, and cleanliness used for cooling.

Fan-Unit - Any unit or assembly containing a fan, motor and drive.

Temperature Controller - Any device which is used to modulate the automatic temperature control system by a change in temperature at the location of the controller.

Explosion Proof - Any equipment or device, which is called to be explosion proof, shall be certified as explosion proof as a complete unit.

1.8 COORDINATION. The Drawings indicate the extent and general arrangement of the systems. If any departures from the Drawings or specifications are deemed necessary, details of such departures and the reasons therefore shall be submitted as soon as practical for review. No such departures shall be made without the prior written concurrence of the Engineer. The Contractor shall coordinate the location and placement of all concrete inserts and welding attachments with the structural engineer. The Contractor shall assume full responsibility for coordination of the HVAC systems, including; scheduling, and verification that all structures, ducts, piping and the mounting of equipment are compatible.

1.9 ENGINEERING SERVICES. When engineering services are specified to be provided by the Contractor, the Contractor shall retain a licensed professional engineer to perform the services. The engineer shall be licensed at the time the work is done and in the State in which the project is located. If the State issues discipline specific licenses, the engineer shall be licensed in the applicable discipline. In addition, the engineer shall be experienced in the type of work being provided.

All work is to be done according to the applicable regulations for professional engineers, to include signing, sealing and dating documents. When submittals are required by a professional engineer, in addition to state required signing and sealing, a copy of the current wallet card or wall certificate indicating the date of expiration shall be included with the submittal.

1.10 ELECTRIC MOTORS. Electric motors in NEMA frame sizes shall conform to the requirements in Section 16150, unless otherwise specified herein.

Clean Dry Areas ODP

Outdoors TEFC

Process Areas

NOT Div. 1 or 2 TEFC

Div. 1 or 2 Explosion Proof.

The motor manufacturer shall confirm that motors used to power equipment are provided with bearings that will provide a bearing life equal to the driven equipment or better. Confirmation shall be included with shop drawing submittal.
Motors will be selected to be non-overloading over the entire operating range of the equipment. A safety factor of 25 percent will be added to all motors up to and including 50 horsepower. A safety factor of 15 percent will be added to all motors over 50 horsepower. Motors indicated in the schedules are to be considered a minimum. The schedule sizing is not to limit compliance with the above requirements.

1.11 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts In addition to special items, the following spare parts shall be provided:

> Furnish all special tools required for normal operation and proper servicing of the equipment.
>
> Spare parts shall include all items on the manufacturer's standard list of spare parts and the following for each unit:
>
> One complete set of drive belts for each piece of belt driven equipment
>
> Pack spare parts in containers suitable for extended storage without deterioration of the parts. Containers shall be clearly labeled designating contents, pieces of equipment for which intended and equipment identification numbers.

Spare parts shall meet the requirements of Sections 01180.

1.12 WARRANTY. In the event that the equipment or components fail to perform satisfactorily at any time within the Defects Liability Period, the Contractor shall replace it with one capable of operating as specified, and shall comply with the requirements in Division 1. The Contractor shall be responsible for all cost incurred in furnishing and installing the replacement equipment.

PART 2 - PRODUCTS

2.1 ELECTRICAL EQUIPMENT. Certain items of electrical equipment which are furnished under this Section shall meet the requirements specified in Division 16:

Disconnect switches, motor starters and combination motor starters (starters with disconnecting means and short circuit protection) shall be as specified in Section 16050.

Cord-connected controls for hazardous areas shall be provided with intrinsically safe relays, which shall be as specified in Section 16050.

Raceways, boxes and fittings shall be as specified in Section 16050. Wires and cables shall be as specified in Section 16050.
Electrical enclosures and panels, to include automatic temperature control panels and components shall be suitable for the environment and electrical classification for the space they are located in. The type of enclosure for the various spaces shall be as specified in Division 16. Refer to the electrical drawings for the space classifications.

Where location designations are not shown on the HVAC Drawings refer to the Electrical Drawings

2.2 EQUIPMENT VIBRATION ISOLATORS AND MOUNTINGS. Unless otherwise specified in this Division all machinery or vibrating mechanical equipment shall be isolated from the building structure by vibration isolators with a minimum deflection as specified. Operating equipment that can transmit objectionable vibration and noise must be installed with special types of vibration isolators such as flexible connectors to ductwork, piping and wiring. In more critical areas and under particular conditions, additional vibration isolators shall be installed as specified in other related Sections in this Division, or in specific equipment schedules.

All equipment shall be provided with attachment points for floor or suspended mounting that will safely transmit all loads to the supports.

The vibration isolator manufacturer shall be responsible for the proper selection of vibration isolators suitable for the particular application. Selection of the vibration isolator shall include the following factors:

Equipment Weight

Equipment operating frequencies

Type of building support structure

Vibration isolators shall be furnished with the equipment.

All floor mounted vibration isolators shall be bolted to the floor or framing on which they rest. Bolts shall be arranged to prevent transmission of vibration through the bolts.
All isolation devices for a single piece of equipment shall be selected for a uniform static deflection according to distribution of weight in the equipment.

All pieces of equipment that have a variation in weight during operation or maintenance such as, but not limited to, cooling towers and hoppers, shall have built-in vertical limit restraints to limit motion to a maximum of 1/4-in.

Isolators exposed to the weather, in rooms classified on electrical drawings as damp, wet, or corrosive or where called for on the Drawings shall be provided with corrosion protection. Steel parts other than springs shall be galvanized. Parts subject to wear, rubbing, shall be non-corrosive material such as rubber or stainless steel. Springs and hardware shall be cadmium plated or otherwise provided with an approved coating.

After installation of equipment, isolators shall be adjusted for proper loading and distribution of weight.

Types - The following types of vibration isolators may be used.

Isolation Types for Floor Mounting

Single elastomer-in-shear isolators, molded mound shaped element designed for 1/4-in deflection under the imposed static load. Double elastomer-in-shear isolators shall be two such elements assembled in series or a molded element designed to provide 1/2-in deflection under the imposed static load. Elastomer-in-shear isolators shall be properly housed to prevent bulging and shall be provided with adequate facilities for bolting to equipment and floor slab.

Spring isolators shall be free standing and laterally stable and shall be equipped with acoustical-friction pads, leveling bolts and bolt holes for anchoring to floor slab. Springs shall have a minimum ratio of outside diameter to operating spring height of 0.8 and an additional travel to solid equal to 50 percent of the specified deflection. Where housed springs are specified or required, provide units with telescoping cast iron or steel housing, containing one or more springs, complete with resilient alignment insert and a minimum of 1/4-in thick rubber or neoprene sound deadening pad bonded to the base of housing.

Heavy load pads shall be 1-1/4-in thick and shall consist of a high load capacity elastomer pad and sandwiched between two 1/8-in thick steel load distribution plates capable of supporting loads up to 250 psi. For large pad area, steel plates of suitable thickness shall be provided to distribute the load.

Light load pads shall be neoprene corrugated single, laminated double or laminated with 1/2-in thick fine granular composition cork sandwiched between two 1/4-in layers of corrugated, oil resistant neoprene. Pads shall be capable of loading to 50 psi.

Isolation for Suspension

Isolation hangers for suspension of equipment and piping shall have a single element of elastomer for 1/4-in deflection, a double or a single molded element of 1/2-in deflection, a single spring element with an elastomer grommet for up to 3/4-in deflection and a combination of an elastomer and spring elements in series for 1-in deflection and up contained within a structural rigid one piece steel hanger box. Springs shall have a minimum ratio of outside diameter to operating spring height of 0.8 and an additional travel to solid equal to 50 percent of the specified deflection.

The neoprene element shall have a bushing to prevent hanger rod contact with the housing box. The lower rod shall be free to swing in a 30 degree arc without touching the spring or the housing.

Rails and Bases - Rails and bases shall be of the following types based on the equipment and deflection required.

Rubber in shear type shall be steel rails running the full length of the supported equipment and extending under any overhang to counteract cantilever effects. The rails shall incorporate single or double deflection elastomer-in-shear fastened in place and a continuous steel floor bearing plate running the full length of each rail. The rails shall be drilled and tapped to accept the supported equipment and shall serve as a template.

Steel spring type shall be steel rails running the full length of the supported equipment and extending under any overhang to counteract cantilever effects. The rails shall consist of structural members supported by individual free standing springs. The rails shall be drilled to accept the supported equipment and shall serve as a template.

Fans and their driving motors shall be mounted on structural steel channel members forming a rigid base. A common member, parallel to the V-belt drive, shall run the full length of the fan and motor and shall be of sufficient rigidity to resist the bending stress of belt pull. The structural steel base shall incorporate single or double deflection elastomer-in-shear elements or free standing springs located for proper weight distribution. The base shall be drilled and tapped to accept the fan and motor and shall serve as a template. Integral motor slide rails shall be provided and welded in place.

Unless specifically noted in other Sections or on specific equipment schedules, all equipment will be provided with vibration isolation as defined by the following table:

Type of Equipment	Vibration Isolation Type	Minimum Deflection for Slab on Grade Inches	Minimum Deflection for up to 20-ft floor span inches	Minimum Deflection for 20-ft to 30-ft Floor Span Inches	Minimum Deflection for 30-ft to 40-ft Floor Span Inches
Axial & Cabinet Fans					
22-in dia. and less	Rubber	0.25	--	--	--
22-in dia. and less	Spring	--	0.75	0.75	0.75
Over 22-in dia. Over 2-in S.P.	Spring	0.75	1.75	1.75	2.50

Type of Equipment	Vibration Isolation Type	Minimum Deflection for Slab on Grade Inches	Minimum Deflection for up to 20-ft floor span inches	Minimum Deflection for 20-ft to 30-ft Floor Span Inches	Minimum Deflectio n for 30-ft to 40-ft Floor Span Inches
Centrifugal Fan					
22-in dia. and less	Rubber	0.25	--	--	--
22-in dia. and less	Spring	--	0.75	0.75	1.75
24-in dia. and greater					
40 HP and less	Spring	0.75	0.75	0.75	1.75
50 HP and greater	Spring	1.00	1.75	1.75	2.50
Condensing Units					
	Rubber	0.25	--	--	--

	Spring	--	0.75	1.75	1.75
Air Handling Units					
10 HP and less	Spring	0.75	0.75	0.75	0.75
15 HP and greater	Spring	0.75	1.75	1.75	1.75

Isolation for Piping

Flexible piping for systems with operating temperatures over 200 degrees F shall be flexible annular corrugated stainless steel hose. The hose shall be provided with an external stainless steel braid to minimize elongation under pressure. Hoses 2-1/2-in and smaller shall be threaded and hoses 3-in and larger shall be flanged. The manufacturer shall confirm the suitability of the flexible piping for the temperature and pressure of the systems.

Flexible piping for systems with operating temperatures 200 degrees F and less shall be spherical EPDM connections. Connections shall have multiple plies of corded fabric reinforcing. Connection shall be rated for 150 psi at 220 degrees F. For equipment with connections from 2-1/2 to 12-in, 90 degree bend connections can be used. Straight connections shall be double sphere and bend connections shall be single sphere. Provide control cables to prevent excessive elongation on straight connection where required. The manufacturer shall confirm the suitability of the connections for the temperature, pressure, and pipe contents for the systems.

Rigidly Mounted Equipment

When equipment doesn't require vibration isolation, it shall be firmly attached to the building structure. Bolts and support structure shall include allowances for seismic loads as required by the applicable building codes to include shear and moment loads.

2.3 BEARINGS. Grease lubricated bearings (except where driven by motors smaller than 1/2 Hp) shall be equipped with Zerk lubrication fittings and with provision for automatic relief of lubricant pressure away from fan wheel or pump seal. The latter may be accomplished by either built-in relief devices or automatic ball-and-spring relief fittings at the bottom of the bearing housing.

Pressure relieves shall be located outside of the units and shall be visible from maintenance locations. Lubrication fittings shall be located to be easily accessible from maintenance or operating levels. Where necessary, extension tubes shall be provided to bring the service fitting to an accessible location and the relief visible from the same location.

Bearings for all equipment in the schedule below shall have heavy-duty grease lubricated ball or roller bearings. Bearings shall have ample thrust provision to prevent end play during the normal life of the bearing. Unless specifically noted otherwise, all fans and pumps shall have bearings for both the equipment and motors with the following ABMA L-10 life.

Fans over 3000 cfm – 40,000 hours.

Continuous duty fans with motors over 25 horse power 100,000 hours.

For systems with bearings requiring L-10 lives of 100,000 hours or greater, the equipment supplier shall provide calculations for both the equipment bearings and the motor bearings to confirm the bearing selections. For belt drives, the calculations shall include the effect of the sheave size, number of belts, the sheave location on the shaft, and the location of the motor to the driven sheave.

The equipment manufacturer shall provide confirmation of the required life based on the actual drive components. For motors 50 horsepower and greater, the bearing life calculations for both the equipment bearings and the motor bearings shall be provided.

2.4 <u>FLAME AND SMOKE RATINGS</u>. All materials, including adhesives, surface coatings, sealers, assemblies of several materials, insulation, jacketing, finish, etc, shall have flame spread ratings not over 25 (fire resistive) and smoke development ratings not over 50 and fuel contributed rating not over 50, as established by tests conducted in accordance with the Federal Standard 00136B, National Bureau of Standards Radiant Energy Fire Test and the National Fire Code of the NFPA.

These requirements shall apply to all circumstances whether the materials are field applied or have been applied by a manufacturer in his/her shop, or elsewhere, prior to delivery to the project for installation.

2.5 <u>V-BELT DRIVE</u>. V-belt drives shall consist of the driver and driven sheaves and one or multiple matched V-belts. Drives furnished to transmit less than 3/4 Hp may be a single groove, single belt type. Drives to transmit 3/4 Hp or more shall consist of at least two belts. Belts smaller than "A" cross-section shall not be used.

Each sheave shall be grooved to match the belt selection, bored and keyed to fit the receiving shaft, and grooves shall be in parallel planes exactly perpendicular to the bore for the full 360 degrees. Sheaves shall have keys and setscrews. Sheave material may be cast iron.

The drive shall be sized 1.5 times the motor nameplate rating and also shall have ample strength to start the driven equipment by full voltage across-the-line motor starting.

Where variable speed drive is specified, the drive sheave shall be of the variable pitch type which will provide a 5 percent speed variation of the driven equipment at the nominal rated speed. However, the higher speed side shall not cause the driven equipment to draw more than full nameplate rating horsepower from the driver.

2.6 NOISE CRITERIA. The selection of fans, air handling equipment, air conditioners, heating ventilating and air conditioning machinery and mechanical equipment and the installation of the system components such as duct work and piping shall be such as not to exceed to maximum permissible noise for non-equipment spaces as defined in Table 2, Design Guidelines for HVAC System Noise in Unoccupied Spaces contained in the 2003 edition of the ASHRAE Application Handbook. Under no conditions shall the noise created by equipment exceed the levels of permissible noise exposures of occupational areas as established by the OSHA and other Federal, State and local safety and health standards, codes and ordinances.

The equipment supplier shall provide actual data for the equipment submitted. If the space does not meet the required criteria, and the noise level of the equipment is found to be the cause, the equipment supplier shall be responsible for the modifications required to correct the condition.

PART 3 – EXECUTION

3.1 INSTALLATION. The Contractor shall start up each piece of equipment and system and shall make all adjustments so that the system is placed in proper operating condition.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

3.2 CLEANING AND DISINFECTION. All piping, ductwork and equipment shall be left in a thoroughly cleaned condition. All piping shall be thoroughly flushed to remove all foreign materials prior to any cleaning procedure. All strainer baskets shall be removed, cleaned and reinstalled at the completion of the cleaning operation and also at the completion of all system and equipment final tests. All flushing and cleaning shall be to the satisfaction of the Engineer. Furnish, install and remove all temporary piping and equipment used in the cleaning and flushing operations. Cleaning and flushing shall be performed as specified in other Sections.

3.3 TESTS AND BALANCING. General - Balance and test all systems. Test the work as required by the Engineer during the progress of the work to demonstrate the strength durability and fitness of the installation. Furnish all instruments, ladders, lubricants, test equipment and personnel required for the tests; including manufacturer's representatives for testing and start-up of all supplied equipment.

Balancing and testing shall be performed as specified in other Sections. Before testing and balancing, all systems shall be cleaned and disinfected as specified. Four copies of records of all tests, measurements, settings of throttling devices and nameplate data shall be presented to the Engineer.

Final Tests - Tests of all systems shall be carried out as required by the Engineer prior to final acceptance of the systems for the purpose of demonstrating satisfactory functional and operating efficiency as well as adjustment. During this period, the setting of all automatic controls shall be checked and sufficient measurements taken to ensure that conditions are correct and that capacities are adequate to meet the specified requirements. Provide competent personnel to conduct all tests. Systems will not be considered complete until all tests have been concluded to the satisfaction of the Engineer and all other parties having jurisdiction. In event of leakage or defects, tests must be repeated until all faults are corrected. All tests shall be performed in the presence of the Engineer. The general operating tests shall be performed under as near design conditions as possible.

Testing and balancing of all heating, ventilating and air conditioning air and water systems shall be performed by an AABC or NEBB certified agency, which is independent of all suppliers and installers on the particular job. All testing, adjusting and balancing shall be done under the supervision of a qualified heating, ventilating, and air conditioning Engineer employed by the air balance and testing agency. Reporting forms for testing and balancing shall be as recommended by the AABC or the NEBB.

3.4 START-UP AND TEMPORARY OPERATION. Properly maintain and service all equipment and systems until the particular equipment or the system has been accepted by the Owner.

This maintenance shall include compliance with the manufacturers operating and maintenance instructions as well as periodic checking and cleaning of the strainers and filters and the lubrication of moving parts and all required adjustments.

Records of all maintenance and lubrication work performed on Owner or Contractor furnished equipment shall be maintained at the construction or installation site and shall be available at all times for a review by the Owner or Engineer. At the request of the Owner or Engineer copies of these records shall be submitted to the Owner for information and/or review.

3.5 PAINTING AND COATINGS. Unless otherwise specified, all machinery and factory finished equipment such as fans, air handling units, air conditioning units, and other items of manufacture shall be hot dipped galvanized or will have a factory applied finish, color as standard with the manufacturer. Components fabricated from stainless steel do not require a coating finish unless otherwise specified. All tanks, supporting steel, hangers, rods and all other uncoated or non-galvanized steel other than standard piping and fittings shall have a shop coat consisting of a suitable primer and finish coat. If not factory applied, the prime coat shall be as specified in Division 9. All items not factory or shop primed prior to installation shall be suitably cleaned of rust and mill scale by wire brushing, sanding, or other means and prime painted, immediately after installation.

The Contractor shall be responsible for the repair of all defects, blemishes, holidays and the like apparent in manufactures coatings and shall ensure that the materials used for such repair shall match and be compatible with the manufacturer's standard color, coatings and practices. Surfaces to be repaired or recoated are to be prepared as recommended by the paint or coating supplier. Care shall be taken not to paint over nameplates.

Furnish touch up paint for the various types of equipment furnished and deliver unopened paint to the Owner at completion of the project. The amount of touch-up paint supplied shall be sufficient to cover 15 percent of the applicable painted surfaces or one pint, whichever is greater.

Where specified, or called for on the following schedule, special corrosion resistant/protective coatings shall be provided. Whenever a protective coating is specified, the equipment shall be coated both inside and out. Whenever necessary to provide full coverage of the equipment, the equipment shall be completely disassembled to allow proper preparation and coating application. Any component that would block the coating process shall be removed. Equipment provided with gaskets or liners shall be coated before the application of the gasketing or liner. The equipment Vendor shall test rotating equipment after coating to confirm dynamic balance. If work needs to be done to correct the equipment balance, the integrity of the coating must be corrected after such work.

Ductwork connections to units that require corrosion resistant coatings shall be made with flanges. Flanges shall be factory drilled before coating. Resilient washers suitable for the environment shall be used to protect the coating from the bolts in the flange. The use of self-tapping screws or other fastening methods that will damage the coating are not acceptable.

All items to be provided with a protective coating shall have the following data on the coating included with the unit submittal. Submittal shall include vendor data sheets on the specific coating being used, corrosion resistance data sheets, detailed application data sheets to include surface preparation procedures. For baked coatings submit a letter from the coating manufacturer, that the company doing the actual coating operation is an approved coating company. When an equipment supplier provides the coating, the information shall be supplied by the coating manufacturers.

Coating shall be factory applied by the equipment manufacturer/supplier. If this is not possible, coating shall be applied by a specialty shop under contract to the equipment manufacturer/ supplier. After coating application is completed, the equipment manufacturer/supplier shall test the equipment and certify system operation prior to releasing the equipment to the job site.

Any holidays, runs, sags, blisters, or inclusions in the coating are unacceptable and will be corrected. With the approval of the Engineer, small areas no more than 4-in by 4-in may be corrected in the field. Larger faults shall be returned to the coater to be repaired. The faulty material shall be removed by sanding and in the case of blisters, the edges feathered. The material used for recoating shall be manufactured by the same manufacturer as the original coating and shall be suitable for field repairs. The touch up material shall have the same corrosion resistance as the original coating, and if the original coating required an ultraviolet protection, the same protection will be provided as part of the repair. The final mil thickness of the repaired coating shall be equal to the originally specified thickness. Where baked coatings have been damaged, the repair shall be made with heat applied to the repaired surface to cure the coating. After curing a solvent test as recommended by the manufacturer shall be used to confirm that the coating is cured.

3.6 BALANCE OF ROTATING EQUIPMENT. All machines shall be balanced both statically and dynamically by the manufacturer within the limits of best commercial practices. The term machine, as used above, is to be considered as any piece of equipment which contains rotating components. All machines furnished shall have operating speed not exceeding 80 percent of the first critical speed.

End of Section

SECTION 15500

HEATING, VENTILATING AND AIR CONDITIONING

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heating, ventilating, and air conditioning (HVAC) equipment, coils, fans, ductwork, duct mounted devices, and appurtenances associated with the HVAC systems.

Schedules on drawings and notes indicate specific HVAC equipment required for the project.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

The refrigerant systems shall be constructed in accordance with ASHRAE Standard 15. Refrigeration system equipment shall have a minimum efficiency of not less than specified in the latest edition of ASHRAE 90.1, unless otherwise indicated on the drawings.

Capacity ratings for packaged air conditioning units and packaged heat pumps with capacities less than 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 210/240. For packaged air conditioning units over 135,000 BTUH (39 kW) the capacity ratings shall be in accordance with ARI Standard 360. Capacity ratings for packaged heat pumps with capacities over 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 340.

Flue piping and fittings shall be factory built, laboratory tested, listed by Underwriters' Laboratories, and shall comply with NFPA 211.

Electric heating coils shall comply with the current National Electrical Code.

Direct fired makeup air units shall be independently certified to meet ANSI Z83.4.

Fans shall be rated in accordance with AMCA standards, shall be licensed to bear the AMCA Certified Rating Label unless otherwise indicated in the Fan Schedule on the drawings, and shall be UL listed.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, ductwork, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where necessary due to excessive length, lettering shall be placed on more than one row and centered.

Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/4 inch (19mm) high for section identity and 1/8 inch (3 mm) high for other information Nameplates and tags shall be at least 12 gage (2.66 mm) thickness. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.3.05 Ductwork. As required, ductwork shall be identified with nameplates as specified herein, or stenciled painting as specified in Master Specification Section 09900, Painting. Ductwork shall be identified with the equipment number and area served, direction of airflow, and service (supply, return, mixed, exhaust, and outside air). The identification shall be located at equipment, at each side of structure or enclosure penetrations, and at each obstruction.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Packaged Air Conditioning Units/Packaged Heat Pumps

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Locations and sizes of field connections.

Certified performance data and ratings.

Capacity at specified conditions.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Makeup Air Units

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Burner or heating coil capacities.

Filter velocities.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least 5 different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

Fans

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least 3 different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Schematic control wiring diagrams showing multiline wiring for the unit and all interconnecting devices. Wiring diagrams shall be detailed to the degree required for field construction, with all terminals identified.

Equipment

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Sheet Metal Fabrication Drawings

Duct layout drawings indicating shop fabricated sections and dimensions.

Pressure and seal classifications.

Access panel and door construction, sizes, and locations.

Duct sealant, adhesive, gasket, and tape information.

Coatings.

Ductwork materials.

Coatings

Name of manufacturer.

Coating type.

Chemical resistance data.

Temperature range data.

Surface preparation and application data.

Film thickness per coat.

Drying and curing time.

Color.

Equipment Motors

Name of Manufacturer.

Type and Model.

Horsepower (kW) rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Type of bearings and method of lubrication.

Net weight.

Overall dimensions.

Efficiency at full, 3/4, and 1/2 loads.

Full load current and power factor.

Locked rotor current.

Temperature Controls

Published descriptive data on each item of equipment and accessories, indicating all specific characteristics and options and identified with the designation used herein and on the drawings.

Schematic control diagrams giving specific data on all settings, ranges, actions, adjustments, and normal positions. Although schematic, these diagrams shall, as closely as possible, represent the actual system with all significant equipment and devices identified and located relative to each other. These diagrams shall also show detailed multiline wiring and instrument piping with all terminals and ports accurately identified. The wiring diagrams shall show the internal connections of the temperature control panels and all field wiring to equipment remote from the control panels, including wiring to Owner-furnished equipment. The wiring diagrams shall be complete, showing all connections necessary to place the temperature control systems in operation. Wiring diagrams shall be detailed to the degree necessary for field construction and shall include all related wiring.

Control valve schedule with each valve identified by the designations used herein and on the drawings and cross-referenced to the manufacturer's equipment data sheet or bulletin. The schedule shall also list complete sizing data for each valve, giving design flow and temperature or pressure, actual pressure drop, normal position, fluid, actual close-off rating, actual capacity index, and any other pertinent data.

Sequence of operation for each system corresponding to the control schematics.

Detailed panel construction drawings, including description of all materials and finishes, complete internal wiring and piping schematics, panel face layout, and complete data on all mounted components.

Space thermostat schedule indicating the types of covers and means of adjustment for each space.

Conduit and wire types.

<u>Number Plates</u>

A listing of equipment to receive number plates.

1.4.02 <u>Operation and Maintenance Data and Manuals</u>. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4.03 Samples. Samples of protective coatings for equipment shall be submitted to Engineer for approval. The samples shall be at least 3 inches by 3 inches (75mm by 75mm) in size, and shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. Extra materials for one complete change of lubricating oil and two sets of filters shall be furnished for the equipment.

Extra materials shall be packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment and coil capacities shall be as indicated on the schedules.

Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as required.

Each fan's operating selection point on the fan curves shall be selected to the right of the peak pressure/efficiency point and below the lowest point along the fan curve, to the left of the peak pressure/efficiency point.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be indicated in Master Specification Section 09900, Painting.

Machined, polished and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.08 Flue Systems. Flues shall be provided for all equipment that exhausts combustible material. Drain tee caps, stack caps, storm collars, and equipment connection kits shall be provided. The systems shall be designed to compensate for all flue gas-induced thermal expansions. Flue system materials and construction shall be in accordance with the vented equipment manufacturer's recommendations and instructions.

2.4.08.01 Factory Built Flues. Flue systems for gravity vented equipment and vertically vented unit heaters listed for use with "Type B" gas vents shall be Selkirk Metalbestos, "Type B" gas vents, Metal-Fab, or approved equal. The flue systems for power vented equipment shall be Selkirk Metalbestos "Type PS" gas vent, Metal-Fab "Model PIC", or approved equal.

The flue pipe and fittings for vertically power vented unit heaters requiring a 5 inch (125 mm) or smaller flue and gravity vented equipment shall be a "Type B" gas vent. The flue shall be of double wall construction, with a 0.25 inch (6 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.012 inch (0.3 mm) aluminum and the outer jacket of at least 0.018 inch (0.5 mm) galvanized steel. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

The flue pipe and fittings for power vented equipment and power vented unit heaters requiring a 6 inch (150 mm) or larger flue shall be of double wall construction with a nominal 1 inch (25 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.035 inch (0.9 mm) AISI Type 304 or Type 316 stainless steel, as required, and the outer jacket of at least 0.025 inch (0.6 mm) aluminum coated steel for interior locations and Type 304 or AISI Type 316 stainless steel, as required, for the portions of the stack exposed to the outdoor environment. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

2.4.08.02 Metal Flues. The flue pipe and fittings for horizontally power vented unit heaters requiring a 5 inch (125 mm) or smaller flue shall be constructed of at least 24 gage (0.61 mm) thickness galvanized steel and shall be sized and arranged as recommended by the vented equipment manufacturer or as directed by Engineer. The flue system shall include all necessary fittings, hangers, supports, and flashings.

2.4.09 Packaged Air Conditioning /Heat Pump Units. Packaged air conditioning units, denoted by the symbol "PAC" and an identifying number, and packaged heat pumps denoted by the symbol "PHP" and an identifying number shall be furnished and installed where indicated on the drawings. Each unit shall be designed for outdoor installation on a full perimeter curb or equipment pad as indicated on the drawings. The packaged air conditioning unit shall be manufactured by Trane, Carrier, McQuay, York, or approved equal.

2.4.09.01 Performance and Design Requirements. The units shall be completely factory assembled and tested, piped, internally wired, fully charged with Refrigerant-22 and compressor oil, and shipped in one piece. The unit shall be designed for direct expansion cooling and configured for heating type indicated. The unit shall be suitable for the power supply and shall have the capacities indicated on the drawings.

The refrigeration system shall be capable of satisfactory operation at outdoor ambient air temperatures of 50°F (10°C) in the cooling mode and for heat pumps, 0°F (-18°C) in the heating mode. When the system must operate in the cooling mode at a lower temperature than the factory standard, a low ambient kit shall be installed. The low ambient kit shall be designed for ambient temperature of 0°F (-18°C) consisting of a solid state controller to vary the speed of the outdoor fan motor in response to refrigerant condensing temperature.

2.4.09.02 Casing. The unit casing shall be of weatherproof design and shall be constructed of 20 gage (0.91 mm) or heavier zinc-coated steel. The casing shall be properly reinforced and braced for maximum rigidity. The casing shall be given a factory-applied coat of rust-inhibitive primer and shall be provided with the manufacturer's standard baked enamel finish. Interior surfaces of exterior casing members in contact with the airstream shall have one inch (25mm) thick, one pound (454 kg) density, insulation coated on the air side. Aluminum foil-faced glass fiber insulation shall be used in gas fired heating sections. Hinged, insulated, neoprene gasketed access doors or removable panels shall be provided to permit easy inspection and maintenance. Removable insulated access panels shall have aluminum or steel covering on the interior to protect the insulation. The unit base shall be a one-piece, welded assembly with suitable roof curb sealing gasket and curb overhang for water runoff. Drains shall be provided to accommodate outdoor coil runoff.

Where an economizer package is not specified, a manually set air damper shall be furnished to provide the indicated outside air volume.

2.4.09.03 Indoor Coil Section. The indoor coil shall be multirow of seamless copper tubing mechanically bonded to heavy-duty aluminum fins. The coil shall be factory leak tested underwater at 200 psig (1380 kPa gauge). The coil shall be provided with expansion device or valve, filter-dryer, and moisture indicator. The indoor coil section shall have fully insulated, sloped drain pan extending under the entire coil section and extending sufficiently past the coil to capture and collect any condensate carryover that may be produced when the unit is operating within the specified operating conditions.

2.4.09.04 Heating Sections. When indicated on the drawings, the unit shall have an electric heating coil, gas heating section, or auxiliary electric heating coil. Electric heater coils shall be completely factory assembled and wired integral within the unit. Coils shall be heavy-duty nickel chromium with an automatic reset device to de-energize all staging contactors on high temperature. The heating coils shall be electrically subdivided within the unit into balanced, individually fused stages as required by the National Electrical Code. The heating coil shall have the minimum number of stages indicated in the schedules on the drawings.

Gas-fired heating sections shall be completely factory assembled and wired integral within the unit. When located upstream of the cooling coil, the heating section shall be AGA design certified specifically for outdoor applications upstream of a refrigerant cooling coil. The heat exchanger shall be of constructed of minimum 20 gage (0.91mm) aluminized steel. The burner shall be induced or forced draft type with pressure regulator, redundant main gas valve, manual shutoff valve, and intermittent spark ignition. A flame sensing device and high limit safety controls shall be provided. The number of heating stages shall be as indicated in the schedules on the drawings.

The unit shall be supplied with natural gas having a calorific value of approximately 1000 Btu per cubic foot (37 MJ/m^3) at an inlet pressure as indicated.

2.4.09.05 Filters. Filters shall be mounted integral within the packaged air conditioning or heat pump unit and shall be 2 inches (50 mm) thick. Hinged access doors shall be provided. Filters shall conform to the requirements in the Air Filtration Equipment paragraph. Filters shall be washable and reusable.

2.4.09.06 Fans and Motors. The indoor supply fan shall be forward-curved, multiblade, centrifugal type and shall be statically and dynamically balanced by the fan manufacturer. The fan shall have die-formed, streamlined inlets and the scroll shall be constructed of steel with all seams sealed airtight. The fan shall have steel shafts operating in self-aligning, grease lubricated ball bearings.

Units 5 tons (17.5 kW) and smaller shall have direct or belt driven fans. Where direct driven fans are used, the fan shall have multiple speeds to allow for airflow adjustment. Units greater than 5 tons (17.5 kW) shall have V-belt drive with adjustable sheaves and shall be designed for 50 percent overload. The supply fan motor shall conform to the requirements of the Motors and Motor Controls paragraph. Vibration isolators shall be provided for the fan assembly and motor assembly.

Static pressure values indicated on the drawings are external to the complete unit. Internal coil(s), dampers, filters and fan housing losses are not included. A filter allowance of 0.35 inch water column (0.087 kPa) shall be used for 2 inch (50 mm) pleated filter losses.

The outdoor fans shall be direct drive, vertical discharge, propeller type with aluminum blades. Fan motors shall be weatherproof with permanently lubricated ball bearings and built-in thermal overload protection. A corrosion resistant wire guard shall be installed over the fan opening.

2.4.09.07 Compressors. Compressors shall be of the reciprocating hermetic, semi-hermetic, or scroll type mounted on vibration isolators. The compressor motor shall have temperature and current sensitive overload protection devices. Each packaged air conditioning or heat pump unit shall have a minimum number of capacity reduction steps as indicated in the schedules on the drawings.

Reciprocating hermetic compressors shall be suction gas cooled with internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, and automatic reset timer to prevent the compressor from rapid cycling.

Reciprocating semi-hermetic compressors shall be suction gas cooled, internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, oil level sight glass, and automatic reset timer to prevent the compressor from rapid cycling. Capacity reduction shall be provided by automatic suction valve unloaders. Each compressor shall start unloaded.

Scroll compressors shall be suction gas cooled with high and low pressure cutout switches and automatic reset timer to prevent the compressor from rapid cycling. The compressor shall have radial and axial compliant scroll plates to allow the compressor to handle liquid slugging without damage to the compressor.

2.4.09.08. Refrigerant Circuit. The factory sealed refrigerant system shall consist of compressors, outdoor coils, indoors coils, expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, refrigerant piping, and a full operating charge of refrigerant. Service gauge connections shall be furnished on the suction, discharge, and liquid lines. Units with multiple compressors shall have multiple circuits with separate expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, compressor, and refrigerant charge. All factory installed gauges, switches, and other devices connected to the refrigerant circuit shall have isolation valves.

2.4.09.09 Outdoor Coil. The outdoor coil shall be of the air-cooled integral finned tube type. The coil shall be constructed of copper tubes with aluminum fins permanently and securely bonded to the tubes. The coil shall be factory leak and pressure tested. The coils shall be protected with hail guards.

2.4.09.10 Accessories. Where indicated on the drawings, the packaged unit shall be provided with economizer cycle to automatically utilize up to 100 percent of outside air for cooling. The economizer shall be controlled as required, and shall modulate return and outside air dampers to maintain proper discharge temperature into the conditioned space. The dampers shall be equipped with automatic lockout when the outside air temperature is too high for proper cooling, and shall have adjustable minimum position control. The damper motor shall be spring return and shall operate to close the outside damper during shutdown. Means for 100 percent relief of the return air shall be provided.

Where indicated on the drawings, hot gas bypass shall be installed to provide reduced capacity control.

When indicated, packaged units shall be furnished with a roof mounting curb. The curb shall be constructed of at least 16 gage (1.52 mm) zinc-coated steel with nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply and return air openings. The curb shall be a minimum of 16 inches (405 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.4.09.11 Controls. Each packaged unit shall be completely factory wired and shall have a single point power connection and unit mounted disconnect switch. All wiring shall be installed in accordance with the National Electrical Code.

The unit shall be provided with remote control and monitoring panel consisting of system operation switches and signal lights. The signal lights shall be for power, outage, dirty filters, and reset relay.

Packaged units shall be provided with a factory wired control panel containing full voltage magnetic starters for compressor, outdoor fan, and indoor fan motors, and internal volt control power transformer.

Defrost controls, electronic timed initiated and temperature terminated with field adjustable timer shall be provided for all packaged heat pumps. When auxiliary electric heating is provided, a factory installed emergency heat package shall be provided. When heating is locked out, the auxiliary heat shall be activated as necessary.

Units with multiple compressors shall have a built-in time delay to prevent both compressors from starting simultaneously.

All internal panel wiring shall be neatly run in gutters or bundles to terminal strips for connection of external wiring. All wires and terminal strips shall be numbered or color coded in accordance with the wiring diagram. All internal and external controls, gauges, lights, and switches shall be identified with nameplates. A complete wiring diagram showing the compressor and fan starting circuits and the control circuit shall be furnished.

Terminal blocks shall be factory wired to provide terminal points for permissive start for each stage of cooling or cooling and heating from a remotely located control panel or thermostat; terminal points to energize remote dirty filter, heating mode, cooling mode, and service indicating lights; and terminal points to de-energize the unit upon detection of smoke.

A thermostat for operation of the unit shall be furnished and installed as indicated and located where indicated on the drawings.

The thermostat shall be a manual changeover, automatic changeover, or programmable heating and cooling type. The number of stages shall be suitable for the unit control and operation. The thermostat shall have a range of approximately 50 to 90°F (10 to 32°C) with at least a 5°F (3°C) deadband between heating and cooling. The thermostat shall have a subbase to control system and fan operation.

2.4.10 Makeup Air Units. Makeup air units, denoted by the symbol "MAU" and an identifying number, shall be Hastings "SBD", Hartzell "GMC", Engineered Air "Series HE", or approved equal for direct fired units and Hastings "Counterflo", Engineered Air "Series DJ", or approved equal for indirect fired units as indicated in the schedules on the drawings. The makeup air units shall be constant volume, gas-fired type, and shall be completely assembled, wired, and flame tested at the factory.

Where indicated in the schedules on the drawings, makeup air units shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.4.10.01 Construction. The casing of the makeup air unit shall be of sectionalized construction consisting of a fan section, a gas-fired burner section, a filter section, and, when located outdoors, an inlet hood with motorized control damper. The unit housing shall be constructed of heavy gage galvanized paint grip carbon steel or aluminized steel, braced and reinforced with steel framework as needed for the operating pressures. The cabinet and casing shall be provided with the manufacturer's standard enamel finish. Gasketed and hinged doors shall be furnished to provide access to all internal components. An observation port shall be provided on the burner section for viewing the pilot and main flames.

The burner section shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density foil-faced fiberglass blanket insulation securely fastened to the panels. The fan and accessory sections shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density mat-faced cleanable fiberglass blanket insulation securely fastened to the panels. Where the insulation is not installed below the floor, the insulation shall be protected by a metal liner. The insulation shall meet the requirements of NFPA.

Makeup air units installed outdoors shall be of weatherproof construction, with roof panels pitched for drainage. The roof panels shall be constructed with triple-break seams which overlap the side panels on all sides. All exterior joints shall be bolted or screwed with a gasket, or shall be welded, and shall be sealed weather tight.

Makeup air units installed outdoors shall have a stormproof weather hood with birdscreen sized for 100 percent outside air shall be mounted on the unit inlet. The hood shall include a two-positioned motorized control damper which opens when the unit is energized and closes when it is de-engerized.

2.4.10.02 Fan Section. The makeup air units shall be equipped with centrifugal fans with forward-curved blades which shall be dynamically balanced and tested after being installed in the factory assembled fan section. Bearings shall be heavy-duty, self-aligning, grease lubricated type for units with motors greater than 15 horsepower (11.2 kW) and permanently lubricated or grease lubricated for units with 15 horsepower (11.2 kW) motors and smaller. Units with regreasable bearings shall have externally mounted, grease lubricated bearings or lubrication fittings extended to the exterior fan casing with aluminum or copper tubing and grease fittings rigidly attached to the casing.

Static pressure values indicated in the schedules are external to the complete unit. Internal burner or heat exchanger, filter, and fan housing losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for filter losses.

2.4.10.03 Motor and Drive. Units located outdoors shall have internally mounted motors. Units located indoors shall have fan motors mounted either in or on the fan housing. Internally mounted motors shall be installed on a steel base mounted on internal vibration isolators and coated with the manufacturer's standard protective coating. Where unit is installed in a seismic area, seismic restraints shall be provided. Externally mounted motors shall be installed on integral casing framework on the exterior of the casing. Units with externally mounted motors shall be furnished with vibration isolator units as indicated in the schedules on the drawings. External belts and drive assemblies shall be protected by a belt guard with tachometer opening.

Fan drive motors and controls shall be as specified in the Electrical paragraph.

Makeup air units with smaller than 10 horsepower (7.5 kW) motors shall have V-belt driven fans with adjustable pitch sheaves and units with 10 horsepower (7.5 kW) and larger motors shall have fans with fixed sheaves. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is selected at the mid-position of the sheave range. Fixed sheaves shall be replaced as necessary with sheaves of the proper size during the air system balancing to provide the required fan speed for the specified airflow. Multiple belts shall be provided in matched sets.

2.4.10.04 Heating Section. The complete fuel burning assembly shall conform to the requirements of UL/ETL, FM, or IRI. The burner assembly and gas piping arrangement shall include, but not be limited to, pilot and main burner gas manual shutoff valves, pilot and main gas regulators, pilot and main gas safety shutoff valves, manual pilot adjustment valves, and electric modulating main gas valves. The burner assembly and gas manifold shall be completely piped and tested at the factory prior to shipment.

The unit shall be suitable for use with the gas pressure range as indicated.

2.4.10.04.01 Direct Fired. Burners shall be in-line type, suitable for use with natural or propane gas, as required, and shall be complete with stainless steel firing plates, cast iron gas feed, and stainless steel side plates for flame rods and ignition spark rods mounted in ceramic isolated bushings. The profile plates shall be adjustable and shall be sized to maintain the required velocity across the burner. The burners shall be capable of modulating turndown of 20 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff.

2.4.10.04.02 Indirect Fired. Burners shall be modulating power type suitable for use with natural or propane gas, as required. The burners shall be capable of modulating turndown of at least 8 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff. The heat exchanger shall be of 3 or 4 pass design consisting of 400 series stainless steel primary drum heat exchanger with multitube secondary heat exchanger.

2.4.10.05 Filter Section. Filter sections for makeup air units shall be of the flat or angular arrangement and shall be selected to limit the filter velocity to 350 feet per minute (1.5 m/s) at design conditions unless otherwise indicated in the schedules on the drawings. Access doors shall be provided for removal of filters from either side of the section. The filters shall be 2 inch (50 mm) pleated type and shall conform to the Air Filters paragraph. All filters shall be washable and reusable.

2.4.10.06 Controls. Each unit shall be furnished with a complete control system consisting of fan starters and overload devices, an airflow proving switch, control circuit fuses, an electronic discharge air temperature sensor and controller, and a disconnect switch. Controls shall be suitable for interfacing with and enacting the control sequence and concept indicated on the drawings. The controls shall include controls to lock out the burner when the outside air temperature is above the controller setpoint.

A remote control station shall be furnished with the makeup air unit and located where indicated on the drawings. The control station shall allow for remote operation of the unit with a fan "On-Off" switch, a "Winter-Summer" switch, a supply temperature setpoint adjustment, and indicating lights for fan, heat, lockout, and dirty filters. Where indicated in the sequence of operations, a room override thermostat shall be mounted on the panel.

Unit mounted panels shall house adequately sized combination starters rated in accordance with NEMA standards, and dead-front 3 lock nonfused disconnect switches.

2.4.10.07 Accessories. Makeup air units indicated or shown to be curb mounted shall be furnished with a roof mounting curb. The curb shall be constructed of 14 gage (1.90 mm) thickness zinc-coated steel with a nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply air opening as indicated on the drawings. The curb shall be a minimum of 16 inches (400 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.4.11 Heaters. Heaters of the types, sizes, and capacities specified herein shall be furnished and installed where indicated on the drawings. All heaters shall be complete with controls and accessories required for satisfactory operation. Heaters shall be UL listed unless otherwise indicated.

2.4.11.01 Electric Duct Heaters. Electric duct heaters, denoted by the symbol "EDH" and an identifying number, shall be manufactured by Indeeco, Brasch, or approved equal.

Electric duct heaters shall be furnished and installed where indicated on the drawings.

Electric duct heaters shall be open coil or finned tube, as required, and zero clearance type with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames with 2 inch (50 mm) wide flanges suitable for fastening to the ductwork.

Bushings for open coils shall be ceramic and terminals shall be stainless steel. Elements for finned tubular coils shall be centered in steel tubes filled with compacted magnesium oxide and copper plated fins brazed to the tube. The assembly shall be finished with high temperature aluminum coating.

Heaters shall be completely factory wired and shall be provided with disconnecting backup and safety contactors, transformers, an automatic reset thermal cutout, a manual reset thermal cutout, a disconnect switch, and a differential pressure airflow switch. All interconnecting wiring shall be enclosed in a terminal box fastened to the heaters and oriented as indicated on the drawings. The terminal boxes shall be furnished with double doors.

Contactors shall be 600 volt rated, 3 pole, UL listed, and shall have a life expectancy for 100,000 operations. A built-in industrial dry type 480/120 volt control transformer shall be furnished to carry the full contactor holding coil load. Transformer primary and secondary windings shall be fused. Secondary windings shall have one lead grounded.

The duct heaters shall be furnished with a silicone controlled rectifier (SCR) control unit mounted in the duct heater terminal box. The control unit shall be suitable for the temperature range of 32 to 132°F (0 to 55°C), and shall be a solid-state proportioning controller designed to modulate the heater output from 0 to 100 percent. The duct heaters shall be controlled by a thermostat as indicated on the drawings. The duct heater SCR controller shall be compatible with the signal from the thermostats.

The duct heater output in kW shall be as specified at 460 volts, 60 Hz, 3 phase. The heater elements shall be suitable for operation on 480 volt, 60 Hz, 3 phase power.

2.4.11.02 Electric Unit Heaters. Electric unit heaters, denoted by the symbol "EUH" and an identifying number, shall have the capacity indicated in the schedules on the drawings.

Electric Unit Heaters (non-explosionproof). Electric unit heaters located in unclassified areas shall be Chromalox "LUH" or "VUH", Brasch, or approved equal. Each heater shall include a fan and motor assembly, a built-in contactor, safety disconnect switch, and a control transformer for 120 volt control, and shall be suitable for use with the power supply indicated in the heater schedule on the drawings. Heater elements shall be steel plate, fin type, with elements brazed to common fins for maximum strength and heat transfer. Each unit heater fan motor shall be provided with automatic reset thermal overload protection. Where shown on the drawings to be wall hung, a wall mounting bracket shall be provided.

Electric Unit Heaters (explosionproof). Where indicated in the heater schedule on the drawings to be explosionproof, unit heaters shall be manufactured by Indeeco "Ultra-Safe", Ruffneck, Markel, or approved equal. Explosionproof electric unit heaters shall be of the fan forced type with a heat exchanger, fan and motor assembly, automatic reset thermal cutout, built-in contactor, factory installed three pole disconnect switch in NEMA 7 enclosure, and 24 volt control transformer. The heater shall be suitable for use with the power supply indicated in the heater schedule on the drawings. The heater shall be listed for installation in a Class I, Division 1 or 2, Group D location and shall have an NEC ignition code of T3B or better.

The heater cabinets shall be constructed of a corrosion resistant cabinet fabricated from an epoxy coated 14 gage (1.90 mm) thickness steel with individually adjustable outlet blades. Cabinet fasteners shall be stainless steel.

The heat exchanger shall be an efficient liquid to air design utilizing a copper or steel core with aluminum fins. The heat exchanger shall be provided with a coating suitable for use in a corrosive atmosphere consisting of hydrogen sulfide. The heating elements shall be housed in an inhibited propylene or ethylene-glycol heat transfer fluid that is suitable for temperatures down to -49°F (-45°C). A pressure relief valve shall provide overpressure protection for the heat exchanger.

The fan and motor assembly shall consist of an aluminum fan connected to a explosionproof, permanently lubricated ball bearing type motor with built-in thermal overload protection. The motor shall be prewired to the control enclosure providing for a heater that is suitable for use with a single point power connection.

2.4.11.03 Gas Unit Heaters. Gas unit heaters, denoted by the symbol "GUH" and an identifying number, shall be Modine Model HS, Reznor, Trane, Sterling, or approved equal.

Gas unit heaters shall be furnished and installed where indicated on the drawings. Each heater shall be of the type, size, and capacity indicated in the schedules on the drawings; shall be suitable for use with the gas type and pressure as required; and shall be of a type approved and listed in the AGA Directory of Approved Gas Appliances and Accessories.

Each gas-fired unit heater shall be power vented, horizontal discharge, propeller type, and suitable for two point suspending mounting. The heater burner and heat exchanger shall be constructed of E-3 (AISI Type 409) stainless steel. Each heater shall be furnished with a vent cap.

Each gas unit heater shall be furnished complete with a 24 volt transformer, single-stage gas control with a regulated combination redundant gas valve, a spark-ignited, intermittent safety pilot with electronic flame supervision and all required limit and safety controls. Units larger than 125,000 Btu (132,000 kJ) input shall have two-stage gas controls.

The fan motor shall be suitable for use with a 120 volt, 60 Hz, single phase power supply, and shall be provided with automatic reset thermal overload protection.

2.4.11.04 Wall Heaters. Wall heaters, denoted by the symbol "WH" and an identifying number, shall be manufactured by Electromode "Model EWA", Brasch, or approved equal.

Wall heaters shall be downflow type; designed for surface mounting; and shall include an electric heating element, a thermal limit switch, a fan delay switch, a fan and motor assembly, and a built-in thermostat. The heaters shall be suitable for use with the specified power supply and shall have the capacity indicated in the schedules on the drawings.

2.4.12 Fans. Each fan shall be complete with an electric motor, a drive, and accessories required for satisfactory operation. Belt-driven fans shall be complete with a V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Adjustable pitch sheaves shall be furnished for fans with less than 10 horsepower (7.5 kW) motors and fixed sheaves for 10 horsepower (7.5 kW) and larger motors. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the proper size after the air system balancing if necessary, to provide the required fan speed for the specified airflow.

Fan drive motors and controls shall be as specified in the Electrical paragraph, unless otherwise indicated. Fans shall be suitable for use with the power supply indicated on the drawings.

Fans indicated in the schedules on the drawings to be explosionproof shall be suitable for installation in a NEC Class I, Division 2, Group D environment.

The external static pressure values indicated in the schedules on the drawings are external to the complete unit. Internal fan housing and when furnished, backdraft damper and filter losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for pleated filter losses.

A solid state variable speed controller shall be provided for each direct-driven fan motor less than 1/2 hp (0.4 kW) to balance the fan airflows to the specified rates. The speed controller shall have a capacity range of approximately 50 through 100 percent of the design airflow rate specified. The speed controller shall be mounted on or in the fan housing unless otherwise indicated.

Where indicated in the schedules on the drawings, fans shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.4.12.01 Cabinet Fans. Cabinet fans, denoted by the symbol "CF" and an identifying number, shall be Greenheck "Model SP" or “Model CSP”, Penn Ventilator, Loren Cook, or approved equal. Cabinet fans shall have steel, forward-curved, squirrel-cage type wheels. The fans shall be statically and dynamically balanced. Motors shall be open dripproof, PSC, with permanently lubricated ball bearings and internal thermal overload protection, and shall be suitable for use with the power supply indicated in the schedules on the drawings. Fan housings shall be fabricated of heavy gage carbon steel with welded seams and shall be acoustically lined and factory primed. Fans shall be installed in the configuration indicated on the drawings. A removable access panel or exhaust grille shall be provided on the bottom of each fan and a factory installed backdraft damper shall be provided on the fan discharge. Vibration isolator units and wall caps shall be provided for each fan as indicated in the schedules on the drawings.

2.4.12.02 Duct In-Line Fans. Duct fans, denoted by the symbol "DF" and an identifying number, shall be Greenheck "SQ", Penn Ventilator, Loren Cook, or approved equal. Duct fans shall be of the centrifugal in-line type, and shall be direct or belt driven, as indicated in the schedules on the drawings. Fan wheels shall be aluminum, backward inclined type, dynamically and statically balanced at the factory.

The fan housing shall be square, constructed of aluminum or heavy gage steel as required, and shall be furnished with duct mounting collars. Access doors or panels shall be provided for servicing internal parts without removing the fan from the ductwork. Vibration isolation units shall be provided for each unit. The interior of the fan housing shall be lined with 1 inch (25 mm) fiberglass duct liner.

Motors and drives shall be isolated from the airstream. The wheel shaft shall be of ground and polished steel, mounted in heavy-duty, permanently sealed pillow block bearings.

Flexible wiring leads shall be provided from the fan motor to an external junction box and disconnect switch which shall be accessible for servicing without disconnecting the field wiring.

2.4.12.03 Duct Axial Fans. Duct axial fans, denoted by DAF and an identifying number, shall be Hartzell, Greenheck, Penn Ventilator, Loren cook, or approved equal. The model and type (fiberglass or stainless steel) of each fan is per Fan Schedule shown on the Drawings. Duct axial fans shall be of the axial belt drive type fan built to be installed in duct systems for process ventilation applications, and where the nature of the corrosive airstream warrants isolation of the motor and drive assembly from the airstream.

The fan housing shall be round, constructed of fiberglass or heavy gage stainless steel as required, and shall be furnished with duct mounting collars. Vibration isolation units shall be provided for each installed fan.

Motor and drives shall be isolated from the air stream. The six-blade propeller shaft shall be stainless steel construction, mounted in heavy duty self-aligning bearings.

2.4.12.04 Power Roof Ventilators. Power roof ventilators, denoted by the symbol "PRV" and an identifying number, shall be Greenheck "G" or "GB", Penn Ventilator "Domex", Loren Cook, or approved equal.

Power roof ventilators shall be centrifugal or propeller type, as indicated in the schedules on the drawings, and shall be statically and dynamically balanced for quiet, vibration-free operation. Each fan shall be complete with a weather hood, a safety disconnect switch mounted in the hood, a 1/2 inch (13 mm) mesh aluminum bird screen over all openings, and, where indicated in the schedules on the drawings, a backdraft damper. Fan housings shall be constructed of aluminum and shall have an aluminum base of the self-flashing type, suitable for mounting on the curbs indicated on the drawings.

2.4.12.05 Propeller Fans. Propeller fans, denoted by the symbol "PF" and an identifying number, shall be Greenheck "Model S" or "Model SC" for direct drive and "Model SB" or "Model SBC" for belt drive, Penn Ventilator, Loren Cook, or approved equal.

Propeller fans shall consist of a panel frame, a wire guard, a motor, and fan blades. Fan blades shall be steel or aluminum, as required. Propeller fans shall be statically and dynamically balanced to ensure quiet, vibration-free operation, and be suitable for mounting as indicated.

When indicated in the schedules on the drawings, a wall mounting kit shall be provided. The wall mounting kit shall consist of a wall collar, motor wire guard, backdraft damper, and weather hood with birdscreen.

2.4.12.06 Utility Fans. Utility fans, denoted by the symbol "UF" and an identifying number, shall be Greenheck "Model SWB", Penn Ventilator, Loren Cook, or approved equal.

Utility fans shall be multiblade, squirrel-cage type, with nonoverloading type blades. The fans shall be statically and dynamically balanced for quiet, vibration-free operation and shall be provided with vibration isolators. Fan inlets and outlets shall be provided with removable angles and bolts for attaching flexible connections. Fan housings shall be heavy gage steel, of all-welded construction and shall be shop coated with universal primer. Fan bearings shall be of the self-aligning, ball type.

2.4.12.07 Wall Fans. Wall fans, denoted by the symbol "WF" and an identifying number, shall be Greenheck "Model GW" or "Model GWB", Penn Ventilator, Loren Cook, or approved equal. Wall fans shall be suitable for sidewall installation; shall be direct or belt driven, centrifugal type, with aluminum wheels and housing, and a wheel guard located on the discharge side; and shall be statically and dynamically balanced at the factory. The fan motors shall be of adequate size to prevent overloading when operating at the specified capacity and shall be suitable for use with the power supply indicated in the schedules on the drawings.

2.4.12.08 Vault Supply Fans. Vault supply fans shall be in-line centrifugal type fiberglass construction, belt driven with removable fiberglass motor guard. Units shall be furnished with integral flanges and straightening vanes. Fan shaft shall be stainless steel construction with Viton seals. Bearing to be sealed pillow block type. Refer to drawings and fan equipment schedule for additional information.

2.4.13 Roof Hoods. Roof hoods, denoted by the symbol "RH" and an identifying number, shall be Greenheck "Model FHI" or "FHR", Penn Ventilator, Loren Cook, or approved equal.

Roof hoods shall be suitable for air intake or exhaust and shall have throat dimensions as indicated in the schedules on the drawings. As required, the roof hood assembly shall be constructed of galvanized steel or aluminum. Each roof hood shall be complete with a weather hood, a 1/2 inch (13 mm) mesh aluminum or galvanized bird screen over all openings, and a mounting base suitable for installation on a curb as indicated on the drawings.

Where indicated in the schedules on the drawings, roof hoods shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.4.14 Dampers.

2.4.14.01 Backdraft Dampers. Backdraft dampers, denoted by the symbol "BDD", shall be Arrow United Industries "Type 655", Ruskin, or approved equal. Backdraft dampers shall be constructed with a 1 by 4 inch by 0.081 inch thick (25 by 100 mm by 2 mm) extruded aluminum frame. Blades shall be of 0.081 inch (2 mm) aluminum, with silicone rubber seals on the edges, and with aluminum shafts and ball bearings.

2.4.14.02 Control Dampers. Control dampers shall be denoted by the symbol "CD" and an identifying number. Dampers with an area larger than 25 square feet (2.3 m^2) or with any dimension exceeding 48 inches (1200 mm) shall be built in sections. All dampers shall be carefully inspected before and after installation, and any damper having poorly fitted blades, insufficient framed rigidity, or excessive clearance or backlash in moving parts will be rejected and shall be replaced with an acceptable unit.

Two-position dampers shall have parallel operating blades. Modulating dampers shall have opposed operating blades.

Damper blades shall be installed on a steel shaft operating in synthetic bearings suitable for industrial service. Dampers shall be close-fitting and shall be designed to offer minimum resistance to the airflow when in the fully open position. Damper blade linkage shall be concealed in the frame.

Control dampers shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.4.14.02.01 Duct Mounted Control Dampers. Control dampers and face bypass dampers mounted in ductwork and equipment curbs shall be Ruskin "CD-50", Arrow United Industries "Type AFD-20", or approved equal. The damper frames shall be constructed of 5 inch (125 mm) Type 6063 T5 extruded aluminum. Damper blades shall be constructed of 6 inch (150 mm) wide airfoil-shaped extruded aluminum.

Control dampers denoted on the drawings to be face and bypass dampers shall be vertically arranged. The face damper dimensions shall be coordinated with the heating coil dimensions. The bypass area shall be half the area of the face damper. Face and bypass damper submittals shall indicate coil size, face dimensions, and bypass dimensions.

2.4.14.02.02 Wall Mounted Control Dampers. Control dampers mounted in walls behind louvers shall be Ruskin "CD-40", Arrow United Industries "Type AFD-20", or approved equal. Control damper frames shall be constructed of 4 by 1 inch (100 by 25 mm) 6063 T5 extruded aluminum. Damper blades shall be constructed of 4 inch (100 mm) wide airfoil-shaped extruded aluminum.

2.4.14.02.03 Round Control Dampers. Round control dampers shall be Arrow United Industries "Type 70, 75, or 80", or approved equal. The damper frames and blades shall be constructed of the material as required.

2.4.14.03 Volume Control Dampers. Volume control dampers shall be denoted by the symbol "VCD". Volume control dampers in round ductwork shall be Arrow United Industries "Type 200 VCRD", Ruskin “Model MDRS25” , or approved equal. Volume control dampers in rectangular ductwork shall be Arrow United Industries "Type 1770", Ruskin “Model MD35” , or approved equal.

Rectangular volume control dampers shall be fabricated of 16 gage (1.52 mm) thickness galvanized steel, with a nominal 4 or 5 inch by 1 inch (100 mm or 125 mm by 25 mm) channel frame, and opposed operating blades. Round dampers shall be fabricated of galvanized steel, with a nominal 7 inch (178 mm) long, 22 gage (0.76 mm) thickness frame, and a minimum 20 gage (0.91 mm) thickness circular blade.

The dampers shall be provided with adjustment quadrants and locking devices so arranged that the position of the damper will be indicated and the damper will not move when locked.

2.4.14.04 Fire Dampers. Fire dampers, denoted by the symbol “FD”, installed in positions having a fire resistance rating of less than 3 hours shall be Air Balance Inc. “Model D19”, Ruskin “Model DIBD2”, or approved equal. Fire dampers installed in partitions having a fire resistance rating of 3 hours or more shall be Air Balance Inc. “Model D30”, Ruskin “Model DIBD23”, or approved equal. Fire dampers shall be style “B” for ducted and style “A” for non-ducted applications unless otherwise indicated on the Drawings.

Dampers shall have a 5 inch (125mm) side galvanized steel channel frame, galvanized steel interlocking blades, stainless steel closure springs and latches, 165°F (74°C) fusible links, and a 20 gage (0.91 mm) thickness galvanized steel housing. Factory fabricated sleeves and mounting angles shall be furnished for each damper for mounting as indicated on the Drawings. Fire dampers shall be rated in accordance with UL-555 for use in dynamic systems.

2.4.15 Damper Operators. The damper operators shall be direct coupled or linkage type. Where linkage type operators are used, each operator shall be complete with all necessary crank arms, ball joint connectors, push rods, linkages, and mounting brackets.

Each operator shall have sufficient torque to operate the connected control damper area. Each damper operator shall have at least a 50 inch-pound (5.6 N-m) normal running torque. Where the required damper torque exceeds the damper operator running torque rating, multiple operators shall be furnished to produce the normal running torque required to operate the damper. Control dampers shall fail to the closed position unless otherwise indicated on the drawings. Face dampers shall fail to the closed position and bypass dampers to the open position.

Where damper operators are installed in explosionproof rated areas indicated on the drawings, the operators shall be furnished and installed in explosionproof housings suitable for installation in an NEC Class I, Division 2, Group D area. Where damper operators are installed outdoors, the operators shall be furnished and installed in weathertight enclosures.

Two-position direct coupled electric damper operators shall be Belimo "NF120-S", Honeywell "ML4195", Johnson Controls, or approved equal. Linkage type electric damper operators shall be Honeywell "Model M4185", Johnson Controls "Model M100", or approved equal. Two-position electric damper operators in hazardous areas shall be installed in explosion proof housings.

Damper operators shall be spring return and shall have one internal spdt auxiliary switch rated 5 amperes at 120 volts ac. Damper operators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers, where required, shall be factory wired to the damper operator and installed in a NEMA Type 1 enclosure fastened to the motor housing.

Direct coupled two position electric damper operators shall be housed in a galvanized steel or aluminum case. Operators shall use a "V" shaped bolt and cradle design to eliminate slippage on the damper shaft. Single bolt or set screw type designs are not acceptable. The operators shall be suitable for direct mounting to shafts up to 1 inch (25 mm) and shall be complete with mounting brackets and damper position indicator.

Linkage type two-position electric damper operators shall be housed in a die-cast aluminum case with a mounting flange. Motor and gear train components shall be immersed in oil. Damper operators shall have a 3/8 inch (9.5 mm) square, double-ended drive shaft.

2.4.16 Air Outlet and Inlet Devices. Air outlet and inlet devices shall be manufactured by Price, Tuttle & Bailey, Titus, or approved equal. Air outlet and inlet devices shall be furnished and installed where indicated on the drawings.

Air outlet and inlet devices shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.4.16.01 Ceiling Diffusers. Diffusers shall be square or rectangular, constructed of the materials indicated in the schedules on the drawings. Diffusers shall have a key-operated, opposed-blade damper mounted in the neck where indicated in the schedules on the drawings. Size, location, and direction of airflow shall be as indicated on the drawings.

2.4.16.02 Registers and Grilles. Registers and grilles shall be constructed of aluminum or steel as indicated in the schedules on the drawings. The front blades of adjustable blade models shall be parallel to the short dimension unless otherwise indicated, and the front blades of fixed blade models shall be horizontal unless otherwise indicated. All registers shall be furnished with key-operated opposed blade dampers. The dampers shall be constructed of the same material as the attached grille.

2.4.17 Flexible Connections. Flexible connections located indoors shall be Ventfabrics "Ventglas", or approved equal. Flexible connections installed outdoors or exposed to sunlight or weather shall be Ventfabrics "Ventlon", or approved equal.

Ductwork connections to the air handling equipment, and where indicated on the drawings, shall be made using fabric connectors with sheet metal collars. The fabric shall be fire resistant, waterproof, mildew-resistant, and airtight. At least 3 inches (76 mm) of fabric shall be exposed. Flexible connections shall be in accordance with the requirements of UL and NFPA.

Fabric for flexible connections protected from sunlight and the weather shall be suitable for a temperature range of -20 to 180°F (-29 to 82°C) and shall weigh at least 27 ounces per square yard (915 g/m^2).

Fabric for flexible connections exposed to sunlight or the weather shall be suitable for a temperature range of -10 to 250°F (-23 to 121°C) and shall weigh at least 24 ounces per square yard (814 g/m^2).

2.4.18 Air Filtration Equipment.

2.4.18.01 Pleated Air Filters. Pleated air filters shall be American Air Filter "AM-AIR 300X", Farr "30/30", or approved equal. Filters shall be washable and reusable type, high-loft blend of cotton and synthetic fiber pleated media. The media shall be rated as Class 1 or Class 2 in accordance with UL 900. A metal support grid shall be bonded to the media. The filter frame shall be constructed of rigid, high-strength, moisture-resistant beverage board. The pleated media pack shall be bonded to the inside of the frame. All filters shall have an average efficiency of 25 to 30 percent based on the ASHRAE 52.1 test method.

One inch (25 mm) filters shall have at least 14 pleats per linear foot (0.3 m) and at least 1.9 square feet of media per square foot of filter area (1.9 square meters per square meter). One inch (25 mm) filters shall have a maximum initial resistance of 0.10 inch wc at 300 feet per minute (0.02 kPa at 1.5 m/s).

Two inch (50 mm) filters shall have at least 12 pleats per linear foot (0.3 m) and at least 4.2 square feet of media per square foot of filter area. (4.2 square meters per square meter). Two inch (50 mm) filters shall have a maximum initial resistance of 0.13 inch wc at 300 feet per minute (0.03 kPa at 1.5 m/s).

2.4.18.02 Side Access Filter Housings. Side access filter housings shall be American Air Filter "Access Air", Farr "Model 4P Glide/Pack", or approved equal. Side access filter housings shall be single-stage, factory-fabricated of 16 gage (1.52 mm) thickness galvanized steel and shall be equipped with flanges for connection to the ductwork. Access doors shall be 16 gage (1.52 mm) thickness galvanized steel and shall be positioned to allow replacement of filters from either side of the housing. Filter housings and doors shall be insulated and of double-wall construction. Filter tracks shall be provided to accommodate nominal 2 inch (51 mm) thick washable and reusable filters as described herein. Leakage at the rated airflow shall be less than 1 percent at a 3 inch wc (0.75 kPa) differential.

2.4.19 Draft Gauges. Draft gauges shall be Dwyer Instruments, Inc. "2000 Series Magnehelic Air Filter Gauge", or approved equal.

Diaphragm actuated dial type draft gauges, located for easy readability, shall be installed across all air filters. The gauges shall have a dial of at least 3-1/2 inch (89 mm) diameter, a die cast aluminum housing, an adjustable signal flag, mounting hardware, an ambient temperature range of 20 to 140°F (-7 to 60°C), and a range of 0 to 1.0 inch wc (0.25 kPa), with a full range accuracy of 2 percent. Each gauge shall be furnished with an air filter kit consisting of a mounting panel, two static pressure tips with integral compression fittings, aluminum tubing, and vent valves.

2.4.20 Sheet Metal Work. The ductwork, accessories, bracing, and supports shall be constructed of the material as required. Galvanized ductwork located in air conditioned spaces shall be constructed of G-60 or better lockforming quality in accordance with ASTM A653. All other galvanized ductwork shall be constructed of G-90 or better galvanized steel. Accessories, bracing, and supports shall be constructed of similar materials as the ductwork. Ductwork, turning vanes, and other accessories shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Plenums shall be constructed of reinforced 16 gage (1.52 mm) thickness galvanized sheet metal.

Sheet metal ductwork shall be sealed according to the classifications described in the SMACNA HVAC Duct Construction Standards. Ductwork shall be fabricated, reinforced, supported, and sealed for the operating pressures indicated in the schedules for the connected equipment. All ductwork shall have a pressure classification of at least 1 inch (25 mm).

Sheet metal fan boxes shall be fabricated with 12 gage (2.66 mm) thickness galvanized sheet metal skin and structural steel framing of sufficient strength to support the fan box and the fan mounted on the box. The framing shall be coated with a universal primer. All welds on galvanized metal shall be cleaned and coated with a zinc-rich paint. Drawings of the fan boxes shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

All joints, seams, connections, and penetrations in ductwork located outdoors shall be sealed watertight and weatherproof. Transverse joints shall be flanged and shall be provided with a continuous gasket and flange cap.

Where indicated on the drawings, ductwork and accessories shall be given a protective coating resistant to the corrosive atmosphere.

2.4.21 Duct Insulation. Interior duct liner shall be Knauf "Duct Liner E M", CertainTeed "ToughGard R", Schuller "Permacote-Linacoustic", or approved equal.

Interior duct liner shall be 1-1/2 pound per cubic foot (24 kg/m^3) density, spray coated duct liner with an "R" value of at least 3.6 $ft^2 \cdot hr \cdot °F/BTU$ (0.63 $m^2 \cdot °C/W$) per 1 inch (25 mm) thickness. The insulation shall be suitable for temperatures up to 250°F (121°C) and shall have at least a 0.55 NRC per 1 inch (25 mm) thickness. The insulation shall conform to ASTM C1071.

2.4.22 Flexible Duct and Takeoffs. Flexible duct shall be Flexmaster "Type 9", Flexible Technologies "Thermaflex Type G-KM", or approved equal. Takeoffs shall be Buckley Air Products "Air-Tite Bellmouth BM-D", or approved equal.

Flexible duct shall be a galvanized or vinyl-coated spring steel helix, bonded to a polymer liner, and wrapped with glass fiber insulation suitable for use in heating and cooling systems. The insulation shall provide an "R" value of at least 4.2 $ft^2 \cdot hr \cdot$ °F/BTU (0.74 $m^2 \cdot$ °C/W). The outer jacket shall be a vapor barrier of fire retardant polyethelene or polyolefin material. The flexible duct shall be listed under UL 181 as Class 1 flexible air duct and shall comply with the latest edition of NFPA 90A.

Takeoffs for the flexible duct shall be bellmouth type manufactured of galvanized steel with a neoprene gasket and predrilled holes. Each takeoff shall be equipped with a balance damper constructed of 26 gage (0.45 mm) thickness galvanized steel. Scoops or other obstructions in the main duct will not be acceptable.

2.4.23 Access Doors. Access doors shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Access doors shall be double skin insulated type for insulated ductwork and single skin type for noninsulated ductwork. Duct-mounted access doors and panels shall be fabricated of the same material as the ductwork, with sealing gaskets and quick-fastening locking devices. Where access doors are insulated, a sheet metal cover shall be installed over the insulation.

2.4.24 Temperature Controls. The temperature control components and systems shall be manufactured by Honeywell; Johnson Controls; Siemens Building Technologies, Landis Division, or approved equal. Where manufacturers are not specified, materials and equipment furnished shall meet the performance and design requirements indicated.

2.4.24.01 Performance and Design Requirements. Contractor shall coordinate with the Work to make certain that the field wiring associated with the work of this section is completed in accordance with the requirements of the heating, ventilating, and air conditioning equipment furnished and their interconnection. Where cable and conduit is not indicated on the drawings but is needed for a complete and functional control system in accordance with the sequence of operation it shall be provided as specified herein. The control wiring shall be installed so that all HVAC equipment will function as described in the HVAC sequence of operation.

Conduit and control wiring for all control circuits needed between all field mounted HVAC controlling and indicating devices, such as, but not limited to, damper actuators, thermostats, temperature control panels, pressure differential switches, control switches, motor starters, and the HVAC equipment, shall be furnished and installed as specified in the Electric Wiring paragraph. Cable and conduit for all HVAC power circuits shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.4.24.02 Tolerances. Unless otherwise indicated, the controls shall maintain space temperatures within ± 2°F (1.1°C), and the relative humidity within ± 5 percent of the setpoint.

2.4.24.03 Thermostats.

Two Position Wall Mounted Thermostats. Two position wall mounted thermostats shall be Honeywell "T631A Airswitch", Penn Controls "A19BAC-1", Siemens Building Technologies, or approved equal.

Two position wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 3.5°F (2°C). The thermostats shall have a spdt switch rated for 1 horsepower (0.746 kW).

Low Limit Thermostats. Low limit thermostats shall be Honeywell "L480", Penn Controls "Model A11A-1", Siemens Building Technologies, or approved equal.

Low limit thermostats used for low temperature cutout shall be capillary, line-voltage type, complete with spst switches. The sensing elements shall be at least 20 feet (6 m) long. The thermostat shall be responsive to the lowest temperature along the measuring element, shall have a range of approximately 35°F to 45°F (2°C to 7°C), and shall be manually reset.

Modulating Duct Mounted Thermostats. Modulating, duct mounted thermostats shall be Honeywell "Model T991", Penn Controls "Model A80ABA-2", Siemens Building Technologies, or approved equal.

Modulating, duct mounted thermostats shall be modulating, proportional control, low voltage type. The thermostats shall have a range of approximately 10°F to 90°F (-12°C to 32°C) with an adjustable throttling range of approximately 5°F to 24°F (3°C to 13°C), and shall be furnished with a duct mounting kit.

Explosion-proof Thermostats. Explosion-proof wall-mounted thermostats controlling explosion-proof equipment in Class I, Division 2, Group D areas shall be Honeywell "Model T6051B", Johnson Controls, Siemens Building Technologies, or approved equal.

Duct-mounted thermostats controlling explosion-proof equipment in Class I, Division 2, Group D areas shall be Indeeco "Model T94A-70".

Explosion-proof thermostats shall be suitable for installation in explosion-proof areas.

2.4.24.04 Temperature Control Panels. Temperature control panels, denoted by the symbol "TCP" and an identifying number, shall be NEMA Type 12 designed for wall mounting and shall be completely prewired and checked. Temperature control panel enclosures shall be manufactured by Hoffman Engineering, Integration Technology Systems Inc, Par Metal Products Inc, or approved equal.

All electrical accessory devices and internal wiring shall be furnished and installed.

All controllers, selector relays, switching relays, interlock relays, manual switches, timers, alarm and indicating lights, and other devices indicated to be panel mounted shall be mounted in or on the respective control panel. Accessories such as indicating lights and selector switches shall be mounted on the front hinged covers of the panels. The accessories shall be identified with an identification plate as described in the Equipment Identification paragraph. The identification plates shall be fastened to the panel with corrosion-resistant pan head screws.

Each temperature control panel shall supply power to all associated control system field control components, including but not limited to, damper operators, thermostats, sensors, and smoke detectors. The controls shall include all necessary relays, interlocks, and control devices to enable the control panel to function as described in the sequence of operation on the drawings.

All interconnecting wiring and wiring to terminals for exterior connection shall be stranded copper, insulated for not less than 600 volts, with a moisture resistant and flame resistant covering rated for at least 90°C. Power distribution wiring on the line side of panel fuses shall be at least 12 AWG. Wiring for secondary power distribution and for control, annunciator, and indicating light circuits shall be at least 14 AWG. Wiring shall be color coded in accordance with the legend on the panel wiring diagrams.

Selector Switches. Selector switches shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Selector switches shall be heavy-duty oiltight type with gloved-hand or wing lever operators. Position legends shall be engraved on switch faceplate. Switches for electric circuits shall have silver butting or sliding contacts, rated 10 amperes continuous at 120 volts ac. Contact configuration shall be as indicated on the drawings or as necessary for the application. Switches used in electronic signal circuits shall have contacts suitable for that duty.

Push Buttons. Push buttons shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Push buttons shall be heavy-duty, oiltight type, with legends engraved on the faceplate. Contacts shall be rated 10 amperes continuous at 120 volts ac.

Indicating Lights. Indicating lights shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Alarm, indicator, and running status lights shall be furnished with bulbs. Indicating lights shall be heavy-duty, push-to-test, oiltight type with low voltage bulbs and built-in transformers. Legends shall be engraved on the lens or on a legend faceplate. Bulbs shall be easily replaceable from the front of the device.

Alarm Horns. Alarm horns shall be Federal Signal "Model 350", or approved equal. Alarm horns shall have a sound output of 100 dB at 10 feet (3 m) and shall be rated for 120 volts ac. Horns shall be furnished with mounting hardware suitable for flush mounting.

Relays. Relays shall be Eagle Signal "Series 22, 80"; Potter & Brumfield "Series KRP, CB"; Struthers-Dunn "Series A3, A4", or approved equal. Relays shall be of the plug-in socket base type, with dustproof plastic enclosures unless noted otherwise. Relays shall be UL recognized and shall have not less than double-pole, double-throw contacts. Control circuit relays shall have silver-cadmium oxide contacts rated 10 amperes at 120 volts ac. Electronic switching-duty relays shall have gold-plated or gold alloy contacts suitable for use with low level signals. Relays used for alarm input or indicating light service shall have contacts rated at least 3 amperes. Time-delay relays shall have dials or engraved switch settings marked in seconds and shall have timing repeatability of ± 2 percent of setting. Latching and special purpose relays shall be as needed for the specific application.

Terminal Blocks and Panel Wiring. Terminal blocks for external connections shall be suitable for 12 AWG wire and shall be rated 30 amperes at not less than 300 volts. Terminal blocks shall be fabricated, shall be complete with marking strip, covers, and pressure connectors, and shall be labeled to agree with the identification on the temperature control manufacturer's submittal drawings.

A terminal shall be provided for each conductor of external circuits, plus one ground cable. At least 8 inches (200 mm) of clearance shall be provided between the terminal strips and the base of vertical panels for conduit and wiring space. At least 25 percent spare terminals shall be provided.

All wiring shall be grouped or cabled and firmly supported inside the panel. Wiring shall be bundled in groups and bound with nylon cable ties or shall be routed in Panduit or similar nonmetallic slotted ducts.

Ducts shall be readily accessible within the panel, with removable covers, and shall have a space of at least 40 percent of the depth of the duct available for future use after the installation including all field wiring, has been completed. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables.

Where signal wiring must be routed to more than one panel or device, the requested circuit routing shall be as indicated on the electrical one-line diagrams.

Control Power Transformers. Where 24 volt ac control power is necessary for the temperature control components, 120/24 volt transformers shall be furnished and mounted in the respective temperature control panel. Control power transformers shall be sized by the manufacturer based on the equipment load of the panel, shall be copper wound, vacuum impregnated with solid polyester varnish, and shall be 100 percent tested in strict compliance with ANSI, CSA, and UL codes. Control power transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded. The control power transformers shall be sized by the manufacturer based on the equipment load of the panel.

Painting. Interior and exterior surfaces of all panels shall be thoroughly cleaned and painted with rust-inhibitive primer. The panel interior shall be painted white with the manufacturer's standard coating. All pits and blemishes in the exterior surfaces shall be filled before the surface is painted with one or more finish coats of the manufacturer's standard coating. Finish coats shall have a dry film thickness of at least 4 mils (100 μm). One quart (0.95 L) of paint shall be furnished with the panels for future touchup painting.

2.4.24.05 Temperature Indicators.

2.4.24.05.01 Dial Thermometers. A dial thermometer shall be supplied and installed at each remote bulb sensor for calibration and calibration checks. The range of the dial thermometers shall be -40°F to 120°F (-40°C to 49°C).

In ducted systems containing coils or electric duct heaters, a dial thermometer shall be furnished and installed on the downstream side of the coil or heater. Thermometers shall be complete with averaging type elements.

2.4.24.06 Smoke Detectors. Smoke detectors, denoted by the symbol "SMD" and an identifying number, shall be System Sensor “DH100”, Simplex, Grinnell, or approved equal.

Detectors shall be designed to detect combustion gases, fire, and smoke in air conditioning and ventilating duct systems in compliance with the NFPA 90A and shall contain a detector and air sampling chamber which serves as a reference point to help stabilize the detector against the effects of changes in temperature, humidity, and pressure.

Smoke detectors shall be duct mounted photoelectric type and shall be completely self-contained, including integral power supply, supervisory and control circuitry and three sets of isolated contacts. The alarm contacts shall be spst normally open; the auxiliary alarm contact shall be spdt, and the trouble contact shall be spdt and shall indicated detector malfunction. The alarm and trouble contacts shall be rated 2 amperes at 30 volts dc. The auxiliary alarm contact shall be rated 10 amperes at 120 volts ac. Pilot lights shall be provided for visual indication of alarm and power supply status on the front of the unit. A remote key-operated test station with alarm light and power supply status shall also be furnished and installed where indicated on the drawings. Detectors shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply.

Detectors shall be provided with sampling tubes extending the width of the air duct.

2.4.24.07 Pressure Differential Switches. The pressure differential switches, denoted by the symbol "PDS" and an identifying number, shall be furnished and installed as indicated on the drawings and the sequence of operation. Each pressure switch operating range shall be selected so that the setpoint is between 25 and 75 percent of the scale range. Initial setpoints shall be as indicated on the drawings. Differential switches shall be UL listed.

Where indicated on the drawings, pressure differential switches shall be provided with an explosion-proof housing suitable for a NEC Class 1, Division 2, Group D environment. Where differential pressure switches are located outdoors, a NEMA 4 rated weather enclosure shall be provided.

2.4.24.07.01 Airflow Switches. Pressure differential airflow switches shall be Dwyer Instruments, Inc. "Series 1800", or approved equal. Pressure differential switches for airflow service shall be diaphragm operated by differential air pressure between duct and atmosphere or across a filter. The switch shall be spst, shall be rated 5 amperes at 120 volts ac and for a temperature range of -20°F to 125°F (-29°C to 52°C), and shall be provided with corrosion resistant mounting brackets. Pressure differential switches located across filters shall be initially set at 0.5 inch wc (125 Pa).

2.4.24.08 Control Stations. Control stations for high rate ventilation fans shall include a two position selector switch with nameplate labeled "High Rate Ventilation On/Off". Control stations shall also include two indicating lights for "On/Off" indication. Indicating lights and selector switches shall be heavy duty oiltight NEMA

Type 13. The control station enclosure shall be NEMA Type 4. Control stations shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.4.24.09 Emergency Ventilation Shutoff Switches. Emergency ventilation shutoff switches shall be double-action manual fire alarm stations. The switches shall be Simplex "Series 2099", or approved equal. The switch operation shall require that a hammer, hung on the front of the station, be lifted and thrown downward against the glass window, thus breaking it to expose the recessed pull lever. The switches shall be provided with phenolic nameplates identifying the switches as "VENTILATION SYSTEM EMERGENCY SHUTOFF". The nameplates shall cover the words "FIRE ALARM" on the switches. Switches located on the exterior of the building shall be provided with a weather protective shield.

2.4.24.10 Accessory Components. All additional control components, including, but not limited to, electric relays, temperature sensors and transmitters, humidity sensors and transmitters, controllers, and position switches, shall be furnished where necessary to ensure a complete, properly operating installation. All components shall be products of the temperature control manufacturer. Accessory components not mounted inside the temperature control panels shall be furnished with equipment enclosures. Relays shall be provided with 120 volt coils and at least 10 ampere contacts.

2.4.24.11 Electrical Wiring. Detailed wiring diagrams shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The wiring diagrams shall show the internal connections of the temperature control panels and all field wiring to equipment remote from the control panels including wiring to Owner-furnished equipment. The wiring diagrams shall be complete, showing all connections necessary to place the temperature control systems in operation.

Control wiring shall be in accordance with the National Electric Code (NEC). Cable shall be multi-conductor, at least 18 AWG size, specifically designed for industrial systems and UL listed for indoor/outdoor installations.

Conduit for all HVAC control circuits shall be EMT, except in areas designated on the electrical drawings as Area Type 1A, Area Type 4, or Area Type 12. In areas designated Type 1A, conduit shall be exposed rigid PVC non-metallic conduit with PVC fittings, boxes, and accessories. In areas designated Type 4 and Type 12, conduit shall be IMC with gasketed enclosures and fittings. All conduit and conduit installation shall be in accordance with the requirements of Master Specification Section 16050, Electrical General Requirements and NEC.

2.4.25 Electrical. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.4.26 Drive Units. Drive units shall be designed for 24 hour continuous service.

2.4.26.01 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor.

2.4.26.02 Safety Guards. All belt drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.4.26.03 Electric Motors. Motors furnished with equipment shall meet the following requirements.

A manufacturer's standard motor may be supplied on packaged equipment and fans in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feed and chemical handling locations.

4. Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor’S option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
   115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
   460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase.
Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

Motors to be used with adjustable frequency drives shall be rated for inverted service.

2.4.27 Shop Testing. The equipment furnished under this section shall be tested at the factory according to the standard practice of the manufacturer. Ratings shall be based on tests made in accordance with applicable AMCA, ASHRAE, ARI, NBS, NFPA, and UL Standards.

2.4.28 Balance. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Field Measurement. Contractor shall be responsible for verifying all field dimensions, and for verifying location of all equipment relative to any existing equipment or structures.

3.2.02 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Flues. Flues for all equipment exhausting combustible material shall be installed where indicated on the drawings. Flue gas systems shall be gastight to prevent leakage of combustible products into the building and shall be complete with all fittings, hangers, supports, and flashing necessary for proper installation.

Roof penetrations shall be flashed and counterflashed to provide a weathertight installation. The installation shall include, where necessary, ventilating collars to give proper clearance from floors, ceilings, and roofs constructed of combustible materials.

Flues shall be supported where indicated on the drawings and where required by the system manufacturer. Supports, guides, and all appurtenances required for a complete system shall be furnished and installed at locations determined by the flue systems manufacturer. The entire system from the equipment connection to the termination, including accessories, shall be from one manufacturer.

The flue height dimensions indicated on the drawing are minimum and shall be increased to conform to any local codes which pertain to such work.

All vertical flues shall be equipped with a capped tee to serve as a condensate drain. Flues 6 inches (150 mm) and larger shall be equipped with a condensate drain connection.

When power vented equipment is listed as being suitable for use with "Type B" gas vents, "Type B" gas vents may be used when all vent joints are sealed to prevent leakage.

Where metal flues are used, each joint shall be sealed with sealant and/or aluminum or teflon tape suitable for the operating temperatures to prevent leakage. The tape shall be wrapped two full turns around each joint. Where single wall metal flues are used to vent equipment, a double wall flue shall be used outside and shall extend through the wall a minimum of 6 inches (150 mm). The annular space of the double wall flue shall be sealed at the connection point between the double and single wall flues. Single wall flues routed through unconditioned spaces or in locations below 8 feet (2.4 m) above the finished floor shall be insulated to prevent condensation or limit the cold face temperature to 150°F (65°C).

Gas unit heater flues shall be installed with a minimum of 12 inches (300 mm) of straight pipe attached to the venter outlet before the installation of an elbow.

3.3.02 Packaged Air Conditioning Units/Packaged Heat Pumps. The packaged air conditioning units and packaged heat pumps shall be installed in accordance with the manufacturer's installation instructions. Each unit shall be leveled and installed to maintain the manufacturer's recommended clearances. The units shall be firmly anchored where indicated on the drawings.

3.3.03 Makeup Air Units. Flexible connections shall not be in tension when the fans are operating.

3.3.04 Heaters. The bottom elevation of unit heaters shall be 8 feet (2.4 m) above finished floor unless otherwise indicated.

Gas fired unit heaters with side burner and control access shall have the access located on heater side opposite the wall.

Electric duct heaters shall be installed with a minimum distance of 4 feet (1.2 m) from all ductwork transitions and obstructions on both sides of the heater.

3.3.05 Fans. Flexible connections shall be installed between fan inlet and outlet sheet metal connections. Flexible connections shall not be in tension when the fans are operating. Where fan inlets and outlets are exposed, safety screens shall be installed over the opening. Scroll drains for equipment installed indoors shall be piped to the nearest floor drain.

Power roof ventilators shall be secured with corrosion resistant lag screws to the roof curb.

3.3.06 Roof Hoods. Roof hoods shall be secured with corrosion resistant lag screws to the roof curb.

3.3.07 Damper Operators. Damper operators shall be installed on a mounting bracket rigidly attached to the damper frame or duct. Where the bracket attaches to the duct, suitable stiffeners shall be installed on the duct to prevent noticeable deflection of the duct when the damper operates. Damper operators may be installed inside or outside the duct but consideration shall be given to the environment and duct dimensions in which the operators are installed. Where the damper installation inside the duct may or actually prevents the design airflow from being achieved, the damper operator shall be installed outside the duct. Damper operators shall be readily accessible and access doors shall be provided when the operator is installed inside the duct.

The number of operators furnished for each damper shall provide the torque necessary to operate the damper. Unless otherwise indicated, control dampers shall fail to the closed position, face dampers shall fail to the closed position, and bypass dampers to the open position.

3.3.08 Air Outlet and Inlet Devices. Diffusers with balance dampers installed in the flexible duct takeoffs shall not have an opposed blade damper mounted in the throat of the diffuser.

Ceiling mounted air terminals or services weighing 20 pounds (89 N) shall be supported directly from the structure.

3.3.09 Draft Gauges. Draft gauges for filters located more than 8 feet (2.4 m) above the finished floor shall be mounted on the nearest wall, 5.5 feet (1.7 m) above the finished floor. Each gauge shall be installed with vent valves in the connecting tubing adjacent to the gauge for checking and re-zeroing functions.

3.3.10 Sheet Metal Work. Ductwork, turning vanes, and other accessories shall be installed and supported in accordance with the latest SMACNA Duct Construction Standards. The locations, arrangement, and sizes of ductwork shall be as indicated on the drawings. The duct sizes indicated are clear dimensions inside the duct or duct lining. Sheet metal sizes are larger for ductwork with interior linings.

Ductwork shall be constructed and installed in accordance with the drawings. When acceptable to Owner, modifications in the size and location of ductwork may be made where required to avoid interference with the building structure, piping systems, or electrical work. The installation shall be coordinated with other phases of work to establish space and clearance requirements. Unless otherwise indicated by a bottom of duct elevation, all ductwork shall be routed as high as possible, with a minimum height of 8 feet (2.4 m) above the finished floor. Ductwork installed above suspended ceilings shall be installed with at least 8 inch (200 mm) lighting allowance between the ceiling and the bottom of the ductwork.

In vertical ducts with a closed bottom which terminate less than 24 inches (600 mm) above finished floor, the bottom of the ductwork shall be broken and sloped to a 1/2 inch (12.5 mm) drain hole in the bottom of the duct.

Single-thickness turning vanes shall be installed in all turns with 45 degree or greater angles.

3.3.11 Duct Insulation. Insulation materials shall be installed in accordance with the manufacturer's written instructions and recommendations. Surfaces which are to be insulated shall be cleaned and dried. Insulation shall be kept clean and dry and shall not be removed from the factory container until it is installed. Packages or factory containers shall have the manufacturer's stamp or label bearing the name of the manufacturer and description of the contents.

Insulation shall be terminated at items mounted in ductwork such as thermometers, controls, damper linkages, flexible connections, access doors, etc., to avoid interference with their function and/or replacement.

The duct liner in the corners of the duct sections shall be folded and compressed or shall be cut and fit to ensure overlapping, butted edges. Top and bottom pieces shall overlap the side pieces. Longitudinal seams shall be made only at corners unless duct dimensions and standard liner product dimensions make seams necessary at other locations.

The duct liner shall be held to the duct by a coat of waterproof, fire-retardant adhesive applied over the entire duct surface. Where duct dimensions exceed 8 inches (200 mm) on any side, mechanical fasteners shall be used in addition to the adhesive. All exposed edges of the duct liner shall be tightly butted and coated with adhesive.

The following ducts shall be insulated with a one inch (25 mm) thick interior duct liner unless otherwise indicated or indicated on the drawings to be wrapped:

Makeup or outside air ducts.

Air conditioning system supply and return ducts.

Other ducts where indicated on the drawings.

3.3.12 Flexible Duct and Takeoffs. The length of the flexible ductwork shall not exceed 8 feet (2.4 m). All support saddles for flexible duct shall be a minimum of 6 inches (150 mm) wide.

3.3.13 Access Doors. Airtight access doors shall be provided for inspection of all control dampers, fire dampers, smoke dampers, operators, filters, smoke detectors, duct-mounted coils, and at other locations indicated on the drawings. The access doors shall be of a size suitable for the duct dimensions and at least 8 inches (200 mm) square for hand access, 18 inches (450 mm) for shoulder access, or as indicated on the drawings. Each access door shall be installed to open against the pressure in the duct.

3.3.14 Temperature Controls. Automatic temperature controls shall be furnished and installed as indicated on the drawings and as specified herein.

Contractor shall be responsible for determining that all equipment supplied is suitable for installation in the space indicated on the drawings. Control equipment shall be installed with adequate space for operating and maintenance access.

3.3.14.01 Temperature Control Panels. The panels shall be mounted so that selector switches and indicating lights on the panel are located approximately 5 feet (1.5 m) above the finished floor.

3.3.14.02 Thermostats. Wall-mounted thermostats shall be mounted above the finished floors as indicated in Master Specification Section 16050, Electrical General Requirements. Insulating spacers shall be provided for thermostats mounted on exterior building walls. The spacers shall be installed between the thermostat and its mounting surface, so that the thermostat will not be affected by surface temperatures.

Wall-mounted thermostats in non air-conditioned areas shall be furnished and installed with a cast aluminum or wire guard.

3.14.03 Device Tag Numbering System. All field mounted control devices shall be identified with an identification plate as described in the Equipment Identification paragraph securely fastened to the device. The device identification shall agree with those listed on the drawings. Hand-lettered or tape labels will not be acceptable.

Identification plates for thermostats, control stations, and emergency ventilation shutoff switches shall in addition to the device identification list the controlled equipment in parenthesis below the device number.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15510

HEATING BOILERS AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heating system boilers and associated devices and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

When required, each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable

municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Equipment Motors

Name of manufacturer.

Type and model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Bearing types and numbers.

Weight.

Overall dimensions.

Full load amperes, efficiency, and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Data and Manuals. When required, operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

Flue piping and fittings shall be factory built, laboratory tested, listed by Underwriters' Laboratories, and shall comply with NFPA 211.

Gas fired boilers shall be rated in accordance with the provisions of the American Gas Association, shall have AGA certified input and gross output ratings, and shall be listed by I-B-R. The gas fired boilers and control components shall be tested in accordance with ANSI Z21.13b. All electrical safety controls shall be of accepted quality and shall be UL and AGA certified. Each boiler shall be constructed in accordance with Section IV of the ASME Boiler and Pressure Vessel Code, shall be stamped with the official ASME symbol, and shall be hydrostatically pressure tested before shipment in accordance with Section IV of the ASME Boiler and Pressure Vessel Code.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. As required, extra materials shall be furnished for the equipment.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment capacities shall be as indicated on the schedules. Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as required.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as required.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound, as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 GAS-FIRED HEATING WATER BOILERS. Gas fired heating water boilers, denoted by the symbol "HWB" and an identifying number, shall be Weil-McLain, Peerless, or approved equal. The boiler model shall be as required.

The boiler shall be furnished complete with a burner assembly, firing controls, control panel, fuel valve gas trains, electrical wiring, safety equipment, a structural steel base, and all accessories and appurtenances specified or required for a complete, properly operating installation.

2.5.01 Performance and Design Requirements. The boiler shall be listed by I-B-R, shall be designed for the I-B-R capacities indicated in the schedule on the drawings, and shall be capable of developing the full I-B-R listed output at 100 percent firing rate. The heating water boiler shall be stamped for the maximum working pressure as required.

2.5.02 Boiler Construction. The boiler shall be a factory assembled package, atmospheric or forced draft burner type as required, low pressure, wet base design, cast iron, sectional type.

Where the boiler physical size precludes the use of a packaged unit and with the written concurrence of Engineer, a field assembled unit will be acceptable. To minimize field assembly work, major components shall be shop assembled to the maximum extent practicable.

The boilers shall be designed for vertical travel of flue gas. Each section of the boiler shall be manufactured with cast-on heat absorbing studs to achieve efficient and rapid heat transfer from the combustion gases to the boiler water. Boiler sections shall be fabricated with ground-faced metal-to-metal joints which do not need putty, cement, or other filler.

Each boiler shall be equipped with access openings for cleaning the flueways between sections.

The boilers shall be provided with a built-in air elimination system to ensure positive separation of air from circulating water. The boilers shall be constructed to provide balanced water flow through the entire boiler. Forced draft boilers shall be designed and constructed so that the combustion chamber is completely surrounded by circulating water.

The boiler sections shall be furnished with a flue collector hood and horizontal to vertical draft hood constructed of heavy gage aluminized steel. The flue collector hood shall be securely bolted to the top of the boiler sections. A gastight seal shall be maintained between the flue collector hood and the top of the boiler sections.

The boilers shall be furnished with insulated heavy gage steel jackets with baked enamel finish and insulated with heavy density fiberglass on the left and right ends, top, back, and interior panels. The jackets shall be designed for installation after the supply and return piping have been connected and shall be easily removable.

Observation ports shall be mounted on the front and back sections of the boiler to permit visual inspection of the burner flame.

The boiler end sections shall be provided with suitable tappings for connection of supply and return piping and controls.

2.5.03 Burner Assembly. The boiler shall be furnished with and designed for use with the burner type and fuel gas type as required.

The atmospheric type main burners shall be aluminized steel of one-piece construction suitable for high flame temperature, quiet ignition and extinction, and reliable flame retention. The burners shall be designed so the proper amount of primary combustion air will be drawn into the burner throat entry over a range of burner manifold gas pressures as required.

The forced draft type burner shall be modulating, low fire start, power gas type, designed to burn the type of fuel as required without vibration, noise, or pulsations. The burner shall incorporate a stainless steel flame retention type combustion head and shall be equipped with an external primary-secondary air ratio adjustment and total air volume adjustment. A permanent observation port shall be provided to allow observation of both pilot and main flames. The burner shall be equipped with a forced draft air fan sized to supply the air required for proper combustion of the specified fuel. The unit shall be equipped with an airflow switch to shut off the fuel supply upon failure of the combustion air.

The complete fuel burning assembly shall conform to the requirements of the UL, FM, or the IRI as required. The fuel train shall consist of pressure regulators, shutoff valves, gas valves, high and low gas pressure switches, and vent valves. The fuel train piping shall include 1/4 inch (6 mm) pressure tappings with pipe plugs upstream and downstream from each valve and regulator.

2.5.04 Boiler Trim. The boilers shall be furnished with combination pressure-temperature gauges to indicate boiler water temperature and system pressure. The combination gauges shall be of rugged, guarded type construction with clearly marked and easy to read dials.

Each boiler shall be furnished with a relief valve. The relief valve shall be of the side outlet discharge type, shall be ASME certified, and shall be set to relieve at the rated boiler ASME working pressure. The valve shall have a discharge capacity equal to or greater than the listed I-B-R gross output of the boiler.

A stack thermometer shall be furnished with each boiler for installation in the boiler vent.

2.5.05 Controls. Burner controls shall be provided for control of the fuel supply to the burner and pilot. The gas control components shall be located outside the boiler jacket for easy access, adjustment, and servicing. The automatic safety pilot system shall provide 100 percent shutoff.

Electronic flame rectification controls and intermittent electric ignition pilot systems shall be provided for each boiler. The safety pilot shall be intermittent burning, electrically ignited, and electronically supervised. In the event of flame failure, the controls shall automatically interrupt the fuel supply to the pilot and burner, sound an audible alarm, and light a visual indicator. After shutdown caused by flame failure, the burner shall have to be manually restarted.

Controls shall provide at least a 30 second pre-purge of the combustion chamber before ignition of the fuel and a 15 second or longer post-purge after interruption of the fuel supply.

The boilers shall be furnished with operating, high temperature, and low water cut-off controls. The operating controller shall be set to maintain the temperature of the water leaving the boiler. The high limit control shall be set at least 20°F (11°C) higher than the design leaving water temperature. The low water cut-off control shall be manually reset and shall automatically prevent boiler operation when the boiler water level falls below the safe limit.

The controls shall include automatic spark ignition and provisions for automatic restarting after a power failure or momentary interruption of the fuel supply.

2.5.06 Control Panel. The boiler controls shall be mounted on an electrical control panel which shall include a circuit breaker for 480 volt, 60 Hz, 3 phase power supply, a forced draft blower motor starter for forced draft type burners, burner firing controls, an ignition transformer, an alarm bell, and all electrical controls and devices specified herein or otherwise required for proper operation of the equipment.

All controls shall be housed in NEMA Type 1 enclosures. All external wiring shall be enclosed in conduit.

All electrical components shall be factory-installed and wired so that only connection of the power supply circuit to the control panel is required during installation of the equipment. A control power transformer for the load of all accessory devices listed in the Sequence of Operations shall be included to supply 120 volt control power.

The boiler control panel shall include an isolated contact for use with the temperature control system to indicate boiler trouble. The contact shall close in the event boiler operation is interrupted by flame failure, low water cutoff, or limit control.

2.6 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.7 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.7.01 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.7.02 Electric Motors. Motors furnished with equipment shall meet the following requirements unless otherwise specified in the motors specification:

> A manufacturer's standard motor may be supplied on packaged equipment, in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.
>
> Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.
>
> Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), departure from rated voltage and frequency, poor ventilation, or frequent starting, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
   115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
   460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase. Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.8 SHOP TESTING. Each individual section of the gas fired boilers shall be hydrostatically pressure tested before shipment in accordance with Section IV of the ASME Boiler and Pressure Vessel Code.

When required, the equipment shall be factory tested. Factory test results shall be delivered to Engineer. Equipment shall not be shipped until Engineer has reviewed the test results and advised Contractor, in writing, that the equipment is acceptable for shipment. Such acceptance, however, will not be considered as final acceptance, which will only be made on the basis of the test results of the equipment after installation.

2.9 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of topcoats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.3.01 Valves. Valves shall be installed with their stems horizontal or vertical and above the valve body.

3.3.02 Gas Heating Water Boiler. The boilers shall be installed in accordance with the manufacturer's recommendations, and in a neat and workmanlike manner.

The boiler sections shall be held together by individual draw rods at the front and back of the assembly. A permanent gastight seal shall be maintained between the boiler sections.

Boiler installation shall include provisions for removing burners; adjusting, cleaning, and lubricating working parts; and replacing controls, safety devices, and other control components.

All boiler sections shall be sealed with high temperature mastic sealant in accommodating sealing grooves to provide a permanent gastight seal. Each port opening shall be equipped with a flexible elastomer sealing ring to ensure a permanent watertight seal between the boiler sections.

Care shall be exercised to avoid the transmission of pipe stresses to the equipment. The boiler shall be operated, adjusted, and tested after installation to confirm proper adjustment and operation of all controls.

Where required by applicable codes, gas train vent piping shall be routed to outdoors at a location acceptable to Engineer.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. When required, an experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field tests and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Initial startup of the boilers, including all burner equipment and burner controls, shall be provided through a qualified manufacturer's representative who shall record all burner and control settings. Copies of the records shall be made available to Engineer prior to acceptance of the equipment.

3.4.03 Operator Instruction and Training. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided as required. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as needed.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

3.5 CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner. Each boiler shall be thoroughly cleaned in accordance with the manufacturer's instructions prior to being placed in service.

End of Section

SECTION 15515

HYDRONIC SPECIALTIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of specialty valves, expansion tanks, air separators, pumps, devices, and appurtenances associated with the heating, ventilating and air conditioning hydronic systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturer's names have been listed as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable

municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as specified in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, and valves denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment

Name of manufacturer

Type and model

Construction materials, thicknesses, and finishes

Manufacturer's performance data

Overall dimensions and required service clearances

Net weight and loading distribution

Pumps

Name of manufacturer

Type and model

Construction materials, thicknesses, and finishes

Rotative speed

Size of suction and discharge nozzles

Overall dimensions and required service clearances

Net weight and loading distribution

Performance curves with the specified operating point clearly identified for each unit, type, and model with capacity in gallons per minute (L/s) as the abscissa and NPSH required and total pump head as the ordinate. The curves shall also indicate pump efficiency and brake horsepower.

Type of coupling

Data on shop painting

Motors

Name of manufacturer

Type and model

Horsepower (kW) rating and service factor

Temperature rise and insulation rating

Full load rotative speed

Type of bearings and method of lubrication

Net weight

Overall dimensions

Efficiency at full, 3/4, and 1/2 loads

Full load current and power factor

Locked rotor current

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting

Parts lists and predicted life of parts subject to wear

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. One mechanical seal for each size and type of pump shall be furnished for the equipment.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment capacities shall be as indicated on the schedules.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces except motors shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Cast iron or welded steel baseplates shall be provided for pumps, compressors, and other equipment. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection. Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.08 Piping. Unless otherwise indicated herein, piping shall be as specified in Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies.

2.4.09 Valves. Unless otherwise specified herein, all valves shall be as specified in Master Specification Section 15100, Miscellaneous Valves.

Unless otherwise indicated, 2 inch (50 mm) and smaller valves shall have threaded end connections and 2-1/2 inch (65 mm) and larger valves shall be flanged.

2.4.09.01 Flow Control Valves. Flow control valves shall be Bell & Gossett "Circuit Setter", Taco, or approved equal. Readout kits shall be Bell & Gossett "Model RO-2", Taco “Model 789” , or approved equal.

Flow control valves shall be suitable for a working pressure of 125 psig (862 kPa gauge) at 250°F (121°C). Each flow control valve shall be equipped with readout ports fitted with an integral check valve designed to minimize system fluid loss during the balancing and monitoring process, and shall have a calibrated nameplate to ensure specific settings. Valves shall be located as indicated on the drawings, and shall be of the same size as the pipe in which they are installed. All valves shall be provided with preformed, molded insulation blocks to permit access for balancing and readout without disturbing system insulation.

A readout kit, compatible with the valves furnished, shall be provided as required. The kits shall be complete with one percent accurate, 0 to 100 feet (0 to 180 kPa) range pressure gauge; color coded hoses for low and high pressure connections; shutoff and vent valves; and carrying case. Upon completion of the work, the kit shall be delivered to Owner.

2.4.09.02 Combination Pump Discharge Valves. Combination pump discharge valves shall be Bell & Gossett "Triple Duty Valve", Taco, or approved equal.

Combination pump discharge valves shall be of straight pattern, flanged, with cast iron body and bolt-on bonnet. The valves shall be suitable for a working pressure of 175 psig (1207 kPa gauge) at 250°F (121°C). Each valve shall be equipped with nonslam check valve with spring-loaded bronze disc and seat, stainless steel stem, and calibrated adjustment for flow regulation. Each combination pump discharge valve shall be equipped with readout ports fitted with an integral check valve design to minimize the system fluid loss during the balancing and monitoring process. The valves shall be of the same size as the pipe in which they are installed and shall be suitable for use with the readout kits specified in the Flow Control Valves paragraph. The combination pump discharge valve shall be used for balancing service, not for isolation of the pump discharge.

2.4.09.03 Pressure Relief Valves. Pressure relief valves shall be Bell & Gossett "Model 790", or approved equal.

Pressure relief valves shall have a low blowdown differential and shall be designed to relieve system pressure as indicated on the drawings, within the maximum operating limits of the valve. Pressure relief valves shall be ASME rated and shall bear ASME nameplates. The valves shall incorporate fail-safe disc to ensure normal operation under emergency conditions.

2.4.09.04 Pressure Reducing Valves. Pressure reducing valves shall be Bell & Gossett "Model FB38", or approved equal.

Pressure reducing valves shall be diaphragm operated, with a low inlet pressure check valve and inlet strainer. The strainer shall be easily removed without shutting down the system. The valve seat, strainer, and stem shall be removable and shall be fabricated of corrosion-resistant material. The pressure reducing valve shall be set at the pressure indicated on the drawings.

2.4.10 Expansion Tanks. Expansion tanks shall be manufactured by Bell & Gossett "Series B" for bladder type, or “Series D” for diaphragm type, Taco, or approved equal.

The expansion tanks shall be pressurized diaphragm or bladder type. The tanks shall be furnished complete with a charging valve and other connections indicated on the drawings or otherwise required for a complete installation. The tanks shall be constructed of steel in accordance with the ASME Code for Unfired Pressure Vessels for a working pressure of 125 psig (862 kPa gauge) and shall bear ASME stamp. The tanks shall have an exterior coating of universal type primer.

The expansion tanks shall have the dimensions and capacity as required. Tanks oriented vertically shall be provided with an integral base suitable for vertical floor mounting. Tanks oriented horizontally shall be suitable for horizontal ceiling-hung installation.

2.4.11 Air Separators. The air separators shall be Bell & Gossett "Model R", Taco, or approved equal.

Air separators shall be constructed of carbon steel in accordance with ASME Code for Unfired Pressure Vessels for working pressures of 125 psig (862 kPa gauge) and shall bear ASME stamp. The air separator connections shall be of the same size as the pipe in which it is installed, and the air separator performance capacity shall be suitable for the system flow rate. The air separators shall include strainers with 3/16 inch (5 mm) perforations and a free area at least five times the cross sectional area of the connecting pipe. The maximum pressure drop shall not exceed 1 psi (7 kPa) at design flow. The air separators shall have an exterior coating of universal primer.

2.4.12 Air Vents.

2.4.12.01 Manual Air Vents. Manual air vents shall be Bell & Gossett "Model 4V", Taco, or approved equal.

Manual air vents shall have bronze bodies and nonferrous internal parts. The vents shall be manually operated using a screwdriver or thumbscrew.

Manual air vents shall have 1/8 inch (3 mm) discharge connections and 1/2 inch (15 mm) inlet connections. Air vents shall be designed for 150 psig (1034 kPa gauge) working pressure and 225°F (107°C) operating pressure.

2.4.12.02 Automatic Air Vents.

a. Type 1 Vents. Type 1 air vents shall be Bell & Gossett "Model 107A", Taco, or approved equal.

Type 1 air vents shall be float.actuated, non-modulating, high capacity type designed to purge air and provide shutoff at pressures up to 150 psig (1034 kPa gauge) and 250°F (121°C). The vent shall be constructed of cast iron and fitted with AISI Type 313 stainless steel, brass, EPDM, and silicone rubber internal components.

b. Type 2 Vents. Type 2 air vents shall be Bell & Gossett "Model 87", Taco, or approved equal.

Type 2 air vents shall be designed to purge air and to provide shutoff at pressures up to 150 psig (1034 kPa gauge) and 240°F (116°C). The vents shall be constructed of brass and cast iron with nonferrous internals.

2.4.12.03 Air Control Accessories. Other piping specialties shall be provided as indicated on the drawings or as needed for a complete system. Specialties shall be manufactured by the expansion tank manufacturer.

All supports, rods, anchors, and accessories required to properly support the tanks, separators, and specialties shall be provided.

2.4.13 Test Plug. Test plug fittings shall be Sisco "P/T Plugs", or approved equal.

Test plug fittings suitable for pipeline pressure and temperature testing shall be furnished and installed where indicated on the drawings. Test plug fittings shall be 1/2 inch (13 mm) NPT solid brass with dual seal core of neoprene and shall be rated zero leakage to 500 psig (3447 kPa gauge). Each fitting shall be furnished with a marked, color coded cap with gasket and brass cap chain. Fitting body shall be long enough to extend past the insulation on the piping.

In addition, Contractor shall furnish a test kit compatible with the test plug fittings furnished. The test kit shall consist of two thermometers with 1 inch (25 mm) dial faces, pressure gauges with 3-1/2 inch (89 mm) dial faces and gauge adapter. The thermometers shall have ranges of approximately 25°F to 125°F (-4°C to 52°C) and 0°F to 220°F (-17°C to 104°C) and the pressure gauges shall have ranges of approximately 0-60 psig (0-414 kPa gauge) and 0-150 psig (0-1034 kPa gauge). The kit shall include internally padded and fitted carrying case.

2.4.14 Chemical Feed Pot. Chemical feed pots shall be Hydac "By-Pass Chemical Feeder", or approved equal.

Chemical feed pots shall be furnished and installed where indicated on the drawings to feed poly-functional corrosion inhibiting chemical solutions to the water system. The feed pots shall be of steel, with a 5 gallon (23 L) capacity, and shall be suitable for use with water at a pressure of 150 psig (1034 kPa gauge) and a temperature of 210°F (99°C). Each feed pot shall have inlet and outlet connections, a bottom drain connection, and at least 3-1/2 inch (89 mm) fill opening with a fill cap. The feed pot shall be designed so that the fill cap cannot be removed when the chemical feeder is pressurized.

A plastic instruction panel engraved in at least 1/4 inch (6 mm) high black letters on white background shall be mounted adjacent to the feed pot, describing the valve sequence to be used.

2.4.15 Base Mounted Pumps and Accessories. Base mounted water pumps, denoted by the symbols "HWP" for heating water pumps, "CWP" for chilled water pumps, or “CDWP” for condenser water pumps and an identifying number, shall be Bell & Gossett "Series 1510", Taco, or approved equal.

Each base-mounted pump assembly shall consist of a pump, electric motor, coupling, coupling guard, and all other accessories required for proper operation. Pump capacities shall be as indicated in the schedules on the drawings.

Pumps shall be horizontal single stage, end suction, centrifugal type, of back pullout design suitable for being serviced without disturbing piping connections. The pump casings shall be cast iron, with gauge ports at the nozzles and vent and drain ports at the top and bottom of the casing. The impellers shall be bronze, enclosed type, keyed to the shaft. The casing wearing rings and shaft sleeve shall be constructed of bronze. Pump shafts shall be stainless steel. Shaft seals shall be a mechanical type, suitable for continuous operation at temperatures up to 225°F (107°C).

Pumps shall be electric motor driven and shall be direct connected to the drive motor through a flexible coupling. Each pump and motor shall be mounted on a common cast iron or fabricated steel sub-base suitable for installation on a concrete foundation as indicated.

Bearings shall be grease lubricated ball type with an L_{10} Life Rating of at least 40,000 hours at specified operating conditions. Pump motors shall conform to the requirements of the Electric Motors paragraph and shall be suitable for use with the power supply indicated on the schedules.

Heating water pumps shall be suitable for use with 200°F (93°C) water.

2.4.15.01 Suction Diffusers. Suction diffusers shall be furnished and installed for the heating, chilled, and condenser water pumps, as required. Each diffuser unit shall consist of cast iron angle type body with inlet vanes and combination diffuser strainer with 3/16 inch (5 mm) openings for pump protection. The units shall be designed for 175 psig (1207 kPa gauge) working pressure and at least 250°F (121°C) operating temperature. Each unit shall be provided with an adjustable support foot to carry the weight of the suction piping and shall be sized to fit the pump and system piping connections.

2.4.15.02 Flexible Connectors. Flexible connectors shall be Resistoflex "Model R6904", or approved equal.

Flexible connectors shall be furnished and installed for the suction and discharge of each pump and where indicated on the drawings. The connectors shall be multiple arch type with TFE T62 teflon bellows, monel reinforcing rings, control units, and flanged ends. The connectors shall be designed for use with water at a pressure of 100 psig (689 kPa gauge) and a temperature of 250°F (121°C).

2.4.16 Pressure Gauges. Pressure gauges shall be Ashcroft "Duragauge 1279", Weiss Instruments, Inc, or approved equal.

Except as modified or supplemented herein, all gauges shall conform to the requirements of ANSI B40.1. Accuracy shall be ANSI Grade A or better. Gauges shall be indicating dial type with C-type phosphor bronze Bourdon tube, stainless steel rotary geared movement, phenolic open-front turret, stainless steel or phenolic ring, case, adjustable pointer, and acrylic or shatterproof glass window.

The dial shall be 4-1/2 inch (114 mm) in diameter with black markings on a white background. The units of measurement shall be indicated on the dial face. The pointer shall span not less than 200 degrees nor more than 270 degrees. The scale shall be so arranged that the normal operating reading is near the midpoint of the range.

Each gauge shall be provided with a threaded end ball-type shutoff valve as specified in Master Specification Section 15091, Miscellaneous Ball Valves.

All stem-mounted gauges shall be provided with 1/2 inch (13 mm) NPT connections.

2.4.17 Thermometers. Thermometers shall be furnished and installed where indicated on the drawings. The thermometer range shall be selected so that when installed and operating, the thermometer will read within the middle two-thirds of the scale range.

Each thermometer shall be furnished with a stainless steel thermowell for installation in steel piping systems or brass thermowell for installation in copper piping systems. The thermowells shall have 3/4 inch (20 mm) NPT thread mounts, a minimum pressure rating of 250 psig (1725 kPa gauge), and a nominal 4 inch (102 mm) insertion length.

2.4.17.01 Dial Type Thermometers. Thermometers shall be Weksler Instruments "Adjust Angle", Ashcroft "Series EI Everyangle", Weiss Instruments, Inc. , or approved equal

Dial type thermometers shall be bimetal type and shall have at least 4-1/2 inch (114 mm) dial with black markings on a white background. Pointer travel shall span not less than 200 degrees nor more than 270 degrees. Each thermometer shall have a stainless steel case, bezel, fittings, and stem and shall be hermetically sealed, with external pointer adjustment and an acrylic or shatterproof glass window.

Each indicator shall be furnished with an angularly adjustable frame for convenient viewing.

2.4.17.02 Stem Type Thermometers. Stem type thermometers shall be Weksler Instruments "Adjust Angle Thermometer" Weiss Instruments, Inc. "9VU", or approved equal.

Stem type thermometers shall be mercury type and shall have at least a 9 inch (225 mm) scale with black markings on a white background. Each thermometer shall have molded Valox polyester case, acrylic or shatterproof glass front, and angularly adjustable stem for convenient viewing.

2.5 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit.

2.6 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.6.01 Safety Guards. All couplings and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.6.02 Electric Motors. Motors furnished with equipment shall meet the following requirements.

A manufacturer's standard motor may be supplied on packaged equipment, fans, pumps, and heaters, in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

Outdoor equipment.

Equipment for installation below grade.

Equipment operating in chemical feed and chemical handling locations.

Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor’S option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof or submersible motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

Below 1/2 hp (0.4 kW).
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

1/2 hp (0.4 kW) and above.
460 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.7 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the lastest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.3.01 Valves. Valves of the types and sizes specified herein shall be furnished and installed where indicated on the drawings and in the schedules and where required for proper operation of the systems. Where valves are furnished as an integral part of the equipment, additional valves serving the same purpose will not be required. Valves shall be installed with their stems horizontal or vertical and above the valve body.

All drain valves shall be 3/4" (19 mm) with hose connection unless otherwise indicated.

Except at circulating pump locations, all 4 inch (100 mm) and larger valves shall be installed in horizontal piping.

Provide all low points in the hydronic water system piping with drain connections.

3.3.02 Air Vents. Manual air vents shall be installed at all high points in the hydronic piping systems and at other locations indicated on the drawings.

Automatic air vents shall be installed in the hydronic piping systems where indicated on the drawings.

3.3.03 Base Mounted Pumps. The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field tests and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15525

DIGESTER HEATING BOILERS

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installing digester gas fueled heating water boilers as indicated on the drawings.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the Engineer.

1.2.01 General Equipment Stipulations. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Governing Standards. All work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, and laws and regulations of the state which pertain to such work. In case of conflict between these specifications and any state law or municipal ordinance, the latter shall govern.

All work shall comply with Underwriters' Laboratories safety requirements.

The boiler and burner safety controls shall comply with the following:

ASME Section IV, Boiler and Pressure Vessel Code

Factory Mutual (FM)

Industrial Risk Insurers (IRI)

ASME CSD-1, Controls and Safety Devices for Automatically Fired Boilers.

NFPA 54, National Fuel Gas Code.

Definitions of terms and hydraulic considerations shall be as set forth in the Hydraulic Institute Standards.

1.2.03 Coordination. The Contractor shall assume full responsibility for coordination of the boilers with the heating water system, including verification that all structures, piping, and equipment components are compatible. The Contractor shall start up the system and shall make all necessary adjustments so that the system is placed in proper operating condition.

The drawings indicate the extent and general arrangement of the system. If the Contractor deems any departures from the drawings are necessary, details of such departures and the reasons therefor shall be submitted as soon as practicable to the Engineer for review. No such departures shall be made without the prior written concurrence of the Engineer.

1.2.04 Quality Assurance. The equipment to be furnished under this section shall be essentially the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the products of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Major items of mechanical equipment shall be of the best quality normally used for the purpose in good commercial practice and shall be the products of reputable manufacturers.

Several manufacturers are indicated as acceptable for each item of equipment in these specifications. The Contractor shall be responsible for determining that all equipment supplied for the project is suitable for installation in the space provided, as indicated on the drawings, with adequate operating and maintenance access space.

1.2.05 Elevation. The equipment will be operated at an elevation as required.

1.2.06 Power Supply. Power supply to equipment shall be as required.

1.2.08 Shop Painting. All ferrous metal surfaces of each boiler which are to be insulated shall be shop painted with a universal primer prior to installation of the insulation and protective enclosure. Panel boards and electrical controls shall be painted with black enamel. All other surfaces shall be painted with gray enamel. Heated surfaces shall be painted with heat resistant paint.

1.2.05 Tagging. Each item of equipment and each part shipped separately shall be tagged and identified with indelible markings for the intended service as required. Tag number shall be clearly marked on all shipping labels and on the outside of all containers.

1.3 SUBMITTALS. Complete assembly and installation drawings, together with detailed specifications and data covering material used and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master

Specification Section 01080, Projects Submittals. Device tag numbers indicated on the contract documents shall be referenced on the wiring and schematic diagrams where applicable.

The data and specifications for the boilers shall include, but shall not be limited to, the following:

Boiler

Manufacturer and model.

Performance data.

Dimensions.

Connection sizes and locations.

Approximate weight, wet and dry.

Control panel schematics and layout drawings.

Fuel Train

Valve manufacturer.

Valve materials.

Schematic.

Burner

Manufacturer and model.

Sequencing Control Panel

Schematics and layout drawings

1.3.03 Operation and Maintenance Data and Manuals. When required, adequate operation and maintenance information shall be supplied. Operation and maintenance manuals with Master Specification Section 01160, Training and Operation and Maintenance Manuals shall be submitted in accordance with the submittals section.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND SHIPPING. handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as required.

Spare parts shall be suitably packaged as required. Spare parts shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Each boiler will be used to heat water for digester and building heating. Each boiler will be dual-fueled with automatic switchover capabilities. Primary fuel shall be digester gas with backup fuel as required.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Each boiler shall be designed for the performance and design requirements as required.

2.4 DIGESTER HEATING BOILER.

2.4.01 Fire Tube Boiler. When required, boilers shall be a packaged, horizontal, multi-pass, fire tube, scotch marine type boiler with front and rear gasketed doors or panels to allow access for inspection and cleaning of the tubes and tube sheets. Boilers shall be constructed with water cooled combustion chamber and multi-pass fire tubes with separate tube sheets. Boilers shall be designed to provide a minimum of 5 square feet of heating surface area per rated boiler horsepower. Boilers shall be factory assembled.

2.4.01 Cast Iron Sectional Boiler. The boiler shall be a factory assembled package, cast iron, sectional type. Boilers shall be designed for vertical travel of flue gas. Each section of the boiler shall be manufactured with cast-on heat absorbing studs to transfer heat from the combustion gases to the boiler water. Boilers shall be designed and constructed so that the combustion chamber is completely surrounded by circulating water. Boiler sections shall be fabricated with ground-faced metal-to-metal joints which do not need putty, cement, or other filler. Each boiler shall be equipped with access openings for cleaning the flueways between sections.

Where the boiler physical size precludes the use of a packaged unit and with the written concurrence of Engineer, a field assembled unit will be acceptable. To minimize field assembly work, major components shall be shop assembled to the maximum extent practicable.

Boilers shall be furnished complete with a burner assembly, firing controls, control panel, fuel valve gas trains, electrical wiring, safety equipment, a structural steel base, lifting lugs, and all accessories and appurtenances specified or required for a complete, properly operating installation.

2.4.02 Burner Assembly. The burner shall be capable of operating on digester gas at the conditions as required and shall automatically switch to the secondary fuel. The pilot shall be suitable for operating fuel as required.

2.4.03 Burner Firing Controls. Burner controls shall provide positive control of the fuel supply to the burner and pilot. Burner controls shall be microprocessor based.

Control shall provide at least a 30 second purge of the combustion chamber before ignition of fuel and a 15 second or longer purge after interruption of the fuel supply.

An electronic scanning device shall sense pilot and main burner flame. Upon flame failure, the controls shall automatically interrupt the fuel supply to the pilot and the burner, sound an audible alarm, and light a visual indicator. A manual reset, low water cutoff switch, and a limit thermostat shall also interrupt operation of each unit. An isolated contact in the low water cutoff switch, which shall close on low water level, shall be wired to terminals in the control panel.

Except when flame failure occurs, automatic spark ignition and provisions for automatic restarting after a power failure or momentary interruption of the fuel supply shall be provided.

When required a signal shall be sent to start a boiler pump when a boiler is energized. The boiler shall not fire until flow is confirmed.

Each boiler unit shall be provided with a fuel selector switch with DIGESTER GAS, AUTO, and secondary fuel positions. When the switch is in the DIGESTER GAS or the secondary fuel position, the boiler shall operate on the single fuel indicated. In the AUTO position, priority shall be given for firing on digester gas, with automatic switchover to the secondary fuel on low digester gas supply pressure. The AUTO mode shall not allow automatic return from the secondary fuel firing to digester gas firing until the remote digester discharge gas pressure input contact indicates sufficient digester gas pressure has returned after an adjustable timer has timed out. Time delay shall be set with a timer furnished in the boiler control panel.

Digester gas and the secondary fuel shall be ignited by a proven gas pilot.

The boiler unit shall be provided with pressure regulators, valves, strainers, filters, fuel pump, and controls as required for the use of the specified fuels.

The burner shall be full modulation type. The gas train shall meet code requirements for burner safety controls as required. All materials in contact with digester gas shall be suitable for the gas. Unless otherwise specified, all valve trim in contact with digester gas shall be fabricated of stainless steel or aluminum. All automatic shutoff valves or vent valves shall have stainless steel bodies, hard-faced stainless steel seats, chrome plated stainless steel discs, and Viton seals, and shall be Maxon with trim 5-3. Pressure reducing valves shall have cast iron bodies and shall be Fisher or approved equal.

2.4.04 Air Fan. Each unit shall be equipped with a forced draft air fan sized to supply the air required for proper combustion of the fuel. Fan motor controls shall be interlocked with the automatic ignition system and the two fuel valves to provide the specified purge period prior to ignition and following cessation of ignition of the fuel. Each fan motor shall be suitable for operation with the specified power supply and shall be provided with a suitable starter.

Each unit shall be provided with all devices required to properly purge the combustion chamber and positively control the air volume produced by each fan to ensure proper combustion of the fuel.

2.4.05 Control Panel. An electrical control panel shall be provided and mounted on each boiler unit. A circuit breaker for suitable for the power supply shall be mounted on the control panel. In addition, fan motor starter, burner firing controls, control transformer, ignition transformer, alarm horn, fuel selector switch, lights, and all electrical controls and devices specified herein or otherwise required for proper operation of the equipment shall be mounted on the panel. The complete control panel shall have an interrupting rating of at least 42,000 amperes at 480 volts ac.

All controls shall be housed in NEMA Type 12 enclosures. All external wiring shall be enclosed in conduit.

Isolated contact outputs shall be provided as required. All contacts shall be rated for 5 amperes at 120 volt ac.

All electrical components of each unit shall be factory installed and wired so that only connection of the power supply circuit to the control panel is required during installation of the equipment.

All electrical components of the boiler unit shall be factory installed and wired so that connections of the power supply circuit to the control panel is required during installation of the equipment.

2.4.06 Boiler Trim. Boilers shall be provided with ASME safety relief valve, burner flame observation ports and additional trim items as required.

Observation ports shall be mounted on the front and back sections of the boiler to permit visual inspection of the burner flame.

Boiler pressure relief valves shall be of the side discharge type and shall be piped to the bottom of the unit. The valves shall be set to relieve at the rated boiler ASME working pressure. The valve shall have a discharge capacity equal to or greater than the listed output of the boiler.

2.4.07 Unit Enclosure. Each boiler shall be furnished with insulated heavy gage steel jacket with baked enamel finish and insulated with heavy density fiberglass.

2.5 SEQUENCING PANEL. When required a sequencing panel suitable for operating multiple boilers shall be provided. A loop-powered temperature transmitter, located in the boiler discharge header, shall be provided and shall send a 4-20 mA signal to the panel to allow automatic sequencing of lead/lag boilers and full modulation control of the burners. The control system shall be microprocessor based, pre-engineered and programmed. The sequencing panel shall be powered as required and shall be enclosed in a lockable steel, NEMA 1 enclosure. The panel controls shall be UL and CSA listed.

The panel shall include the following:

ON, OFF, AUTO, STANDBY selector switch for each boiler

Manual/Automatic Lead/Lag rotation switch.

Normally open contact for burner start/stop.

Control power transformer as required.

Burner firing rate controller.

Lead and activated boiler lights.

Ignition start adjustment for each boiler.

Modulation start adjustment for each boiler.

Terminals for accepting discrete signals from remote-mounted emergency shutdown switches.

Terminals for accepting a 4-20 mA signal from remote-mounted digester gas pressure switch.

Terminals for accepting a 4-20 mA signal from remote-mounted temperature transmitter

Temperature setpoint adjustment knob.

Purge timer.

Battery backup.

LED display of actual temperature, setpoint temperature, gain adjustment, and boiler percent modulation.

The lead/lag control of the boilers and modulation of the burner shall be based on the heating water supply temperature. On drop of supply water temperature, the lead boiler shall be energized. Following a time delay to allow the boiler to be fired, the controls shall begin modulating the lead burner upward at a rate proportional to the supply temperature rate of change. When the burner on lead boiler goes to high fire, the first lag boiler shall be energized and controlled similar to the lead boiler. When the burner of the first lag boiler goes to high fire, the second lag boiler shall be energized and controlled similar to the lead boiler. As the supply temperature rises, the modulation of the last boiler on line shall decrease until it gets to its ignition start point. It shall be held at that point until the previous on line boiler burner has been modulated to its ignition start point. The last boiler on line then shall be de-energized.

When the boiler fuel selector switch is in the AUTO position, controls shall be provided for automatic fuel switchover from digester gas to natural gas based on a 4-20 mA signal from a remote pressure transmitter. Priority shall be given to firing on digester gas. As the digester gas pressure decreases to a setpoint, the lag boilers shall be switched to fire on natural gas. If the pressure decreases to a setpoint pressure, the lead boiler shall be switched to fire on natural gas. When the pressure increases above the setpoint pressure, after a time delay, the lead boiler shall be switched back to fire on digester gas. If the pressure continues to increase, the lag boiler shall be switched back to fire on digester gas.

2.6 BOILER FLUE. Boiler flues shall be furnished and installed where indicated on the drawings. The boiler flue systems shall be factory built, laboratory tested and listed by Underwriters' Laboratories, and shall comply with the requirements of NFPA 211. Flue systems shall be designed and installed to be gastight to prevent leakage of combustion products into the building.

The boiler flue should be double walled with a nominal 1-inch air space between the walls. The inner and outer jackets shall be constructed of materials as required. The materials and construction of the modular sections shall be as specified by the terms of the product's UL listing.

Drain tee caps, stack caps, storm collars, and flanged boiler kits shall be provided. Caps shall be constructed of stainless steel materials. The systems shall be designed to compensate for all flue gas inducted thermal expansions. Flues shall be supported where indicated on the drawings and as required by the system’s manufacturer. Supports, guides, and all appurtenances required for a complete system shall be furnished at locations determined by the flue systems manufacturer. The entire system from each boiler to the termination, including accessories, shall be the product of one manufacturer.

The flue systems shall be installed according to the manufacturer's installation instructions and shall comply with all applicable codes. The flue systems shall be Selkirk Metalbestos "Model PS" or approved equal.

2.4.08 Anchor Bolts. Anchor bolts and nuts shall be furnished as required for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed.

The bolts shall be at least 3/4 inch (19 mm) in diameter.

Anchor bolts shall be accurately located and centered in pipe sleeves having an inside diameter approximately 2-1/2 times the bolt diameter and a length approximately 8 times the bolt diameter. A square anchor plate with thickness of approximately 1/2 the bolt diameter and side dimensions 4 times the bolt diameter shall be welded to the bottom of each sleeve, with the anchor bolt extended through the plate and welded thereto. Two nuts and a washer shall be furnished with each anchor bolt.

All anchor bolts, nuts, and washers shall be carbon steel, stainless steel, or galvanized steel, as required.

Anchor Bolts and Nuts

Stainless Steel	AISI Type 316, 316L; Bolts ASTM F593, Alloy Group 2; Nuts ASTM F594, Alloy Group 2.
Galvanized Steel	Carbon steel bolts and nuts; hot-dip galvanized, ASTM A153 and A385.
Flat Washers	ANSI B18.221; of the same material as the bolts and nuts.

Anchor bolts shall be long enough to accommodate at least 1-1/2 inches (38 mm) of grout beneath the baseplate and to provide adequate anchorage into structural concrete.

Anti-seize compound will be applied to the threads of all stainless steel bolts before assembly.

2.7 SHOP TESTING.

2.7.01 Hydrostatic Tests. When required, each boiler shall be hydrostatically pressure tested before shipment in accordance with Section IV of the ASME Boiler and Pressure Vessel Code.

2.7.02 Fire Test. When required and after assembly, each boiler shall be filled and brought to and maintained at operating temperature with the furnished burner using either the primary or secondary fuel specified. In addition, control functional tests shall be performed.

2.7.03 Balance. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

PART 3 - EXECUTION

3.1 INSTALLATION. The equipment shall be installed in accordance with the manufacturer's recommendations, and all work shall be completed in a neat and workmanlike manner. Installation shall provide the required accessibility for adjusting, cleaning, and lubricating working parts; and replacing controls, safety devices, and other control components. Care shall be exercised to ensure that piping stresses are not transmitted to the equipment. Each unit shall be operated, adjusted, and tested after installation as required to ensure proper adjustment and operation of all controls.

Each boiler shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. The base for each boiler shall be grouted after initial fitting and alignment, but before final bolting of connecting piping. No stresses shall be transmitted to the boiler flanges. After final alignment and bolting, boiler connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to proper fit.

3.2 INSTALLATION CHECK. An experienced, competent, and authorized representative of the manufacturer of each item of equipment shall visit the site of the Work for at least 1 days (travel time excluded) and inspect, check, adjust if necessary, start-up, and approve the equipment installation. In each case, the manufacturer's representative shall be present when the equipment is placed in operation. The manufacturer's representative shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

Each manufacturer's representative shall furnish to Owner, through Engineer, a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3 TRAINING. Training shall be as specified in the Master Specification Section 01160, Training and Operation and Maintenance Manuals. A minimum of 8 hours of training shall be provided to instruct the Owner's operating and maintenance personnel in the actual operation and maintenance of the new boilers once the equipment is in proper working condition.

The training time required shall be separate from the time required in paragraph 3.2.

End of Section

SECTION 15550

HEATING SYSTEMS EQUIPMENT

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heating system equipment, flues, heaters, and associated devices and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations In Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 <u>Equipment Plates</u>. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 <u>Piping</u>. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 <u>Valves</u>. Valves that have been assigned an identification number shall be identified with tags.

1.4 <u>SUBMITTALS</u>.

1.4.01 <u>Drawings and Data</u>. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

<u>Equipment</u>

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Equipment Motors

Name of manufacturer.

Type and model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Bearing types and numbers.

Weight.

Overall dimensions.

Full load amperes, efficiency, and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

Flue piping and fittings shall be factory built, laboratory tested, listed by Underwriters' Laboratories, and shall comply with NFPA 211.

Electric heaters shall be UL listed unless otherwise indicated. Electric duct heaters shall comply with the National Electrical Code.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer'S review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 SPARE PARTS. One burner flame detector and boiler pressure relief valve shall be furnished for the equipment.

Spare parts shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Spare parts shall be delivered to Owner as directed.

Spare parts subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment capacities shall be as indicated on the schedules. Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as indicated.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be in accordance with Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound, as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 FLUE SYSTEMS. Flues shall be provided for all equipment that exhausts combustible material. Drain tee caps, stack caps, storm collars, and equipment connection kits shall be provided. The systems shall be designed to compensate for all flue gas-induced thermal expansions. Flue system materials and construction shall be in accordance with the vented equipment manufacturer's recommendations and instructions.

2.5.01 Factory Built Flues. Flue systems for gravity vented equipment and vertically vented unit heaters listed for use with "Type B" gas vents shall be Selkirk Metalbestos, "Type B" gas vents, Metal-Fab, or approved equal. The flue systems for power vented equipment shall be Selkirk Metalbestos "Type PS" gas vent, Metal-Fab "Model PIC", or approved equal.

The flue pipe and fittings for vertically power vented unit heaters requiring a 5 inch (125 mm) or smaller flue and gravity vented equipment shall be a "Type B" gas vent. The flue shall be of double wall construction, with a 0.25 inch (6 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.012 inch (0.3 mm) aluminum and the outer jacket of at least 0.018 inch (0.5 mm) galvanized steel. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

The flue pipe and fittings for power vented equipment and power vented unit heaters requiring a 6 inch (150 mm) or larger flue shall be of double wall construction with a nominal 1 inch (25 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.035 inch (0.9 mm) AISI Type 304 or Type 316 stainless steel, as required, and the outer jacket of at least 0.025 inch (0.6 mm) aluminum coated steel for interior locations and Type 304 or AISI Type 316 stainless steel, as required, for the portions of the stack exposed to the outdoor environment. The materials and construction of the modular sections shall meet the terms of the product's UL listing.

2.5.02 Metal Flues. The flue pipe and fittings for horizontally power vented unit heaters requiring a 5 inch (125 mm) or smaller flue shall be constructed of at least 24 gage (0.61 mm) thickness galvanized steel and shall be sized and arranged as recommended by the vented equipment manufacturer or as directed by Engineer. The flue system shall include all necessary fittings, hangers, supports, and flashings.

2.6 HEATERS. Heaters of the types, sizes, and capacities specified herein shall be furnished and installed where indicated on the drawings. All heaters shall be complete with controls and accessories required for satisfactory operation. Heaters shall be UL listed unless otherwise indicated.

2.6.01 Baseboard Heaters. Baseboard heaters, denoted by the symbol "BH" and an identifying number, shall be Chromalox, Electromode, or approved equal. The heater model shall be as indicated.

Baseboard heaters shall be constructed of heavy gage, cold-rolled steel. The heating element shall be an aluminum finned tube, suitable for a maximum operating temperature of 400°F (204°C) in an ambient temperature of 70°F (52°C). Watt density of the element shall not exceed 187 watts per foot (614 w/m). Heaters shall be equipped with a thermal limit control, built-in thermostat, shall be prewired for service connection in boxes of equal dimensions at both ends and shall be suitable for use with the indicated power supply.

2.6.02 Cabinet Heaters. Cabinet heaters, denoted by the symbol "CH" and an identifying number, shall be manufactured by McQuay, Trane, or approved equal. The heater model shall be as indicated.

Cabinet heaters utilizing the required heat source shall be furnished and installed as indicated on the drawings. Cabinet heaters shall be complete with controls and accessories as needed for satisfactory operation. The cabinet heaters shall include a chassis, coil, fan assembly, filter, motor, motor disconnect, and insulation.

Cabinet heaters shall be vertical or horizontal as indicated in the schedules on the drawings with a front discharge grille, a bottom return, and a built-in thermostat. Heater casings shall be of steel construction with a minimum 16 gage (1.52 mm) thickness front panel and 18 gage (1.21 mm) thickness end and top panels. Exposed corners and edges of the cabinet heater shall be rounded. Heater casings shall be insulated, furnished with removable access panels, and shall be finished with lacquer or enamel. Finish color shall be selected by Engineer from the manufacturer's standard line of colors.

The cabinet heater fans shall be direct driven, centrifugal, forward-curved, double-width wheels statically and dynamically balanced. Fan motors shall have integral thermal overload protection and shall be suitable for use with a 120 volt, 60 Hz, single phase power supply. When necessary, factory-mounted transformers shall be provided to step down voltage for the control circuit.

Water coils shall be 5/8 inch (16 mm) OD seamless copper tubes mechanically bonded to aluminum fins. The coils shall be suitable for a working pressure of 300 psig (2069 kPa gauge), shall be factory tested for leaks under water at 300 psig (2069 kPa gauge), and shall be rated for entering water and entering air temperatures as indicated in the heater schedule on the drawings.

Electric heating elements shall be finned tube or open coil as required. The units shall be factory wired with a unit-mounted heat switch, magnetic contactors, a high temperature cutout safety control, and a fan override thermostat.

Cabinet heaters shall be provided with removable 1 inch (25 mm) disposable filters located in front of the heating coil.

2.6.03 Heating Water Convectors. Heating water convectors, denoted by the symbol "C" and an identifying number, shall be Trane, or approved equal. The heater model shall be as indicated.

Convector elements shall be constructed of copper tubes expanded and rolled into cast iron headers. Fins shall have integral collars which space the fins, and shall be bonded to the tube by mechanical expansion of the tube. End supports shall carry the weight of element and shall be designed to fit over header.

The cabinet shall be constructed of 14 gage (1.9 mm) thickness or heavier carbon steel reinforced with channel stiffeners. Fronts shall be secured by quick-opening fasteners.

Convector cabinets shall have a baked enamel finish of a color selected by Engineer from manufacturer's standard colors.

Dampers to reduce heating capacity by up to 70 percent when closed shall be factory mounted on the element.

Convector capacity shall be as indicated in the schedule on the drawings.

Convectors shall have 24 inch (610 mm) high cabinets.

2.6.04 Electric Duct Heaters. Electric duct heaters, denoted by the symbol "EDH" and an identifying number, shall be manufactured by Indeeco, Brasch, or approved equal.

Electric duct heaters shall be furnished and installed where indicated on the drawings.

Electric duct heaters shall be open coil or finned tube, as required, and zero clearance type with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames with 2 inch (50 mm) wide flanges suitable for fastening to the ductwork.

Bushings for open coils shall be ceramic and terminals shall be stainless steel. Elements for finned tubular coils shall be centered in steel tubes filled with compacted magnesium oxide and copper plated fins brazed to the tube. The assembly shall be finished with high temperature aluminum coating.

Heaters shall be completely factory wired and shall be provided with disconnecting backup and safety contactors, transformers, an automatic reset thermal cutout, a manual reset thermal cutout, a disconnect switch, and a differential pressure airflow switch. All interconnecting wiring shall be enclosed in a terminal box fastened to the heaters and oriented as indicated on the drawings. The terminal boxes shall be furnished with double doors.

Contactors shall be 600 volt rated, 3 pole, UL listed, and shall have a life expectancy for 100,000 operations. A built-in industrial dry type 480/120 volt control transformer shall be furnished to carry the full contactor holding coil load. Transformer primary and secondary windings shall be fused. Secondary windings shall have one lead grounded.

The duct heaters shall be furnished with a silicone controlled rectifier (SCR) control unit mounted in the duct heater terminal box. The control unit shall be suitable for the temperature range of 32 to 132°F (0 to 55°C), and shall be a solid-state proportioning controller designed to modulate the heater output from 0 to 100 percent. The duct heaters shall be controlled by a thermostat as indicated on the drawings. The duct heater SCR controller shall be compatible with the signal from the thermostats.

The duct heater output in kW shall be as specified at 460 volts, 60 Hz, 3 phase. The heater elements shall be suitable for operation on 480 volt, 60 Hz, 3 phase power.

2.6.05 Electric Infrared Heaters. Electric infrared heaters, denoted by the symbol "IH" and an identifying number, shall be manufactured by Chromalox, or approved equal. The heater model shall be as indicated.

Electric infrared heaters shall be metal sheathed double element type, with 30 degree symmetrical reflector for a narrow controlled beam pattern.

Reflectors shall be constructed of clear anodized aluminum. The heater housing shall be constructed of 20 gage (0.91 mm) thickness steel finished with neutral gray baked enamel.

The heaters shall be mounted at 30 degrees from horizontal.

Electric infrared heaters shall be UL listed and suitable for use with the power supply indicated in the heater schedule on the drawings. Capacities shall be as indicated in the heater schedule on the drawings.

2.6.06 Electric Unit Heaters. Electric unit heaters, denoted by the symbol "EUH" and an identifying number, shall have the capacity indicated in the schedules on the drawings.

Electric Unit Heaters (non-explosionproof). Electric unit heaters located in unclassified areas shall be Chromalox "LUH" or "VUH", Brasch, or approved equal. Each heater shall include a fan and motor assembly, a built-in contactor, safety disconnect switch, and a control transformer for 120 volt control, and shall be suitable for use with the power supply indicated in the heater schedule on the drawings. Heater elements shall be steel plate, fin type, with elements brazed to common fins for maximum strength and heat transfer. Each unit heater fan motor shall be provided with automatic reset thermal overload protection. Where shown on the drawings to be wall hung, a wall mounting bracket shall be provided.

Electric Unit Heaters (explosionproof). Where indicated in the heater schedule on the drawings to be explosionproof, unit heaters shall be manufactured by Indeeco "Ultra-Safe", Ruffneck, Markel, or approved equal. Explosionproof electric unit heaters shall be of the fan forced type with a heat exchanger, fan and motor assembly, automatic reset thermal cutout, built-in contactor, factory installed three pole disconnect switch in NEMA 7 enclosure, and 24 volt control transformer. The heater shall be suitable for use with the power supply indicated in the heater schedule on the drawings. The heater shall be listed for installation in a Class I, Division 1 or 2, Group D location and shall have an NEC ignition code of T3B or better.

The heater cabinets shall be constructed of a corrosion resistant cabinet fabricated from an epoxy coated 14 gage (1.90 mm) thickness steel with individually adjustable outlet blades. Cabinet fasteners shall be stainless steel.

The heat exchanger shall be an efficient liquid to air design utilizing a copper or steel core with aluminum fins. The heat exchanger shall be provided with a coating suitable for use in a corrosive atmosphere consisting of hydrogen sulfide. The heating elements shall be housed in an inhibited propylene or ethylene-glycol heat transfer fluid that is suitable for temperatures down to -49°F (-45°C). A pressure relief valve shall provide overpressure protection for the heat exchanger.

The fan and motor assembly shall consist of an aluminum fan connected to a explosionproof, permanently lubricated ball bearing type motor with built-in thermal overload protection. The motor shall be prewired to the control enclosure providing for a heater that is suitable for use with a single point power connection.

<u>Electric Unit Heaters (corrosion resistant)</u>. Where indicated on the drawings to be corrosion resistant, unit heaters shall be manufactured by Indeeco "Traid", Chromolox "HDH", or approved equal. Each heater shall include fan and motor assembly, operating and safety controls, and shall be suitable for use with a single point power supply indicated in the schedules on the drawings.

Heater elements shall be Type 304 or 316 stainless steel, fin tubular type, with stainless steel fittings forming a watertight seal between the elements and the junction box. Unit heater fan motors shall be totally enclosed, permanently lubricated ball bearing type designed to resist corrosion and moisture. The fan blades shall be epoxy coated aluminum and the heater housing shall be at least a 20 gage (0.91 mm) Type 304 stainless steel. Where indicated on the drawings to be wall hung, a swivel wall mounting bracket shall be provided.

The controls shall include automatic reset thermal cutout, fan delay relay, built-in control and motor contactors, control transformer, and terminal block all housed in a NEMA 4X enclosure. A pilot light visible on the heater exterior shall indicate heater operation.

2.6.07 Gas Unit Heaters. Gas unit heaters, denoted by the symbol "GUH" and an identifying number, shall be Reznor Model "Venturion FE", Trane, Sterling, or approved equal.

Gas unit heaters shall be furnished and installed where indicated on the drawings. Each heater shall be of the type, size, and capacity indicated in the schedules on the drawings; shall be suitable for use with the gas type and pressure as required; and shall be of a type approved and listed in the AGA Directory of Approved Gas Appliances and Accessories.

Each gas-fired unit heater shall be power vented, horizontal discharge, propeller type, and suitable for two point suspending mounting. The heater burner and heat exchanger shall be constructed of E-3 (AISI Type 409) stainless steel. Each heater shall be furnished with a vent cap.

Each gas unit heater shall be furnished complete with a 24 volt transformer, single-stage gas control with a regulated combination redundant gas valve, a spark-ignited, intermittent safety pilot with electronic flame supervision and all required limit and safety controls. Units larger than 125,000 Btu [132,000 kJ] input shall have two-stage gas controls.

The fan motor shall be suitable for use with a 120 volt, 60 Hz, single phase power supply, and shall be provided with automatic reset thermal overload protection.

2.6.08 Heating Water Unit Heaters. Heating water unit heaters, denoted by the symbol "HUH" and an identifying number, shall be manufactured by Modine, Trane, Armstrong-Hunt, Inc., or approved equal

Heating water unit heaters shall be of the discharge orientation indicated, propeller type and shall be suitable for use with the power supply indicated in the schedules on the drawings. The heating water unit heaters shall be rated for entering water and entering air temperatures as indicated in the schedules on the drawings. The noise level generated by each heater shall be appropriate for the space in which the heater is installed. Efficient air deflectors shall be provided for each heater. Heater casings shall be of sturdy, rigid steel construction and shall be finished with lacquer or enamel. Each unit heater fan motor shall be provided with automatic reset thermal overload protection. Heating water unit heater capacities and discharge arrangement shall be as indicated in the schedules on the drawings.

Where indicated in the schedules on the drawings to be explosionproof, unit heaters shall be suitable for installation in an NEC Class I, Division 2, Group D area.

2.6.09 Wall Heaters. Wall heaters, denoted by the symbol "WH" and an identifying number, shall be manufactured by Electromode "Model EWA", Brasch, or approved equal.

Wall heaters shall be downflow type; designed for surface mounting; and shall include an electric heating element, a thermal limit switch, a fan delay switch, a fan and motor assembly, and a built-in thermostat. The heaters shall be suitable for use with the specified power supply and shall have the capacity indicated in the schedules on the drawings.

2.7 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements,, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under the electrical section, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.8 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.8.01 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.8.02 Electric Motors. Motors furnished with equipment shall meet the following requirements unless otherwise specified in the motors specification:

> A manufacturer's standard motor may be supplied on packaged equipment, fans, pumps, and heaters, in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally

enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40° C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feed and chemical handling locations.

4. Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor'S option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
   115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
   460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase. Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.9 SHOP TESTING. The equipment shall be factory tested. Factory test results shall be delivered to Engineer. Equipment shall not be shipped until Engineer has reviewed the test results and advised Contractor, in writing, that the equipment is acceptable for shipment. Such acceptance, however, will not be considered as final acceptance, which will only be made on the basis of the test results of the equipment after installation.

2.10 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the lastest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath base plates shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Valves. Valves shall be installed with their stems horizontal or vertical and above the valve body.

3.3.02 Flues. Flues for all equipment exhausting combustible material shall be installed where indicated on the drawings. Flue gas systems shall be gastight to prevent leakage of combustible products into the building and shall be complete with all fittings, hangers, supports, and flashing necessary for proper installation.

Roof penetrations shall be flashed and counterflashed to provide a weathertight installation. The installation shall include, where necessary, ventilating collars to give proper clearance from floors, ceilings, and roofs constructed of combustible materials.

Flues shall be supported where indicated on the drawings and where required by the system manufacturer. Supports, guides, and all appurtenances required for a complete system shall be furnished and installed at locations determined by the flue systems manufacturer. The entire system from the equipment connection to the termination, including accessories, shall be from one manufacturer.

The flue height dimensions indicated on the drawing are minimum and shall be increased to conform to any local codes which pertain to such work.

All vertical flues shall be equipped with a capped tee to serve as a condensate drain. Flues 6 inches (150 mm) and larger shall be equipped with a condensate drain connection.

When power vented equipment is listed as being suitable for use with "Type B" gas vents, "Type B" gas vents may be used when all vent joints are sealed to prevent leakage.

Where metal flues are used, each joint shall be sealed with sealant and/or aluminum or teflon tape suitable for the operating temperatures to prevent leakage. The tape shall be wrapped two full turns around each joint. Where single wall metal flues are used to vent equipment, a double wall flue shall be used outside and shall extend through the wall a minimum of 6 inches (150 mm). The annular space of the double wall flue shall be sealed at the connection point between the double and single wall flues. Single wall flues routed through unconditioned spaces or in locations below 8 feet (2.4 m) above the finished floor shall be insulated to prevent condensation or limit the cold face temperature to 150°F (65°C).

Gas unit heater flues shall be installed with a minimum of 12 inches (300 mm) of straight pipe attached to the venter outlet before the installation of an elbow.

3.3.03 Heaters. The bottom elevation of unit heaters shall be 8 feet (2.4 m) above finished floor unless otherwise indicated.

Gas fired unit heaters with side burner and control access shall have the access located on heater side opposite the wall.

Electric duct heaters shall be installed with a minimum distance of 4 feet (1.2 m) from all ductwork transitions and obstructions on both sides of the heater.

3.4 FIELD QUALITY CONTROL.

3.4.01 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field tests and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

3.2 CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner. Each boiler shall be thoroughly cleaned in accordance with the manufacturer's instructions prior to being placed in service.

End of Section

SECTION 15575

FLUE STACKS, BREECHINGS AND VENTS

PART 1 - GENERAL

1.1 SCOPE. Furnish and install all flue stacks, breechings and vents as shown on the Drawings, schedules and as specified herein.

1.2 RELATED REQUIREMENTS. Section 15855 - Air Handling Units

1.3 SUBMITTALS. Submit, in accordance with Section 01160, the following: Catalog cuts and assembly directions for each type of flue or stack.

1.4 REFERENCE STANDARDS. Underwriters Laboratories (UL).

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

The complete system shall meet all applicable governing codes.

PART 2 - PRODUCTS

2.1 GENERAL. Type H or SS Factory Built Chimney - UL listed for use with residential and commercial buildings when forced venting is not required. The double wall metal chimney shall have an outer casing of aluminum coated steel (0.4 oz/sq ft), an inner casing of Type 430 or equal corrosion resistant stainless steel and a minimum dead air space of 1/2-in. Chimney shall be complete with UL listed support plates, roof thimble and guy wires and other accessories as recommended by the manufacturer for a complete installation as manufactured by Metalbestos or equal.

Type PS - UL listed for use with forced venting equipment (MAUS). The system shall be completely design by the flue manufacturer with accessories required as manufactured by Metalbestos or equal. Outer and inner casings shall be 316 stainless steel.

PART 3 - EXECUTION

3.1 INSTALLATION. Flues for all equipment exhausting combustible material shall be installed where indicated on the drawings. Flue gas systems shall be gastight to prevent leakage of combustible products into the building and shall be complete with all fittings, hangers, supports, and flashing necessary for proper installation.

Roof penetrations shall be flashed and counter flashed to provide a weather tight installation. The installation shall include, where necessary, ventilating collars to give proper clearance from floors, ceilings, and roofs constructed of combustible materials.

The flue height dimensions indicated on the drawing are minimum and shall be increased to conform to any local codes which pertain to such work. Flues shall be supported where indicated on the drawings and where required by the system manufacturer. The entire system from the equipment connection to the termination, including accessories, shall be from one manufacturer.

Install all equipment per manufacturer's recommendations.

End of Section

SECTION 15650

REFRIGERATION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of refrigerant piping and accessories, condensing units, heat pumps, room air conditioners, packaged air conditioning units, package heat pumps, water chillers, and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for functions and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein as indicated in the Contract Documents, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between these specifications and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

The refrigerant systems shall be constructed in accordance with ASHRAE Standard 15.

Refrigeration system equipment shall have a minimum efficiency of not less than specified in the latest edition of ASHRAE 90.1, unless otherwise indicated on the drawings.

Capacity ratings for condensing units, heat pumps, packaged air conditioning units, and packaged heat pumps with capacities less than 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 210/240. For condensing units, heat pumps, packaged air conditioning units over 135,000 BTUH (39 kW) the capacity ratings shall be in accordance with ARI Standard 360. Capacity ratings for packaged heat pumps with capacities over 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 340.

Water chiller construction, ratings, and testing shall conform to the requirements of ANSI/ARI 590.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise indicated or required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, and valves denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Refrigerant Piping

Schematic arrangement showing equipment, coils, piping sizes, valves, and accessories.

A refrigerant piping schematic indicating refrigerant piping sizes and corresponding velocities, accessories, accessory pressure losses, and piping pitch and direction.

Air Cooled Condensing Units/Heat Pumps

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Locations and sizes of field connections.

Certified performance data and ratings.

Capacity and saturated suction temperature at specified conditions.

Equipment efficiency ratings.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Room Air Conditioners

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Certified performance data and ratings.

Capacity at specified conditions.

Overall dimensions and required clearances.

Wiring diagrams and electrical requirements.

Net weight.

Information on local equipment manufacturers' representatives.

Packaged Air Conditioning Units/Packaged Heat Pumps

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Locations and sizes of field connections.

Certified performance data and ratings.

Capacity at specified conditions.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Water Chillers

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Certified performance data and ratings.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Equipment Motors

Name of Manufacturer.

Type and Model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Bearing types and numbers.

Weight.

Overall dimensions.

Full load amperes, efficiency, and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied and shall be submitted in accordance with the Master Specification Section 01160, Training and Operation and Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. One complete change of lubricating oil and two sets of air filters shall be furnished for the equipment.

Extra materials shall be packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment and coil capacities shall be as indicated on the schedules.

Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as required.

Each fan's operating selection point on the fan curves shall be selected to the right of the peak pressure/efficiency point and below the lowest point along the fan curve, to the left of the peak pressure/efficiency point.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Cast iron or welded steel baseplates shall be provided for pumps, compressors, and other equipment. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection. Baseplates will be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.08 Refrigerant Piping and Accessories. Refrigerant piping shall conform to Master Specification Section 15070, Copper Tubing and Accessories. Piping shall be supported as specified in Master Specification Section 15140, Pipe Supports. Refrigerant filter dryers, expansion valves, solenoid valves, combination sight glass and moisture indicators, charging valves, relief valves, and other accessories shall be furnished and installed as needed for proper operation of the system.

The refrigerant piping size and arrangement shall be in accordance with the manufacturer's recommendations. Pipe routing and isolation shall be selected to minimize vibration and sound transmission to the conditioned space. The refrigerant piping system shall be provided with the necessary traps and risers for uniform oil return to the compressor. The suction gas line shall be sized to produce a minimum load gas velocity of 1,000 feet per minute (5 m/s) in vertical risers with upward gas flow and 500 feet per minute (2.5 m/s) in horizontal piping. The full load pressure drop should not exceed 3 psi (20 kPa) or 2°F (1°C) change in saturated refrigerant temperature. The maximum gas velocity shall not exceed 4,000 feet per minute (20 m/s). The liquid lines shall be sized to limit the pressure loss to an equivalent of 2°F (1°C) of temperature change and a maximum liquid line velocity of 360 feet per minute (1.8 m/s).

2.5 EQUIPMENT.

2.5.01 Condensing Units/ Heat Pumps. Condensing units, denoted by the symbol "CU" and an identifying number and heat pumps denoted by the symbol "HP" and an identifying number, shall be furnished and installed where indicated on the drawings. Each unit shall consist of compressor(s), condenser coil, condenser fan(s) and motor(s), starters, and all controls necessary for proper operation. Condensing units and heat pumps shall be manufactured by Trane, Carrier, McQuay, York, or approved equal.

2.5.01.01 Performance and Design Requirements. Each unit shall be completely factory assembled and tested, piped, internally wired, and shipped in one piece. Condensing units and heat pumps shall be selected to satisfy the cooling and cooling/heating requirements of the air handling unit being served. A 2°F (1°C) suction temperature difference for piping losses shall be allowed between the condensing unit or heat pump and the air handling unit when in the cooling mode.

As required, condensing units and heat pumps shall be capable of satisfactory operation in the cooling mode at the minimum ambient air temperature indicated. When required to operate in the cooling mode at a lower temperature than the factory standard, a low ambient kit shall be installed. The low ambient kit shall be designed for ambient temperature of 0°F (-18°C) consisting of a solid state controller to vary the speed of the outdoor fan motor in response to refrigerant condensing temperature. Heat pumps shall be capable of operating satisfactorily at an ambient air temperature of 0°F (-18°C) in the heating mode.

The condensing units and heat pumps shall be designed to operate on the power supply as indicated on the drawings.

2.5.01.02 Casing. The unit casing shall be of weatherproof design, constructed of heavy gage galvanized or zinc-coated steel, and reinforced and braced for maximum rigidity. All bracing and reinforcing members shall be integral to each unit. The casing shall be given a factory-applied coat of rust-inhibitive universal primer, followed by the manufacturer's standard baked enamel finish. Fasteners shall be stainless steel or coated for corrosion protection. Each unit shall have removable panels or access doors for access to all components and connections. Drainage holes shall be located in the base section for moisture removal. The unit shall be supported above the mounting surface with base rails or feet.

2.5.01.03 Outdoor Coils. Outdoor coils shall be of the air-cooled, finned tube type with liquid accumulator and integral subcoolers. The coils shall be constructed of 3/8 inch (10 mm) OD seamless copper tubing with aluminum fins securely bonded to the surface. Coils shall be factory leak and pressure tested at 425 psig (2930 kPa gauge) and then completely dehydrated and sealed with a holding charge of nitrogen or refrigerant. The coils shall be protected from hail damage by louvered metal grilles or on units 5 tons or less, corrosion resistant wire maybe used.

2.5.01.04 Fans and Motors. Outdoor fans shall be vertical discharge, direct-driven propeller type, and shall be statically and dynamically balanced. Fan guards shall be located on the discharge of each fan. Fan motors shall be TEFC suitable for outdoor installation and shall have permanently lubricated ball bearings and built-in overload protection.

2.5.01.05 Compressors. Compressors shall be of the reciprocating hermetic, semi-hermetic, or scroll type mounted on vibration isolators. The compressor motor shall have temperature and current sensitive overload protection devices. Where the compressors are located outside the cabinet, grilles shall be installed over the openings to protect the compressor area.

Reciprocating hermetic compressors shall be suction gas cooled with internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, and automatic reset timer to prevent the compressor from rapid cycling.

Reciprocating semi-hermetic compressors shall be suction gas cooled, internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, oil level sight glass, and automatic reset timer to prevent the compressor from rapid cycling. Capacity reduction shall be provided by automatic suction valve unloaders. The minimum number of capacity step reductions shall be as required. Each compressor shall start unloaded.

Scroll compressors shall be suction gas cooled with high and low pressure cutout switches and automatic reset timer to prevent the compressor from rapid cycling. The compressor shall have radial and axial compliant scroll plates to allow the compressor to handle liquid slugging without damage to the compressor.

2.5.01.06 Refrigerant Circuit and Accessories. Each unit shall be completely factory assembled, tested, and fully charged with Refrigerant-22 and compressor oil. Each refrigerant circuit shall be equipped with filter-dryer and multiuse liquid and gas line valves. The multiuse valves shall be constructed of brass with service pressure gauge ports. For condensing units and heat pumps larger than 20 tons (70.3 kW), factory mounted suction and discharge pressure gauges shall be provided. All factory installed gauges, switches, and other devices connected to the refrigerant circuit shall have isolation valves.

Heat pumps shall be provided with reversing valve, flow control check valve, and solid state defrost control system. The defrost system shall be a time and temperature initiated system that activates in response to a temperature sensing element mounted at the outdoor coil.

A hot gas bypass kit, including but not limited to a solenoid valve and hot gas bypass valve shall be provided for each condensing unit larger than 5 tons (17.5 kW). For condensing units larger than 20 tons (70.3 kW), the kits shall be factory installed. For condensing units smaller than 20 tons (70.3 kW), the kit maybe field installed.

2.5.01.07 Controls. Condensing units and heat pumps shall be completely factory wired for a single point power supply connection. All wiring shall be installed in accordance with the National Electrical Code.

Condensing units and heat pumps 5 tons (17.5 kW) or less shall be provided with factory wired control panel containing magnetic contactors, relays, and control power transformer. Units larger than 5 tons (17.5 kW) shall be provided with a factory wired control panel containing full voltage magnetic starters for compressor and outdoor fan motors and internal volt control power transformer.

Units with multiple compressors shall have a built-in time delay to prevent both compressors from starting simultaneously.

All internal panel wiring shall be neatly run in gutters or bundles to terminal strips for connection of external wiring. All wires and terminal strips shall be numbered or color coded in accordance with the wiring diagram. All internal and external controls, gauges, lights, and switches shall be identified with nameplates. A complete wiring diagram showing the compressor and fan starting circuits and the control circuit shall be furnished.

Terminal blocks shall be factory wired to provide terminal points for permissive start for each stage of cooling or cooling and heating from a remotely located control panel or thermostat, supply voltage terminal points for remotely located refrigerant solenoid valves, and terminal points to energize remote condensing unit and heat pump indicating lights.

An electrically separate, normally open contact shall be furnished to actuate remote indication of unit shutdown in the event any of the safety interlocks automatically shuts down the unit. The contact shall close on any safety condition except low refrigerant suction pressure.

A thermostat for operation of the unit shall be furnished and installed as indicated on the drawings. The thermostat type shall be as needed to perform the sequence of operation as indicated on the drawings.

The thermostat shall be a programmable or a nonprogrammable heating and cooling type with automatic changeover. The number of stages shall be suitable for the unit control and operation. The thermostat shall have a range of approximately 50 to 90°F (10 to 32°C) with at least a 5°F (3°C) deadband between heating and cooling. The thermostat shall have a subbase to control system and fan operation.

2.5.02 Room Air Conditioner. A room air conditioner denoted by the symbol "RAC" and an identifying number, shall be furnished and installed where indicated on the drawings. The unit manufacturer and model number shall be as indicated.

The unit shall be complete with hermetic motor-compressor, evaporator coil, condenser coil, fan motor, evaporator blower and condensing fan, drain pan, built-in thermostat, and all other necessary operating and safety controls. The slide-out chassis shall be mounted in a heavy gage galvanized steel cabinet. The unit shall provide positive exhaust and ventilation and shall have easily removable, washable filter. The unit shall be designed to operate on the power supply as indicated on the drawings.

2.5.03 Packaged Air Conditioning /Heat Pump Units. Packaged air conditioning units, denoted by the symbol "PAC" and an identifying number, and packaged heat pumps denoted by the symbol "PHP" and an identifying number shall be furnished and installed where indicated on the drawings. Each unit shall be designed for outdoor installation on a full perimeter curb or equipment pad as indicated on the drawings. The packaged air conditioning unit shall be manufactured by Trane, Carrier, McQuay, York, or approved equal.

2.5.03.01 Performance and Design Requirements. The units shall be completely factory assembled and tested, piped, internally wired, fully charged with Refrigerant-22 and compressor oil, and shipped in one piece. The unit shall be designed for direct expansion cooling and configured for heating type indicated. The unit shall be suitable for the power supply and shall have the capacities indicated on the drawings.

The refrigeration system shall be capable of satisfactory operation at outdoor ambient air temperatures of 50°F (10°C) in the cooling mode and for heat pumps, 0°F (-18°C) in the heating mode. When required to operate in the cooling mode at a lower temperature than the factory standard, a low ambient kit shall be installed. The low ambient kit shall be designed for ambient temperature of 0°F (-18°C) consisting of a solid state controller to vary the speed of the outdoor fan motor in response to refrigerant condensing temperature.

2.5.03.02 Casing. The unit casing shall be of weatherproof design and shall be constructed of 20 gage (0.91 mm) or heavier zinc-coated steel. The casing shall be properly reinforced and braced for maximum rigidity. The casing shall be given a factory-applied coat of rust-inhibitive primer and shall be provided with the manufacturer's standard baked enamel finish. Interior surfaces of exterior casing members in contact with the airstream shall have one inch (25mm) thick, one pound (454 kg) density, insulation coated on the air side. Aluminum foil-faced glass fiber insulation shall be used in gas fired heating sections. Hinged, insulated, neoprene gasketed access doors or removable panels shall be provided to permit easy inspection and maintenance. Removable insulated access panels shall have aluminum or steel covering on the interior to protect the insulation. The unit base shall be a one-piece, welded assembly with suitable roof curb sealing gasket and curb overhang for water runoff. Drains shall be provided to accommodate outdoor coil runoff.

Where an economizer package is not specified, a manually set air damper shall be furnished to provide the indicated outside air volume.

2.5.03.03 Indoor Coil Section. The indoor coil shall be multirow of seamless copper tubing mechanically bonded to heavy-duty aluminum fins. The coil shall be factory leak tested underwater at 200 psig (1380 kPa gauge). The coil shall be provided with expansion device or valve, filter-dryer, and moisture indicator. The indoor coil section shall have fully insulated, sloped drain pan extending under the entire coil section and extending sufficiently past the coil to capture and collect any condensate carryover that may be produced when the unit is operating within the specified operating conditions.

2.5.03.04 Heating Sections. When indicated on the drawings, the unit shall have an electric heating coil, gas heating section, or auxiliary electric heating coil. Electric heater coils shall be completely factory assembled and wired integral within the unit. Coils shall be heavy-duty nickel chromium with an automatic reset device to de-energize all staging contactors on high temperature. The heating coils shall be electrically subdivided within the unit into balanced, individually fused stages as required by the National Electrical Code. The heating coil shall have the minimum number of stages indicated in the schedules on the drawings.

Gas-fired heating sections shall be completely factory assembled and wired integral within the unit. When located upstream of the cooling coil, the heating section shall be AGA design certified specifically for outdoor applications upstream of a refrigerant cooling coil. The heat exchanger shall be of constructed of minimum 20 gage (0.91mm) aluminized steel. The burner shall be induced or forced draft type with pressure regulator, redundant main gas valve, manual shutoff valve, and intermittent spark ignition. A flame sensing device and high limit safety controls shall be provided. The number of heating stages shall be as indicated in the schedules on the drawings.

The unit shall be supplied with natural gas having a calorific value of approximately 1000 Btu per cubic foot (37 MJ/m^3) at an inlet pressure as required.

2.5.03.05 Filters. Filters shall be mounted integral within the packaged air conditioning or heat pump unit and shall be 2 inches (50 mm) thick. Hinged access doors shall be provided. Filters shall conform to the requirements in Master Specification Section 15880, Air Distribution Systems.

2.5.03.06 Fans and Motors. The indoor supply fan shall be forward-curved, multiblade, centrifugal type and shall be statically and dynamically balanced by the fan manufacturer. The fan shall have die-formed, streamlined inlets and the scroll shall be constructed of steel with all seams sealed airtight. The fan shall have steel shafts operating in self-aligning, grease lubricated ball bearings.

Units 5 tons (17.5 kW) and smaller shall have direct or belt driven fans. Where direct driven fans are used, the fan shall have multiple speeds to allow for airflow adjustment. Units greater than 5 tons (17.5 kW) shall have V-belt drive with adjustable sheaves and shall be designed for 50 percent overload. The supply fan motor shall conform to the requirements of the Motors and Motor Controls paragraph. Vibration isolators shall be provided for the fan assembly and motor assembly.

Static pressure values indicated on the drawings are external to the complete unit. Internal coil(s), dampers, filters and fan housing losses are not included. A filter allowance of 0.35 inch water column (0.087 kPa) shall be used for 2 inch (50 mm) pleated filter losses.

The outdoor fans shall be direct drive, vertical discharge, propeller type with aluminum blades. Fan motors shall be weatherproof with permanently lubricated ball bearings and built-in thermal overload protection. A corrosion resistant wire guard shall be installed over the fan opening.

2.5.03.07 Compressors. Compressors shall be of the reciprocating hermetic, semi-hermetic, or scroll type mounted on vibration isolators. The compressor motor shall have temperature and current sensitive overload protection devices. Each packaged air conditioning or heat pump unit shall have a minimum number of capacity reduction steps as indicated in the schedules on the drawings.

Reciprocating hermetic compressors shall be suction gas cooled with internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, and automatic reset timer to prevent the compressor from rapid cycling.

Reciprocating semi-hermetic compressors shall be suction gas cooled, internal pressure relief for high pressure protection, high and low pressure cutout switches, temperature actuated crankcase heater, oil level sight glass, and automatic reset timer to prevent the compressor from rapid cycling. Capacity reduction shall be provided by automatic suction valve unloaders. Each compressor shall start unloaded.

Scroll compressors shall be suction gas cooled with high and low pressure cutout switches and automatic reset timer to prevent the compressor from rapid cycling. The compressor shall have radial and axial compliant scroll plates to allow the compressor to handle liquid slugging without damage to the compressor.

2.5.03.08 Refrigerant Circuit. The factory sealed refrigerant system shall consist of compressors, outdoor coils, indoors coils, expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, refrigerant piping, and a full operating charge of refrigerant. Service gauge connections shall be furnished on the suction, discharge, and liquid lines. Units with multiple compressors shall have multiple circuits with separate expansion device, refrigerant dryer, reversing valves for heat pump units, accumulators, compressor, and refrigerant charge. All factory installed gauges, switches, and other devices connected to the refrigerant circuit shall have isolation valves.

2.5.03.09 Outdoor Coil. The outdoor coil shall be of the air-cooled integral finned tube type. The coil shall be constructed of copper tubes with aluminum fins permanently and securely bonded to the tubes. The coil shall be factory leak and pressure tested. The coils shall be protected with hail guards.

2.5.03.10 Accessories. Where indicated on the drawings, the packaged unit shall be provided with economizer cycle to automatically utilize up to 100 percent of outside air for cooling. The economizer shall be controlled as required, and shall modulate return and outside air dampers to maintain proper discharge temperature into the conditioned space. The dampers shall be equipped with automatic lockout when the outside air temperature is too high for proper cooling, and shall have adjustable minimum position control. The damper motor shall be spring return and shall operate to close the outside damper during shutdown. A means for 100 percent relief of the return air shall be provided unless otherwise noted.

Where indicated on the drawings, hot gas bypass shall be installed to provide reduced capacity control.

When required, packaged units shall be furnished with a roof mounting curb. The curb shall be constructed of at least 16 gage (1.52 mm) zinc-coated steel with nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply and return air openings. The curb shall be a minimum of 16 inches (405 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.5.03.11 Controls. Each packaged unit shall be completely factory wired and shall have a single point power connection and unit mounted disconnect switch. All wiring shall be installed in accordance with the National Electrical Code.

The unit shall be provided with remote control and monitoring panel consisting of system operation switches and signal lights. The signal lights shall be for power, outage, dirty filters, and reset relay.

Packaged units shall be provided with a factory wired control panel containing full voltage magnetic starters for compressor, outdoor fan, and indoor fan motors, and internal volt control power transformer.

Defrost controls, electronic timed initiated and temperature terminated with field adjustable timer shall be provided for all packaged heat pumps. When auxiliary electric heating is provided, a factory installed emergency heat package shall be provided. When heating is locked out, the auxiliary heat shall be activated as necessary.

Units with multiple compressors shall have a built-in time delay to prevent both compressors from starting simultaneously.

All internal panel wiring shall be neatly run in gutters or bundles to terminal strips for connection of external wiring. All wires and terminal strips shall be numbered or color coded in accordance with the wiring diagram. All internal and external controls, gauges, lights, and switches shall be identified with nameplates. A complete wiring diagram showing the compressor and fan starting circuits and the control circuit shall be furnished.

Terminal blocks shall be factory wired to provide terminal points for permissive start for each stage of cooling or cooling and heating from a remotely located control panel or thermostat; terminal points to energize remote dirty filter, heating mode, cooling mode, and service indicating lights; and terminal points to de-energize the unit upon detection of smoke.

A thermostat for operation of the unit shall be furnished and installed as indicated and located where indicated on the drawings.

The thermostat shall be a manual changeover, automatic changeover, or programmable heating and cooling type. The number of stages shall be suitable for the unit control and operation. The thermostat shall have a range of approximately 50° to 90°F (10° to 32°C) with at least a 5°F (3°C) deadband between heating and cooling. The thermostat shall have a subbase to control system and fan operation.

2.5.04 Water Chillers. Packaged water chillers, denoted by the symbol "WC" and an identifying number, shall be furnished and installed where indicated on the drawings. The water chillers shall be manufactured by McQuay, Carrier, Trane, or approved equal.

2.5.04.01 Performance and Design Requirements. The package chillers shall consist of compressors, evaporator, shell and tube type condenser, thermal expansion valve, refrigerant accessories, and control panel. The chillers shall be completely factory assembled, wired, factory run tested. The complete assembly shall be mounted on a structural steel base.

The water chiller capacity and the evaporator and condenser fouling factors shall be as indicated in the schedules on the drawings. The capacity indicated is a minimum capacity. Units furnished shall be provided with sufficient capacities to account for tolerances due to manufacturing and testing variations. The minimum coefficient of performance (COP) and integrated part-load value (IPLV) shall meet the latest version of the ASHRAE Standard 90.1.

2.5.04.02 Compressors. Each compressor shall be a reciprocating, direct drive, 1750 rpm, semi-hermetic type suitable for use with Refrigerant-22. The compressors shall be equipped with suction and discharge service valves, hot gas muffler, internal relief valves, double-mesh suction inlet screens, and shall be mounted on spring isolators.

Each compressor shall be furnished with forced feed lubrication system complete with reversible, positive displacement oil pump, oil charging valve, oil level sight glass, and oil filter arranged to provide lubrication during startup, normal, and stopping operations. A crankcase heater shall be provided to prevent dilution of the oil by the refrigerant.

The compressor motor shall be suction gas cooled with solid state motor protector and shall have automatic capacity reduction equipment consisting of suction valve unloaders. As required, the minimum number of capacity step reductions shall be as indicated. Each compressor shall start unloaded.

2.5.04.03 Evaporators. The evaporators shall be shell and tube type with removable heads, internal water baffles, and integrally finned seamless copper tubes expanded into tube sheets. Each tube shall be individually replaceable. The evaporators shall be constructed, tested, and stamped in accordance with the ASME Code for Unfired Pressure Vessels for a refrigerant side working pressure of 225 psig (1550 kPa gauge) and a water side working pressure of 150 psig (1035 kPa gauge), and shall be insulated with 3/4 inch (19 mm) flexible closed cell plastic insulation.

2.5.04.04 Condensers. The condensers shall be shell and tube design with high strength steel shell and seamless, integral fin, copper tubes expanded into tube sheets. The condensers shall be constructed, tested, and stamped in accordance with the ASME Code for Unfired Pressure Vessels for a refrigerant side working pressure of 300 psig (2070 kPa gauge) and a water side working pressure of 150 psig (1035 kPa gauge). Each condenser shall have an integral subcooler circuit and a safety pressure relief.

Where potable water is supplied to the condenser, the condenser construction shall be suitable for use with potable water. Tubes shall be constructed of 90/10 cuppro-nickel, tube sheets shall be monel clad, and the heads epoxy coated.

2.5.04.05 Refrigerant Circuit. Each package chiller shall have a liquid line shutoff valve, filter dryer, liquid line sight glass with moisture indicator, liquid line solenoid valve, thermal expansion valve, compressor discharge service valve, insulated suction line, pressure relief device, and a charging valve. Chillers which have multiple compressors shall use independent refrigerant circuits. Each circuit shall be permitted to be shutdown without impacting the operation of the other circuit. The chillers shall be pressure tested, evacuated, and given full operating charge of Refrigerant-22 at the factory.

2.5.04.06 Accessories. The compressor shall be enclosed by a sound attenuator consisting of an acoustically lined compartment of 16 gage (1.52 mm) metal with one inch (25mm) of 1-1/2 pound (24 kg/m^3) density glass fiber lining.

When required, the chiller shall have hot gas bypass permitting the unit to operate down to 10 percent of the full load capacity. The hot gas bypass shall include hot gas bypass valve, solenoid valve, manual shutoff valve and all required controls. Units with hot gas bypass need not include a lead-lag compressor control.

Rubber-in-shear or spring isolators shall be provided for installation beneath the unit frame.

Each chiller shall be fitted with a gauge package consisting of high and low side refrigerant pressure gauges per refrigerant circuit and oil pressure gauge per compressor. A shutoff valve shall be included for each gauge.

Each chiller shall be provided with an evaporator and condenser water flow switches.

Condenser water regulating valves shall be provided by the chiller manufacturer.

2.5.04.07 Controls. A factory-built control panel with hinged access doors shall be mounted on each chiller. The control panel shall contain provisions for single point power connection, non-fused disconnect switch, starters, safety controls, control power transformer, fused control circuit, and terminal strips. Each compressor shall be provided with starter and motor contactors, non-recycling three phase compressor overload protection, and current overload protection. The starter type shall be as required. All accessories provided with the unit as specified herein and indicated in the sequence of operations shall be prewired for power and control to the unit control panel by the unit manufacturer.

A standard control package, or a microprocessor based interface shall be provided, as required.

As indicated, a factory-built sequence control panel shall be provided to control a multiple chiller system as set forth in the Sequence of Operations on the drawings.

2.5.04.07.01 Standard Control Package. The control panel shall have lights to indicate the status of all unit safeties, power, and compressor staging. An individual light shall be provided for each safety condition. An electrically separate, normally open contact shall be furnished to actuate a remove indication in the event any of the safety interlocks, except low refrigerant suction pressure, automatically shuts down the unit.

Each chiller circuit shall have recycling pump-down control, high pressure control, low pressure control, motor protector with oil pressure cutout, and low temperature cutout. An anti-recycle timer and timed periodic pumpout shall be provided to prevent rapid compressor cycling and liquid slugging. Except for units with hot gas bypass on one refrigerant circuit, units with multiple compressors shall have lead-lag compressor control.

A chilled water temperature controller and sensor set to maintain a nominal 45°F (7°C) leaving chilled water temperature shall cycle the compressors and activate the cylinder unloaders in response to the supply/return chilled water temperature.

2.5.04.07.02 Microprocessor Based Interface. The control panel shall contain a microprocessor based interface system capable of controlling the unit operation, setting control parameters, and monitoring alarm status. The microprocessor control system shall be pre-programmed with English language display, non-volatile memory, and shall be capable of displaying alarm diagnostics. Entering/leaving evaporator temperatures, entering/leaving condenser water temperatures, suction temperature of each circuit, suction pressure, discharge pressure, and alarm status shall be displayed using the interface system.

2.6 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.7 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.7.01 Adjustable Frequency Drives. Adjustable frequency drives shall be provided as indicated on the drawings and shall be coordinated with the requirements of the associated equipment. The equipment manufacturer shall be responsible for furnishing the adjustable frequency drive, for matching the motor and the drive, and for coordinating the collection of data and the design to limit harmonics to the levels specified.

Adjustable frequency drives shall be as covered in Master Specification Section 16150, Variable Frequency Drives.

2.7.02 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor.

2.7.03 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm thick) or thicker galvanized or aluminum-clad sheet steel or from ½ inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.7.04 Electric Motors. Motors furnished with equipment shall meet the following requirements.

> A manufacturer's standard motor may be supplied on packaged equipment and fans in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

Outdoor equipment.

Equipment for installation below grade.

Equipment operating in chemical feed and chemical handling locations.

Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor’s option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

Motors shall be rated as follows:

<u>Below 1/2 hp (0.4 kW)</u>.
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

<u>½ hp (0.4 kW) and above</u>.
460 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

Motors to be used with adjustable frequency drives shall be rated for inverted service.

2.8 <u>SHOP TESTING</u>. The equipment furnished under this section shall be tested at the factory according to the standard practice of the manufacturer. Ratings shall be based on tests made in accordance with applicable AMCA, ASHRAE, ARI, NBS, NFPA, and UL Standards.

2.9 <u>BALANCE</u>. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the lastest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will prevent dust or other contaminants from getting on freshly painted surfaces. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath the baseplate shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Valves. Valves shall be installed with their stems horizontal or vertical and above the valve body and with the applicable requirements of the miscellaneous valve sections.

3.3.02 Refrigerant Piping and Accessories. The refrigerant piping shall be sized and arranged in accordance with the manufacturer's recommendations. Pipe routing and isolation shall be selected to minimize vibration and transmission of sound to the conditioned space. The refrigerant piping system shall be provided with the necessary traps and risers for uniform return of oil to the compressor. The suction gas line shall be sized to produce a minimum load gas velocity of 1,000 feet per minute (5 m/sec) in vertical risers with upward gas flow and 500 feet per minute (2.5 m/s) in horizontal piping. The full load pressure drop should not exceed 3 psi (20 kPa) or 2°F (1°C) change in saturated refrigerant temperature. The maximum gas velocity shall not exceed 4,000 feet per minute (20 m/s). The liquid lines shall be sized to limit the pressure loss to the equivalent of 2°F (1°C) of temperature change and a maximum liquid line velocity of 360 feet per minute (1.8 m/s). A piping schematic indicating refrigerant piping sizes and corresponding velocities, accessories, accessory pressure losses, and piping pitch and direction shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

3.3.03 Condensing Units/Heat Pumps. The condensing units and heat pumps shall be installed in accordance with the manufacturer's installation instructions. Each unit shall be leveled and installed to maintain the manufacturer's recommended clearances. The units shall be firmly anchored where indicated on the drawings.

After the refrigerant system has been tested, the system shall be fully charged with refrigerant 22 and compressor oil.

3.3.04 Packaged Air Conditioning Units/Packaged Heat Pumps. The packaged air conditioning units and packaged heat pumps shall be installed in accordance with the manufacturer's installation instructions. Each unit shall be leveled and installed to maintain the manufacturer's recommended clearances. The units shall be firmly anchored where indicated on the drawings.

3.3.05 Water Chillers. Packaged water chillers shall be installed in accordance with the manufacturer's installation instructions. Each chiller shall be installed level on vibration isolators firmly anchored to the concrete equipment base. Piping around chiller shall be arranged for easy dismantling and permit tube cleaning.

The chiller safety relief valve shall be piped to outdoors at a location not less than 15 feet (4.6 m) above grade and not less than 20 feet (6.1 m) from any operable window, ventilation opening, or exit. The discharge termination shall be arranged to prevent direct spray on personnel in vicinity and foreign material from entering the discharge piping. The pipe size shall be as recommended by the water chiller manufacturer.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

If inspection or tests indicate defects, the defective work or material shall be replaced, and inspection and tests repeated. All repairs to piping shall be made with new materials. Caulking of threaded joints or holes will not be acceptable

3.4.03 Operator Instruction and Training. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

3.5. CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner.

End of Section

SECTION 15755

HEAT EXCHANGERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heat exchangers for the locations and services as indicated.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts and Tools shall apply to all equipment provided under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer. At least 3 feet (1 m) of clear access space shall be provided on all sides of the unit.

1.2.03 Tagging. Each item of equipment and each part shipped separately shall be tagged and identified with indelible markings for the intended service. Tag number shall be clearly marked on all shipping labels and on the outside of all containers.

1.2.04 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow convenient collection of waste oil in containers from the operating area or platform without removing the unit from its normal installed position.

1.2.05 Abbreviations. Reference to standards and organizations herein shall be as indicated by the following designations.

AISC	American Institute of Steel Construction
AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
AWS	American Welding Society
NEMA	National Electrical Manufacturers Association
NPT	National Pipe Thread
UL	Underwriters' Laboratories
USS	United States Standard

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals. The data and specifications for each unit shall include, but shall not be limited to, the following:

Equipment drawings showing dimensions, connection sizes and locations, and maintenance clearances.

Unit shipping and operation weights.

Heat transfer capacity rating.

Design conditions of heat transfer capacity rating.

Heat transfer surface area.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with the Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.5 SPARE PARTS. A matched set of V-belts and matched set of gaskets shall be provided.

Spare parts shall be suitably packaged with labels indicating the contents of each package. Spare parts shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The heat exchangers shall be suitable for the service conditions as indicated.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Heat exchangers and accessories shall be designed for the performance and design requirements as indicated.

2.3 MATERIALS.

Plate and Frame Heat Exchangers	
Plates	As required.
Guide Bars	Stainless or chrome plated steel.
Frame	Carbon steel.
Tie Bolts	Stainless or zinc plated steel.
Gaskets	One-piece molded elastomer suitable for the specified service.
Cover	Galvanized steel, 14 gage (1.89 mm) minimum thickness.
Air-Cooled Heat Exchangers	
Frame	Carbon steel, galvanized.
Core	Continuous aluminum plate fins mechanically bonded to tubes.
Fan Impeller	Aluminum; air foil design.
Shell and Tube Heat Exchangers	
Shell	Fabricated steel.
Tubes	Inhibited Admiralty
Tube Sheets	90-10 Cu Ni
Rust-Preventive Compound	As recommended by manufacturer.

2.4 CONSTRUCTION. Connections 2-1/2 inch (63 mm) and larger shall be ANSI B16.5, Class 150 flanges. Connections 2 inch (50 mm) and smaller shall be NPT threaded.

Each unit shall be provided with provisions for lifting.

Each exchanger shall be designed to ASME Section VIII requirements. The heat exchanger shall bear the ASME stamp for unfired pressure vessels.

2.5 PLATE AND FRAME EXCHANGERS. Plate and frame type heat exchangers shall be constructed with a frame suitable for mounting on a concrete pad foundation. Plates shall be corrugated and shall include flow directors which shall evenly distribute the fluids over the exchange surface. Each plate shall have provisions for support and proper alignment of the members. Plates shall be of standard size of the manufacturer and replaceable with minimum disassembly of the unit. Each heat exchanger shall be provided with a protective sheet metal cover over the plate sections which can be easily removed without disturbing the piping connections. Heat exchangers shall be shop assembled with all openings sealed prior to shipment.

2.6 AIR-COOLED EXCHANGERS. Air-cooled heat exchangers shall consist of the heat exchange core section complete with fan and structural frame suitable for mounting on a concrete pad foundation. Manifolds shall be removable for access to and cleaning of tubes. Core shall be pitched to a drain connection with shutoff valve.

Fans shall be forced draft driven by an electric drive motor.

2.7 SHELL AND TUBE EXCHANGERS. Shell and tube type heat exchangers shall be horizontal tube type with removable tube bundle. Exchangers shall be constructed with fabricated channels at each end. Channels shall have flanged and bolted covers which can be removed without disturbing any piping connections

Shells shall be of welded construction and include provisions for expansion of one of the tube sheets and channels if required by the manufacturer's design for the specified conditions. Shells shall have two supports suitable for mounting on concrete pad foundations. All necessary connections shall be provided for piping, vents, drains and instruments.

Tubes shall be rolled into the tube sheets and shall be adequately supported to prevent sagging or vibration. The method of expanding the tubes shall be such as to not change the size of the tube sheet opening. The tube bundle supports shall be arranged as baffles to obtain the most effective distribution of the fluid above and around the entire tube bundle.

Tube sheets shall be of adequate thickness for the design pressures and physical size of the exchanger with a minimum thickness of one inch. Tube holes shall be arranged on a triangular pitch. Tube hole edges shall be chamfered on the shell side and each hole shall be provided with a minimum of two grooves. The bridge between tube holes shall be not less than 3/16 inch (5 mm) nominal.

2.8 ACCESSORIES.

2.8.01 Relief Valves. A relief valve shall be furnished on each liquid side of each exchanger. Relief valves shall have manual lifting levers and shall be capable of protecting the exchanger from overpressure in the event the exchanger is operated with closed isolation valves.

2.8.02 Temperature Switches. Temperature switches shall be provided in the air-cooled exchanger manifold for control of the fan. Switches shall close on rising temperature to start the fan motor. Switch contacts shall be rated at least 10 amperes at 120 volts ac.

2.8.03 Anchor Bolts. Anchor bolts and nuts shall be furnished as required for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed.

The bolts shall be at least 3/4 inch (19 mm) in diameter.

Anchor bolts shall be accurately located and centered in pipe sleeves having an inside diameter approximately 2-1/2 times the bolt diameter and a length approximately 8 times the bolt diameter. A square anchor plate with thickness of approximately 1/2 the bolt diameter and side dimensions 4 times the bolt diameter shall be welded to the bottom of each sleeve, with the anchor bolt extended through the plate and welded thereto. Two nuts and a washer shall be furnished with each anchor bolt.

All anchor bolts, nuts, and washers shall be carbon steel, stainless steel, or galvanized steel.

Anchor Bolts and Nuts

Carbon Steel	ASTM A307 or ASTM A36.

Stainless Steel

AISI Type 304, 305, 384, 304L	Bolts ASTM F593, Alloy Group 1; Nuts ASTM F594, Alloy Group 1.
AISI Type 316, 316L	Bolts ASTM F593, Alloy Group 2; Nuts ASTM F594, Alloy Group 2.
Galvanized Steel	Carbon steel bolts and nuts; hot-dip galvanized, ASTM A153 and A385.
Flat Washers	ANSI B18.22.1; of the same material as the bolts and nuts.

Anchor bolts shall be long enough to accommodate at least 1-1/2 inches (38 mm) of grout beneath the baseplate and to provide adequate anchorage into structural concrete.

Anti-seize compound will be applied to the threads of all stainless steel bolts before assembly.

2.9 DRIVE UNITS Each fan shall be driven by an electric motor. Drive units shall be designed for 24 hour continuous service.

2.9.01 Belt Drive When belt drives are required by the manufacturer's design, V-belt and sheave groove dimensional tolerances shall be in accordance with the "Engineering Standards - Multiple V-Belt Drives" published by the Multiple V-Belt Drive and Mechanical Power Transmission Association. Belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate power rating of the drive motor. The speed reduction ratio of belt drives shall not exceed 4 to 1. Each belt drive shall include a sliding base or other suitable means of tension adjustment.

2.9.02 Safety Guards All belt drives, fan blades, couplings, and other moving or rotating parts of the units shall be covered on all sides by a safety guard, fabricated from 16 USS gage (1.52 mm thick) or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal and shall be furnished complete with all necessary supports and accessories. Supports and accessories, including bolts, shall be galvanized. Safety guards in outdoor locations shall be designed to keep out rain and dripping water.

2.9.03 Electric Motors. The electric motors shall be as indicated in Master Specification Section 16220, General Purpose Induction Motors.

2.10 SHOP COATING. All steel and iron surfaces shall be protected by suitable shop-applied coatings. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment with coatings suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for coating. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for being top-coated in the field with a universal primer and aliphatic polyurethane system.

Machined, polished, and nonferrous surfaces shall be coated with rust-preventive compound.

All other surfaces to be coated after installation shall be prepared for coating as recommended by the coating manufacturer for the intended service, and then shop coated with one or more coats of the specified shop primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

2.11 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the contract price for the number of days and round trips to the site as required.

3.2.02 Installation Supervision. The equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the contract price.

Manufacturers' installation supervisor shall observe, instruct, guide, and direct the installing contractor's erection or installation procedures. The equipment manufacturer will be notified with written notification 10 working days prior to the need for such services.

3.3 TRAINING. The manufacturer's representative shall provide training for Owner in proper operation and maintenance of the equipment. Such services shall be included in the contract price.

End of Section

SECTION 15820

DEHUMIDIFICATION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of equipment and accessories associated with the dehumidification systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable local codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thicknesses. Metal thicknesses and gages as indicated on the Contract Documents are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Temperature Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but not be limited to, the following:

Name of manufacturer.

Type and model.

System flow diagram.

Construction materials, thickness, and finishes.

Overall dimensions and required clearances.

Net weight and load distribution.

Process fan horsepower.

Reactivation fan horsepower.

Precooling equipment data and capacities.

Post heating equipment data and input/output capacities.

Reactivation heater equipment data and input/output capacities.

Filter velocities.

Dehumidifier performance curves or data and desiccant type.

Process and reactivation entering and leaving air conditions.

Fan performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least 5 different rotative speeds.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

<u>Equipment Motors</u>

Name of Manufacturer.

Type and Model.

Horsepower rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Type of bearings and method of lubrication.

Net weight.

Overall dimensions.

Efficiency at full, 3/4, and 1/2 loads.

Full load current and power factor.

Locked rotor current.

1.4.02 Operation and Maintenance Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. A set of air filters, fan belts, and other belts shall be furnished for each equipment unit.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The dehumidifiers shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The dehumidifier capacities shall be as indicated in the schedules on the drawings.

Gas fired dehumidifiers shall be suitable for operation with a natural gas or propane inlet pressure range as indicated.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as required.

2.2.03 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as indicated in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 DESICCANT DEHUMIDIFIERS. Honeycomb wheel type desiccant dehumidifers shall be Bry-Air "Model VFB", Cargocaire, or approved equal. Each unit shall be complete with desiccant wheel, process and reactivation air fans, reactivation heaters, volume dampers, motor starters, and a control panel, and shall be completely assembled, wired, and tested at the factory. The dehumidifier shall be capable of removing moisture continuously from the process air stream.

2.5.01 Casing. The unit casings shall be welded aluminum construction with a thickness of at least 0.125 inches (3.2 mm) and shall be properly braced and reinforced with aluminum framework as needed for the operating pressures. The casing shall be provided with the manufacturers standard finish.

Gasketed removable panels or doors shall be furnished to provide access to all internal parts and components. The cabinet shall be constructed to be vapor tight for indoor installation. An observation window shall be provided to permit visual inspection of the bed while the unit is in operation.

The reactivation air and process air sides of the unit shall be divided by a positive sealing arrangement designed for at least 20,000 hours of normal operation. The seals shall be removable and access doors shall be provided for inspections.

2.5.02 Desiccant Wheel. The dehumidifier shall use an automatic, continuous duty, honeycomb style desiccant wheel as required for the adsorption medium. The desiccant material shall be chemically inert, non-corrosive, non-flammable, non-toxic type, and shall contain no asbestos. The wheel shall have a flame spread of 0 and a smoke developed rating not to exceed 10 when tested in accordance with ASTM E84.

The desiccant wheel shall be belt driven and shall have a maximum wheel rotation speed of 10 revolutions per hour.

2.5.03 Reactivation Heater. The type of reactivation heaters shall be electric, direct fired gas, or steam, as indicated in the schedules on the drawings.

2.5.03.01 Electric Type. Electric reactivation air heaters shall consist of an electric heating coil with solid-state modulating control. The controls shall be able to modulate the electric heating coil capacity from 0 to 100 percent. The electric heating coil shall be of open coil zero clearance construction with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames. Bushings shall be ceramic and terminals shall be stainless steel. The electric heating coil control panel shall be completely factory wired to the unit control panel and shall include disconnecting backup and safety contactors, transformers, fusing, disconnect switch, automatic reset thermal cutout, manually reset thermal cutout, and differential pressure airflow switch.

2.5.03.02 Natural Gas Type. Natural gas reactivation air heaters shall consist of a modulating direct fired burner, suitable for use with natural gas. The controls shall be able to modulate the burner firing rate to match the reactivation air requirements. The complete fuel burning assembly shall conform to the requirements of the UL/ETL, FM, or IRI as required. The burner assembly and gas piping arrangement shall include pilot and main burner gas manual shutoff valves, pilot and main gas regulators, pilot and main gas safety shutoff valves, manual pilot adjustment valve, electric modulating main gas valve, low and high pressure safety switches, flame rod, spark igniter, ignition transformer, and flame safeguard relay. The burner assembly and gas manifold shall be completely piped and tested at the factory prior to shipment and shall be suitable for an inlet gas pressure range as required.

2.5.03.03 Steam Type. Steam reactivation heaters shall provide heat for the dehumidifier by a steam heating coil utilizing steam. The steam coil shall be a non-freeze type constructed of 5/8 inch (16 mm) OD copper tubes with at least a 0.049 inch (1.2 mm) wall thickness mechanically bonded to aluminum fins. Coils shall be rated for 150 psi (1030 kPa) and tested at 300 psi (2070 kPa) steam working pressure.

Modulating dampers capable of modulating the heating capacity from 0 to 100 percent shall control the reactivation air temperature to match the reactivation air requirements.

2.5.04 Fans. Both process and reactivation air fans shall be factory mounted as part of the unit base. The fans shall be of the single width, single inlet, multiblade, centrifugal type with motor, belt, drives, and guards and shall be arranged to provide counterflow arrangement of the process and reactivation airflows. The fans shall be dynamically balanced and tested after being installed in the factory-assembled fan section. Fans shall be mounted on vibration isolators.

Belt-driven fans shall be complete with V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Adjustable pitch sheaves shall be furnished for fans with smaller than 10 horsepower (7.5 kW) motors and fixed sheaves for 10 horsepower (7.5 kW) and larger motors. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the appropriate size after the air system balancing, if necessary, to achieve the fan speed required for the specified airflow.

Multiple belts shall be provided in matched sets.

Static pressure values indicated on the schedules are external to the complete unit. The desiccant wheel, filters, and fan housing losses are not included. A filter allowance of 0.35 inch water column (87 Pa) shall be used for filter losses.

A high static fan shall be provided if required to overcome the fan total static pressure.

2.5.05 Filter Section. Dehumidifiers shall be provided with built-in filter racks or filter enclosures fastened directly to the process and reactivation air inlets. Racks or enclosures shall be suitable for housing two inch (50 mm) thick pleated filters. Gasketed access doors shall be provided for removal of filters. Filters shall be removable when the dehumidifier equipment is installed as indicated on the drawings. Air filters shall conform to the requirements of the Air Filters paragraph.

2.5.06 Accessories. Factory mounted volume dampers shall be factory mounted in both the process and reactivation air streams. Dampers shall be of the opposed blade type with positive locking quadrants. A 4 inch (100 mm) U-tube manometer complete with tubes and probes shall be factory installed across the unit for measuring pressure differentials.

2.6 REFRIGERANT DEHUMIDIFIERS. Refrigerant dehumidifiers shall be Desert Aire "LT Series", Dectron, or approved equal as required. Each unit shall be of the packaged, self-contained, closed loop, refrigerant type, completely factory assembled, piped, wired, and tested at the factory. Dehumidifiers shall be of the horizontal type suitable for suspended mounting. The units shall be complete with supply fan, fan motor, compressor, evaporator coil, condenser coil, refrigeration valves, and electrical controls.

2.6.01 Casing. The unit casing shall be constructed of at least 20 gage (0.91 mm) thickness steel and shall be properly braced and reinforced with steel framework as needed for maximum rigidity. The base panel shall be a minimum 14 gage (1.9 mm) thickness steel with welded 1/8 inch (3 mm) steel angle supports on the underside for maximum rigidity. Removable panels shall be provided to allow easy access to internal parts within each section. Access shall be on the side indicated on the drawings. The unit casing and panels shall be provided with the manufacturer's standard enamel finish. The electrical control panel shall be housed in a separate compartment.

The enclosures shall be internally insulated with a flame-attenuated glass fiber insulation bonded with a thermosetting resin. The air stream surface shall be faced with a black coated mat. The insulation shall be securely fastened to the unit enclosure by mechanical means. The insulation shall not exceed a flame spread rating of 25 when tested in accordance with ASTM E84.

2.6.02 Coils. Both the evaporator and condenser coil tubes shall be fabricated from 1/2 inch (13 mm) OD seamless drawn copper. The fins shall be die-formed, plate-type tempered aluminum for easy cleaning and shall be damage resistant.
The tubes shall be hydraulically extruded into the fins to form a permanent metal-to-metal bond. All manifolds, headers, and connecting tubing shall be made with heavy wall seamless copper tubing. Coils shall be leak tested at pressures not less than 400 psig (2760 kPa gauge). Coils shall be designed and tested in accordance with UL and CSA standards. After testing, coils shall be sealed.

Air velocity across evaporator and condenser coils shall not exceed 500 FPM (2.5 m/s). Evaporator coils shall be at least six rows deep with a maximum of ten fins per inch (25 mm). Condenser coils shall be at least four rows deep with a maximum of twelve fins per inch (25 mm).

2.6.03 Compressors. Compressors shall be heavy-duty hermetic reciprocating type with crankcase heater to protect against liquid slugging or scroll type. Compressors shall be equipped with low and high pressure safety switches, and shall be internally protected from overheating. Compressors shall be vibration-isolated internally and externally.

2.6.04 Fans. Dehumidifiers shall have a double-inlet, double-width, centrifugal, forward-curve fan mounted on permanently lubricated sealed or grease lubricated ball bearings, selected for 200,000 hours of average life. Fans shall be dynamically and statically balanced. Fan housings shall be vibration-isolated.

Belt-driven fans shall be complete with V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Sheaves shall be of the adjustable type and shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the appropriate size after the air system balancing, if necessary, to achieve the fan speed required for the specified airflow.

Multiple belts shall be provided in matched sets.

Static pressure values indicated on the schedules are external to the complete unit. Internal coil(s), filter and fan housing losses are not included. A filter allowance of 0.35 inch water column (87 Pa) shall be used for filter losses.

A high static fan shall be provided, if required, to overcome the fan total static pressure.

2.6.05 Filter Section. Dehumidifiers shall be provided with built-in filter racks or filter enclosures fastened directly to the process air inlets. Racks or enclosures shall be suitable for housing filters one or two inches (25 or 50 mm) thick. Gasketed access doors shall be provided for removal of filters. Filters shall be removable when the dehumidifier equipment is installed as indicated on the drawings. Air filters shall conform to the requirements of the Air Filters paragraph.

2.6.06 Accessories. Dehumidifiers shall be furnished with a sloped condensate drain pan constructed of stainless steel and positioned under the dehumidifier coil. The drain pan shall extend sufficiently past the evaporator coil to capture and collect any condensate carryover that may occur when the unit is operating. It shall be formed of 20 gage (0.91 mm) thickness stainless steel, silver-solder welded, and attached securely to the evaporator end plates. The drain pan shall be pitched to completely drain and fitted with a 1 inch (25 mm) NPT non-corrosive plastic drain connection.

Refrigerant type dehumidifiers shall include the compressor and condenser fan motor starters; start and run capacitors; high and low pressure control with manual reset of the high pressure cut out, and automatic reset of low pressure cut out; anti-cycling timer to protect against compressor cycling, and indicating lights. Indicating lights shall be provided to indicate system, fan, and compressor operation.

Refrigerant type dehumidifiers shall also include an electrically controlled damper assembly within the unit enclosure to maintain optimum coil temperature under varying load conditions. The unit shall be equipped with a low ambient valve to control discharge pressure regardless of ambient condensing temperatures. A hot gas bypass valve to prevent the coil from freezing shall be provided. A diverting valve shall be provided to control refrigerant flow through the condenser coil or water-cooled condenser depending on space temperature requirements.

2.7 AIR FILTERS. Filters shall be American Air Filter "AM-AIR 300X", Farr "30/30", or approved equal. Filters shall be disposable type, with 1 or 2 inch (25 or 50 mm) thick, high-loft blend of cotton and synthetic fiber pleated media. A metal support grid shall be bonded to the media. The filter frame shall be constructed of rigid, high-strength, moisture-resistant beverage board. The pleated media pack shall be bonded to the inside of the frame.

Unless otherwise specified, all filters shall have an average efficiency of 25 to 30 percent based on the ASHRAE 52.1-92 test method. The filters shall have a maximum initial resistance of 0.13 inch water column at 300 feet per minute (30 Pa at 1.5 m/s).

2.8 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.9 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2.9.01 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor unless otherwise indicated.

2.9.02 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized.

2.9.03 Electric Motors. Motors furnished with equipment shall meet the following requirements.

> A manufacturer's standard motor may be supplied on packaged equipment in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall

be furnished if offered by the manufacturer as a standard option.

Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

Designed for full voltage starting.

Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

Bearings shall be either oil or grease lubricated.

Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feeding and chemical handling locations.

4. Equipment operating in wet or dust-laden locations.

Dripproof motors, or totally enclosed motors at Contractor's option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
   115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
   460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase.
Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

2.10 CONTROLS. Dehumidifiers shall be provided with an electrical control panel. The control panels shall be easily accessible after dehumidifier installation. Control panels shall be factory prewired with protective fuses, contactors, motor starters, control transformer, overload protection, pilot lights, relays, and all necessary components to insure continuous automatic operation. The control panels shall be of adequate size to house all electrical controls and devices necessary to provide control as described in the Sequence of Operation. Controls shall be suitable for 120 volts, 60 Hz, single phase power supply.

Humidistats for on-off operation of the unit shall be furnished and installed where indicated on the drawings

A condensation controller for on-off operation of the unit shall be furnished and installed. The controller shall consist of a control power module and a sensor module mounted where indicated on the drawings. The control power module shall contain the power supply, differential setpoint adjustment switch, signal indicating lights, and control relay to start and stop the dehumidifier. The sensor module shall continuously monitor the surface humidity level and the control power module shall compare it to the selected differential dew point setting and control the unit accordingly.

2.11 SHOP TESTING. The equipment shall be factory tested and the test results shall be delivered to Engineer. Equipment shall not be shipped until Engineer has received the test results and advised Contractor, in writing, that the equipment is acceptable for shipment. Such acceptance, however, will not be considered as final acceptance, which will only be made on the basis of the test results of the equipment after installation.

2.12 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or its components shall be more than 1.3.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Field Measurement. Contractor shall be responsible for verifying all field dimensions, and for verifying location of all equipment relative to any existing equipment or structures.

3.2.02 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. The dehumidification systems shall be installed where indicated on the drawings. Flexible connections shall be installed between fan inlet and outlet sheet metal connections. Flexible connections shall not be in tension when the fans are operating. The flexible connections shall comply with the requirements of Master Specification Section 15880, Air Distribution Systems.

Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, preliminary field and field system operation tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.4.03 Operator Instruction and Training. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided as required. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as necessary for compliance.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15845

REGISTERS AND GRILLES

PART 1 - GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of stainless steel supply registers and exhaust grilles, and appurtenances associated with heating and ventilation systems. It shall include the following duct mounted air outlets and inlets:

Supply Registers

Exhaust Grilles

1.2 SUBMITTALS.

1.2.01 Product Data. For each model indicated, include the following:

Data Sheet: Indicate construction, finish, and mounting details for each type of air outlet, inlet, and accessory indicated.

Performance Data: Include throw and drop, static-pressure drop, and noise ratings for each type of air outlet and inlet indicated.

Schedule of registers and grilles indicating drawing designation, room location, quantity, model number, size, and accessories.

Assembly Drawing: Indicate materials and methods of assembly of components for each type of air outlet and inlet indicated.

1.3 QUALITY ASSURANCE. NFPA Compliance: Install diffusers, registers, and grilles according to NFPA 90A, "Standard for the Installation of Air-Conditioning and Ventilating Systems."

PART 2 - PRODUCTS

2.1 MANUFACTURERS. In other Part 2 articles where subparagraphs titles below introduce lists, the following requirements apply for product selection:

Products: Subject to compliance with requirements, provide one of the products specified.

2.2 REGISTERS.

2.2.01 Supply Register. Stainless Steel, 3/4” spacing, Double-Deflection

Acceptable Manufacturers:

Titus; Model 300 RL-SS.

Krueger

Or approved equal

Material: Roll-formed, Type 304 Stainless Steel

Face Blade Arrangement: Adjustable parallel to short dimension

Rear Blade Arrangement: None.

Frame: 1-1/4 inches

Mounting: On Ductwork.

Damper Type: Adjustable opposed-blade assembly, Type 304 Stainless Steel.

2.3 GRILLES.

2.3.01 Exhaust Grille. Stainless Steel, 3/4” spacing, 45° fixed deflection

Acceptable Manufacturers:

Titus; 350 RL-SS

Krueger

Or approved equal

Material: Roll-formed, Type 304 Stainless Steel

Face Blade Arrangement: 45° Fixed parallel to long dimension

Frame: 1-1/4 inches

Mounting: On Ductwork.

2.4 SOURCE QUALITY CONTROL.

2.4.01 Testing. Test performance of registers and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 INSTALLATION. Ductwork-Installed outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practicable.

Install registers, and grilles with airtight connection to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

End of Section

SECTION 15855

AIR HANDLING UNITS

PART 1 - GENERAL

1.1 SCOPE. Furnish and install all indoor make-up air handling units with filters as shown on the Drawings, scheduled and as specified herein.

1.2 SCHEDULES. All units shall be of the type, capacity and arrangement as listed on the schedules. Units shall consist of the components listed in the schedule and those components obviously required for the type of unit. Unit shall be capable of being installed together in sections in the final location where shown on the drawing or as one entire unit. The order of component assembly will be as called for on the schedule. Particular attention must be paid to the remarks and notes in these schedules.

1.3 SUBMITTALS. Submit, in accordance with Sections 01160 and 15501, the following:

Unit data sheets; to include catalog data, a description of the proposed unit, size, type, arrangement, and materials of construction.

For belt drive equipment, provide drive data indicating sheave sizes, belt size, number and length.

Each submittal shall include pertinent equipment dimensional data, heating and cooling coil operating data. Submit, in accordance with Sections 01160 and 15501, all data and the fan schedules. The submittal shall include fan data sheets with a description of the proposed fan, fan size, type, arrangement, materials of construction, weight, motor horsepower, motor type, power supply, and frame size. Provide catalog data and selections for vibration isolators, include materials of construction. For belt drive equipment; provide drive data indicating the sheave sizes, belts size, number and length. Each submittal shall include pertinent equipment dimensional data, fan performance (operating data information, and a performance curve showing the fan operating point and range. Minimum curve size shall be 8-in by 6-in. Faxed copies of curves are not acceptable. A list of accessories to be furnished shall be included on each submittal. Copies of operating and maintenance manuals shall be submitted.

Significant dimensional differences between the specified equipment and the proposed equipment shall be noted on the equipment submittal. The Contractor shall provide data to show the dimensionally different equipment will fit within the space and still provide suitable clearance. Where corrosion resistance is required, provide conformation of material suitability for the specified service.

For condensing sections provide information on number and type of compressors, type of refrigerant and refrigerant charge, and controls provided and operating weight. Provide electrical data for power and controls. For condensing coils, provide air entering and leaving conditions, air pressure drop, size, type, arrangement, and materials of construction.

List of accessories to be furnished shall be included on each submittal. Provide a recommended list of spare parts.
Significant dimensional differences between the specified equipment versus the proposed equipment shall be noted on the equipment submitted.

For units that will be shipped exposed, provide a description of the protective packaging that will be used during transit.

All submittals shall contain a statement that Section 15501, and all other Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal.

Submit to the Engineer as provided in Section 01730, Operating and Maintenance Manuals. The following information shall be considered a minimum. Where applicable, provide information required for specific pieces of equipment.

Personnel familiar with the operation and maintenance of the specific information shall prepare manuals.

Equipment shall be identified with the Engineers Equipment Numbers and Identification as shown in the Schedules and on the Drawings.

Provide information in three ring binders. All sheets shall have reinforced punches. Tabbed dividers shall separate all sections. Drawings will be bound in the manual, or contained in envelopes bound into the manual.

Contents - Each volume shall contain the following minimum contents:

Installation including instructions for unpacking, installing, aligning, checking and testing. Foundation data, allowable piping loads, and electrical design shall be included.

Operating Instructions to provide pre-operational checks, start up and shut down, and description of all control modes. Include emergency procedures for all fault conditions and actions to be taken for all alarms. Procedures for long term storage shall be included.

Maintenance shall include preventive, and corrective. Schedules for test of other functions are to be included. Provide a list of tools required to service the equipment. Trouble shooting instructions to include a trouble-shooting guide shall be included.

Shop Drawing Data to include performance curves, data sheets, flow diagrams, wiring diagrams, and descriptive drawings.

In general, corrections or comments or lack there of, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4 REFERENCE STANDARDS. All equipment to be furnished under this section shall be designed, constructed, and tested in accordance with the following standards:

American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE)

ASHRAE 52 - Method of Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter.

Air Movement and Control Association (AMCA) National Fire Protection Association (NFPA)
NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems

NFPA 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems.

American Society for Testing and Materials (ASTM)

ASTM C581 - Standard Practice for Determining Chemical Resistance of Thermosetting Resins Used in Glass- Fiber- Reinforced Structures Intended for Liquid Service.

ASTM C1071 - Standard Specification for Thermal and Acoustical Insulation (Glass Fiber, Duct Lining Materials).

Air-conditioning and Refrigeration Institute (ARI)

American Society of Mechanical Engineers (ASME)

National Electrical Code (NEC)

National Electrical Manufacturers Association (NEMA)

Association of Home Appliance Manufacturers (AHAM)

Factory Mutual (FM)

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.5 QUALITY ASSURANCE. All equipment of a given type included in this section shall be furnished by or through a single manufacturer or as specified on the schedules. Inspection by the Engineer's representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents. The Owner and Engineer reserve the right to sample and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements. An authorized representative of the manufacturer shall perform the initial startup of the equipment. The Owner and Engineer shall witness startup. The use of local sales representatives to perform this work is not acceptable, unless the manufacturer provides documented evidence that the sales representative has been specifically trained for this work. All rotating parts of equipment shall be dynamically balanced at the factory.

1.6 DELIVERY, STORAGE AND HANDLING. Shipping, handling and storage are detailed in the Master Specification Section 01180.

Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer.

All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container.

All equipment shipped that is exposed such as on a flatbed truck shall be protected during transit. The equipment shall be protected from moisture, road salt, dirt and stones or other materials thrown up from other vehicles. Electrical components shall be protected as above, but with special attention to moisture. The method of shipment protection shall be defined in the submittals.

Instructions for the servicing and startup of equipment in long term prolonged storage shall accompany each item.

All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.7 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts and shall meet the requirements of Sections 01180.

Furnish all special tools required for normal operation and proper servicing of the equipment. Spare parts shall include all items on the manufacturer's standard list of spare parts and the following for each unit:

One complete set of drive belts for each piece of belt driven equipment

One complete shaft seal for all fans with shaft seals. Three full sets of air filters if not otherwise specified.

1.8 WARRANTY. In addition to the General Warranty, the equipment manufacturer shall warrant against parts and labor and any defect in material, construction, or performance of the Make Up Air Units and its components for a period of five (5) years from the date of acceptance for the Equipment, without any cost to the owner.

1.8.01 MAINTENANCE SERVICE. Concurrent with Parts and Labor Warranty, Manufacturer shall provide Five (5) year Full Maintenance program. Maintenance program shall include monthly service visits on each unit subject to the following:

Filter changes

Digital Performance Log

Check and/or replacement of belts

Check, Lubrication and/or replacement of fan bearing assemblies

Check and/or adjustment/replacement of electrical or control components

Check and/or adjustment/replacement of damper and operators

Check and/or adjustment/replacement of cabinetry seals, latches, panels etc

Check and/or cleaning of interior unit and coil surfaces

The above at a minimum shall appear on a Monthly Maintenance Sheet for each unit. Verification of maintenance via this sheet shall bear Witness signature of DWSD representative and turned in monthly in hard copy and/or digital copy in quantities up to Five (5) sets as determined by the DWSD. Sheet and format to be approved by DWSD prior to commencement of Five (5) Year Program.

1.8.02 WARRANTY SUBMITTAL. Submit a Written warranty signed by manufacturer agreeing to repair, restore, or replace defective work and maintain as specified in this section, within the specified warranty period without any cost to the owner.

PART 2 - PRODUCTS

2.1 MAKE-UP AIR UNITS. Acceptable manufacturers shall be Rush Air or approved equal.

2.2 DESIGN AND CONSTRUCTION. In general, units shall be factory assembled, packaged industrial type with fan, heating section, filters, motorized intake dampers, access sections with hinged access doors, motor, starters, motor base, gas train, gas pressure reducing valve, controls, drive, drive guard and vibration isolators. Rooftop units shall be completely weather proof. All units as shown and specified shall be furnished by the same manufacturer. Units shall be designed to provide an integrated assembly and factory tested when all of the components are assembled. All transition sections and filler pieces required between sections are to be provided as part of the unit. The equipment dimensions shall be coordinated to fit in the space allocated in the Mechanical Room. Support brackets or rails are to be provided with the floor- mounted unit. Units shall have all rotating components internally isolated from the main unit with vibration isolators and floor mounting rails.

2.2.01 Casings. The unit casing shall be 2” double wall constructed of 20 ga, 304 Stainless Steel for both inner and outer liner. Unit floor shall be double wall 14 ga, 304 Stainless Steel. In addition, Unit frame, unit coil frames and all structural components shall be constructed of 304 Stainless Steel. Removable panels and access doors shall be 2” double wall constructed utilizing 20ga 304 Stainless Steel for both inner and outer skins. Insulation: Insulation shall be 2” thick closed cell foam. All sections including, but not limited to, filter, spacers, access sections, fan cabinet, shall be insulated. Insulation shall be 25.4 mm (1-in) verify all English units dims provided mat faced or neoprene coated fiberglass liner, 24 kg/M3 (1-1/2 lb/ft3) minimum density, installed with stick clips and adhesives to prevent erosion of the insulation.

2.2.02 Fan Section. Fans shall be centrifugal cabinet fans with belt drives. Extended external lubrication fittings shall be provided. Drives shall be adjustable V-belt type, with motor mounted on an adjustable slide base.

Backward curved wheels shall be airfoil types.

All fans shall be statically and dynamically balanced before shipment. All fans shall be AMCA rated for sound and air performance.
Motor shall be energy efficient TEFC, with internal load protection.

Factory wired controls shall be provided in the unit control panel. Panel shall include all safety controls and interlocks, control devices and terminal strip for remote wired devices. Control type shall be as specified on the schedules. Control voltage shall not exceed 120 Volt.

Makeup AHU’s shall utilize SWSI plenum style fans for supply air. Fans shall be constructed of 304 stainless steel. Fans performance shall be as scheduled. Fan Bearings shall be rated for L10 at 200000. Fan housing shall be vibration isolated.

2.2.03 Filters. Filter Box shall have tracks for the specified filter types, to allow filter replacement from either side. Sealing material shall be provided at tracks and ends to prevent air by-passing the filters.

Disposable Filters shall be framed filters, 50.8 mm (2-in) thickness as scheduled. Filter pressure drop for clean filters at 91 M\min (300 fpm) face velocity shall be 0.15-in wg for 50.8 mm (2-in) thick filters. Filter shall have 30 to 35 percent efficiency on ASHRAE Test Standard 52. Manufacturers and type shall be American Air Filter Co., AmAir 300X; Farr Co., 30/30 Disposable; Cambridge, Aeroplate or equal.

A total of three complete sets of filter media shall be provided for each unit.

For all types of filters, each filter section shall be provided with a magnehelic type gauge to indicate static pressure across the filter. Where more than one filter is used in series, each filter shall be provided with its own gauge. Where a control panel is provided gauges shall be mounted in the control panel.
2.2.04 Unit Control Panel. Remote panels shall include all stand alone DDC controls, and all safety controls and interlocks, heavy duty fused visible break, disconnect, control devices, motor starters and terminal strip for remote wired devices. Control type and sequence shall be as specified in other Sections and on the Drawings. Control voltage shall not exceed 120 Volts. Control panel door shall be provided with a keyed lock. A complete wiring diagram shall be permanently attached to the inside of the panel door. Provide hardware and software as required to monitor with
remote building central DDC management system. Remote LCD display shall show lights for dirty filter, alarm, fan on/off, air temperature heat on/off etc.

All air handling control devices shall be compatible with control devices supplied under Section 15950 by the successful Temperature Control Contractor Division 15. The Make-up Air Unit Manufacturer shall coordinate with the Control and Mechanical contractors.

For self-contained package units, split systems and fuel burning units, factory wired control panel shall be furnished and mounted on the unit. Panels shall include all controls required in other sections, and all safety controls and interlocks, heavy duty fused visible break, disconnect, control devices, motor starters and terminal strip for remote wired devices. Control type and sequence shall be as specified in other Sections and on the Drawings. Control voltage shall not exceed 120V. Control panel door shall be provided with a keyed lock. A complete wiring diagram shall be permanently attached to the inside of the panel door.

Where specific area classifications are called for or shown on the electrical drawings, all equipment and wiring shall be in conformance with the requirements for that classification. Unless otherwise specified herein or shown on the Drawings, electrical enclosures shall have the following ratings:

NEMA 12 for indoor locations.

2.2.05 Accessories. Dampers shall be opposed blade type with blades mounted on 1/2-in minimum steel rods. Dampers shall be provided with low friction bushings and edge gaskets to reduce air leakage. Blades shall be sectionalized to limit unsupported blade length and warping at full system fan static pressures. Maximum damper blade width shall not exceed 6-in.

Provide top discharge section for air discharge.

Access sections shall have hinged doors for servicing.

Provide smoke detector, low and high temperature stats with additional contacts and accessories.
Provide airflow sensing switch to prove airflow and set visual and audible alarm in case of failure.

2.3 TESTING. Factory performance testing shall be provided using the governing standards of ARI, ASHRAE and SMACNA. These tests will be performed with the option of witnessing by the owner or owner's representative. Complete test procedure must be submitted for approval prior to testing. Approved testing procedures may then be scheduled. Run test will include but not limited to Air flow. Energy consumption, largest panel deflection test, per SMACNA and component verification (match components to submittal data).

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment shall be installed in accordance with manufacturer's recommendation. Provide piping and ductwork connections in accordance with the requirements of the other related Sections. Wire and install any equipment shipped loose for field installation.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

When units are shipped disassembled, field connect all sections including wiring together as shown on the Drawings to form single air handling unit. Seal all joints with gaskets and/or sealants.

Do not operate equipment without filters. Do not run equipment with dirty filter pressure drop more than twice clean filter pressure drop. A total of three complete sets of filters shall be provided. The first set is to be installed for start-up, test and balancing. The second set shall be installed after final cleanup and acceptance by the Owner. The third set shall be turned over to the Owner as a spare.

The Contractor shall start up each piece of equipment and system and shall make all adjustments so that the system is placed in proper operating condition.

Install unit level and plumb, maintaining manufacturer's recommended clearances and tolerances.

Install wall sleeves in finished wall assembly; seal and weatherproof. Joint-sealant materials and applications are specified in Division 7 Section "Joint Sealants."

Install wall sleeves to withstand, without damage to equipment and structure, seismic forces required by building code.

Provide necessary supports to accommodate weight of unit. Supports shall be epoxy coated to withstand corrosion. Provide vibration isolation fittings.

3.2 CONNECTIONS. Electrical System Connections: Comply with applicable requirements in Division 16 Sections for power wiring, switches, and motor controls. Ground equipment according to Division 16 Section "Grounding and Bonding."

End of Section

SECTION 15880

AIR DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of air distribution equipment, coils, fans, ductwork, duct mounted devices, and appurtenances associated with the heating, ventilating, and air conditioning (HVAC) systems.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable

municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements. Fans shall be UL listed.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thicknesses and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, ductwork, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.3.05 Ductwork. As required, ductwork shall be identified with nameplates as specified herein, or stenciled painting as specified in Master Specification Section 09900, Painting. Ductwork shall be identified with the equipment number and area served, direction of airflow, and service (supply, return, mixed, exhaust, and outside air). The identification shall be located at equipment, at each side of structure or enclosure penetrations, and at each obstruction.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section

01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Central Station Air Handling Units

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Coil capacities and velocities.

Filter velocities.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower (kW), static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least five different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

Makeup Air Units

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Burner or heating coil capacities.

Filter velocities.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least five different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

<u>Fans</u>

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least three different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Schematic control wiring diagrams showing multiline wiring for the unit and all interconnecting devices. Wiring diagrams shall be detailed to the degree required for field construction, with all terminals identified.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4.03 Samples. Samples of protective coatings for equipment as required shall be submitted to Engineer for approval. The samples shall be at least 3 inches by 3 inches (75 mm by 75 mm) in size, and shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.5 QUALITY ASSURANCE.

Central station air handling units shall be certified in accordance with ARI 430.

Central station air handling unit coil capacities, pressure drops, and selection procedures shall be certified in accordance with ARI 410.

Electric heating coils shall comply with the National Electrical Code.

Direct fired makeup air units shall be independently certified to meet ANSI Z83.4.

Fans shall be rated in accordance with AMCA standards, shall be licensed to bear the AMCA Certified Rating Label unless otherwise indicated in the Fan Schedule on the drawings, and shall be UL listed.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. One set of matched belts per unit and two sets of air filters per unit shall be furnished for the equipment.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

1.8 FRP DUCTWORK REGULATORY REQUIREMENTS. Comply with NFPA No. 255 for flame spread rating of 25 or less. Comply with NBS-15p69 and ASTM D4097.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment and coil capacities shall be as indicated on the schedules.

Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as indicated.

Each fan's operating selection point on the fan curves shall be selected to the right of the peak pressure/efficiency point and below the lowest point along the fan curve, to the left of the peak pressure/efficiency point.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for topcoating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be as indicated in Master Specification Section 09900, Painting.

Machined, polished and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 CENTRAL STATION AIR HANDLING UNITS. Central station air handling units, denoted by the symbol "AHU" and an identifying number, shall be manufactured by McQuay, Trane, York, or approved equal. Each central station air handling unit shall be complete with all sections and components indicated on the drawings.

2.5.01 Casing. Central station air handling units shall be factory built and tested draw-through units. The units shall be constructed of properly braced and reinforced steel framework with G90 galvanized steel panels as needed for the operating pressures. Gasketed removable panels or doors shall be furnished to provide access to all internal parts and components. The unit shall be constructed such that removal of side panels will not affect the structural integrity of the unit.

The casing shall be of sectional construction, consisting of a fan section, a cooling coil section with a sloped drain pan, a heating coil section, a face and bypass damper section, a filter section, blender section, and an access/spacer section as indicated on the drawings. The cabinets and casing shall be provided with the manufacturer's standard galvanized finish. Where indicated in the schedules on the drawings, units shall be double wall construction. When a unit is indicated to have double wall construction, all sections shall be constructed with internal liners. Liners shall be constructed of at least 20 gage (0.91 mm) thickness galvanized steel.

Sloped drain pans shall extend under the entire cooling coil section and sufficiently past the coil to capture and collect any condensate carryover when the unit is operating within the specified conditions. The unit design shall not require a drain pan in any downstream section to contain coil condensate. The drain pan shall be accessible for inspection and cleaning. The drain pan shall be constructed of stainless steel cross broken and pitched (double sloped) to the drain connection. The drain pans shall be completely insulated.

The interior of the fan section, coil section, and accessory sections shall be insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density, cleanable blanket type fiberglass insulation securely fastened to the panels. Insulation shall meet the requirements of the NFPA.

2.5.02 Fan Section. The fans shall be of the double width, double inlet, multiblade type. Wheel type shall be as indicated in the schedules on the drawings. Fans shall be dynamically balanced and tested after being installed in the factory-assembled fan section. The maximum fan speed shall not exceed 80 percent of the first critical speed. The units shall have externally mounted grease lubricated bearings or lubrication fittings extended to the exterior fan casing, with copper tubing and grease fittings rigidly attached to the casing. The fan bearings shall be self-aligning, grease lubricated ball type with an average life (L50) of at least 200,000 hours.

Static pressure values indicated in the schedules on the drawings are external to the complete unit. Internal coil(s), face and bypass damper, filter, and fan housing losses are not included. A filter allowance of 0.35 inches water column (87 Pa) shall be used for 2 inch (50 mm) pleated filter losses and 0.80 inches water column (200 Pa) shall be used for extended surface air filter losses.

2-5.03 Motor and Drive. Units located outdoors shall have internally mounted motors. Units located indoors shall have fan motors mounted either in or on the fan housing. Internally mounted motors shall be installed on a steel base mounted on internal vibration isolators and coated with the manufacturer's standard protective coating. Where unit is installed in a seismic area, seismic restraints shall be provided. Externally mounted motors shall be installed on integral casing framework on the exterior of the casing. Units with externally mounted motors shall be furnished with vibration isolator units as indicated in the schedules on the drawings. External belts and drive assemblies shall be protected by a belt guard with tachometer opening.

Fan drive motors and controls shall be as specified in the Electrical paragraph.

Central station air handling units with smaller than 10 horsepower (7.5 kW) motors shall have V-belt driven fans with adjustable pitch sheaves and units with 10 horsepower (7.5 kW) and larger motors shall have fans with fixed sheaves. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is selected at the mid-position of the sheave range. Fixed sheaves shall be replaced as necessary with sheaves of the proper size during the air system balancing to provide the required fan speed for the specified airflow. Multiple belts shall be provided in matched sets. Belt drives shall be designed for 1.5 times the fan brake horsepower.

Where indicated in the schedules on the drawings to be explosionproof, central station air handling units shall be suitable for installation in an NEC Class I, Division 2, Group D area.

2.5.04 Coil Section. The cooling and heating coils required by the central station air handling units shall be manufactured by the same manufacturer as the air handling units. Cooling and heating coils shall conform to the requirements of the Coils paragraph. Coil headers and return bends shall be completely enclosed by the unit casing. Coil connections, vents, and drains shall extend outside the unit casing and shall be clearly labeled.

Central station air handling units with hydronic cooling coils shall be selected to limit cooling coil velocities to 550 feet per minute (2.8 m/s) at the design airflow unless otherwise indicated in the schedules on the drawings. Central station air handling units with hydronic heating coils shall be selected to limit the heating coil velocities to 750 feet per minute (3.8 m/s) at the design airflow unless otherwise indicated in the schedules on the drawings.

2.5.05 Filter Section. Filter sections for central station air handling units shall be of the flat or angular arrangement and shall be selected to limit the filter velocity to 300 feet per minute (1.5 m/s) for pleated air filters or 500 feet per minute (2.5 m/s) for extended surface air filters at design conditions, unless otherwise indicated in the schedules on the drawings. Gasketed access doors shall be provided for removal of filters from either side of the section. The filter thickness shall be as indicated in the schedules on the drawings and shall conform to the Air Filters paragraph.

2.5.06 Face and Bypass Damper Section. Face and bypass damper sections for central station air handling units shall be of the internal or external type as indicated in the schedules on the drawings. The dampers shall be opposed blade, low leakage type arranged to match the heating coil face area with top bypass. The damper shall have a maximum leakage rate of 10 cubic feet per minute per square foot at 4 inches water column (0.05 m^3/s per m^2).

2.5.07 Air Blender Section. Air blender sections for central station air handling units shall be factory installed within the unit. Air blenders shall be fixed devices with suitable clearances up and down stream of the blender for proper performance and uniform airflow through downstream components. The air blender shall be fabricated of 0.080 inch (2 mm) aluminum designed to mix the two airstreams to within ±6°F (3°C) of the theoretical mixed air temperature.

2.5.08 Accessories. Where indicated in the schedules on the drawings as variable volume with inlet vanes, central station air handling units shall be furnished with integral variable inlet vanes complete with a control ring, crank arms, a connecting shaft, and all interconnecting linkages required to provide a complete, properly operating unit.

Central station air handling units indicated or shown to be curb mounted shall be furnished with a roof mounting curb. The curb shall be constructed of 14 gage (1.9 mm) thick zinc-coated steel with a nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply and return air opening as indicated on the drawings. The curb shall be a minimum of 16 inches (400 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.6 COILS. Hydronic coils shall be of the drainable type with plugged vent and drain tappings.

Where indicated in the schedules on the drawings, coils shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.6.01 Hydronic Heating Coils. Heating coils, denoted by the symbol "HC" and an identifying number, shall be McQuay, Trane "Type W", York, or approved equal (installed in air handling equipment) or McQuay, Trane "Type ST", York, or approved equal (installed in ductwork).

Hydronic heating coils shall be extended surface type, arranged in a rectangle to fit the space available. The coils shall be designed for a working pressure of 200 psig (1380 kPa gauge) and shall have been hydrostatically tested and proved watertight at 200 psig (1380 kPa gauge). Coil casings shall be of galvanized or stainless steel and shall be rigidly braced. Coil headers shall be constructed of cast iron or a nonferrous material. Coil tubes shall be at least 0.024 inch (0.61 mm) thick, 5/8 inch

(16 mm) OD seamless copper with at least 0.006 inch (0.15 mm) thick aluminum fins mechanically bonded to the tubes. Seals shall be provided at top, bottom, and intermediate channels to minimize air bypassing the coil surface. Inlet and outlet connections shall be on the same end of the coils. Coils shall be removable from either side of the air handling unit.

The face velocity of a heating coil installed in ductwork shall not exceed 900 feet per minute (4.6 m/s) at maximum airflow.

2.6.02 Direct Expansion Cooling Coils. Direct expansion cooling coils, denoted by the symbol "CC" and an identifying number, shall be manufactured by McQuay, Trane, York, or approved equal.

Direct expansion cooling coils shall be multirow, 1/2 inch (13 mm) or 5/8 inch (16 mm) OD seamless copper tubes of 0.025 inch (0.64 mm) nominal wall thickness mechanically bonded to aluminum fins. Direct expansion cooling coils used in systems with multiple steps or circuits shall have interlaced circuitry. Refrigerant shall be distributed equally to multiple circuits by a pressure type distribution header with minimum pressure drop through the header and tubing. Coils shall be matched with the condensing unit or heat pump and shall be tested at 250 psig (1725 kPa gauge) prior to dehydration. Coils shall be purged and sealed with inert gas prior to shipment.

2.6.03 Hydronic Cooling Coils. Cooling coils, denoted by the symbol "CC" and an identifying number, shall be McQuay, Trane "Type W", York, or approved equal. Hydronic cooling coils shall be extended surface type, arranged in a rectangle to fit the space available. The coils shall be designed for a working pressure of 200 psig (1380 kPa gauge) and shall have been hydrostatically tested and proved watertight at a working pressure of 200 psig (1380 kPa gauge). Coil casings shall be constructed of galvanized steel and shall be rigidly braced. Coil headers shall be constructed of cast iron or nonferrous material. Coil tubes shall be at least 0.024 inch (0.61 mm) thick, 5/8 inch (16 mm) OD seamless copper with at least 0.006 inch (0.15 mm) thick aluminum fins mechanically bonded to the tubes. Cooling coils shall be rated for use with a fouling factor of 0.0005.

2.6.04 Electric Heating Coils. Electric heating coils, denoted by the symbol "HC" and an identifying number, shall be manufactured by Indeeco, Brasch, or approved equal. Electric heating coils shall be of open coil or finned tube zero clearance construction, as required, with 80 percent nickel and 20 percent chromium resistance elements. Heaters shall have galvanized or aluminized welded steel frames with flanges suitable for fastening directly to the fan or coil and filter sections.

Bushings for open coils shall be ceramic and terminals shall be stainless steel. Elements for finned tubular coils shall be centered in steel tubes filled with compacted magnesium oxide and copper plated fins brazed to the tube. The assembly shall be finished with high temperature aluminum coating.

A remote electric heating coil control panel shall be furnished and installed where indicated on the drawings. The electric heating coil control panel shall be completely factory wired and shall include disconnecting backup and safety contactors, transformers, fusing, and a disconnect switch. The heating coil terminal box shall include an automatic reset thermal cutout, a manually reset thermal cutout, a differential pressure airflow switch, and a pilot switch. The control panel shall be furnished with double doors.

The contactors shall be rated for 600 volt, 3 pole, UL listed, and shall have a life expectancy for 100,000 operations. The control transformer shall be built-in, industrial dry type, 480/120 volt sized to carry the full control system load. Primary and secondary windings shall be fused, and secondary windings shall have one lead grounded.

The heater shall be furnished with a silicone controlled rectifier (SCR) control unit mounted in the remote electric heating coil control panel. The SCR control unit shall be suitable for operation at temperatures of 32° to 132°F (0° to 55°C) and shall be solid-state, proportioning type, designed to modulate the heater output from 0 to 100 percent. The heater shall be controlled by a thermostat as indicated on the drawings. The SCR controller shall be compatible with the signal from the thermostat.

The electric heating coil output shall be as specified at 460 volts, 60 Hz, 3 phase. The heater elements shall be suitable for operation on 480 volt, 60 Hz, 3 phase power.

2.7 <u>MAKEUP AIR UNITS</u>. Makeup air units, denoted by the symbol "MAU" and an identifying number, shall be Hastings "SBD", Hartzell "GMC", Engineered Air "Series HE", or approved equal for direct fired units and Hastings "Counterflo", Engineered Air "Series DJ", or approved equal for indirect fired units as indicated in the schedules on the drawings. The makeup air units shall be constant volume, gas-fired type, and shall be completely assembled, wired, and flame tested at the factory.

Where indicated in the schedules on the drawings, makeup air units shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.7.01 <u>Construction</u>. The casing of the makeup air unit shall be of sectionalized construction consisting of a fan section, a gas-fired burner section, a filter section, and, when located outdoors, an inlet hood with motorized control damper. The unit housing shall be constructed of heavy gage galvanized paint grip carbon steel or aluminized steel, braced and reinforced with steel framework as needed for the operating pressures. The cabinet and casing shall be provided with the manufacturer's standard enamel finish. Gasketed and hinged doors shall be furnished to provide access to all internal components. An observation port shall be provided on the burner section for viewing the pilot and main flames.

The burner section shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density foil-faced fiberglass blanket insulation securely fastened to the panels. The fan and accessory sections shall be internally insulated with 1 inch (25 mm) thick, 1-1/2 pound per cubic foot (24 kg/m^3) density mat-faced cleanable fiberglass blanket insulation securely fastened to the panels. Where the insulation is not installed below the floor, the insulation shall be protected by a metal liner. The insulation shall meet the requirements of NFPA.

Makeup air units installed outdoors shall be of weatherproof construction, with roof panels pitched for drainage. The roof panels shall be constructed with triple-break seams which overlap the side panels on all sides. All exterior joints shall be bolted or screwed with a gasket, or shall be welded, and shall be sealed weather tight.

Makeup air units installed outdoors shall have a stormproof weather hood with birdscreen sized for 100 percent outside air shall be mounted on the unit inlet. The hood shall include a two-positioned motorized control damper which opens when the unit is energized and closes when it is de-energized.

2.7.02 Fan Section. The makeup air units shall be equipped with centrifugal fans with forward-curved blades which shall be dynamically balanced and tested after being installed in the factory assembled fan section. Bearings shall be heavy-duty, self-aligning, grease lubricated type for units with motors greater than 15 horsepower (11.2 kW) and permanently lubricated or grease lubricated for units with 15 horsepower (11.2 kW) motors and smaller. Units with regreasable bearings shall have externally mounted, grease lubricated bearings or lubrication fittings extended to the exterior fan casing with aluminum or copper tubing and grease fittings rigidly attached to the casing.

Static pressure values indicated in the schedules are external to the complete unit. Internal burner or heat exchanger, filter, and fan housing losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for filter losses.

2.7.03 Motor and Drive. Units located outdoors shall have internally mounted motors. Units located indoors shall have fan motors mounted either in or on the fan housing. Internally mounted motors shall be installed on a steel base mounted on internal vibration isolators and coated with the manufacturer's standard protective coating. Where unit is installed in a seismic area, seismic restraints shall be provided. Externally mounted motors shall be installed on integral casing framework on the exterior of the casing. Units with externally mounted motors shall be furnished with vibration isolator units as indicated in the schedules on the drawings. External belts and drive assemblies shall be protected by a belt guard with tachometer opening.

Fan drive motors and controls shall be as specified in the Electrical paragraph.

Makeup air units with smaller than 10 horsepower (7.5 kW) motors shall have V-belt driven fans with adjustable pitch sheaves and units with 10 horsepower (7.5 kW) and larger motors shall have fans with fixed sheaves. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is selected at the mid-position of the sheave range. Fixed sheaves shall be replaced as necessary with sheaves of the proper size during the air system balancing to provide the required fan speed for the specified airflow. Multiple belts shall be provided in matched sets.

2.7.04 <u>Heating Section</u>. The complete fuel burning assembly shall conform to the requirements of UL/ETL, FM, or IRI as required. The burner assembly and gas piping arrangement shall include, but not be limited to, pilot and main burner gas manual shutoff valves, pilot and main gas regulators, pilot and main gas safety shutoff valves, manual pilot adjustment valves, and electric modulating main gas valves. The burner assembly and gas manifold shall be completely piped and tested at the factory prior to shipment.

The unit shall be suitable for use with the gas pressure range as required.

2.7.04.01 <u>Direct Fired</u>. Burners shall be in-line type, suitable for use with natural or propane gas, as required, and shall be complete with stainless steel firing plates, cast iron gas feed, and stainless steel side plates for flame rods and ignition spark rods mounted in ceramic isolated bushings. The profile plates shall be adjustable and shall be sized to maintain the required velocity across the burner. The burners shall be capable of modulating turndown of 20 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff.

2.7.04.02 <u>Indirect Fired</u>. Burners shall be modulating power type suitable for use with natural or propane gas, as required. The burners shall be capable of modulating turndown of at least 8 to 1 and shall have an intermittent spark pilot ignition system with 100 percent shutoff. The heat exchanger shall be of 3 or 4 pass design consisting of 400 series stainless steel primary drum heat exchanger with multitube secondary heat exchanger.

2.7.05 <u>Filter Section</u>. Filter sections for makeup air units shall be of the flat or angular arrangement and shall be selected to limit the filter velocity to 350 feet per minute (1.5 m/s) at design conditions unless otherwise indicated in the schedules on the drawings. Access doors shall be provided for removal of filters from either side of the section. The filters shall be 2 inch (50 mm) pleated type and shall conform to the Air Filters paragraph.

2.7.06 Controls. Each unit shall be furnished with a complete control system consisting of fan starters and overload devices, an airflow proving switch, control circuit fuses, an electronic discharge air temperature sensor and controller, and a disconnect switch. Controls shall be suitable for interfacing with and enacting the control sequence and concept indicated on the drawings. The controls shall include controls to lock out the burner when the outside air temperature is above the controller setpoint.

A remote control station shall be furnished with the makeup air unit and located where indicated on the drawings. The control station shall allow for remote operation of the unit with a fan "On-Off" switch, a "Winter-Summer" switch, a supply temperature setpoint adjustment, and indicating lights for fan, heat, lockout, and dirty filters. Where indicated in the sequence of operations, a room override thermostat shall be mounted on the panel.

Unit mounted panels shall house adequately sized combination starters rated in accordance with NEMA standards, and dead-front 3 lock nonfused disconnect switches.

2.7.07 Accessories. Makeup air units indicated or shown to be curb mounted shall be furnished with a roof mounting curb. The curb shall be constructed of 14 gage (1.9 mm) thickness zinc-coated steel with a nominal 2 by 4 inch (50 by 100 mm) wood nailer strip and with supply air opening as indicated on the drawings. The curb shall be a minimum of 16 inches (400 mm) high. The curb shall be approved by the National Roofing Contractors Association.

2.8 FANS. Each fan shall be complete with an electric motor, a drive, and accessories required for satisfactory operation. Belt-driven fans shall be complete with a V-belt drive designed for 50 percent overload capacity, sheaves, adjustable base or rails for belt tightening, and a belt guard. Adjustable pitch sheaves shall be furnished for fans with less than 10 horsepower (7.5 kW) motors and fixed sheaves for 10 horsepower (7.5 kW) and larger motors. Adjustable sheaves shall be selected so that the fan speed at the specified conditions is at the mid-position of the sheave range. Sheaves shall be replaced with sheaves of the proper size after the air system balancing if necessary, to provide the required fan speed for the specified airflow.

Fan drive motors and controls shall be as specified in the Electrical paragraph, unless otherwise indicated. Fans shall be suitable for use with the power supply indicated on the drawings.

Fans indicated in the schedules on the drawings to be explosionproof shall be suitable for installation in a NEC Class I, Division 2, Group D environment.

The external static pressure values indicated in the schedules on the drawings are external to the complete unit. Internal fan housing and when furnished, backdraft damper and filter losses are not included. An allowance of 0.35 inch water column (0.087 kPa) shall be used for pleated filter losses.

A solid-state variable speed controller shall be provided for each direct-driven fan motor less than 1/2 hp (0.4 kW) to balance the fan airflows to the specified rates. The speed controller shall have a capacity range of approximately 50 through 100 percent of the design airflow rate specified. The speed controller shall be mounted on or in the fan housing unless otherwise indicated.

Where indicated in the schedules on the drawings, fans shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.8.01 Cabinet Fans. Cabinet fans, denoted by the symbol "CF" and an identifying number, shall be Greenheck "Model SP" or "Model CSP", Penn Ventilator, Loren Cook, or approved equal. Cabinet fans shall have steel, forward-curved, squirrel-cage type wheels. The fans shall be statically and dynamically balanced. Motors shall be open dripproof, PSC, with permanently lubricated ball bearings and internal thermal overload protection, and shall be suitable for use with the power supply indicated in the schedules on the drawings. Fan housings shall be fabricated of heavy gage carbon steel with welded seams and shall be acoustically lined and factory primed. Fans shall be installed in the configuration indicated on the drawings. A removable access panel or exhaust grille shall be provided on the bottom of each fan and a factory installed backdraft damper shall be provided on the fan discharge. Vibration isolator units and wall caps shall be provided for each fan as indicated in the schedules on the drawings.

2.8.02 Duct Fans. Duct fans, denoted by the symbol "DF" and an identifying number, shall be Greenheck "SQ", Penn Ventilator, Loren Cook, or approved equal. Duct fans shall be of the centrifugal in-line type, and shall be direct or belt driven, as indicated in the schedules on the drawings. Fan wheels shall be aluminum, backward inclined type, dynamically and statically balanced at the factory.

The fan housing shall be square, constructed of aluminum or heavy gage steel as required, and shall be furnished with duct mounting collars. Access doors or panels shall be provided for servicing internal parts without removing the fan from the ductwork. Vibration isolation units shall be provided for each unit. The interior of the fan housing shall be lined with 1 inch (25 mm) fiberglass duct liner.

Motors and drives shall be isolated from the airstream. The wheel shaft shall be of ground and polished steel, mounted in heavy-duty, permanently sealed pillow block bearings.

Flexible wiring leads shall be provided from the fan motor to an external junction box and disconnect switch which shall be accessible for servicing without disconnecting the field wiring.

2.8.03 Fume Hood Exhaust Fans. Fume hood exhaust fans and exhaust duct stackheads, denoted by the symbol "EF" and an identifying number, shall be manufactured by Kewaunee Scientific Equipment Corporation, or approved equal. Fume hood exhaust fans shall be of the single inlet, multiblade, flat or backward-inclined centrifugal type and shall be statically and dynamically balanced at the factory.

Fans shall be furnished with removable weather covers over the motors, drive shaft, and bearings. Each fan shall be furnished with vertical exhaust duct stackheads, and NEMA Type 3R disconnect switches.

Exhaust fan outlets shall consist of a duct stackhead and a transition section that fits directly onto the outlet of the exhaust fans. The duct stackhead shall be a zero pressure vertical stack weather cap designed to keep water out of the fan housing. Stackheads shall be rigidly supported as indicated on the drawings. The stackheads shall be fabricated of cold rolled steel, coated with a baked, chemical-resistant, synthetic resin finish, or fabricated of AISI Type 316 stainless steel. The exhaust stack shall be fabricated with all seams welded and ground smooth.

The fans shall be sized to fit in the space indicated on the drawings and shall be provided with vibration isolators, threaded 1/4 inch (6 mm) drain connections at the low point of the scrolls, and inlets suitable for attaching flexible connections to the fans.

The exhaust fans shall have welded housings and steel frames with a baked, chemical-resistant finish. Fan wheels shall be of steel and shall be coated with a baked, chemical-resistant finish, "Kem-FP" or approved equal.

2.8.04 Power Roof Ventilators. Power roof ventilators, denoted by the symbol "PRV" and an identifying number, shall be Greenheck "G" or "GB", Penn Ventilator "Domex", Loren Cook, or approved equal.

Power roof ventilators shall be centrifugal or propeller type, as indicated in the schedules on the drawings, and shall be statically and dynamically balanced for quiet, vibration-free operation. Each fan shall be complete with a weather hood, a safety disconnect switch mounted in the hood, a 1/2 inch (13 mm) mesh aluminum bird screen over all openings, and, where indicated in the schedules on the drawings, a backdraft damper. Fan housings shall be constructed of aluminum and shall have an aluminum base of the self-flashing type, suitable for mounting on the curbs indicated on the drawings.

2.8.05 Propeller Fans. Propeller fans, denoted by the symbol "PF" and an identifying number, shall be Greenheck "Model S" or "Model SC" for direct drive and "Model SB" or "Model SBC" for belt drive, Penn Ventilator, Loren Cook, or approved equal.

Propeller fans shall consist of a panel frame, a wire guard, a motor, and fan blades. Fan blades shall be steel or aluminum, as required. Propeller fans shall be statically and dynamically balanced to ensure quiet, vibration-free operation, and be suitable for mounting as indicated.

When indicated in the schedules on the drawings, a wall mounting kit shall be provided. The wall mounting kit shall consist of a wall collar, motor wire guard, backdraft damper, and weather hood with birdscreen.

2.8.06 Utility Fans. Utility fans, denoted by the symbol "UF" and an identifying number, shall be Greenheck "Model SWB", Penn Ventilator, Loren Cook, or approved equal.

Utility fans shall be multiblade, squirrel-cage type, with nonoverloading type blades. The fans shall be statically and dynamically balanced for quiet, vibration-free operation and shall be provided with vibration isolators. Fan inlets and outlets shall be provided with removable angles and bolts for attaching flexible connections. Fan housings shall be heavy gage steel, of all-welded construction and shall be shop coated with universal primer. Fan bearings shall be of the self-aligning, ball type.

2.8.07 Vaneaxial Fans. Vaneaxial fans, denoted by the symbol "VF" and an identifying number, shall be manufactured by Aerovent, Buffalo Forge, or approved equal. Vaneaxial fans shall have heavy gage steel housings with straightening vanes and adjustable blades. Fans shall be direct connected to an electric drive motor suitable for use with the power supply indicated in the schedules on the drawings. The fans shall be furnished with inlet bells, inlet and outlet screens, and support legs for mounting vertically or horizontally, as indicated in the drawings. The support legs shall be constructed of heavy steel plate attached to the fan housing and braced for rigidity. Each fan shall be equipped with access doors for blade adjustment and vibration isolators.

2.8.08 Wall Fans. Wall fans, denoted by the symbol "WF" and an identifying number, shall be Greenheck "Model GW" or "Model GWB", Penn Ventilator, Loren Cook, or approved equal. Wall fans shall be suitable for sidewall installation; shall be direct or belt driven, centrifugal type, with aluminum wheels and housing, and a wheel guard located on the discharge side; and shall be statically and dynamically balanced at the factory. The fan motors shall be of adequate size to prevent overloading when operating at the specified capacity and shall be suitable for use with the power supply indicated in the schedules on the drawings.

2.8.09 FRP Fans. Fans to be used in FRP applications shall be as manufactured by Plasticair, or approved equal.

2.9 ROOF HOODS. Roof hoods, denoted by the symbol "RH" and an identifying number, shall be Greenheck "Model FHI" or "FHR", Penn Ventilator, Loren Cook, or approved equal.

Roof hoods shall be suitable for air intake or exhaust and shall have throat dimensions as indicated in the schedules on the drawings. The roof hood assembly shall be constructed of galvanized steel or aluminum. Each roof hood shall be complete with a weather hood, a 1/2 inch (13 mm) mesh aluminum or galvanized bird screen over all openings, and a mounting base suitable for installation on a curb as indicated on the drawings.

Where indicated in the schedules on the drawings, roof hoods shall be given a protective coating resistant to the corrosive atmosphere indicated.

2.10 AIR TERMINAL UNITS. Air terminal units shall include a sheet metal casing, volume dampers, an air volume sensing device, actuators, acoustical lining, sound baffles and accessory controls. The actuators type shall be as required. The acoustical lining shall conform to UL-181 and NFPA-90A. Enclosures of terminal units shall be constructed of galvanized steel not lighter than 22 gage (0.76 mm) thickness or aluminum sheet not lighter than 18 gage (1.21 mm) thickness. Single or multiple discharge outlets shall be provided as indicated on the drawings.

Terminal units shall be pressure independent and shall maintain a calibrated set or varying airflow rates with varying inlet static pressures. Unit air volume shall be factory preset and shall be readily field adjustable without special tools. Pressure losses through the unit at maximum flow rate shall not exceed the values indicated in the schedules on the drawings.

Acoustic performance of the terminal units shall be based upon units tested in accordance with ARI 880. Certified discharge and radiated sound power data for the units giving dB referenced to 10^{-12} watts in each of the octave bands shall be included with the air terminal unit submittal. Discharge sound power shall be shown for a pressure range from minimum up to the inlet static pressure as required. Radiated sound shall be indicated without allowance for ceiling absorption.

2.10.01 Coils. Heating water coils shall be furnished and installed where indicated on the drawings. The coils shall be fin-and-tube type, constructed of seamless copper tubes with copper or aluminum fins mechanically bonded or soldered to the tubes. Casing and tube support sheets shall be 16 gage (1.52 mm) thickness or 0.0635 inch (1.6 mm), galvanized steel, formed to provide structural strength. Each coil shall be designed for 150 psig (1035 kPa gauge) working pressure and shall be tested at an air pressure not less than 250 psig (1725 kPa gauge).

Electric resistance heating coils shall be duct-mounted type consisting of a nickel-chromium resistor mounted on refractory material and a steel or aluminum frame for attachment to ductwork. Electric duct heaters shall meet UL requirements and shall be provided with a built-in or surface-mounted high-limit thermostat. Electric duct heaters for use with fan-powered air terminal units shall be interlocked electrically so that heaters cannot be energized unless the fan is running.

2.10.02 Controls. Unit operators and controls shall be provided by the temperature controls supplier and shall be factory-installed by the air terminal unit manufacturer. The air terminal units will receive a control signal from the temperature control system and shall be furnished with controls to provide proper system operation. Controls shall include an automatic changeover control when heating and cooling air is supplied to the unit. The signal will modulate the primary air valve and the heating output as described in the sequence of operation.

2.10.03 Air Terminal Units - Single Duct. Single duct air terminal units, denoted by the symbol "ATS" and an identifying number, shall be Price, Environmental Technologies "Model SDR", Titus, or approved equal.

Constant volume, single duct terminal units shall be equipped with a mechanical or pneumatic constant volume regulator. The units shall control air volume within ±5 percent of each air set point volume as determined by the thermostat with variations in inlet pressures from 0.50 to 6 inch wc (0.12 to 1.5 kPa).

Variable volume, single duct, low pressure terminal units shall be provided with a calibrated air volume sensing device, an air valve or damper, an actuator, and accessory relays. External differential pressure taps (separate from the control pressure taps) shall be provided for air flow measurement with a 0 to 1 inch wc (0 to 0.25 kPa) range. Unit volume controller shall be normally open or closed, as required, upon loss of the control signal.

2.10.04 Air Terminal Units - Fan Powered. Fan powered air terminal units, denoted by the symbol "ATF" and an identifying number, shall be Price, Environmental Technologies "Model VVF-II", Titus, or approved equal.

Variable volume, single duct, low pressure, fan-powered terminal units shall be provided with a calibrated air volume sensing device, an air valve or damper, an actuator, a fan and motor, and accessory relays. The units shall control primary air volume to within ±5 percent of each air set point as determined by the thermostat with variations in inlet pressure 0.5 to 6 inches wc (0.12 to 1.5 kPa). The unit fan shall be centrifugal, direct-driven, double-inlet type, with forward curved blades. The fan motor shall be permanently lubricated, permanent split-capacitor type. The fan speed shall be controlled by a solid-state speed controller to balance the fan airflow rate to the specified rates. The fan/motor assembly shall be isolated from the casing to minimize transmission of vibration. The fan control shall be factory furnished and wired into the terminal unit's control system. A factory-mounted pressure switch shall be furnished to operate the unit fan whenever pressure exists at the unit primary air inlet or when the control system fan operates.

2.11 DAMPERS.

2.11.01 Backdraft Dampers. Backdraft dampers, denoted by the symbol "BDD", shall be Arrow United Industries "Type 655", Ruskin "BD6", or approved equal. Backdraft dampers shall be constructed with a 1 by 4 inch by 0.081 inch thick (25 by 100 mm by 2 mm) extruded aluminum frame. Blades shall be of 0.081 inch (2 mm) aluminum, with silicone rubber seals on the edges, and with aluminum shafts and ball bearings.

2.11.02 Control Dampers. Control dampers shall be denoted by the symbol "CD" and an identifying number. Dampers with an area larger than 25 square feet (2.3 m^2) or with any dimension exceeding 48 inches (1200 mm) shall be built in sections. All dampers shall be carefully inspected before and after installation, and any damper having poorly fitted blades, insufficient framed rigidity, or excessive clearance or backlash in moving parts will be rejected and shall be replaced with an acceptable unit.

Two-position dampers shall have parallel operating blades. Modulating dampers shall have opposed operating blades.

Damper blades shall be installed on a steel shaft operating in synthetic bearings suitable for industrial service. Dampers shall be close-fitting and shall be designed to offer minimum resistance to the airflow when in the fully open position. Damper blade linkage shall be concealed in the frame.

Control dampers shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.11.02.01 Duct Mounted Control Dampers. Control dampers and face bypass dampers mounted in ductwork and equipment curbs shall be Arrow United Industries "Type AFD-20", Ruskin "CD-50", or approved equal. The damper frames shall be constructed of 5 inch (125 mm) Type 6063 T5 extruded aluminum. Damper blades shall be constructed of 6 inch (150 mm) wide airfoil-shaped extruded aluminum.

Control dampers denoted on the drawings to be face and bypass dampers shall be vertically arranged. The face damper dimensions shall be coordinated with the heating coil dimensions. The bypass area shall be half the area of the face damper. Face and bypass damper submittals shall indicate coil size, face dimensions, and bypass dimensions.

2.11.02.02 Wall Mounted Control Dampers. Control dampers mounted in walls behind louvers shall be Ruskin "CD-40", Arrow United Industries "Type AFD-20", or approved equal. Control damper frames shall be constructed of 4 by 1 inch (100 by 25 mm) 6063 T5 extruded aluminum. Damper blades shall be constructed of 4 inch (100 mm) wide airfoil-shaped extruded aluminum.

2.11.02.03 Round Control Dampers. Round control dampers shall be Arrow United Industries "Type 70, 75, or 80", or approved equal. The damper frames and blades shall be constructed of the material as required.

2.11.03 Fire Dampers. Fire dampers, denoted by the symbol "FD", installed in partitions having a fire resistance rating of less than 3 hours shall be Air Balance Inc. "Model D19", Ruskin "Model DIBD2", or approved equal. Fire dampers installed in partitions having a fire resistance rating of 3 hours or more shall be Air Balance Inc. "Model D39", Ruskin "Model DIBD23", or approved equal. Fire dampers shall be style "B" for ducted and style "A" for non-ducted applications unless otherwise indicated on the drawings.

Dampers shall have a 5 inch (125 mm) wide galvanized steel channel frame, galvanized steel interlocking blades, stainless steel closure springs and latches, 165°F (74°C) fusible links, and a 20 gage (0.91 mm) thickness galvanized steel housing. Factory fabricated sleeves and mounting angles shall be furnished for each damper for mounting as indicated on the drawings. Fire dampers shall be rated in accordance with UL-555 for use in dynamic systems.

2.11.04 Smoke Dampers. Smoke dampers, denoted by the symbol "SCD" and an identifying number, shall be Air Balance Inc. "Series S", Ruskin, or approved equal. The damper leakage class shall be as required.

Damper frames shall be fabricated of 16 gage (1.52 mm) thickness, 5 inch by 1 inch (125 by 25 mm) galvanized steel channel and shall be sized to fit the ductwork as indicated on the drawings. Blades shall be parallel, 16 gage (1.52 mm) thickness galvanized steel, and shall be furnished with blade and jamb seals. Smoke dampers shall meet all applicable provisions of UL-555S and shall bear the UL label.

Axles and control shafts shall be of 1/2 inch (13 mm) plated steel, with oil impregnated bronze bearings. Linkages shall be concealed and shall be located outside the airstream.

2.11.05 Combination Smoke/Fire Dampers. Combination smoke/fire dampers, denoted by the symbol "SFD" and an identifying number, shall be Air Balance Inc. "Model FS2", Ruskin, or approved equal.

Combination smoke/fire damper frames shall be fabricated of a 16 gage (1.52 mm) thickness, 5-1/2 by 7/8 inch (140 by 22 mm) galvanized steel channel, interlocking 16 gage (1.52 mm) thickness galvanized steel blades, and an 18 gage (1.21 mm) thickness galvanized steel sleeve. The sleeve shall be at least 6 inches (150 mm) longer than the thickness of the wall or floor in which the damper is installed. Bearings shall be oil-impregnated bronze. Blade edge seals shall be high-temperature silicone rubber.

Each damper shall be provided with a matching UL-approved, factory installed electric actuator with 165°F (74°C) thermal disc. The actuator shall be installed for power-open/spring-return (fail closed) operation. The actuator shall be suitable for 120 volt single phase power supply and shall be rated for a temperature of 250°F (121°C).

Combination smoke/fire dampers and actuators shall meet all applicable provisions of UL-555 and shall bear the UL label. Dampers shall be rated 1-1/2 hour, leakage class II, and temperature class of 250°F (121°C).

2.11.06 Volume Control Dampers. Volume control dampers shall be denoted by the symbol "VCD". Volume control dampers in round ductwork shall be Arrow United Industries "Type 200 VCRD", Ruskin "Model MDRS25", or approved equal. Volume control dampers in rectangular ductwork shall be Arrow United Industries "Type 1770", Ruskin "Model MD35", or approved equal.

Rectangular volume control dampers shall be fabricated of 16 gage (1.52 mm) thickness galvanized steel, with a nominal 4 or 5 inch by 1 inch (100 mm or 125 mm by 25 mm) channel frame, and opposed operating blades. Round dampers shall be fabricated of galvanized steel, with a nominal 7 inch (178 mm) long, 22 gage (0.76 mm) thickness frame, and a minimum 20 gage (0.91 mm) thickness circular blade.

The dampers shall be provided with adjustment quadrants and locking devices so arranged that the position of the damper will be indicated and the damper will not move when locked.

2.12 DAMPER OPERATORS. The damper operators shall be direct coupled or linkage type. Where linkage type operators are used, each operator shall be complete with all necessary crank arms, ball joint connectors, push rods, linkages, and mounting brackets.

Each operator shall have sufficient torque to operate the connected control damper area. Each damper operator shall have at least a 50 inch-pound (5.6 N-m) normal running torque. Where the required damper torque exceeds the damper operator running torque rating, multiple operators shall be furnished to produce the normal running torque required to operate the damper. Control dampers shall fail to the closed position unless otherwise indicated on the drawings. Face dampers shall fail to the closed position and bypass dampers to the open position.

Where damper operators are installed in explosionproof rated areas indicated on the drawings, the operators shall be furnished and installed in explosionproof housings suitable for installation in an NEC Class I, Division 2, Group D area. Where damper operators are installed outdoors, the operators shall be furnished and installed in weathertight enclosures.

2.12.01 Electric Damper Operators. The electric damper operators shall be two-position or modulating type, as indicated in the sequence of operation or schedules on the drawings.

2.12.01.01 Modulating Electric Damper Operators. Modulating electric damper operators shall be Honeywell "Model M9185", or approved equal. Modulating electric damper operators in hazardous areas shall be installed in Honeywell "ES-650-118" explosionproof housing, or approved equal.

Modulating electric damper operators shall be housed in a die-cast aluminum case with a mounting flange. Motor and gear train components shall be immersed in oil. Damper operators shall have a 3/8 inch (9.5 mm) square, double-ended drive shaft.

Damper operators shall be electrically operated, reversing, proportional operators with spring return, and internal single pole-double throw auxiliary switch rated 5 amperes at 120 volts ac.

Damper operators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers where required, shall be factory wired to the damper operator and installed in a NEMA Type 1 enclosure fastened to the motor housing.

2.12.01.02 Two-Position Electric Damper Operators. Two-position direct coupled electric damper operators shall be Belimo "NF120-S", Honeywell "ML4195", Johnson Controls, or approved equal. Linkage type electric damper operators shall be Honeywell "Model M4185", Johnson Controls "Model M100", or approved equal. Two-position electric damper operators in hazardous areas shall be installed in explosion proof housings.

Damper operators shall be spring return and shall have one internal spdt auxiliary switch rated 5 amperes at 120 volts ac. Damper operators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers, where required, shall be factory wired to the damper operator and installed in a NEMA Type 1 enclosure fastened to the motor housing.

a. Direct coupled two position electric damper operators shall be housed in a galvanized steel or aluminum case. Operators shall use a "V" shaped bolt and cradle design to eliminate slippage on the damper shaft. Single bolt or set screw type designs are not acceptable. The operators shall be suitable for direct mounting to shafts up to 1 inch (25 mm) and shall be complete with mounting brackets and damper position indicator.

b. Linkage type two-position electric damper operators shall be housed in a die-cast aluminum case with a mounting flange. Motor and gear train components shall be immersed in oil. Damper operators shall have a 3/8 inch (9.5 mm) square, double-ended drive shaft.

2.12.02 Pneumatic Damper Operators. The pneumatic damper operators shall be two-position or modulating type as indicated on the drawings. Each operator shall be provided with factory-mounted pilot positioners.

2.12.02.01 Two-Position Pneumatic Damper Operators. Two-position pneumatic damper operators shall be housed in a die-cast aluminum case with a mounting flange. Pneumatic operators shall be piston type, with a 3/8 inch (9.5 mm) square, double-ended drive shaft.

Pneumatic operators shall have a spring return and shall have one internal spdt auxiliary switch rated 5 amperes at 120 volts ac.

2.12.02.02 Modulating Pneumatic Damper Operators. Modulating pneumatic damper operators shall be housed in a die-cast aluminum case with a mounting flange. Pneumatic operators shall be piston type, with a 3/8 inch (9.5 mm) square, double-ended drive shaft.

Modulating pneumatic damper operators shall be reversing type.

2.13 AIR OUTLET AND INLET DEVICES. Air outlet and inlet devices shall be manufactured by Price, Tuttle & Bailey, Titus, or approved equal. Air outlet and inlet devices shall be furnished and installed where indicated on the drawings.

Air outlet and inlet devices shall be given a protective coating identical to the coating applied to the connected ductwork and equipment.

2.13.01 Linear Diffusers. Linear diffusers shall be constructed of aluminum or steel as indicated in the schedules on the drawings. All linear supply diffusers shall have adjustable air pattern control.

2.13.02 Ceiling Diffusers. Diffusers shall be square or rectangular, constructed of the materials indicated in the schedules on the drawings. Diffusers shall have a key-operated, opposed-blade damper mounted in the neck where indicated in the schedules on the drawings. Size, location, and direction of airflow shall be as indicated on the drawings.

2.13.03 Registers and Grilles. Registers and grilles shall be constructed of aluminum or steel as indicated in the schedules on the drawings. The front blades of adjustable blade models shall be parallel to the short dimension unless otherwise indicated, and the front blades of fixed blade models shall be horizontal unless otherwise indicated. All registers shall be furnished with key-operated opposed blade dampers. The dampers shall be constructed of the same material as the attached grille.

2.14 FLEXIBLE CONNECTIONS. Flexible connections located indoors shall be Ventfabrics "Ventglas", or approved equal. Flexible connections installed outdoors or exposed to sunlight or weather shall be Ventfabrics "Ventlon", or approved equal.

Ductwork connections to the air handling equipment, and where indicated on the drawings, shall be made using fabric connectors with sheet metal collars. The fabric shall be fire resistant, waterproof, mildew-resistant, and airtight. At least 3 inches (76 mm) of fabric shall be exposed. Flexible connections shall be in accordance with the requirements of UL and NFPA.

Fabric for flexible connections protected from sunlight and the weather shall be suitable for a temperature range of -20 to 180°F (-29 to 82°C) and shall weigh at least 27 ounces per square yard (915 g/m^2).

Fabric for flexible connections exposed to sunlight or the weather shall be suitable for a temperature range of -10 to 250°F (-23 to 121°C) and shall weigh at least 24 ounces per square yard (814 g/m^2).

2.15 AIR FILTRATION EQUIPMENT.

2.15.01 Pleated Air Filters. Pleated air filters shall be American Air Filter "AM-AIR 300X", Farr "30/30", or approved equal. Filters shall be disposable type, high-loft blend of cotton and synthetic fiber pleated media. The media shall be rated as Class 1 or Class 2 in accordance with UL 900. A metal support grid shall be bonded to the media. The filter frame shall be constructed of rigid, high-strength, moisture-resistant beverage board. The pleated media pack shall be bonded to the inside of the frame. All filters shall have an average efficiency of 25 to 30 percent based on the ASHRAE 52.1 test method.

One inch (25 mm) filters shall have at least 14 pleats per linear foot (0.3 m) and at least 1.9 square feet of media per square foot of filter area (1.9 square meters per square meter). One inch (25 mm) filters shall have a maximum initial resistance of 0.10 inch wc at 300 feet per minute (0.02 kPa at 1.5 m/s).

Two inch (50 mm) filters shall have at least 12 pleats per linear foot (0.3 m) and at least 4.2 square feet of media per square foot of filter area. (4.2 square meters per square meter). Two inch (50 mm) filters shall have a maximum initial resistance of 0.13 inch wc at 300 feet per minute (0.03 kPa at 1.5 m/s).

2.15.02 Extended Surface Air Filters. Extended surface air filters shall be American Air Filter "VariCel II", Farr "Riga-Flo", or approved equal. Filters shall be of the disposable type with glass fiber or synthetic media pack. The media shall be rated as Class 1 or Class 2 in accordance with UL 900. Extended surface air filters shall have an average efficiency of 60 to 65 percent based on the ASHRAE 52.1 test method. Filters shall have a maximum initial resistance of 0.40 inch wc at 500 feet per minute (0.10 kPa at 2.5 m/s).

2.15.03 Side Access Filter Housings. Side access filter housings shall be American Air Filter "Access Air", Farr "Model 4P Glide/Pack", or approved equal. Side access filter housings shall be single-stage, factory-fabricated of 16 gage (1.52 mm) thickness galvanized steel and shall be equipped with flanges for connection to the ductwork. Access doors shall be 16 gage (1.52 mm) thickness galvanized steel and shall be positioned to allow replacement of filters from either side of the housing. Filter housings and doors shall be insulated and of double-wall construction. Filter tracks shall be provided to accommodate nominal 2 inch (51 mm) thick disposable filters as described herein. Leakage at the rated airflow shall be less than 1 percent at a 3 inch wc (0.75 kPa) differential.

2.16 AIR FILTER MONITORING EQUIPMENT. Air filter monitoring equipment in the form of draft gauges and shaft power monitors shall be installed within all air distribution systems. The Contractor shall be responsible for equipment installation in accordance with the Manufacturers instructions. Furthermore, the Contractor will be responsible for start-up, testing, and operation and maintenance training of the Owner’s personnel.

2.16.01 Draft Gauges. Draft gauges shall be Dwyer Instruments, Inc. "2000 Series Magnehelic Air Filter Gauge", or approved equal.

Diaphragm actuated dial type draft gauges, located for easy readability, shall be installed across all air filters. The gauges shall have a dial of at least 3-1/2 inch (89 mm) diameter, a die cast aluminum housing, an adjustable signal flag, mounting hardware, an ambient temperature range of 20 to 140°F (-7 to 60°C), and a range of 0 to 1.0 inch wc (0.25 kPa), with a full range accuracy of 2 percent. Each gauge shall be furnished with an air filter kit consisting of a mounting panel, two static pressure tips with integral compression fittings, aluminum tubing, and vent valves.

2.16.02 Shaft Power Monitors. Shaft power monitors shall be Emotron “EL-FI M20” or approved equal.

Shaft power monitors shall at minimum include a system that is suitable for installation within the air filter electrical control panel. Shaft power monitors shall provide two (2) programmable alarm outputs for detecting overload and underload conditions. The system will provide user information via an on-board alpha-numeric display, which may be in the form of an LCD or LED. Alarm Status should be displayed. A DIN Rail mounted device is preferable. A panel mount kit should be available as an option. The system shall derive its power supply from the same source as that required for the air filter motor, i.e., the system must not require the provision of low voltage supplies, such as 110 VAC or 24 DC. To facilitate expanded plant wide monitoring and analysis, i.e., a SCADA system, the Air Filter Monitoring and Protection System must provide a self-powered, 2-wire, 4-20mA output signal that is proportional to the load on the air filter.

Shaft power monitors shall be installed no further than 25 radial feet (7.6 m) away from corresponding air units. The unit display shall be visible within the control panel or equipment setting. If multiple air handling units are to be installed, then all output signals and alarms relating to clogged or unclogged status shall be sent to a local PLC. This signal shall also be transferred to the main facility control panel. The system shall provide the user the ability to remotely reset an alarm condition that is initiated by the system. I/O connections shall be made in accordance with Master Specifications Section 17500, Programmable Logic Controllers.

2.17 SHEET METAL WORK. The ductwork, accessories, bracing, and supports shall be constructed of the material as required. Galvanized ductwork located in air conditioned spaces shall be constructed of G-60 or better lockforming quality in accordance with ASTM A653. All other galvanized ductwork shall be constructed of G-90 or better galvanized steel. Accessories, bracing, and supports shall be constructed of similar materials as the ductwork. Ductwork, turning vanes, and other accessories shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Plenums shall be constructed of reinforced 16 gage

(1.52 mm) thickness galvanized sheet metal.

Sheet metal ductwork shall be sealed according to the classifications described in the SMACNA HVAC Duct Construction Standards. Ductwork shall be fabricated, reinforced, supported, and sealed for the operating pressures indicated in the schedules for the connected equipment. All ductwork shall have a pressure classification of at least 1 inch (25 mm).

Sheet metal fan boxes shall be fabricated with 12 gage (2.66 mm) thickness galvanized sheet metal skin and structural steel framing of sufficient strength to support the fan box and the fan mounted on the box. The framing shall be coated with a universal primer. All welds on galvanized metal shall be cleaned and coated with a zinc-rich paint. Drawings of the fan boxes shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Sheet metal ductwork for the laboratory exhaust systems shall be constructed of AISI Type 304 stainless steel with standard mill finish. Longitudinal seams and transverse joints shall be made with continuous welds. The welding procedure shall produce joints with corrosion resistance at least equal to that of the base material. Duct thickness shall be as needed for the welding procedure, but shall not be less than 22 gage (0.76 mm) thickness. Flanged connections shall be provided at all equipment and damper connections, and at intervals not more than 10 feet (3 m) as measured along the centerline of the duct. Flanged joints shall be provided with 1/8 inch (3.2 mm) thick viton gaskets suitable for temperatures up to 250°F (121°C).

All joints, seams, connections, and penetrations in ductwork located outdoors shall be sealed watertight and weatherproof. Transverse joints shall be flanged and shall be provided with a continuous gasket and flange cap.

Where indicated on the drawings, ductwork and accessories shall be given a protective coating resistant to the corrosive atmosphere.

2.18 DUCT INSULATION. Interior duct liner shall be Knauf "Duct Liner E M", CertainTeed "ToughGard R", Schuller "Permacote-Linacoustic", or approved equal.

Interior duct liner shall be 1-1/2 pound per cubic foot (24 kg/m^3) density, spray coated duct liner with an "R" value of at least 3.6 ft^2·hr· °F/BTU (0.63 m^2· C/W) per inch (25 mm) thickness. The insulation shall be suitable for temperatures up to 250°F (121°C) and shall have at least a 0.55 NRC per 1 inch (25 mm) thickness. The insulation shall conform to ASTM C1071.

2.19 FLEXIBLE DUCT AND TAKEOFFS. Flexible duct shall be Flexmaster "Type 9", Flexible Technologies "Thermaflex Type G-KM", or approved equal. Takeoffs shall be Buckley Air Products "Air-Tite Bellmouth BM-D", or approved equal.

Flexible duct shall be a galvanized or vinyl-coated spring steel helix, bonded to a polymer liner, and wrapped with glass fiber insulation suitable for use in heating and cooling systems. The insulation shall provide an "R" value of at least 4.2 $ft^2 \cdot hr \cdot$ °F/BTU (0.74 $m^2 \cdot$ C/W). The outer jacket shall be a vapor barrier of fire retardant polyethelene or polyolefin material. The flexible duct shall be listed under UL 181 as Class 1 flexible air duct and shall comply with the latest edition of NFPA 90A.

Takeoffs for the flexible duct shall be bellmouth type manufactured of galvanized steel with a neoprene gasket and predrilled holes. Each takeoff shall be equipped with a balance damper constructed of 26 gage (0.45 mm) thickness galvanized steel. Scoops or other obstructions in the main duct will not be acceptable.

2.20 ACCESS DOORS. Access doors shall be fabricated in accordance with the latest SMACNA HVAC Duct Construction Standards. Access doors shall be double skin insulated type for insulated ductwork and single skin type for noninsulated ductwork. Duct-mounted access doors and panels shall be fabricated of the same material as the ductwork, with sealing gaskets and quick-fastening locking devices. Where access doors are insulated, a sheet metal cover shall be installed over the insulation.

2.21 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

2.22 DRIVE UNITS. Drive units shall be designed for 24 hour continuous service.

2-22.01 Adjustable Frequency Drives. Adjustable frequency drives (AFD) shall be provided as indicated in the schedules on the drawings. Each adjustable frequency drive shall be coordinated with the requirements of the driven equipment. Particular attention shall be directed toward the driven equipment torque requirements.

The equipment supplier shall be responsible for coordinating the AFD with the driven equipment to assure compatibility between the drive and motor. All equipment shall be derated as recommended by the AFD and motor manufacturers for reduced speed operation with an adjustable frequency controller.

Each AFD shall be pulse-width modulated type and shall produce an adjustable ac voltage/frequency output. Each AFD shall maintain a minimum displacement power factor of 0.95 over the entire speed range, and shall be equipped with an output voltage regulator to maintain correct output V/Hz despite incoming voltage variations.

Each AFD shall be equipped with an input line reactor and a full-wave diode bridge rectifier to convert incoming fixed voltage/frequency to a fixed dc voltage.

The AFD inverter output shall be generated by insulated gate bipolar transistors (IGBT) which shall be controlled by six identical base driver circuits. The AFD shall not induce excessive power losses in the motor. The worst case RMS motor line current measured at rated speed, torque, and voltage shall not exceed 1.05 times the rated RMS motor current for pure sine wave operation. Each AFD shall be configurable for automatic and manual reset and shall have an adjustable carrier frequency to at least 16,000 Hz.

2.22.02 V-Belt Drives. Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor.

2.22.03 Safety Guards. All belt drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.22.04 Electric Motors. Motors furnished with equipment shall meet the following requirements.

a. A manufacturer's standard motor may be supplied on packaged equipment and fans in which case a redesign of the unit would be required to furnish motors of other than the manufacturer's standard design. However, in all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

b. Designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

c. Rated for continuous duty at 40°C ambient, unless the application is well recognized for intermittent duty service as a standard industry practice.

d. Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, frequent starting, or adjustable frequency drive applications, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits in accordance with ANSI/NEMA MG 1 for insulation class, service factor, and motor enclosure type.

e. To ensure long life, motors shall have nameplate horsepower (kW) equal or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Open	1.15
	Other Than Open	1.0
Integral hp (kW)	Open	1.15
	Other Than Open	1.0

f. Designed for full voltage starting.

g. Designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

h. Totally enclosed motors shall have a continuous moisture drain that also excludes insects.

i. Bearings shall be either oil or grease lubricated.

j Totally enclosed motors shall be furnished on:

1. Outdoor equipment.

2. Equipment for installation below grade.

3. Equipment operating in chemical feed and chemical handling

locations.

4. Equipment operating in wet or dust-laden locations.

k. Dripproof motors, or totally enclosed motors at Contractor's option, shall be furnished on equipment in indoor, above-grade, clean, and dry locations.

l. Explosionproof motors shall be furnished as specified by applicable codes or as specified in other sections.

m. Motors shall be rated as follows:

1. Below 1/2 hp (0.4 kW).
115 volts, 60 Hz, single phase; or 240 volts, 60 Hz, single phase.

2. 1/2 hp (0.4 kW) and above.
460 volts, 60 Hz, 3 phase.

Motors used on 240 volt systems shall be 230 volts, 60 Hz, 3 phase.
Motors used on 208 volt systems shall be 200 volts, 60 Hz, 3 phase.

n. All motors shall meet the minimum efficiency standards required by the Energy Policy Act (EPACT) of 1992.

o. Motor nameplates shall indicate as a minimum the manufacturer name and model number, motor horsepower, voltage, phase, frequency, speed, full load current, locked rotor current, frame size, service factor, power factor, and efficiency.

p. Motors to be used with adjustable frequency drives shall be rated for inverted service.

2.23 SHOP TESTING. The equipment furnished under this section shall be tested at the factory according to the standard practice of the manufacturer. Ratings shall be based on tests made in accordance with applicable AMCA, ASHRAE, ARI, NBS, NFPA, and UL Standards.

2.24 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient course for rejection of the equipment. The mass of the unit and its distribution shall be such that the resonance at normal operating speeds is avoided. In any case, the maximum measured root-mean-square (rms) value as measured at any point on the equipment shall not exceed those listed in the latest ASHRAE Applications Handbook. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in pounds
N = RPM for N greater than 1,000

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be more than 1.3.

2.25 FRP DUCTWORK.

2.25.01 Material. Fiberglass reinforced polyester resin; complying with ASTM C581. Do not add thixotropic agent to resin.

2.25.02 Corrosion Liner. Consists of one “C” veil and one chopped strand mat (1-1/2 ounces) or one layer of chopped strand prior to filament winding. Provide minimum 30 mil thickness.

2.25.03 Duct Wall Thickness. Minimum 1/4 inch.

2.25.04 Fittings. Provide smooth bends or internal turning vanes at elbows, tees and at other changes in direction.

2.25.05 Suction Inlet. Provide suction inlet with vinyl coated screen; 50 percent free area.

2.25.06 Flanges. Comply with ASTM D4024 and PC15-69, Sections 3.4.7.1 to 3.4.7.5.

2.25.07 Fabrication. Comply with Voluntary Product Standard PS15-69, Sections 3.1.1 to 3.4.9. Fabricate for water drainage.

2.25.07.01 Visual Defects. Comply with ASTM D2563, Level II.

2.25.07.02 Exterior Coating. Comply with PS-15-69, Section 3.3.3.1.

2.25.07.03 Duct Deflection Rectangular Duct. Rectangular Duct: Not to exceed 2 percent of the width of the side at a test vacuum pressure of 6 inch wc.

2.25.07.04 Duct Deflection Round Duct. Not to exceed 2 percent or “S” of duct diameter under an impolsed hoop (point) loading of 550 pounds.

2.25.08 Duct Supports. Provide at least every 5 feet; fabricated of galvanized steel.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01. Field Measurement. Contractor shall be responsible for verifying all field dimensions, and for verifying location of all equipment relative to any existing equipment or structures.

3.2.02 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will protect freshly painted surfaces from dust or other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of topcoats.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall be as specified in Master Specification Section 09900, Painting.

3.3 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

The space beneath baseplates shall be grouted as specified in Master Specification Section 03600, Grout.

3.3.01 Air Handling Units. Flexible connections shall not be in tension when the fans are operating.

3.3.02 Coils. Hydronic coils shall be installed level, except for drainable coils which shall be installed with a pitch toward the drain end of the coil. Hydronic coil piping shall be arranged with the supply connection at the bottom of the coil and the return connection on the top. The water supply connection shall be toward the leaving side of the air coil for counterflow arrangement.

A sight glass shall be installed in the liquid line adjacent to each refrigerant coil. Where air handling units are installed on vibration isolators, flexible connectors shall be installed in the coil piping.

3.3.03 Makeup Air Units. Flexible connections shall not be in tension when the fans are operating.

3.3.04 Fans. Flexible connections shall be installed between fan inlet and outlet sheet metal connections. Flexible connections shall not be in tension when the fans are operating. Where fan inlets and outlets are exposed, safety screens shall be installed over the opening. Scroll drains for equipment installed indoors shall be piped to the nearest floor drain.

Power roof ventilators shall be secured with corrosion resistant lag screws to the roof curb.

3.3.05 Roof Hoods. Roof hoods shall be secured with corrosion resistant lag screws to the roof curb.

3.3.06 Air Terminal Units. Each air terminal unit shall be individually supported from the building structure.

3.3.07 Dampers. Fire, smoke, and combination fire/smoke dampers and smoke dampers shall be furnished and installed where indicated on the drawings and as specified by NFPA 90A. All dampers shall be installed in accordance with the manufacturer's UL installation instructions.

Fire dampers shall be installed square and free from racking with blades horizontal. Fire damper frames shall not be compressed or stretched into duct or opening and shall be handled using the sleeve or frame. Where multiple section assemblies are needed, bracing shall be installed to support fire damper weight and to hold assembly against system pressure.

Smoke dampers shall be mounted with the damper blades running horizontal. A duct mounted access door shall be located on the jackshaft side of each damper.

3.3.08 Damper Operators. Damper operators shall be installed on a mounting bracket rigidly attached to the damper frame or duct. Where the bracket attaches to the duct, suitable stiffeners shall be installed on the duct to prevent noticeable deflection of the duct when the damper operates. Damper operators may be installed inside or outside the duct but consideration shall be given to the environment and duct dimensions in which the operators are installed. Where the damper installation inside the duct may or actually prevents the design airflow from being achieved, the damper operator shall be installed outside the duct. Damper operators shall be readily accessible and access doors shall be provided when the operator is installed inside the duct.

3.3.09 Air Outlet and Inlet Devices. Diffusers with balance dampers installed in the flexible duct takeoffs shall not have an opposed blade damper mounted in the throat of the diffuser.

Ceiling mounted air terminals or services weighing 20 pounds (89 N) shall be supported directly from the structure.

3.3.10 Draft Gauges. Draft gauges for filters located more than 8 feet (2.4 m) above the finished floor shall be mounted on the nearest wall, 5.5 feet (1.7 m) above the finished floor. Each gauge shall be installed with vent valves in the connecting tubing adjacent to the gauge for checking and re-zeroing functions.

3.3.11 Sheet Metal Work. Ductwork, turning vanes, and other accessories shall be installed and supported in accordance with the latest SMACNA Duct Construction Standards. The locations, arrangement, and sizes of ductwork shall be as indicated on the drawings. The duct sizes indicated are clear dimensions inside the duct or duct lining. Sheet metal sizes are larger for ductwork with interior linings.

Ductwork shall be constructed and installed in accordance with the drawings. When acceptable to Owner, modifications in the size and location of ductwork may be made where required to avoid interference with the building structure, piping systems, or electrical work. The installation shall be coordinated with other phases of work to establish space and clearance requirements. Unless otherwise indicated by a bottom of duct elevation, all ductwork shall be routed as high as possible, with a minimum height of 8 feet (2.4 m) above the finished floor. Ductwork installed above suspended ceilings shall be installed with at least 8 inch (200 mm) lighting allowance between the ceiling and the bottom of the ductwork.

In vertical ducts with a closed bottom which terminate less than 24 inches (600 mm) above finished floor, the bottom of the ductwork shall be broken and sloped to a 1/2 inch (12.5 mm) drain hole in the bottom of the duct.

Single-thickness turning vanes shall be installed in all turns with 45 degree or greater angles.

3.3.12 Duct Insulation. Insulation shall be terminated at items mounted in ductwork such as thermometers, controls, damper linkages, flexible connections, access doors, etc., to avoid interference with their function and/or replacement.

The duct liner in the corners of the duct sections shall be folded and compressed or shall be cut and fit to ensure overlapping, butted edges. Top and bottom pieces shall overlap the side pieces. Longitudinal seams shall be made only at corners unless duct dimensions and standard liner product dimensions make seams necessary at other locations.

The duct liner shall be held to the duct by a coat of waterproof, fire-retardant adhesive applied over the entire duct surface. Where duct dimensions exceed 8 inches (200 mm) on any side, mechanical fasteners shall be used in addition to the adhesive. All exposed edges of the duct liner shall be tightly butted and coated with adhesive.

The following ducts shall be insulated with a 1 inch (25 mm) thick interior duct liner unless otherwise indicated or indicated on the drawings to be wrapped:

Makeup or outside air ducts.

Air conditioning system supply and return ducts.

Other ducts where indicated on the drawings.

3.3.13 Flexible Duct and Takeoffs. The length of the flexible ductwork shall not exceed 8 feet (2.4 m). All support saddles for flexible duct shall be a minimum of 6 inches (150 mm) wide.

3.3.14 Access Doors. Airtight access doors shall be provided for inspection of all control dampers, fire dampers, smoke dampers, operators, filters, smoke detectors, duct-mounted coils, and at other locations indicated on the drawings. The access doors shall be of a size suitable for the duct dimensions and at least 8 inches (200 mm) square for hand access, 18 inches (450 mm) for shoulder access, or as indicated on the drawings. Each access door shall be installed to open against the pressure in the duct.

Access doors at locations where smoke and fire dampers are installed shall be permanently identified on the exterior by a "Smoke Damper" or "Fire Damper" label with letters not less than 1/2 inches (12.5 mm) in height.

Access doors for fire dampers shall be located as close as possible to the damper, and be located so that the spring catch and fusible links are accessible when the damper is closed. Where the size of the duct permits, the minimum size access door shall be 18 inches by 18 inches (450 mm by 450 mm). For dampers that are too large to access from outside the duct, the door shall be a minimum of 24 inches by 18 inches (600 mm by 450 mm). Where possible, the access shall be located on the underside of the duct.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. After the equipment and systems have been installed, adjusted, and balanced, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.5 CLEANING. At the completion of the testing, all equipment, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

End of Section

SECTION 15890

ODOR CONTROL SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the installation and furnishing of odor control systems Included, but not limited to, are the following concepts; carbon odor control vessels, grease filter/mist eliminators, FRP fans, fan acoustical enclosure units, interconnecting ductwork, anchorage devices, tools and spare parts.

1.2 GENERAL. Contractor shall provide all labor, materials, equipment and incidentals required to furnish and install new odor control system(s) for the wastewater collection and treatment facilities.

1.2.01 Coordination. Contractor shall be responsible for coordination of the design, fabrication, and installation of the odor control system shown on the drawings and specified herein. Contractor shall coordinate the installation of the items to comply with the requirements of the Work specified under this Section.

1.2.02 General Equipment Stipulations.
Obtain all equipment included in this Section from a single carbon odor equipment manufacturer, hereon referred as the Odor Control System Supplier (OCSS), regardless of the component manufacturer. The OCSS shall review and approve or shall prepare all shop Drawings and other submittals for all components furnished under this Section. All components shall be specifically designed for odor control services and shall be integrated into the overall system by the OCSS.

1.2.03 Governing Standards. Comply with the applicable provisions and recommendations of the following, except as otherwise shown or specified:

ASTM A193, Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High Temperature Service.
ASTM A194, Standard Specification for Carbon and Alloy Steel Nuts and Bolts for High-Pressure and High-Temperature Service.
ASTM C581, Chemical Resistance of Thermosetting Resins Used in Glass Fiber Reinforced Structures.
ASTM C582-87, Standard Specification for Contact Molded Reinforced Thermosetting Plastic (RTP) Laminates for Corrosions-Resistant Equipment.
ASTM D2563-87, Standard Practice for Classifying Visual Defects in Glass-Reinforced Plastic Laminate Parts.
ASTM D2583-87, Standard Test method for Indentation Hardness of Rigid Plastics by Means of Barcol Impresser.
ASTM D2584-68, Standard Test Method for Ignition Loss of Cured Reinforced Resins.
ASTM D3299-88, Standard Specification for Filament-Wound Fiberglass

Reinforced Thermoset Resin Chemical Resistant Tanks.
ASTM4097-88, Standard Specification for Contact Molded, Glass Fiber Reinforced Thermoset Resin Chemical Resistant Tanks.
ASTM E84, Standard Test Method for Surface Burning Characteristics for Building Materials.
American Society of Heating, Refrigeration and Air-Conditioning Engineers, Inc. (ASHRAE).
National Electric Code (NEC).
National Electrical Manufactures Association (NEMA).
National Fire Protection Association (NFPA).
Underwriters Laboratories, Inc. (UL).
National Bureau of Standards (NBS) Voluntary Product Standard PS 15-69 Custom Contact Molded Reinforced Polyester Chemical-Resistant Process Equipment.
Society of Plastics Industry (SPI) Standards of Recommended Practices for Shipping and Installation of Fiberglass Reinforced Plastic Pipe, Duct and Tanks.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Manufactures of carbon vessel, fan, fan enclosure, grease filter/mist elimination and ductwork shall have a minimum of 5 years of experience or producing substantially similar equipment, and shall be able to show evidence of at least 5 installations in satisfactory operations for at least 5 years in the United States.

1.3.02 Testing. Odor controls system shall be shop tested in accordance with Master Specifications Section 15990, Testing, Adjusting, and Balancing, unless otherwise specified herein.

1.3.03 Vessel shop test. Provide services of an Independent FRP Testing Inspector to be present at the point of manufacture, upon completion of fabrication and prior to shipment, to perform or witness the following; visual inspection to the requirement of ASTM C582 and ASTM D2563, Barcol Hardness measurements per ASTM D2583-87, acetone sensitivity test for all internal secondary bonds, glass content by ignitions loss on three cutouts per ASTM D2584, and Hydrostatic Leak Test on each vessel by filling to the top of vessel and allowing to stand for 2 hours with no visible leakage.

1.3.04 Fan Shop Test. Perform a shop test on each fan at each operating condition.

Running Test: record volume, static pressure, speed, efficiency, BHP and housing vibration.
Running time at each condition shall be a minimum of one hour
Data shall be continuously recorded

Test shall be conducted with the job motor

Acoustical test: Record octave band sound power levels (LW) IN/dB RE 10-12 W, from 63 to 8000Hz. Convert to sound pressure level dB on "A" weighted scale, at a distance of 5 ft.

Test all fans from a facility in succession.

Motor Shop Test. Each motor shall be given a complete shop test. Ship motor to the fan manufacturer following successful completion of shop tests. Test reports shall provide the following minimum information:

Starting Torque.
Efficiently at ½, ¾ and full load.
Power factor at ½, ¾ and full load.
Percent slip.
No load, running light, full load and locked rotor current.
Current balance check.
Test curves for current, voltage, brake horsepower and power factor.
Full load heat run.
Vibration check.
Temperature rises and results of dielectric tests.
Motor type and frame size.
Bearing type and lubrication medium.
Insulation and enclosure type.
Load sound pressure levels in dB on the A weighted scale at 5 feet from the motor fan end. Sound pressure levels shall be determined in accordance with the procedures of IEEE Standard 85.

1.3.05 Ductwork Shop Test. Provide services of an Independent FRP Testing Inspector to be present at the point of manufacture, upon completion of fabrication and prior to shipment, to perform or witness the following; visual inspection to the requirements of ASTM C582 and ASTM D2563, Level III, Barcol Hardness measurements per ASTM D2583, acetone sensitivity test for all internal secondary bonds and glass content by ignition loss on three counts per ASTM D2584. Repairs deemed Acceptable by Independent FRP Testing Inspector must be approved by Owner.

1.4 SUBMITTALS.

OCSS shall be responsible for preparing and reviewing submittals for all system components as specified in Section 1.3.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project

Submittals. Submit for approval; fabrication, assembly and installation diagrams, manufacturer's literature, illustrations, paint certifications, specifications and engineering data including dimensions, materials, size and weight of all components and complete assembly, setting drawings, templates, and directions, for the installation of anchor bolts and other anchorages, drawings showing plans and sections of the equipment to demonstrate proper coordinates between components, fabrication methods, assembly, accessories, installation details, and wiring diagrams. Description of surface preparation, shop printing and finish painting system and deviations of Contract Documents. Provisions shall be included to adequately ground the carbon bed. Manufacturer shall supply adequate submittal details to demonstrate that the carbon bed will be adequately electrically grounded. Odor Control System data shall include, but not limited to; detail product information on the control and layout drawings including locations of external wiring and piping connections and mounting, and panel wiring and piping diagrams including identification of external wiring connections.

1.4.02 Test Reports. Submit results of the required shop tests and a written field test report giving the results of required field tests.

1.4.03 Record Drawings Submit complete manuals including, copies of all shop drawings, test, reports, maintenance and data and schedules, description of operation, acceptable lubricants, and spare parts information. Operations and Maintenance data shall be submitted in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
Deliver materials to the Site to insure uninterrupted progress of the Work. Deliver anchors bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to insure not to delay Work. Store all materials in a manner that will permit easy access for inspection and identification purposes. Keep steel members off the ground using pallets, platforms and other supports. Protect equipment including packaged materials from corrosion and deterioration. Odor control vessels shall be shipped empty and all interior components shall be shipped separately. Store mechanical equipment in covered storage off the ground to prevent condensation.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. The odor control vessel shall have the following performance specifications: Number of units, Size, Type, Bed depth, Bed velocity flow, Pressure drop, and Maximum head loss at the bed velocity flow per foot depth of packed bed.

2.2 CARBON ADSORPTION UNITS.

2.2.01 Acceptable Manufacturers. Provide odor control equipment as manufactured by one of the following: Calgon Carbon Corporation, U.S. Filter, Norit Americas, Inc., or Approved Equal

2.2.02 Activated Carbon. The activated carbon shall be virgin pelletized activated carbon, derived from bituminous coal. The activated carbon shall be suitable for the vapor phase adsorption of wastewater treatment odors. The activated carbon shall have the following specifications:

Iodine No., mg/g	1000 min
Butane Activity, weight % (per ASTM D 5742)	26 min
Hardness	95 min
Apparent Density, g/cc	0.46 – 0.49
Minimum Particle Density	3.7 mm to 4 mm pellet
H_2S Breakthrough Capacity (g H_2S removed/cc Carbon)*	0.30 min

Ignition Temperature, ^oC, minimum (per ASTM D 3466): 350

* The H_2S breakthrough capacity shall be determined using ASTM standard method D6646-01. Prior to testing, the test sample should be completely humidified by exposing the sample to a flow of humid air for at least 12 hours. Testing of 3.5 to 4 mm diameter pellets is accomplished by passing a moist (85% RH) stream of air containing 1 vol. % H_2S and the selected concentration of CO_2 through a 1.5 inch inner diameter tube with a 9" deep bed of closely packed carbon at a rate of 3,262 cc/min and monitoring to a 50 ppm H_2S breakthrough. The results are reported as grams of H_2S adsorbed per cc of carbon.

2.2.03 Odor Control Vessels Construction. Vessels shall either be contact-molded in accordance with ASTM D4097, Grade 1 or Type I, filament-wound in accordance with ASTM D3299-88, Grade 1. Portions of the vessel including joints, heads and nozzles shall be fabricated by contact molding. Contact molded laminates shall be in accordance with ASTM C582, Table 1. All laminate physical properties shall comply with requirements for laminate thickness of 3/8 inch and thicker.

All vessels shall be designed using a minimum structural safety factor of 10 to 1 for pressure and 5 to 1 for vacuum. Vessels shall have bottom knuckle reinforcement and be designed for hydrostatic head load 10-foot above the top of the inlet.

Vessel housing shall be designed for full bottom support and shall be provided with a minimum of four Type 316 stainless steel hold down lugs. All hold down lugs shall be designed to account for all anticipated loads and shall comply with local code requirements. Furnish all anchor bolts, nuts and washers which shall be Type 316 stainless steel.

The support system for carbon beds shall be as recommended by the odor control vessel supplier and approved by the Engineer. The carbon beds shall be individually supported on a polypropylene screen basket resting on each support system. The carbon bed screens and support systems shall be removable through access manways. The support system shall be a system of grating, beams and columns or equal. The support system shall be capable of withstanding a load of not less than 300 lbs./sq.ft with a deflection not greater than 1/4 –inch under any operating condition. All components of the support system shall be constructed of materials resistant to the chemical service conditions specified for corrosion. The carbon bed shall be provided with a molded fiberglass reinforced vinyl ester grating to act as a bed limiter for the lower bed. The grating shall be 1-inch thick by 2-inch by 2-inch square type to achieve a minimum free area of 75 percent. The grating shall cover the entire surface of the lower bed and shall be installed in sections that shall be removable through the access door. Cope bed limiter to match diameter of vessel. A fully seamed polypropylene screen sewn basket shall be provided to hold the activated carbon without fraying. All edges and seams shall have “piping” to reinforce the seams and edges to prevent fraying. The basket shall be of sufficient strength to hold the carbon without tearing.

2.2.04 Resins. Resins used in laminate shall be premium corrosion resistant and fire retardant brominated bisphenol. All vinylester resins are to achieve a 25 or less flame spread rating in accordance with NFPA 91. Provide products of one of the following manufacturers: Ashland Chemical Co. Hetron 992 FR with 3 % antimony trioxide, Dow Chemical Co. DeraKane 510A or 510C with 5 % antimony trioxide, Reichold, Dion 9300 FR with 5 % antimony trioxide, or approved equal.

All cut edges shall be sealed with a resin coating of the same resin as used in the fabrication. The resin shall contain paraffin.

2.2.05 Reinforcement. Synthetic surfacing veil shall be Veil-Nexus 1012 (aperture) as manufactured by Burlington Industries. Chopped strand mat shall be Type E glass, minimum 1.5 ounces per square foot, with silane finish and styrene soluble binder. Continuous roving used in chopped gun shall be Type E glass. Woven roving shall be Type E glass, nominal 24 ounces per square yard, with a 4 by 5 weave and a silane type finish. Continuous roving used for filament winding shall be Type E glass with a silane type finish, with a nominal yield of at least 110 strand yards per pound. Glass content for filament wound layers shall be 55%-70%.

2.2.06 Laminates. Laminates shall consist of a corrosion resistant resin-rich inner surface, an interior corrosion barrier, an interior structural layer, and an exterior layer. Composition specified for inner surface and interior corrosion barrier is intended to achieve optimum chemical resistance. Corrosion resistant resin-rich inner surface shall be reinforced using a single aperture Nexus synthetic veil. Minimum resin-rich inner surface thickness shall be 10-20 mils. Thixotropic agents shall not be used for this service. Glass content of resin-rich inner surface shall be 10 % plus or minus 5 % by weight. Interior corrosion barrier shall be a minimum of 100 mils of Type E glass chopped strand mat to a total of 3 oz/sqft. The interior corrosion barrier shall be applied by either the hand laid up technique, filament winding or chopper gun. Chopper gun is only permitted if an automated process is used. Manual operation of chopper gun shall not be permitted. Glass content of interior corrosion barrier shall be 25 % plus or minus 5 % by weight.

Laminate Physical Properties:

Ultimate Tensile Strength (min.PSI) ASTM Method D638:	15,000
Modulus of Elasticity Procedure A of ASTM Method D790	10 x10
Flexural Strength – (min.PSI) ASTM Method D790	22,000
Average Glass content of Completed Tanks by Ignition (%)	45

Interior structural layer shall be of sufficient thickness to meet minimum thickness requirements specified. Glass reinforcements shall be in accordance with the appropriate standards of construction. Interior structural layer shall be fabricated using either the hand lay up, filament wound technique or approved chopper gun technique. Glass content of interior structural layer shall be 60 % plus or minus 5 % by weight. In no case shall total thickness of the interior structural layer be less than 0.50 inches. Exterior layer shall be reinforced using a single “A” glass veil with a layer of surfacing “Nexus” veil followed by a clear resin rich 10 mil thick coating similar to the inner surface. Topcoat shall be pigmented parafinated get-coat with ultraviolet inhibitors. The pigmentations shall be beige. There shall be no glass fibers exposed. Vessel wall shall be reinforced around all openings and connections.

2.2.07 Curing. Each vessel shall be given a BPO-DMA cure system to increase service life. In addition, interior of vessel shall be post-cured. Post cure shall consist of an FRP vessel wall cure temperature of at least 180° F for a minimum of 4 hours. Independent of exterior ambient fabrication shop temperature, the temperature inside the vessel may have to be elevated above 180° F. At no time shall the vessel wall temperature approach 90 % of the thermal distortion temperature for the resin used Barcol readings taken after the post-cure shall not be greater than 4 points less than the resin manufacturers published Barcol readings and in no case less than 35. Where steam is used in the post-cure, no steam shall impinge on the interior surface of the vessel of the inside of any nozzle. A steam sparge pipe projecting at least 12 inches beyond the interior surface of any nozzle and 12 inches away from any wall shall be used. During steam post-curing, the vessel shall be maintained at atmospheric pressure. Alternate curing methods may be submitted for the Engineers approval. Cobalt compounds shall not be used to accelerate curing of the FRP in any way.

2.2.08 Connections. All necessary connections for piping, instrumentation, sampling, and ductwork shall be provided as shown on Drawings or required. Suitable EPDM gaskets shall be provided. Two inch drain assembly with CPVC ball valve and 2 inch over flow drain with threaded coupling and plug. Each carbon bed shall have two 11/2 inch diameter sample probes adjacent to the carbon bed which shall extend a minimum 6 inches into the carbon bed. Probes shall be adequate to provide suitable extraction of carbon samples from the carbon bed and be non-binding. Probes shall extend outside the vessel wall and be blocked off with ball valves. One additional ¾ inch diameter sample probe shall be installed in each discharge stack and shall extend down and adjacent to the other probes. Probes and ball valve shall be of CPVC construction. Carbon adsorption unit manufacturer shall provide factory mounted pipe supports for outlet air sample ports, bottom drain connection, and 3-inch wide baffle ring around the interior circumference of each carbon bed. Flanges of air inlet, air outlet and access doors shall be manufactured by hand lay up method and shall conform to NBS-PS15-69; standard dimensions for bolting, but in no case shall the thickness be less than ¾ inch thick. Flange nozzles for piping connections shall conform to ASTM D3299, all nozzles up to and including 8-inch diameter shall be reinforced with blade type gussets. Flanges for piping connections shall be ANSI 150 lb dimensions. All flanges shall be pre-drilled. Flanges shall be checked for alignment, thickness and mating prior to shipment to field. Area on the back of all flanges around each bold hole shall be the diameter of a standard washer and shall be flat and parallel to flange face. This area shall be spot faced, if necessary, to meet this requirement.

2.2.09 Hatches. Access hatches shall be provided above top and bottom of main carbon bed sections to allow easy inspection, cleaning and maintenance of carbon. Support gratings and lower carbon bed limiter shall be removable through access hatches. All access hatches shall be in easily accessible locations and coordinated with all structural columns, structural wind bracing, ductwork and piping. All access hatches shall be corrosion resistant to acidic and basic cleaning solutions. Access hatches shall be outfitted with clear PVC, removable, corrosion resistant panels, all stainless steel type 316 hardware including nuts, washers, bolts and extruded silicon gaskets. Minimum size of access doors shall be 24-inches high by 30-inches wide by ½ inch thick with not less than 18 bold hold-down assemblies. Blind flanges and access hatch doors shall be same thickness and material as flanges to which they are attached. Tolerances and flatness shall be same as for flanges. Manways shall have word” CAUTION” stenciled on in 3-inch high red block style lettering.

2.2.10 Miscellaneous. Odor control vessels shall contain the following:

A grounding system as submitted under item 1.4, Submittals.

Lifting Lugs that shall be capable of withstanding weight of empty vessel with minimum safety factor of 5 to 1. A minimum of three lugs shall be furnished per vessel. Lifting lugs shall be Type 316 stainless steel and attached to vessel wall with hand lay-up laminate equal to or greater than the vessel wall thickness.

Mounting Lugs that are suitable for mounting electrical junction boxes. Mounting lugs shall be Type 316 stainless steel and attached to the vessel wall with hand lay-up laminate equal to or greater than the vessel wall thickness.

Odor control vessel exhaust stack and any other transition pieces required. These items shall be fiberglass, reinforced vinyl ester and furnished by the odor control vessel manufacturer. All fiberglass reinforced vinyl ester ductwork shall be as specified in this Section.

Carbon Sampling Device. A One grain thief sampling device shall be provided. The device shall be a fisher Scientific Model 14-208, or approved equal.

Hydrogen Sulfide Bed Monitor. Furnish a bed monitoring system to enable plant personnel to check for the presence of hydrogen sulfide at any sample port within the carbon bed. The monitor shall be sensitive to H_2S concentrations from 0.5 ppm to 20 ppm, and visually indicate that concentration range. The hydrogen sulfide bed monitor assembly shall provide means to detect H_2S levels with the carbon bed. The monitor shall include an adjustable flowmeter and lead acetate paper color indicating disk. The monitor shall have a fitting to attach to any carbon bed sampling port. The monitor shall be manufactured by the vessel manufacturer.

Differential Pressure Gage. Provide a photohelic differential pressure gage/switch at each carbon bed (two per vessel) to measure the differential pressure through each carbon bed through the entire vessel. Gages shall be the dial type with die cast aluminum, irridite dipped for corrosion resistance. The range shall be 0 - 20 inches water gage for odor control vessel and accuracy shall be 2 percent of scale. Switches for high and low set point shall be adjustable from knobs on gage face.

Quantity	2 per unit
Type	DPDT, Rated 10A @ 120VAC
Power requirements	120 VAC
Deadband	Maximum 1 percent of full scale
Enclosure	NEMA 4X

Manufacturer: Provide products one of the following, Dwyer Instrument, Incorporated Model 3000 series Photohelic Pressure Switch/Gage or approved equal.

2.3 FIBERGLASS REINFORCED PLASTIC FAN.

2.3.01 Manufacturer. Provide fans as manufactured by one of the following, New York Blower Company, The Ceilcote Company, Hartzell Fan, Inc., or approved equal.

2.3.02 Construction. Provide fiberglass reinforced plastic fire retardant fans with an epoxy coating to protect against ultraviolet degradation. Fans shall be installed, complete with motors, drives, guards and coatings of sufficient capacity for the duty required. Fans shall operate to draw odorous air from the basin and shall exhaust air through the carbon vessel. Fans shall be tested and rated in accordance with ASHRAE 51-75 and fan shall be licensed to bear the AMCA 210 Test Code Seal, and be certified by manufacturer to deliver rated performance. Manufacturer shall provide sound power level ratings outlined in AMCA Standard 301, ratings to be the results of testing in accordance with AMCA Standard 300. For additional details refer to Master Specifications Section 15880, Air Distribution Systems.

Service conditions shall include 1) Specified number of units, 2) CFM: as specified, balanced fan cfm shall not vary from quantity listed above by more than 5 %, OCSS shall co-ordinate fan total static pressure with actual total pressure drop across the carbon material bed, 3) the OCSS shall submit the calculations of static pressure requirements certified by a registered Professional Engineer in Michigan or any other state approved by Engineer, 4) total static pressure as specified, 4), fan rpm shall be as specified, 5) fan static efficiency shall be 64.4%, 6) outlet velocity shall be not be less than specified, 7) brake horsepower shall be as specified, 8) approximate noise level on weighted scale shall be less than 80 db maximum at 5 feet, 9) Sound power levels shall not exceed the following:

Octave bands	1	2	3	4	5	6	7	8	Overall
Total Fan Power Levels	112.3	109.3	103.3	65.3	89.2	87.3	90.3	83.3	114.5

Housing: Fan housing shall be designed so that there is no air leakage through joints and seals. All bolted pieces shall be tightened by putting gasket for air tightness. Fan housing shall be corrosion resistant, fire-retardant, sold fiberglass reinforced plastic design which shall equal or exceed the ASTM En 84 Tunnel Test Rating of 30 or less with construction classification suitable for pressure range. Fan housing shall be constructed of a premium brominated bisphenol-A vinylester resin. All exterior surfaces of the fan shall have a factory applied beige pigmented, paraffinated gel-coat with UV inhibitors. All laminates shall be manufactured in accordance with National Bureau of Standards PS 15-69, ASTM C 582. All interior portions of fan housing in the air stream shall be coated with graphite impregnated resin in accordance with ASTM D 4167.

Fan Wheel: Provide backward inclined fan wheel constructed of Type 316 stainless steel with back pressure vanes adjacent to shaft seal. Surface preparation of the metal surfaces to provide a surface metal profile via degreasing, radiusing and abrasive blasting. Remove all grit or dust particles.

Fan Shaft: Shaft shall be of Type 316 stainless steel designed to operate below first critical speed. Shaft and impeller shall be statically and dynamically balanced at normal operating speed listed in schedule below to allow a maximum vibration peak-to-peak displacement of 2 mils. Provide mechanical or Teflon seal between shaft and housing. The shaft's first critical speed shall be at least 125% of the fan's maximum operating speed.

Shaft Bearings: Heavy duty, grease, lubricated, sealed, self-aligning, pillow block design, frictionless ball bearings having minimum life of 150,000 hours shall be used. Fan bearings shall be visible and accessible for inspection and maintenance. Bearings enclosed within the fan housing where they can be exposed to the corrosive gas stream are not acceptable.

Fan impeller and driving pulley shall be secured to shaft with keys and set screws. Fan housing shall have flanged discharge and inlet drilled connection and companion flanges. Fan shall be separated from ductwork at inlet and outlet by flexible connections. Fan inlet box shall have flanged inlet and outlet connections. The fan inlet box shall be coated with graphite impregnated resin in accordance with ASTM D 4167. Equipment slab shall be unitary base constructed of channel steel as required by the fan manufacturer. The fan and motor shall both mount to the structural steel frame. Fan mounting shall be AMCA Standard Arrangement 1. Fan base shall be bolted directly to the equipment slab and painted as specified in Master Specification Section 09900, Painting. The drive shall be of matched V-belts and adjustable sheave pulleys shall be cast steel. The belt and shaft guard shall be steel construction and galvanized then painted as specified in Master Specification Section 09900, Painting, with tachometer hole, OSHA approved. The access doors shall be raised type, bolted with gasket. Nuts, bolts and fasteners in contact with the gas stream shall by Type 316-stainless steel and encapsulated in FRP. Stainless steel nameplates giving the name of the manufacturer, serial number, model number, rated capacity in cfm, head in inches of water gage, fan rpm, and any other pertinent data shall be permanently affixed with stainless steel hardware to each fan.

Drains: Provide drains at low point of scroll, 1-inch pipe bonded to housing with threaded corrosion resistant plug.

Coatings: Ferrous metal fan part coatings shall as per Steel Structures Painting Council SSPC-SP 5-63 white metal blast cleaning. Ferrous metal fan part coating for baked epoxy phenolic or “cold set” epoxy-phenolic amine cured shall be brushed or sprayed coats as per manufacturer's specifications.

Fans: Fan assembly shall be tested and balanced in accordance with Master Specifications Section 15990, Testing, Adjusting and Balancing. The complete fan assembly shall be inter-radial dynamic machine (IRD) 245 balanced at design RPM with motor sheaves and belts in place to 1.0-mil displacement or less and shall be checked for vibration after installation by the fan manufacturer's personnel trained in such work. A complete report shall be furnished to Engineer. If the amplitude of any vibration exceeds 1.0 mils, the fan shall be dynamically balanced in place and retested.

Differential Pressure Gage/Switch: Provide a photohelic differential pressure gage/switch at the fan inlet and outlet, to measure the fan inlet pressure and the fan outlet pressure. Gage shall be the dial type with die cast aluminum, irridite dipped for corrosion resistance. The range for fan inlet shall be 10 in vacuum to 10 inches water gage and range for fan outlet shall be 0 to 12 inches water gage with accuracy of 2 percent of scale. Switches for high and low set point shall be adjustable from knobs on gage face.

Quantity	2 per unit
Type	DPDT, Rated 10 A @ 120 VAC
Power requirement	120 VAC
DeadBand	Maximum 1 percent of full scale
Enclosure	NEMA 4X

Manufacturer: Provide products of one of the following: Dwyer Instrument, Incorporated Model 3000 series Photohelic Pressure Switch/Gage, or approved equal.

2.3.03 Drive Units. Motors shall be provided with specified maximum horsepower at 1800 RPM constant speed. Motor information specified herein shall be coordinated with Master Specifications Section 16220, General Purpose Induction Motors. TEFC type with premium efficiency suitable for operation (480 volt, 3 phase, 60 Hz power, solid shaft, ball bearing type), mount Fan per manufacturer requirements for outdoor use, and shall be provided with a service factor of 1.15. Provide positive temperature thermistors and a solid state relay. The sealed thermistors shall be installed in the end turns of the stator winding, one per phase. Solid state relay shall detect and protect against open or shorted sensors. Relay shall be mounted in and powered from MCC (120 VAC). Relay shall provide dry contact interlock to shutdown motor on high temperature. Provide thermistors from one of the following manufacturers: Therma Sentry by U.S motors, Reliance Thermistor System by Reliance or approved equal. Provide 120 volt space heaters in motor windings to prevent condensation.

2.3.04 Controls. Odor Control Fan Operation: Furnish a local control panel for each fan, provided by the fan manufacturer, for mounting adjacent to each. Each odor control fan shall have two modes of operation, “Local” and “Remote”. Fan shall be placed in “Local” or “Remote” from local control panel. In the “Local” position a fan shall operate by the “start” and “stop” pushbuttons located on the local control panel.

In “Remote” position, a remote signal from the specified control system in the control building shall start and stop the fan.

Safeties/Interlocks: All safeties/interlocks shall be hard wired to the fan MCC starter. All alarm conditions shall be repeated individually at the local panel and at the specified control system. In the “Remote” position, if a fan fails to start when called an alarm shall be signaled. If a fan fails when running, an alarm will be signaled. Low suction pressure shall stop a fan and signal an alarm. High discharge pressure shall stop a fan and signal an alarm. The “Stop” pushbutton shall stop a fan in both “Local” and “Remote” mode of operation.

Local control panel: Local control panel shall be a NEMA 4X enclosure mounted on support framework adjacent to the fan. Panel shall be all Type 316 stainless steel construction with a minimum thickness of 12 gauge for all surfaces (except those areas requiring reinforcement) having a smooth brushed finished. Provide continuous stainless steel piano hinged door with stainless steel screws and clamps on three sides of door. Provide all internal devices mounted on 12 gauge steel sub panel with white enamel finish.

2.4 GREASE FILTERS/MIST ELIMINATOR.

2.4.01 Acceptable Manufacturer. Provide grease filter/mist eliminators as manufactured by one of the following: Calgon Carbon Corporation, U.S. Filters, Munters Corporation, or approved equal.

2.4.02 Construction. Service conditions shall include that at the design gas flow rate, the external demisters shall remove minimum of 99.9% of droplets between 5 microns and 10 microns, and pressure drop through the demisters shall not exceed 1.0 in w.c. at 25,000 cfm.

External demisters shall contain horizontal grease and mist eliminator constructed of PVC with FRP frames. Provide two nested modules suitable for operation at the design gas flow rated 25,000 cfm.

The grease filter/mist eliminator shall be enclosed in FRP housing. The housing shall be of hand lay-up construction with the same resins and reinforcements as specified for the odor control vessel. Minimum thickness of the housing shall be 0.5 inches. The FRP shall be pigmented beige.
The grease filter pad shall be 2 inches thick and constructed of 304L stainless steel.

The mist eliminator pad shall be 4 inches thick and constructed of woven polypropylene. Provide a side mounted module access cover.

Gas inlet and outlet connections shall be circular, flanged connections the same size as the connecting ductwork. Flanges shall be of hand lay-up construction in accordance with NBS PS 15-69 and shall be ANSI 16.5, 150 lb.

Provide a flanged, ¾ inch diameter drain connections at the bottom of the FRP housing.

Differential Pressure Gage/Switch: Provide a magnehelic differential pressure gages at each grease filter /mist eliminator to measure the differential pressure through the grease filter/mist eliminator. Gages shall be the dial type with die cast aluminum, irradiate dipped for corrosion resistance. The range shall be 0 to 15 inches water gage for the grease filter/mist eliminator, accuracy of 2 percent of scale. The accessories used shall be Two 1/8 inch NPT plugs, two 1/8-inch NPT pipe thread to rubber tubing adapters and three flush mounting adapters with screws, 50 linear feet of tygon plastic tubing, two static pressure tips, two plastic vent valves, with integral compression fittings on tips and valves. Mount gages as grease filter/mist eliminator on brackets provided by Contractor. Provide products of one of the following manufacturers: Dwyer Instrument Incorporated Model 2015 Magnehelic Gage, or approved equal.

2.5 FAN ACOUSTICAL ENCLOSURE.

2.5.01 Acceptable Manufacturers. Provide a Fan Enclosure Unit as Manufactured by on of the following: Niess, Industrial Acoustics Company, or approved equal.

2.5.02 Construction. Provide a double wall, insulated, acoustical enclosure for each fan-motor unit suitable for outdoor installation. The enclosure shall be complete with frame walls, roof, observations, windows and air intake and discharge silencers. All panels and components shall be prefabricated and shall not be susceptible to damage form extended to airflow, pressure differentials, vibration, air, temperature, or humidity. The entire enclosure shall be designed by the manufacturer to be self-supporting when any or all of the side panels are removed. The enclosure shall be independent of the fan and ductwork. Enclosure size is shown approximately on the drawings. Final size shall be determined by the Contractor and enclosure manufacturer to suit the face actually furnished.

Enclosure shall have three double-leaf access doors on both long side and one double-leaf access door on the inlet side arranged to permit access to all parts of the fan assembly for services and major maintenance.
All panels shall be not less than 6 inches thick with a solid steel exterior shell with a minimum 16-gauge thickness and a perforated, galvanized steel interior shell with a minimum 22-gauge thickness.

The outer framework shall be constructed of steel with a minimum 11-gauge thickness, and shall be painted a gloss black color.

Each panel assembly shall be completely filled with acoustical/thermal insulating material that is noncombustible, inert, mildew resistant, and vermin-proof. Insulations shall not settle within the panel assembly. No insulating materials shall be used that have a flame spreader greater that 25 or smoke developed greater than 50, as determined by ASTM Standard E 84 (UL-723, NFPA 255).

Each panel shall contain a 1/8 inch thick layer of mineral wool attached to the perforated interior surfaces for vibration damping. The mineral wool layer shall be completely wrapped in 2 mil. Polyethylene for protection.

A layer of 1 inch thick mineral wool shall be placed adjacent to the vibration damping layer. Insert a 2 pound per square foot Septum barrier between the mineral wool and second 1 inch thick layer of mineral wool. The paint color shall be approved by Engineer.

Provide an additional 4 inch thick layer of mineral wool into the fabricated, galvanized steel frame. The exterior color of the panels shall be painted with industrial enamel paint.

Acoustical Performance: The manufacturer shall provide certified testing data from an acoustical laboratory, listing sound absorption and transmission loss characteristics of the panel assembly. Testing data may be for galvanized panels. The Insertion Loss measured at a 1 meter distance form the enclosure and 2 meter above the ground shall be a minimum of 24 dBA. The test shall be performed in accordance with the OSHA measurement standards and the NMTBA (National Machining Tool Builders Association) standards.

Insulating materials used in all prefabricated panel assemblies shall have the following maximum thermal conductivities and nominal thermal resistance (r) at a mean temperature of 75F.
Thermal Conductivity (BTU/HR ft^2-°F) Nominal R Value
4-inch panel construction -.06 BTU/HR ft^2-°F

All perimeter and interior channel members and trim items shall be of steel, not less that 11 gauge. Furnish all anchor bolts, nuts, and washers which shall be Type 316 stainless steel. The enclosure unit shall be bolted directly to the equipment slab.

Where required for acoustical performance, base/channel/floor interface shall be sealed with a caulking sealant. Sufficient sealant shall be used to extrude surplus sealant and give a visual indication of complete coverage in all joints. The sealants shall have sufficient adhesive strength to prevent air leakage through the assembly when a pressure differential exists, but still allow system disassembly without damage to the panel components.

Provide one 18 inch by 24 inch observation window to visually observe the motor. Window shall be constructed of double pane ¼ inch thick safety glass held in place with neoprene acoustical seals and separated by an air space of the same thickness as the panel.

Provide an acoustical air intake silencer and acoustical discharge silencers with an integral fan curb in the enclosure wall so it will admit air for cooling the enclosure with minimizing sound exiting enclosure. The air intake and discharge silencers shall meet the following service conditions and the requirements of Master Specifications Section 01180, Equipment, Materials, Parts, and Tools. Number of Units shall be as specified, CFM shall be as specified, and total Static Pressure in each silencer shall be in w.c.: as specified, for acoustical performance, the insertion loss shall be at a minimum equal the performance of the enclosure walls. The fan of the fan motor may provide primary air movement and cooling inside the enclosure. An auxiliary exhaust fan shall be mounted on the acoustical enclosure to provide air circulation during fan operation.

Auxiliary exhaust fan motors: Service conditions shall include number of units as 1 per enclosure, CFM shall be as specified, and Total Static Pressure each silencer, in w.c.:as specified. Motor information specified herein shall be coordinated with Master Specification Section 16220, General Purpose Induction Motors. The requirements of this article supersede any conflicting requirements in Master Specification Section 16220, General Purpose Induction Motors. The electric motor shall be Dome Type suitable for operation on 480 volt, 3 phase, 60 Hz power, solid shaft, and with ball bearing.

Openings for pipe penetrations and conduits shall be field cut to ensure proper positioning. Provide framing members, collars and fittings as required insuring the openings are sealed against acoustical leakage.

PART 3 – EXECUTION

3.1 INSPECTION. Inspect and verify that structures or surfaces on which the equipment will be installed have no defects, which will adversely effect installation, inspect all equipment prior to installation, and promptly report defects, which may affect Work to the Engineer.

3.2 INSTALLATION. Install equipment in accordance with the Drawings, approved Shop Drawings, the manufacturer's instructions and the supplemental requirements. Connect all piping and instruments as required. Support all piping independent of odor control vessel. Align, adjust, and lubricate equipment in accordance with the manufacturer's instructions, and leave in proper working condition. Provide minimum of one inch of non-shrink grout below all floor stands. Touch up minor scratches and scrapes in painted finishes as specified in Master Specification Section 09900, Painting.

3.2.01 Protection. Field and shop painting shall be provided in accordance with Master Specification Section, 09900, Painting. Paint FRP surfaces of ductwork and grease filter/mist eliminator FRP housing. Prepare FRP surfaces by hand sanding FRP surfaces to be coated with a medium grit sand paper prior to painting. Large areas may be power sanded or brush-off blasted, provided sufficient controls are employed so surface is roughed without removing excess material. Painting shall be provided in accordance with Master Specification Section 09900, Painting.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Test. After Contractor and Engineer have mutually agreed that the equipment installation is complete and ready for continuous operation, Contractor and a qualified field service representative of the manufacturer shall conduct a running test of the odor control system in the presence of Engineer to demonstrate that the mechanism and its controls will function correctly. Make adjustments required to place equipment in proper operating condition. During initial operation and in the presence of manufacturer's representative the Contractor shall set dampers to balance the airflow through the vessel.

3.3.02 Inspection. A manufacturer's factory trained representative shall check and approve the installation before operation. The representative shall operate and test system in the presence of Engineer and verify that the equipment conforms to requirements, and instruct plant personnel on care and maintenance. The representative shall revisit the job site as often as necessary until all deficiencies are corrected. Perform testing, checkout and start-up of the equipment under the technical direction of the manufacturer's factory-trained representative. Do not energize motor operators without authorization from manufacturer's representative. Conduct a leakage test on each odor control vessel by providing a suitable area on site, but not on the basin cover to perform a hydrostatic test on each vessel by:

Filling each vessel to a height of 12' of water.

Allowing to standing for 2 hours to verify no leakage.

Vessel shall be inspected for leakage by manufacturer's representative.

Provide a written report in accordance with Section 1.4

If leakage is determined manufacturer shall submit a corrective action plan for the repair or replacement of the vessel. No corrective action shall be taken without Owner's approval.

If the vessel fails a second hydrostatic test, it shall be replaced.

Contractor shall install the odor control vessel within 24 hours of passing the hydrostatic test.

3.4 TRAINING. Furnish services of a qualified factory trained operations and maintenance serviceman to instruct and train operators in the proper care, operation and maintenance of the equipment. Provide these services for the time period of a minimum of 30 days and in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

3.5 MAINTENANCE. Provide services of factory trained representative of the manufacturer to correct defective work during the one year correction period. Replacement parts of equipment installed during the one-year correction period shall be equal to or better than the original.

End of Section

SECTION 15891

DUCTWORK AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. Furnish, fabricate and install all ductwork, including fittings, accessories, dampers, duct liner, hangers, diffusers, registers, grilles and any incidental work or components required to provide complete air supply, return and exhaust ductwork systems as shown on the Drawings and as specified herein.

In general, ductwork shall consist of any passageway made of sheet metal or other material substantially air-tight, used for the conveying of air, gas or materials. Included are fittings, transitions, bracing, fasteners, sealers, supports and accessories such as access panels, access doors, turning vanes and manual air balancing dampers. All ductwork shall be of size and material as specified herein and as shown on the Drawings. All duct sizes indicated on the Drawings are clear, inside dimensions. Where ductwork is lined with fiberglass, duct sizes shown on the Drawings are clear, inside dimensions to the duct liner material.

Any change in duct sizes, offsets, transitions and fittings required to accommodate job conditions shall be submitted to the Engineer for approval.

All ductwork and equipment shown on the drawings is intended to be approximately correct to scale, but figured dimensions and detailed drawings of the actual equipment furnished shall be followed in every case. The drawings shall be taken in a sense as diagrammatic. Size of ductwork and piping are shown, but it is not the intent to show every offset or fitting, nor every hanger or support, or structural difficulty that may be encountered. To carry out the intent and purpose of the drawings all necessary parts to make a complete working system ready for use shall be furnished without extra charge. The contractor shall be responsible to coordinate the system installation and routing with the work of all trades.

1.2 RELATED REQUIREMENTS. Cutting and patching is included in Division 2 except for items specified herein. Concrete work is included in Division 3 except for required HVAC anchor bolts, sleeves and templates, which shall be furnished under this Section.

Structural steel and miscellaneous metal is included in Division 5 except for supplementary steel required for HVAC hangers, equipment supports, anchors and guides, which shall be furnished under this Section.

Flashing and counter flashing is included in Division 7 except for items specified herein.

Painting is included in Division 9 except for factory finished HVAC equipment, HVAC shop painting and HVAC identification labeling and as required in Paragraph 3.15 below.

Exterior louvers and louver blank-off panels are included in this Section.

Thermal Insulation is included in Section 15290. This Section specifies the insulation type and thickness for the systems specified herein.

Electric duct heaters are specified in Section 15550 and installed under this Section.

Control dampers and duct mounted instruments are specified in Section 15950 and installed under this Section.

For fiberglass ductwork refer to Section 15895.

1.3 SUBMITTALS. Submit, in accordance with Section 01300, the following Drawings and data. Detailed equipment and ductwork drawings at a minimum scale of 1/8-in =1-ft-0-in. Drawings shall locate ductwork accessories including manual, automatic and fire dampers. Ratings of fire dampers shall be shown. Drawings shall also show and dimension maintenance clear spaces for motors, drives, coils, filters and access doors or panels. Indicate ductwork pressure class used for fabrication.

Standard shop and field installation details for transitions, elbows, takeoffs, discharge nozzles, turning vanes, access panels and doors, volume control and splitter dampers, hangers and volume extractors. When SMACNA references are used, the specific methods for the project shall be clearly defined. Where SMACNA has more than one option, the option to be used shall be indicated.

Ductwork materials, joining methods, reinforcing and material gauges. Where options are allowed by SMACNA, the proposed option shall be clearly defined. Indicate proposed materials and methods for ductwork and equipment hangers.

For units that will be shipped exposed, provide a description of the protective packaging that will be used during transit.

All submittals shall contain a statement that Sections 15500, and all other Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal.

In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4 REFERENCE STANDARDS. These standards shall be considered as minimum requirements. This is a general list and not all standards listed are necessarily referenced elsewhere in this Section. Specific requirements of this Section and/or Drawings shall have precedence. The Engineer shall resolve conflicts between published requirements.

Titles and abbreviations of Federal, State and industry standards, technical societies, associations and institutes and other organizations which may be used are as follows:

American Conference of Governmental Industrial Hygienists (ACGIH)

Air Movement and Control Association (AMCA)

American National Standards Institute (ANSI)

Air-conditioning and Refrigeration Institute (ARI)

Air Diffusion Council (ADC)

ADC 1062-R4 - Certification, Rating and Testing Manual.

American Society of Heating, Refrigerating and Air-conditioning Engineers (ASHRAE)

ASHRAE 68 - Laboratory Method of Testing In-Duct Sound Power Measurement Procedure for Fans.

American Society of Mechanical Engineers (ASME)

American Society for Testing and Materials (ASTM)

ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron, Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM D1784 - Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.

ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.

Factory Mutual (FM)

National Institute of Standards and Technology (NBS)

National Fire Protection Association (NFPA)

NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems.

NFPA 102 - Standard for Grandstand, Folding and Telescopic Seating, Tents and Membrane Structures.

NFPA 252 - Standard Methods of Fire Tests of Door Assemblies.

NFPA 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials.

Occupational Safety and Health Administration (OSHA)

Sheet Metal and Air Conditioning Contractors National Association (SMACNA)

Underwriters Laboratories (UL)

UL 181 - UL Standard for Safety Tests for Flame-Propagation of Fabrics and Films.

UL 555 - UL Standard for Safety Fire Dampers.

UL 723 - UL Standard for Safety Test for Surface Burning Characteristics of Building Materials.

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.5 QUALITY ASSURANCE. Inspection by the Engineer’s representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents. The Owner and Engineer reserve the right to check and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements.

1.6 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved shop drawings upon delivery. Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer. All materials shall be stored in a covered dry location off of the ground.

1.7 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts and shall meet the requirements of Sections 01750 and 01760. In addition to special items, the following spare parts shall be provided:

Furnish all special tools required for normal operation and proper servicing of the equipment.

Provide a minimum of 1 or 5 percent of the total units rounded to the next full unit whichever is greater for each size and rating of the following components.

Fire damper fusible links

Thermostats

Thermometers

Pressure gages

Control relays

Damper operators

Control transmitters

Control transformers

Pack spare parts in containers suitable for extended storage without deterioration of the parts. Containers shall be clearly labeled designating contents, pieces of equipment for which intended and equipment identification numbers.

1.8 DEFINITIONS. Particular terminology used under this Section is defined as follows: Traffic Level and Personnel Level - Areas, including process areas, equipment rooms, boiler rooms and other areas where insulation may be damaged by normal activity and local personnel traffic. Area extends vertically to 8-ft above floor, walkways, platforms and stairs, and horizontally 3-ft beyond the edge of walkways, platforms, and stairs.

Exposed Piping and Ductwork - Piping and ductwork visible from the floor level and includes all piping and ductwork in equipment rooms, boiler rooms, etc.

Concealed Piping and Ductwork - Piping and ductwork not visible from the floor level and includes piping and ductwork above hung ceilings and in shaftways.

Supply Air Ductwork - Ductwork carrying air from a fan or air handling unit to the space or spaces to which it will be introduced. This air may have been heated or cooled or in the case of ventilation system the air would be neither heated nor cooled. Supply air ductwork extends from the fan or air handling unit to the registers, grills or diffusers at the end of the ductwork.

Return Air Ductwork - Ductwork carrying air from the space it was supplied to back to a fan or air handling unit. Return air ductwork extends from the registers or grills at the end of the ductwork to the air handling unit or connection with an outdoor air intake duct.

Exhaust Air Ductwork - Ductwork carrying air from a space to a fan and then to be discharged to the outdoors. Exhaust air ductwork extends from the registers or grills at the end of the ductwork to the fan. From the fan the exhaust ductwork extends to the discharge point, exhaust air damper, or exhaust air plenum, whichever comes first.

Relief Air Ductwork - Ductwork carrying air from a space without a fan to be discharged to the outdoors. Relief air ductwork extends from the registers or grills at the end of the ductwork, the discharge point, relief air damper, or relief air plenum, whichever comes first.

Outdoor Air Ductwork - Ductwork carrying untreated air from the outside to a fan or air handling unit. Outdoor air ductwork starts at the intake point, outdoor air damper, or outdoor air plenum, whichever comes last. The outdoor air ductwork extends to the fan, air handling unit, or connection with a return air duct, whichever comes first.

Mixed Air Ductwork - Ductwork that can carry either return air or outdoor air or a combination of both. Mixed air ductwork starts at the connection of the return air and outdoor air ducts and extends to the fan or air handling unit.

Outdoor Air Plenum - A plenum that extends from the opening in the skin of the structure to the outdoor air duct. If the outdoor air damper is directly at the intake or there is no outdoor air damper, the plenum will extend to the first size reduction. If the outdoor air damper is not at the intake, the plenum will extend to the outdoor air damper.

Exhaust Air Plenum - A plenum that extends from the opening in the skin of the structure to the exhaust air duct. If the exhaust air damper is directly at the discharge or there is no exhaust air damper, the plenum will extend from the last size reduction. If the exhaust air damper is not at the discharge, the plenum will extend to the exhaust air damper.

Relief Air Plenum - A plenum that extends from the opening in the skin of the structure to the relief air duct. If the relief air damper is directly at the discharge or there is no relief air damper, the plenum will extend from the last size reduction. If the relief air damper is not at the discharge, the plenum will extend to the relief air damper.

Ventilated Spaces - Areas supplied with outdoor air on a continuous or intermittent basis. The outdoor air may be heated and/or cooled or untreated.

Heated Spaces - Areas where heat is supplied to maintain a minimum temperature during the heating season.

Unheated Spaces - Areas where heat is not applied and there is no minimum temperature during the heating season.

Conditioned Spaces - Areas that are provided with heating and mechanical cooling.

Non-Conditioned Spaces - Areas that are not provided with mechanical cooling.

Thermal Conductivity - The rate of heat flow through unit area of a homogeneous substance under the influence of unit temperature gradient in the direction perpendicular to the area. Units-BTU per (hour)(sq ft)(degrees F temperature difference)(per inch thickness).

Indoor Ductwork - Ductwork within a building that is not exposed to the weather.

Outdoor Ductwork - Ductwork that is not within a building and is exposed to the weather.

Hot Ductwork - Ductwork carrying air with a temperature above the surrounding space temperature.

Cold Ductwork - Ductwork carrying air with a temperature below the surrounding space temperature.

Hot/Cold Ductwork - Ductwork carrying air with a temperature that can be either above or below the surrounding space temperature.

Flues/Stacks/Breeching - Ductwork carrying products of combustion to atmosphere.

1.9 COORDINATION. The Drawings indicate the extent and general arrangement of the systems. If any departures from the drawings or specifications are deemed necessary, details of such departures and the reasons therefore shall be submitted as soon as practical for review. No such departures shall be made without the prior written concurrence of the Engineer.

The Contractor shall coordinate the location and placement of all concrete inserts and welding attachments with the structural engineer.

The Contractor shall assume full responsibility for coordination of the HVAC systems, including; scheduling, and verification that all structures, ducts, piping and the mounting of equipment are compatible.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATION FOR DUCTWORK. Flexible connections for conventional air conditioning systems shall be glass fabric coated with polychloroprene. Fabric must comply with Underwriters Laboratories Standard UL214 and NFPA Bulletin 90A. Connections shall be Ventglas by Ventfabrics or equal.

Flexible connections for process exhaust systems shall be fiberglass fabric coated with Duponts teflon. Fabric must be resistant to Sodium Hypochlorate. Fabric must comply with Underwriters Laboratories Standard UL181 and NFPA Bulletin 102. Connections shall be Ventel by Vent Fabric or equal.

Furnish flexible connectors at each inlet and outlet of fan and in the duct runs where required for expansion, contraction and movement, and where called for on the Drawings. Flexible connections shall be integrally flange molded arch type units constructed of EPDM rubber 1/4-in thick, reinforced with a strong synthetic asbestos-free fabric suitable for corrosive service. The flexible connections shall be designed to minimize the transmission of vibration from the fans to the ductwork at the suction and discharge connections. Expansion or contractor flexible connections shall be designed to allow 1-in movement. Working length or “live” length shall be as designed by the manufacturer to allow up to 1-in of movement.

Ends shall be flanged, with flanges matching duct connection flanges. Corners on rectangular expansion joints shall be molded and free of patches or splices. The flexible connections shall be suitable for outdoor service and temperature ranges from minus 10 up to 125 degrees F, and pressure to 5 psig. Specially fabricated split Type 316 stainless steel retaining back-up bars shall be supplied to prevent damage to the EPDM rubber flanged with Type 316 stainless steel bolts are tightened. Acceptable Manufacturer: Holz Rubber Company, Mercer Rubber, Company, Proco Products Incorporated, or approved equal.

2.2 FLAME AND SMOKE RATINGS. All materials, including adhesives, surface coatings, sealers, assemblies of several materials, insulation, jacketing, finish, etc, shall have flame spread ratings not over 25 (fire resistive) and smoke development ratings not over 50 and fuel contributed rating not over 50, as established by tests conducted in accordance with the Federal Standard 00136B, National Bureau of Standards Radiant Energy Fire Test and the National Fire Code of the NFPA. These requirements apply to all circumstances whether the materials are field applied or applied by a manufacturer in his/her shop, or elsewhere, prior to delivery to the project.

2.3 SOUND CONTROL. The selection of ductwork and accessories shall be such as not to create noise that will exceed the levels of permissible noise exposures for occupational areas as established by the OSHA and other Federal, State and local safety and health standards, codes and ordinances. Acoustical Lining - Internal sound attenuation and insulation (for air conditioning ductwork) shall be 1-in thick bonded fiberglass mat coated with black pigmented fire resistive coating on the air stream side. Liner shall comply with NFPA 90A requirements. Flame spread and smoke development ratings shall be 25 and 50 respectively. Material shall be Owens Corning; Aeroflex or equal.

2.4 HANGERS, SUPPORTS AND ANCHORS. Furnish supports, hangers and other devices necessary to support firmly and substantially the equipment and ductwork described in this Section. Ductwork support systems shall include restrains as required by the applicable building codes to withstand seismic loading. All equipment, ductwork, and supports that are installed outdoors shall be designed and installed to meet wind loadings as required by the International Building Code, all other applicable codes, and the requirements specified herein. Design shall be provided by a professional engineer hired by the Contractor as specified in other sections of the specification. Signed and sealed calculations shall be submitted for record purposes.

Rectangular, Round and Flat-Oval Ductwork - Spacing and size of hangers shall be as called for in the SMACNA standards, except as limited below.

Rectangular ductwork 48-in wide and larger shall be supported by adjustable threaded rod hangers.

Round ductwork 37-in and larger shall be supported by two adjustable threaded rods at each support.

All hangers shall be of same material as ductwork which they serve, e.g., galvanized, aluminum, black steel, etc, except for PVC ductwork which shall be Type 304 stainless steel.

All hanger hardware and fasteners shall be of the same material as the duct they serve or shall be of a material with equal or greater corrosion resistance. Where materials other than the duct material are used, they must be approved by the Engineer before installation.

Perforated band iron or wire for supporting ducts shall not be permitted.

Where C-clamp type hangers are used, furnish with a retainer strap.

Support flexible duct withType 304 stainless steel band hangers, 1-in wide minimum, attached so as not to crush the ductwork. The use of wire to hang flexible ductwork shall not be permitted.

The following methods of hanger attachment to the building structure are NOT allowed. The numbers and letters refer to hanger methods shown in Figure 4-1, 4-2 and 4-3 of the 1985 edition of the HVAC Duct Construction Standards Metal and Flexable as published by SMACNA.

"T"- wrap around strap on open web joist.

"W" - bent over band on open web joist.

"14" - friction clamps.

"17" - bent wire in metal deck.

Design of hangers shall include the effect of all loads applied to the duct as well as the load of the duct. These loads include, but are not limited to wind, snow and internal dirt or liquid buildup.

Hangers shall not be supported from roof decking or bulb tees. Where required, provide supplemental steel to span between the building structures.

2.5 DUCTWORK MATERIAL. Ductwork shall be constructed of the materials specified using the gauges or thicknesses, reinforcing and construction methods in accordance with SMACNA standards. Unless otherwise specified, all components of the duct systems shall be constructed of the same material as the ductwork. This is to include braces and turning vanes.

Galvanized steel ductwork shall be constructed of hot-dip galvanized sheet steel, per ASTM A653.

Stainless steel ductwork shall be constructed of Type 316 stainless steel. Aluminum ductwork.

2.6 DUCTWORK CONSTRUCTION DETERMINANTS. Low pressure ductwork shall be constructed of the following materials and to the SMACNA standards:

The following is to be used as a general guide for duct material select.

> Galvanized Steel – shall be used for normal heating, cooling, and ventilation applications where the air handled in surrounding the duct is relatively dry, and there are no corrosives.
>
> Stainless Steel – shall be used in areas that galvanized steel and aluminum are not suitable and as shown on the drawing.
>
> Aluminum – shall be used in areas where shown on drawing.

Design of ductwork shall include all loads applied to the ductwork, in addition to the load of the duct. These loads include but are not limited to wind, snow and internal dirt or liquid build up.

2.7 DUCTWORK CONSTRUCTION. All ductwork shall be substantially built with joints and seams smooth on the inside and given a neat appearance on the outside. Inside surfaces and joints shall be smooth and free from pockets, burrs and projections. All joints shall be substantially airtight with laps made in the direction of air flow and no flanges projecting into the air stream.

2.7.01 Pressure Classes. Pressure classes for determination of sheet metal gauge and reinforcing shall be as defined by the latest issue of the SMACNA - Industrial Duct Construction Standards. For systems with fans with a shut off static pressure higher than 2-in w.g., design pressure shall be as listed in Paragraph 2.06 above. For systems with fans a shut off static pressure 2-in w.g. or less design pressure shall be equal to the maximum pressure indicated for the fans or air handling units on the Schedules and the pressure class shall be the same for the entire length, including branches, of the specific duct system.

2.7.02 Rectangular Ductwork (Sheet Metal). Ductwork shall be constructed as shown on the Drawings in accordance with the specified SMACNA - Construction Standard. Cross-breaking shall conform to SMACNA standard. Cross-breaking shall be applied to the sheet metal between the standing seams or reinforcing angles. The center of the cross-break shall be of the required height to assure rigidity for each panel.

Alternate Construction - Factory fabricated joint systems may be offered as an alternate form of construction. The system offered shall meet all requirements of

SMACNA. Alternate joint systems shall be "Ductmate System" as manufactured by Ductmate Industries, Inc., installed in accordance with the manufacturer's recommendations. The system shall be sealed for zero leakage and angle attachment to the main duct section shall be by tack welding. The use of screws is not allowed.

2.7.03 Round Ductwork (Sheet Metal). Ductwork shall be constructed as shown on the Drawings in accordance with the specified SMACNA - Construction Standard.

Round ductwork longitudinal seams shall be either lock type or continuous welded construction. Slip joints shall be used on ductwork and fittings up to 36-in in diameter and Vanstone flanges shall be used on ducts over 36-in in diameter.

Fittings shall be fabricated with continuous welds. 90 degree elbows shall have a turning radius of 1.5 times the fitting diameter. 90 degree elbows shall be mitered construction with five segments. All fittings in the round duct system shall be of the male and female type. Mechanically fasten the conduits together using sheet metal screws not less than four per fitting 6-in on centers maximum and equally spaced around the circumference of fitting.

Round ductwork and fittings shall be manufactured by United Sheet Metal; SEMCO or equal.

2.7.04 Insulated Round Flexible Ducts. Round flexible ducts shall comply with specified SMACNA - Construction Standards and be constructed of corrugated ductile aluminum that can be bent and rebent by hand and is self-supporting. 1-in insulation shall be applied around the outside and be finished with a vinyl cover.

Thermal conductivity of the insulation shall not exceed 0.27 BTU/hr/sq ft/1 degree F at75 degree mean temperature. Duct shall be Class I, per UL 181.

Maximum length shall be 5-ft. The remainder shall be galvanized sheet metal. Duct run shall be as short and straight as possible to minimize static resistance.

Ducts shall be Bendway as manufactured by Flexaust Company or approved equal.

2.8 VOLUME AND SHUT OFF DAMPERS. Rectangular dampers shall be multiple blade type with channel frame, exterior linkage and position indicator and locking device. Blades shall not exceed 6-in in width.

Round or oval dampers and splitters shall be shop fabricated, single blade type with position indicators and locking device. For galvanized sheet metal systems, material shall be two gauges heavier than ductwork or 18 gauge, whichever is heavier.

Dampers shall be constructed of the same material as the ductwork.

Shut off dampers shall have replaceable neoprene seals. Leakage rates shall not exceed 7 cfm/sq ft at 4-in w.g. for rectangular dampers and 0.15 cfm/in of perimeter at 4-in w.g. for round or oval dampers.

Dampers shall be supplied with locking quadrants. Quadrants in galvanized steel and black steel ductwork shall be galvanized steel. All other duct systems shall have stainless steel locking quadrants. Locking quadrants shall have a positive method of holding the damper in its selected position such as a bolt through both the quadrant and the lever arm. Systems using springs or other devices that can vibrate loose are not acceptable.

All dampers shall be flanged connections unless otherwise noted.

All dampers shall be selected for a rating that equals or exceeds the specified system pressure and velocity. Manufacturer shall be Ruskin or equal.

Balancing and balancing/shut off dampers shall be opposed blade. Shut off dampers shall be parallel blade.

2.9 ACCESS DOORS. Access doors shall be minimum 24-in by 24-in in ducts 26-in and larger. Where the duct size is less than 26-in, the largest door that can be accommodated shall be used. Access doors shall be of the same material as the duct, pan type construction for metal ductwork, with smooth edges and fitted seals, constructed and installed for air-tight fit with ease of opening and closing. Doors shall be substantially butt hinged, with heavy sash locks and substantial door pulls. Door openings and door frames shall be reinforced with bar stock or angle. Where ductwork is installed with duct liner or exterior duct insulation, the access door shall be of the insulated type. Access doors shall be factory fabricated. Where ductwork is constructed of aluminum or stainless steel, access door and hardware shall be of similar material.

Hand hole access panels shall be 12-in by 12-in, constructed of the same material as the ductwork, with peripheral gaskets and sash locks. Provide hinges or chain for attachment to duct.

2.10 FASTENERS. Sheet metal screws, drive cleats, cinch bands and other fasteners shall be fabricated from materials with an equal or greater corrosion resistance than the ductwork in which they are installed. Where a material other than the duct material is used, it shall be approved by the Engineer before installation

2.11 RELIEF DAMPERS. Relief dampers shall be manually operated or automatic gravity-type used for exhaust of air. Dampers shall be constructed of the same material as the ductwork with flanged connection and blades set in parallel-bladed position and gang operated by exterior linkage. Dampers shall have a shop coat of primer or aluminum finish as specified. Relief dampers shall be of size, type and capacity as specified on the Drawings. Adjustable counter-balanced gravity dampers shall be provided where indicated on the Drawings. Manufacturer shall be Ruskin or equal.

2.12 LABELS. The service of each duct along with and arrow indicating direction of flow shall be provided on each duct system. Labels shall be located not more than 26 linear feet apart and shall also be provided at both sides of wall penetrations, at each damper, and each equipment connection.

Labels shall contain the service spelled out, the duct size, and the equipment number of the equipment served. Label locations shall have unobstructed view from normal viewing locations.

Numbers and letters shall be die-cut from 3.5 mil vinyl film and pre-spaced on carrier film. Adhesive and finish shall be protected with one piece removable liners. Colors shall be white letters on black backgrounds.

The system for preparation and application of letters shall be Type B a.s.i./2 by ASI Sign Systems; Architectural Graphics Inc. or equal. Letters shall be 3-in high Optima Bold, upper case using Grid 2 spacing. Direction arrows are to match. The instructions of the manufacturer shall be followed in respect to storage, surface preparation and application of letters.

Each piece of equipment is to be provided with an identification label listing the unit number and the areas served. Labels shall be as specified above.

2.13 DIFFUSERS, REGISTERS AND GRILLES. All diffusers, registers and grilles shall be of the shape, sizes, capacity and type as shown on the Drawings. On all duct openings that do not have a specific diffuser, register, grill or mesh cover provide a wire mesh cover.

Finish - Unless otherwise specified, diffusers, registers and grilles shall have the following finish. All diffusers, registers and grilles located in ceilings shall have a baked white enamel finish except where the ceiling system has an exposed aluminum support grid. Where the ceiling has an exposed aluminum support grid the diffusers, registers and grilles shall have a baked aluminum enamel finish. All diffusers, registers and grilles not located in ceilings shall have baked aluminum enamel finish.

2.13.01 Supply Air Diffusers. General - Diffusers shall be a factory-assembled unit of welded steel construction consisting of a housing with built-in louvers, cones, vanes or other means of directing discharge of air in a particular pattern principally for overhead or ceiling air diffusion. All diffusers shall be equipped with a volume control device. Distribution of air may be adjustable if so specified.

2.13.02 Exposed Duct Mounted Diffusers. Diffusers shall be of the adjustable type for ease of horizontal and vertical adjustment of air pattern. Refer to Drawings for direction of air throw. Each diffuser shall be equipped with an equalizing grid, baffles as required and extended bottom plate flange designed specifically for air diffusion from diffusers mounted on exposed ductwork. Acceptable manufacturers shall be Titus, Krueger and Price.

2.13.03 Supply Air Grilles. In general, grilles shall be a factory-assembled unit consisting of a grille with double deflecting adjustable airfoil vanes to diffuse supply air in the various directional patterns as shown on the Drawings. Grilles shall be of aluminum frame and border with aluminum louver blades. All grilles shall be furnished with a sponge rubber gasket to prevent streaking. Front and rear louver blades shall be individually adjustable. Where wall mounted, front blades shall be vertical and rear blades shall be horizontal. Where ceiling mounted, front blades shall be parallel to long dimension. Grilles shall be Series 272F by Titus Manufacturing Corp.; Krueger and Price.

2.13.04 Supply Air Registers. Registers shall be a factory-assembled unit consisting of a grille with adjustable vanes to diffuse supply air in the various directional patterns as shown on the Drawings and a damper. Grilles shall be of aluminum frame and border with aluminum louver blades. All registers shall be furnished with a sponge rubber gasket to prevent streaking. Supply air registers shall have aluminum opposed-blade dampers. Front and rear louver blades shall be individually adjustable. Where wall mounted, front blades shall be vertical and rear blades shall be horizontal. Where ceiling mounted, front blades shall be parallel to the long dimension.

2.13.05 Exhaust Air Grilles / Registers. Acceptable manufacturer shall be Titus Manufacturing Corp.; Krueger and Price

2.13.06 Return Air Grilles / Registers. Louver-Faced Return Air Grilles. In general, grilles shall be a factory-fabricated unit of aluminum frame border and louver blades. All grilles shall be furnished with a sponge rubber gasket to prevent streaking. Acceptable manufacturer shall be by Titus Manufacturing Corp.; Krueger and Price.

2.13.07 Eggcrate Type Return Air Grilles. Return air grilles shall be of all aluminum construction consisting of 1/2-in thick cores with 1/2-in square grid size. The square grid pattern shall provide maximum free area with minimum "see through." Acceptable Manufacturers shall be: Titus Manufacturing Corp., Price, Krueger Manufacturing Co., Inc., or approved equal.

2.13.08 Wire Mesh Covers. Where wire mesh covers are called for on the Drawings, the wire mesh and support frame shall be the same material as the duct where the cover is installed. Unless otherwise noted the wire mesh shall be 0.5-in mesh. The wire mesh shall be contained in a metal frame. The mesh shall be firmly attached to the frame to prevent it being pulled out of the frame by casual contact. The frame shall be a minimum of 16 gauge sheet metal or the minimum gauge for a flange based on SMACNA, whichever is greater. The frame shall be on both sides of the mesh creating a sandwich with the mesh in the middle. Fastenings shall go through the frame on both sides of the cover.

2.14 ROOF CURBS. Roof curbs shall be furnished for all roof mounted HVAC equipment including fans and relief or intake vents. Roof curbs shall be pre-fabricated type, minimum 12-in height and sized to match the dimensions of the equipment base supported. Roof curbs for fans are specified under Section 15860. Curbs shall be straight sided type of all aluminum welded construction with nominal 2-in thick acoustical/thermal insulation in curb walls. A perforated metal liner shall be provided to protect the insulation. Curbs shall provide a flat top surface regardless of the roof slope. Curb interiors shall be provided with protective coatings when a coating is specified.

2.15 TURNING VANES. Turning vanes shall be shop fabricated and installed in all abrupt rectangular elbows. Single thickness or airfoil type double thickness blades shall be chosen based on SMACNA recommendations.

Vanes shall be fabricated from the same material as the ductwork and manufactured by Elgen; Duro-Dyne; Aero/Dyne or equal.

2.16 VOLUME EXTRACTORS. Volume extractors shall be shop fabricated with synchronized curved extractor blades, heavy side rails and screw operator.

Extractors shall be fabricated from the same material as the ductwork and manufactured by Carnes; Titus or equal.

2.17 FIRE DAMPERS. Fire dampers shall meet local codes and the requirements of the NFPA Pamphlet No. 90A. Dampers in systems constructed of materials other than galvanized steel shall be constructed of Type 316 stainless steel.

Dampers shall be sized so that the free air space is not less than the connected duct free area. Location shall be as shown on the Drawings and required by code. Dampers shall have a minimum 1-1/2 hour standard fire protection rating in accordance with NFPA Pamphlet No. 252 and UL 555. Where the fire protection rating of the partition exceeds 2 hours, multiple dampers in series may be used to provide a rating equal to the partition.

Fusible Links - Dampers shall be arranged to close automatically and remain tightly closed upon the operation of a UL approved fusible link or other approved heat actuated device, located where readily affected by an abnormal rise of temperature in the duct. Fusible links shall have a temperature rating of 50 degrees F above the maximum normal duct operating temperature, but not less than 165 degrees F.

Workmanship - Install dampers in sleeve unless noted otherwise on the Drawings or in the case of dampers listed for installation without sleeves after specific approval from the Engineer. Fire dampers shall be installed to provide a positive barrier to passage of air when in a closed position. Dampers shall be installed so they will be self-supporting in case of duct destruction due to heat. Care shall be exercised that the frame be set so that the closing device will not bind.

Factory fabricated, steel-curtain type, UL approved fire dampers, with damper blades out of the air stream, are acceptable. These fire dampers shall be installed in accordance with the manufacturer's instructions and UL 555.

Access Doors - Tight fitting access doors shall be provided for accessibility to dampers and fusible links for inspection and maintenance.

All fire dampers shall have written approval from local authorities.

PART 3 - EXECUTION

3.1 <u>INSTALLATION OF DUCTWORK</u>. Fabricate and erect all ductwork where shown on the Drawings, as specified herein, and in accordance with SMACNA standards. Rigidly support and secure ductwork.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

Wherever ducts are divided, maintain the cross-sectional area. All such changes must be approved and installed as directed by the Engineer or as approved on shop or erection drawings.

During installation, temporarily close the open ends of ducts to prevent debris and dirt from entering. Install work in accordance with the overall approved progress schedule and in cooperation with all other trades so there will be no delay to other trades.

Install louver blank off panels provided by the louver manufacturer as specified under Section 10200. Provide louver manufacturer the louver blank off panel dimension requirements. Secure blank off panels to the building structure using aluminum angles and rustproof fasteners. Caulk perimeter completely to eliminate water penetration.

Cross-break sheet metal in accordance with SMACNA duct construction standard. Apply cross-breaking to the sheet metal between the standing seams or reinforcing angles. The center of the cross-break shall be of the required height to assure each panel section being rigid.

Cross-break streamlined ducts on top only and adequately brace internally.

Beading as specified in SMACNA will be acceptable in lieu of cross-breaking.

The Drawings of the air ducts and air risers show the general location for installation of the ducts and risers. Should additional offsets or changes in direction be made, these changes must be considered in the original bid and shall be installed at no additional cost to the Owner.

All necessary allowances and provisions shall be made in the installation of the ducts for the structural conditions of the building. Ducts shall be transformed or divided as may be required. Wherever this is necessary, maintain the cross-sectional area. All of these changes, however, must be approved and ducts installed as directed by the Engineer or as approved on shop or erection drawings.

The taper of all transformations shall be not more than 15 degrees.

Secure casing to curbs according to SMACNA "Duct Construction Standards."

Provide baffle plates as required to prevent stratification and to provide proper operation of controls.

Where ducts are constructed of materials other than galvanized steel the reinforcing members shall be of the same material as the ductwork.

The use of button punching or snap locks on ductwork constructed of aluminum shall not be permitted.

Ducts carrying moist air that pass through areas that could cause condensation shall be pitched to facilitate condensate removal. Low points of such ducts shall be provided with drains.

Ductwork connections to units that require corrosion resistant coatings shall be made with flanges. Flanges shall be factory drilled before coating. Resilient washers suitable for the environment shall be used to protect the coating from the bolts in the flange. The use of self-tapping screws or other fastening methods that will damage the coating are not acceptable.

3.2 HANGERS. Rectangular, Round and Flat-Oval Ductwork - Spacing and size of hangers shall be as recommended in the SMACNA standards except as noted in PART 2.

Install hangers plumb and securely suspended from supplementary steel or inserts in concrete slabs. Sufficiently thread lower ends of hanger rods to allow adequate vertical adjustment. Do not use building siding or metal decking to hang ductwork.

Ducts shall not be supported from furring, hung ceilings or from another duct or pipe.

C-clamp type hangers shall be supplied with a retainer strap.

Ductwork shall not come in contact with any of the ceiling construction or any other equipment in the ceiling cavity.

Duct support at flexible connections shall be adjustable for ease of aligning the duct to the piece of equipment.

3.3 SEALING OF DUCTWORK. General - Unless otherwise indicated, seal all ductwork joints and seams using sealant in accordance with the instructions of the sealant manufacturer and this Section. All transverse seams, joints and fitting connections, both shop and field assembled, shall be sealed in accordance with this Section. Longitudinal seams shall be sealed on all duct systems with a design operating pressure greater than 2-in w.g.

Application of Sealant - Thoroughly clean all seams, joints, etc, of dirt, oil, grease, or other coatings which might interfere with the adhesion of the duct sealant before the sealant is applied.

Uncured sealant may be forced into the slotted side of the seam or joint before shop or field assembly and the joint or seam completed while the sealant is still uncured. Excess sealant shall be removed from both the inside and outside of the duct before it sets.

Duct Tape - The use of duct tape alone for sealing ductwork is prohibited. Duct tape may be used primarily for the purpose of retaining the uncured duct sealant in seams and joints until it has cured. Duct tape shall not be applied to the inside of any duct nor shall it be applied to standing type joints at any time. All duct tape used shall be compatible with the sealant. The use of sealant saturated tape is acceptable when part of an integrated sealing system.

Sealant shall be either in liquid form or a mastic with a maximum flame spread of 25 and a maximum rate of fuel contributed and smoke developed of 50 when tested in accordance with ASTM E84, NFPA 255 and UL 723.

Sealing systems shall be suitable for the environment. The following schedule is to be used to select the sealant.

Indoor, dry galvanized round and rectangular duct is to be sealed with Iron Grip 601 or equal.

Indoor, dry, stainless steel, aluminum and PVC coated is to be sealed with FTA 20 adhesive and DT-Tape gypsum or equal.

All other areas unless otherwise noted are to be sealed with FTA 50 adhesive and DT- Tape gypsum or equal.

All sealers listed are manufactured by Hardcast Inc and are to define the type of sealer. Other equal sealants are acceptable.

3.4 DUCTWORK FITTINGS AND ACCESSORY ITEMS. Duct Elbows - Changes in direction and offsets shall be made in a gradual manner to facilitate streamline flow of air. All elbows shall have a centerline radius of not less than 1-1/2 times the width of the duct in the plane of the elbow. For rectangular ductwork where full radius elbows cannot be installed, provide abrupt elbows equipped with shop-installed turning vanes unless noted otherwise on the Drawings.

3.4.01 Flexible Fabric Connectors. Install flexible connectors for vibration isolation at all duct connections to fans, fan units or blowers, air handling units and air conditioning units. Make connections substantially airtight at all seams and joints.

Where the construction of the flexible connection or vibration isolator results in a cross sectional area of the connection which is less than 90 percent of the adjacent ductwork, the size of the connection shall be increased to provide a cross sectional area equal to or greater than 90 percent of the adjacent duct.

Provide flexible duct connections at both the intake and discharge connections for all fans and air handling units except as noted below.

Wall and roof fans that have integral motor/fan wheel isolation.

Air handling units where the fan is isolated from the intake and discharge connections by internal flexible connections or separations, and the unit is mounted without vibration isolators between the unit and the support structure.

Ductwork spacing and alignment for flexible connections shall be aligned to the tolerances of the flexible connection manufacturer, or plus/minus 1/4-in whichever is less. Bolts shall be torqued to the manufacturer's recommendations. Do not over tighten.

Where flexible connections are used as expansion joints, the manufacturer's precompression recommendations must be followed. When the temperature at installation differs from the temperature in the precompression recommendation, a correction shall be made.

3.4.02 Dampers. Install manual volume control dampers wherever it may be necessary to regulate air volume for system air balancing and where shown on the Drawings.

Install splitter dampers, where shown on the Drawings, to regulate air volume for system air balancing.

Install motorized and pneumatic actuated dampers when supplied by other trades.

3.4.03 Volume Extractors. Factory-fabricated volume extractors shall be installed at all main duct takeoffs to supply air diffusers.

3.4.04 Access Doors. Hinged access doors shall be installed where listed below, wherever shown on the Drawings and wherever access may be required for service, maintenance and adjustment.

Provide access doors at the following locations (minimum requirements):

Coils in ducts - both entering and leaving side.
Motorized or pneumatic actuated dampers - linkage side.
Duct mounted temperature controllers.
Freeze-stats.
Smoke detectors.
Plenums.
Fire dampers.
Smoke dampers.
Electric duct heaters.
Filter banks.
Manual dampers and splitters.
Inlet side of centrifugal fans.
Volume extractors.
Inlet and outlet ducts to fans and air handlers.
As necessary or required.

Where access doors are required in ductwork located above ceilings, coordinate the location of the access doors to clear the ceiling support system and to be accessible through the ceiling grid.

3.4.05 Duct Liner. Duct liner shall be shop installed on the interior surfaces of ductwork, where shown on the Drawings or as specified herein. Installation shall be made using a single thickness of duct liner and shall be in accordance with Duct Liner Application Standard by SMACNA. Liner shall be adhered with adhesive having a minimum of 90 percent coverage. Fasteners shall be spaced in accordance with SMACNA. After the duct has been formed the leading edges of the insulation that will be abutting another lined duct shall be spray-coated with fire-resistive adhesive. For ductwork with velocities exceeding 4000 fpm a metal nosing shall be installed at all transverse edges to secure the duct liner.

3.4.06 Blast Gates. Blast Gates shall be installed where shown on the Drawings. After final balancing of the system, drill a hole through both the frame and gate and insert a positive locking device, such as a pop rivet, to prevent moving the gate.

3.5 GRILLES, REGISTERS AND DIFFUSERS. The location of diffusers, registers and grilles shall be as shown on the Reflected Ceiling Plans and as shown on the ductwork drawings. The exact location of these devices shall be determined in the field in cooperation with the other trades. Install all devices in an approved manner in accordance with the manufacturer's recommendation.

3.6 FLEXIBLE DUCTWORK. Make connections, joints and terminations air tight as recommended by the manufacturer. Where joints are made to rigid sheet metal ductwork, apply 3M Company EC-800 sealer and the joint shall be drawn tight with a drawband. Collars shall be 2-in long minimum and sleeves shall be 4-in long minimum. Install flexible ducts with one duct diameter-radius elbows and cut as short as possible. Duct shall not be compressed and the length shall be kept short so minimum hangers or supports are required and static pressure losses are kept to a minimum. Sag in flexible duct shall not exceed 1/2-in/ft between duct supports.

3.7 FILLING IN SPACE AROUND DUCTWORK. To prevent sound passing through the area between the duct and the framed or cut opening in the floors, walls or partitions, pack mineral wool to completely fill the space the full depth of the opening. Whenever a fire-rated wall or floor is penetrated and a fire damper is not required, fill the space around the duct with a locally approved fireproof rope. At penetration, apply escutcheon plates on both faces of the wall to close the gap between the structure and the sides of the insulated or bare duct. Escutcheon plates shall be the same material as the duct for metal ducts and stainless steel for PVC ducts.

3.8 DUCT SUPPORTS AT FLOOR PENETRATION. Where vertical ducts pass through floor openings and a fire damper is not required, rigidly attach supporting angles to the ducts and anchor with expansion bolts to the floor or curb. Angles shall be of the same material as the duct for metal duct and stainless steel for PVC ducts, placed on the two long sides of the duct extending 3-in over edge of opening and shall not be less than the sizes recommended by SMACNA.

Remaining open area in the floor opening shall be sealed with a plate of the same material as the angle.

3.9 SUPPORTING OUTDOOR DUCTS. Roof top ductwork shall be installed using structural steel angles for support. Sizes of angles shall be as shown on the Drawings.

The vertical supporting angles shall be continuous full height of the duct and shall be bolted to same. Intermediate duct supporting angles and bottom plates shall be welded to the vertical angles. Weld all of these angles together to form a stiff continuous supporting unit for the duct. Paint angles with rust inhibitive primer after welding.

Slope ductwork to shed water.

3.10 DUCTWORK TERMINATIONS AT MASONRY OR CONCRETE. Where ducts terminate at masonry or concrete openings, place a continuous 2-1/2-in by 2-1/2-in by 3/16-in angle of the same material as the duct around the ductwork. Use stainless steel angles for PVC ductwork. Bolt the angle to the construction and make airtight by applying caulking compound on the angle before it is drawn down tight to construction.

Fasten plenums to concrete curbs with 3-in by 3-in by 1/4-in continuous angle. Concrete curbs are provided under another Division. Mount angle on a continuous bead of caulking compound and anchor to the curb on 16-in centers. Terminate duct at the curb and bolt to the angle. Seal the duct to the curb with a continuous bead of caulking compound. Apply neoprene filler strip to level curb surface as necessary

3.11 DUCTWORK GENERATED NOISE. All ductwork shall be free from pulsation, chatter, vibration or objectionable noise. After system is in operation, should these defects appear, correct by removing, replacing or reinforcing the work. No discreet tones will be allowed.

3.12 PLENUMS. Seal fresh air inlet and exhaust air plenums watertight at louvers or otherwise subject to water entrainment at all bottom joints and seams and up all vertical seams for a minimum of 12-in. Remove excess sealant before it sets hard. Where possible, pitch fresh air inlet and exhaust air plenums down towards the louver. Where it is not possible to pitch the plenum, provide a 1-in capped drain connection at the low point of the plenum.

3.13 TEST PORTS. Where shown on the Drawings and where required for testing and balancing, provide instrument insertion ports. Size and location of ports shall be coordinated with the Contractor performing air balancing. Seal ports with plastic snap lock plugs. When the ductwork will be insulated, extend the port to the face of the insulation and seal the vapor barrier to the port. When the ductwork is lined, extend the port into the duct to the inner surface of the duct liner.

In round ductwork provide 2 ports 90 degrees on centers. In rectangular ductwork provide ports as required by AABC or NEBB for a full traverse measurement.

As a minimum, ports shall be provided in the following connections:

All duct mains.

All duct branches unless all connections are diffusers, registers, or grilles and the total can be calculated by summing the readings for all of the connections.

All connections to tanks or hoods where there is no other access for taking a measurement.

A main duct is defined as one of the following:

A duct serving five or more outlets.

A duct serving two or more branch ducts.

A duct emanating from a fan or plenum.

All remaining ducts are considered branch ducts.

3.14 ADJUSTMENT. Start-Up and Temporary Operation

Properly maintain and service all equipment and systems until the particular equipment or the system has been accepted by the Owner.

3.15 PAINTING. Paint the outside face of all louver blank off panels and the interiors of unlined plenums and ductwork where connected to louvers. Prime and paint with two coats of flat black exterior paint. Painting shall be performed under this Section and shall be as specified in Division 9.

3.16 CLEANING OF DUCTWORK. Maintain all ductwork, fans, coils, air filters, outlets and other parts of the ductwork systems in a clean condition during installation. Clean complete ductwork systems prior to testing and air balancing. Secure cheese cloth over all openings of the ductwork system for entrapment of dirt during the cleaning operation.

3.17 I NSTALLATION OF DUCTWORK INSULATION. Provide ductwork insulation as specified under Section 15250 and with thickness as specified under this Section.

Ductwork Insulation - Blanket Type (Type I-5)

Hot Ductwork (Heating and Ventilation)

Insulation Thickness - Concealed round and rectangular hot ductwork.

Supply ducts in heated spaces - 1-1/2-in

Supply ducts in unheated spaces - 2-in

Return ducts - 1-1/2-in

Mixed air ducts - 1-1/2-in

Cold and Hot/Cold Ductwork

Insulation Thickness - Concealed round and rectangular cold and hot/cold ductwork and exposed round cold and hot/cold ductwork.

All ducts in non-conditioned spaces 2-in

All ducts in conditioned spaces 1-1/2-in

Outdoor air ducts and plenums 2-in

Exhaust air ducts and plenums between shut-off damper and outdoors 1-1/2-in

Ventilation supply air ducts and plenums between shut-off damper and outdoors 2-in

Ductwork Insulation - Fiberglass Board Type (Type I-6)

Hot Ductwork

Insulation Thickness - Exposed rectangular hot ductwork.

Supply ducts in heated spaces 1-1/2-in

Supply ducts in unheated spaces 2-in Return ducts 1-1/2-in

Mixed air ducts 1-1/2-in

Cold and Hot/Cold Ductwork

Insulation Thickness - Exposed rectangular cold and hot/cold ductwork.

All ducts in non-conditioned spaces 2-in

All ducts in conditioned spaces 1-1/2-in

Outdoor air ducts and plenums 2-in

Exhaust air ducts and plenums between shut-off damper and outdoors 1-1/2-in

Ventilation supply air ducts and plenums between shut-off damper and outdoors 2-in

Ductwork Insulation - Closed Cell Foam Type (Type I-7)

Insulation Thickness - Outdoor mounted round and rectangular hot, cold and hot/cold ductwork.

All air ducts 2-in

Weatherproof all outdoor ductwork.

All ductwork, except as specifically noted below, shall be insulated unless approved in writing by the Engineer.

Exposed supply and return air ductwork located in the area it serves.

Exposed ventilation exhaust and relief ductwork located in the area it serves.

Exposed ventilation and relief ductwork located in areas that are neither heated
nor cooled.

Exposed outdoor air intake ductwork and plenums located in areas that are neither heated nor cooled.

Return air ductwork located in return air ceiling spaces above the area it serves, except where the return ductwork is installed in ceiling spaces with a roof above.

End of Section

SECTION 15950

ELECTRIC AUTOMATIC TEMPERATURE CONTROL SYSTEM

PART 1 - GENERAL

1.1 SCOPE. Furnish and install a complete electric automatic temperature control system as manufactured by Honeywell, Inc., Johnson Controls, Andover Controls or approved equal. The automatic temperature control (ATC) shall be as specified herein and shall perform the functions specified and shown on the Drawings. The control system shall be installed by competent mechanics, technicians and electricians approved by the automatic temperature control manufacturer. The manufacturer shall be fully licensed at the time of bid to do business in the job site area for each type of subsystem. Wholesalers, contractors, franchisers, dealers, or any firm whose principle business is not that of manufacturing and installing DDC controls will not be acceptable. The manufacturer shall provide a system to meet requirements of NFPA-72A, 72B, 72C and 72D, and shall be listed by UL. Each component of the system shall be, where applicable, UL listed for the intended service. All materials and equipment used shall be standard components, regularly manufactured for this and/or other systems, and not custom designed especially for this project. All systems and components shall have been thoroughly tested and proven in actual use.

The control system shall consist of all thermostats, temperature transmitters, flow switches, flow elements, transformers, alarms, flow transmitters, local flow controllers, ionization type smoke detectors, automatic valves and dampers, damper operators, control panels, electric relays, and other accessory equipment along with a complete system of wiring and conduit to fill the intent of the specification to provide for a complete and operable system. All control equipment shall be fully proportioning, except as noted otherwise.

HVAC equipment remote monitoring coordinate with Owner’s ovation facility management system contractor and fire alarm system contractor. Provide necessary equipment to achieve required control operation. Control sequences shall be as shown on the Drawings to be Automatic Temperature Control System. Coordinate with HVAC equipment manufacturers for controls furnished with the equipment.

1.2 RELATED REQUIREMENTS. The following shall be furnished and/or installed, under other sections:

Separable thermometer wells are included under Division 15.

All necessary valve pressure taps, water drain and overflow connections and piping are included under Division 15.

On magnetic starters the necessary auxiliary contacts, with buttons and switches in the required configurations are included under Division 15 and Division 16.

The necessary sheet metal baffle plates to eliminate stratification and provide air volumes specified is included under Division 15. Locate baffles by experimentation and affix and seal permanently in place only after stratification problem has been eliminated.

Access doors or other approved means of access through ducts for service to control equipment is included under other Sections.

The installation of the following shall be under Division 15:

Automatic valves. Section 15950

Automatic dampers. Section 15950

The following are to be furnished and installed under other sections of Division 15, but will be integrated with the work of this Section:

Air Handling Units Section 15855.

Centrifugal Fans Section 15860

Heating Equipment Section 15550.

1.3 SUBMITTALS. Submit, in accordance with Section 01080, shop drawings and product data for the following:

Control drawings with composite wiring diagrams, and description of operation for all systems.

Panel layouts and nameplates lists for all local and central panels.

Valve and damper schedules showing size, configuration, sizing, pressure vs. flow diagrams for the fluid used, capacity, and location of all equipment.

Data sheets for all control system components.

Provide a recommended list of spare parts to be provided.

Sequence of operation descriptions.

Technical specification data sheets of each system component and device with indication of its use.

Complete listing of deviations from the system as specified.

Training manuals for each of the subjects required to be covered in training to include teaching plans, duration of each class, and maximum size of each class are to be submitted for review a minimum of three months prior to starting training. The manuals are to be broken down into the material required for each of the various courses. The submittal shall also include supplemental materials that will be used in the class and copies of overheads or slides if they are not in the preceding material.

All submittals shall contain a statement that Section 15501, and all other Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal. In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4 QUALITY ASSURANCE. The manufacturer must have a branch office facility with 50 miles of the project for at least 5 years, with technical staff and complete spare parts inventory and test and diagnostic equipment to keep systems in operation 24 hours per day 7 days per week. He/She shall have emergency service available in the local area for temperature control systems for which he/she is currently performing on-call emergency service 24 hours per day 7 days per week with a maximum response time of 4 hours. The automatic temperature control contractor shall have in his/her direct employ the personnel capable of detailed engineering, coordination, drafting, procurement, and expediting, scheduling construction, testing, inspection, installation, startup, calibration, and commissioning. The equipment to be furnished under this Section shall be essentially the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Several manufacturers are indicated as acceptable for some items of equipment in these specifications. The contractor shall be responsible for determining that all equipment supplied for this project is suitable for installation and proper operation in the space provided with fully adequate operating and maintenance access space.

The equipment furnished for installation under this Section shall be tested at the factory as standard with the manufacturer of the equipment. Unless otherwise indicated, the controls shall maintain space temperatures within plus or minus 0.5 degrees F, and space relative humidity within plus or minus 5 percent of their set points. Inspection by the Engineer’s representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents. The Owner and Engineer reserve the right to sample and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements. All work to applicable codes and Owner’s standard practice.

1.5 COORDINATION. All coordination responsibility is vested on the General Contractor.

1.6 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved Shop Drawings upon delivery. Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer. All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container. Instructions for servicing and startup of equipment in long term or prolonged storage shall accompany each item. All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.7 ENVIRONMENT. All components, including data processing equipment, shall be suitable for operating in a normal plant environment without requirements for special temperature and humidity control.

1.8 WARRANTY. Provide one gear part and labor warranty after the completion of the project. Meet the requirements of Section 01170.

1.9 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts. In addition to special items, the following spare parts shall be provided:
Furnish all special tools required for normal operation and proper servicing of the equipment.

Spare parts shall include all items on the manufacturer's standard list of spare parts and the following for each unit:

One complete set of gaskets for each sealed unit.

Provide a minimum of 1 or 5 percent of the total units rounded to the next full unit whichever is greater for each size and rating of the following components:

Thermostats

Humidistat

Thermometers

Pressure gages

Control relays

Damper operators

Valve operators

Control transmitters

Control transformers

Photo-electric type smoke detectors

Ionization type smoke detectors

Provide a minimum of 4 or 10% of the total units rounded to the next full unit whichever is greater for each size and rating of the following components:

Panel light bulbs

Fuses

Pack spare parts in containers suitable for extended storage without deterioration of the parts. Containers shall be clearly labeled designating contents, pieces of equipment for which intended and equipment identification numbers. Spare parts shall meet the requirements of Sections 01180.

PART 2 - PRODUCTS

2.1 MATERIALS. All products and materials used in this project shall be new and currently under manufacture and shall have been applied in similar installations for a minimum of two years. This installation shall not be used as a test site for any new products unless explicitly approved in writing. Spare parts shall be guaranteed to be available for a minimum of five years after the completion of the project.

2.2 ATC EQUIPMENT.

2.2.01 Area Classification. Where specific area classifications are called for or shown on the electrical drawings, all equipment and wiring shall be in conformance with the requirements for that classification. Special attention shall be given to hazardous areas specifically "Class I, Group D, Div. 1" and "Class I, Group D, Div. 2" to comply with code requirements for equipment selection and installation procedures. The type of enclosure shall be as specified in Division 16.

2.2.02 Room Thermostats. Temperature sensors shall be provided with concealed adjustment, exposed thermometer for displaying room temperature. All temperature sensors shall have an end to end (element to readout display) accuracy of plus or minus 0.5 degree F. Temperature sensors shall be of the wire-wound resistive element type (RTD) using either nickel or platinum alloy as the resistive element. All temperature sensors shall have an end to end (element to readout display) accuracy of plus or minus 0.5 degree F. Thermostats shall be of the heavy duty all metal type 24 volt, provided with concealed adjustment and exposed thermometer. Provide rugged clear plastic-locking cover and steps of control as required. Room thermostat and temperature sensors mounted on exterior walls shall be provided with insulated mounting plates. All room thermostats and sensors shall be mounted 4-ft-0-in above finish floor except where otherwise indicated on the Drawings or specified herein or as required by code. Electric thermostats in corrosive areas shall be installed in electric boxes with remote stainless steel bulbs.

2.2.03 Low Temperature Duct Mounted Safety Thermostat. Electric low temperature thermostats shall be duct mounted probe type. These thermostats shall be two- position with manual reset.

2.2.04 High Temperature Safety Thermostat. Electric high temperature thermostats shall have a bimetal type sensing element with at least a 10-in insertion length. These thermostats shall be two-position manual reset type.

2.2.05 Static Pressure Sensors. Shall be adjustable, set point proportional type, with adjustable range in inches of water to meet the performance or function specified.

2.2.06 Ionization Type Smoke Detectors (Four Wire Type). Furnish and install ionization type smoke duct detectors downstream of the air filters and ahead of any branch connections in air supply systems wastewater process areas as shown on the Drawings and having a capacity greater than 2,000 cfm. In addition, furnish and install ionization type smoke detectors all exhaust systems serving wastewater process areas as shown on the Drawings and having a capacity greater than 2,000 cfm. Smoke detectors shall also be installed where shown on the Drawings and where called for on the control sequences.

Duct smoke detector shall be suitable for expected air velocity range, temperature range, humidity range, and contaminant range in the airstream as indicated on the associated HVAC Equipment Unit Schedules. The detector housing shall be listed per UL 268A specifically for use in air handling systems. The detector housing shall be equipped with an integral mounting base capable of accommodating either photo electronic or ionization detector heads. It shall be capable of local testing via remote testing station. The duct detector housing shall incorporate an airtight smoke chamber in compliance with UL 268A, Standard for Smoke Detectors for Duct Applications. The housing shall be capable of mounting to either rectangular or round ducts without brackets. An integral filter system shall be included to reduce dust and residue effects on detector and housing, thereby reducing maintenance and service. Detectors shall be provided with two sets of DPDT 10 amp dry contacts in the smoke detector housing to provide smoke alarm signals. One contact is to be used by the ATC systems, and the second is for use by Division 16 for interface to the fire alarm systems.

Remote test switch and alarm indicator stations shall be furnished for all duct smoke detectors as specified above. The installation and wiring of the remote stations will be provided under this Section. The remote test stations shall be wall mounted within the visible location of the smoke detector and easily accessible from the floor.

2.2.07 Motorized Control Dampers. Source Quality Control: Motorized dampers for air intake shall allow a maximum air leakage of 5 cfm per square foot at 4 inches water gage static pressure. Design for maximum 6 inches water gage static pressure differential and 4,000 feet per minute approach velocity.

Type: Parallel Blade similar to Ruskin CD36.

Reference: SMACNA Standards.

Construction:

Tight seal ultra-low leakage construction.

Galvanized steel

Blades

Blade Shafts: 1/2-inch plated steel

All stainless steel construction where shown

Provide thermal blade edge seals for air tight damper closure.

Blade ends shall be sealed with spring loaded continuous strips fastened to frame.

Bearings: Bearings at each end of shaft.

Blades to be designed for minimal resistance to air flow.

Linkage brackets, connecting rods an mounting hardware. Provide bird screen where required.

Approved Manufacturer shall be:

Ruskin

Louvers and Dampers

American Warming

Arrow

or equal

2.2.08 Electronic Damper Actuators. Electronic actuators, less than 600 in-lb of rated torque, shall have ISO 9001 quality certification and be UL listed under standard 873, CSA C22.2 No. 24 and have CE certification. Electronic actuators used on valves shall be designed to directly couple and mount to a stem, shaft or ISO style- mounting pad. Actuator mounting clamps shall be a V-bolt with a toothed V-clamp creating a cold weld, positive grip effect. Single point, bolt or single screw actuator type fastening techniques or direct-coupled actuators requiring field assembly of the universal clamp is not acceptable. Actuators shall be two position as required and be factory or field selectable. Actuators shall have visual position indicators and shall operate in sequence with other devices if required.

Two sets of DPDT switches with fully adjustable set points shall be provided to activate panel indicators and provide signals for equipment operation. Actuator shall have an operating range of minus 22 to 122 degrees F. Proportional actuators shall accept a 0 to 10 VDC or 0-20 mA input signal and provide a 2 to 10 VDC or 4-20 mA (with a load resistor) operating range. Actuators shall be capable of operating on 24, VAC and Class 2 wiring as directed by the application. Power consumption shall not exceed 10 VA for AC, including 120 VAC actuators and 8 watts per actuator for applications. Provide transformer as required. NEMA 2 rated actuators shall be provided with a three foot (minimum), prewired, electrical cable. Actuators requiring removal of the actuator cover for access to wiring terminals, exposing electronics, printed circuit boards to damage, are unacceptable. Actuators shall have electronic overload protection or digital rotation sensing circuitry to prevent actuator damage throughout the entire rotation. End switches to deactivate the actuator at the end of rotation or magnetic clutches are not acceptable.

For power-failure/safety applications, an internal mechanical spring return mechanism shall be built into the actuator housing. Spring return actuators shall be capable of CW or CCW mounting orientation. Spring return models >60 in-lb will be capable of mounting on shafts up to 1.05-in diameter. Spring return actuators with more than 60 in-lb of torque shall have a manual override metal crank. Upon loss of control signal, a proportional actuator shall fail open or closed based on the minimum control signal. Upon loss of power, a non-spring return actuator shall maintain the last position.

Actuators using “on-board” chemical storage systems, capacitors or other “on-board” non-mechanical forms of fail-safe operation are unacceptable.

Actuators shall be capable of being mechanically and electrically paralleled to increase torque if required. Dampers requiring greater torque or higher close off may be assembled with multiple low torque actuators. Dual mounted actuators using additional anti-rotation strap mechanical linkages, or special factory wiring to function are not acceptable. Actuators in a tandem pair must be “off the shelf” standard actuators ready for field wiring. Damper actuators will not produce more than 62 dbA when furnished with a mechanical fail-safe spring. Non-spring return actuators shall conform to a maximum noise rating of 45 dbA with power on or in the running or driving mode. Where special classifications are shown on the electrical drawings damper actuators shall be provided with suitable enclosures. NEMA 4X enclosures shall be as specified in Division 16 and shall have a shaft seal and all electrical connections shall be suitable for the space classification. Enclosure shall be UL listed.

Explosion-proof enclosure shall be suitable for Class I, II and III as specified in Division 16. A suitable shaft seal must be provided. Housing shall be cast copper fill aluminum with stainless steel fasteners and shall be UL listed. Housing shall be suitable for NEMA 4, 7 and 9.

Local Direct Digital Control (DDC) Panels - General: Local DDC panels shall be standalone microprocessor based, multi-tasking, multi-user, real-time digital control processors. Each local DDC panel shall consist of modular hardware with plug-in enclosed processors, communication controllers, power supplies, and input/output modules. A sufficient number of controllers shall be supplied to fully meet the requirements of this specification and the control functions. Local panel shall be capable of communicating with Owner’s Ovation Facility Management system

Hardware Override Switches: As indicated in the control sequences, the operator shall have the ability to manually override automatic or centrally executed commands and reset alarms at the DDC panel via local, point discrete, onboard hand/off/auto operator override switches for binary control points and gradual switches for analog control type points. These override switches shall be operable whether the panel is powered or not.

Local Status Indicator Lamps: The DDC panel shall provide local status indication for each binary input and output for constant, up-to-date verification of all point conditions without the need for an operator I/O device. Indicator lights called for on the control sequence shall be on the face of the panel. Also provide audible alarm where shown.

Integrated On-line Diagnostics: Each DDC panel shall continuously perform self-diagnostics, communication diagnosis and diagnosis of subsidiary equipment. The DDC panel shall provide both local and remote annunciation of any detected component failures, or repeated failure to establish communication. Indication of the diagnostic results shall be provided at each DDC panel, and shall not require the connection of an operator I/O device.

Surge and Transient Protection: Isolation shall be provided at all network terminations, as well as all field point terminations to suppress induced voltage transients consistent with IEEE Standard 587-1980.

Power Failure Restart: In the event of the loss of normal power, there shall be an orderly shutdown of all standalone DDC panels to prevent the loss of database or operating system software. Non-Volatile memory shall be incorporated for all critical controller configuration data, and battery back-up shall be provided to support the real-time clock and all volatile memory for a minimum of 72 hours. Upon restoration of normal power, the DDC panel shall automatically resume full operation without manual intervention.

All panels shall be provided with lugs, brackets or field supplied devices to allow the panel to be firmly fastened to the structure. The lugs, brackets or field supplied devices shall be sized to withstand the expected seismic loads for the area and type of application.

Miscellaneous Devices - Provide all the necessary relays, limit switches, positioners, valves, clocks, transformers, etc, to make a complete and operable system. Locate these devices on local ATC panel unless specified otherwise.

Set points on thermostats, temperature controllers, humidistats, humidity controllers and static pressure controllers shown on the Drawings are indicative only and devices shall be adjustable above and below such set points. If a set point is not stated, the control range of devices shall be suitable for the intended service. Range of devices shall be approximately 50 percent greater in both directions than span of variable, with a minimum of 25 degrees and a maximum of 100 degrees F for air systems. Thermometers - Thermometers shall be flush mounted on local panels. These thermometers shall be of the dial type, minimum 3-in diameter.

Flow Switches and Sensors - Duct air flow elements for modulating control shall be of the multipoint, self-averaging pitot tube, differential pressure type. Each element shall have air straightening vanes. These elements shall be fabricated of heavy-gauge, galvanized steel welded casing with 90 degree connecting flanges in a configuration and size equal to that of the duct it is mounted into. The maximum allowable unrecovered pressure loss through the element shall not exceed 0.065-in w.c. at 1000 fpm. Element accuracy shall be plus or minus 1 percent of actual flow rate over the flow range. Repeatability shall be plus or minus 0.1 percent of the actual flow rate over the flow range. Rangeability shall be guaranteed to meet flows as specified. Flow switches for clean air applications to include supply and makeup air systems shall be adjustable differential pressure type with an adjustment range suitable for the application including pressure range, temperature range, and expected containment range. Switches shall be arranged for sensing system velocity pressure through the use of a pitot tube arrangement. Pitot tubes shall be accessible and removable for inspection and maintenance without disturbing wiring connections or transmitters. Tube shall be stainless steel. Flow switches for general HVAC exhaust applications shall be vane (paddle) type switches suitably selected for the expected duct velocity, pressure range, temperature range, humidity range, and expected contaminants in the air stream. Positioned in the ductwork to be accessible and located so as to avoid nuisance tripping and unreliable operation due to flow turbulence. Vane and vane blocks shall be Type 316 stainless steel.

Switches and control wiring shall be arranged so switch is easily removable from ductwork to permit vane inspection, without disconnecting the wiring.

Thermal dispersion flow sensors shall be set and calibrated after air balancing has been completed. Unless otherwise noted, the set points for high or low shall be plus/minus 10 percent. For high high, or low low shall be plus/minus 15 percent. When the sensor has a varying speed response for start up and shut down, the shorter time response shall be used for the system alarm or shut down signal.

Where specifically called for on the Drawings or in the control sequences, current measuring devices shall be used for flow monitoring. Devices shall measure the actual current for the fan motor and compare it to a predetermined range. The range is to be determined by measurement during system balancing. The use of sensors that only respond to a condition of current or no current are not acceptable.

Electronic Sensors - All mixed air and coil discharge sensors shall utilize industry standard 4-20 mA sensors with averaging elements. Sensing elements shall be a minimum of 25-ft and temperature sensed shall be averaged over the entire length of the element. Thermistor type sensors will not be acceptable for this application. Space type sensors shall have an accuracy of plus/minus .5 degrees over sensed temperature range (20 to 120 degrees F).

Well type sensors used for liquid immersion shall have stainless steel removable wells. Sensing element shall have an accuracy of plus/minus .5 degrees over range (70 to 220 degrees F or 20 to 120 degrees F) of the sensor. Each sensor shall have a suitable electrical box to enclose all wiring connections.

Temperature control wells shall be installed according to manufacturer's recommendations.

2.3 ELECTRIC WIRING. All field wiring (other than power wiring) between control cabinets, control devices, unitary control panel and control terminals in motor control centers shall be furnished under this Section and shall conform to the requirements of Division 16. Wiring to suspended and cabinet unit heaters and their thermostats shall be considered power wiring. All interlocking wiring within MCC shall be done by Division 16. Refer to the electrical drawings for NEMA enclosure types.

Installation of all conduit, wire, sleeves, outlet boxes, insulating bushings, system cabinets, terminal boxes, pull boxes, junction boxes, inserts, anchors, system devices, etc, shall be in accordance with the appropriate requirements of Division 16, and in accordance with sections of the current edition of the local codes for signal systems and electrical systems.

Wiring shall be run in rigid steel conduit except in dry locations above ceilings and wood or metal stud framed partition walls, where EMT may be used. Conduit, boxes and fittings and their installation and testing shall be as specified in Section 16110.

In the event of any conflict among referenced codes, current editions of the applicable local codes shall take precedence for interpretation of "Signal System" installation requirements.

Installation of sensor wiring in finished areas shall be concealed whenever possible. Where concealed wiring is not possible, written approval for exposed work must be obtained from the Engineer prior to installation.

A power supply 115V, single phase, 60 Hz, 20 Amp circuit for ATC, requirements will be taken from local control panel. Power shall not be taken from the control power transformers of the motor control center. All low-voltage wiring shall meet NEC Class 2 requirements. (Low-voltage power circuits shall be subfused when required to meet Class 2 current limit.) All wiring in mechanical, electrical or service rooms or where subject to mechanical damage shall be installed in conduit at levels below 10- ft. Do not install Class 2 wiring in conduit containing Class 1 wiring. Boxes and panels containing high voltage wiring and equipment may not be used for low voltage wiring except for the purpose of interfacing the two (e.g., relays and transformers).

All wire to device connections shall be made at a screw type terminal block or screw type terminal strip. All wire to wire connections shall be at a screw type terminal block. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals. All wiring shall be installed as continuous lengths, with no splices permitted between termination points. Install plenum wiring in sleeves where it passes through walls and floors. Maintain fire rating at all penetrations. Size of conduit and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer's recommendations and code requirements, except as noted elsewhere. Include one pull string in each conduit (1-in) or larger. Use coded conductors throughout with conductors of different colors.

Control and status relays are to be located in designated enclosures only. These enclosures include packaged equipment and control panel enclosures unless they also contain Class 1 starters.

Conceal all conduits, except within mechanical, electrical or service rooms. Install conduits to maintain a clearance of 6-in from high temperature equipment. Secure conduits with conduit clamps fastened to the structure and spaced accordingly to code requirements. Conduits and pull boxes may not be hung on flexible duct strap or tie rods. Conduits may not be run on or attached to ductwork. Comply with Division 16 requirements where conduit crosses building expansion joints. Install insulated bushings on all conduit ends and openings to enclosures. Seal top end of all vertical conduits. The Contractor shall terminate all control and/or interlock wiring and shall maintain updated (as-built) wiring diagrams with terminations identified at the job site. Flexible metal conduits and liquid tight, flexible metal conduits shall not exceed 3-ft in length and shall be supported at each end. Flexible metal conduits less than 1/2-in electrical trade size shall not be used. In areas exposed to moisture, including chiller and boiler rooms, liquid tight, flexible metal conduits shall be used. Conduits must be rigidly installed, adequately supported, properly reamed at both ends and left clean and free of obstructions. Conduit sections shall be joined with couplings (according to code). Terminations must be made with fittings at boxes.

PART 3 - EXECUTION

3.1 INSTALLATION. The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

3.2 INSTRUCTION AND ADJUSTMENT. Upon completion of the project: Completely adjust and calibrate, ready for use, all thermostats, valves, damper operators, relays, thermometers and recorders, etc, provided under this Section.

Furnish four instruction manuals covering the function and operation of the control and automation systems on the project for the use of the Owner's operating personnel. A competent technician shall be provided for a period of 16 hours for instruction purposes.

The system contractor shall provide complete system documentation at acceptance time, as specified herein. Documentation shall be provided in four sets, unless otherwise elsewhere in this Section. Documentation shall include the following:

All data specified in the Paragraph 1.03 above, in its final as-built approved form.

As-built interconnection wiring diagrams, or wire lists, or list of the complete field installed system with complete, properly identified, ordering number of each system component and device.

3.3 CONTROL SEQUENCES. HVAC equipment will operate with the sequences of operation shown on the drawings. The following will apply to all sequences.

All sequences are reversible unless otherwise noted.

Manual reset of control functions with manual reset will be at the local control panel unless otherwise noted.

Where required to prevent nuisance shut downs of systems, provide time delay of sensors to allow system start up before the sensors are activated. This would include, but not be limited to low temperature freeze protection on 100 percent outdoor air units.

The ATC contractor shall provide all connections, relays and other devices required to operate the system under the control of the firefighter control panel.

End of Section

SECTION 15955

BUILDING SYSTEM CONTROLS

PART 1 - GENERAL

1.1 SCOPE. This section covers the design, furnishing, and installation of control systems and instrumentation associated with the heating, ventilation, and air conditioning (HVAC) equipment and systems including all associated equipment, devices, and controls necessary for proper operation.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. The control and instrumentation shall be designed and coordinated for proper operation with the controlled equipment and materials furnished under other sections, under other contracts, and with related existing equipment. All controls devices and instruments shall be applied in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the device manufacturer and controlled equipment manufacturer unless exceptions are noted by Engineer.

Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment or instrumentation are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Review of drawings submitted prior to the final determination of related equipment shall not relieve Contractor from supplying systems in full compliance with the specific requirements of the controlled equipment. Controlled equipment and materials may include, but will not be limited to, fans, pumps, actuators, measuring devices, supervisory control equipment, cable, conduit, and piping as described in other sections. Installation drawings shall be prepared for interconnecting wiring and instrument tubing between the controlled equipment and equipment furnished in this section. All interconnecting wiring shall be appropriate for the service and shall result in a properly functioning system. Contractor shall provide coordination with the other contractors and supervision of installation as needed during construction.

Contractor shall coordinate with the Work to make certain that the field wiring associated with the work of this section is completed in accordance with the requirements of the heating, ventilating, and air conditioning equipment furnished and their interconnection. The temperature controls supplier shall design and furnish a complete and functional control system in accordance with the drawings, specifications, and sequence of operation. The control wiring shall be installed so that all HVAC equipment will function as described in the HVAC sequence of operation

Conduit and control wiring for all control circuits needed between all field mounted HVAC controlling and indicating devices, such as, but not limited to, damper and valve actuators, temperature/digital control panels, motor starters, and the HVAC equipment, shall be furnished and installed as specified in the control circuits paragraph. Cable and conduit for all HVAC power circuits shall be as specified in Master Specification Section 16050, Electrical General Requirements.

Motor starters will be provided with terminal blocks for the termination of conductors for operational control and run/off status of the equipment. Refer to the electrical schematics for additional information.

The temperature controls supplier shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on suppliers representatives for temperature controls shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

When indicated by the applicable codes, panel assemblies, materials, and equipment shall be approved, identified, labeled, or listed by Underwriters' Laboratories or other testing organization acceptable to the governing authority.

1.2.04 Power Supply. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise indicated or necessary for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during start-up or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All valves, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Control Equipment Items	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plateNameplates and tags shall be at least 12 gage thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm).

Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners. Nameplates shall be firmly secured to temperature control panels with stainless steel panhead screws.

1.3.02 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Published descriptive data on each item of equipment and accessories, indicating all specific characteristics and options and identified with the designation used herein and on the drawings.

Schematic control diagrams giving specific data on all settings, ranges, actions, adjustments, and normal positions. Although schematic, these diagrams shall, as closely as possible, represent the actual system with all significant equipment and devices identified and located relative to each other. These diagrams shall also show detailed multiline wiring and instrument piping with all terminals and ports accurately identified. The wiring diagrams shall show the internal connections of the temperature control panels and all field wiring to equipment remote from the control panels, including wiring to Owner-furnished equipment. The wiring diagrams shall be complete, showing all connections necessary to place the temperature control systems in operation. Wiring diagrams shall be detailed to the degree necessary for field construction and shall include all related wiring.

Control valve schedule with each valve identified by the designations used herein and on the drawings and cross-referenced to the manufacturer's equipment data sheet or bulletin. The schedule shall also list complete sizing data for each valve, giving design flow and temperature or pressure, actual pressure drop, normal position, fluid, actual close-off rating, actual capacity index, and any other pertinent data.

Sequence of operation for each system corresponding to the control schematics.

Detailed panel construction drawings, including description of all materials and finishes, complete internal wiring and piping schematics, panel face layout, and complete data on all mounted components.

Space thermostat schedule indicating the types of covers and means of adjustment for each space.

Conduit and wire types.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals with Master Specification Section 01160, Training and Operation & Maintenance Manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manual. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE. The equipment furnished for installation under this section shall be tested according to the manufacturer's standard procedures.

1.5.01 Contractor's Qualification. The entire system shall be designed, coordinated, and supplied by a qualified Contractor who is regularly engaged in the business of designing and building instrument and control systems for heating, ventilating, and air conditioning equipment. The Contractor shall have at least 5 years of documented experience in designing and installation of the products specified and shall be employed by the control manufacturer or be an approved certified installer with full responsibility for proper operation of the control including startup and calibration of each component in the controls system.

1.5.02 Manufacturer Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.5.03 Tolerances. Unless otherwise indicated, the controls shall maintain space temperatures within ± 2°F (1.1°C), and the relative humidity within ± 5 percent of the setpoint.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools .

1.7 EXTRA MATERIALS. Extra materials shall be packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, with labels indicating the contents of each package. Each label shall indicate the manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Thermostats: 1 of each type.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. A complete system of automatic temperature controls shall be furnished and installed to accomplish the control described in the sequence of operations. All control equipment shall be compatible for operating with the control system provided.

The control system shall consist of all necessary thermostats, control valves, switches, relays, timers, and gauges in accordance with the sequence of operation indicated on the drawings. Technical engineering services, including but not limited to engineering, programming, installation supervision, commissioning, and troubleshooting shall be provided for a complete and functional system.

2.3 ACCEPTABLE MANUFACTURERS. The temperature control components and systems shall be manufactured by Honeywell; Johnson Controls; Andover Controls; or Siemens Building Technologies, Landis Division. Where manufacturers are not specified, materials and equipment furnished shall meet the performance and design requirements indicated.

2.4 MATERIALS.

2.4.01 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.02 Electric/Electronic Control Systems. Electric/electronic control systems shall be furnished and installed as indicated on the drawings and specified herein.

2.4.03 Thermostats.

Two Position Wall Mounted Thermostats. Two position wall mounted thermostats shall be Honeywell "T631A Airswitch", Penn Controls "A19BAC-1", Siemens Building Technologies, or approved equal.

Two position wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 3.5°F (2°C). The thermostats shall have a spdt switch rated for 1 horsepower (0.746 W).

Two Position Corrosion Resistant Wall Mounted Thermostats. Two position wall mounted thermostats located in wet or corrosive environments shall be Honeywell "T631F", or approved equal.

Two position corrosion resistant wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 3.5°F (2°C). The thermostats shall have a spdt switch rated for 1 horsepower (0.746 kW).

Two Stage Wall Mounted Thermostats. Two stage wall mounted thermostats shall be Honeywell "T631B Airswitch", Penn Controls "A28AA-4", Siemens Building Technologies, or approved equal.

Two stage wall mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 35°F to 100°F (2°C to 38°C) with a nonadjustable differential of 2°F (1.1°C) for each stage and 3.5°F (1.9°C) between stages.

Low Limit Thermostats. Low limit thermostats shall be Honeywell "L480", or Penn Controls "Model A11A-1", Siemens Building Technologies, or approved equal.

Low limit thermostats used for low temperature cutout shall be capillary, line-voltage type, complete with spst switches. The sensing elements shall be at least 20 feet (6 m) long. The thermostat shall be responsive to the lowest temperature along the measuring element, shall have a range of approximately 35°F to 45°F (2°C to 7°C), and shall be manually reset.

Remote Bulb Thermostats. Remote bulb thermostats shall be Honeywell "T675A", Penn Controls "A19ABC-24", Siemens Building Technologies, or approved equal.

Remote bulb thermostats shall be line voltage, fast response type. The thermostats shall have a range of approximately 0°F to 100°F (-18°C to 38°C) with an adjustable differential of 3°F to 10°F (1.7°C to 5.6°C). The thermostat shall include a capillary holding frame suitable for duct mounting.

Modulating Wall Mounted Thermostats. Modulating, wall mounted thermostats shall be Honeywell "Model T92", Penn Controls "Model T80ABA-1", Siemens Building Technologies, or approved equal.

Modulating, wall mounted thermostats shall be modulating, proportional control, low voltage type. The thermostats shall have an operating range of approximately 63°F to 87°F (17°C to 31°C) with a throttling range of approximately 1.5°F to 6.5°F (0.8°C to 3.6°C).

Modulating Duct Mounted Thermostats. Modulating, duct mounted thermostats shall be Honeywell "Model T991", Penn Controls "Model A80ABA-2", Siemens Building Technologies, or approved equal.

Modulating, duct mounted thermostats shall be modulating, proportional control, low voltage type. The thermostats shall have a range of approximately 10°F to 90°F (-12°C to 32°C) with an adjustable throttling range of approximately 5° F to 24°F (3°C to 13°C), and shall be furnished with a duct mounting kit.

Explosionproof Thermostats. Explosion-proof wall-mounted thermostats controlling explosionproof equipment in Class I, Division 2, Group D areas shall be Honeywell "Model T6051B", Johnson Controls "Model A19BUC-2", Siemens Building Technologies, or approved equal.

Explosionproof wall-mounted thermostats shall be line voltage type. The thermostats shall have a range of approximately 45°F to 85°F (7°C to 29°C) with a nonadjustable differential of 1°F (0.6°C). The thermostats shall have a spdt switch rated for 10 amperes at 120 volts ac.

Duct-mounted thermostats controlling explosionproof equipment in Class I, Division 2, Group D areas shall be Indeeco "Model T94A-70", or approved equal.

Non-programmable Wall Mounted Thermostats. Non-programmable, wall mounted thermostats shall be Honeywell "Model T874", Penn Controls, Siemens Building Technologies, or approved equal.

Non-programmable wall mounted thermostats shall be single or multistage as required by the controlled equipment, electromechanical type configurable for use with a conventional or heat pump system. The thermostats shall have a setpoint range of approximately 42°F to 88°F (6°C to 31°C) with the following features:

- Automatic heat/cool changeover
- Auxiliary heat LED
- Tamper-resistant cover with thermometer.

Where an economizer is used, the non-programmable thermostat shall be suitable for interfacing with the economizer control package.

Programmable Wall Mounted Thermostats. Programmable, wall mounted thermostats shall be Honeywell "Model T7300", Penn Controls, Siemens Building Technologies, or approved equal.

Programmable wall mounted thermostats shall be single or multistage as required by the controlled equipment, solid state programmable electronic type configurable for use with a conventional or heat pump system. The thermostats shall have a setpoint range of approximately 45°F to 95°F (7°C to 35°C) with the following features:

- 7 day programming with 2 occupied/unoccupied periods per day.
- Automatic heat/cool changeover.
- Battery backup.
- Digital display.
- Temporary override of setpoints.
- 2 configurable LED's.

Where an economizer is used, the programmable thermostat shall be suitable for interfacing with the economizer control package.

2.4.02.02 Humidistats. Humidistats, denoted by the symbol "H" and an identifying number, shall be Honeywell "H46C", Johnson Controls, Siemens Building Technologies, or approved equal.

Humidistats shall have a nylon element coupled to a spst mercury contact that closes on a rise in relative humidity. Each humidistat shall have an adjustable range of 20 to 80 percent relative humidity and an operating differential of approximately 5 percent relative humidity.

2.4.02.03 Economizer Control System. A complete economizer control system shall be provided for the system as indicated in the sequence of operations on the drawings. The economizer control system shall be Honeywell "Model W6215", or approved equal. The economizer control system shall be electronic solid state type with logic module, temperature and enthalpy sensors as required for the application. The economizer system shall provide temperature, single enthalpy, or differential enthalpy control and shall be suitable for use with the space thermostat. The economizer control system shall be mounted in the temperature control panel associated with the controlled system.

2.4.03 Direct Digital Control Systems.

2.4.03.01 General. The Direct Digital Control (DDC) system shall be furnished and installed as indicated on the drawings and as specified herein. The DDC system shall be capable of integrating multiple HVAC system functions, including data sharing, alarm/event management, scheduling, trending, and device/network management.

The DDC system shall consist of, but shall not be limited to, the following:

Stand-alone system and zone level DDC controllers for control of air handling units, air terminal units, heating water system, and chilled water system.

A network bus for communication between controllers.

A network control unit (NCU), if necessary to accomplish the control strategies described in the Sequence of Operation.

Portable operator interface terminal.

Sensors, transmitters, detectors, and accessories necessary for proper operation of the system and equipment.

Personal computer as necessary for alarm management, configuration, and programming.

The system shall be of modular design, and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, DDC controllers, and operator devices.

The failure of any single component, including the NCU, or network connection shall not interrupt the execution of control strategies at other operational devices. Master controllers shall employ a spare control strategy to ensure control execution is not interrupted.

2.4.03.02 Networking/Communications. The DDC system shall be an integrated network system configured to perform the functions described in the sequence of operation. The system's design shall include provisions to expand or modify the network.

The DDC controllers and NCU shall be capable of full stand-alone operation allowing execution of control strategies with default values when bus communication and global data is not available. In addition, the controllers shall reside on the network so that communications may be executed directly to and between DDC controllers, and shall allow intelligent interface for program changes, command inputs, and output of operating data.

The digital control system shall allow all operator devices, either network resident or connected via dial-up modems, to access all point status and application report data on the network. Access to system data shall not be restricted by the hardware configuration of the DDC system.

When it would be inefficient or impractical to provide multiple sensors, the digital control system shall provide global data sharing or global point broadcasting between DDC controllers.

The network design shall provide:

Data transfer rates for alarm reporting and quick point status from multiple DDC controllers.

Support of any combination of DDC controllers. A minimum of 20 DDC controllers shall be supported on a single local network or control bus. The bus shall be addressable for up to 20 DDC controllers.

Detection of single or multiple failures of DDC controllers or the network media.

Error detection, correction, and re-transmission as necessary to guarantee data integrity.

Commonly available, multiple-sourced, networking components shall be used.

Use of an industry standard protocol, such as Optomux, and IEEE RS-485 communications interface at the network interface level.

Each DDC controller, air terminal unit zone thermostat, and the NCU, if provided, shall include provisions for connection to a portable operator's terminal which will allow the system operator to interface with the control network. The operator's terminal shall be mounted at the digital control panel as required, and shall be available for connecting to remote DDC controllers. The portable operator's terminal shall include a keypad and full English language display. A touchpad, menu-driven display shall also be acceptable. If the Echelon zone communication bus is utilized, then a 50 foot (15 m) operators terminal cable maybe provided in lieu of the room sensor jack connection.

The operator's terminal shall have multiple-level password access protection to allow the user to limit control, display, and data base manipulation capabilities for each user, based upon an assigned password. The passwords shall be exactly the same for all operator devices with a minimum of three levels of access. A minimum of 4 passwords shall be supported at each digital controller. The same passwords shall be used at any controller for the specific user.

Operators will be able to perform only the commands available for their respective passwords. Menu selections displayed at any operator device shall be limited to only the items defined for the access level of the password used to log-on. User-definable, automatic log-off timers of from 1 to 60 minutes shall be provided to prevent operators from inadvertently leaving devices on-line.

The operator interface shall allow the operator to perform commands including, but not limited to, the following:

Start up or shut down selected equipment.

Adjust setpoints.

Add/modify/delete time programming.

Enable/disable process execution.

Enable/disable totalization for each point.

Enter temporary override schedules.

Define holiday schedules.

Change time/date.

Enter/modify analog alarm limits.

Command controller outputs for maintenance/test operations.

View and acknowledge a minimum of the last 50 alarms.

2.4.03.03 System Software Features. All necessary software to form a complete operating system shall be provided as an integral part of the DDC system, and shall not be dependent upon a higher level computer for execution. As a minimum, the software shall include the following:

Equipment Cycling Protection: Control software shall include a provision for limiting the number of times each piece of equipment may be cycled within any one-hour period.

Energy Management Applications: The DDC system shall be able to perform any or all of the following energy management routines:

- Time of Day Scheduling
- Calendar Based Scheduling
- Holiday Scheduling
- Optimal Start
- Optimal Stop
- Heating/Cooling Interlock
- Demand Limiting
- Load Rolling

All programs shall be executed automatically without the need for operator intervention, and shall be flexible enough to allow user customization. The programs shall be applied to building equipment described in the Sequence of Operations.

Programming Capability: The DDC system shall be able to execute configured processes defined by the user to automatically perform calculations and control routines.

Process Inputs and Variables: It shall be possible to use any of the following in a configured process:

- Any system-measured point data or status
- Any calculated data
- Any results from other processes
- Boolean logic operators (and, or)

Process Triggers: Configured processes may be triggered based on any combination of the following:

- Time of day
- Calendar date
- Other processes
- Events (e.g., point alarms)

Data Access: A single process shall be able to incorporate measured or calculated data from any DDC controller and shall be able to issue commands to points in any and all other DDC controllers on the local network.

Alarm Management: Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. Each DDC controller and the NCU, if necessary, shall perform distributed, independent alarm analysis and filtering to minimize operator interruptions due to non-critical alarms, minimize network traffic, and prevent alarms from being lost. Alarms shall be displayed and acknowledged via the portable operator's terminal or other device provided by the System Supplier.

The DDC system's ability to report alarms shall be affected neither by operator activity at the local I/O device, nor by communications with other DDC controllers on the network.

Point Change Report Description: All alarm or point change reports shall include a verbal description of the point and the time and date of occurrence.

Prioritizing: The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of three priority levels shall be provided. Users shall have the ability to manually inhibit alarm reporting for each point.

The user shall be able to identify the conditions under which point changes need to be acknowledged by an operator, and/or logged for analysis at a later date.

Alarm Messages: In addition to the point description and the time and date, the user shall be able to display or store an alarm message to more fully describe the alarm condition or direct operator response. Each DDC controller shall be capable of storing at least 20 alarm messages. Each message may be assignable to any number of points in the panel.

2.4.03.04 <u>DDC Controllers</u>. Each DDC controller shall operate as a stand-alone controller capable of performing its specified control strategies independently of other controllers in the network. Each DDC controller shall be a microprocessor-based, multi-tasking, real-time digital control processor.

Each DDC controller shall have sufficient memory to support its own operating system and data bases, including the following:

Control processes.

Energy management applications.

Operator I/O (portable service terminal).

The operator interface to any DDC controller point data or programs shall be through the portable operator's terminal connected to any DDC controller on the network. In addition, a communication bus shall be provided for connection to an Owner furnished personal computer. A software package and necessary interface card shall be furnished and installed on the computer to allow communication in text format with the DDC system.

DDC controllers shall directly support the temporary use of a portable service terminal that can be connected to the DDC controller via an input jack located on the zone temperature sensor or the controller. If the Eschelon Lonworks Bus is utilized at the terminal unit controller level, a portable bus control/display operator's terminal shall be provided. The capabilities of the portable service terminal shall include, but not be limited to, the following:

Display temperatures.

Display status.

Display setpoints.

Display control parameters.

Override binary output control.

Override analog setpoints.

Modification of gain and offset constants.

All system setpoints, proportional bands, control algorithms, and any other programmable parameters shall be stored such that a power failure of any duration does not necessitate reprogramming the DDC controller.

Each controlled device or function shall be a separate output of the DDC controller.

2.4.03.04.01 Air Terminal Unit Controllers. Air terminal unit controllers shall be configured to support single duct cooling with hot water coil and remote hot water convective heating. The air terminal unit controllers shall support the following types of point inputs and outputs:

Cooling outputs (proportional).

Box heating outputs (proportional).

Air terminal unit controllers shall support the following library of control strategies to address the requirements of the sequences described in the sequence of operation and for future expansion:

Daily schedules.

Occupied/unoccupied mode.

Morning warm-up mode.

Temporary override mode.

Temporary comfort mode.

Boost (occupant warmer/cooler control).

The controller interface to the zone temperature sensor shall allow an optional momentary switch to change the mode of the controller from unoccupied to occupied mode.

The controller interface to the zone temperature sensor shall allow an optional momentary switch or setpoint pot to override the controller's output to full heating or cooling as necessary. This command shall be active for a preset amount of time to anticipate a substantial change in the room's heating or cooling load via set-point adjustment.

Continuous Zone Temperature Histories: Each air terminal unit controller shall automatically and continuously maintain a history of the associated zone temperature. This allows users to quickly analyze space comfort and equipment performance for the past 24 hours. A minimum of two temperature samples per hour shall be stored.

Alarm Management: Each air terminal unit controller shall perform its own limit and status monitoring and analysis to maximize network performance by reducing unnecessary communications.

Direct digital control (DDC) panels associated with the air terminal units are not shown on the drawings but shall be located at the respective volume control unit location.

2.4.03.04.02 Air Handling Unit (AHU) Controllers. The AHU controllers shall support, but not be limited to, the following configurations of systems to address current requirements as described in the sequence of operation, and for future expansion:

Mixed air-single path.

VAV system, including supply and return fan speed control.

Heating and cooling control.

System economizer.

Low temperature safeties/shutdown sequence.

Smoke detection/purge/vent protection.

Supply and return airflow measurement.

User defined points alarming for:

a. High filter pressure loss.

b. High/low duct static pressure.

c. Freeze detection.

d. Smoke alarms.

AHU controllers shall support all the necessary point inputs and outputs to perform the specified control sequences in a totally stand-alone fashion.

AHU controllers shall have a library of control routines and program logic to perform the sequence of operation.

Each AHU controller shall automatically and continuously maintain a history of the associated zone temperature and air system temperatures to allow users to quickly analyze space comfort and equipment performance for the past 24 hours. A minimum of two samples per hour shall be stored.

Each AHU controller shall perform its own limit and status monitoring and analysis to maximize network performance by reducing unnecessary communications.

2.4.03.04.03 Heating Water System Controller. The heating water system controller shall support, but not be limited to, the following configurations of systems to address current requirements as described in the sequence of operation and for future expansion:

Boiler sequencing.

Boiler firing rate.

Boiler blending valve control.

Primary heating water loop temperature control.

Secondary heating water loop temperature control.

Heating water pump control.

User defined points alarming for:

a. High/low water temperature.

b. Low water flow.

The heating water system controller shall support all the necessary point inputs and outputs to perform the specified control sequences in a totally stand-alone fashion.

The controller shall have a library of control routines and program logic to perform the sequence of operation.

The controller shall automatically and continuously maintain a history of the associated loop supply and return heating water temperature to allow users to quickly analyze equipment performance for the past 24 hours. A minimum of two samples per hour shall be stored.

The controller shall perform its own limit and status monitoring and analysis to maximize network performance by reducing unnecessary communications.

2.4.03.05 Sensors and Controllers.

Wall-Mounted Temperature Sensors. Space temperature sensors shall use a precision type accurate to ± 0.5°F (0.3°C) over a temperature range of 40°F to 90°F (5°C to 32°C). The assembly shall be installed within a ventilated off white enclosure suitable for wall mounting. The output shall be compatible with the controller it serves. Where manual overrides are indicated, the sensor shall include push button override capability, thermometer or temperature indication, sliding warmer/ cooler mechanism for adjusting the temperature setpoint, and latching cover.

Duct-Mounted Temperature Sensors. Duct-mounted temperature sensors installed in ducts smaller than 10 square feet (0.92 square meters) shall be a single point type. Duct-mounted temperature sensors installed in ducts greater than 10 square feet (0.92 square meters) or subject to temperature stratification shall be averaging type. Sensors shall be a general purpose type with an operating range as needed for the application and an accuracy of ± 1 percent over the full range. The output shall be compatible with the controller it serves.

Pipe Insertion Temperature Sensors. Pipe insertion temperature sensors shall contain a sensing element with an operating range as needed for the application and an accuracy of ± 1 percent over the full range. The sensors shall be installed in brass or stainless steel thermal wells of sufficient size with a minimum insertion length of 2-1/2 inches (65 mm). The output shall be compatible with the controller it serves.

Wall-Mounted Humidity Sensors. Wall-mounted humidity sensors shall be capable of providing continuous measurement of percent relative humidity with an accuracy of ± 5 percent over the range of 10 to 80 percent RH. The assembly shall be installed within a enclosure matching the wall thermostat cover. The output shall be compatible with the controller it serves.

Duct-Mounted Humidity Sensors. Duct-mounted humidity sensors shall be capable of providing continuous measurement of percent relative humidity with an accuracy of ± 3 percent over the range 20 to 90 percent RH. Sensors located outdoors shall be installed in a weather enclosure. The output shall be compatible with the controller it serves.

Pressure Sensors. Pressure sensors shall be suitable for air or water service. Accuracy shall be ± 1 percent of full scale. The unit shall have temperature compensation so that thermal effects are no more than ± 0.5 percent of the full scale from 32 to 100°F. The transmitter shall be suitable for the media and pressure measured.

2.4.04 Temperature Control Panels. Temperature control panels, denoted by the symbol "TCP" and an identifying number, shall be NEMA Type 12 designed for wall mounting and shall be completely prewired and checked. Temperature control panel enclosures shall be manufactured by Hoffman Engineering, Integration Technology Systems Inc, or Par Metal Products Inc.

All controllers, selector relays, switching relays, interlock relays, manual switches, timers, alarm and indicating lights, and other devices indicated to be panel mounted shall be mounted in or on the respective control panel.

Accessories such as indicating lights and selector switches shall be mounted on the hinged front covers of the panels. The accessories and panels shall be identified with an identification plate as described in the Equipment Identification paragraph. The identification plates shall be fastened to the panels with corrosion resistant pan head screws.

Each temperature control panel shall supply power to all associated control system field control components, including but not limited to, damper operators, thermostats, sensors, smoke detectors, and valves. The controls shall include all necessary relays, interlocks, and control devices to enable the control panel to function as described in the sequence of operations on the drawings.

All interconnecting wiring and wiring to terminals for exterior connection shall be stranded copper, insulated for not less than 600 volts, with a moisture and flame-resistant covering rated for at least 90°C. Power distribution wiring on the line side of panel fuses shall be at least 12 AWG. Secondary power distribution wiring, wiring for control circuits, and annunciator and indicating light circuits shall be at least 14 AWG. Wiring shall be color coded in accordance with the color coding legend on the panel wiring diagrams.

<u>Selector Switches</u>. Selector switches shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Selector switches shall be heavy-duty oiltight type with gloved-hand or wing lever operators. Position legends shall be engraved on switch faceplate. Switches for electric circuits shall have silver butting or sliding contacts, rated 10 amperes continuous at 120 volts ac. Contact configuration shall be as indicated on the drawings or as necessary for the application. Switches used in electronic signal circuits shall have contacts suitable for that duty.

<u>Push Buttons</u>. Push buttons shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Push buttons shall be heavy-duty, oiltight type, with legends engraved on the faceplate. Contacts shall be rated 10 amperes continuous at 120 volts ac.

<u>Indicating Lights</u>. Indicating lights shall be Micro Switch "Type PT", Cutler-Hammer "Type T", General Electric "CR", or approved equal. Alarm, indicator, and running status lights shall be furnished with bulbs. Indicating lights shall be heavy-duty, push-to-test, oiltight type with low

voltage bulbs and built-in transformers. Legends shall be engraved on the lens or on a legend faceplate. Bulbs shall be easily replaceable from the front of the device.

Alarm Horns. Alarm horns shall be Federal Signal "Model 350", or approved equal. Alarm horns shall have a sound output of 100 dB at 10 feet (3 m) and shall be rated for 120 volts ac. Horns shall be furnished with mounting hardware suitable for flush mounting.

Relays. Relays shall be Eagle Signal "Series 22, 80"; Potter & Brumfield "Series KRP, CB"; Struthers-Dunn "Series A3, A4", or approved equal. Relays shall be of the plug-in socket base type, with dustproof plastic enclosures unless noted otherwise. Relays shall be UL recognized and shall have not less than double-pole, double-throw contacts. Control circuit relays shall have silver-cadmium oxide contacts rated 10 amperes at 120 volts ac. Electronic switching-duty relays shall have gold-plated or gold alloy contacts suitable for use with low level signals. Relays used for alarm input or indicating light service shall have contacts rated at least 3 amperes. Time-delay relays shall have dials or engraved switch settings marked in seconds and shall have timing repeatability of ± 2 percent of setting. Latching and special purpose relays shall be as needed for the specific application.

Terminal Blocks and Panel Wiring. Terminal blocks for external connections shall be suitable for 12 AWG wire and shall be rated 30 amperes at not less than 300 volts. Terminal blocks shall be fabricated, shall be complete with marking strip, covers, and pressure connectors, and shall be labeled to agree with the identification on the temperature control manufacturer's submittal drawings.

Control Power Transformers. Where 24 volt ac control power is necessary for the temperature control components, 120/24 volt transformers shall be furnished and mounted in the respective temperature control panel. Control power transformers shall be sized by the manufacturer based on the equipment load of the panel, shall be copper wound, vacuum impregnated with solid polyester varnish, and shall be 100 percent tested in strict compliance with ANSI, CSA, and UL codes. Control power transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded. The control power transformers shall be sized by the manufacturer based on the equipment load of the panel.

Terminals. A terminal shall be provided for each conductor of external circuits, plus one ground cable. At least 8 inches (203 mm) of clearance shall be provided between the terminal strips and the base of vertical panels for conduit and wiring space. At least 25 percent spare terminals shall be provided.

All wiring shall be grouped or cabled and firmly supported inside the panel. Wiring shall be bundled in groups and bound with nylon cable ties or shall be routed in Panduit or similar nonmetallic slotted ducts. Ducts shall be readily accessible within the panel, with removable covers, and shall have a space of at least 40 percent of their depth remaining for future use after completion of installation and field wiring. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables.

Painting. Interior and exterior surfaces of all panels shall be thoroughly cleaned and painted with universal primer. The panel interior shall be painted white with the manufacturer's standard coating. All pits and blemishes in the exterior surfaces shall be filled before the surface is painted with one or more finish coats of the manufacturer's standard coating. Finish coats shall have a dry film thickness of at least 4 mils (100 μm). One quart (0.95 L) of paint shall be furnished with the panels for future touchup painting.

2.4.05 Temperature Indicators.

2.4.05.01 Dial Thermometers. A dial thermometer shall be supplied and installed at each remote bulb sensor for calibration and calibration checks. The range of the dial thermometers shall be -40°F to 120°F (-40°C to 49°C).

In ducted systems containing hydronic coils or electric duct heaters, a dial thermometer shall be furnished and installed on the downstream side of the coil or heater. Thermometers shall be complete with averaging type elements.

2.4.05.02 Electronic Temperature Transmitters. Electronic temperature transmitters shall be furnished to transmit an electronic signal to a controller as indicated in the sequence of operation. The signal shall be compatible with the controller. Sensors shall be calibrated at the temperature control manufacturer's factory. Field adjustable sensors shall be used, with a dial thermometer installed adjacent to each sensor for calibration checks. The sensors shall have a temperature range of at least -20°F to 75°F (-7°C to 24°C).

2.4.06 Smoke Detectors. Smoke detectors, denoted by the symbol "SMD" and an identifying number, shall be System Sensor "DH100", Simplex, Grinnell, or approved equal.

Detectors shall be designed to detect combustion gases, fire, and smoke in air conditioning and ventilating duct systems in compliance with the NFPA 90A and shall contain a detector and air sampling chamber which serves as a reference point to help stabilize the detector against the effects of changes in temperature, humidity, and pressure.

Smoke detectors shall be duct-mounted photoelectric type and shall be completely self-contained, including integral power supply, supervisory and control circuitry and three sets of isolated contacts. The alarm contact shall be spst normally open; the auxiliary alarm contact shall be spdt, and the trouble contact shall be spdt and shall indicate detector malfunction. The alarm and trouble contacts shall be rated 2 amperes at 30 volts dc. The auxiliary alarm contact shall be rated 10 amperes at 120 volts ac. Pilot lights shall be provided for visual indication of alarm and power supply status on the front of the unit. A remote key-operated test station with alarm light and power supply status shall also be furnished and installed where indicated on the drawings. Detectors shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply.

Detectors shall be provided with sampling tubes extending the width of the air duct.

2.4.07 Pressure Differential Switches. The pressure differential switches, denoted by the symbol "PDS" and an identifying number, shall be furnished and installed as indicated on the drawings and the sequence of operation. Each pressure switch operating range shall be selected so that the setpoint is between 25 and 75 percent of the scale range. Initial setpoints shall be as indicated on the drawings. Differential switches shall be UL listed.

Where indicated on the drawings, pressure differential switches shall be provided with an explosionproof housing suitable for a NEC Class 1, Division 2, Group D environment. Where pressure differential switches are located outdoors, a NEMA 4 rated weather enclosure shall be provided.

2.4.07.01 Differential Airflow Switches. Pressure differential airflow switches shall be Dwyer Instruments, Inc. "Series 1800", or approved equal.

Pressure differential switches for airflow service shall be diaphragm operated by differential air pressure between duct and atmosphere or across a filter. The switch shall be spst, shall be rated 5 amperes at 120 volts ac and for a temperature range of -20°F to 125° F (-29° C to 52°C), and shall be provided with corrosion resistant mounting brackets. Pressure differential switches located across filters shall be initially set at the following setpoints.

Filter Type	Setpoint
1 inch (25 mm) pleated	0.75 inch wc (186 Pa)
2 inch (50 mm) pleated	1.0 inch wc (250 Pa)

Extended Surface 1.2 inch wc (300 Pa)

2.4.07.02 Differential Water Flow Switches. Pressure differential water flow switches shall be Mercoid "Series DP", or approved equal.

Differential pressure switches for water service shall be diaphragm operated by differential pressure. The switches shall be single pole double throw, bellows operated, suitable for 100 psig (690 kPa) working pressure, and shall be rated 15 amperes at 120 volts ac.

2.4.08 Water Flow Switches. Water flow switches, denoted by the symbol "FS" and an identification number, shall be furnished and installed as indicated on the drawings. Switches shall be W.E. Andersen "Model V4-2-U", or approved equal.

Water flow switches shall be spdt, operated by vane motion through a magnetic link. The flow switch body shall be brass with Type 316 stainless steel vane. The flow switch shall be rated for 275°F (135°C) and 150 psig (1034 kPa) service. Piping connection shall be 1-1/2 inch (40 mm) NPT. Switch contacts shall be rated at 5 amperes at 120 volts ac. The water flow switches shall be suitable for mounting in the hydronic system piping as indicated on the drawings.

2.4.09 Control Stations. Control stations for high rate ventilation fans shall include a two position selector switch with nameplate labeled "High Rate Ventilation On/Off". Control stations shall also include two indicating lights for "On/Off" indication. Indicating lights and selector switches shall be heavy duty oiltight NEMA Type 13. The control station enclosure shall be NEMA Type 4. Control stations shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.4.10 Emergency Ventilations Shutoff Switches. Emergency ventilation shutoff switches shall be furnished and installed where indicated on the drawings. The switches shall be Square D, Emergency Break-glass Operator "9001K15", or approved equal. Each break-glass switch for HVAC emergency shutoff shall be furnished with a NEMA Type 4 stainless steel enclosure with hammer, hammer clip, and chain. Each switch shall have one normally open and one normally closed contact block. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position to de-energize the equipment. Nameplates shall be provided as indicated on the on-line diagrams. The switches shall be provided with phenolic nameplates identifying the switches as 'VENTILATION SYSTEM EMERGENCY SHUTOFF."

2.4.11 Control Valves. Modulating control valves shall be sized for a pressure drop of at least 5 psig (35 kPa) and not more than 10 psig (69 kPa) at design flow. Control valves shall be modulating two-way or three-way as indicated in the schedule and on the drawings. Two inch (5.08 cm) and smaller valves shall have bronze bodies and threaded connections. Two and a half inch (6.35 cm) and larger valves shall have cast iron bodies and flanged ends.

Modulating valves shall be equipped with throttling plugs and removable discs and electric actuators or shall be refrigerant pressure actuated as specified herein and as indicated on the drawings. Refrigerant pressure actuated valves shall be suitable for use with the chiller refrigerant.

Modulating electric valve actuators shall be equipped with a proportional, reversing motor which shall produce a linear relationship between valve lift and valve flow at constant pressure drop. Each actuator shall have an internal spdt auxiliary switch rated 5 amperes at 120 volts ac. Actuators shall be suitable for operation on a 120 volt, 60 Hz, single phase power supply. Auxiliary transformers, where needed shall be factory wired to the actuator and installed in a NEMA Type 3R enclosure secured to the motor housing.

Valves shall be furnished with linkage bolted directly to the bonnet and motor flange.

2.4.12 Accessory Components. All additional control components, including, but not limited to, electric relays, temperature sensors and transmitters, humidity sensors and transmitters, controllers, and position switches, shall be furnished where necessary to ensure a complete, properly operating installation. All components shall be products of the temperature control manufacturer. Accessory components not mounted inside the temperature control panels shall be furnished with equipment enclosures. Relays shall be provided with 120 volt coils and at least 10 ampere contacts.

2.5 CONSTRUCTION.

2.5.01 Shop Painting. Unless otherwise indicated, shop painting shall be as specified in the General Equipment Stipulations. Surface finish damaged during installation shall be repaired to the satisfaction of the Engineer. Field painting shall conform to the requirements of Master Specification Section 09900, Painting.

2.5.02 Control Circuits. Control wiring shall be in accordance with the National Electrical Code (NEC). Conduit for all HVAC control circuits shall be EMT, except in areas designated on the electrical drawings as Area Type 1A, Area Type 4, or Area Type 12. In areas designated Type 1A conduit shall be exposed rigid PVC non-metallic conduit with PVC fittings, boxes, and accessories. In areas designated Type 4 and Type 12, conduit shall be IMC with gasketed enclosures and fittings. All conduit and conduit installation shall be in accordance with the requirements of Master Specification Section 16050, Electrical General Requirements and the NEC.

2.6 CABLE AND RACEWAYS.

2.6.01 Cable. Cable used in the temperature control system shall be multi-conductor cable, at least 18 AWG size, specifically designed for industrial systems and UL listed for indoor/outdoor installations. All cable necessary for the system, except 120 volt ac power, shall be furnished by the System Supplier.

2.6.02 Raceways. All cable shall be installed in conduit furnished under this section. All conduit shall conform to the applicable paragraphs of Master Specification Section 16050, Electrical General Requirements.

2.7 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except for equipment with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

Typical schematics on the drawings indicate electrical control items and functions necessary for most of the equipment; however, actual motor sizes shall comply with Master Specification Section 16220, General Purpose Induction Motors.

2.8 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories needed for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.9 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Contractor shall be responsible for determining that all equipment supplied is suitable for installation in the space indicated on the drawings. Control equipment shall be installed with adequate operating and maintenance access space.

3.2.01 Temperature Control Panels. The panels shall be mounted so that selector switches and indicating lights on the panel are located approximately 5 feet (1.5 m) above the finished floor.

3.2.02 Thermostats. Wall-mounted thermostats shall be mounted above the finished floors as indicated in Master Specification Section 16050, Electrical General Requirements. Insulating spacers shall be provided for thermostats mounted on exterior building walls. The spacers shall be installed between the thermostat and its mounting surface, so that the thermostat will not be affected by surface temperatures.

Wall-mounted thermostats in nonairconditioned areas shall be furnished and installed with a cast aluminum or wire guard.

3.2.03 Damper Operators. The number of operators furnished for each damper shall provide the torque necessary to operate the damper. Unless otherwise indicated, control dampers shall fail to the closed position, face dampers shall fail to the closed position, and bypass dampers to the open position.

3.2.04 Device Tag Numbering System. All devices shall be provided with permanent identification tags numbered to agree with the manufacturer's equipment drawings. All field-mounted control devices shall bear securely fastened identification tags. Hand-lettered labels or tape will not be acceptable.

Phenolic nameplates shall be provided and permanently attached to the wall at each control device to indicate the equipment controlled. The letters used shall be the same as the equipment designations indicated herein and on the drawings. Nameplates shall have white letters on black backgrounds.

3.2.05 Control Valves. Three-way hot water valves shall fail open to the heating coil unless otherwise indicated. Three-way chilled water valves shall fail open to the bypass unless otherwise indicated.

3.2.06 Cable. Cable shall be installed in conduit as described in the cable installation paragraphs in Master Specification Section 16050, Electrical General Requirements. The system conductors shall be installed in conduits or junction boxes separate from conductors of other systems. Conduit fill shall meet applicable NEC requirements.

3.2.07 Raceways. Conduit shall be installed as described in the conduit installation paragraphs in Master Specification Section 16050, Electrical General Requirements.

3.3 FIELD QUALITY CONTROL.

3.3.01 Installation Check. An experienced, competent, and authorized representative of the temperature controls supplier shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3.02 Field Testing. After the installation of the equipment and systems has been completed, tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer. Tests shall be as indicated in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.4 ADJUSTING. The building system controls supplier shall provide initial startup and adjustment of the control systems, instruction of operating personnel, and set point maintenance for one year.

The building system controls supplier shall be responsible for establishing the final control system settings necessary for proper operation of the equipment and systems. These settings and calibration shall have the concurrence of the equipment manufacturer's representative.

The building system controls supplier shall demonstrate to Owner the complete and correct functioning of all control systems and equipment, and shall make all necessary repairs, replacements, or adjustments to items which fail to perform to the satisfaction of the Owner.

3.5 CLEANING. At the completion of testing, all equipment, pipes, ductwork, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to the Owner.

3.6 OPERATOR INSTRUCTION AND TRAINING. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as needed.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

End of Section

SECTION 15990

TESTING, ADJUSTING, AND BALANCING

PART 1 - GENERAL

1.1 SCOPE. This section covers the cleaning, testing, adjusting, and balancing of the air and water systems associated with the heating, ventilating, and air conditioning (HVAC), emergency gas treatment system and odor control systems, as indicated in the Contract Documents.

1.2 GENERAL. Equipment and systems shall be cleaned, tested, adjusted, and balanced in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that all components and devices necessary for a properly functioning system have been provided. Prior to cleaning, testing, adjusting, and balancing, Contractor shall verify that each air or hydronic system has been installed properly and is operating as specified. Equipment bearings shall be lubricated in accordance with the manufacturer's recommendations.

Air systems shall be complete and operating, with dampers, filters, ductwork, air outlet and inlet devices, duct mounted equipment, and control components.

Hydronic systems shall be complete and operating, with valves, coils, pumps, piping, and control components, and shall be cleaned, filled, and vented. All strainers shall be checked for installation of the appropriate basket and shall be cleaned.

1.2.02 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with the latest edition of AABC, NEBB, or SMACNA standard manuals for testing, adjusting, and balancing of air and hydronic systems.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete apparatus report sheets for all air or hydronic systems shall be accurately and completely filled out in accordance with the Standard's manual. Copies of the final test readings and report sheets shall be submitted in accordance with the Master Specification Section 01080, Project

Submittals. As indicated in the Contract Documents, a description of the standard procedures used during testing, adjusting, and balancing shall be included in the submittal. The submittal shall include a reduced set of drawings, with the air outlet devices, air inlet devices, and equipment identified to correspond with the report sheets.

The apparatus report sheets shall include the following information:

1. Title Page:
    a. Company name.
    b. Company address.
    c. Company telephone number.
    d. Project name.
    e. Project location.
    f. Project Engineer.
    g. Project Contractor.
    h. Project altitude.
2. Instrument List:
    a. Instrument.
    b. Manufacturer.
    c. Model.
    d. Serial number.
    e. Range.
    f. Calibration date.
3. Air Moving Equipment:
    a. Location.
    b. Manufacturer.

c. Model.

d. Airflow, specified and actual.

e. Return airflow, specified and actual.

f. Outside airflow, specified and actual.

g. Total static pressure (total external), specified and actual.

h. Inlet pressure.

i. Discharge pressure.

j. Fan RPM.

4. Return Air/Outside Air Data:

a. Identification/location.

b. Design airflow.

c. Actual airflow.

d. Design return airflow.

e. Actual return airflow.

f. Design outside airflow.

g. Actual outside airflow.

h. Return air temperature.

i. Outside air temperature.

j. Required mixed air temperature.

k. Actual mixed air temperature.

l. Design outside/return air ratio.

m. Actual outside/return air ratio.

5. Electric Motors:

a. Manufacturer.

b. HP/BHP.

c. Phase, voltage, amperage; nameplate, actual, no load.

d. RPM.

e. Service factor.

f. Starter size, rating, heater elements.

6. V-Belt Drive:

a. Identification/location.

b. Required driven RPM.

c. Driven sheave, diameter, and RPM.

d. Belt, size, and quantity.

e. Motor sheave, diameter, and RPM.

f. Center to center distance, maximum, minimum, and actual.

7. Duct Traverse:

a. System zone/branch.

b. Duct size.

c. Area.

d. Design velocity.

e. Design airflow.

f. Test velocity.

g. Test airflow.

h. Duct static pressure.

i. Air temperature.

j. Air correction factor.

8. Air Distribution Test Sheet:

a. Air terminal number.

b. Room number/location.

c. Terminal type.

d. Terminal size.

e. Area factor.

f. Design velocity.

g. Design air flow.

h. Test (final) velocity.

i. Test (final) airflow.

j. Percent of design airflow.

9. Air Terminal Unit Data:

a. Manufacturer.

b. Type, constant, variable, single.

c. Identification/number.

d. Location.

e. Model.

f. Size.

g. Minimum static pressure.

h. Minimum design airflow.

i. Maximum design airflow.

j. Maximum actual airflow.

k. Inlet static pressure.

10. Electric Duct Heater:

a. Manufacturer.

b. Identification/number.

c. Location.

d. Model.

e. Design kW.

f. Number of stages.

g. Phase, voltage, amperage.

h. Test voltage (each phase).

i. Test amperage (each phase).

j. Airflow, specified and actual.

k. Temperature rise, specified and actual.

11. Pump Data:

a. Identification/number.

b. Manufacturer.

c. Size/model.

d. Impeller.

e. Service.

f. Design flow rate, pressure drop, BHP.

g. Actual flow rate, pressure drop, BHP.

h. Discharge pressure.

i. Suction pressure.

j. Total operating head pressure.

k. Shut off, discharge and suction pressures.

l. Shut off, total head pressure.

12. Chillers:

a. Identification/number.

b. Manufacturer.

c. Capacity.

d. Model.

e. Evaporator entering water temperature, design and actual.

f. Evaporator leaving water temperature, design and actual.

g. Evaporator pressure drop, design and actual.

h. Evaporator water flow rate, design and actual.

i. Condenser entering water temperature, design and actual.

j. Condenser leaving water temperature, design and actual.

k. Condenser pressure drop, design and actual.

l. Condenser water flow rate, design and actual.

13. Air Cooled Condenser:

a. Identification/number.

b. Location.

c. Manufacturer.

d. Model.

e. Entering DB air temperature, design and actual.

f. Leaving DB air temperature, design and actual.

g. Number of compressors.

14. Heat Exchanger:

a. Identification/number.

b. Location.

c. Service.

d. Manufacturer.

e. Model.

f. Primary water entering temperature, design and actual.

g. Primary water leaving temperature, design and actual.

h. Primary water flow, design and actual.

i. Primary water pressure drop, design and actual.

j. Secondary water entering temperature, design and actual.

k. Secondary water leaving temperature, design and actual.

l. Secondary water flow, design and actual.

m. Secondary water pressure drop, design and actual.

15. Coil Data:

a. Identification/number.

b. Location.

c. Service.

d. Manufacturer.

e. Airflow, design and actual.

f. Entering air DB temperature, design and actual.

g. Entering air WB temperature, design and actual.

h. Leaving air DB temperature, design and actual.

i. Leaving air WB temperature, design and actual.

j. Water flow, design and actual.

k. Water pressure drop, design and actual.

l. Entering water temperature, design and actual.

m. Leaving water temperature, design and actual.

n. Air pressure drop, design and actual.

16. Sound Level Report:

a. Location.

b. Octave bands - equipment off.

c. Octave bands - equipment on.

17. Combustion Test:

a. Boiler manufacturer.

b. Model.

c. Firing rate.

d. Overfire draft.

e. Gas pressure at meter outlet.

f. Gas flow rate.

g. Heat input.

h. Burner manifold gas pressure.

i. Percent carbon monoxide (CO).

j. Percent carbon dioxide (CO_2).

k. Percent oxygen (O_2).

l. Percent excess air.

m. Flue gas temperature at outlet.

n. Ambient temperature.

o. Net stack temperature.

p. Percent stack loss.

q. Percent combustion efficiency.

r. Heat output.

Product data indicating cleaning materials and treatment, chemicals, and reports on the analysis of system water after cleaning and after treatment, shall be submitted in accordance with the Master Specification Section 01080, Project Submittals.

1.4 QUALITY ASSURANCE. Contractor shall provide the services of a licensed independent contractor, certified by AABC or NEBB and with proven experience on at least three similar projects, to perform operational testing, adjusting, and balancing of the air or hydronic systems. The total system balance shall be performed in accordance with AABC, SMACNA, or NEBB Procedural Standards for the work.

1.5 MAINTENANCE. Contractor shall provide the services of a company specializing in water analysis and chemical treatment with at least 3 years of documented experience. The company shall have local representation with water analysis laboratories and full-time service personnel.

The water treatment company shall provide laboratory services and technical assistance for one year from the date of substantial completion of the project. At the completion of the service period, the water treatment company shall conduct a 4 hour training course to instruct facility operating personnel in system maintenance, testing methods, and chemical water treatment procedures.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be adjusted or balanced to meet the specified conditions and to operate at the elevation indicated in the Contract Documents.

2.2 CONSTRUCTION.

2.2.01 Painting. Surface finish damaged during cleaning, testing, adjusting, and balancing of equipment shall be repaired to the satisfaction of Engineer. Field coatings shall be as specified in Master Specification Section 09900, Painting.

2.3 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual unbalance in each plane of correction shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in punds
N = RPM for N greater than 1,000

PART 3 - EXECUTION

3.1 INSPECTION. Before testing and balancing the air system, doors and windows surrounding the area served by the system shall be closed. Fans shall be checked for correct rotation and rotative speed. Fire and smoke dampers shall be open and access doors and panels shall be closed during the testing and balancing. A resistance shall be placed at all filter locations to simulate dirty filter conditions. The filter resistance shall be as follows:

Filter Type	Simulated Loss
1 inch (25 mm) pleated	0.15 inch water column (37 Pa)
2 inch (50 mm) pleated	0.35 inch water column (87 Pa)
Extended surface	0.80 inch water column (200 Pa)

Before starting the hydronic system testing and balancing, all valves and control components shall be opened or set to direct flow through the heat transfer element. The pumps shall be checked for correct rotation and rotative speed.

3.2 STARTUP REQUIREMENTS. System equipment shall be subject to preliminary field tests as indicated.

3.3 FIELD PERFORMANCE TESTING. Field performance tests shall be conducted for each system to demonstrate each is functioning as specified and to the satisfaction of Engineer. All tests shall be conducted in a manner acceptable to Engineer and shall be repeated as many times as necessary to secure Engineer's acceptance of each system. If inspection or tests indicate defects, the defective item or material shall be replaced, and the inspection and tests shall be repeated. All repairs to piping shall be made with new materials. Caulking of threaded joints or holes will not be acceptable.

Air filters which are subject to a pressure loss exceeding the dirty filter values shall be removed and replaced. The spare air filters furnished with equipment shall not be used as the replacement filters. Dirty filter values shall be as follows:

Filter Type	Dirty Filter Conditions
1 inch (25 mm) pleated	0.75 inch water column (186 Pa)
2 inch (50 mm) pleated	1.0 inch water column (250 Pa)
Extended surface	1.2 inch water column (300 Pa)

3.3.01 Hydronic Piping. The hydronic piping systems shall be hydrostatically tested in accordance with ANSI/ASME B31.9.

All equipment or accessories which are connected to the piping systems, and which would be damaged if subjected to the specified test pressure, shall be disconnected and the ends of the branch lines shall be plugged or capped as needed during the testing procedure.

All hydronic piping shall be hydrostatically tested at a test pressure not less than 1.5 times the working pressure, and not less than 50 psi (345 kPa).

3.3.02 Refrigerant Piping. The refrigerant piping system shall be tested in accordance with ANSI/ASME B31.5.

After testing of the refrigerant piping system is completed, the system shall be charged with the proper refrigerant and placed in operation.

The completed refrigerant system shall be guaranteed to be sufficiently free from leaks for 1 year from the date of acceptance. The loss of refrigerant shall not exceed 5 percent.

3.4 CLEANING. At the completion of the testing, all parts of the installation shall be thoroughly cleaned. All equipment, ductwork, pipes, valves, and fittings shall be cleaned of grease, debris, metal cuttings, and sludge. Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired by Contractor at no additional cost to Owner.

3.4.01 Piping. Piping shall be cleaned with a liquid alkaline compound consisting of emulsifying agents and detergents conforming to applicable codes governing the addition of nonpotable chemicals to the buildings' mechanical systems and their discharge to public sewerage systems. All terminal control valves shall be placed in the open position during cleaning. The cleaning agent shall be added to the closed hydronic systems at the concentrations recommended by the cleaner manufacturer.

After piping systems have been cleaned, they shall be flushed with a neutralizing agent recommended by the cleaner manufacturer. All strainer screens in the piping systems shall be removed, cleaned, and replaced.

After the completion of the flushing and neutralizing, the piping systems shall be inspected and any remaining sludge shall be removed. This inspection shall include disassembly of components if necessary.

3.4.01.01 Heating Water System. While the cleaning solution is circulating in the system, it shall be slowly heated to 160°F (71°C) and maintained at that temperature for at least 12 hours. The heating shall then be stopped and the temperature of the circulating solution shall be allowed to drop to 100°F (38°C). The system shall then be drained as rapidly as possible and shall be refilled with clean water. The clean water shall be circulated for 6 hours at design temperatures and then drained. The system shall again be filled with clean water and the procedure repeated until all cleaning solution is removed.

3.4.01.02 Chilled and Condenser Water Systems. The cleaning solution shall be circulated in the system for 48 hours, and then drained as rapidly as possible. The system shall then be filled with clean water, which shall be circulated for 24 hours, and drained. The sequence of rinsing with clean water shall be repeated until all cleaning solution is removed.

3.4.02 Hydronic Systems. After the hydronic system has been cleaned, it shall be filled with clean potable water and immediately treated with the appropriate chemicals. The treatment chemicals shall be suitable for use at the system operating temperature and shall be compatible with the system construction materials of steel, cast iron, stainless steel, and copper alloys.

The water treatment chemicals shall conform to applicable codes governing the addition of nonpotable chemicals to the buildings' mechanical systems and their discharge to public sewerage systems. Sufficient treatment chemicals shall be furnished for the duration of the services period.

Chemical treatment of the hydronic system shall consist of applying corrosion inhibitors, conductivity enhancers, and sequestering agents to reduce deposits and adjust pH.

3.5 ADJUSTING & BALANCING. After completion of the hydronic system chemical treatment, the air and hydronic systems shall be adjusted and balanced.

All instrumentation shall be calibrated within 6 months of use and shall be checked for accuracy before testing, adjusting, and balancing the air and hydronic systems. The accuracy of the instrumentation shall be not less than specified by the testing, adjusting, and balancing standard manual or the instrument manufacturer.

All data, including system deficiencies encountered and corrective measures taken, shall be recorded. If a system cannot be adjusted to meet the design requirements, Contractor shall notify Engineer in writing as soon as practicable.

Following final acceptance of the certified balancing reports, the testing and balancing contractor shall permanently mark the settings of all adjustment devices, including valves and dampers, and shall lock the memory stops.

All ceiling tiles, belt guards, panels, and doors removed during testing, adjusting, and balancing shall be reinstalled.

3.5.01 Air Systems. Air systems shall be adjusted to the design airflows indicated on the drawings. Airflows shall be adjusted to maintain a net positive (supply airflow greater than exhaust airflow) or negative (exhaust airflow greater than supply airflow) pressure as indicated on the drawings. Dampers located behind air outlet and inlet devices shall be used to adjust the airflow only to the extent that the adjustments do not create objectionable air movement or noise.

Dampers with operators shall be checked for tight shutoff when in the closed position.

3.5.02 Hydronic Systems. The hydronic systems shall be adjusted to the design flow rates indicated on the drawings. Equipment or system shutoff valves shall not be used for flow rate adjustment.

End of Section

INDEX

DIVISION 16 – ELECTRICAL

SECTION 16050

ELECTRICAL GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of all equipment and materials needed for the electrical requirements of this contract. It also covers conduit, wiring, and terminations for electrical equipment installed under other sections. This section includes:

Power and telephone service entrances
Cable
Conduit
Wiring devices, boxes and fittings
Junction boxes, pull boxes and wiring gutters
Lighting fixtures
Lighting panels
Power panels
Transient voltage surge suppression
Separately enclosed motor starters
Separately enclosed manual starters
Control stations
Separately enclosed circuit breakers
Disconnect switches
Lighting and auxiliary power transformers
Power centers
Power factor correction capacitors
Lighting contactors
Photoelectric controls
Relay enclosures
Alarm horn and beacon
Heat-traced piping
Door entry switches
Drain fittings
Wireways

This section covers the installation of electrical equipment furnished under other sections, except electrical items designated to be installed under those sections.

When indicated, this section covers installation of equipment furnished by Owner.

The Contractor shall field check and thoroughly get familiarized with the plant field conditions, equipment and devices locations and the plant work environment.

1.2 GENERAL. Electrical apparatus on all equipment shall be installed complete and placed in readiness for proper operation.

Electrical materials furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

All tags, labels, signs, etc shall be installed by the contractor before work is complete and the equipment turned over to the Owner.

The Contractor must provide “as-built” drawings upon completion of project before final walkthrough.

The responsibility of pulling all permits for work is that of the Contractor, DWSD does not authorize work without all required permits.

Remove all wiring, panels, cabinets, and equipment that is no longer in service or has been left from old contracts and not needed. Verify removal of equipment with Owner and Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.02 Coordination. Electrical work shall conform to the construction schedule and the progress of other trades.

1.2.03 Anchor Bolts and Expansion Anchors. Unless otherwise specified or indicated on the drawings, all anchor bolts, nuts, and washers shall be hot-dip galvanized. Anchor bolts shall be at least 3/4 inch (19 mm) except a smaller size will be permitted to match NEMA standard size bolt holes on motors and electrical equipment.

When expansion anchors are indicated on the drawings, only an acceptable expansion anchor shall be used. Alternative anchoring systems may be used only when acceptable to Engineer. Expansion anchors shall be installed in conformity with the manufacturer's recommendations for maximum holding power, but in no case shall the depth of the hole be less than six bolt diameters. The minimum distance between the center of any expansion anchor and an edge or exterior corner of concrete shall be at least six times the diameter of the bolt. Unless otherwise indicated on the drawings, the minimum distance between the centers of expansion anchors shall be at least 12 times the diameter of the bolt.

Nuts and washers for expansion anchors shall be as specified for anchor bolts.

Expansion anchors shall be Hilti "Kwik-Bolt II", ITW Ramset/Red Head "Thrubolt Wedge Anchor", or approved equal.

1.2.04 Drawings. Supplementing this section, the drawings indicate locations of equipment and enclosures and provide one-line and schematic diagrams regarding the connection and interaction with other equipment.

The electrical drawings indicate the general design and extent of the electrical systems. Follow the Drawings as closely as actual construction and the work of other trades will permit.

Examine architectural, mechanical, and other trades' drawings and specifications. Notify the Contracting Officer should any discrepancies occur between them and the electrical work.

Drawings are not intended to be scaled for roughing-in or to serve as shop drawings. Take all field measurements required for fitting the installation to the building.

1.2.05 Maintenance. For all electrical equipment and systems requiring periodic scheduled preventive maintenance, asset number and recommended maintenance procedure data sheet shall be provided for the owner's EMPAC system

1.3 CODES AND PERMITS. All work shall be performed and materials shall be furnished in accordance with the current NEC - National Electrical Code, the NESC - National Electrical Safety Code, and the following standards where applicable:

ANSI	American National Standards Institute.
ASTM	American Society for Testing and Materials.
Fed Spec	Federal Specification.
ICEA	Insulated Cable Engineers Association.
IEEE	Institute of Electrical and Electronics Engineers.
IES	Illuminating Engineering Society.
ISA	Instrument Society of America
JIC	Joint Industrial Council
MDPH	Michigan Department of Public Health

MIOSHA	Michigan Occupational Safety and Health Administration
NBFU	National Board of Fire Underwriters
NECA	National Electrical Contractor's Association
NEMA	National Electrical Manufacturers Association.
NFPA	National Fire Protection Association.
OSHA	Occupational Safety and Health Administration
UL	Underwriters' Laboratories.

Equipment covered by this section shall be listed by UL, or by a nationally recognized third party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of Contractor. If no third-party testing laboratory provides the required listing, an independent test shall be performed at Contractor's expense. Before the test is conducted, Contractor shall submit a copy of the testing procedure to be used.

1.3.01 <u>Changes Required</u>. Notify the Contracting Officer before submitting the proposal should any changes in Drawings or Specifications be required to conform to the above codes, rules or regulations. After entering into Contract, make all changes required to conform to above ordinances, rules and regulations without additional expense to the Owner.

1.3.02 <u>Standards Of Materials And Workmanship</u>. All materials shall be new. The electrical and physical properties of all materials, and the design, performance, characteristics, methods of construction and testing of all items of equipment, shall be in accordance with the latest issue of the various, applicable standard specifications in Paragraph 1.3 and NETA: International Electrical Testing Association

1.3.03 All equipment of the same or similar systems shall be by the same manufacturer.

1.3.04 <u>Resolution of Conflicts</u>. In case of conflicts between codes, reference specifications or drawings, the code, reference specifications or drawings with more stringent requirement shall be used. To use a lesser code or reference, a written permission by the Contracting Officer must be obtained.

1.3.05 <u>Standards</u>. When reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.4 IDENTIFICATION.

1.4.01 Conduit. Conduits in manholes, handholes and in underground duct banks, building entrance pull boxes, junction boxes, and equipment shall be provided with identification tags. Identification tags shall be 14 gage (1.63 mm) thick stainless steel, with 1/2 inch (13 mm) stamped letters and numbers as indicated on the drawings. Identification tags shall be attached to conduits with stranded stainless steel tie wraps and shall be positioned to be readily visible.

1.4.02 Cable. Except for lighting and receptacle circuits, each individual wire in power, control, indication, and instrumentation circuits shall be provided with identification markers at the point of termination.

Whenever replacing a 15KV or 5KV cables, the identification tags explained in 1.4.01 shall be at the point of connection and also at the point of termination. If the point of termination being a load break switch, the switch shall be tagged as well, in accordance with the one line diagram of the contract documents. As part of the as-built, the contractor shall also provide terminal to terminal connection drawings for all equipment installed or wired by this contract including the equipment provided by others

The wire markers shall be of the heat-shrinkable tube type, with custom typed identification numbers, or shall be of the self-laminating, write-on type as required.

The wire numbers shall be as indicated on the equipment manufacturer's drawings.

The wire markers shall be positioned to be readily visible for inspection.

Power wires shall be color coded with electrical tape or colored wire jacket; white-N, black, and red for 120/240 volt, 3-wire; and gray-N, brown, orange and yellow for 480/277 volt, 4-wire circuits.

1.4.03 Motor Starters. Motor starters shall be provided with nameplates identifying the related equipment. Pilot controls and indicating lights shall have engraved or etched legends ("start", "stop", etc.) as indicated on the drawings. Nameplates shall have 1/8 inch black baked enamel letters on anodized aluminum plate, and shall be securely fastened to the motor starters.

Motor starters shall be tagged per the identification name assigned in the contract documents. The tags shall be installed on the motor starter housing with three compression bolts. No adhesive tags shall be allowed. Refer to specification section 16075 for more details

1.4.04 Control Stations. Control stations shall be provided with nameplates identifying the related equipment. Pilot controls and indicating lights shall have engraved or etched legends ("start", "stop", etc.) as indicated on the drawings. . Nameplates shall have 1/8 inch black baked enamel letters on anodized aluminum plate, and shall be securely fastened to the control stations.

1.4.05 Circuit Breakers. Circuit breakers shall be provided with nameplates identifying related equipment. . Nameplates shall have 1/8 inch black baked enamel letters on anodized aluminum plate, and shall be securely fastened to the circuit breakers.

Circuit Breakers compartments or cubicles shall be tagged per the identification name assigned in the contract documents. The tags shall be installed on the circuit breaker cubicle or compartment housing with three compression bolts. No adhesive tags shall be allowed. Refer to specification section 16075 for more details. Also label the source of power to the MCC and indicate the individual destination loads from the MCC

1.4.06 Disconnect Switches. All switches shall have front cover-mounted permanent nameplates that include switch type, manufacturer's name and catalog number, and horsepower (kW) rating. An additional nameplate with 1/8 inch black baked enamel letters on anodized aluminum plate, shall be provided to identify the associated equipment. Both nameplates shall be securely fastened to the enclosure. Primary disconnect Switch rated for 5 KV or above provided with CTs, PTs, and local/remote disconnecting means to isolate the main power transformers.

Load Break Switches (15KV & 5KV rated) shall be tagged per the identification name assigned in the contract documents. The tags shall be installed on the switch housing with three compression bolts. No adhesive tags shall be allowed. Refer to specification section 16075 for more details. For the rest of the disconnect switches rated 600V and below, label the source of power to the disconnecting switches and indicate the individual destination loads from the disconnect switches

1.4.07 Nameplates And Directories. Panel directories shall be neatly typed, showing equipment served and location for each breaker or switch with a clear plastic protective cover.

All duplex receptacles shall be identified with the associated panelboard and circuit number.

1.5 SUBMITTALS. Drawings for approval shall be submitted as specified in General Requirements Section 01340 – Shop Drawings, Product Data and Samples.

1.5.01 Submittal Identification. Information covering all materials and equipment shall be submitted for review in accordance with Master Specification Section 01080, Project Submittals. Each sheet of descriptive literature submitted shall be clearly marked to identify the material or equipment as follows:

Lamp fixture descriptive sheets shall show the fixture schedule letter, number, or symbol for which the sheet applies.

Equipment and materials descriptive literature and drawings shall show the specification paragraph for which the equipment applies.

Sheets or drawings covering more than the item being considered shall have all inapplicable information crossed-referenced with the drawings or specifications.

A suitable notation shall identify equipment and materials descriptive literature not readily cross-referenced with the drawings or specifications.

Schematics and connection diagrams for all electrical equipment shall be submitted for review. A manufacturer's standard connection diagram or schematic showing more than one scheme of connection will not be accepted, unless it is clearly marked to show the intended connections.

Transient voltage surge suppressor submittals shall include manufacturer's catalog and specification data, including device dimensions, weight, material composition, and connection diagrams. Documentation shall be provided showing the file number of compliance with UL 1449 listing requirements and results of independent, third party NRTL certification of listed surge ratings. The test results submitted shall include UL file number, date or report, product covered, electrical ratings, voltages, phases, modes of protection, nomenclatures, and UL 1449 ratings with and without disconnect device.

Contractor shall submit the name and qualifications of the Engineering and Testing Services firm proposed to perform the coordination study and the on site testing.

Within 90 days after the Notice to Proceed, Contractor shall furnish a submittal for all types of cable and conduit to be provided. The submittal shall include the cable manufacturer and type, and sufficient data to indicate that the cable and conduit meet the specified requirements.

In addition to the complete specifications and descriptive literature, a sample of the largest size of each type of cable shall be submitted for review before installation. Each sample shall include legible and complete surface printing of the cable identification.

1.5.02 Shop Drawings. Prepare layout shop drawings drawn to scale showing building floor plans and all details of electrical construction, routing of conduits, wiring, grounding, circuiting and related information necessary for the installation and future maintenance of the electrical wiring systems. Shop drawings shall include conduit and wiring schedule showing the number of wires, size of wires, size of conduit, and conduit tag number.

No apparatus or equipment shall be shipped from stock or fabricated until associated shop drawings have been reviewed by the Contracting Officer. By the review of shop drawings, the Contracting Officer does not assume responsibility for actual dimensions or for the fit of completed work in position, nor does such review relieve Electrical Contractor of full responsibility for the proper and correct execution of the work required.

Submit shop drawings with all pertinent data and with identification mark number for all equipment, devices and components specified in the specifications or scheduled on the Drawings. Include Cable and Conduit Schedules/Charts as shop drawings for Contracting Officer’s review. The cable and conduit numbering system shall be in accordance with Owner’s Standards. All conduits shall be tagged on stainless steel plate and connected with stainless steel wire. Letters shall be minimum 3/16" high.

Shop drawings shall be reviewed by the Electrical Contractor for completeness and accuracy prior to submitting to the Owner/Contracting Officer for review. The shop drawings shall be dated and signed by the Electrical Contractor prior to submission.

Where the shop drawings consist of manufacturer's standard detail drawings or schedules and contain data for a variety of similar equipment, cross out the not applicable information and indicate the data pertinent to the equipment furnished for this project only. Standard detail drawings and schedules not clearly indicating which data is associated with this Project shall be returned "Rejected - Resubmit".

Where accessories and/or options are specified and do not appear as part of manufacturer's standard detail drawings, state each accessory that is to be provided with the equipment on the standard detail drawings.

Partial submittals of shop drawings for equipment will not be permitted. Where partial submittals are transmitted to the Contracting Officer, they will be returned "Rejected - Resubmit".

Lighting Fixtures shop drawings shall be submitted as one (1) package including all fixtures intended to be used for this project.

Furnish and deliver to the Owner's Representative manuals of all shop drawings when work is completed. See Specification Section 01080 for number of sets and manuals.

Submit manufacturer's shop drawings on all electrical systems and/or equipment to be furnished and installed.

1.5.03 ELECTRICAL CONDUIT AND WIRING SCHEDULE DRAWINGS. Prepare electrical drawings that include conduit and wiring schedules showing the number of wires, sizes of wires, sizes of conduits and conduit tag numbers for approval.

1.5.04 Final Issue Drawings. Revise layout shop drawings as required after construction to indicate the as-built condition.

At the completion of the Project, resubmit to the Owner's Representative the revised Mylars, Electronic Copies (diskettes) and one set of prints for Owner's record.

Submit final project record documents as described in Division 1 Specification 01150.

Approval of shop drawings by Contracting Officer/Owner shall not relieve the Contractor or Supplier of his responsibility for furnishing material and equipment in conformance with the specifications, nor will it invalidate any claim made by the Contracting Officer/Owner because of defective or unsatisfactory material and workmanship.

1.6. PROTECTION AND STORAGE. During construction, the insulation on all electrical equipment insulation shall be protected against absorption of moisture, and metallic components shall be protected against corrosion by strip heaters, lamps, or other suitable means. This protection shall be provided immediately upon receipt of the equipment and shall be maintained continuously.

PART 2 - PRODUCTS

2.1 POWER AND TELEPHONE SERVICE ENTRANCES. Contractor shall consult the local electric and telephone utilities regarding their service installation requirements, and shall furnish the service equipment in compliance with these requirements.

When required by the power company, power service equipment shall include meter board, meter socket, meter test cabinet, metering transformer cabinet, disconnect means, grounding materials, and riser conduits and service entrance fittings required by the utility and for compliance with codes and regulations.

When required for underground services, trenching and backfill, ducts, service cables, and concrete for duct banks and transformer pads shall be furnished.

When required by the telephone company, telephone service provisions shall include a termination box and an empty conduit from the box to a weatherhead at the point of service. The box shall be NEMA Type 1, galvanized, surface mounted, at least 12 by 18 by 6 inch (300 by 450 by 150 mm) deep, or larger if required. The box shall have a hinged door and an inner mounting board of 3/4 inch (19 mm) exterior plywood, with two coats of varnish.

When required by the telephone company, telephone service provisions shall include one 2 by 4 foot (0.6 by 1.2 m), or 4 by 8 foot (1.2 by 2.4 m) sheet of 3/4 inch (19 mm) exterior plywood mounted on the wall and an empty conduit from the panel installed underground to the point of service.

A weatherhead shall be provided on each service riser conduit.

2.2 CABLE. All cables of each type (such as lighting cable or 600 volt power cable) shall be from the same manufacturer.

All types of cable shall conform to the Cable Data Figures at the end of this section and as described herein.

Primary power cables shall meet Detroit Edison Standards.

2.2.01 Lighting Cable. When required for lighting circuits, lighting cable (Figure 1-16050 THHN-THWN) shall be provided only in lighting and receptacle circuits operating at 277 volts or less. Lighting and receptacle circuits, 8 AWG (10 mm^2) or larger, shall be as specified for 600 volt (Figure 2-16050 XHHW), (Figure 3-16050 THHN-THWN), or (Figure 13-16050 RHH-RHW-USE) power cable as indicated on the Contract Documents.

Lighting cable shall be manufactured by American Insulated Wire Corp., Rome Cable Corp., or approved equal.

2.2.02 600 Volt Power Cable. When required, cable in power, control, indication, and alarm circuits operating at 600 volts or less, except where lighting, multiconductor control, and instrument cables are permitted, shall be 600 volt (Figure 2-16050 XHHW), (Figure 3-16050 THHN-THWN), or (Figure 13-16050 RHH-RHW-USE) power cable as indicated on the Contract Documents.

600 volt power cable shall be manufactured by The Okonite Co., Prysmain Cable.., or approved equal.

2.2.03 Instrument Cable. When required, cable for electronic circuits to instrumentation, metering, and other signaling and control equipment shall be two- or three-conductor instrument cable twisted for magnetic noise rejection and protected from electrostatic noise by a total coverage shield. Types of instrument cables shall be (Figure 4-16050 single pair), (Figure 5-16050 single triad), or (Figure 6-16050 multiple pair and/or triad) as indicated on the Contract Documents.

Instrument cable shall be manufactured by Belden Electronic Wire & Cable, Fluorocarbon, Samuel Moore Group, Dekoron Div., or approved equal

2.2.04 Multiconductor Control Cable. When indicated on the drawings as multiconductor, cable in control, indication and alarm circuits shall be multiconductor. Cable shall be (Figure 7-16050 14 AWG THHN-THWN) or (Figure 8-16050 12 AWG THHN-THWN) as required.

Multiconductor control cable shall be manufactured by Belden Electronic Wire & Cable, Fluorocarbon, Samuel Moore Group, Dekoron Div., or approved equal.

2.2.05 Medium Voltage Power Cable. Cable for circuits rated higher than 600 volts but not above 5,000 volts, and for wet or dry locations in conduit and open air, shall be (Figure 9-16050 8 KV EPR) power cable.

2.2.05.2 System Description

A. Design Requirements

1. Provide medium voltage cable designed and constructed for use under the following service conditions and as per the contract documents:
   a. 13,800, 4,800 or 4,160 volts (line to line), 3 phase, 3 and 4 wire, 60 hertz.
   b. Delta and Wye grounded and ungrounded.
   c. These are underground cables that will be fully submerged in water.

2.2.05.3 Submittals

A. Product Data
   1. Submit manufacturer's technical product data for each type of medium voltage cable and accessory specified and indicated on the contract documents.

2.2.05.4 Products (Shielded Medium Voltage Cable)

A. Manufacturers
   1. The Okonite Co.
   2. Prysmian (previously Pirelli Cable Co.)

B. Cable Description
   1. General
      a. Provide shielded medium voltage cable per AEIC CS6 and NEMA WC 8.
   2. Conductor/s
      a. Three-power conductors, 98 percent conductivity soft drawn bare annealed copper, class B, standard or compacted strand, sized as indicated.
      b. Single-ground conductor, 98 percent conductivity soft drawn bare annealed copper, class B, standard or compacted strand, sized per NFPA 70 for equipment grounding.
   3. Conductor shield
      a. Extruded layer of semi-conducting cross-linked co-polymer thermosetting compound suitable for free-stripping from conductor.
   4. Insulation
      a. Ethylene propylene rubber based thermosetting polymer.
      b. (133) percent insulation level for 5kV & 15kV applications.
      c. Strippable extruded layer of semiconducting cross-linked thermosetting co-polymer compound with cover of bare copper tape, minimum 0.13 mm (five mils) thick, helically applied, 12-1/2 percent overlap or with a cover of concentric serve of annealed solid bare copper wires covered by non-metallic binder tape.
   5. Jacket
      a. Polyvinyl chloride or interlocking metal tape with polyvinyl chloride

jacket.

6. Identification
   a. Print the following information on the cable jacket at maximum 910-mm (36inch) intervals along the entire length:
      1) Manufacturer's name and type.
      2) Conductor size - American wire gauge (AWG) or circular mils(CM).
      3) Conductor material.
      4) Insulation"

Cable for circuits rated higher than 5,000 volts but not above 15,000 volts, and for wet or dry locations in conduit and open air, shall be (Figure 10-16050 15 KV EPR) power cable.

Medium voltage power cable shall be manufactured by BICC Cables Co., The Okonite Co., or approved equal.

2.2.06 Tray Cable. On projects using electrical trays as raceways, cable shall be (Figure 11-16050 3 conductor XLP-PVC) or (Figure 12-16050 single conductor XHHW) tray cable.

Tray cable shall be manufactured by The Okonite Co., Prysmian Cable Corp, or approved equal.

2.2.07 Metal Clad Lighting Cable. Lighting cable (Figure 14-16050 Metal Clad THHN) shall be provided only in lighting and receptacle circuits operating at 277 volts or less, concealed in interior partition walls and above suspended ceilings of finished office and administration areas.

Metal clad lighting cable shall be manufactured by Francis Metals Inc. or approved equal.

2.3 CONDUIT. Conduit and raceways shall be as described in the following paragraphs:

2.3.01 Rigid Steel Conduit. Rigid steel conduit shall be heavy wall, hot-dip galvanized, shall conform to Fed Spec WW-C-581 and ANSI C80.1, and shall be manufactured in accordance with UL 6.

Terminations and connections shall be taper threaded and the minimum size shall be ¾ inch (19 mm).

Rigid steel conduit shall be manufactured by Allied Tube and Conduit, Western Tube and Conduit Corp., Wheatland Tube Co., or approved equal.

2.3.02 Intermediate Metal Conduit (IMC). IMC shall be hot-dip galvanized, shall conform to Fed Spec WW-C-581, and shall be manufactured in accordance with UL 1242.

Terminations and connections shall be taper threaded and the minimum size shall be ¾ inch (19 mm).

Intermediate metal conduit shall be manufactured by Allied Tube and Conduit, Western Tube and Conduit Corp., Wheatland Tube Co., or approved equal.

2.3.03 Liquidtight Flexible Metal Conduit. Liquidtight flexible metal conduit shall be hot-dip galvanized steel, shall be covered with a moistureproof polyvinyl chloride jacket, and shall be UL labeled. The minimum size shall be ¾ inch (19 mm).

Liquidtight flexible metal conduit shall be Anaconda Sealtite, Electri-Flex Liquatite, or approved equal.

2.3.04 Utility (PVC) Duct. Utility duct with concrete encasement shall be polyvinyl chloride (ASTM F-512 designation DB-20) and shall conform to NEMA TC-6 and ASTM F-512.

Utility duct shall be manufactured by Carlon, PWPipe, or approved equal.

2.3.05 Rigid Nonmetallic (PVC) Conduit. PVC conduit shall be heavy wall, Schedule 80, UL labeled for aboveground and underground uses, and shall conform to Fed Spec W-C-1094, NEMATC-2, and UL 651.

Utility duct shall be manufactured by Carlon, PWPipe, or approved equal.

2.3.06 PVC-Coated Rigid Steel Conduit. The conduit shall be rigid steel. Before the PVC coating is applied, the hot-dip galvanized surfaces shall be coated with a primer to obtain a bond between the steel substrate and the coating. The PVC coating shall be bonded to the primed outer surface of the conduit. The bond on conduit and fittings shall be stronger than the tensile strength of the PVC coating. The thickness of the PVC coating shall be at least 40 mils (1000 μm).

A chemically cured two-part urethane coating, at a nominal 2 mil (50 μm) thickness, shall be applied to the interior of all conduit and fittings. The coating shall be sufficiently flexible to permit field bending the conduit without cracking or flaking of the coating.

Every female conduit opening shall have a PVC sleeve extending one conduit diameter or 2 inches (50 mm), whichever is less, beyond the opening. The inside diameter of the sleeve shall be the same as the outside diameter of the conduit before coating. The wall thickness of the sleeve shall be at least 40 mils (1000 μm).

All fittings, condulets, mounting hardware, and accessories shall be PVC-coated. All hollow conduit fittings shall be coated with the interior urethane coating described above. The screw heads on condulets shall be encapsulated by the manufacturer with a corrosion-resistant material.

PVC coated rigid steel conduit shall be manufactured by Ocal, Perma-Cote, Robroy Industries, or approved equal.

2.3.07 Electrical Metallic Tubing (EMT). EMT shall be hot-dip galvanized, shall be UL approved, and shall conform to Fed Spec WW-C-563 and ANSI C80.3.

Electrical metallic tubing shall be manufactured by Allied Tube and Conduit, Western Tube and Conduit Corp., Wheatland Tube Co., or approved equal.

2.3.08 Rigid Aluminum Conduit (RAC). Rigid aluminum conduit and fittings shall be manufactured of 6063-T1 alloy, shall be UL approved, and shall conform to Fed Spec WW-C-540 and ANSI C80.5.

Rigid aluminum conduit shall be manufactured by Indalex Inc., or approved equal.

2.4 WIRING DEVICES, BOXES, AND FITTINGS. Concealed conduit systems shall have flush-mounted switches and convenience outlets. Exposed conduit systems shall have surface-mounted switches and convenience outlets.

2.4.01 Conduit Boxes and Fittings. Galvanized or cadmium plated, threaded, malleable iron, or aluminum when indicated, boxes and fittings shall be manufactured by Crouse-Hinds, Appleton, O Z Gedney, or approved equal.

Rigid PVC device boxes and fittings shall be manufactured by Carlon, Cantex, or approved equal.

Sheet steel device boxes shall be manufactured by Appleton, Raco, Steel City, or approved equal.

PVC coated device boxes shall be manufactured by Ocal, Perma-Cote, Robroy Industries, or approved equal.

Hub arrangements on threaded fittings shall be the most appropriate for the conduit arrangement to avoid unnecessary bends and fittings.

2.4.02 Device Plates. Galvanized or cadmium-plated device plates shall be used on surface mounted outlet boxes where weatherproof plates are not indicated.

Device plates on flush mounted outlet boxes where weatherproof plates are not indicated shall be AISI Type 302 stainless steel, Eagle "93nnn series", Hubbell "S series", Leviton "840nn-40 series", or approved equal; nylon or polycarbonate, Eagle "513nV series", Hubbell "Pn series", Leviton "807nn-I series", or approved equal.

Device plate mounting hardware shall be countersunk and finished to match the plate.

Device plates for switches outdoors or indicated as weatherproof shall have provisions for padlocking switches "On" and "Off", and shall be Appleton "FSK-1VS", Crouse-Hinds "DS185", O Z Gedney "FS-1-WSCA", or approved equal.

Device plates for receptacles indicated as weatherproof shall be Appleton "FSK-WRD", Crouse-Hinds "WLRD1", O Z Gedney "FS-1-WDCA, or approved equal.

Flush-mounted, weatherproof plates shall be provided with adapter plates, Appleton "FSK-SBA", Crouse-Hinds "FS031", or approved equal.

Device plates for ground fault interrupter receptacles outdoors or indicated to be weatherproof shall be Appleton "FSK-WGFI", Eagle "966", O Z Gedney "FS-1-GFCA", or approved equal.

Engraved device plates, where indicated, shall be manufactured by Leviton, or equal.

Device plates on PVC conduit fittings shall be Carlon "E98 Series", Cantex "513300 Series", or approved equal.

2.4.03 Wall Switches. Switches on ac lighting panel load circuits through 277 volts shall be 20 amperes, 120/277 volts, Eagle "2221V" through "2224V", Hubbell "HBL 1221I" through "HBL 1224I", Leviton "1221-2I" through "1224-2I", or approved equal.

Switches for pulse control of lighting contactors shall be 15 amperes, 120/277 volts, momentary, double-throw, center "Off", Eagle "1220V", Hubbell "1556I", Leviton "1256-I", or approved equal.

2.4.04 Receptacles. Provide at least one spare receptacle for general building use compatible with each electrical service installed at a DWSD building.

Standard convenience outlets shall be duplex, three-wire, grounding, 20 amperes, 125 volts, Eagle "5362V", Hubbell "5362I" or Leviton "5362-I" for 120 volt circuits, and 250 volts, Eagle "5462V", Hubbell "5462I" or Leviton "5462-I" for 240 volt circuits.

Ground fault circuit interrupter receptacles shall be duplex, 20 amperes, 125 volts, Eagle "647-2V", Hubbell "GF5352I" or Leviton "6899-I".

600 Volt Welding receptacles shall be 30 amperes, 600 volts, 3 phase, with grounding conductors connected through a fourth pole, Appleton "ACRE3034-100", Crouse-Hinds "AR348" plus "ARRC33" and "AR30" or Leviton " 430MI5W". One matching plug, Appleton "ACP3034BC", Crouse-Hinds "APJ3485" or Leviton "430P5W" with appropriate woven grip and plug cap, shall be furnished for the cable size directed by the Owner.

240 Volt Welding receptacles shall be 60 amperes, 240 volts, 3 phase, with grounding conductors connected through a fourth pole, Appleton "ACRE6035-150", Crouse-Hinds "AREA6485" or Leviton "460MI9W". One matching plug, Appleton "ACP6034BC", Crouse-Hinds "APJ6485" or Leviton "460P9W" with appropriate woven grip and plug cap, shall be furnished for the cable size directed by Owner.

2.4.05 Special Outlets. Clock outlets shall be Eagle "93632", Hubbell "5235" or Leviton "5261-CH".

2.5 JUNCTION BOXES, PULL BOXES, AND WIRING GUTTERS. Indoor boxes (larger than switch, receptacle, or fixture type) and gutters shall be constructed of sheet steel and shall be galvanized after fabrication. Similar enclosures outdoors shall be provided with foam or neoprene gaskets, firmly secured in place, on the hinged doors or removable covers. Box and gutter sizes, metal thickness, and installation details shall comply with the National Electrical Code.

Indoor junction boxes in corrosive areas indicated on the drawings shall be NEMA Type 4X, ABS or stainless steel, manufactured by Hoffman Engineering Co.

Bolt-on junction box covers 3 feet (900 mm) square or larger, or heavier than 25 lbs (11 kg), shall have rigid handles. Covers larger than 3 feet by 4 feet (900 by 1200 mm) shall be split.

Where indicated on the drawings, junction boxes with a removable side opposite the underground conduits shall be provided over building ends of underground conduit banks. Boxes shall be at least Code size, including space for full size continuations of all underground conduits not originally continued. Conduit arrangement shall leave maximum space for future conduits.

2.6 LIGHTING FIXTURES. Lighting fixtures shall be furnished as described in the fixture schedule, in accordance with Master Specifications Section 16500, Lighting, and as indicated in the contract documents. Lighting fixtures shall be furnished complete with lamps. Pendant fixtures shall have swivel type box covers and threaded conduit pendants unless otherwise specified.

2.6.01 Electronic Ballasts. Electronic ballasts furnished with fluorescent type lighting fixtures shall be CBM certified as meeting requirements of ANSI C82.11 with a THD level of not more than 10 percent.

2.7 LIGHTING PANELS. Unless otherwise specified, each lighting panel shall be a dead-front, 120/240 volt, single phase or 120/208 volt, three phase panelboard with circuit breakers, in accordance with the drawings, Master Specifications Section 16500, Lighting, and the following:

2.7.01 Cabinet. The panel shall have a flush-mounted or surface-mounted enclosure with a NEMA designation appropriate for the location where it will be installed. The enclosure shall have a hinged trim (cover). Breaker operating handles shall be accessible through a latched, lockable, door. At the completion of the contract, a neatly printed or typed directory listing the panel and circuit identities shall be mounted inside the door.

2.7.02 Circuit Breakers. Circuit breakers shall be thermal-magnetic, bolt-in, individually front replaceable, and shall indicate "On", "Off", and "Tripped". Breakers indicated as multiple-pole shall be common trip. Breakers shall have interrupting ratings not less than 10,000 or 22,000 amperes as indicated. Handle clips, to prevent casual operation of breakers, shall be provided for 10 percent (at least two) of the breakers and applied to the circuits as directed. Breakers and provisions for future breakers shall be provided in the quantities, number of poles, and ampere ratings indicated on the Contract Documents.

2.7.03 Buses. The panel shall have main and neutral buses insulated from the cabinet, and a ground bus. Buses shall be copper, with ampere ratings and main lugs or breaker as indicated. The ground bus shall be similar to a neutral bus and shall have a good ground connection to the cabinet, a removable bond to the neutral bus, clamp type lugs for the ground cable in each supply conduit, and connections for a ground cable in each load conduit.

Lighting panels shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.8 POWER PANELS. Unless otherwise specified, each power panel, with or without a neutral, shall be dead-front, 3 phase panelboard with circuit breakers, in accordance with the drawings and the following:

2.8.01 Cabinet. The panel shall have a flush-mounted or surface-mounted enclosure with a NEMA designation appropriate for the location where it will be installed. The enclosure shall have a door with latch and lock. At the completion of the contract, a neatly printed or typed directory listing the panel and circuit identities shall be mounted inside the door.

2.8.02 Circuit Breakers. Circuit breakers shall be thermal-magnetic, bolt-in, individually front replaceable, and shall indicate "On", "Off", and "Tripped". Breakers indicated as multiple-pole shall be common trip type. Breakers up to 240 volts shall have interrupting ratings not less than 10,000, 22,000 or 65,000 amperes. Breakers for 277 volts shall have interrupting ratings not less than 14,000, 25,000 or 65,000 amperes. Breakers for 480 volts shall be rated 600 volts, with interrupting ratings not less than 14,000, 25,000 or 65,000 amperes at 480 volts. Handle clips, to prevent casual operation of breakers, shall be provided for 10 percent (at least two) of the breakers and applied to the circuits as directed.

2.8.03 Buses. The panel shall have 3 phase buses, a neutral bus insulated from the cabinet, and/or a ground bus as indicated. Buses shall be copper, with ampere and voltage ratings and main lugs or breakers as indicated. The ground bus shall be similar to a neutral bus and shall have a good ground connection to the cabinet, a removable bond to the neutral bus, clamp type lugs for the ground cable in each supply conduit, and connections for a ground cable in each load conduit.

Power panels shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.9 TRANSIENT VOLTAGE SURGE SUPPRESSION. Transient voltage surge suppressors (TVSS) shall be provided and installed integral to each lighting panel and power panel assembly. Units shall be UL 1449 listed for installation into motor control centers. TVSS devices shall be designed, manufactured, tested, and installed in accordance with the following standards:

ANSI/IEEE C62.41-1991 and C62.45-1987.

NEMA LS1-1992 Guidelines.

NFPA 20, 70, 75, and 780.

UL 1449 and 1283.

Each TVSS device shall be configured for permanent connection. In-line, series connected components shall not be acceptable. Each TVSS device shall utilize metal oxide varistors (MOV) connected in parallel.

2.9.01 Device Performance. The minimum surge current capability for each device shall be:

	L-L	L-N	L-G	N-G
Lighting Panels	150,000 A	150,000 A	150,000 A	150,000 A
Power Panels	200,000 A	200,000 A	200,000 A	200,000 A

The minimum UL 1449 rating shall be (inclusive of disconnect):

	L-L	L-N	L-G	N-G
Lighting Panels	330 V	330 V	330 V	330 V
Power Panels	330 V	330 V	330 V	330 V

Each unit shall have a maximum continuous operating voltage (MCOV) greater than 115 percent of the nominal system operating voltage for L-L, L-N, L-G, and N-G.

Each unit shall be capable of suppressing a Category B3 impulse at less than 500 volts. Each unit shall be UL 1283 listed as an electromagnetic interference filter. Electromagnetic filtering shall provide insertion loss with a system noise attenuation of 120 dB from 100 kHz to 100 MHz when tested per 50 Ohm insertion loss method as defined by MIL 220A.

Each unit shall incorporate 200 kAIC rated fusing and shall monitor all modes of protection inclusive of N-G and provide indicator lights (one green and one red LED) on the front cover of the enclosure and an indicator light on each module (inclusive of N-G) to individually monitor each module for failure.

2.9.02 Testing. The Supplier shall provide the following test data for each unit:

Third party testing from a nationally recognized testing laboratory (NRTL) verifying that the total surge current can be passed through the fuse with no charring, flames, or projection of materials. Testing of the fuse only will not be acceptable for this requirement. Testing shall indicate the lowest possible surge that can disrupt the fusing.

Third party, NRTL testing verifying the fault current withstand rating of the fusing employed. Testing shall be conducted in both a high and low impedance fault condition and shall confirm no charring, flaming, or projection of materials.

Life cycle testing per ANSI/IEEE C62.41 and C62.45 with fusing in place for category C3 transients (20 KV at 1.2 x 50 microseconds and 10 KV at 8 x 20 microseconds).

2.10 SEPARATELY ENCLOSED MOTOR STARTERS. Separately enclosed motor starters, unless otherwise specified, shall be full voltage, magnetic, nonreversing and NEMA rated. The starter enclosures shall have NEMA type designations appropriate for the locations where they will be installed. Unless otherwise noted, NEMA Type 4X stainless steel enclosures shall be provided for outdoor locations.

Motor starters shall be manufactured by Cutler Hammer, Square D, or approved equal.

One thermal overload relay shall be provided in each phase lead. Each starter shall be provided with an external, manually reset push button for resetting the thermal overload relays.

Each starter shall include auxiliary contacts as required, plus one spare NO and one spare NC contact.

Contractor shall match the sizes of control power transformers, overload devices, heaters, and starters to the equipment furnished, as they may differ from the values indicated on the drawings. Control power transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded.

All push buttons, selector switches, and lights indicated on the schematics to be provided on or in the starter enclosure shall be heavy-duty, oiltight type. Push buttons on starters located outdoors shall be provided with protective caps.

2.10.01 Three Phase Starters. Three phase starters shall be circuit breaker combination type consisting of 3 phase, 60 Hz contactors with thermal overloads, a 120 volt ac coil, a dry type control power transformer, and a circuit breaker disconnect. Control power transformers shall be sized to handle all simultaneous loads. Starters shall be at least NEMA Size 1 or shall be sized as indicated on the Contract Documents.

Circuit breakers shall be 600 volt magnetic motor circuit protectors for motors smaller than 100 horsepower (75 kW) and 600 volt thermal-magnetic type for 100 horsepower (75 kW) and larger motors. Each breaker shall be manually operated with a quick-make, quick-break, trip-free toggle mechanism.

Three phase starters shall be furnished with external manual breaker operating handles and provisions for up to three padlocks. The access door shall be interlocked with the motor circuit protector, so that the door cannot be opened, except by an interlock override, while the breaker is closed.

The complete 3 phase starter shall have an interrupting rating of at least 14,000, 25,000 or 65,000 amperes at 480 volts as indicated on the Contract Documents.

2.10.02 Single Phase Starters. Single phase starters shall consist of single phase, 60 Hz contactors with thermal overloads and an integral or separately enclosed short-circuit protection device. Starters shall be at least NEMA Size 0, or shall be sized as indicated on the drawings. Integral short-circuit protection devices for single phase starters shall be 120/240 volt, magnetic motor circuit protectors.

Separately enclosed short-circuit protection devices for single phase starters shall be molded-case circuit breakers for motor loads 6 amperes and higher and fused switch disconnects for motor loads lower than 6 amperes. Circuit breaker disconnects shall be 120/240 volt, molded-case, thermal-magnetic circuit breakers. Fused switch disconnects shall have quick-make, quick-break mechanisms and 250 volt, dual-element, time-delay fuses.

The short-circuit protection devices shall have external operating handles capable of being padlocked in the open position, and shall have an interrupting rating of at least 10,000 or 22,000 amperes at 240 volts as indicated.

2.11 SEPARATELY ENCLOSED MANUAL STARTERS. Separately enclosed manual starters not specified elsewhere shall be provided hereunder. Manual starters shall be provided with thermal overload protection properly sized for the motors served and with a contact and overload in each phase lead. Manual starters shall be mounted in NEMA Type 1 enclosures unless otherwise noted.

Manual starters shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.12 CONTROL STATIONS. Control stations shall be provided as indicated on the one-line diagrams or schematics or as required by the equipment furnished. Pilot devices shall be heavy-duty, oiltight, and shall perform the functions indicated. Indoor control stations shall have NEMA Type 13 enclosures. Control stations outdoors or indicated to be weatherproof shall have NEMA Type 4 stainless steel enclosures with protective caps on the control devices. Control stations in NEC Class I, Division 2, Group D hazardous areas shall have NEMA Type 7 enclosures, or be factory sealed type, Appleton N2 Series, Killark, or approved equal.

2.12.01 Emergency Break-Glass Switch. Each break-glass switch for HVAC emergency shutoff shall be furnished with a NEMA enclosure as specified herein with hammer, hammer clip, and chain. Each switch shall be Square D "Type 9001K15", Cutler Hammer 10250T Series, or approved equal, with one normally open and one normally closed contact block, or equal. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position.

2.13 SEPARATELY ENCLOSED CIRCUIT BREAKERS. Circuit breakers shall be 3 pole, 480 volt, molded-case circuit breakers of not less than 14,000, 25,000, or 65,000 amperes interrupting rating at 480 volts ac as indicated, complete with thermal and instantaneous trip elements. Breaker enclosures shall have NEMA designations appropriate for the locations where they will be installed. NEMA Type 4 stainless steel enclosures shall be provided for outdoor locations. Each breaker shall be manually operated with a quick-make, quick-break, trip-free toggle mechanism. Bimetallic thermal elements shall withstand sustained overloads and short-circuit currents without injury and without affecting calibration.

Circuit breakers shall have "On", "Off", and "Tripped" indication and padlockable exterior handles.

Circuit breakers shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.14 DISCONNECT SWITCHES. Unless otherwise specified, each disconnect switch shall be 3 pole, nonfusible, 600 volts, with a continuous current rating as indicated on the Contract Documents.

Switches located indoors shall have NEMA type enclosure designations as required by the locations where they will be installed. Switches located outdoors shall have NEMA Type 4 enclosures. Switches in chlorine rooms, or in other areas where contact with caustic substances may occur, shall have NEMA Type 4X enclosures of AISI Type 316 stainless steel or of molded reinforced polyester.

Switches shall have high conductivity copper, visible blades; nonteasible, positive, quick-make, quick-break mechanisms; and switch assembly plus operating handle as an integral part of the enclosure base. Each switch shall have a handle whose position is easily recognizable and which can be locked in the "Off" position with three padlocks. The "On" and "Off" positions shall be clearly marked.

All switches shall be UL listed and horsepower (kilowatt) rated, and shall meet NEMA KS1-1990. Switches shall have defeatable door interlocks that prevent the door from being opened while the operating handle is in the "On" position.

Disconnect switches shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.15 LIGHTING AND AUXILIARY POWER TRANSFORMERS. Separately mounted transformers shall be provided in the phases, KVA, and voltages indicated on the Contract Documents. Transformers shall be self-air-cooled, dry type, wall- or floor-mounted, and enclosed for wiring in conduit. Transformers installed outdoors shall be weatherproof. Transformers shall have at least two full capacity voltage taps. Winding for the lighting and auxiliary transformers shall be of copper. Low voltage dry-type transformers shall meet the Energy Policy Act of 2005 minimum efficiency standards.

Transformers shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.16 POWER CENTERS. Power centers shall consist of a primary breaker, a 480-120/240 volt or 480-120/208 volt transformer, a secondary breaker, and a distribution panelboard in a NEMA Type 3R enclosure. Transformer and circuit breaker configuration and ratings shall be as indicated on the Contract Documents.

Power Centers shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.16.01 Transformers. Transformers shall be self-air-cooled, dry type. Transformers shall have at least two full capacity voltage taps.

2.16.02 Circuit Breakers. Circuit breakers shall be thermal-magnetic, bolt-in, individually front replaceable, and shall indicate "On", "Off", and "Tripped". Breakers and provisions for future breakers shall be provided in the quantities, poles, and ampere ratings indicated on the drawings. Breakers shall be single pole, 20 amperes, except as indicated otherwise.

2.17 POWER FACTOR CORRECTION CAPACITORS. Capacitors shall be rated 3 phase delta and for the voltage of the system to which they will be connected. The capacitors shall not contain PCBs. Enclosures shall be suitable for the areas in which they are installed and as indicated by the area designations on the drawings.

The KVAR sizes indicated on the drawings are only approximate and shall be as recommended by the motor manufacturer to improve the power factor to 95 percent at full load. Capacitors shall be complete with discharge resistors and fuses.

Capacitors shall be manufactured by Cutler Hammer, Square D, or approved equal.

2.18 LIGHTING CONTACTORS. Remote control lighting Contactors shall have main and auxiliary contacts as indicated on the drawings. Contactors shall have positive locking features and shall be mechanically held in both positions. Main and auxiliary contacts shall be double-break, continuous-duty rated 20 amperes, 600 volts ac, for all types of loads. Terminals shall accept 18 through 10 AWG conductors. Contactors shall operate in any position and may be manually operated for testing and maintenance.

Contactors shall be Emerson-ASCO 917, Square D Type L and LX (Class 8903), or approved equal.

2.19 PHOTOELECTRIC CONTROLS. Photoelectric controls shall be weatherproof, swivel adjustable, with built-in time delay to prevent accidental turnoff by momentary brightness. The photocell shall be rated 1800 VA, 120 volts ac, and shall be field adjustable from 1 ft/c (11 lux) turnon to 15 ft/c (161 lux) turnoff.

Photoelectric controls shall be manufactured by Intermatic Inc., Tork, or approved equal.

2.20 RELAY ENCLOSURES. Relay enclosures shall be furnished as indicated on the drawings. The enclosure shall have a NEMA designation appropriate for the location where it will be installed. Pilot devices shall be heavy duty, oiltight construction. Relays and timers shall have 120 volt, 60 Hz coils rated for continuous duty in 40°C ambient and 10 ampere, 120 volt ac contacts. Intrinsically safe relays shall be installed within the enclosures in accordance with NEC requirements and shall be Gems "Safe-Pak", B/W "Series 53", or approved equal.

2.21 ALARM HORN AND BEACON. The alarm horns and beacons shall be provided and located as indicated on the drawings. The beacon shall be 120 V ac, strobe light with red lens and acrylic dome, Edwards "Model No. 94C-N5" or Federal Signal "Model 371DST". The alarm horn shall be 120 V ac, weatherproof horn, Edwards "Model No. 876-N5", Federal Signal "Model 350WB", or approved equal.

2.22 HEAT-TRACED PIPING. Outdoor exposed piping shall be heat-traced as indicated on the drawings and as described herein. Heat tracing shall be sized to maintain pipe temperatures at 40°F (4°C) with an outdoor ambient temperature of 0°F (-18°C). Heat tracing shall be of the self-regulating type and shall be suitable for single-phase, 120 volt service. Each run of heat tracing tape shall be provided with a circuit controller, an end-of-line indicating light, junction boxes, mounting accessories, insulation and all other equipment for a complete, properly operating system. The insulation for all heat tracing shall be fiberglass type. Each outdoor installation shall be equipped with an aluminum weatherproof jacket. Each heat-tracing circuit shall be provided with a microprocessor-based circuit controller to monitor temperature and ground fault current. The controller shall be Raychem "DigiTrace 910", Chromalox “IntelliTrace HTLS”, or approved equal. On all plastic pipe equipped with heat tracing, a layer of conducting tape shall be installed prior to installation of the heat tracing.

2.23 DOOR ENTRY SWITCHES. Door entry switches shall be provided as indicated on the drawings and as specified herein. Switches shall be heavy-duty industrial, adjustable, magnetic wide gap type. Switch and magnet housings located in NEC Class I, Division 1 and 2, Group D hazardous areas shall be die-cast aluminum, explosionproof, SimplexGrinnell "Model 2760-9077", Sentrol-Interlogix, or approved equal. Switch and magnet housings located in other areas shall be anodized aluminum, SimplexGrinnell "Model 2760-9082", Sentrol-Interlogix, or approved equal.

2.24 DRAIN FITTINGS. Drain fittings shall be Crouse Hinds type ECD or approved equal.

2.25 WIREWAYS. All wireways shall be NEMA Class 12, enclosed, galvanized 12 gauge steel. Wireways shall be provided with 14 gauge removable covers with captive screws. Wireways shall be sized as shown on the Drawings or as provided by the Engineer.

2.25.01 Acceptable Manufacturers. Wireways shall be as manufactured by Keystone Co., Hoffman, or Square D Co. (type "JIC") or approved equal.

PART 3 - EXECUTION

3.1 COORDINATION STUDY. Contractor shall commission a coordination study of relays, fuses, circuit breakers, and all other protective devices and shall submit a coordination report as specified in Master Specification Section 16052, Coordiantion Study and Arc Flash Hazard Analysis.

3.2 POWER AND TELEPHONE SERVICE ENTRANCES INSTALLATION. Contractor shall consult the local electric and telephone utilities regarding their service installation requirements, and shall install the service equipment in compliance with these requirements.

Contractor shall coordinate details and timing of service entrance installations with the utilities.

3.3 CABLE INSTALLATION.

3.3.01 General. Except as otherwise specified or indicated on the drawings, cable shall be installed according to the following procedures, taking care to protect the cable and to avoid kinking the conductors, cutting or puncturing the jacket, contamination by oil or grease, or any other damage.

Stranded conductor cable shall be terminated by lugs or pressure type connectors. Wrapping stranded cables around screw type terminals is not acceptable.

Stranded conductor cable shall be spliced by crimp type connectors. Twist-on wire connectors may be used for splicing solid cable and for terminations at lighting fixtures.

Splices may be made only at readily accessible locations as allowed by the NEC, but never inside of the conduit bodies.

Cable terminations and splices shall be made as recommended by the cable manufacturer for the particular cable and service conditions. All shielded cable stress cone terminations shall be IEEE Class 1 molded rubber type. Shielded cable splices shall be molded rubber type. Shielded cable splices and stress cone terminations shall be made by qualified splicers. Materials shall be by 3M Company, Plymouth/Bishop, or Tyco Electronics-Energy (Raychem).

All equipment rated for 4.16 KV and above shall be terminated with stress cones.

Cable shall not be pulled tight against bushings nor pressed heavily against enclosures.

Cable-pulling lubricant shall be compatible with all cable jackets; shall not contain wax, grease, or silicone; and shall be Polywater "Type J", Quote #1823.

Cables operating at more than 3,000 volts shall be fireproofed in all cable vaults, manholes, and handholes. Fireproofing shall be done with a half-lapped layer of 3M "Scotch 77 Arc-Proofing Tape", anchored at each end with a double wrap of 3M "Scotch 69 Glass Cloth Tape" or with equivalent tape by Anixter Brothers or Plymouth/Bishop.

Where necessary to prevent heavy loading on cable connections, in vertical risers, the cable shall be supported by Kellems, or approved equal, woven grips.

Spare cable ends shall be taped, coiled, and identified.

Cables shall not be bent to a radius less than the minimum recommended by the manufacturer. For cables rated higher than 600 volts, the minimum radius shall be 8 diameters for nonshielded cable and 12 diameters for shielded cable.

All cables in one conduit, over 1 foot (305 mm) long, or with any bends, shall be pulled in or out simultaneously.

Circuits to supply electric power and control to equipment and devices are indicated on the one-line diagrams. Conductors in designated numbers and sizes shall be installed in conduit of designated size. Circuits shall not be combined to reduce conduit requirements unless acceptable to Engineer.

3.3.02 Underground Cable Pulling Procedure. Care shall be taken to prevent excessive physical stresses that would cause mechanical damage to cables during pulling. Before pulling cables into the underground duct system and when indicated, Contractor shall submit a pulling procedure for the indicated Circuit Numbers. The procedure shall include the following information:

Point of cable entrance into the duct system.

Point of cable exit from the duct system.

Type of cable grip to be used.

Type of pulling device to be used.

Method of continuously monitoring cable tension during pulling.

Identification of manholes through which cable will be pulled or where splices will be made.

Size and type of cable sheave assemblies to be used.

3.3.03 Cable Insulation Test. Unless otherwise indicated, conductors with insulation rated 5,000 volts and higher shall be given a field dc insulation test.

The ampacity of direct current testing equipment shall be at least 2,500 microamperes.

Final test voltages and the duration of the test shall be as indicated on Figure 9-16050 or 10-16050.

Test procedures shall conform to ICEA S-68-516 (Interim Standard No. 1), Cable Rated 0-35,000 Volts and Having Ozone-Resistant Ethylene-Propylene Rubber Insulation.

The tests shall be performed by experienced personnel specializing in electrical cable testing. Triplicate copies of test data for each cable shall be submitted to Engineer. A Cable Test Data Form is included on Figure 15-16050.

3.4 CONDUIT INSTALLATION. Except as otherwise specified or indicated on the drawings, conduit installation and identification shall be done according to the following procedures. A pulling string shall be left inside of every conduit, and accessible at every junction box and panel.

3.4.01 Installation of Interior and Exposed Exterior Conduit. This section covers the installation of conduit inside structures, above and below grade, and in exposed outdoor locations. In general, conduit inside structures shall be concealed. Large conduit and conduit stubs may be exposed unless otherwise specified or indicated on the drawings. No conduit shall be exposed in water chambers unless so indicated on the drawings.

Unless otherwise indicated on the drawings, Contractor shall be responsible for routing the conduit to meet these installation requirements.

Conduit installed in all exposed indoor locations, except corrosive areas indicated on the drawings, and in floor slabs, walls, and ceilings of hazardous (classified) locations, shall be rigid steel or intermediate metal. Exposed conduit shall be rigidly supported by hot-dip galvanized hardware and framing materials, including nuts and bolts.

Conduit installed in floor slabs and walls in non-hazardous locations shall be rigid PVC Schedule 80.

Conduit installed in all exposed outdoor locations shall be PVC-coated rigid steel, rigidly supported by PVC-coated mounting hardware and framing materials. Nuts and bolts shall be stainless steel. All damaged coatings shall be repaired according to the manufacturer's instructions.

Final connections to dry type transformers, to motors without flexible cords, and to other equipment with rotating or moving parts shall be liquidtight flexible metal conduit with watertight connectors installed without sharp bends and in the minimum lengths required for the application, but not longer than 6 feet (1.8 m) unless otherwise acceptable to Engineer.

Terminations and connections of rigid steel and intermediate metal conduit shall be taper threaded. Conduits shall be reamed free of burrs and shall be terminated with conduit bushings.

Exposed conduit shall be installed either parallel or perpendicular to structural members and surfaces.

Two or more conduits in the same general routing shall be parallel, with symmetrical bends.

Conduits shall be at least 6 inches (150 mm) from high temperature piping, ducts, and flues.

Rigid PVC Schedule 80 conduit shall have supports and provisions for expansion as required by NEC Article 347.

Metallic conduit connections to sheet metal enclosures shall be securely fastened by locknuts inside and outside.

Rigid PVC Schedule 80 conduit shall be secured to sheet metal device boxes using a male terminal adapter with a locknut inside or by using a box adapter inserted through the knockout and cemented into a coupling.

Conduits in walls or slabs, which have reinforcement in both faces, shall be installed between the reinforcing steel. In slabs with only a single layer of reinforcing steel, conduits shall be placed under the reinforcement.

Conduits that cross structural joints where structural movement is allowed shall be fitted with concrete tight and watertight expansion/ deflection couplings, suitable for use with metallic conduits and rigid PVC Schedule 80 conduits. The couplings shall be Appleton type DF, Crouse-Hinds type XD, OZ/Gedney type DX, or approved equal.

Conduit shall be clear of structural openings and indicated future openings.

Conduits through roofs or metal walls shall be flashed and sealed watertight with approved sealant.

Conduit installed through any openings cut into concrete or masonry structures shall be neatly grouted with approved grout and sealant.

Conduits shall be capped during construction to prevent entrance of dirt, trash, and water.

Exposed steel conduit stubs for future use shall be terminated with galvanized pipe caps.

Concealed conduit for future use shall be terminated in equipment or fitted with couplings plugged flush with structural surfaces.

Where the drawings indicate future duplication of equipment wired hereunder, concealed portions of conduits for future equipment shall be provided.

Horizontal conduit shall be installed to allow at least 7 feet (2.1 m) of headroom, except along structures, piping, and equipment or in other areas where headroom cannot be maintained.

PVC-coated rigid steel conduit shall be threaded and installed as recommended by the conduit manufacturer's installation procedure using appropriate tools.

All conduits that enter enclosures shall be terminated with acceptable fittings that will not affect the NEMA rating of the enclosure.

Nonmetallic conduit, which turns out of concrete slabs or walls shall be connected to a 90 degree elbow of metallic conduit before it emerges.

Conduits that turn out of concrete floor slabs shall be given a heavy coat of coal tar paint extending 2 inches (50 mm) on each side of the point of turn-out, or a three lap wrap of 4 inch (100 mm) wide 3M Company 51 tape applied over a coat of 3M No. 34548 primer.

Conduit for Heliax type foam dielectric coaxial cable shall be installed as follows:

Heliax Size inches (mm)	Minimum Conduit Size inches (mm)	Minimum Conduit Bend Radius inches (mm)
1/2 (13)	1-1/2 (40)	10 (250)
7/8 (22)	2 (50)	18 (450)
1-1/4 (32)	4 (100)	22 (550)
1-5/8 (42)	4 (100)	28 (700)

Power conductors to and from adjustable frequency drives shall be installed in steel conduit.

3.4.02 Underground Conduit Installation. All excavation, backfilling, and concrete work shall conform to the respective sections of these specifications. Underground conduit shall conform to the following requirements.

All underground conduits shall be concrete encased unless indicated otherwise on the drawings. Concrete encasement installed under roadways shall be reinforced as indicated on the drawings.

Concrete encased conduit shall be rigid schedule 80 (PVC) conduit or PVC utility duct as indicated on the Contract Documents. Conduits shall have end bells where terminated at walls. All joints shall be solvent welded in accordance with the recommendations of the manufacturer.

Concrete encasement on exposed outdoor conduit risers shall continue to 6 inches (150 mm) above grade, with top crowned and edges chamfered.

Conduit and concrete encasement installed underground for future extension shall be terminated flush at the bulkhead with a coupling and a screw plug. The termination of the duct bank shall be reinforced with bars 100 diameters long that shall be terminated 2 inches (50 mm) from the bulkhead. Matching splice bars shall be 50 bar diameters long. Each longitudinal bar shall be provided with a Lenton "Form Saver" coupler and plate or a Dayton "Superior DBR" coupler at the bulkhead. The coupler shall be threaded to accept a dowel of like diameter in the future. Threads shall be protected with screw-in plastic caps. A 1-3/4 by 3/4 inch (45 by 20 mm) deep horizontal shear key shall be formed in the concrete encasement above and below the embedded conduits. After concrete placement, conduit and bar connector ends shall be cleaned and coated with two coats of thixotropic coal tar.

Underground conduits indicated not to be concrete encased shall be rigid Schedule 80 PVC.

Underground conduit bend radius shall be at least 2 feet (600 mm) at vertical risers and at least 3 feet (900 mm) elsewhere.

Underground conduits and conduit banks shall have at least 2 feet (600 mm) of earth cover, except where indicated otherwise.

Underground conduit banks through building walls shall be cast in place, or concreted into boxouts, with water stops on all sides of the boxout. Water stops are specified in Master Specification Section 03300, Cast-in-Place Concrete.

Underground nonmetallic conduits, which turn out of concrete or earth in outdoor locations, shall be connected to 90 degree elbows of PVC-coated rigid steel conduit before they emerge.

Conduits not encased in concrete and passing through walls, which have one side in contact with earth, shall be sealed watertight with special rubber-gasketed sleeve and joint assemblies or with sleeves and modular rubber sealing elements.

Underground conduits shall be sloped to drain from buildings to manholes.

Each 5 KV or higher voltage cable, each 250 kcmil (120 mm^2) or larger cable, and each conduit group of smaller cables shall be supported from manhole walls by Kindorf "D-990" or Unistrut "P-3259" inserts, with Kindorf "F-721-24" or Unistrut "P-2544" brackets and Unistrut "P1753" or "P1754" fiberglass reinforced polyester cable saddles.

Telephone cables shall not be installed in raceways, conduits, boxes, manholes, or handholes containing other types of circuits.

Intercommunication and instrument cables shall be separated the maximum possible distance from all power wiring in pull-boxes, manholes, and handholes.

3.4.03 Sealing of Conduits. After cable has been installed and connected, conduit ends shall be sealed by forcing nonhardening sealing compound into the conduits to a depth at least equal to the conduit diameter. This method shall be used for sealing all conduits at handholes, manholes, and building entrance junction boxes, and for 1 inch (25 mm) and larger conduit connections to equipment.

Conduits entering chlorine feed and storage rooms shall be sealed in a junction box or conduit body adjacent to the point of entrance.

Conduits entering hazardous (classified) areas and submersible or explosion proof enclosures shall have Appleton "Type ESU", Crouse-Hinds "EYS", or approved equal sealing fittings with sealing compound.

3.4.04 Reuse of Existing Conduits. Existing conduits may be reused subject to the concurrence of Engineer and compliance with these requirements.

A wire brush shall be pulled through the conduit to remove any loose debris and a mandrel shall be pulled through the conduit to remove sharp edges and burrs.

3.5 WIRING DEVICES, BOXES, AND FITTINGS INSTALLATION. Metallic and nonmetallic conduit boxes and fittings shall be installed in the following locations:

3.5.01 Conduit Boxes and Fittings. Galvanized or cadmium plated, threaded, malleable iron boxes and fittings shall be installed in concrete walls, ceilings, and floors; in the outdoor faces of masonry walls; and in all locations where weatherproof device covers are required. These boxes and fittings shall also be installed in exposed rigid steel and intermediate metal conduit systems.

Galvanized or cadmium plated sheet steel boxes shall be installed in the indoor faces of masonry walls, in interior partition walls, and in joist supported ceilings.

Rigid PVC device boxes shall be installed in exposed nonmetallic conduit systems.

PVC coated boxes and fittings shall be installed in PVC coated conduit systems.

Telephone conduit shall be provided with separate junction boxes and pull fittings.

3.5.02 Device Plates. Oversized plates shall be installed where standard-sized plates do not fully cover the wall opening.

3.5.03 Wall Switches. Wall switches shall be mounted 3'-6" (1.05 m) above floor or grade.

After circuits are energized, all wall switches shall be tested for proper operation.

3.5.04 Receptacles. Convenience outlets shall be 18 inches (450 mm) above the floor unless otherwise indicated.

Convenience outlets outdoors and in garages; in basements, shops, storerooms, and rooms where equipment may be hosed down; shall be 4 feet (1.2 m) above floor or grade.

Welding receptacles shall be surface-mounted 4 feet (1.2 m) above the floor.

After circuits are energized, each receptacle shall be tested for correct polarity and each GFCI receptacle shall be tested for proper operation.

3.5.05 Special Outlets. Wall thermostats shall be 4'-6" (1.35 m) above the floor unless otherwise indicated. Thermostats on exterior walls shall be suitably insulated from wall temperature.

Telephone outlets shall be 18 inches (450 mm) above the floor unless otherwise indicated. Telephone outlets outdoors and in garages; in basements, shops, storerooms, and rooms where equipment may be hosed down; shall be 4 feet (1.2 m) above floor or grade.

Clock outlets shall be located 7 feet (2.1 m) above the floor.

3.6 EQUIPMENT INSTALLATION. Except as otherwise specified or indicated on the drawings, the following procedures shall be used in performing electrical work.

3.6.01 Setting of Equipment. All equipment shall be installed level and plumb. Sheet metal junction boxes, equipment enclosures, sheet metal raceways, and similar items mounted on water- or earth-bearing walls shall be separated from the wall by at least 1/4 inch (6 mm) thick corrosion-resistant spacers.

3.6.02 Sealing of Equipment. All outdoor substation, switchgear, motor control center, and similar equipment shall be permanently sealed at the base, and all openings into equipment shall be screened or sealed with concrete grout to keep out rodents and insects the size of wasps and mud daubers. Small cracks and openings shall be sealed from inside with silicone sealant, Dow-Corning "795", General Electric "SCS1200", or approved equal.

3.7 GROUNDING. The electrical system and equipment shall be grounded in compliance with the NFPA National Electrical Code and these requirements.

All ground conductors shall be at least 12 AWG (4 mm^2) soft drawn copper cable or bar, bare or green-insulated in accordance with the National Electrical Code.

Ground cable splices and joints, which will be inaccessible after completion of construction, shall meet the requirements of IEEE 837, and shall be Cadweld "Exothermic", Burndy "Hyground", or approved equal.

Ground cable through exterior building walls shall enter within 3 feet (900 mm) below finished grade and shall be provided with a water stop. Unless otherwise indicated, installation of the water stop shall include filling the space between the strands with solder and soldering a 12 inch (300 mm) copper disc over the cable.

Ground cable near the base of a structure shall be installed in earth and as far from the structure as the excavation permits, but not closer than 6 inches (150 mm).

Lighting fixtures and receptacles shall be grounded by a copper ground conductor in addition to the conduit connection.

Ground connections to equipment and ground buses shall be made with copper or high conductivity copper alloy ground lugs or clamps. Connections to enclosures not provided with ground buses or ground terminals shall be made with clamp type lugs inserted under permanent assembly bolts or under new bolts drilled and inserted through enclosures, other than explosion proof, or by grounding locknuts or bushings. Ground cable connections to anchor bolts; against gaskets, paint, or varnish; or on bolts holding removable access covers will not be acceptable.

The grounding system shall be bonded to the station piping by connecting to the first flange inside the building, on either a suction or discharge pipe, with a copper bar or strap. The flange shall be drilled and tapped to provide a bolted connection.

Ground conductors on equipment shall be formed to the contour of the equipment and firmly supported.

Ground rods not described elsewhere shall be 3/4 inch (19 mm) in diameter by 10 feet (3 m) long, with a copper jacket bonded to a steel core.

Inspect grounding and bonding system conductors and connections for tightness and proper installation.

Ground Resistance Test: Use a ground resistance test instrument for ground resistance testing. Perform testing in accordance with test instrument manufacturer’s instructions. Perform test in normally dry weather, not less than 48 hours after rainfall. Resistance shall be 3 ohms or less to pass.

3.8 <u>LIGHTING FIXTURE INSTALLATION</u>. Installation of lighting fixtures shall be as specified in Master Specifications Section 16500, Lighting.

3.9 <u>POWER FACTOR CORRECTION CAPACITOR INSTALLATION</u>. Capacitors shall be furnished and installed for the motors indicated on the drawings. Capacitors shall not be connected to the load side of solid-state starters, reduced-voltage autotransformer starters with open transition, multi-speed starters, or adjustable frequency drives. Galvanized angle iron mounting stands shall be furnished for mounting the capacitors at least 4 inches (100 mm) above the mounting surface.

3.10 <u>MODIFICATIONS TO EXISTING EQUIPMENT</u>. Modifications to existing equipment shall be completed as indicated on the Contract Documents. All existing facilities shall be kept in service during construction. Temporary power or relocation of existing power and control wiring, equipment, and devices shall be provided as required during construction. Coordination and timing of outages shall be as indicated on the Contract Documents. Electrical power interruptions will only be allowed where agreed upon in advance with Owner, and scheduling at times of low demand may be required.

3.10.01 Demolition. Unless otherwise specified or indicated on the drawings, all cable and all exposed conduit for power and control signals of equipment indicated to be removed shall be demolished. Conduit supports and electrical equipment mounting hardware shall be removed, and holes or damage remaining shall be grouted or sealed flush. Conduit partially concealed shall be removed where exposed, and plugged with expanding grout flush with the floor or wall. Repairs shall be refinished to match the existing surrounding surfaces. Demolished equipment shall be discarded or salvaged as indicated on the Contract Documents.

End of Section

SECTION 16052

COORDINATION STUDY AND ARC FLASH HAZARD ANALYSIS

PART 1 - GENERAL

1.1 SCOPE. This section specifies the Contract requirements for conducting and implementing plant-wide arc flash as well as short circuit and coordination studies. The arc flash study is to include all equipment over all voltage levels throughout the plant, including emergency generators and new equipment added under this Contract. Similarly, the short circuit and coordination study is to include the entire existing electrical system and all new electrical systems added under this Contract.

1.2 GENERAL. Information for Bidders, is made available for Contractor use in conducting Work specified herein. Contractor is responsible for field-verifying all information used in conducting the studies and implementing all study results.

1.3 COORDINATION. Contractor is responsible for conducting and carrying out all Work specified in accordance with the requirements of Master Specification Section 01070, Project Coordination and Meetings. Additionally, Contractor shall incorporate Work specified herein with the requirements of Master Specification Section 01060, Quality Control. In carrying out the implementation of the study recommendations, all Work must be completed as specified in Master Specification Sections 16050, Electrical General Requirements, and 01180, Equipment, Materials, Parts, and Tools. All necessary training shall be carried out per Master Specification Section 01160, Training and Operations and Maintenance Manuals.

1.4 SUBMITTALS. Study reports generated under this section shall be submitted for review in accordance with the requirements of Master Specification Section 01080, Project Submittals. Reports shall meet the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SHORT CIRCUIT AND COORDINATION STUDY. A Coordination Study shall be prepared detailing electrical system protection, protective equipment selectivity and arc flash hazard analysis studies. As minimum, the report shall include the following sections:

1.5.01 One-line diagram showing protective device ampere ratings and associated designations, cable size & lengths, transformer kVA & voltage ratings, motor & generator kVA ratings, and switchgear/switchboard/panelboard designations.

1.5.02 Descriptions, purpose, basis and scope of the study.

1.5.03 Tabulations of the worst-case calculated short circuit duties as a percentage of the applied device rating (automatic transfer switches, circuit breakers, fuses, etc.). The short circuit duties shall be upward-adjusted for X/R ratios that are above the device design ratings.

1.5.04 Protective device time versus current coordination curves with associated one-line diagram identifying the plotted devices, tabulations of ANSI protective relay functions and adjustable circuit breaker trip unit settings.

1.5.05 Fault study input data, case descriptions, and current calculations including a definition of terms and guide for interpretation of the computer printout.

1.5.06 Incident energy and flash protection boundary calculations.

1.5.07 Comments and recommendations for system improvements, where needed.

1.5.08 Executive Summary including source of information and assumptions made.

1.6 COORDINATION AND ARC FLASH HAZARD STUDY

1.6.01 Include as part of Contract a complete Coordination and Short Circuit Study and arc flash hazard study from incoming power lines through the high voltage switchgear, unit substations, and the motor control center branch circuits. Obtain available short circuit current, inrush current, and upstream protective device time current curves from the power company. Include power company current data and protective device curve as part of study. Study shall include all coordinating curves with each fuse size, trip settings, and thermal overloads given for connected loads. Curves shall include feeder wire melting curves and transformer ANSI rating points. The study shall also include variable frequency drives for motors larger than 40 Hp, harmonic filters, power factor correction equipment, transformers and protective devices associated with variable frequency drives, emergency and standby generators, associated paralleling equipment and distribution switchgear. Fuse sizes on motor control centers shall be those shown in Drawings throughout the short circuit and coordination study. Changes in loads from those shown on Drawings shall be incorporated in Study.

1.6.02 Contractor shall furnish all field data as required for the power system studies and arc flash hazard analysis studies. Include fault contribution of existing motors in the study, with motors < 50 hp grouped together. The Contractor shall obtain required existing equipment data, if necessary, to satisfy the study requirements.

1.6.03 Studies shall be performed by an independent engineering specialty firm, subject to the approval of the Engineer. Study results shall be submitted to Engineer for approval.

Short circuit, and protective device coordination and motor starting studies shall be performed on nationally recognized computer software such as SKM System Analysis, Paladin Design Base (formally EDSA), ETAP, or approved equal.

1.6.04 After approval, electrical equipment settings, thermal overloads, and fuses for equipment installed as part of this project shall be made to conform to approved results. Contractor shall test all trip settings, time delays, and indicating devices on all switchgear, unit substations, and motor control centers installed as part of this project. Tests shall be witnessed by Engineer. A list of recommended fuse sizes, overloads and settings conforming to approved results, shall be provided for all fuses, thermal overloads, and electrical settings of equipment and loads included as part of the power system coordination study and arc flash hazard analysis study.

1.6.05 Data sheets for the testing are to be furnished by Contractor and shall be filled out showing the desired settings from Coordination Study and results obtained from witnessed test. Data sheets shall be signed by those performing test and the test witness. Test data sheets and motor list showing fuses, thermal overload sizes, etc. shall be submitted to Engineer as part of Contract.

1.7 SHORT-CIRCUIT AND PROTECTIVE DEVICE EVALUATION STUDY

1.7.01 Use actual conductor impedances if known. If unknown, use typical conductor impedances based on IEEE Standards 141, latest edition. Transformer design impedances and standard X/R ratios shall be used when test values are not available.

1.7.02 Provide the following information in the study report:

Calculation methods and assumptions.

Base per unit quantities.

One-line diagram of the system being evaluated with available fault at each bus, and interrupting rating of devices noted.

Source impedance data, including electric utility system and motor fault contribution characteristics.

Typical calculations and tabulations of calculated quantities.

Results, conclusions, and recommendations.

1.7.03 Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault at each:

Electric utility's supply termination point.

Incoming switchgear.

Unit substation primary and secondary terminals.

Low voltage switchgear.

Motor control centers.

Standby generators and automatic transfer switches.

Branch circuit panelboards.

Other significant locations throughout the system.

1.7.04 On grounded systems, provide a bolted line-to-ground fault current study for areas as defined for the three-phase bolted fault short-circuit study.

1.7.05 Protective Device Evaluation:

Evaluate equipment and protective devices and compare to short circuit ratings.

Adequacy of switchgear, motor control centers, and panelboard bus bracing to withstand short-circuit stresses.

Adequacy of transformer windings to withstand short-circuit stresses.

Cable and busway sizes for ability to withstand short-circuit heating.

Notify Owner in writing, of existing circuit protective devices improperly rated for the calculated available fault current.

1.8 PROTECTIVE DEVICE COORDINATION STUDY

1.8.01 Proposed protective device coordination time-current curves shall be graphically displayed on log-log scale paper.

1.8.02 Include on each curve sheet a complete title and one-line diagram with legend identifying the specific portion of the system covered.

1.8.03 Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which device is exposed.

1.8.04 Identify device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.

1.8.05 Plot the following characteristics on the curve sheets, where applicable:

Electric utility's protective device.

Medium voltage equipment relays.

Medium and low voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands.

Low voltage equipment circuit breaker trip devices, including manufacturer's tolerance bands.

Transformer full-load current, magnetizing inrush current, and ANSI transformer withstand parameters.

Conductor damage curves.

Ground fault protective devices, as applicable.

Pertinent motor starting characteristics and motor damage points.

Pertinent generator short-circuit decrement curve and generator damage point.

Other system load protective devices for the largest branch circuit and the largest feeder circuit breaker in each motor control center.

1.8.06 Provide adequate time margins between device characteristics such that selective operation is provided, while providing proper protection.

1.9 ARC FLASH HAZARD ANALYSIS

1.9.01 The arc flash hazard analysis shall be performed according to the IEEE 1584 equations that are presented in NFPA70E-2004, Annex D.

1.9.02 When appropriate, the short circuit calculations and the clearing times of the phase overcurrent devices will be retrieved from the short-circuit and coordination study model.

1.9.03 The flash protection boundary and the incident energy shall be calculated at all significant locations in the electrical distribution system (switchboards, switchgear, motor-control centers, panelboards, busway and splitters) where work could be performed on energized parts.

1.9.04 The Arc-Flash Hazard Analysis shall include all medium voltage and 480v locations and significant locations in 240 volt and 208 volt systems fed from transformers equal to or greater than 125 kVA.

1.9.05 Safe working distances shall be specified for calculated fault locations based upon the calculated arc flash boundary considering an incident energy of 1.2 cal/cm^2.

1.9.06 The Arc Flash Hazard analysis shall include calculations for maximum and minimum contributions of fault current magnitude. The minimum calculation shall assume arcing impedances which limit fault values to 33 percent of three phase bolted fault values. Medium voltage calculations shall use values over 38 percent as recommended in IEEE 1584-2002. The maximum calculation shall assume a maximum contribution from the utility and shall assume motors to be operating under full-load conditions.

1.9.07 Arc flash computation shall include both line and load side of main breaker calculations, where necessary.

1.9.08 Arc Flash calculations shall be based on actual over current protective device clearing time. Maximum clearing time will be capped at 2 seconds based on IEEE 1584-2002 section B.1.2.

1.10 REPORT SECTIONS

1.10.01 Input Data:

Utility three-phase and line-to-ground available contribution with associated X/R ratios.

Short-circuit reactance of rotating machines with associated X/R ratios.

Cable type, construction, size, # per phase, length, impedance and conduit type.

Bus duct type, size, length, and impedance.

Transformer primary & secondary voltages, winding configurations, kVA rating, impedance, and X/R ratio.

Reactor inductance and continuous ampere rating.

Aerial line type, construction, conductor spacing, size, # per phase, and length.

1.10.02 Short-Circuit Data:

Source fault impedance and generator contributions.

X to R ratios.

Asymmetry factors.

Motor contributions.

Short circuit kVA.

Symmetrical and asymmetrical fault currents.

1.10.03 Recommended Protective Device Settings:

Phase and Ground Relays:

Current transformer ratio.

Current setting.

Time setting.

Instantaneous setting.

Specialty non-overcurrent device settings.

Recommendations on improved relaying systems, if applicable.

Circuit Breakers:

Adjustable pickups and time delays (long time, short time, ground).
Adjustable time-current characteristic.

Adjustable instantaneous pickup.

Recommendations on improved trip systems, if applicable.

1.10.04 Incident energy and flash protection boundary calculations.

Arcing fault magnitude.

Device clearing time.

Duration of arc.

Arc flash boundary.

Working distance.

Incident energy.

Hazard Risk Category.

Recommendations for arc flash energy reduction

PART 2 - PRODUCTS

NOT USED

PART 3 – EXECUTION

3.1 ARC FLASH WARNING LABELS

3.1.01 The CONTRACTOR shall provide a 3.5 in. x 5 in. thermal transfer type label of high adhesion polyester for each work location analyzed.

3.1.02 The label shall have an orange header with the wording, “WARNING, ARC FLASH HAZARD”. For locations where arc flash energy at working boundary exceeds 40 cal/cm^2 label shall have a red header with the wording, “WARNING, ARC FLASH HAZARD”. Labels shall include the following information:

Location designation

Nominal voltage

Flash protection boundary

Hazard risk category

Incident energy at working distance

Working distance

DWSD Project Number

Engineering report number, revision number and issue date.

3.1.03 Arc flash labels shall be provided in the following manner and all labels shall be based on recommended over current device settings.

For each 600, 480 and applicable 208 volt panel boards and disconnects, one arc flash label shall be provided.

For each motor control center, up to four arc flash labels shall be provided, one at each main breaker, and one at each end of the motor control center.

For each low voltage switchboard, one arc flash label shall be provided.

For each switchgear or unit substations, up to four arc flash labels shall be provided, one at each main breaker, and one at each end of the equipment.

For each medium voltage switch, one arc flash label shall be provided.

3.1.04 Labels shall be field installed by the independent engineering specialty firm during the Startup and Acceptance Testing.

3.2 <u>ARC FLASH TRAINING</u>

3.2.01 The Contractor shall train personnel of the potential arc flash hazards associated with working on energized equipment (minimum three (3) sessions, each comprised of four (4) hours for eight (8) trainees). Contractor shall provide all materials necessary for conducting the training. Maintenance procedures in accordance with the requirements of NFPA 70E, Standard For Electrical Safety Requirements For Employee Workplaces, shall be provided in the equipment manuals. The training shall be certified for continuing education units (CEUs) by the International Association for Continuing Education Training (IACET).

End of Section

SECTION 16150

VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 SCOPE. This section covers pulse width modulated (PWM) type variable frequency drives (VFD) for the equipment and locations as indicated on the drawings or as specified in other sections.

VFD's shall be designated and shall be located as required.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Equipment provided under this section shall be fabricated as specified in this section and as shown on the schematics and one line diagrams on the Contract Drawings.

Unless otherwise indicated on the drawings, one variable frequency drive, complete with all required control components, shall be furnished for each motor.

VFD’s shall be manufactured/assembled in their entirety at the manufacturer's factory. Systems fabricated or assembled in whole or in part by parties other than the drive manufacturer will not be acceptable.

Motors shall be compatible with the VFD’s.

1.2.01 Coordination. The design of the variable frequency drive shall be coordinated with the driven equipment. Unless otherwise indicated, the manufacturer of the driven equipment shall be responsible for furnishing the variable frequency drive, for matching the motor and the drive, and for coordinating the collection of data and the design effort to limit harmonics to the levels specified.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.03 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer.

1.2.04 Workmanship and Materials. Contractor shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.05 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
AWG	American Wire Gage
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.2.06 Governing Standards. The variable frequency drive shall be designed, constructed, and tested in accordance with the applicable standards of NEMA, ANSI, UL, and IEEE, and shall be designed for installation in accordance with the NEC. The drives shall be UL or ETL listed.

1.2.07 Nameplates. All devices mounted on the face of the drive shall be provided with suitable nameplates. Nameplates shall have 1/8 inch black baked enamel letters on anodized aluminum plate. Push buttons, selector switches, and pilot lights shall have the device manufacturer's standard legend plate. All other devices shall have a nameplate with black baked enamel letters on anodized aluminum plate.

1.3 DESCRIPTION. The VFD shall produce a variable ac voltage/frequency output and shall be equipped with an output voltage regulator to maintain correct output V/Hz despite incoming voltage variations.

1.3.01 Six-Pulse Drives. Each drive, for motors rated below 100 horsepower, shall be of the pulse-width modulated type and shall consist of a full-wave diode or gated-open SCR bridge. The rectifier shall convert incoming fixed voltage and fixed frequency to a fixed dc voltage. The pulse-width modulation technology shall be of the space vector type, implemented in a microprocessor that generates a sine-coded output voltage.

The drive inverter output shall be generated by insulated gate bipolar transistors (IGBT) that shall be controlled by six identical base driver circuits. The drive shall not induce excessive power losses in the motor. The worst case RMS motor line current measured at rated speed, torque, and voltage shall not exceed 1.05 times the rated RMS motor current for pure sine wave operation.

1.3.02 Eighteen-Pulse Drives. Unless otherwise indicated, each drive, for motors rated 100 horsepower and above, shall be of the pulse-width modulated type and shall consist of an 18-pulse, full-wave diode or gated-open SCR bridge. The rectifier shall convert incoming fixed voltage and fixed frequency to a fixed dc voltage. The pulse-width modulation technology shall be of the space vector type, implemented in a microprocessor that generates a sine-coded output voltage.

The phase shifting transformer required to produce the phase shifted input to the 18-pulse rectifier shall be factory wired and mounted within the drive enclosure as an integral part of the drive assembly. External transformers shall not be required.

The VFD inverter output shall be generated by insulated gate bipolar transistors (IGBT) that shall be controlled by six identical base driver circuits. The VFD shall not induce excessive power losses in the motor. The worst case RMS motor line current measured at rated speed, torque, and voltage shall not exceed 1.05 times the rated RMS motor current for pure sine wave operation.

1.4 SUBMITTALS. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the motor control center shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data shall include, but shall not be limited to, the following:

Name of manufacturer.

Types and model numbers.

Rated drive input kVA and output kVA.

Percent efficiency at 100 percent speed and 60 percent speed.

Maximum Btu (kJ) heat release data and verification of the drive cooling requirements.

Total weight and lifting instructions, height, mounting, and floor space required.

Panel interior and front and side exterior view details showing maximum overall dimensions of all transformer, bypass contactor, ac line filter, ac line reactor, and drive compartments.

Schematics, including all interlocks.

Wiring diagrams, including all internal and external devices and terminal blocks.

Locations and sizes of electrical connections, ground terminations, and shielded wires.

List of diagnostic indicators.

List of fault and failure conditions that the drive can recognize and indicate for simultaneous occurrence.

List of standard features and options.

List of spare parts to be furnished.

Unless furnished under another section, submit harmonic calculations by the drive manufacturer at the points of common coupling. Detailed drawings and information showing how protection is applied to comply with harmonic limits.

Input line protection model numbers and manufacturer's data sheets.

Output filter model number and manufacturer's data sheets.

Certification of conformal coating on all printed circuit boards.

Unless this testing plan is furnished under another section, submit a detailed harmonic testing plan. The test plan should include instruments to be used, verification of testing locations for voltage and current harmonic metering, verification of maximum allowable voltage and current distortion, and drive load and speed test parameters.

1.5 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Manufacturer's operation and maintenance manual for each size of variable frequency drive.

Manufacturer's standard manuals for each size and type of bypass contactor, transformer, line reactor, and filter.

Schematics, wiring diagrams, and panel drawings in conformance with construction record.

Model numbers and up-to-date cost data for spare parts.

Troubleshooting procedures, with a cross-reference between symptoms and corrective recommendations.

Connection data to permit removal and installation of recommended smallest field-replaceable parts.

Information on testing of power supplies and printed circuit boards and an explanation of the drive diagnostics.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.6 <u>SHIPPING, STORAGE, AND HANDLING</u>. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Each item of equipment shall be tagged or marked as required. Complete packing lists and bills of material shall be included with each shipment.

1.7 <u>SPARE PARTS</u>. The drive manufacturer shall provide spare parts for each type and size of drive supplied. The spare parts shall include at least one complete set of all plug-in components, including printed circuit boards and control boards, for each size and type of drive, and shall also include the following:

Power fuses

Control fuses

Indicating lights

Rectifier power semiconductors

Inverter power semiconductors

One of each type printed circuit board and gate firing board

Other field-replaceable component parts

Spare parts shall be suitably packaged, labeled, and delivered as specified in Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. All drives shall be pulse-width modulated type, as manufactured by ABB, Allen Bradley, Cutler Hammer, Siemens, Square "D", or approved equal.

All variable frequency drives shall be a product of the same manufacturer.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS.

2.2.01 Performance. The variable frequency drive controller shall be of sufficient capacity and shall produce a quality output waveform for stepless motor control from 10 to 100 percent of base speed. The variable frequency drive shall be suitable for either constant torque (CT) or variable torque (VT) loads as required by the driver's equipment. The variable frequency drive shall meet the following ratings and parameters:

Input voltage and frequency	460 volts (±10 percent) unless otherwise indicated; 3 phase, 60 Hz (±2 Hz); imbalance, 2 percent maximum.
	Continued operation with additional momentary 25 percent voltage dip of 0.5 second duration from nominal input voltage level.
Minimum drive efficiency	95 percent at 100 percent speed, 90 percent at 60 percent speed.

Ambient temperature	15°F to 105°F (-10°C to 40°C).
Relative Humidity	0 to 95 percent non-condensing.
Displacement Power Factor	95 percent or higher throughout the entire operating speed range, measured at drive input terminals.
Drive service factor	1.15.
Over current capability	110 percent for 1 minute for variable torque; 150 percent for 1 minute for constant torque.
Volts/Hz ratio	Voltage varies as the square of frequency over the entire range of the unit for variable torque drives, constant over the entire range of the unit for constant torque drives; except under voltage boost condition.
Acceleration/deceleration time	Variable over a range that meets the requirements of the drive equipment.
Output speed regulation	0.5 percent.
Output frequency stability	0.5 percent of nominal.

2.2.02 Adjustments. The following drive adjustments shall be provided:

Maximum speed.

Minimum speed.

Linear acceleration time.

Linear deceleration time.

Volts/Hz ratio; linear, squared, and automatic settings.

Voltage boost.

Process follower gain, offset, and bias.

Torque limit.

Critical frequency avoidance with variable bandwidth.

2.2.03 Fault Protection. Design of the power circuit shall include provisions for protection against fault conditions as follows.

2.2.03.01 Input Protection.

High speed current limiting fuses rated 200,000 AIC, specifically designed for solid state applications.

Solid state instantaneous overcurrent trip set at 180 percent.

Variable over voltage and under voltage protection with automatic restart.

Phase loss and reverse phase trip with manual restart.

2.2.03.02 Internal Protection.

AC line, phase-to-phase transient voltage surge suppression utilizing metal oxide varistors. Drive shall meet the requirements of IEEE C62.41.

Power device snubbers.

Power devices rated 2.5 times line voltage.

Instantaneous overcurrent.

Static overspeed (overfrequency) protection.

DC bus over voltage trip.

DC bus discharge circuit with an indicator lamp, for protection of personnel.

Individual transistor overtemperature and overcurrent protection.

Control logic circuit malfunction indication.

2.2.03.03 Output Protection.

Inverse-time motor overload protection variable from 10 percent to 100 percent.

Overvoltage protection.

Overfrequency protection.

Short circuit protection (three phase, phase to phase, and ground fault protection).

Protection against opening or shorting of motor leads.

Static overspeed protection.

Stall protection on overload with inverse time Over current trip, variable current limit from 10 percent to 120 percent.

2.2.04 Harmonic Distortion Abatement. The electrical system shall be provided with the necessary equipment to protect the drive and the power system ahead of the drive from harmonic distortion, as described below.

The drive shall operate satisfactorily when connected to a bus supplying other solid-state power conversion equipment which may be causing up to 10 percent total harmonic voltage distortion and commutation notches up to 36,500 volt-microseconds.

Harmonic distortion abatement equipment shall be provided to bring the facility and its electrical system into compliance with IEEE 519, 1992 at the points of analysis defined below and indicated on the Contract Drawings. The supplier shall review the existing facility loads and shall take note of the equipment – as indicated in the Contract documents. All distortion reports and/or testing shall include the existing facility loads. The maximum total harmonic distortion (THD and TDD) allowed at the points of analysis shall include harmonics from the existing equipment as well as the harmonics from equipment provided under this section.

2.2.04.01 Current Distortion Limits. Maximum allowable total and individual harmonic current distortion limits for each odd harmonic shall not exceed limits set forth in IEEE 519, 1992. The power company connection shall be the primary point of analysis for current distortion. The values of utility short circuit current at the utility interface and the total maximum running amperes of all equipment powered from the utility connection shall be as indicated on the drawings.

2.2.04.02 Voltage Distortion Limits. Individual or simultaneous operation of the drives shall result in a maximum total harmonic voltage distortion of 5 percent on the bus feeding the drives. Individual or simultaneous operation of the drives shall not add more than 10 percent total harmonic voltage distortion to the bus feeding the drives while operating from a standby generator. The point(s) of analysis for harmonic voltage distortion testing shall be the nearest electrical bus on the supply side of each drive. The three phase fault current at the bus feeding the drives is as indicated on the drawings.

2.3 CONSTRUCTION.

2.3.01 Fabrication and Assembly. The variable frequency drive system shall be shop assembled in a single enclosure using interchangeable plug-in printed circuit boards and power conversion components wherever possible. Shop assembly shall be performed by the drive manufacturer; systems fabricated or assembled in whole or in part by parties other than the drive manufacturer will not be acceptable. Changes to the drive manufacturer's product by a distributor or system integrator are not allowed.

Input line reactors, fuses, circuit breakers, and filters, where required, shall be mounted within the drive enclosure, without exception. Isolation/voltage matching transformers, where required, may be enclosed separately from the remaining drive equipment.

2.3.02 Wiring. Internal cabinet wiring shall be neatly installed in wireways or with wire ties where wireways are not practical. If wire ties are used, the wire bundles shall be held at the back panel with a screw-mounted mounting base. Bases with a self-sticking back are not acceptable.

Power entry and exit for the drive shall be through the top or bottom of the drive as indicated on the drawings.

Terminal blocks shall be nonbrittle, interlocking, track-mounted type, complete with a marking strip, covers, and pressure connectors. Screw terminals will not be acceptable. A terminal shall be provided for each conductor of external circuits, plus one ground for each shielded cable. In freestanding panels, 8 inches (200 mm) of clearance shall be provided between terminals and the panel base for conduit and wiring space. Not less than 25 percent spare terminals shall be provided. Terminals shall be labeled to agree with the identification on the submittal drawings. Each control loop or system shall be individually fused, clearly labeled, and located for ease of maintenance.

All grounding wires shall be attached to the sheet metal enclosure with a ring tongue terminal. The surface of the sheet metal shall be prepared to ensure good conductivity and corrosion protection.

Wires shall not be kinked or spliced and shall be color coded or marked on both ends. The markings or color coding shall agree with the submittal drawings.

With the exception of electronic circuits, all interconnecting wiring and wiring to terminals for external connection shall be stranded copper, insulated for at least 600 volts, with a moisture-resistant and flame-retardant covering rated for at least 90°C.

2.3.03 Enclosures. The drive shall consist of factory mounted and wired components within a dead front, grounded, NEMA Type 1 enclosure, or other type when indicated on the drawings. The complete drive package, including accessories, shall fit into the space indicated on the drawings.

Freestanding panels shall be suitable for mounting on a concrete pad and shall include provisions for anchoring to the supporting structure. Suitable lifting facilities shall be provided for handling and shipment.

Relays, terminals, and special devices inside the control enclosure shall have permanent markings to match the identification on the manufacturer's wiring diagrams.

2.3.04 Printed Circuit Boards. All printed circuit boards shall be sprayed on both sides with a conformal coating. The conformal coating shall be a part of the VFD manufacturing process and shall be selectively applied to the circuit board connections only. Heat sinks and resistors on the circuit board shall not be coated. Conformal coating shall be Konform "C416" or HumiSeal.

All plug-in type boards shall be mechanically held at the circuit board connector. Compression fit only at the connector will not be acceptable.

2.3.05 Shop Painting. All iron and steel surfaces, except machined surfaces and stainless steel, shall be shop cleaned in accordance with the coating manufacturer's recommendations, and finished with the drive manufacturer's standard coating. Finish color shall be medium gray or the manufacturer's standard color. Dry film thickness of the finish coat shall be at least 4 mils (100 μm). Field painting, other than touch up, will not be required. A sufficient quantity of additional coating material and thinner shall be furnished for field touch up of damaged coatings. When required, a corrosion resistant coating or a special color shall be furnished.

When the drive will be exposed to hydrogen sulfide, all intermediate and finish coating materials shall be guaranteed by the manufacturer to be fume proof and suitable for wastewater plant atmosphere that contains hydrogen sulfide. Coatings that cannot be so guaranteed shall not be used. Lead-free and mercury-free coatings shall be used.

2.4 OPTIONAL EQUIPMENT.

2.4.01 Bypass Switch. When indicated on the drawings, a contactor type bypass switch shall be provided for operation of the ac motor on either the VFD or the ac line. The bypass shall consist of two mechanically and electrically interlocked, NEMA rated magnetic contactors with a common ambient compensated, bi-metallic motor overload relay for motor protection of both circuits. The contactors shall be rated for at least the horsepower (kilowatt) rating of the motor. The bypass contactors shall be part of the packaged unit and shall be mounted within the enclosure of the variable frequency drive.

Door-mounted devices for the bypass shall include an "VFD-Line" switch and a push-pull "Stop/Reset" push button. The controls for the VFD, as indicated on the drawings, shall start and stop the motor, regardless of whether it is connected to the VFD or to the ac line. The "Stop/Reset" push button shall prevent motor operation when it is pulled out. Once the automatic bypass has been activated, no action of the "VFD-Line" switch can change the state of operation. The "Stop/Reset" push button must be depressed before the automatic mode can be restored.

The bypass shall include a door-interlocked circuit breaker so that when the circuit breaker is opened, the output lines are disconnected from the motor. The contactor for the VFD shall serve as an output contactor and shall be electrically interlocked with the input circuit breaker of the VFD so that when the circuit breaker is opened, the drive is disconnected from the motor.

2.4.02 AC Line Reactors. Each six-pulse drive shall be supplied with an input ac line reactor. AC line reactors shall be designed to address performance issues of NEMA MG1-20.55 and to provide proper transient protection of the VFD input power devices. AC Line reactors shall be factory mounted and wired within the VFD enclosure. AC line reactors shall be K-rated per IEEE C57-110 and shall be TCI Model KLR, or approved equal.

2.4.03 Harmonic Filters. When harmonic filters are required to comply with the total harmonic distortion limits specified herein, the VFD manufacturer shall design and provide the required filters. The harmonic filters shall utilize an interlocking contactor that shall be automatically operated by the VFD run circuit. The VFD manufacturer shall be responsible for the complete filter unit, including the filter contactor. Harmonic filters shall be TCI Harmonic Guard Series, or approved equal.

2.4.04 Isolation/Voltage Matching Transformers. Transformers furnished with VFD’s to provide the required operating voltage shall be constructed in accordance with applicable NEMA and ANSI standards. Transformer voltages shall be as indicated on the drawings unless otherwise required by the variable frequency drive. Transformers shall have Class B, F, or H insulation systems. Terminal compartments shall be front-accessible and shall have adequate space for minimum bending radii of the cables to be terminated. The transformers shall be UL listed and shall be provided with a K rating of 15 in accordance with IEEE C57.110.

Transformers rated 15 kVA and lower shall be indoor/outdoor, totally enclosed type, with sound levels generated by each transformer not to exceed 45 dB.

Transformers rated higher than 15 kVA shall be indoor/outdoor, self-air-cooled type with dripproof enclosures and ventilating openings, in accordance with NEMA and NEC requirements. The ventilating openings shall be located to provide adequate cooling even with other equipment located on both sides. Sound levels generated by each transformer shall not exceed 60 dB.

2.4.05 Output dV/dt Filters. When motor feeder lengths are greater than 150 feet, output filters shall be installed inside the drive enclosure on the inverter output. Output filters shall consist of a minimum 1.5 percent impedance reactor, in conjunction with a resistor and capacitor network, to form a damped low-pass filter. Use of output reactors alone is not acceptable. Output filters shall be TCI Model KLC, or approved equal.

2.5 CONTROLS.

2.5.01 Features. Each drive shall include the following features in addition to those indicated on the drawings:

A door mounted membrane keypad with integral 2-line, 24 character minimum LCD display that is capable of controlling the VFD and setting drive parameters. The keypad module shall be programmed with factory set drive parameters in nonvolatile EEPROM or FLASH memory and shall be resettable in the field through the keypad. The keypad module shall contain a self-test software program that can be activated to verify proper keypad operations.

Microprocessor-based regulator. Nonvolatile memory modules shall have a useful life of at least 20 years without requiring battery or module replacement.

Input thermal-magnetic molded-case circuit breaker disconnect with interrupting capacity rated in RMS symmetrical amperes of 14,000, 22,000, or 42,000, and labeled in accordance with UL standard 489. The disconnect shall be mounted inside the controller enclosure and shall have door interlocks and a handle with provisions for padlocking in the "Off" position.

Input line high-speed, current limiting fuses rated 200,000 amperes interrupting and specifically designed for solid-state applications.

Manual speed adjustment.

Indications of power "On", drive "Run", and drive "Fault". Indication of these parameters shall be provided by high intensity push to test pilot lights that utilize 6 volt LED lamps with built-in transformers. Lamps shall be easily replaceable from the front of the indicating light.

Elapsed time meter.

Speed indication - calibrated in percent rpm.

Control circuits of not more than 115 volts supplied by internal control power transformers. Control power transformers shall have additional capacity as required by external devices indicated on the drawings. Control power transformers shall be equipped with two primary leads fused, one secondary lead fused, and one secondary lead grounded.

Automatic controller shutdown on overcurrent, overvoltage, undervoltage, motor overtemperature and other drive fault conditions. Controller shutdown shall be manually reset type. Terminals shall be provided for control wiring from motor temperature switches, or a motor protection relay located in the drive enclosure.

Diagnostic indicators that pinpoint failure and fault conditions. Indicators shall be manually reset to restore operation after abnormal shutdown.

Accept a remote 4-20 mA speed control signal.

Process control output for remote 4-20 mA speed indication, rated 0 to 100 percent speed.

Spare interlock contacts rated 5 amperes at 120 volts ac, wired separately to the unit terminal board. One NO and one NC isolated spare interlock shall be furnished with each drive. Additional interlock contacts shall be provided as indicated on the drawings.

Drive fault and run status contacts for remote indication, rated 5 amperes at 120 volts ac.

Speed droop feature which reduces the speed of the drive on transient overloads. The drive shall return to set speed after the transient is removed. If the acceleration or deceleration rates are too rapid for the moment of inertia of the load, the drive shall automatically compensate to prevent drive trip.

Heavy duty, oil-tight pilot devices of the 30.5 mm type.

Individual variable speed profile settings for start, stop, entry, slope, and minimum and maximum speed points.

Coast, controlled ramp, or dc injection selectable modes of stopping.

PID setpoint control selection.

Variable PWM carrier frequency. The inverter output section shall be provided with variable PWM carrier frequency from 500 Hz to at least 10 kHz.

Noise level of installed equipment shall not exceed 85 dB as measured by an appropriate calibrated instrument. This sound level limit shall be met at a minimum of four locations, each not more than 3 feet (0.9 m) above the floor and not more than 10 feet (3 m) from the equipment. This requirement shall apply to all drives, motors, filters, reactors, and transformers supplied with the drive.

2.5.02 Diagnostics. Diagnostic indicators on the face of the drive shall display the type of fault responsible for drive shutdown, warning, or failure. If two or more faults occur simultaneously, the diagnostic segment shall record or indicate each condition. The drive shall be capable of storing 10 events with a time and date stamp for each event.

2.5.03 Motor Protection Relay. When indicated on the drawings, a three phase modular electronic relay to protect motors against overloads (51/49), acceleration time, RTD over temperature (49), negative sequence current (46), variable current unbalance (46), phase loss (46), multiple starts (48), short circuit (50), ground fault (50G/51G), hot motor compensation, undercurrent minimum load (37), phase reversal (46), variable lockout on thermal trip, and mechanical jam shall be incorporated into a single field motor overload, stator RTD alarm, ground fault alarm, undercurrent alarm, unbalance alarm, thrust and guide bearing RTD alarm, broken RTD alarm, and self-test alarm shall be provided. Other features shall include alphanumeric display, actual motor values display, status indication, analog output load amperes, analog output motor thermal capacity, and analog output stator temperature. The relay shall be Multilin "369 Motor Management Relay."

2.6 ACCESSORIES.

2.6.01 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.7 TESTING. All power switching components shall be prerun under anticipated operating temperature and load conditions.

2.7.01 Factory Testing. After the drive system has been assembled at the manufacturer's facility, it shall be tested for at least 24 hours before it is shipped. The complete drive system, including all peripherals, shall be factory tested under simulated operating conditions, including normal operating sequences and fault conditions. Contact closure inputs and simulated driven-outputs shall be connected to the system input/output modules.

A test report summary indicating satisfactory final test results shall be submitted to Engineer before shipment of the equipment.

2.7.02 Secondary Factory Testing. Unless otherwise indicated, the drive units shall be assembled with the driven equipment for shop testing . The drive manufacturer shall provide the services of a qualified representative to work with the equipment manufacturer at the equipment manufacturer's facility. The representative shall advise and assist in assembling and testing the equipment and drive unit packages.

Personnel conducting the tests shall be competent, authorized representatives of the equipment and drive manufacturers who are familiar with operation of the equipment furnished and who have satisfactory experience in conducting similar tests. Qualified personnel shall perform the tests, record the data, make the required calculations, and prepare a report on the results. Five copies of the report shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The information collected shall be used as a basis for determining acceptability of the manufacturer's test results. In case of conflict, interpretations and calculations made by Engineer will govern.

Testing shall be conducted in a manner acceptable to Engineer. At least 2 weeks before the proposed testing date, Contractor shall notify Engineer of the testing date and shall submit a report from the equipment manufacturer detailing the proposed performance testing.

PART 3 - EXECUTION

3.1 PREPARATION FOR SHIPMENT. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked. Complete packing lists and bills of material shall be included with each shipment.

3.2 INSTALLATION CHECK. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.3 FIELD TESTING.

3.3.01 Field Acceptance Testing. After installation of the system at the site of the work and checkout by the drive manufacturer, a field acceptance test shall be conducted jointly by the drive manufacturer and the manufacturer of the driven equipment.

The field acceptance test shall consist of repeating the factory acceptance testing procedure and an additional 5 days of similar testing, during which the system shall run continuously without loss of basic functions. Functional tests shall demonstrate satisfactory operation of all interlocks, alarms, and normal operating sequences. The drive manufacturer shall use suitable test equipment to identify and correct malfunctions. Failure of redundant equipment will not be considered as downtime, provided that automatic failover occurs as specified herein and, that in the opinion of Engineer, the failure was not caused by deficiency in design or installation. Repeated failure of any component shall be cause for the acceptance test to be terminated and restarted.

3.3.02 Harmonic Distortion Test. Contractor shall provide temporary four-channel power line monitoring equipment at the site to graph and record the harmonic line distortion for ac voltage and current, and to compute individual harmonic values up to the 50th harmonic as well as total harmonic distortion (THD) and total demand distortion (TDD). Distortion testing shall include all drives furnished under this section and all existing drives as specified in paragraph 2.2.04 and as indicated in the Contract Documents.

The monitoring equipment shall include a four-channel power line monitor, temperature and humidity compensation probes, a recorder, and any additional instruments required to compute harmonic values, THD, and TDD. The equipment shall be Basic Measuring Instruments "Model 3030A Power Profiler" or Dranetz "Model 8000".

Measurements shall include phase-to-phase, phase-to-neutral, and neutral-to-ground. The harmonic distortion shall be monitored at the primary and secondary points of common coupling. The test shall be run for the full range of drive operation to the extent practicable.

Graphs of harmonic spectra and of current waveforms shall be submitted for the following running conditions of the equipment:

All drives at 100 percent speed.

Half, two-thirds, or three-fifths of each type of drive at 60 percent speed and the others at 100 percent speed.

All drives at 60 percent speed.

All drives off.

The test shall be conducted by qualified personnel acceptable to Engineer.

3.4 TRAINING OF OWNER'S PERSONNEL. Employees of Owner shall be trained in the proper operation, troubleshooting, and maintenance of the equipment. Training shall be conducted by a qualified representative of the drive manufacturer and shall consist of at least 16 hours of combined classroom and hands-on instruction. Training shall be conducted at a place and time mutually agreeable to Owner and the drive manufacturer.

End of Section

SECTION 16220

GENERAL PURPOSE INDUCTION MOTORS

PART 1 – GENERAL

1.1 SCOPE. This section covers single and three-phase, small (fractional) and medium (integral) horsepower, alternating current motors rated 500 horsepower and less (NEMA MG1-1998), as specified herein and as indicated on the drawings.

Motors shall be designated and shall be located as indicated on the drawings.

1.2 GENERAL. Motors furnished under this section shall be fabricated, and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.03 Workmanship and Materials. Contractor shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thickness so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.2.05 Abbreviations. Reference to standards and organizations shall be indicated by the following abbreviated letter designations:

AFBMA	Anti Friction Bearing Manufacturers Association
ANSI	American National Standards Institute
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories
USN	United States Navy

1.2.06 Governing Standards. Motors furnished under this section shall be designed, constructed, and tested in accordance with NEMA MG1-1998 and IEEE 112, Test Method B.

Motors shall be designed and applied in accordance with NEMA, ANSI, IEEE, AFBMA, and NEC for the duty service imposed by the driven equipment, such as frequent starting, intermittent overload, high inertia, mounting configuration, or service environment.

Motors covered by this section shall be listed by UL or a nationally recognized third-party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of Contractor. In the event, no third-party testing laboratory provides the required listing; an independent test shall be performed at Contractor's expense. Before testing, Contractor shall submit a copy of the testing procedure that will be used in evaluating the equipment.

Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.2.07 Nameplates. The motor nameplates shall be engraved or embossed on stainless steel and fastened to the motor frame with stainless steel screws or drive pins. Nameplates shall indicate clearly all of the items of information enumerated in NEMA Standard MGI-10.38 or MGI-20.60, as applicable.

1.3 SUBMITTALS. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the motor shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data shall include, but shall not be limited to, the following:

Motors

Name of manufacturer.

Type and model.

Type of bearing and method of lubrication.

Rated size of motor, hp (kW), and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Net weight.

Efficiency at full, 3/4, and 1/2 load.

Full load current.

Locked rotor current.

Space heater wattage, where applicable.

Motor temperatureswitch data, where applicable.

RTD data, where applicable.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. Six (6) operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Assembly, installation, alignment, adjustment, and checking instructions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

The CONTRACTOR shall furnish the ENGINEER with six (6) certified copies of characteristic curves for each motor furnished (except 115 volt motors) and all other data required for designing the control equipment.

1.5 DESCRIPTION 1.5.01 The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install Electric Motors.

1.6 RELATED DOCUMENTS

1.6.01 Section 16120, Wires and Cables 600 Volt and Less
1.6.03 Section 16150 Low Voltage Variable Frequency Drives

1.7 DESCRIPTION OF SYSTEMS

1.7.01 Electric motors are for the operation of equipment furnished and installed by other trades.

1.7.02 The types of motors shall be selected to be suitable for the ambient conditions in which they are to operate, including moisture, dust, temperature, etc.

1.8 WORK SPECIFIED

1.8.01 Furnish all labor, materials, equipment, technical supervision, and incidental services required to complete, test and leave ready for operation the electrical motors as specified in all Sections of these specifications or as indicated.

1.8.02 Place motor operated equipment and accessories into proper adjustment and operating condition so that the component parts function together as a workable unit.

1.8.03 Provide all labor, material, and equipment required to install, wire, connect, set, and place in operation all motors as part of equipment furnished by other trades as specified and as shown on the plans of these contract documents. The work shall include all conduits, fittings, wires, mounting systems, etc., as shown in the specifications and as instructed by the equipment manufacturers.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. The motors shall be manufactured by General Electric, Ideal, Reliance Electric Co., Siemens Energy & Automation, Inc., U. S. Motors, or approved equal.

2.2 SERVICE CONDITIONS. Service conditions for motors shall be as required for driven equipment. Motors shall be designed for special conditions such as area classification, altitude, frequent starting, intermittent overload, high inertia, mounting configuration, or environment as required.

Motors used in applications which exceed the usual service conditions as defined by NEMA, such as higher than 40°C ambient, altitude exceeding 3,300 feet (1005 m), explosive or corrosive environments, departure from rated voltage and frequency, poor ventilation, or frequent starting, shall be properly selected with respect to their service conditions and shall not exceed specified temperature rise limits.

Manufacturer's standard motor may be supplied on appliances, tools, and unit heaters. If the manufacturer’s standard motor is not supplied, a redesign of the general purpose induction motor may be necessary. In all cases, totally enclosed motors are preferred and shall be furnished if offered by the manufacturer as a standard option.

Unless specified otherwise, all motors shall be designed for full voltage starting and to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

Motors utilizing a reduced-voltage, auto-transformer starter shall be capable of reduced-voltage starting at a 65 percent tap setting.

When powered from a variable frequency drive (VFD), motors shall be specifically selected for service with a variable frequency type speed drive and shall be derated as required to compensate for harmonic heating effects and reduced self-cooling capability at low speed operation. Each motor shall not exceed a Class B temperature rise when operating in the installed condition at load with power received from the variable frequency drive. All motors driven by VFD’s shall be supplied with full phase insulation on the end turns and shall meet the requirements of NEMA MG 1, Part 31. In addition to the requirements of NEMA MG 1, Part 31, motors shall be designed to be continually pulsed at the motor terminals with a voltage of 1600 volts ac.

Requirements for motor arrangement, speed type, torque type, and special enclosures shall be as required for the driven equipment and as indicated in that section.

2.3 PERFORMANCE AND DESIGN REQUIREMENTS. Design and construction of each general-purpose motor shall be as specified herein and as indicated.
2.3.01 Voltage. Motor voltage shall be as indicated in the driven equipment section and shall be designed to operate from an electrical system that may have a maximum of 5 percent voltage distortion according to IEEE 519.

2.3.02 Nameplate Horsepower. Motor nameplate horsepower (kW) shall be equal to or greater than the maximum load imposed by the driven equipment and shall carry a service factor rating as follows:

Motor Size	Enclosure	Service Factor
Fractional hp (kW)	Other than Open	1.15
Integral hp (KW)	Open	1.15
	Other than Open	1.15

2.3.03 Insulation. Motor insulation and temperature rise above 40°C design ambient (measured by resistance method) may be Class F with 90°C rise at 1.15 SF.

2.3.04 Enclosures. All motors shall be self-ventilated. All self-ventilated open type motors, including those with drip-proof, splash-proof, and weather protected enclosures, and the fan covers of totally enclosed fan cooled motors shall meet NEMA MG 1 requirements for a fully guarded machine.

Vertical motors of the open drip-proof type shall be provided with drip hood of acceptable shape and construction. When the drip hood is too heavy to be easily removed, provision shall be made for access for testing.

Single-phase motors requiring switching devices and auxiliary starting resistors, capacitors, or reactors shall be furnished as combination units with such auxiliaries either incorporated within the motor housings or housed in suitable enclosures mounted upon the motor frames. Each combination unit shall be mounted upon a single base and shall be provided with a single conduit box.

All fractional horsepower motors shall be totally enclosed.

2.3.05 Totally Enclosed Motors. Totally enclosed motors shall be furnished with drain holes and rotating shaft seals. Frames, bearing brackets, external terminal housings, and fan covers for fan cooled motors shall be cast iron. External cooling fans for fan cooled motors shall be fabricated of brass, bronze, aluminum alloy containing not more than 0.2 percent copper, malleable iron, or plastic.

2.3.06 Outdoor Motors. Outdoor motors shall have NEMA weather protected enclosures. All exposed metal surfaces shall be protected, where practical, with a corrosion resistant polyester coating. Exposed uncoated surfaces shall be of a corrosion resistant metal. Enclosure exterior and interior surfaces, air gap surfaces, and windings shall be protected with a corrosion resistant alkyd enamel, polyester, or epoxy coating.

2.3.07 Motors for Hazardous Locations. Motors for hazardous locations shall be in accordance with the NEC and of the correct type enclosures for the particular service as specified in NEMA MG 1. Motors shall meet the requirements of UL 674. Motors shall be suitable for a Class I, Group C and D, Division 1 area; or for a Class I, Group C and D, Division 2 area as indicated on the drawings.

2.3.08 Encapsulated Windings. When indicated, motors shall be provided with a totally enclosed, fan-cooled enclosure with special corrosion-resistant finish and encapsulated windings meeting the requirements of NEMA MG 1-1.27.2.

2.3.09 Severe Duty Motors. When indicated, motors shall be provided with a totally enclosed, fan-cooled enclosure with special corrosion-resistant finish and encapsulated windings meeting the requirements of NEMA MG1-1.27.2 and IEEE 841.

2.3.10 Conduit Boxes. Externally mounted conduit boxes shall be in accordance with NEMA MG 1. The conduit boxes shall be diagonally split for easy access to the motor leads, and designed for rotation in 90 degree increments. A gasket shall be furnished between the halves of the box. Conduit openings in the main conduit box shall match the size and quantity of conduits indicated on the one line drawings.

The main conduit box shall be sized for all indicated accessory leads. All medium voltage motors shall have conduit boxes sized for stress cones on the cable leads.

Motors shall have terminal boxes for auxiliary equipment with terminal leads grouped in boxes for all external connections. Terminal boxes shall be oversized and shall have terminals and conduit hubs sized for the cables and conduit indicated on the drawings.

Motors furnished in NEMA 320 frame series and larger shall have conduit boxes designed and constructed to permit motor removal after installation without disconnecting raceways.

Motor conduit boxes shall be oversized at least one size larger than NEMA standard. Size shall be increased as required for stress cone terminations and current transformers.

Totally enclosed and explosion-proof motors shall have cast iron terminal boxes.

2.3.11 Leads. Motor power leads shall be wired into the motor terminal housing. Unless otherwise specified, space heater leads shall be wired into a separate motor space heater terminal box. All motor leads and their terminals shall be permanently marked in accordance with the requirements of NEMA MG 1, Part 2. Each lead marking shall be visible after taping of the terminals.

All motors rated 100 horsepower (74 kW) and larger, all motors furnished with unidirectional blowers, and all vertical motors shall have the direction of rotation marked by an arrow mounted visibly on the stator frame near the terminal housing, or on the nameplate, and the leads marked for phase sequence T1, T2, T3, to correspond to the direction of rotation and supply voltage sequence.

Leads for dual-voltage rated or for multi-speed motors shall be easily connected or reconnected in the terminal housing for the operating voltage or for the specified speeds. Permanent instructions for making these connections shall be furnished inside the terminal housing or on the motor frame or nameplate.

Motors shall also have flexible leads of sufficient length to extend beyond the face of the box for a distance of not less than 4 inches (10.16 cm).

2.3.12 Terminals. Cable type leads shall be provided with Burndy Type YA or acceptable equal compression type connectors.

2.3.13 Grounding Connections. All motors, including those with resilient mountings, shall be furnished with a ground connection.

2.3.14 Bearings. All bearings shall be self-lubricating, shall have provisions for re-lubrication, and shall be designed to operate in any position or at any angle.

Motor bearings shall be anti-friction type with L_{10} life rating of 40,000 hours in accordance with AFBMA Standards.

All bearing mountings shall be designed to prevent the entrance of lubricant into the motor enclosure or dirt into the bearings, and shall be fitted with pipes, drain plugs, and fittings arranged for safe, easy re-lubrication from the outside of the motor while the motor is in service.

Vertical motors shall be provided with thrust bearings adequate for all thrusts to which they can be subjected in operation.

2.3.15 Rotors. All induction motors shall have squirrel-cage rotors adequately sized to avoid overheating during acceleration of the motor and driven equipment. Rotors shall be dynamically balanced to 0.08 in./sec (2.03 mm/s) or less.
2.3.16 Shafts. Shafts shall be furnished with corrosion resistant treatment or shall be of a corrosion resistant material.

2.3.17 Torque Characteristics. Motors rated 200 horsepower (149 kW) and less shall have torques and locked-rotor current in accordance with NEMA MG 1, Part 12.

2.3.18 Motor Space Heaters. When indicated, motors shall be provided with a space heater element sized to prevent condensation on the core and windings. The space heaters shall be isolated or so located as to prevent heat damage to adjacent painted surfaces and shall be suitable for 120 volt, 60 Hz, single phase power supply.

2.3.19 Temperature Sensing Devices. When indicated, each motor shall be furnished with resistive temperature devices (RTD) placed to sense temperature in the motor windings and bearings. All RTD's shall be 100 ohm, platinum type. Each motor shall be equipped with a pair of RTD's in each phase winding and a pair in the thrust and guide bearings. All RTD's shall be connected with a twisted shielded triad to the motor protection relay and shall be connected as indicated on the electrical schematics and one-line diagrams.

When indicated, each motor shall be furnished with at least one automatic reset winding temperature switch per phase. Temperature switch contacts shall be normally closed and rated 5 amperes at 120 volts ac. The contacts shall be wired in series with the end leads brought out to a separate motor terminal box. Switches shall be as recommended by the motor manufacturer.

When indicated, temperature detectors for sleeve or anti-friction bearings, complete with detector head and holder assemblies, shall be furnished in accordance with the applicable requirements of ANSI MC96.1 and IEEE 119.

2.3.20 Assembly. All motors shall be completely assembled with the driven equipment, lubricated, and ready for operation.

2.3.21 Efficiency. Minimum motor efficiencies shall conform to the requirements of Energy Policy Act of 1992 (EPACT) and when indicated, shall be premium efficiency type and shall have a NEMA nominal efficiency nameplate value equal to or greater than values indicated in the following table. Efficiency shall be determined in accordance with IEEE 112, Test Method B.

Vertical motors shall be premium efficiency type and shall have efficiency values equal to or greater than those indicated in the following table minus 0.50.

		Nominal Efficiency Values Open Drip Enclosure				Nominal Efficiency Values TEFC Enclosure			
Motor		3600	1800	1200	900	3600	1800	1200	900
kW	hp	rpm	rpm	rpm	rpm	rpm	rpm	rpm	rpm

373	500	95.8	95.8			95.4	95.8		

2.4 ACCESSORIES.

2.4.01 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Each motor shall be provided with lifting eyebolts or lugs, and appropriate fittings for adding bearing lubricant when required. Grease lubricated units shall be provided with a means of venting the casing. Oil lubricated units shall be provided with constant level oilers or with sight glasses arranged to indicate operating and static oil levels.

2.5 ANCHORS. Contractor shall furnish suitable anchors for each item of equipment as required for driven equipment.

2.6 SHOP PAINTING. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for coating. Electric motors shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

2.7 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4W/N (oz*in).

Where:
W = Weight of rotor in pounds
N = RPM for N greater than 1,000

2.8 TESTS. For induction motors larger than 100 hp., complete tests of each motor furnished shall be made and certified test data sheets shall be submitted, witness shop tests are required by the detail specifications pertaining to the equipment. Each motor shall be tested for efficiency and power factor at 50, 75, and 100 percent of its rated horsepower for temperature rise, torque, starting current, and dielectric strength, and for compliance with all specified performance requirements.

For induction motors 5 hp. up to, and including, 100 hp., six (6) copies of routine test reports of electrically duplicated motors shall be furnished.

For motors 3 hp or less, no test data need be furnished.

Additional tests on individual motors shall be as specified in the Master Specification section for the equipment driven by the motor.

2.9 ADDITIONAL REQUIREMENTS. Unless otherwise specified or permitted, all electric motors furnished and installed by the Contractor shall conform to the requirements hereinafter set forth.

2.9.01 Ratings of Motors

2.9.01.01 Every motor shall be of sufficient horsepower and speed to operate the driven equipment under all load and operating conditions without exceeding its rated nameplate current or power or specified temperature limits.

2.9.01.02 Each motor shall develop ample torque for its required service throughout its acceleration range at a voltage 10 percent below nameplate rating. Where shown on the Electrical Drawings to be operated on a reduced voltage starter, the motor shall develop ample torque under the conditions imposed by the reduced voltage starting method.

2.10 TYPE OF MOTORS

2.10.01 All motors shall be of a type having starting characteristics and ruggedness as may be necessary under the actual conditions of operation and, unless otherwise specified, shall be suitable for full-voltage starting.

2.11 GENERAL DESIGN OF MOTORS

2.11.01 Motor windings shall be braced to withstand successfully the stresses resulting from the method of starting. The windings shall be treated thoroughly with acceptable insulating compound suitable for protection against moisture and slightly acid or alkaline conditions.

2.11.02 Bearings shall be of the self-lubrication type, designed to ensure proper alignment of rotor and shaft and to prevent leakage of lubricant. The motors shall be lifetime lubricated with silicone grease. Antifriction bearings shall be designed to be re-greasable and initially shall be filled with grease suitable for ambient temperature of 40° C. Bearings shall be AFBMA Types BC or RN, heavy duty, or shall otherwise be shown to be suitable for the intended application in terms of B-10 life rating, Class M3 or better. All grease lubricated bearings, except those specified to be factory sealed and lubricated, shall be fitted with easily accessible grease supply, flush, drain and relief fittings. Extension tubes shall be used when necessary. Grease supply fittings shall be standard hydraulic type by the Alemite Division of the Stewart-Warner Corporation or approved equal.

2.11.03 Vertical motors shall be provided with thrust bearings adequate for all thrusts to which they can be subjected in operation.

2.11.04 Locked rotor current shall not be greater than specified in NEMA Standard MGI-12.32, Design "N".

2.11.05 Motor shall be totally enclosed in conformance with NEMA Standard MGI-10.35. Small fan motor may be open type if suitably protected from moisture, dripping water and lint accumulation.

2.11.06 When indicated, each motor shall be provided with x-y, velocity type vibration sensors with transmitters at each end of the motor. The sensors & transmitters shall be as per 17550, 3.2.17. All wiring shall be brought out to a separate terminal box for external connections.

2.12 SINGLE PHASE MOTORS AUXILIARY DEVICES

2.12.01 Single phase motors requiring switching devices and auxiliary starting resistors, capacitors, or reactors shall be furnished as combination units with such auxiliaries either incorporated within the motor housing or housed in suitable

enclosures mounted upon the motor frames. Each combination unit shall be mounted upon a single base and shall be provided with a single conduit box.
2.13 SPECIAL MOTORS

2.13.01 Hoists and other devices complying with special safety codes shall be furnished complete with their control equipment and with all accessories and safety devices for code-approved, safe and efficient operation.

PART 3 - EXECUTION

3.1 INSTALLATION. Each motor will be installed in accordance with the requirements of the Master Specification section for the equipment being driven.

End of Section

SECTION 16310

SECONDARY INTEGRAL UNIT SUBSTATIONS

PART 1 - GENERAL

1.1 SCOPE. This section covers secondary integral unit substation equipment that shall be furnished, installed, and tested as specified herein and as indicated on the drawings. Equipment shall meet the following requirements, and the design conditions and features as indicated.

Each secondary unit substation shall consist of one or more enclosed high voltage incoming line sections, close-coupled three phase power transformer(s), and an enclosed secondary low voltage section(s) all as defined in NEMA Publication 210 - 1970. Low voltage section shall be a terminal chamber, circuit breaker, panelboard, low voltage switchboard or switchgear, or motor control center as required.

Secondary integral unit substation equipment shall meet the design conditions and features indicated.

Secondary integral unit substation equipment shall be designated and shall be located as indicated.

1.2 GENERAL. Equipment furnished under this section shall be fabricated, assembled, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer. Working space in front of the unit substations shall meet the minimum requirements of the latest NFPA 70: National Electrical Code.

1.2.03 Workmanship and Materials. Equipment supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thickness so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

ANSI	American National Standards Institute
AWG	American Wire Gage
FS	Federal Specifications
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.2.05 Governing Standards. All equipment to be furnished under this section shall be designed, constructed, and tested in accordance with the following standards:

IEEE C37.20.3, IEEE C37.20.4 and NEMA SG-2 (high-voltage switches)

ANSI C26.1 and NEMA LA1 (lightning arresters)

NEMA SG-5, and UL 1558 (low-voltage switchgear)

NEMA PB 2 (switchboards)

ANSI C57.12.00 & C57.90 (liquid immersed transformer)

ANSI C57.12.00, C57.90 & C57.94 (dry type transformer)

NEMA AB1 (molded case circuit breakers)

NEMA PB 210 (unit substation)

NEMA ICS 6 (enclosures)

The equipment shall also conform to all the applicable standards of ANSI, NEMA, UL, and NEC 230-95, 240, 380, 384, 430, 450, and 710.

Equipment covered by this section shall be listed by UL or a nationally recognized third-party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of Contractor. In the event no third-party testing laboratory provides the required listing, an independent test shall be performed at Contractor's expense. Before the test is conducted, Contractor shall submit a copy of the testing procedure that will be used.

1.2.06 Nameplates. When indicated, nameplates with unit description and designation of each control or indicating device shall be mounted on all hinged doors and rear cover plates. Nameplates shall have black baked enamel 3/4 inch (19 mm) high letters for section identity and 1/8 inch (3 mm) letters for other information on anodized aluminum plate.
Each control device and each control wire terminal block connection inside the units shall be identified with a permanent nameplate or painted legend to match the identification on the manufacturer's wiring diagram.

1.2.07 System Characteristics. The secondary unit substation will be connected to an electric system with characteristics as indicated on the drawings.

1.3 SUBMITTALS. Complete assembly, foundation requirements, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the substation, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data shall include, but shall not be limited to, the following:

Incoming Line Section

Elevation, plans, and weight.

Fuse time-current characteristic curves.

Rating and specifications for switches.

Surge arrester ratings and characteristics.

Transformer

Elevation, plan, weight, and nameplate.

Shop tests.

Outgoing Line Section

Elevation, plan, weight, and bill of material.

Single-line, control schematic, wiring connection, and wiring interconnection diagrams.

Circuit breaker time-current characteristic curves.

1.3.01 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Assembly, installation, alignment, adjustment, and checking instructions.

Frame sizes and trip settings of all breakers

Short circuit and Coordination analysis including curves of all breakers, new transformer damage curve, curves for all fuses and other protective devices

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 SHIPPING, STORAGE, AND HANDLING. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked as required. Complete packing lists and bills of material shall be included with each shipment.

1.5 SPARE PARTS. Spare parts shall be provided as indicated on the Contract Documents.

Spare parts shall be suitably packaged with labels indicating the contents of each package and shall meet all the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.. Spare parts shall be delivered to Owner as directed.

1.6 COORDINATION STUDY. When a coordination study of the power distribution system will be conducted as specified in the electrical section Master Specification Section 16052, Coordination Study and Arc Flash Analysis. The equipment manufacturer shall provide the following information to Engineer with the initial equipment shop drawings:

Curves for each current-limiting fuse.

Coordination curves for each circuit breaker.

Damage curves and protection evaluated in accordance with ANSI/IEEE C57.109 for each transformer.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. The equipment shall be as manufactured by Square D/ Schneider Electric, Eaton Cutler-Hammer, General Electric, Siemens Energy & Automation, or ABB,or .

2.2 DESIGN AND CONSTRUCTION. Each substation shall consist of a primary incoming line section, a transformer section, and a secondary outgoing line section. Each substation shall conform to the arrangement, one-line diagram, schematics, and requirements indicated on the drawings or specified herein.

2.2.01 Sills and Anchors. Contractor shall furnish steel channels, floor sills, and anchor bolts as required for proper installation.

2.3 PRIMARY INCOMING LINE SECTION. The primary incoming line section for each substation shall consist of line terminals or switches and fuses as indicated on the drawings.

2.3.01 Primary Selective Radial Switch. Each primary selective radial switch shall consist of two parallel two-position (Open/Closed), three-pole, load break type, air-or vacuum-interrupter switches, with stored energy mechanism. The switches shall be key interlocked so that both incoming line switches cannot be closed at the same time. Each switch shall be rated 5, 15, 25, or 34.5 kV; 60, 95, or 150kV BIL; 600 or 1200 amperes continuous; with a momentary asymmetrical rating of 40,000, 60,000, or 80,000 amperes as indicated. All three poles of each switch shall open simultaneously by a handle on the front of the primary incoming line section compartment. Each switch shall have a mechanical position indicator. Each switch shall be enclosed in a separate compartment to permit maintenance on one switch while the other one is energized. A shatterproof window shall be provided to permit visual inspection of each interrupter switch.

2.3.02 Two-Position Air-Interrupter Switch. Each two-position (Open/Closed) air-interrupter switch shall be of the three-pole, load break type, with stored energy operating mechanism. Each switch shall be rated 5, 15, 25, or 34.5 kV; 60, 95, or 150kV BIL; 600 or 1200 amperes continuous; with a momentary asymmetrical rating of 40,000, 60,000, or 80,000 amperes as required. All three poles of each switch shall open simultaneously by a handle on the front of the primary incoming line section compartment. Each switch shall have a mechanical position indicator.

2.3.03 Incoming Line Terminals. Incoming line terminals shall be crimp or compression type and shall be suitable for terminating shielded cables of at least the size indicated on the drawings with Class 1 type stress cones. The incoming lines will enter from the top or bottom of the enclosure as required. Adequate space shall be provided for stress cones on the incoming lines. Bus connections shall be provided between the connecting terminals and the disconnecting switches or the transformer.

2.3.04 Current-Limiting Fuses. Current-limiting fuses or electronic power fuses as indicated, shall be included in each switch compartment to protect the transformer. The fuses and fuse holders shall be rated approximately 200 to 250 percent of transformer full load amperes continuous. Access to the fuse compartment shall be by a hinged door interlocked with the switch so that the door cannot be opened unless the switch is opened. The door shall be on the front of the enclosure.

Fuses shall be disconnect style and shall have provisions for grounding on the load side of each fuse and on the enclosure ground bus. Each fuse shall be equipped with a blown fuse indicator that provides visible evidence of fuse operation while installed in the fuse mounting. Fusible elements shall be nonaging and nondamageable, so it is unnecessary to replace unblown companion fuses following a fuse operation. Fusible elements shall be protected against damage caused by current surges.

Any arcing accompanying power fuse operation shall be contained within the fuse and any arc products and gases produced shall be vented through exhaust control devices.

One hundred percent spare fuses shall be provided for each switch. Spare fuses shall be placed in a spare fuse compartment on each door.

2.3.05 Buses. All phase bus conductors shall be tin-plated copper and shall be mounted on NEMA class insulators. A 600 ampere copper ground bus with a connector for incoming ground cable shall be provided.

2.3.06 Space Heaters. Space heaters for 120 volt ac service shall be provided in each high-voltage switch compartment to prevent condensation in the switch enclosure. The space heaters shall be controlled by a thermostat factory-set to maintain the enclosure above the dew point for anticipated environmental conditions. Space heaters shall be connected to a circuit breaker disconnect in the transformer secondary terminal compartment. The space heater power supply shall be from an external source or shall be from an integral power supply provided in the secondary compartment as indicated.

2.3.07 Lightning Arresters. Intermediate class metal oxide lightning arresters shall be provided, connected at the incoming terminations, and securely grounded to the metal structure. Arrester kV ratings shall be 3, 4.5, 36, or 39 kV, as indicated.

2.4 LIQUID-INSULATED TRANSFORMER SECTION. Each transformer shall be 3 phase less-flammable liquid-insulated or oil-insulated unit substation type, as indicated, with kVA and voltage ratings as indicated on the drawings and as specified herein. Less-flammable liquid shall be fire resistant hydrocarbon type. Transformers filled with silicone fluid will not be acceptable. Each transformer shall match and line up with the primary switch or switches. Bus connections shall be provided between the transformer high-voltage bushings and the interrupter switch or switches. Each transformer shall conform to NEMA standards for liquid-insulated transformers. Transformers shall be K-rated.

2.4.01 Rating. Each transformer shall be rated as indicated on the drawings, and the primary winding shall have four 2-1/2 percent fully rated taps, two above and two below rated voltage.

An OA rating shall indicate that the transformer will carry its continuous rating with average winding temperature (by resistance) that shall not exceed 150°F (65°C) rise, based on an average ambient of 85°F (30°C) over 24 hours with a maximum of 105°F (40°C).

An OA/OA rating shall indicate that the transformer will carry its continuous rating with average winding temperature (by resistance) that shall not exceed 130°F (55°C) rise, based on an average ambient of 85°F (30°C) over 24 hours with a maximum of 105° F (40°C). The insulation system shall allow an additional 12 percent continuous output at 150°F (65°C) rise without any decrease in the transformer's normal service life.

An FA rating shall indicate the transformer shall include a temperature monitor, wiring, fans and auxiliary equipment necessary for automatic temperature controlled forced air cooling to obtain 15 percent or 25 percent additional capacity. Control power for fans shall be from a control power transformer in the transformer secondary terminal compartment or from a separate control power source as indicated on the drawings.

An FFA rating shall indicate the transformer shall include the same provisions as for the FA rating except the fans will be provided in the future.

Transformers shall be derated when installed at an altitude exceeding 3,300 feet (1005 m).

2.4.02 BIL. The BIL of the high-voltage windings shall conform to the following:

Nominal System Voltage kV	Basic Impulse Level kV
1.2	45
2.4	60
4.8	75
8.32	95
14.4	110
23.0	150
34.5	200

2.4.03 Impedance. Transformers shall have the following impedance ($\pm$ 7.5 percent) at their lowest self-cooled rating:

Transformer Size kVA	Impedance Percent
225	5.0
300 & 500	5.0
750 & 1000	5.75
1500 & 2000	5.75
2500 & 3000	5.75
4000 & 5000	5.75

2.4.04 Construction. Each transformer tank shall be fabricated of steel plate reinforced by structural steel members and shall have a structural steel base. All structural members, attachments, assemblies, tank seams, and tube connections shall be welded. All bolted, flanged connections shall be provided with suitable gaskets. The tank shall be equipped with lifting lugs suitable for convenient and safe handling of the transformer when fully assembled and filled with liquid. The tank shall be filled and sealed at the factory.

Incoming and outgoing sections of each transformer shall be located on opposite ends of the transformer and shall be equipped with tamper-resistant hardware.

2.4.05 Efficiency. Each transformer shall meet the minimum efficiency standards required by the U.S. Department of Energy (10 CFR Part 431).

2.5 AIR- INSULATED TRANSFORMER SECTION. Each transformer shall be 3 phase, air-insulated dry type, with kVA and voltage ratings as indicated on the drawings and as specified herein. Each transformer shall match and line up with the primary switch or switches. Bus connections shall be provided between the transformer high-voltage bushings and the interrupter switch or switches. Each transformer shall conform to NEMA standards for dry type transformers. Transformers shall be K-rated.

2.5.01 Rating. Each transformer shall be rated as indicated on the drawings, and the primary winding shall have four 2-1/2 percent fully rated taps, two above and two below rated voltage. The electrical insulation shall utilize Class H material in a fully rated 430°F (220°C) system. Design temperature rise shall be based on 85°F (30°C) average ambient over a 24 hour period, with a maximum of 105°F (40°C). The windings shall be impregnated with polyester or silicone resin by a vacuum pressure process.

As indicated on the drawings, the transformer shall be designed for a temperature rise of 300°F (150°C), 240°F (115°C), or 175°F (80°C) and shall be capable of continuously operating at 0, 15, or 35 percent above base nameplate kVA capacity without any decrease in the transformer's normal service life.

An FA rating shall indicate that the transformer shall include the necessary wiring, temperature monitor, relays, and fans required to increase the kVA rating by 33 percent. Control power for fans shall be from a control power transformer in the transformer secondary terminal compartment or from a separate control power source as indicated on the drawings or as required.

An FFA rating shall indicate the transformer shall include the same provisions as for the FA rating except the fans will be provided in the future.

2.5.02 BIL. The BIL of the high-voltage windings shall conform to the following:

Nominal System Voltage kV	Basic Impulse Level kV
1.2	10

2.4	20
4.8	30
8.32	45
14.4	60
34.5	150

2.5.03 Impedance. Transformers shall have the following impedance ($\pm$ 7.5 percent) at their lowest self-cooled rating:

Transformer Size kVA	Impedance percent
112.5	3.5
150	4.5
225	5.75
300	5.75
500 & 750	5.75
1000 & 1500	5.75

2.5.04 Construction. The transformer shall be supplied in a knockdown case design, for ease in fitting through limited openings. The case shall be constructed of USS 13 gage (2.28 mm thick) carbon steel sheet and shall be equipped with removable panels for access to the core and coils. Front and rear panels shall be provided with ventilating grills. The transformer shall have provisions for lifting and jacking.

2.6 SECONDARY OUTGOING LINE SECTION.
The secondary outgoing line section shall be factory installed on, or close-coupled to, the transformer. It shall consist of an air-filled terminal compartment, a secondary switchgear section and all other equipment indicated on the drawings or as required.

2.6.01 Air-Filled Terminal Compartment. The air-filled terminal compartment shall consist of a full-height NEMA rated enclosure with features as required. The compartment shall enclose the transformer low voltage bushings and terminal connectors for secondary cables or bus.

A 480-120 volt control power transformer with primary and secondary breakers, for space heaters or for fan cooling, shall be provided in the compartment.

2.6.02 Secondary Switchgear. The switchgear section shall be a main-tie-main configured low voltage, metal-enclosed switchgear with draw-out type power circuit breakers. The sides and rear of the enclosure shall be covered with removable bolt- on plates. Bus bars shall be tin-plated copper with bolted connections at joints and sized for the ampere ratings indicated on the design drawings. The switchgear assembly including all breakers, buses, terminations and any other power distributing conductors shall be rated to withstand and interrupt an available fault current of 65,000 amps.

2.6.03 <u>Draw-out Circuit Breakers.</u> Low voltage draw-out power circuit breakers shall be provided in the frame ratings, quantities and configurations shown on the design drawings. Electronic trip units shall be provided with each breaker according to the requirements of subsection 2.6.04. Power monitoring devices shall be provided where indicated on the design drawings.

2.6.04 <u>Electronic Trip Units.</u> Each trip unit shall be supplied with a trip plug sized to the trip rating indicated on the design drawings. The trip units shall have adjustable time-overcurrent settings that include: long-time pickup and time delay, short-time pickup and time delay, and an instantaneous pickup capable of being turned off.

Each trip unit shall also be provided with ground fault protection with an adjustable pickup not exceeding 1200 A, and adjustable time delay. A neutral current transformer shall be included where required for proper ground fault protection.

Each breaker trip unit shall be capable of communicating the status of the breaker (Open/Closed/Tripped), trip settings and trip event data through the plant's existing process network using either a direct Ethernet connection or by sending the information through its associated power monitoring device as described in section
2.6.06.

2.6.05 <u>Automatic Transfer System.</u> An automatic transfer system shall be provided to facilitate automatic or manual operation of the main-tie-main configuration of the switchgear. The system shall be controlled through a PLC with a touch-screen interface for manual control of the system. The transfer system shall be capable of monitoring the synchronization of the two main power feeds and performing a closed transition when safe to do so without damaging any equipment. The Owner shall be provided with backup copies and loading procedures for any software programs
used to control or interface with the system.

2.6.06 <u>Power Monitoring</u>. Information from all power monitoring devices located within the substation shall be made available for communication through the plant's existing Ethernet process network utilizing an open data format compatible with the Ovation DCS system.

Each main and feeder breaker shall be provided with power metering devices capable of measuring the voltage, phase currents, frequency, kilowatts, (kilo)watt- hours, power factor, total harmonic distortion, and the first seven harmonics as a minimum.

Trip units with integral power metering that are capable of providing all required functions listed in the paragraph above may be supplied for the feeder breakers. Separate power monitoring units shall be provided for the incoming feeds to the main breakers. If capable, the power metering units may be used to communicate information from their associated breaker's trip unit to the network.

2.7 ACCESSORIES.

2.7.01 Special Tools and Accessories. All special tools and accessories necessary for testing and maintenance of the equipment shall be furnished.

2.7.02 Transformer Accessories. When a liquid-insulated transformer is required, it shall be provided with the following accessories:

Magnetic-type liquid gauge with low level alarm contact and a mark at normal 75°F (25°C) level.

Upper and lower filter press connections.

Liquid sampling valve.

Drain valve.

Liquid temperature dial-type thermometer with a high temperature alarm contact.

Pressure-vacuum gauge of suitable range.

Stainless steel nameplate with information as prescribed in ANSI standards.

Grounding pad with clamp-type terminal for 250 kcmil (120 mm^2) ground cable.

Tank pressure relief device with alarm contact.

Pressure test valve.

Tank lifting lugs.

Gang-operated tap-changer control switch.

Handhole.

2.7.03 Transformer Accessories. When a dry type transformer is required, it shall be provided with the following accessories:

Diagram instruction plate.

Removable panel for access to high voltage strap type connector taps for de-energized tap changing.

Two ground pads with clamp-type terminals for 250 kcmil (120 mm^2) ground cables.

2.8 SHOP PAINTING. All iron and steel surfaces, except machined surfaces and stainless steel, shall be shop painted with the manufacturer's standard coating. Finish color shall be ANSI 61 for indoor equipment, ANSI 61 or 70 for outdoor equipment, or another color as required. Field painting, other than touch up painting, will not be required. Quantities of coating material and thinner, as required, shall be furnished to permit field touch up painting of damaged coatings.

The underside of equipment installed in exposed outdoor locations shall be thoroughly cleaned and coated with an automotive type undercoating material. The coating shall be thick enough to withstand normal handling during shipping and installation. The underside is considered to be the surfaces in contact with the floor or pad and other surfaces not readily accessible for field painting.

2.9 SHOP TESTS. After the equipment has been completely assembled, it shall be shop tested for general operating condition, circuit continuity, high potential, and other standard tests for the particular class of equipment, as defined by industry standards.

The transformers shall be subjected to all standard factory tests, including quality control tests. Four certified copies of test results shall be submitted to Engineer before the equipment is shipped to the project site. Temperature tests will not be required, but calculated temperature rise based on tests of similar transformers of the same size shall be furnished.

PART 3 - EXECUTION

3.1 INSTALLATION. The equipment shall be installed in accordance with the drawing specifications and the manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Supervision. When indicated, the equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the contract price. Manufacturers' installation supervisor shall observe, instruct, guide, and direct Contractor's erection or installation procedures as required. The equipment manufacturer will be provided with written notification 10 days prior to the need for such services.

3.2.02 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, set all relays in accordance with the settings designated in the coordination study, and approve the equipment installation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools. The representative shall be present when the equipment is placed in operation. Such services shall be included in the contract price.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.3 TRAINING

Contractor shall provide training for DWSD employees. Training shall consist of two (2) four-hour sessions and shall include, but not be limited to, racking in and out breakers; setting breakers; using breaker lifting mechanisms; operation of throwover PLC; safety features of switchgear; operation of breakers; operation of meters; preventive maintenance of breakers and switchgear; transformer maintenance; and operation and maintenance of primary switches. Number of trainees, training agenda, topics and days and times shall be coordinated with and preapproved by DWSD prior to start of the training.

End of Section

SECTION 16320

MEDIUM-VOLTAGE THREE PHASE PAD-MOUNTED TRANSFORMERS

PART 1 - GENERAL

1.1 SCOPE. This section covers compartmented, tamper-resistant, weatherproof transformers for mounting on concrete pads. The transformers shall be furnished, installed, and tested as specified herein and as indicated on the drawings. Equipment shall meet the following requirements, and the design conditions and features as indicated.

Transformer equipment shall meet the design conditions and features indicated.

Transformer equipment shall be designated and shall be located as indicated.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer. Minimum clear working space in front of transformers shall conform to NEC Table 110-34(a).

1.2.03 Workmanship and Materials. Equipment supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

ANSI	American National Standards Institute
AWG	American Wire Gage
FS	Federal Specifications
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.2.05 Governing Standards.

(1) The transformer shall be designed, constructed, and tested in accordance with the latest revision of the applicable IEEE, ANSI, ASTM and NEMA standards except where specific requirements of these specifications conflict with these standards. In such cases, these specifications shall take precedence.

(2) It is assumed that the equipment provided by the manufacturer will be in strict compliance with these specifications unless specific exception is taken and explanation provided.

(3) Current applicable revisions of IEEE, ANSI, ASTM and NEMA standards:

a. C57.12.00 IEEE Standard General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers
b. C57.12.10 American National Standard for Transformers – 230 kV and Below 833/958 through 8333/10 417 KVA, Single-Phase, and 750/862 through 60 000/80 000/100 000 KVA Three-Phase Without Load Tap Changing; and 3650/4687 through 60,000/80,000/100,000 KVA Three-Phase With Load Tap Changing –Safety Requirements.
c. C57.12.20 American National Standard for Overhead-Type Distribution Transformers.
d. C57.12.70 American National Standard Terminal Markings and Connections for Distribution and Power Transformers.
e. C57.12.90 IEEE Standard Test Code for Liquid-Immersed Distribution, Power, and Regulating Transformers
f. C57.19.01 IEEE Standard Performance Characteristics and Dimensions for Outdoor Apparatus Bushings

g. C57.91 IEEE Guide for Loading Mineral-Oil-Immersed Transformers (Revision of IEEE Std C57.91-1981, IEEE Std C57.92-1981 & IEEE Std C57.115-1991)
h. C57.98-1993 IEEE Guide for Transformer Impulse Tests.
i. C57.109 IEEE Guide for Liquid-Immersed Transformer through-Fault-Current Duration
j. C 57.119. Recommended Practice for Performing Temperature Rise Tests on Oil Immersed Power Transformers at Loads beyond Nameplate Ratings
k. C57.131. IEEE Standard Requirements for Load Tap Changers
l. C57.13. IEEE Standard Requirements for Instrument Transformers
m. C57.104. IEEE Guide for the Interpretation of Gasses Generated in Oil-Immersed Transformers
n. C57.116. IEEE Guide for Transformers Directly Connected to Generators
o. C57.119. Recommended Practice for Performing Temperature RiseTests on Oil Immersed Power Transformers at Loads beyond Nameplate Ratings
p. C57.120. IEEE Loss Evaluation Guide for Power Transformers and Reactors
q. NEMA Standards Publication TR1 Transformers, Regulators and Reactors
r. ASME, B1.1. American National Standard for Unified Inch ScrewThreads (UN and UNR Thread Form)
s. ASTM, D3487-00 Standard Specification for Mineral Insulating Oil Used in Electrical Apparatus.
t. ASTM, D5222-00 Standard Guide for High Fire-Point Mineral Electrical Insulating Oils."

The equipment shall also conform to, UL, and NEC 230-95, 240, and 450.

1.2.06 Nameplates. A nameplate with unit description shall be provided on each transformer. Nameplates shall have high black baked enamel 3/4 inch (19 mm) high letters on anodized aluminum.

An instruction nameplate shall be mounted in the low-voltage compartment and shall be readable with cables in place. All doors giving access to high-voltage parts shall be posted with DANGER - HIGH VOLTAGE - KEEP OUT signs. The signs shall be constructed of heavy gage metal, with red letters on a white background.

1.2.07 System Characteristics. The primary side of the transformer will be connected to an electric system with characteristics as indicated on the drawings.

1.3 SUBMITTALS. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the transformer, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. The drawings and data shall include, but shall not be limited to, the following:

High-Voltage Section

Catalog and data sheets on high-voltage bushings, intermediate lightning arresters, bushing wells, bushing inserts and separable connectors, metal oxide varistor elbow type arresters, load-break switch, tap changer, and fuses.

Fuse time-current characteristic curves.

Transformer

Elevation, plan, weight, and nameplate.

Low-Voltage Section

Catalog and data sheets on low-voltage bushings and terminals, and secondary circuit breakers.

Circuit breaker time-current characteristic curves.

Operation and Maintenance Data and Manuals

1.4 SHIPPING, STORAGE, AND HANDLING. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage, in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked. Complete packing lists and bills of material shall be included with each shipment.

1.5 SPARE PARTS. Spare parts shall be provided based on the spare parts list recommended by the transformer manufacturer or supplier and approved by the client.

Spare parts shall be suitably packaged with labels indicating the contents of each package and shall meet all the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Spare parts shall be delivered to Owner as directed.

1.6 COORDINATION STUDY. When a coordination study of the power distribution system will be conducted in accordance with Master Specification Section 16050, Electrical General Requirements. The equipment manufacturer shall provide the following information to Engineer with the initial equipment shop drawing submittal:

Protective fuse curves for each current-limiting fuse.

Coordination curves for each circuit breaker.

Transformer damage curves and protection evaluated in accordance with ANSI/IEEE C57.109 for each transformer.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Each transformer shall be a product of a manufacturer who has supplied such equipment for at least 5 years.

The equipment shall be manufactured by ABB Power T&D, Cooper Power Systems, General Electric, Siemens Energy & Automation, Square D, Waukesha Electric Systems, Reinhausen Manufacturing Inc. for load tap changer or approved equal.

2.2 CONSTRUCTION. Each transformer shall be tamper-resistant and weatherproof, with integral high-voltage and low-voltage compartments, and shall conform to the arrangement, one-line diagram, schematics, and requirements indicated on the drawings or specified herein.

2.2.01 Sills and Anchors. The Contractor shall furnish and install steel channels, floor sills, and anchor bolts as required by the equipment manufacturer for proper installation.

2.2.02 Enclosure. The transformer tank and terminal compartments shall be bolted together to form an integral unit of weatherproof construction, suitable for outdoor installation. The transformer shall be completely enclosed, with one high-voltage and one low-voltage compartment door. No externally removable bolts, screws, or other fastening devices shall be used (with the exception of pentahead bolts for security) that provide access to the energized parts within the enclosure. The enclosure shall be of tamper-resistant design.

2.2.03 Terminal Compartments. Full height, air-filled, dead-front incoming and outgoing terminal compartments with hinged doors shall be located side by side, separated by an isolation barrier. The low-voltage compartment shall be on the right when facing the transformer. The fastenings of the high-voltage compartment door shall not be accessible until the low-voltage compartment door has been opened. The low-voltage compartment door shall have a 3-point latching mechanism with vault type handle and provisions for a single padlock. The doors shall be equipped with stainless steel lift-off type pin hinges and doorstops to hold the doors open when working in the compartments. The doorsills shall be removable to permit the transformer to be rolled or skidded into place over conduit stubs. Each compartment shall be suitable for installation of incoming and outgoing cables through the bottom. A tank-grounding pad shall be furnished in each compartment.

2.2.04 Transformer Section. Each transformer shall be 3 phase self cooled less-flammable liquid-insulated, or a self cooled oil-insulated type, as required, with kVA and voltage ratings as indicated on the drawings and as specified herein. Less-flammable liquid shall be fire resistant hydrocarbon type. Transformers with silicone fluid will not be acceptable. The average temperature rise of the windings, measured by resistance, shall not exceed 150°F (65°C) when the transformer is operated at rated kVA output at an average ambient temperature of 85°F (30°C) over 24 hours, with a maximum of 105°F (40°C).

The primary winding shall have four 2-1/2 percent fully rated taps, two above and two below rated voltage. The tap-changer shall be used only when the equipment is de-energized and shall be operated with a hot-stick tool.

The basic impulse level (BIL) of the high-voltage windings shall conform to the following:

Phase to Phase Voltage - kV	BIL Voltage - kV
2.4	45
4.16 & 4.8	60
7.2 & 8.3	75
12.0 through 14.4	95
24.9 delta	150
24.9 wye	125
34.5 delta	200
34.5 wye	150

Transformers shall have the following impedances at their lowest self-cooled ratings:

Transformer Size - kVA	Impedance - percent
75, 112.5, & 225	4.0
300 & 500	4.5
750 & 1000	5.75
1500 & 2000	5.75
2500 & 3000	5.75
3500, 3750, & 5000	6.5
37,500, 50,000, & 62,500	6.5

The transformer tank shall be of sealed construction, with a welded cover. A bolted tamper-resistant handhole shall be provided in the cover for access to internal connections. The tank shall have provisions for installation by lifting, jacking, or rolling into position. The transformer shall be equipped with a liquid level indicator; a pressure relief device; and standard provisions for filling, draining, and sampling.

2.2.05 High-Voltage Terminations. The high-voltage terminations and equipment shall be live-front type conforming to ANSI C57.12.22, or dead-front type conforming to ANSI C57.12.26, as indicated. Three or six terminations shall be furnished as required by the primary distribution system.

2.2.06 Bushings. When live-front type construction is required, bushings shall be porcelain with a 2-hole blade terminal. Bushings shall be externally clamped and front removable. Adequate space shall be provided below the bushings for stress cones on cables. Three intermediate class lightning arresters shall be provided with voltage rating as required.

2.2.07 Bushing Wells. When dead-front type construction is required, bushings shall be either universal bushing wells or one-piece integrated bushings for use with separable connectors. Bushings shall be externally clamped and front removable. Each bushing shall have an adjacent parking stand.

2.2.08 Switches and Fuses. When indicated, primary switches shall be furnished. Switches shall be internal, liquid-immersed two-position or four-position load break type. The size and ratings of the switches shall be as indicated on the drawings.

When bayonet type fuses are indicated, they shall be, liquid-immersed, expulsion fuses accessible through the primary compartment. The fuses shall be removable for external replacement of fuse links using a hot-stick tool without disassembly of the primary cabinet.

When the available short circuit current exceeds the ratings for bayonet type fuses, the fuses provided shall be a combination of internally mounted, liquid-immersed, cartridge fuses (sized approximately 3 times full load primary current) and bayonet type, liquid-immersed, expulsion fuses coordinated to provide full range protection for faults up to 50,000 amperes. The bayonet type fuses shall be removable for external replacement of fuse links using a hot-stick tool without disassembly of the primary cabinet.

2.2.09 Secondary Terminations. When indicated, the secondary terminations shall consist of low-voltage bushings. The bushings shall be of molded epoxy, and shall be provided with blade-type spade terminals with NEMA standard hole spacing arranged for vertical takeoff. The low-voltage neutral shall be an insulated bushing, grounded to the tank by a removable link.

When indicated, one or two molded-case circuit breaker shall be provided in the low-voltage compartment and connected to the low-voltage bushings with a tin-plated copper bus or rigidly supported cable. The circuit breaker and enclosure assembly shall be rated to interrupt and withstand the maximum fault current available from the transformer. The circuit breaker shall have a solid-state trip unit complete with built-in current transformers and flux transfer shunt trip. The ampere rating of the trip rating plug shall be as indicated on the drawings.

The trip unit shall have adjustable short time setting with a fixed instantaneous override for circuit protection. When required, the trip unit shall be provided with additional short delay trip time adjustment for improved system coordination.

When indicated, built-in ground fault protection with adjustable pick-up ratings not exceeding 1200 amperes, time delay adjustable from 0.1 to 0.5 second, and a neutral ground fault current transformer shall be provided.

The breaker shall have built-in test points for testing long delay, instantaneous, and ground fault functions of the breaker by means of a 120 volt ac operated test kit capable of testing breakers 600 amperes and larger.

2.2.10 Shop Painting. All iron and steel surfaces, except stainless steel and machined surfaces, shall be shop painted with the manufacturer's standard coating to a minimum thickness of 3 mils. Finish color shall be ANSI 61 for indoorequipment and ANSI 61 or 70 for outdoor equipment. A sufficient quantity of additional coating material and thinner shall be furnished to permit field touchup painting of damaged coatings.

When indicated, the underside of equipment installed in exposed outdoor locations shall be thoroughly cleaned and coated with an automotive type undercoating material.

The coating shall be thick enough to withstand normal handling during shipping and installation. The underside shall be defined as the surfaces in contact with the floor or pad and other surfaces not readily accessible for field painting.

2.2.11 Transformer Rating

2.2.11.01 Phases & Frequency: Three @ 60 Hz

2.2.11.02 Capacity HV & LV:
HV Capacity @ 55 Deg C Rise 37.5/50.0/62.5 MVA
HV Capacity @ 65 Deg C Rise 42.0/56.0/70.0 MVA
LV Capacity @ 55 Deg C Rise 37.5/50.0/62.5 MVA
LV Capacity @ 65 Deg C Rise 42.0/56.0/70.0 MVA

2.2.11.03 Cooling Class: ONAN/ONAF/ONAF
KNAN/KNAF/KNAF (Ester Fluids designation)

2.2.11.04 Coolant: Mineral BETA Oil - FR3 per ASTM D3487 Natural Ester Fluid per ASTM D6871-0

2.2.11.05 High Voltage: 120,000 Volts, DELTA connected.

2.2.11.06 High Voltage BIL: 450 KV

2.2.11.07 Low Voltage: 13,800Y/7967_Volts, GND. Y connected.

2.2.11.08 Low Voltage BIL: 110 KV

2.2.11.09 LV Neutral BIL: 110 KV

2.2.11.10 Impedance: 10.5 % @ 37.5 MVA (HV-LV) +/- 7.5%
(9.7-11.3%) @ 42 MVA base with LTC on Neutral and
with 9.8% minimum impedance at any tap.

2.2.11.11 Manufacturer shall state the guaranteed impedance at nominal voltage ratings and ONAN rating with HV DETC @ C (nominal voltage) tap and LV LTC @ Neutral position in the quotation.

2.2.11.12 Impedance tolerance is ± 7.5% for two winding transformers per ANSI C5712.00-2000, paragraph 9.2.

2.2.11.13 De-Energized Taps (DETC) for the primary winding: 2 1/2% steps, 2 above and 2 below rated voltage, full capacity taps. Tap changer for de-energized operation with operating handle brought outside the tank. The operating handle for the de-energized tap changer shall be located at a convenient height for operation by a person standing on the transformer pad, and shall include a position indicator with the highest voltage tap designated as "A".

2.2.11.14 Load Tap changing for the secondary winding: For LTC equipment, refer to Load tap changer, item 2.3.24.

2.2.11.15 Vector Relationship: High voltage shall lead low voltage by 30ºC.

2.2.11.16 Elevation: 3300 Ft or less above sea level and shall be rated for continuous operation at nameplate MVA rating.

2.2.11.17 Ambient temperature: 30°C daily average, 40°C maximum, -20°C minimum.

2.2.12 Transformer Loss Evaluation

2.2.12.01 The guaranteed no-load and load losses shall be stated in the Proposal. An amount in dollars shall be added to the quoted price for loss evaluation according to the following factors:

a. No-Load Losses @ 20ºC $_____/kW

b. Load Losses @ 75ºC $ _____/kW at 37.5 MVA

c. Auxiliary Losses $______/kW at 37.5MVA

2.2.12.02 Reported losses shall use IEEE reference temperatures of 20°C for No Load Losses and 75°C for Full Load Losses.

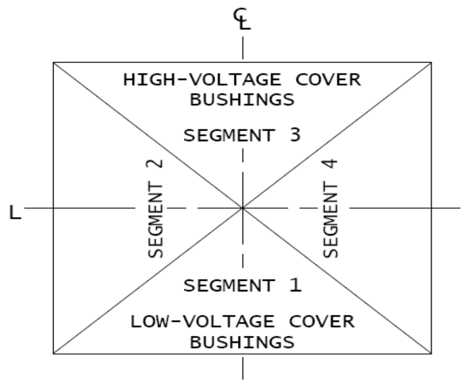
2.2.12.03 Test system accuracy must be verified for conformance with the current revision requirements of IEEE C57.12.00.

2.2.12.04 The proposal shall include documentation, which verifies the accuracy of the loss measurement system. Documentation provided with the quotation shall include sufficient identification of the test system to enable the owner to confirm that it is the same system used to test the transformer

2.3 ACCESSORIES.

2.3.01 Special Tools and Accessories. The transformer shall be equipped all accessories and shall be located as required by latest revision of ANSI Standard C57.12.10 below including:

ANSI C57.12.10-1997



Accessories	Locations	Section
Tap-changer operating handle	S1, S4, See Ref	5.1.1
*Liquid-level indicator	S1	5.1.2
*Liquid-temperature indicator	S1	5.1.3
Drain and filter valves	S1	5.1.5
Nameplate	S1	5.4
*Pressure-vacuum gauge	S1	5.1.4
Jacking facilities	See Ref	5.3.4
Ground pad(s)	See Ref	5.5
†Load-tap-changing equipment	S1 or S2	6
†Auxiliary cooling control	S1 or S2	5.9

*Not furnished for transformers with distribution BIL characteristics 200 kV and below.
†When furnished.

NOTE—Some designs include accessories and wiring connections as part of the load-tap-changing equipment assembly. When this is the case, accessories may be located in the same segment as the load tap changer and may be viewed parallel to the segment centerline.

Figure 1 – Accessories

2.3.01.01 Hot-Stick Tool. When indicated, an insulated hand-held epoxy fiberglass tool shall be furnished with the transformer. The tool shall have a retracted length of less than 5 feet (1.5 m), extended lengths of 8 and 12 feet (2.4 and 3.6 m), and shall have a disconnect type head. The tool shall be manufactured and tested according to OSHA specifications.

2.3.02 Magnetic liquid level indicator with form "C" alarm contacts. Indicators shall have minimum 6” diameter dials.

2.3.03 Top Liquid temperature indicator shall be designed with a capillary tube for remote mounting of the indicator dial at a height within 6 feet of the base for convenience when reading the temperature and resetting the drag hands while standing on the transformer foundation. With form "C" alarm contacts the indicator shall have minimum 6” diameter dials.

2.3.04 Winding hot spot temperature indicator shall be designed with an electronic gauge that can perform all the heat load calculations and control the cooling groups. Recommended system is MTec-EPT202 from Messko or approved equal.

2.3.05 Drain valve and the oil sampling valve, located to allow complete draining or sampling from the bottom of the tank.

2.3.06 Cover-mounted mechanical pressure relief device with automatic resealing operation, form "C" alarm contacts and mechanical signal for indication of device operation.

2.3.07 Fault Pressure Relay (Mounted below the oil level to monitor the liquid pressure).

2.3.07.01 The relay shall be sensitive to the rate of pressure increase and consisting of 120 volts (AC/DC) form "C" contact wired to identified terminal points in the main control cabinet and shall be suitable for use in the transformer protection scheme.

2.3.07.02 The relay shall be installed on the valve near the bottom of the transformer and monitor the pressure of the oil.

2.3.08 Future Monitoring Provisions.
The transformer shall be provided with the following for future addition of monitoring equipment including:

2.3.08.01 On line DGA monitors.
This would include the addition of two sampling valves, one near the top oil/top winding and the second near the bottom winding/ about 1-2 feet above the base. For best results, the sampling shall be in the active oil flow between the cooling/radiators and windings to provide the sampling in the active oil stream.

2.3.08.02 Additional thermal wells for future addition of thermal digital monitoring systems for the top oil, HV, LV and TV winding temperature monitoring.

2.3.08.03 One oil level gauge set for critical oil level (minimum oil level for energized operation).

2.3.08.04 Additional space in the transformer control cabinet for supplying power to these devices and bringing the outputs back to the control cabinet for customer convenience for wiring from the transformer by the customer.

2.3.09 A minimum of two circular, bolted manhole covers with raised flanges shall be provided.

2.3.09.01 They shall be located such that they are accessible without the removal of any other equipment.

2.3.09.02 Manholes shall be constructed with flush handles to reduce tripping hazard when working on the transformer cover.

2.3.10 Core grounds:

2.3.10.01 Cores shall be grounded at only one point and the core grounds for both the main and series transformer shall be brought to a convenient location for testing and be brought out on the cover through bushings and grounded externally. Core ground bushing(s) shall be enclosed.

2.3.10.02 Core grounds for series transformer or preventive auto transformers shall also be brought out for testing when applicable.

2.3.11 Provide a device suitable for mounting a safety device in the approximate center of the tank cover to be capable of supporting the hardware including harnesses utilizing gravity brakes.

2.3.12 Radiators:

2.3.12.01 Removable radiators will be supplied with individual shut-off valves at each tank connection. Each radiator will be supplied with means for draining and venting.

2.3.12.02 Radiators shall be constructed to withstand tank operating pressure and full vacuum.

2.3.12.04 All radiators shall be interchangeable.

2.3.12.05 All fans shall have galvanized fan guards and be provided with one-piece fan blades.

2.3.12.06 Radiators shall be hot dipped galvanized.

2.3.13 Jacking and moving provisions including:

2.3.13.01 Lifting lugs for lifting complete oil filled transformers.

2.3.13.02 Lifting eyes for lifting the cover only.

2.3.13.03 Facilities for lifting core and coil assembly from tank.

2.3.13.04 Jacking facilities at four corners of the base.

2.3.14 Nameplates

2.3.14.01 Transformer nameplate shall meet the requirements of IEEE C57.12.00.

2.3.14.02 For LTC transformers, the transformer nameplate shall also include the booster ratio data when applicable.

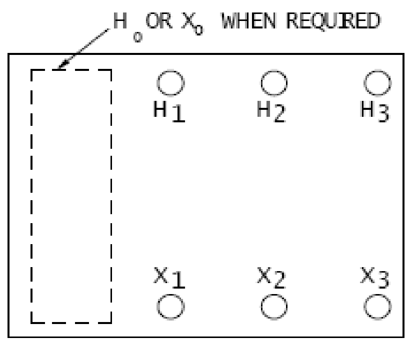
2.3.14.03 Diagrammatic engraved stainless steel nameplate for both the transformer and load tap changer. Information provided on the nameplate shall be included with the bid documents.

2.3.14.04 Load Tap Changer nameplate shall include the following information:

a. Manufacturer of the mechanism.
b. Model number of the mechanism.

c. Year of Manufacture.
d. Maximum rated through current of the mechanism.
e. Type of transition impedance, resistor or reactor.
f. Method of arc interruption (Type of Mechanism)
g. Type of drive mechanism, energy spring or direct
h. Amount of oil in the mechanism compartment.

2.3.15 Bushings:
Bushings shall be cover mounted and installed per ANSI, C57.12.10. Refer to figure2 below:



High voltage line bushings will be located on the transformer cover in IEEE Segment 3 and shall be rated 800 Amperes, 138 kV, 650 kV BIL.

2.3.15.01 Low voltage line bushings will be located on the transformer cover in ANSI Segment 1 and shall be rated 4000 Amperes, 25KV, 150 KV BIL.

2.3.15.02 Low voltage neutral bushing will be located on the transformer cover in ANSI Segment 2 with a flange for bus duct connection and shall be rated 4000 Amperes, 25 KV, 150 KV BIL.

2.3.15.03 Low Voltage Neutral Bushings shall be same rating as Low Voltage line bushings.

2.3.15.04 All bushings shall be Sky Gray (ANSI 70) and shall have provisions for power factor testing. Bushings shall be oil-filled condenser type.

2.3.15.05 The transformer shall be equipped with a ground pad on the cover for grounding the LV neutral bushings.

2.3.15.06 LV neutral bushing shall be grounded to the ground pad on the transformer cover with a removable link for testing

2.3.15.07 A ground cable shall be installed from the cover ground pad to a ground pad at the base of the transformer.

2.3.16 Surge Arresters:
Metal-oxide station type transformer mounted surge arresters shall be provided as follows.

2.3.16.01 Three (3) 138 KV, 84 KV MCOV surge arresters mounted near and connected to the high voltage bushings.

2.3.16.02 Three (3) 15 KV, 9 KV MCOV surge arresters mounted near and connected to the low voltage bushings.

2.3.16.03 The transformer shall be equipped with ground cables for connection of high and low voltage surge arresters to the ground pad(s) at the base of the transformer.

2.3.16.04 Porcelain shall be ANSI 70 Sky Gray. Arresters shall meet the requirements of ANSI C62.1.

2.3.17 Current Transformers
Multi-ratio bushing type current transformers for relaying service shall be furnished as described below:

2.3.17.01 Each high voltage bushing with Qty 2, 600 /5 MR, with accuracy of C400.

2.3.17.02 Each low voltage bushing as shown on the one line.

2.3.17.3 Low voltage neutral bushing with Qty 1, 600/5 MR, with accuracy of C 400.

2.3.17.4 All Current Transformers shall have fully distributed windings and a minimum Thermal Rating Factor of 2.0

2.3.18 Electrical Design:

2.3.18.01 The transformer, including all core and coil assemblies, shall be power class, round core/circular coil design and construction. High voltage and low voltage windings for the main core/coil assembly shall be either disk or helical construction layer/barrel windings are not acceptable. All windings shall be copper conductor and either rectangular magnet wire or continuously transposed cable.

2.3.18.02 The owner reserves the right to inspect the completed core and coil assembly prior to tanking. The manufacturer shall notify the owner not less than five days prior to the date of tanking to allow the owner to witness tanking, if so desired.

2.3.18.03 The transformer design shall be adequate to withstand short circuits with the fault current limited only by the impedance of the transformer itself. Short circuit withstand shall be calculated utilizing Finite Element Analysis (FEA) and shall consider all combinations of DETC and LTC tap positions for single line to ground faults, double line to ground faults, line to line faults and other fault conditions to determine the tap position combination resulting in the highest stresses for transformer windings.

2.3.18.04 The regulating winding for the load tap changer shall be fully distributed and be electrically independent from or placed on a separate winding tube from the high and low voltage windings.

2.3.18.05 Internal surge arresters or non-linear resistors shall not be included as part of the internal insulation system, unless written authorization is first obtained from the owner.

2.3.18.06 Insulation on all conductors used in the coil winding process (except CTC) copper conductors shall be cellulose insulating paper suitable for a minimum of 65°C rise continuous operation.It shall be wound onto the conductor employing a spinning process. The paper insulation shall be applied in single or multiple strands such that a minimum of 30% of the paper surfaces are overlapped to provide for a continuous insulating surface. Sufficient tension shall be maintained on the paper strands so as to prevent loose wraps. If clamping rings are utilized in the transformer design, full circumference rings shall be used. Core and coils shall be dried using a “vapor phase” system prior to filling.

2.3.19 Cooling Equipment and Controls

2.3.19.01 Cooling equipment shall be furnished as required to provide the transformer's rated capacity without exceeding the guaranteed temperature rise.

2.3.19.02 Forced cooling capacity shall be provided by the use of fans for forced air cooling. Temperature control shall be provided by the winding temperature equipment, including a temperature indicator and relay contacts to automatically actuate forced cooling equipment in proportion to the transformer load.

2.3.19.03 Cooling equipment motors shall be rated for service on a 120/240 volt, single-phase power supply.

2.3.19.04 Control circuit devices shall be rated 120 volt single phase.

2.3.19.05 Alarm circuit devices shall be rated for 120 volts AC/DC for SCADA interface.

2.3.19.06 Manual control switches shall be provided in the control cabinet to allow testing and maintenance of the cooling fans, and to enable selection of which group of fans is used for the first forced cooled stage.

2.3.19.07 Transformer cooling equipment shall be designed for a continuous self-cooled and maximum force-cooled operation.

2.3.20 Mechanical Construction

2.3.20.01 The tank and radiators shall be fabricated from steel with sufficient strength to withstand normal service stresses without distortion or damage.

2.3.20.02 The tank shall be designed to withstand an internal operating pressure of 8 psi with margin for a minimum of 25% over pressure, and full vacuum. All joints in the tank and radiators shall be made oil tight and gas tight by welding inside and outside.

2.3.20.03 All tank seams shall be double welded (inside and outside) and shall be a minimum of six (6) inches from the corner. Corner welds are not acceptable.

2.3.20.04 Cover shall be domed to shed water and welded to the tank. During welding of the transformer cover, an inorganic gasket will be permanently located between the cover and the tank flange to prevent the entrance of weld spatter into the tank.

2.3.20.05 All gasketed openings shall be designed with means provided for controlled compression of the gasket, utilizing metal-to-metal stops, and re-usable gaskets of an oil resistant material. All gasketed joints on top of the transformer shall utilize flanges, which are raised at least 3/4 inch above the cover surface.

2.3.20.06 All external tank supports or stiffeners shall be box beam construction and continuously welded.

2.3.20.07 Paint:

a. Transformer tank and all auxiliary equipment shall be painted with a rust-inhibiting primer and top coat to provide a minimum 3 mil dry film thickness. External paint color shall be Sky Gray, ANSI 70.

b. Inside of main tank and LTC compartment shall be painted white.

c. Accelerated aging test must be performed on the paint to be used inside the tank. A plate steel sample coated with the white paint shall be submerged in the transformer insulating oil and heated to 130 degrees C. After 1,000 hours, there may not be any change in the painted surface, or in the power factor of the oil used for the test.

d. The top of the main tank and LTC compartment shall be provided with a non-skid coating.

2.3.21 Insulating Fluids

2.3.21.01 Mineral Oil:

A sufficient quantity of inhibited mineral oil shall be furnished for the transformer to fill it to the normal operating level. The insulating liquid shall meet all requirements as defined by ANSI Standards, shall be chemically stable, free from acidity or other corrosive ingredients, and shall be certified "Non-PCB" in accordance with current EPA Regulations.

2.3.21.02 Natural Ester Fluid:

A sufficient quantity of natural ester fluid shall be furnished for the transformer to fill it to the normal operating level. The insulating liquid shall meet all requirements as defined by ANSI Standards, shall be chemically stable, free from acidity or other corrosive ingredients.

2.3.22 Oil Preservation Systems:

The transformer shall be equipped with a nitrogen inert-gas oil preservation system. The nitrogen for use with inert-gas-protected transformers shall be in accordance with ASTM D1933-1997. The nitrogen shall be supplied in 200 ft^3 cylinders equipped with Connection No 580 of ANSI/CGA-V-1-1994. The filling pressure shall be 2200 $lbs/in.^2$ at 70°F.

2.3.23 Auxiliary Power and Control Circuits:

2.3.23.01 All auxiliary power and control circuits which are supplied for connection to external circuits shall be brought to suitable terminal blocks located in a common, weather-resistant, NEMA 3R control cabinet. All contacts on auxiliary devices shall be wired to terminal blocks in the same cabinet for owner's use. Terminal blocks shall be with washer head binding screws and white circuit identification marking strips. Shorting type terminal blocks shall be used on current transformer leads.

2.3.23.02 Cabinet shall be equipped with a stainless steel 3-point latching mechanism, and a continuous stainless steel hinge.

2.3.23.03 All welds on all enclosures shall be continuous to prevent moisture entrance.

2.3.23.04 Wire for control and power circuits shall be rated for use in conduits as well as cabinets, and shall utilize insulation which is both fire resistant and resistant to transformer insulating oil.

2.3.24 Load Tap Changer

2.3.24.01 The transformer shall be complete with a load tap changer having a range of 10 percent above and 10 percent below normal voltage in 32 equal 5/8 per cent steps. The Load Tap Changer shall meet the requirements of IEEE Std. C57-131-1995 IEEE Standard Requirements for Load Tap Changers.

2.3.24.02 The tap changer shall be able to deliver full rated KVA on tap positions above rated voltage and rated current and on tap positions below rated voltage.

2.3.24.03 The LTC shall be Constant Flux Voltage Variation connected to regulate the low voltage winding.

2.3.24.04 The LTC mechanism shall be High Speed Resistive Waukesha Electric UZD or ABB UZE or Vacuum Reactance Reinhausen RMV-II (2,500A – 15KV) and designed for 1M electrical and mechanical operations before contact or vacuum bottle replacement is required. A contact life curve for the load tap changer being provided shall be supplied with the bid documents. The Tap changer shall be supplied with the maintenance free package stipulating (1 million operations of life span) and a 5-year warranty.

2.3.24.05 If the tap changing system quoted requires a preventive autotransformer or a series transformer, they shall be power class, round core/coil design, disc or helical type winding design and construction, and all winding conductors shall be copper.

2.3.24.06 The tap changer mechanism shall be mounted in a separate oil filled compartment, capable of withstanding full vacuum in the main tank, without the use of bypass piping and equipped with:

a. Liquid level gauge with alarm contacts.
b. Pressure control switch with trip contacts.
c. Cover mounted mechanical pressure relief device. The pressure relief device mechanism including micro switches must be fully protected by a cover featuring lateral openings for transformer tank and OLTC. A yellow semaphore for visual indication shall be provided. The trip contacts (insulation IP65) must be directly activated by a self-locking red signal pin. Utilized spring steel corresponds to class1 according EN 10270-1 and are synthetic coated according DIN2095. Device release time must be within 2ms. All important parts like trip contacts, springs, must be mounted inside the protective cover. All material must be rated for salt water and corrosive environment operation. Approved devices are the Reinhausen-Messko MPreC.
d. Drain valve with sampling device.

e. Filling plug located at the top of the compartment.

f. LTC tank bottom shall be sloped to drain oil away from the door.

2.3.24.07 The load tap changer mechanism shall be equipped with a motor drive unit. The motor drive shall be supplied by the LTC manufacturer and completely wired and tested at their facility. The approved drive shall be Reinhausen, MD-11 and shall include:

a. Automatic voltage regulation regulator (AVR) shall be wired and mounted in the motor drive by the LTC manufacturer. The approved voltage Controllers are the ReinhausenTAPCON250. If required, it shall include menu selectable paralleling capabilities via either the master/follower or minimum circulating current methods.

b. The paralleling mode shall be able to operate up to 16 individual transformers.

c. The communication between paralleling transformers shall be via CAN Bus technology and uses a three wire shielded conductor cable.

d. In addition the AVR shall be capable of taking a position signal from the LTC motor drive, relaying this information on its display and provide an active remote position analog output for customer's use.

e. If necessary, provision for SCADA communication via preferred method (DNP 3.0, Ethernet, RTU, etc.) as well as fiber optic capability shall be easily adaptable to the unit.

2.3.24.08 The cover on the oil filled compartment, regardless of weight of the cover, shall be hinged to support itself when open.

2.3.24.09 The manufacturer shall include (in the main transformer tank) a current transformer for input to the line drop compensator. The owner will provide a potential source for operating the voltage regulating relay, which will consist of one line to ground potential transformer on X1 and X0 with a secondary voltage of 120 volts.

2.3.24.10 The following equipment shall be supplied, and mounted in a cabinet attached to the transformer tank:

2.3.24.10.01 Static voltage regulating relay equipped with

a. Line drop compensator with resistance and reactance adjustments.

b. Reactance reversing switch.

c. Provision for manual operation.

2.3.24.10.02 If the load tap changer operation sequence is susceptible to interruption and consequently can be stopped in the “off-tap” position, the preventive autotransformer shall be designed to carry the maximum current available in the “off-tap” position indefinitely. The transformer shall also be equipped with an alarm to be activated if the “off-tap” position occurs.

2.3.24.10.03 Automatic-manual selector switch.

2.3.24.10.04 Raise and lower switches for manual operation.

2.3.24.10.05 Motor and controls protected by circuit breakers.

2.3.24.10.06 Voltage testing terminals.

2.3.24.10.07 Space for mounting equipment for parallel operation by the circulating current method.

2.3.24.10.08 Control compartment heater with switch.

2.3.24.10.09 Terminal board in control compartment for termination of control and wiring.

2.3.24.10.10. Drill plate in bottom of cabinet for attachment of owner's conduit.

2.3.24.10.11. The drive mechanism shall be designed such that the load tap changer can be manually operated, while energized under full load, safely with no potential harm to the operator or transformer.

2.3.24.10.12. If the drive mechanism can be stalled in the "off-tap" position, it shall be designed to include an alarm with remote contacts and be capable of maintaining full load indefinitely.

2.3.24.10.13. A self-regenerating microprocessor controlled maintenance free dehydrating breather shall be supplied for the LTC compartment and the transformer conservator. The breather shall include humidity and temperature sensors and a test button to verify the electronic circuit. LEDs for device status indication shall be provided as well as a space heater in the control box to prevent condensation of moisture. Breathers for transformer application shall feature the BETA control software, designed to allow regeneration only when the transformer is breathing out. In addition error and status relays shall be provided for remote indications. A 4-20mA output for remote temperature indication shall be available. The breather shall be installed with a ¼” isolation valve and on an installation pad welded on the OLTC and transformer wall. Based on climatic circumstances, an output filter heater should be installed to prevent formation of ice. Approved devices are Reinhausen-Messko MTraB.

2.3.24.10.14 LTC performance shall be based on entire range of operations (+/-16) and maximum nameplate rating unless otherwise specified by the owner.

2.4 SHOP TESTS.

2.4.01 All routine tests listed in ANSI C57.12.00 for class II substation power transformers plus additional tests as specified herein, are required. All tests shall have the physical voltages induced. No voltage simulation tests shall be allowed for testing the transformer windings.

2.4.01.01 Class II testing including:

2.4.01.01.01 Winding insulation resistance

2.4.01.01.02 Core insulation resistance

2.4.01.01.03 Insulation Power factor

2.4.01.01.04 Control (auxiliary) cooling losses

2.4.01.01.05 No Load losses and exciting current @ 100 and 110%

2.4.01.01.06 Dielectric Tests:

2.4.01.01.06.01 Low frequency testing including 1 hour induced test with partial discharge measurements

2.4.01.01.06.02 Low frequency on auxiliary devices control and current transformer circuits

2.4.01.01.06.03 Lightning Impulse

2.4.01.01.06.04 Dissolved gasses in oil

2.4.01.02 Optional factory tests:

2.4.01.02.01 Zero Sequence impedance tests

2.4.01.02.02 Temperature rise

2.4.01.02.03 Time Constant heat runs

2.4.01.02.04 Overload heat runs

2.4.01.02.05 Audible Sound level

2.4.01.03 Baselines for field acceptance test data including:

2.4.01.3.01 Single phase excitation tests

2.4.01.03.02 10 kV leakage reactance tests

2.4.02 Five certified copies of the certified test report shall be delivered to the owner's representative on site after completion of all factory tests.

2.4.03 Insulation power factor tests shall be performed on all winding-to-winding-to-ground insulation. Measured values exceeding 0.5% (corrected to 20 C) will not be accepted.

2.4.04 The owner reserves the right to request through-fault testing (at extra cost) at any time prior to final testing of assembled unit.

2.4.05 The owner reserves the right to witness testing. The manufacturer shall notify the owner of the performance dates for all tests not less than five days prior to the date of a test to allow the owner to witness testing if so desired. Refer to item 2.6

2.4.06 The manufacturer shall notify the owner of any unusual event or damage occurring during the fabrication of the transformer and of all tests which do not meet the specified or guaranteed values. The owner reserves the right to inspect such damages or test failures. Corrective measures to overcome such damage or failure shall be reviewed with the Owner.

2.4.07 Manufacturer shall provide all the information necessary to perform Arc Flash study analysis by others.

2.5 SHIPPING REQUIREMENTS

2.5.01 The manufacturer is responsible to ship the transformer F.O.B destination.

2.5.02 For truck shipment the destination shall be the substation site.

2.5.03 For rail shipment the destination shall be the rail siding nearest to the substation site to which the manufacturer can obtain clearance for shipment.

2.5.04 The transformer shall be shipped from the factory without oil-filled radiators.

2.5.05 Electronic Impact recorders with GPS technology for shipment tracking and on line reporting of shipping progress shall be provided with any rail shipped equipment. The manufacturer shall mount them at the factory to provide a permanent record of the magnitude of axial, transverse and vertical forces to which the equipment will be subjected while in transit. The impact recorders shall be returned to the manufacturer.

2.5.06 Fans shall be mounted on and shipped with appropriate radiator bank(s).

2.6 WITNESS TESTING.
The general contractor shall arrange for witness testing at the factory with the transformer manufacturer and coordinate with the client the number of people that will be attending the test. The selected individuals shall submit their report at the end of the testing period to the acting project manager.

PART 3 - EXECUTION

3.1 INSTALLATION. The transformer shall be installed in accordance with drawings, specifications, and manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools, and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting conduit or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price for the number of days and round trips to the site as required.

End of Section

SECTION 16345

MEDIUM-VOLTAGE METAL-CLAD SWITCHGEAR

PART 1 - GENERAL

1.1 SCOPE. This section covers medium-voltage metal-clad switchgear that shall be furnished and installed as specified herein and as indicated on the drawings.

Switchgear shall meet the design conditions and features as indicated.

Switchgear shall be designated and shall be located as indicated on the drawings.

1.2 GENERAL. Equipment furnished under this section shall be fabricated, assembled and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer.

1.2.03 Workmanship and Materials. Contractor shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
AWG	American Wire Gage
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.2.05 Governing Standards. All equipment to be furnished under this section shall be designed, constructed, and tested in accordance with the applicable standards of ANSI, NEMA and IEEE, including, but not limited to; IEEE C37.04, C37.06, C37.11, C37.20.2, C37.09, and C57.13; and NEMA SG-4 and SG-5.

Equipment covered by this section shall be listed by UL or a nationally recognized third-party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of Contractor. In the event no third-party testing laboratory provides the required listing, an independent test shall be performed at Contractor's expense. Before the test is conducted, Contractor shall submit a copy of the testing procedure to Engineer.

1.2.06 Nameplates. Nameplates with unit description and designation of each control or indicating device shall be provided on all hinged doors and rear cover plates. Nameplates shall have 3/4 inch (19 mm) high letters for section identity and 1/8 inch (3 mm) letters for other information black baked enamel letters on anodized aluminum plate.

Each control device and each control wire terminal block connection inside the units shall be identified with permanent nameplates or painted legends to match the identification on the manufacturer's wiring diagram.

1.2.07 System Characteristics. The switchgear will be connected to a power system with characteristics as indicated on the drawings.

1.2.08 Rating. The metal-clad switchgear assembly shall be rated as indicated.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the switchgear, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data shall include, but shall not be limited to, the following:

Master drawing index.

Front view elevation.

Floor plan.

Top view.

Conduit entry/exit locations.

Weight.

Bill of materials.

Single line diagram.

Three line diagram.

Schematic diagram.

Nameplate schedules.

Assembly ratings including short circuit rating, voltage, continuous current, and basic impulse level.

Major component ratings including voltage, continuous current, interrupting rating.

Cable terminal sizes.

Descriptive bulletins.

Product data sheets.

Seismic certification, when required.

When a power company metering compartment is specified, drawings and details pertaining to each utility metering section shall be subject to the approval of the electric utility company in addition to review by Engineer.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Assembly, installation, alignment, adjustment anchorage, and checking instructions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 SHIPPING, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.4.01 Preparation for Shipment. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Switchgear shall be equipped to be handled by crane. Where cranes are not available, switchgear shall be suitable for skidding in place on rollers using jacks to raise and lower the groups.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked as identified in the delivery schedule or on the Shop Drawings. Complete packing lists and bills of material shall be included with each shipment.

1.5 SPARE PARTS. Spare parts shall be suitably packaged, with labels indicating the contents of each package and shall meet all the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Spare parts shall be delivered to Owner as directed.

A complete set of spare power and control fuses, indicating lamps, and indicating color caps shall be provided for each section of switchgear.

1.6 COORDINATION STUDY. When indicated, a coordination study of the power distribution system will be conducted as specified in Master Specification Section 16050, Electrical General Requirements.

The initial equipment drawing submittal shall include the protective relay time-current curves for each relay provided as a part of the medium-voltage switchgear assembly.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. The switchgear shall be manufactured by Cutler-Hammer, General Electric, Siemens Energy & Automation, Square D, or approved equal.

2.2 CONSTRUCTION. All equipment furnished under this section shall be designed and constructed in accordance with the following requirements. The switchgear shall be the product of a manufacturer of both the stationary and draw out elements of a complete power circuit breaker assembly.

2.2.01 Sills and Anchors. Contractor shall furnish sills for all switchgear that requires sills to be embedded in the floor for leveling and alignment. The sills shall be drilled and tapped as required. All equipment requiring anchor bolts shall be provided with the anchor materials, complete with bolts, nuts, and washers. Sills and anchor materials shall be shipped ahead of the scheduled equipment delivery to permit installation before concrete is placed. Equipment drawings shall show sill and anchor bolt locations.

2.2.02 Enclosure. The type of switchgear enclosure shall be as indicated. The enclosure shall contain circuit breakers and all necessary accessory components. The integrated switchgear assembly shall withstand the effects of closing, carrying, and interrupting currents up to the assigned short circuit rating.

Outdoor non-walk-in switchgear shall have individual weatherproof doors on the breaker draw out side of each switchgear section. A 120 volt light with a switch and a service receptacle shall be mounted behind each door.

Outdoor walk-in switchgear shall have a sheltered operating and maintenance aisle, large enough to permit interchange of breakers, along the full length on the draw out side of the switchgear. A weatherproof door with an outside lock and an inside quick-release latch mechanism, to permit opening the door from the inside even when locked from the outside, shall be provided on each end. All maintenance aisles shall be provided with light fixtures rated for 120 volts ac, with three-way light switches at each door. The lights shall provide 75 foot-candles (807 lux) of general illumination. A 120 volt grounding type duplex receptacle shall be provided at each end of the aisle.

Electric unit heaters with thermostats shall be furnished to maintain a temperature of at least 40°F (4°C) in the aisle under the outdoor temperature and the relative humidity design conditions as required.

When indicated, a ventilating system consisting of fans with manual-automatic thermostats, intake louvers with screens and filters, two-position open-close control dampers, and electric damper operators shall be furnished in the aisle to provide 12 air changes per hour. Power supply to the ventilating system will be 120 V ac.

All outdoor type switchgear shall be provided with weathertight gasketing on all exterior doors, removable covers, and panels.

Switchgear lights, receptacles, heaters and fans shall be served by either an integrally installed auxiliary power source or an external auxiliary power source as indicated on the Contract Documents.

Adequate bracing shall be provided for seismic forces.

2.2.03 Vertical Sections. The switchgear assembly shall consist of individual vertical sections housing various combinations of circuit breakers and auxiliaries, bolted together to form a rigid metal-clad switchgear assembly. Each vertical section shall accommodate breakers stacked two high and auxiliaries four high. Metal side sheets shall serve as grounded barriers between adjacent structures. Solid removable metal barriers shall isolate the primary major sections of each circuit. Two rear covers shall be furnished for each vertical section for circuit isolation and ease of handling.

2.2.04 Space Heaters. When indicated, each switchgear compartment shall be equipped with a space heater of adequate capacity to prevent moisture condensation within the switchgear. The heaters shall be thermally insulated and located at a safe distance from painted surfaces. Each space heater shall be rated for double the applied voltage. The heaters shall be controlled by an adjustable thermostat set to cut out when the temperature rises to 90°F (32°C) and to cut in when the temperature falls below 85°F (29°C). Each space heater shall be equipped with a disconnect switch.

A space heater power bus shall be provided throughout the switchgear to power the space heaters. When indicated, the bus shall be served by an integrally installed auxiliary power source.

2.2.05 <u>Circuit Breakers</u>. The circuit breakers shall be three-pole, single-throw, and shall be furnished complete with all equipment on a draw out carriage. The breakers shall be operated by a stored energy mechanism consisting of a heavy-duty spring, charged normally by a universal electric motor, and, in an emergency, by a manual handle. The circuit breaker control voltage shall be as indicated. For ac operation, the capacitance trip device shall be of the type that retains tripping power for at least 48 hours after loss of control power.

Each circuit breaker shall contain three vacuum interrupters, separately mounted in a self-contained, self-aligning housing which can be removed as a complete unit. The vacuum interrupter pole unit shall be mounted on glass polyester supports. Each vacuum interrupter shall be provided with a contact wear gap indicator which requires no tools to indicate available contact life, and is easily visible when the breaker is withdrawn on the extension rails. For ease of inspection and maintenance, the breaker front panel shall be removable when the breaker is withdrawn.

Interlocks shall be provided to prevent closing of a breaker between operating and test positions, to trip breakers upon insertion or removal from the housing, and to discharge the stored energy mechanism upon insertion or removal from the housing. The breaker shall be secured positively in the housing between, and including, the operating and test positions.

All removable breaker units of the same type and ampere capacity shall be wired alike and shall be electrically and mechanically interchangeable.

2.2.06 <u>Main Bus</u>. The main bus shall consist of rigidly supported, tin-plated copper bars of suitable design and cross-sectional area to satisfactorily carry the rated current without exceeding the specified temperature rise.

The bus shall have insulation, bus joint covers, and supports of molded epoxy that is nontracing, nonflammable, and nonhygroscopic. Bus supports shall be glass polyester inserts. The bus shall be capable of withstanding the magnetic forces imposed by short-circuit currents equal to the close and latch rating of the largest circuit breakers.

The bus insulation shall be of molded epoxy material over the entire length and shall be designed for the voltage service as required. The bus insulation shall be able to withstand the ANSI standard 60 Hz full wave and impulse (1-1/2 x 40 microseconds) test voltages of 19 and 60 kV or 36 and 90 kV as indicated. The molded epoxy insulation shall have a high resistance conducting surface in contact with the bus to eliminate corona damage to the bus insulation.

The current-carrying capacity shall be based on actual service conditions, including skin and proximity effect, insulation, steel enclosure, and an ambient temperature of 105°F (40°C). The bus shall be derated in accordance with NEMA SG-5 for ambient temperatures higher than 105°F (40°C). The bus shall be supplied in unit lengths that will permit the reassembly of the units in the field.

All joints shall have tin-to-tin contact surfaces and minimum contact resistance. Joints shall be equipped with removable insulating fittings at least equal to the bus bar insulation.

To prevent undesirable or destructive mechanical strains in the bus supports and connections, provisions shall be made for bus expansion through an ambient temperature range of -22°F to 120°F (-30°C to +50°C). Expansion joints shall be supplied as necessary.

2.2.07 Ground Bus. An uninsulated ground bus of tin-plated high conductivity copper, with momentary and short time ratings at least equal to those of the largest circuit breaker, shall be furnished through the entire length of the switchgear. All switchgear equipment requiring grounding shall be connected to this ground bus. A clamp type connector shall be provided on each end of the ground bus for external connection of a 500 kcmil (240 mm^2) stranded copper grounding cable to the grounding system. A clamp type connector shall also be provided in each vertical section for connection of stranded copper grounding cable run with incoming and outgoing phase wires, as indicated on the drawings.

2.2.08 Neutral Bus. When required, a fully-rated insulated ground bus of tin-plated high conductivity copper, with momentary and short time ratings at least equal to those of the largest circuit breaker, shall be furnished through the entire length of the switchgear. All switchgear equipment requiring a neutral shall be connected to this neutral bus.

2.2.09 Auxiliary Contacts. Each breaker shall be furnished with a sufficient number of auxiliary contacts and auxiliary switch contacts to provide all necessary interlocks for proper operation of the equipment. Not less than two spare NO and two spare NC auxiliary contacts shall be furnished on each breaker. In addition, mechanically operated auxiliary switches mounted in the stationary switchgear housing shall be provided with not less than two spare NO and two spare NC contacts. All auxiliary contacts and auxiliary switch contacts, including spare contacts, shall be wired to terminal blocks for use with control circuits.

2.2.10 Bus Connections. All current-carrying connections to the main buses shall be insulated copper of suitable capacity and shall conform to the requirements of the main bus insofar as bracing and temperature limits are concerned. Stationary contacts for the circuit breaker connections shall be suitable for the particular service.

Connections to the bus shall be made with suitable bus clamps or bolts with lock washers, and the copper bars shall be tin-plated at current-carrying connections. Molded removable covers or similar devices shall be used at connections to the bus.

Connections from the current transformers shall permit the transformers to be easily replaced.

Insulated cable connections shall be furnished for the potential transformers and control power transformers.

All materials required for insulation of field connections and their associated bus and terminals shall be provided.

2.2.11 Current Transformers. Ring type or toroidal current transformers of ANSI standard relay accuracy shall be furnished as indicated herein, as indicated on the drawings, and as verified by the coordination study. The thermal and mechanical ratings of the current transformers shall be coordinated with the circuit breakers. The standard arrangement of two current transformers on the bus side and two on the line side of the breaker units shall be front accessible to permit adding or changing the current transformers without removing high-voltage insulation connections. Shorting terminal blocks shall be furnished on the secondary of all current transformers.

When indicated, current transformers rated 600 amperes and smaller shall be of the wound type, with tin-plated primary terminals and insulated to withstand ANSI standard test voltages for the switchgear. The accuracy of these current transformers shall be suitable for the meters and relays specified with the normal burdens of the various devices, and not less than ANSI standard accuracy classification of 0.3 with burdens B-0.1 and B-0.5, and 1.2 with burden B-2.0.

2.2.12 Potential and Control Power Transformers. Potential and control power transformers shall be supplied in the quantities and of the ratings specified herein or indicated on the drawings. Potential or control power transformers up to 15 kVA single phase shall be mounted in a drawer or a tilt-out carriage in an auxiliary compartment. Opening the drawer shall ground the primary fuses of the transformer and permit easy inspection, testing, and fuse replacement. Shutters shall isolate primary bus stabs when drawers are withdrawn.

The instrument potential transformer rating shall be coordinated with the instruments, relays, meters, and devices specified. The transformers shall have a mechanical rating equal to the momentary rating of the circuit breakers and shall have metering and relaying accuracies conforming to ANSI standards. The primary fuses furnished with the transformers shall be current-limiting type and shall be rated approximately 1/2 ampere. The fuses shall clear a faulted transformer in approximately 1/2 cycle (on 60 Hz basis), but shall not blow on magnetizing inrush current nor protect a transformer with a shorted secondary. Secondary fuses shall be provided for protection of potential transformers.

A mechanical interlock shall be provided for control power transformers, to require the secondary breaker to open before the drawer can be withdrawn.

2.2.13 Control Devices. Control switches shall be 600 volt, 20 ampere, multistage rotary type with black handles. Each switch shall have a fixed pistol grip handle with an engraved black plastic escutcheon plate. All circuit breaker control switches mounted on the front instrument panels shall be equipped with red, white, and green indicating lights. Indicating lights shall be high intensity push to test LEDs.

White lights shall indicate breaker trip and shall be wired in series with a breaker auxiliary normally closed contact and control switch slip contacts, so the light will not be energized when the breaker is operated by the control switch.

Each electrically operated breaker shall be provided with a two-pole control power disconnecting and protective device in the closing circuit and another in the tripping circuit. The disconnecting and protective device shall be either a molded-case circuit breaker or an enclosed fuse pullout.

Additional control devices shall consist of auxiliary relays and switches, control wiring and operating mechanism required for the particular breaker, an operation counter, a manually operated trip bar or lever, and provisions for manual closing.

2.2.14 Relays. The manufacturer shall furnish and install protective relays in the metal-clad switchgear in the quantities, types, and ratings indicated on the drawings and specified herein.

Switchgear protective relays shall be of the draw out type in a semiflush mounting case, with test switches and devices incorporated in the relay unit. Relays shall have hand reset indicators. Exposed metal surfaces of relays shall have a dull black finish. Relays shall be wired so that the tripping current of the circuit breaker trip coil will be interrupted by means other than relay contacts.

Relays shall have low burden, solid-state, microprocessor based circuitry and shall meet or exceed ANSI/IEEE standards. All settings shall be stored in non-volatile memory. Relays shall be manufactured by ABB Power T&D Company, Basler Electric, Cutler-Hammer, GE Power Management, Siemens Energy and Automation or approved equal.

2.2.15 Solid State Metering and Protection Unit. Microprocessor based metering and protection units shall be capable of monitoring and displaying values of phase amperes, phase voltage, watts, vars, power factor, frequency, watt-hours, and watt demand shall be provided when required. The protection functions shall include voltage phase loss, current phase loss, phase voltage unbalance, phase voltage reversal, overvoltage, undervoltage, and time delay for overvoltage, undervoltage, and phase unbalance. When required, the unit shall be capable of digital communication using a RS 232 or RS 485 twisted pair circuit. When required, the unit shall have four isolated 4-20 ma selectable outputs.

2.2.16 Overcurrent Relays. Microprocessor based multiphase and ground, instantaneous and time overcurrent relay (devices 50/51 and 50N/51N) shall have programmable trip parameters (time curve, time dial, timed pickup and instantaneous) accessible from the front of the unit. Push buttons and a digital display shall be provided for manual programming. The relay shall have eight groups of time overcurrent curves selectable from the relay memory. Fault records for at least four faults shall be stored in memory for use in trouble-shooting and system analysis. Timed overcurrent pickup range for the relay shall be 25 to 250 percent of CT secondary amperes adjustable in steps of 1 percent. Instantaneous current pickup range shall be 1 to 18 times phase pickup adjustable in steps of 0.1. Time dial range shall have at least 32 selections for each curve.

A lockout relay (device 86) shall be wired to trip the bus tie and the associated incoming feeder breakers.

2.2.17 Bus Differential Relays. When required, microprocessor based differential relays (device 87) shall provide a zone of protection which shall overlap the tie breaker and include all breakers normally served by the associated incoming feeder breaker.

A lockout relay (device 86), shall be wired to trip all breakers associated with the zone.

2.2.18 Power Company Metering Sections. Metering sections shall consist of a sheet steel enclosed stationary cubicle of sufficient width to provide the specified spacing and clearance required by the power company. The section shall include the following equipment:

> Set of draw out carriage and mounting provisions for metering potential transformers as required, with primary windings connected line-to-line, and associated primary fuses. The potential transformers and fuses will be provided by the power company.
>
> Set of mounting provisions for metering current transformers as required.

The current transformers will be provided by the power company.

Set of primary leads for potential transformers. These leads shall be connected to the main bus and shall be coiled during shipment.

Set of secondary leads for the potential transformers. These leads shall be connected to a meter test block and shall be coiled during shipment.

Set of secondary leads for current transformers. These leads shall be connected to a meter test block.

Blank inner panel, not less than 30 inches (760 mm) wide and 30 inches (760 mm) high, with at least 15 inches (380 mm) clearance between the face of the panel and the front door, for field mounting of power company metering equipment.

Hinged door on the draw out side of the switchgear, with provisions for a power company padlock and a nameplate.

It is the intent of this specification that the Power Company will furnish current transformers, potential transformers, potential transformer fuses, meter sockets, and sealing rings. The Power Company will also provide mounting dimensions for the instrument transformers and fuses. If the Power Company wishes to ship the instrument transformers to the manufacturer, the transformers and fuses shall be mounted in the switchgear during fabrication and assembly. Depending upon the manufacturer, the Power Company may elect to place an order with the manufacturer for the instrument transformers and fuses. In this case, the manufacturer shall furnish the instrument transformers completely assembled in the switchgear at no additional cost.

The name of the Power Company and the contact person shall be obtained from Owner.

2.2.19 Auxiliary Power Section. Auxiliary power sections shall consist of a sheet steel enclosed stationary cubicle, which houses the following:

Draw out auxiliary transformer, 15 kVA or as required, 120/240 volts, complete with primary current-limiting fuses.

Breaker panel with thermal-magnetic, 10,000 ampere interrupting breakers, including a two-pole, 70 ampere or as required, main breaker. The panel shall be wired to the 120/240 volt transformer in this section and to all switchgear loads specified or indicated on the drawings. Six spare 15 ampere breakers shall be included.

When required, the switchgear lineup shall be equipped with an uninterruptible power supply (UPS) mounted in an accessory compartment. The UPS shall provide backup power to the Auxiliary Power Section circuit breaker panel and shall be equipped with 25 percent spare capacity. The UPS shall be off-line type with a minimum backup time of 10 minutes and a minimum 600 VA rating.

2.2.20 Potential Transformers Sections. Potential transformer sections shall consist of a sheet steel enclosed stationary cubicle, which houses the following:

Set of draw out potential transformers as required by the drawings.

Hinged door, on the draw out side of the switchgear, serving as an instrument and control panel containing a voltmeter to indicate line-to-line voltage and a voltmeter transfer switch when required.

2.2.21 Ground-Test Device. When indicated, a grounding, phasing, and testing device shall be furnished. The device shall be designed so that it can be inserted in the switchgear units in place of and in the same manner as the circuit breaker removable elements, to permit grounding either the bus or the feeder, or to make connections to either the bus or the feeder for testing purposes. The device shall include a solenoid-operated circuit closing device arranged with a gang-operated, three-pole selector disconnect switch to effectively ground either the bus or the feeder when the device is inserted in the unit and closed. The device shall be electrically closed by a suitable remote control switch station connected to the device by a 35 foot (11 m) flexible cable to permit the operator to stand well clear of the equipment. The device shall have momentary and 4-second current-carrying capacities at least equal to those of the circuit breakers. The device shall connect solidly to the ground bus in the unit when in the operating position. No provisions for automatic tripping of the device shall be included. The device shall be provided with suitable windows or a transparent enclosure and barriers to permit visual observation of the positions of all selector switch blades.

External connections for testing shall be made by 15 kV insulated plug connectors for insertion into deep ports or wells on the face of the device. The ports shall be provided with closing shutters. Locking and interlocking features shall be provided to prevent improper or unsafe operation of the equipment.

2.2.22 Wiring. The switchgear manufacturer shall provide suitable terminal blocks for secondary wire terminations and at least 25 percent spare terminal points. Switchgear secondary wire shall be 14 AWG (2.5 mm^2), Type SIS, rated 600 volts, 195°F (90°C), and furnished with wire markers at each termination. Wires shall terminate on terminal blocks, with marker strips numbered to agree with detailed connection diagrams.

Compression type lugs, of the size indicated on the drawings, shall be furnished for all incoming line and feeder cables. The design and arrangement of each section shall provide sufficient space for terminating power cables with IEEE Class 1 stress cones. The design shall take into account space for minimum bending radii of the cables to be terminated.

2.2.23 Switchgear Arrangement. The assembly shall consist of sections arranged as indicated on the drawings and as specified herein.

2.2.24 Incoming Line Sections. When incoming line sections are required, each section shall consist of a basic incoming line unit, which houses the equipment and devices as indicated on the Contract Documents; installed and completely wired.

2.2.25 Bus Tie Breaker Sections. When bus tie sections are required, each section shall consist of a bus sectionalizing unit, which houses the equipment and devices as indicated on the Contract Documents installed and completely wired.

2.2.26 Feeder Breaker Sections. When feeder breaker sections are required, each section shall consist of a basic feeder unit, which houses the equipment and devices as indicated on the Contract Documents installed and completely wired.

2.2.27 Power Company Metering Sections. When power company metering sections are required, each section shall consist of a stationary cubicle which houses the transformers and devices as indicated on the Contract Documents installed and completely wired.

2.2.28 Auxiliary Power Sections. When auxiliary power sections are required, each section shall consist of a sheet steel enclosed stationary cubicle, which houses the transformers and devices as indicated on the Contract Documents installed and completely wired.

2.2.29 Potential Transformers Sections. When potential transformer sections are required, each section shall consist of a sheet steel enclosed stationary cubicle, which houses the transformers and devices as indicated on the Contract Documents installed and completely wired.

2.3 ACCESSORIES.

2.3.01 Special Tools and Accessories. Special tools, instruments, and accessories required for proper maintenance; and special devices for lifting or handling shall be furnished. The following accessories shall be supplied with the metal-clad switchgear.

Set of special wrenches or tools required for installation, operation, or maintenance of the equipment.

Test cabinet with test jumper for testing breakers out of the housing, for mounting on the wall, and wired for a power source separate from the switchgear control bus.

Breaker lifting device and transfer truck for moving the circuit breaker into and out of the breaker housing.

Set of extension rails.

Maintenance closing lever for closing the circuit breakers.

Manual operating lever for moving the breaker element into and out of the operating position.

Set of test plugs suitable for testing the relays.

2.4 SHOP PAINTING. All iron and steel surfaces, except machined surfaces and stainless steel, shall be shop coated with the manufacturer's standard coating. Finish color shall be ANSI 61 for indoor equipment and ANSI 61 or 70 for outdoor equipment. Field painting, other than touchup painting, will not be required. A sufficient quantity of additional coating material and thinner shall be furnished to permit field touchup painting of damaged coatings.

The underside of equipment installed in exposed outdoor locations shall be thoroughly cleaned and coated with an automotive type undercoating material. The coating shall be thick enough to withstand normal handling during shipping and installation. The underside is considered to be the surfaces in contact with the floor or pad and other surfaces not readily accessible for field painting.

2.5 SHOP TESTS. After the equipment has been completely assembled, it shall be shop tested for general operating condition, circuit continuity, high potential, and other standard tests for the particular class of equipment, as defined by industry standards.

PART 3 - EXECUTION

3.1 INSTALLATION. Installation will be in accordance with the drawings, specifications, and manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, set all relays in accordance with the settings designated in the coordination study, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.2.02 Field Installation Supervision. The equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the contract price for the number of days and round trips to the site as required.

Manufacturers' installation supervisor shall observe, instruct, guide, and direct Contractor's erection or installation procedures as required. The equipment manufacturer will be provided with written notification 10 days prior to the need for such services.

End of Section

SECTION 16360

METAL-ENCLOSED LOAD INTERRUPTER SWITCHGEAR

PART 1 - GENERAL

1.1 SCOPE. This section covers an expandable line-up of metal-enclosed load interrupter switchgear that shall be furnished and installed as specified herein and as indicated on the drawings. The assembly shall consist of dead-front, completely metal-enclosed vertical sections containing load interrupter switches and fuses of the numbers, ratings, and types indicated on the drawings.

Switchgear shall meet the design conditions and features as indicated.

Switchgear shall be designated and shall be located as indicated on the drawings.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer. At least six feet (2 m) of clear access space shall be provided in front of the switchgear.

1.2.03 Workmanship and Materials. Contractor shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard size and thickness so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
AWG	American Wire Gage
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.2.05 Governing Standards. All equipment to be furnished under this section shall be designed, constructed, and tested in accordance with the latest applicable standards of ANSI, NEMA, and IEEE, including, but not limited to, IEEE C37.20.3 & 4, and NEMA SG 6.

1.2.06 Nameplates. Nameplates with unit description and designation of each control or indicating device shall be provided on all hinged doors and rear cover plates. Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be ¾ inch (9mm) high for section identity and 1/8 inch (3 mm) high for other information.

Each control device and each control wire terminal block connection inside the units shall be identified with permanent nameplates or painted legends to match the identification on the manufacturer's wiring diagram.

1.2.07 System Characteristics. This equipment will be connected to power system with characteristics as indicated on the drawings.

1.2.08 Rating. The metal-enclosed load interrupter switchgear assembly shall have minimum ratings as indicated.

1.2.09 Load Interrupter Switch Rating. The load interrupter switches shall be quick-make, quick-break, three pole, and gang operated. Switches shall meet the requirements of IEEE C37.20.4 and shall have minimum ratings as indicated.

1.3 SUBMITTALS. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the switchgear, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data for switchgear shall include, but shall not be limited to the following:

Elevation plan, weights, and bill of material.

Single-line, control schematic, wiring connection, and wiring interconnection diagrams.

Fuse time-current characteristic curves.

When a power company metering compartment is specified, drawings and details pertaining to each utility metering section shall be subject to the approval of the electric utility company in addition to review by Engineer. For Operations and Maintenance Data and Manuals, provide the following:

Assembly, installation, alignment, adjustment, and checking instructions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered and shall meet therequirements of Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.4 SHIPPING, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.4.01 Preparation for Shipment. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked. Complete packing lists and bills of material shall be included with each shipment.

1.5 SPARE PARTS. One set of spare power fuses shall be furnished for each fused switch and five spare control fuses for each fuse type and ampere rating supplied in the line-up. Spare parts shall be suitably packaged, with labels indicating the contents of each package and shall meet all the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Spare parts shall be delivered to Owner as directed.

1.6 COORDINATION STUDY. When a coordination study of the power distribution system will be conducted in accordance with Master Specification Section 16050, Electrical General Requirements, the initial shop drawing submittal for the equipment shall include the coordination curves for each fuse provided as a part of the metal-enclosed switchgear assembly.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. The switchgear shall be manufactured by Cutler-Hammer, Siemens Energy & Automation Inc., S&C Electric Company, Square D, or approved equal.

2.2 CONSTRUCTION. The enclosure for each bay shall be designed according to all relevant design factors such as controlled access and tamper-resistance; shall be sealed against ingress of rodents, insects, and weeds; and shall include provisions to preclude the possibility of arcing faults within the enclosure.

The enclosures shall be constructed to maximize strength, minimize weight, and inhibit corrosion. The basic material shall be 11 gage (3.04 mm thick) sheet steel. Each bay containing high-voltage components shall be a complete, self-contained unit, with full side sheets securely bolted together and with steel floor plates.

Adequate bracing shall be provided for seismic forces.

The top and side edges of adjoining bays shall be equipped with gasket seals to keep out water. The roof shall be weather-sealed with suitable gaskets, and bus openings between bays shall be gasketed for additional protection against entrance of water.

Each bay shall have ventilation louvers, with an inside screen and baffle, at the top and bottom. Louvers shall be rain- and corrosion-resistant, with externally accessible glass fiber filters.

All hardware shall be either of nonferrous material or of galvanized or zinc-plated ferrous materials. Cadmium-plated ferrous parts are not acceptable.

Outdoor vertical sections shall have a sloped weatherproof roof. All openings shall be fitted with screens to keep out small animals, and with barriers against snow, sand, and blowing debris.

2.2.01 <u>Vertical Sections</u>. The following features shall be incorporated in every vertical section containing a three-pole, two-position open-closed switch:

> A high impact viewing window in the door that permits full view of the position of all three switch blades with out opening the door.
>
> The door shall be interlocked with the switch so that the switch must be opened before the door can be opened, and the door must be closed before the switch can be closed.
>
> When indicated, a grounded metal barrier in front of every switch to prevent inadvertent contact with any live part, yet allow full-view inspection of the switch blade position.
>
> Provisions for padlocking the switch in the open or closed position.
>
> Permanent "Open-Closed" switch position indicators.

When indicated, at least one 250 watt, 120 volt space heater shall be provided in each vertical section to prevent condensation. Space heaters shall be controlled by a thermostat that is factory-set to maintain the enclosure above the dewpoint for anticipated environmental conditions. Power for the space heaters shall be furnished as indicated.

2.2.02 <u>Buses</u>. All phase bus conductors shall be tin-plated copper and shall be mounted on NEMA insulators rated for the design voltage of the switchgear. A continuous tin-plated copper ground bus shall be provided throughout the multi-bay lineup.

2.2.03 <u>Wiring</u>. One NEMA terminal pad per phase shall be provided along with compression type cable terminal lugs for a maximum of two conductors per phase. The cable sizes are indicated on the drawings. Sufficient vertical space shall be allowed for electrical stress relief termination devices.

Small wiring, fuse blocks, and terminal blocks within the vertical section shall be furnished as indicated on the drawings. Each control wire shall be labeled with wire markers. Terminal blocks shall be provided for customer connections to other apparatus. Current transformer secondary windings shall be connected to shorting-type terminal blocks. All terminal blocks and connection points shall be readily accessible.

2.2.04 Key Interlocks. Key interlocks shall be supplied as required and as indicated on the drawings to prevent switch operation unless the associated device is in the correct position.

2.2.05 Lightning Arresters. When indicated, intermediate class metal oxide lightning arresters, rated as required, shall be provided. The arresters shall be connected at the incoming terminations, and securely grounded to the metal structure.

2.2.06 Load Interrupter Switches. The load interrupter switches shall have a stored energy type mechanism that utilizes a heavy-duty coil spring to provide opening and closing action. The speed of opening and closing the switch shall be independent of operator control, and it shall be impossible to "tease" the switch into any intermediate position. Automatic operation shall be accomplished by an electric motor or a linear actuator that charges the spring of a manually operated switch.

The interrupter switches shall have silver or silver alloy main contacts and auxiliary contacts, if required, to provide maximum endurance for fault closure and load interrupting duty. Insulating barriers, as needed, shall be provided between each phase and between the outer phases and the enclosure. The switches shall include a maintenance provision for slow closing to check switch blade engagement and for slow opening to check the operation of the arc interrupting contacts.

2.2.07 Motor Operators. Switches shall be supplied with motor operators when required, and as indicated on the drawings. All motor operated switches shall consist of a standard manually operated switch in combination with an electric motor or linear actuator type drive that charges the spring. The motor operator and the associated low-voltage wiring shall be mounted in a low-voltage compartment or separated from the high voltage by a barrier.

Motor operator voltage shall be 120 volts ac or 125 volts dc as indicated.

2.2.08 Fuses. All fuses shall be disconnect style. Fuses in feeder bays shall include provisions for grounding on the load side and on the enclosure ground bus. Each fuse shall be equipped with a blown fuse indicator that provides visible evidence of fuse operation while installed in the fuse mounting. Fusible elements shall be nonaging and nondamageable so that it is unnecessary to replace unblown companion fuses following a fuse operation. Fusible elements shall be protected from damage by current surges.

All arcing accompanying power fuse operation shall be contained within the fuse and any arc products and gases resulting from fuse operation shall be vented through exhaust control devices.

2.2.09 Power Company Metering Sections. When a power company metering section is required, it shall contain provisions for current transformers and voltage transformers, as required, and shall conform to all applicable power company standards, including arrangement and size. The metering sections shall also conform to the general electrical and construction requirements for the switchgear assembly specified above.

It is the intent of this specification that the Power Company will furnish current transformers, potential transformers, potential transformer fuses, meter sockets, and sealing rings. The Power Company will also provide mounting dimensions for the instrument transformers and fuses. If the Power Company wishes to ship the instrument transformers to the manufacturer, the transformers and fuses shall be mounted in the switchgear during fabrication and assembly. Depending upon the manufacturer, the Power Company may elect to place an order with the manufacturer for the instrument transformers and fuses. In this case, the manufacturer shall furnish the instrument transformers completely assembled in the switchgear at no additional cost.

2.2.10 Customer Metering. When indicated on the drawings, the switchgear section(s) shall be provided with microprocessor-based, digital power meters. Current transformers and potential transformers shall be provided for input of current and voltage signals to the metering package. Current transformers shall be wired to shorting-type terminal blocks. Potential transformers shall include primary and secondary fuses and a disconnecting means. Currents, voltages, active power, reactive power, power factor, watt-hours, frequency, and demand values shall be available for display. Total harmonic distortion waveforms shall also be available. The following alarm features shall be provided: undervoltage, power factor leading or lagging, kVAR limit, voltage sequence reversal, under frequency, and overcurrent. The metering package shall be capable of RS 485 serial communication for remote monitoring. The digital power meters shall have built-in face display and shall be Cutler-Hammer "IQ Analyzer", Multilin PQM, Square D PowerLogic Model 2350, Basler "Energy Transducer", or approved equal.

Sufficient lengths of communication cable shall be provided for connection of metering units within the switchgear and as indicated on the drawings.

The metering package shall be compatible with the metering system software and metering system network as indicated in the Contract Documents. Contractor shall furnish and install applications software for origination and display of all metering data and microprocessor-based trip-unit data as indicated in the Contract Documents.

The unit shall have two isolated 4-20 ma selectable outputs.

2.2.11 Shop Painting. All iron and steel surfaces, except stainless steel and machined surfaces, shall be shop painted with the manufacturer's standard coating to a minimum thickness of 2 mils (50 mm). Finish color shall be ANSI 61 for both indoor and outdoor equipment. Field painting, other than touchup painting, will not be required. A sufficient quantity of additional coating material and thinner shall be furnished to permit field touchup of damaged coatings.

The underside of equipment installed in exposed outdoor locations shall be thoroughly cleaned and coated with an automotive type undercoating material. The coating shall be thick enough to withstand normal handling during and after installation. The underside is defined as the surfaces in contact with the concrete mounting pad and other surfaces not readily accessible for field painting.

2.2.12 Shop Tests. The manufacturer shall supply test results to confirm that the design of the switchgear assembly has been tested for conformance with applicable ANSI and NEMA standards, and for UL listing when required. The tests shall verify not only the performance of the switch or integrated switch and fuse, but also the adequacy of the enclosure venting, rigidity, and bus bracing. In addition, the switchgear assembly shall be factory tested in accordance with IEEE C37.20.3, C37.57, and C37.58.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment shall be installed in accordance with the drawings, specifications, and the equipment manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, set all relays in accordance with the settings designated in the coordination study, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

End of Section

SECTION 16395

MEDIUM-VOLTAGE MOTOR CONTROL EQUIPMENT

PART 1 - GENERAL

1.1 SCOPE. This section covers medium-voltage motor control equipment that shall be furnished and installed as specified herein, as indicated on the drawings. Medium-voltage motor control equipment shall meet the design conditions and features as required.

Medium-voltage motor control equipment shall be designated and shall be located as indicated on the drawings.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer.

1.2.03 Workmanship and Materials. Equipment supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

ANSI	American National Standards Institute
AWG	American Wire Gage
ICS	Industrial Control and Systems
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
NFPA	National Fire Protection Association
UL	Underwriters' Laboratories

1.2.05 Governing Standards. All equipment furnished under this section shall be designed, constructed, and tested according to UL 347 and NEMA ICS 3-1993.

Equipment covered by this section shall be listed by UL or a nationally recognized third-party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of Contractor. In the event no third-party testing laboratory provides the required listing, an independent test shall be performed at Contractor's expense. Before testing, Contractor shall submit a copy of the testing procedure that will be used in evaluating the equipment.

1.2.06 Nameplates. Nameplates with unit description and designation of each control or indicating device shall be provided on hinged doors. Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/4 inch (9mm) high for section identity and 1/8 inch (3 mm) high for other information.

Each control device and each control wire terminal block connection inside the units shall be identified with permanent nameplates or painted legends to match the identification on the manufacturer's wiring diagram.

1.2.07 System Characteristics. The medium voltage motor control equipment will be connected to an electric system with characteristics as indicated on the drawings.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the motor controllers, shall be submitted in accordance with Master Specification Section 01080, Project

Submittals. The drawings and data for the motor controller lineup shall include, but shall not be limited to, the following:

Elevations, plan, and weight.

Unit wiring diagrams showing devices, connections, and terminal designations.

Interconnection diagrams.

Control schematic diagrams.

Fuse time-current characteristic curves.

Motor protective relay time-current characteristic curves.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals and shall include the following:

Assembly, installation, alignment, adjustment, and checking instructions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 SHIPPING, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.4.01 Preparation for Shipment. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Grease and lubricating oil shall be applied to all bearings and similar items.

Each item of equipment shall be tagged or marked as identified on the drawings or Equipment Schedule Sheet. Complete packing lists and bills of material shall be included with each shipment.

1.5 SPECIAL TOOLS AND SPARE PARTS. All special tools and other devices normally furnished or required for installation, care, and maintenance of the controller equipment shall be furnished. Spare parts shall be provided as indicated on the Contract Documents and shall meet all the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Spare parts shall be suitably packaged, as specified herein, with labels indicating the contents of each package. Spare parts shall be delivered to Owner as directed.

1.6 COORDINATION STUDY. When a coordination study of the power distribution system will be conducted in accordance with Master Specification Section 16050, Electrical General Requirements, the equipment manufacturer shall provide the following information to Engineer with the initial equipment shop drawings:

> Protective relay coordination curves and operation manuals for each relay provided as a part of the medium-voltage motor control assembly.
>
> Protective fuse curves for each current-limiting fuse provided as a part of the medium-voltage motor control assembly.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. The interrupting rating of the line up assembly and the motor controllers shall be 350 MVA symmetrical at 4,000 volts, or 200 MVA symmetrical at 2,300 volts, as indicated.

The power bus shall be braced for 50 kA symmetrical or greater.

2.2 ACCEPTABLE MANUFACTURERS. The equipment shall be manufactured by Cutler-Hammer, General Electric, Siemens Energy & Automation, Square Dor approved equal.

2.3 MAIN DISCONNECT, BUS TIE, AND FEEDER UNITS. When shown on the drawings, each unit shall include a gang operated load break switch and current limiting type fuses. Isolating switch and fuse units, instrument transformers, buses, and outgoing cable connections shall be provided in separate compartments formed by grounded steel barriers. Key interlocks shall be provided where indicated on the drawings or as required.

2.3.01 Load Break Switches. Gang-operated load break switches shall be stationary, manually operated, three-pole, single-throw disconnecting type, with integral interrupter and stored-energy mechanism. Each switch shall have an external operating handle, with provisions for padlocking the switch in both the "On" and "Off" positions. Mechanical interlocks shall be provided to prevent the switch from being operated when the door is open and the door from being opened when the switch is closed.

Load break switch ratings shall be 5 or 15 kV, 60 or 95 kV BIL, and 600 or 1200 amperes, as indicated.

A viewing window shall be provided at each switch to display the condition and position of the switch blades and the blown-fuse indicator.

2.3.02 Fuses. Current-limiting fuses shall ensure positive interruption of faults to limit the magnitude of short-circuit currents and electromechanical stresses to values within the allowable design of the component apparatus of the control assembly.

A positive action indicator shall be provided to identify fuses blown during operation. Fuses for protection of potential transformers, control power transformers, power transformers, and feeder circuits shall be Cutler-Hammer "Type CLE", General Electric "Type EJ-1", Gould Shawmut "Type CS-3", or approved equal.

2.3.03 Metering. When indicated, the main disconnect section(s) shall be provided with a microprocessor-based, digital power meter. Current transformers and potential transformers shall be provided for input of current and voltage signals to the metering package. Currents, voltages, active power, reactive power, power factor, watt-hours, frequency, and demand values shall be available for display. Total harmonic distortion waveforms shall also be available. The following alarm features shall be provided: undervoltage, power factor leading or lagging, kVAR limit, voltage sequence reversal, under frequency, and overcurrent. The metering package shall be capable of RS 485 serial communication for remote monitoring. The digital power meters shall have built-in face display and shall be Cutler-Hammer "IQ Analyzer", Multilin PQM, Square D PowerLogic Model 2350, Basler "Energy Transducer", or approved equal.

Sufficient lengths of communication cable shall be provided for connection of metering units within the motor control lineup and as indicated on the drawings.

The metering package shall be compatible with the metering system software and metering system network as indicated in the Contract Documents. Contractor shall furnish and install applications software for origination and display of all metering unit data and microprocessor-based trip-unit data as indicated in the Contract Documents.

The unit shall have two isolated 4-20 ma selectable outputs.

2.4 MOTOR AND FEEDER CONTROLLER UNITS. Each controller unit shall consist of an externally operable isolation switch and a magnetically operated vacuum contactor with current limiting fuses as indicated on the drawings.

2.4.01 Isolation Switch. Each controller shall be isolated by a quick-make quick-break isolation switch with an externally mounted operating handle. Mechanical interlocks shall be provided to prevent operation of the isolation switch under load, opening of the high-voltage compartment door before the controller is isolated, and closing the contactor while the door is open.

2.4.02 Fuses. Fuses for motor controller duty shall be Cutler-Hammer "Type CLS", General Electric "Type EJ-2", Gould Shawmut "Type A480R", Siemens "Type FM", or approved equal.

2.4.03 Controllers. Controllers shall be drawout type, for full voltage or reduced voltage autotransformer type starting as indicated. Controllers shall be provided with current-limiting fuses to meet the interrupting rating indicated, and shall be suitable to operate induction or synchronous motors as required. Controllers shall use magnetically operated vacuum contactors rated 360 or 720 amperes and having an interrupting capacity of 50 mVA, 3 phase symmetrical.

2.5 PROTECTIVE RELAYS. Relays shall be provided as indicated on the drawings and as specified herein.

2.5.01 Motor Protection Relay-Thermistor Protection. When indicated, the electronic motor protection relay shall protect the motor against overload (51), single phase/unbalance (46), winding overtemperature (49), phase short circuit (50) and ground fault (50G/50N). Overtemperature sensing shall be via a 100 to 30,000 ohm thermistor input. Programmable setpoints and fault diagnosis data shall be available from a front panel 2-line digital display. Four relay outputs shall be provided, including trip, alarm, service (internal fault), and a programmable auxiliary contract.

The relay shall include a 2-wire RS485 communication port, suitable for ModBus RTU communication protocol. The relay shall be Multilin "Model 239", Basler "MPS100", or approved equal.

2.5.02 Motor Protection Relay-RTD Protection. When indicated, the electronic motor protection relay shall protect the motor against overload (51), single phase/unbalance (46), overtemperature (49), short circuit (50), undercurrent (37), starts per hour (66), power factor (55), and ground fault (50G/51G). Overtemperature sensing shall be via RTD inputs from the motor windings and motor bearings as indicated on the drawings. The relay shall accept up to 10 RTD inputs for overtemperature sensing. Programmable setpoints and fault diagnosis data shall be available from a front panel 2-line digital display. Four relay outputs shall be provided, including trip, alarm, service (internal fault), and a programmable auxiliary contract.

The relay shall include a 2-wire RS485 communication port, suitable for ModBus RTU communication protocol. The relay shall be Multilin "Model 369", Basler "MPS200", or approved equal.

2.6 CONSTRUCTION. Each control lineup shall conform to the arrangement, one-line diagram, schematics, and requirements indicated on the drawings or specified herein.

2.6.01 Sills and Anchors. Contractor shall furnish and install steel channels, floor sills, and anchor bolts as required by the equipment manufacturer for proper installation.

2.6.02 Enclosures. When indicated, enclosures shall be NEMA Type 1 with gasketed doors for indoor locations, NEMA Type 3R walk-in for outdoor locations, or NEMA Type 3R non-walk-in for outdoor locations.

2.6.03 Vertical Sections. When indicated, the equipment furnished shall be of two-high type construction in which two single full-voltage motor controllers require a full-height section of the equipment, or of one-high type construction in which a single full-voltage motor controller requires a full-height section of the equipment.

Equipment shall consist of a lineup of freestanding, metal-enclosed cubicles forming an integrally built group of medium-voltage control. All connections and servicing shall require access from the front only.

The individual sections shall be divided into high voltage and low voltage compartments, to assure isolation of equipment for safety of personnel during servicing and maintenance or cable pulling, while adjacent sections of the group remain energized.

2.6.04 Wiring Labels. All internal wires shall be labeled at each termination. Terminals shall also have labels giving the terminal block and terminal number.

2.6.05 Busing. All buses shall be tin-plated copper and shall be covered with molded insulating material or shall be taped. The main horizontal bus shall be located in an isolated bus compartment within or at the top of the enclosure and shall be rated 600, 1000, 1200, or 2000 amperes as indicated.

A tin-plated copper ground bus rated at least 500 amperes shall be furnished through the lineup. A clamp type connector shall be provided on each end of the ground bus for external connection of a 500 kcmil (240 mm^2) stranded copper grounding cable to the grounding system. A clamp type connector shall also be provided in each controller section for connection of stranded copper grounding cable run with incoming and outgoing phase wires, as indicated on the drawings.

2.6.06 Current Transformers. Current transformers shall be selected so that full load secondary currents will be approximately 2.5 to 4.0 amperes to provide for proper operation of out-of-step protective relays on synchronous motors, and shall be coordinated with indicating meters so they read one-half to three-quarters scale at full load. Conventional wound type current transformers having higher burden-capacity, up to 200 volt-amperes within general industry accuracy requirements, shall be furnished where necessary for certain devices such as current type phase reversal relays. "Ring" type current transformers, with burden-capacity as low as 50 volt-amperes, may be used where such capacity is sufficient for the particular application.

2.6.07 Potential Transformers. Potential transformers shall have a primary voltage rating that is not exceeded by more than 10 percent under normal conditions, yet under emergency conditions the transformers shall function at temporary system over voltage of 1.25 times primary voltage rating. The transformer insulation-class voltage shall in all cases exceed the system line-to-line voltage. Thermal ratings shall be such that, at rated voltage, the burden imposed does not cause the allowable temperature rise to be exceeded. Transformers shall meet the required accuracy limits in accordance with the ANSI accuracy classification system. Potential transformers shall be General Electric "Type JVM-3" or "Type JVM-4", Siemens "Type DP" or "Type PT3-45", Cutler- Hammer "Type PT-45", or approved equal. Current-limiting primary fuses shall be provided.

2.6.08 Control Power Transformers. Individual control power transformers shall be provided with each contactor and each motor starter. The transformer primary windings shall be fused and the secondary windings shall have one lead fused and the other grounded. Control power transformers, which serve external device loads, shall have extra capacity for motor space heaters and other associated equipment.

2.6.09 Control Test Circuit. Test control power interlocking provisions shall allow testing of contactor or starter control operations from an external source of 120 volt control power with the high voltage disconnected and isolated.

2.6.10 Cable Connectors. Crimp type terminal connectors for incoming and outgoing power cables shall be provided in each section. Connectors shall match the size of cables and the number of cables per phase as indicated on the drawings. Connectors to the ground bus shall be provided in each section for connecting the grounding cable in each power circuit.

2.6.11 Stress Cones. The design and arrangement of each section shall provide sufficient space for terminating power cables with IEEE Class 1 stress cones. The design shall provide adequate space for minimum bending radii of the cables to be terminated.

2.6.12 Relays and Timers. Auxiliary relays and timers shall have 120 V ac, 60 Hz coils for continuous duty in 105 F (40 C) ambient, and 10 ampere, 120 V ac contacts. Auxiliary relays shall be NEMA rated.

2.6.13 Control Switches and Pilot Lights. Control switches and pilot lights shall be heavy-duty, oiltight construction. Pilot lights shall be transformer type with high intensity push to test LED lamps.

2.6.146 Auxiliary Contacts. Auxiliary contacts for interlocking and control shall be furnished as indicated on the drawings. In addition, one spare NO isolated contact and one spare NC isolated contact shall be provided on each controller.

2.6.15 Wiring. All external connections to the equipment will enter at the bottom or the top as indicated. As much space as possible shall be provided for conduits in unit floors and tops. All spare contacts shall be wired to terminals for external connections. In addition to spare contact terminals and spare terminals, terminals marked to match the manufacturer's drawing shall be provided for all connections wired through the controllers.

2.6.16 Space Heaters. Space heaters shall be furnished in each section or unit of motor control groups provided with NEMA Type 3R enclosures. The heaters shall be thermally insulated and shall be located to prevent damage or discoloration to painted surfaces. Heaters shall be located where they do not interfere with cable entrances. The heaters shall be controlled by an adjustable thermostat set to open when the temperature rises to 90°F (32°C) and to close when the temperature falls below 85°F (29°C), and shall have capacity to maintain the interior temperature above dew point of the section. Heaters shall be rated 120 volts ac.

When indicated, space heater wiring, with branch circuit protection, shall be factory installed, with terminals provided for connection of an external power supply.

When indicated, power to space heaters shall be supplied from the unit control power transformer. All wiring and branch circuit protection shall be factory installed.

2.7 SHOP PAINTING. All iron and steel surfaces, except machined surfaces and stainless steel, shall be shop coated with the manufacturer's standard coating. Finish color shall be ANSI 61 for indoor equipment and ANSI 61 or 70 for outdoor equipment. Field painting, other than touch up painting, will not be required. A sufficient quantity of additional coating material and thinner shall be furnished to permit field touch up painting of damaged coatings.

The underside of equipment to be installed in exposed outdoor locations shall be thoroughly cleaned and coated with an automotive type undercoating material. The coating shall be thick enough to withstand normal handling during shipping and installation. The underside shall be considered to be the surfaces in contact with the floor or pad and other surfaces not readily accessible for field painting.

2.8 SHOP TESTS. The complete control lineup shall be tested at the factory. All circuits, including power and control circuits, shall be tested in accordance with NEMA ICS 3.

2.9 ACCESSORIES. Special tools, instruments, and accessories needed for proper maintenance, and special devices for lifting or handling, shall be furnished.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment shall be installed in accordance with the drawings, specifications, and the manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Supervision. When indicated, the equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the contract price.

Manufacturers' installation supervisor shall observe, instruct, guide, and direct Contractor's erection or installation procedures as required. The equipment manufacturer will be provided with written notification 10 days prior to the need for such services.

3.2.02 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, set all relays in accordance with the settings designated in the coordination study, and approve the equipment installation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools. The representative shall be present when the equipment is placed in operation. Such services shall be included in the contract price.

All over current protective devices shall be adjusted as required by Engineer. Current limiting fuse selection shall be checked and over current relays shall be adjusted according to NEC requirements and the relay coordination study. All controls shall be tested for conformance with schematics or as required by Engineer.

The manufacturer's representative shall furnish a written report certifying that equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting conduit or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

End of Section

SECTION 16425

SWITCHBOARDS

PART 1 - GENERAL

1.1 SCOPE. This section covers switchboard equipment, which shall be furnished and installed as specified herein and as indicated on the drawings. Switchboards shall meet the following requirements, and the design conditions and features as required.

Switchboards shall be designated and shall be located as indicated on the drawing.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers, and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer.

1.2.03 Workmanship and Materials. Equipment supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

AISI	American Iron and Steel Institute

ANSI	American National Standards Institute
AWG	American Wire Gage
ICS	Industrial Control and Systems
IEEE	Institute of Electrical and Electronics Engineers
MIL	Method of Insertion Loss Measurement
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
NFPA	National Fire Protection Assocation
NRTL	Nationally Recognized Testing Laboratory
UL	Underwriters' Laboratories

1.2.05 Governing Standards. All equipment furnished under this section shall be designed, constructed, and tested in accordance with all the applicable standards of ANSI, NEMA, and UL, including, but not limited to, NEMA PB 2 and UL 891 (switchboards); NEMA AB1 and UL 489 (molded-case circuit breakers); ICS-6 (enclosures); and NEMA PD 2.2 (Ground Fault Protection).

Equipment covered by this section shall be listed by UL or a nationally recognized third-party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of Contractor. In the event no third-party testing laboratory provides the required listing, an independent test shall be conducted at Contractor's expense. Before the test is conducted, Contractor shall submit a copy of the testing procedure to Engineer.

1.2.06 Nameplates. Each switchboard section shall have a nameplate permanently affixed to it, listing the following information:

Name of manufacturer.

System voltage.

Main bus rating.

Type.

Manufacturer's shop order number and date.

In addition, each circuit breaker and instrument on the front of the switchboard shall have a suitable nameplate. Each incoming line section shall be furnished with a nameplate to indicate the power source or substation from which it is fed. The nameplates for the distribution circuit breakers shall indicate the equipment fed through the breaker. Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/4 inch (19mm) high for section and circuit breaker identity and 1/8 inch (3 mm) high for other information.

Each control device and each control wire terminal block connection inside the units shall be identified with a permanent nameplate or painted legend to match the identification on the manufacturer's wiring diagram.

1.2.07 System Characteristics. The equipment will be connected to a system as indicated on the drawings.

1.3 SUBMITTALS. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the switchboard, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data for switchboard shall include, but shall not be limited to, the following:

Elevation, plan, conduit entrance locations, and weight.

Circuit breaker time-current characteristic curves.

Nameplate legends and equipment schedule.

Single-line and control wiring interconnection diagrams.

Metering section details.

Shop test report.

Installation report.

When transient voltage surge suppressors are required, submittals shall include manufacturer's catalog and specification data, including device dimensions, weight, material composition, and connection diagrams. Documentation shall be provided showing the file number of compliance with UL 1449 listing requirements and results of independent, third party NRTL certification of listed surge ratings. The test results submitted shall include UL file number, date of report, product covered, electrical ratings, voltages, phases, modes of protection, nomenclatures, and UL 1449 ratings with and without disconnect device.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Assembly, installation, alignment, adjustment, and checking instructions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 SPARE PARTS. Spare parts shall be provided as indicated on the Contract Documents.

Spare parts shall be suitably packaged with labels indicating the contents of each package and shall meet all the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Spare parts shall be delivered to Owner as directed.

1.6 COORDINATION STUDY. When a coordination study of the power distribution system will be conducted as specified in Master Specification Section 16050, Electrical General Requirements, the equipment manufacturer shall provide the following information to Engineer with the initial equipment drawing submittal:

Protective relay coordination curves for each solid-state trip device.

Time current curves shall be provided for circuit breakers as required.

Data for all devices with adjustable settings shall be submitted, with all literature necessary to determine the appropriate settings. This shall include, but shall not be limited to, Operation Manuals for each type of adjustable trip device.

1.7 SHIPPING, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. The switchboard shall be manufactured by Cutler-Hammer, General Electric, Siemens Energy & Automation, Square D,or approved equal.

2.2 INCOMING LINE SECTIONS. Incoming line sections shall be provided as shown on the one-line diagram and when required shall have all necessary components for a cable pull box, a busway entry compartment, a power utility metering compartment, an Owner metering compartment, or a main breaker.

2.2.01 Cable Pull Box. When indicated, each bussed pull section shall have compression type terminals for the number and size of copper conductors indicated on the drawings. When indicated, the cable pull box shall include provisions for a power utility seal.

2.2.02 Busway Entry Compartment. When the switchboard is fed by a busway, the switchboard manufacturer shall be responsible for coordination, proper phasing and internal bussing to the incoming busway. All hardware, splice plates, flexible connectors, and insulating material for connection to the switchboard shall be furnished.

2.2.03 Power Utility Metering Compartment. This compartment shall meet the requirements of the local utility and shall be provided with a sealable hinged door. Busses shall include provisions for mounting utility company current transformers and potential transformers or bus taps.

2.2.04 Owner Metering Compartment. When indicated, the incoming line section(s) shall be provided with a microprocessor-based, digital power meter for Owner metering. Current transformers and potential transformers shall be provided for input of current and voltage signals to the metering package. Currents, voltages, active power, reactive power, power factor, watt-hours, frequency, and demand values shall be available for display. Total harmonic distortion waveforms shall also be available. The following alarm features shall be provided: undervoltage, power factor leading or lagging, kvar limit, voltage sequence reversal, underfrequency, and overcurrent. The metering package shall be capable of RS 485 serial communication for remote monitoring. The digital power meters shall have built-in face display and shall be Cutler-Hammer "IQ Analyzer", Multilin "PQM", Square D "PowerLogic Model 2350", Allen-Bradley "Power Monitor II", Basler "Energy Transducer" or approved equal.

Sufficient lengths of communication cable shall be provided for connection of metering units within the switchboard and as indicated on the drawings.

When indicated, the metering package shall be compatible with the metering system software and metering system network as indicated in the Contract Documents. Contractor shall furnish and install applications software for origination and display of all metering unit data and microprocessor-based trip-unit data as indicated in the Contract Documents.

The unit shall have two isolated 4-20 ma selectable outputs.

2.2.05 Main Breaker. When indicated, each incoming line section shall include a molded case, fixed mounted insulated case, or drawout insulated case power circuit breaker with a current rating as indicated on the drawings. Internal control power transformers shall be provided to furnish control power for insulated case power circuit breakers.

Compression type terminals shall be provided for terminating the number and size of copper conductors indicated on the drawings.

When indicated, the incoming line circuit breakers shall be furnished with a captive key interlock to prevent both incoming circuit breakers from being closed at the same time.

2.3 TIE BREAKER SECTION. Each tie breaker section shall include a molded case, fixed mounted insulated case, or drawout insulated case power circuit breaker with a current rating as indicated on the drawings. Internal control power transformers shall be provided to furnish control power for insulated case power circuit breakers.

2.4 DISTRIBUTION SECTION. The distribution section shall be provided to house branch circuit breakers as indicated on the drawings. Circuit breakers shall be molded case (individually mounted or panel mounted as indicated), fixed mounted insulated case, or drawout insulated case as indicated. Circuit breakers shall be removable from the front without disturbing adjacent units. The switchboard shall contain space for future units as indicated on the drawings.

2.5 TRANSIENT VOLTAGE SURGE SUPPRESSION. When indicated, transient voltage surge suppressors (TVSS) shall be provided and installed integral to each switchboard assembly. Units shall be UL 1449 listed for installation into switchboards. TVSS devices shall be designed, manufactured, tested, and installed in accordance with the following standards:

ANSI/IEEE C62.41-1991 and C62.45-1987.

NEMA LS1-1992 Guidelines.

NFPA 20, 70, 75, and 780.

UL 1449 and 1283.

Each TVSS device shall be configured for permanent connection. In-line, series connected components shall not be acceptable. Each TVSS device shall utilize metal oxide varistors (MOV) connected in parallel.

2.5.01 Device Performance. The minimum surge current capability for each device shall be:

	L-L	L-N	L-G	N-G
Switchboards	250,000 A	250,000 A	250,000 A	250,000 A

The minimum UL 1449 rating shall be (inclusive of disconnect):

	L-L	L-N	L-G	N-G
Switchboards	2000 V	1000 V	1000 V	800 V

Each unit shall have a maximum continuous operating voltage (MCOV) greater than 115 percent of the nominal system operating voltage for L-L, L-N, L-G, and N-G.

Each unit shall be capable of suppressing a Category B3 impulse at less than 500 volts. Each unit shall be UL 1283 listed as an electromagnetic interference filter. Electromagnetic filtering shall provide insertion loss with a system noise attenuation of 55 dB from 100 kHz to 100 MHz when tested per 50 Ohm insertion loss method as defined by MIL 220A.

Each unit shall incorporate 200 kAIC rated fusing and shall monitor all modes of protection inclusive of N-G and provide indicator lights (one green and one red LED) on the front cover of the enclosure and an indicator light on each module (inclusive of N-G) to individually monitor each module for failure.

2.5.02 Testing. Contractor shall provide the following test data for each unit:

Third party testing from a nationally recognized testing laboratory (NRTL) verifying that the total surge current can be passed through the fuse with no charring, flames, or projection of materials. Testing of the fuse only will not be acceptable for this requirement. Testing shall indicate the lowest possible surge that can disrupt the fusing.

Third party, NRTL testing verifying the fault current withstand rating of the fusing employed. Testing shall be conducted in both high and low impedance fault conditions and shall confirm no charring, flaming, or projection of materials.

Life cycle testing per ANSI/IEEE C62.41 and C62.45 with fusing in place for category C3 transients (20 kV at 1.2 x 50 microseconds and 10 kV at 8 x 20 microseconds).

2.6 CONSTRUCTION. All equipment furnished under this section shall be designed and constructed in accordance with the following requirements:

2.6.01 Enclosure. The switchboard shall be of deadfront, modular type construction with the required number of vertical sections bolted together to form one rigid, metal-enclosed unit as required. All sections shall be aligned in both front and rear. The switchboard frame shall be of formed UL gauge steel, rigidly bolted together to support all cover plates, buses, and circuit breakers. Steel base channels shall be bolted to the frame. Each section shall have a removable top plate and an open or a barriered bottom for installation and termination of conduit. All front covers shall be removable with a single tool and all doors shall be hinged, with removable hinge pins.

Switchboard enclosures shall be NEMA Type 1 indoor, NEMA Type 3R outdoor, or NEMA Type 3R outdoor walk-in as indicated.

Switchboard connections shall be made in the front, or in the rear, as indicated. Access to the switchboard shall from the front, or from the rear as indicated.

2.6.02 Main Bus. The main bus shall be tin-plated copper and shall be of sufficient size to limit the temperature rise to 150°F (65°C), based on UL tests. Ampere rating, and bus fault rating shall be as indicated on the drawings. End sections shall be predrilled for units to be added in the future.

2.6.03 Neutral Bus. When indicated, a tin-plated copper neutral bus shall be provided through all vertical sections and shall be rated full capacity.

When indicated, the incoming line section shall be equipped with a neutral bond lug suitable to bond the service entrance neutral conductors. The service entrance neutral pad shall be equipped with a main bonding jumper to the switchboard ground bus in accordance with the National Electrical Code.

2.6.04 Ground Bus. The ground bus shall extend the entire length of the switchboard and shall be firmly secured to each vertical section. A ground lug shall be provided at each end of the ground bus for connection to building grounding system with 4/0 AWG bare copper cables. Other ground lugs for feeder circuits shall also be supplied as indicated on the drawings.

2.6.05 Molded Case Circuit Breakers. Molded case circuit breakers shall be individual or panel mounted as indicated. Circuit breakers shall be rated to interrupt and withstand an available fault current at the system line voltage as indicated. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break, over-center switching mechanism that is mechanically tripfree. When required, circuit breakers shall be thermal magnetic or shall be furnished with a solid-state electronic trip unit complete with built-in current transformers. The ampere rating of the trip unit shall be as indicated on the drawings.

The trip unit shall have adjustable settings for continuous amperes, instantaneous pickup, and short-time pickup. When required, the trip unit shall be provided with additional short delay trip time adjustment for better system coordination. Circuit breakers indicated to be rated less than 100 amperes shall be thermal-magnetic types.

When indicated, built-in ground fault protection shall have adjustable pick-up ratings not exceeding 1,200 amperes, time delay adjustable from 0.1 to 0.5 seconds, and a neutral ground fault current transformer.

The solid-state electronic trip breakers shall have built-in test points for testing long delay, instantaneous, and ground fault functions of the breaker by means of a 120 volt ac operated test kit.

2.6.06 Insulated Case Power Circuit Breakers. Insulated case power circuit breakers shall be fixed or drawout type with a manually or electrically operated stored energy mechanism as required. The insulated case breakers shall be UL listed for operation at 100 percent of continuous current rating. The circuit breakers shall be rated to interrupt and withstand an available fault current as indicated, at system line voltage, as required. The breaker control faceplate shall include color-coded visual indicators for open and closed positions as well as mechanism charged and discharged positions. Manual push buttons shall be provided for opening and closing the breaker.

Each breaker shall be furnished with a solid-state tripping system consisting of three current sensors, a solid-state trip device, and shunt trip. The solid-state element shall have long delay current pickup, short delay pickup, instantaneous pickup, ground fault pickup and fault trip indicators. All elements of the solid-state trip device shall be of the sealed potentiometer type providing adjustable current pickup in percentage of current sensor primary rating and time delay adjustments. The current sensor primary ampere rating shall be as indicated on the drawings.

The breaker shall have built-in test points for testing long delay, short delay, instantaneous, and ground fault functions of the breaker by means of a 120 volt ac operated test kit.

2.6.07 Shop Painting. All iron and steel surfaces, except machined surfaces and stainless steel, shall be shop painted with the manufacturer's standard coating. Finish color shall be ANSI 61. Field painting, other than touchup painting, will not be required. A sufficient quantity of additional coating material and thinner shall be furnished for field touch up of damaged coatings.

The underside of equipment to be installed in exposed outdoor locations shall be thoroughly cleaned and coated with an automotive type undercoating material. The coating shall be thick enough to withstand normal handling during shipping and installation. The underside is defined as the surfaces in contact with the floor or pad and other surfaces not readily accessible for field painting. The coating may be factory or field applied.

2.7 ACCESSORIES.

2.7.01 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.8 SHOP TESTS. After the equipment has been completely assembled, it shall be shop tested for general operating conditions, circuit continuity, and high potential and other standard tests for the particular class of equipment as defined by industry standards. Four certified copies of the test results shall be submitted to Engineer before the equipment is shipped.

PART 3 - EXECUTION

3.1 INSTALLATION. Installation will be in accordance with the drawings, specifications, and the manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools, and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting conduit or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3 FIELD TESTS. After completion of the installation, a qualified factory service representative shall verify that the settings of all protective devices are as recommended in the coordination study, make all adjustments, approve the installation, and test the ground fault system. The ground fault system testing shall satisfy the requirements of the National Electrical Code. Certified copies of the test report shall be furnished to the Owner and the Engineer at the completion of the testing.

End of Section

SECTION 16480

600 VOLT CLASS MOTOR CONTROL CENTERS

PART 1 - GENERAL

1.1 SCOPE. This section covers motor control center equipment that shall be furnished and installed as specified herein and as indicated on the drawings.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless Engineer notes exceptions.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer.

1.2.03 Workmanship and Materials. Equipment supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thickness so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.2.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

AISI	American Iron and Steel Institute
ANSI	American National Standards Institute

AWG	American Wire Gage
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
NFPA	National Fire Protection Association
NRTL	Nationally Recognized Testing Laboratory
UL	Underwriters' Laboratories

1.2.05 Governing Standards. All equipment furnished under this section shall be designed, constructed, and tested in accordance with NEMA ICS 2 and UL 845.

Equipment covered by this section shall be listed by UL or a nationally recognized third-party testing laboratory. All costs associated with obtaining the listing shall be the responsibility of the Contractor. In the event, no third-party testing laboratory provides the required listing; an independent test shall be performed at the Contractor's expense. Before testing, the Contractor shall submit a copy of the testing procedure that will be used in evaluating the equipment.

1.2.06 Nameplates. Nameplates with unit description and designation of each control or indicating device shall be provided on all hinged doors. Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/8 inch (10 mm) high for compartment identity and 3/16 inch (5 mm) high for other information.

Each control device and each control wire terminal block connection inside the units shall be identified with permanent nameplates or painted legends to match the identification on the manufacturer's wiring diagram.

1.2.07 System Characteristics. This equipment will be connected to a system with characteristics as indicated on the drawings.

1.3 SUBMITTALS. Complete assembly, foundation, and installation drawings, together with complete engineering data covering the materials used, parts, devices, and accessories forming a part of the motor control center shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The drawings and data for motor control centers shall include, but shall not be limited to, the following:

Drawings and weight.

Unit wiring diagrams indicating devices, connections, and terminal designations.

Interconnection diagrams.

Control schematic diagrams.

Circuit breaker time-current characteristic curves.

When transient voltage surge suppressors are indicated, submittals shall include manufacturer's catalog and specification data, including device dimensions, weight, material composition, and connection diagrams. Documentation shall be provided indicating the file number of compliance with UL 1449 listing requirements and results of independent, third party NRTL certification of listed surge ratings. The test results submitted shall include UL file number, date or report, product covered, electrical ratings, voltages, phases, modes of protection, nomenclatures, and UL 1449 ratings with and without disconnect device.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Assembly, installation, alignment, adjustment, and checking instructions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 COORDINATION STUDY. When a coordination study of the power distribution system will be conducted, in accordance with Master Specification Section 16050, Electrical General Requirements, the initial equipment drawing submittal shall include the circuit breaker coordination curves for the main breaker(s), the tie breaker, the largest circuit breaker utilized in a combination starter, and the smallest circuit breaker provided as a part of the motor control center assembly.

1.6 SHIPPING, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Each motor control center assembly shall be a product of a manufacturer of industrial motor starter and circuit breaker equipment who has supplied such equipment both individually and together as feeder breakers, starters, and combination starters for at least 5 years.

The equipment shall be manufactured by Allen-Bradley, Cutler-Hammer, General Electric, Siemens Energy & Automation, Square D, or approved equal.

2.2 CONSTRUCTION. Each control center shall conform to the arrangement, one-line diagram, schematics, and requirements indicated on the drawings or specified herein.

Control centers shall have adequate bus bracing and combination starter ratings of 42,000, 65,000, or 100,000 amperes compatible with anticipated short circuit current.

Control centers connected Power Company feeders shall be rated for service entrance duty.

Control center enclosures shall be NEMA Type 1-Gasketed, NEMA Type 12-Industrial, or NEMA Type 3R, suitable for the environment in which they will be installed.

2.2.01 Vertical Sections. The control center shall consist of standardized, freestanding structures bolted together to form a single dead-front panel assembly containing combination motor control units; feeder units; transformers; lighting panels; and metering, relaying, and interlocking, and miscellaneous control devices, as indicated on the drawings. A removable lifting angle shall be mounted on the top of each shipping group. Removable front and rear bottom channel sills shall extend the full width of the motor control center.

Each vertical section shall be 90 inches (2250 mm) high, not less than 20 inches (500 mm) wide, and not less than 20 inches (500 mm) deep. Each 20 inch (500 mm) wide standard section shall have all necessary hardware and busing for modular plug-in units to be added and moved around. All unused space shall be covered by hinged blank doors and equipped to accept future units. Removable rear plates shall be sectionalized so that it is unnecessary to handle any plate larger than the section width or one-half the section height.

Cable entry shall be provided at top, bottom, or both as indicated.

2.2.02 Compartmented Units. Each vertical section shall be constructed of modular components of various sizes. The modular components shall be designed to accommodate not more than six Size 1 or Size 2 full voltage combination motor starters per vertical section.

Removable circuit breaker and motor starter units shall be provided with a mechanical interlock to prevent insertion or withdrawal when in the "on" position.

Individual motor starter units, feeder breaker units, transformers, lighting panels, and control device compartments shall be isolated from each other by barriers of metal or a suitable insulating material.

Each vertical section shall have a vertical-wiring trough for power and control wiring, and wiring troughs on top and bottom, which are continuous through the entire control center. Wire ties shall be provided in the vertical wireways unless the wireways are separated from the plug-in units by a permanent wall.

2.2.03 Wiring Labels and Terminal Blocks. All internal wires shall be labeled at each termination. Terminals shall also be identified with labels showing the terminal block and terminal number.

Wiring shall be NEMA Class IIS, NEMA Type B, unless otherwise indicated.

All starter units shall be provided with unit control terminal blocks. Terminal blocks shall be pull-apart type rated 20 amperes. All current carrying parts shall be tin-plated. The removable portion of the terminal blocks shall be used for factory installed wiring.

2.2.04 Main Bus. The horizontal main bus and the vertical bus extensions shall be tin-plated copper mounted on supports formed of materials having high dielectric strength, low moisture absorbency, and high impact strength. The bus shall be rated 600, 800, 1,000, 1,200, 1,600, 2,000, or 2,500 amperes as indicated. The main bus shall extend the full length of the motor control center and shall have provisions for splicing additional sections onto either end. Both horizontal and vertical busing shall be braced against forces resulting from fault current, as required. Ampere rating of the bus shall be as required.

The vertical bus connecting an incoming power feeder cable shall have the same ampere rating as the main horizontal bus. Each vertical bus extension shall be rated 300 or 600 amperes as indicated.

A tin-plated copper ground bus rated 300 amperes shall extend through the entire control center and shall be located where it will not interfere with pulling of external cable. Grounding connections shall be accessible from the front. The ground bus shall be provided with six 0.38 inch (10 mm) holes for each vertical section to accept ground lugs for any loads requiring a ground conductor. A solderless connector shall be provided on the ground bus in each end section for an external ground cable, sized from 1/0 AWG to 250 kcmil (50 to 120 mm^2).

Each vertical section shall have a vertical ground bus. The plug-in units shall engage the ground bus prior to engagement of the power stabs and shall disengage only after the power stabs are disconnected.

2.2.05 Neutral Bus. When MCC will be connected to a 4-wire system, a tin-plated copper neutral bus shall be provided through all vertical sections and shall be rated full capacity.

The incoming line section shall be equipped with a neutral bond lug or pad suitable to bond the service entrance neutral conductors. The service entrance neutral pad shall be equipped with a main bonding jumper to the control center ground bus in accordance with the National Electrical Code.

2.2.06 Isolation of Buses. The main bus shall be isolated from the horizontal wiring trough. The entire vertical bus assembly shall be enclosed within grounded steel or glass filled polyester barriers. The barriers shall have openings for power stabs of plug-in units. Shutters shall be provided to close the openings when units are removed.

2.2.07 Combination Magnetic Starters. Control center starters, as indicated on the drawings, shall be breaker combination, magnetic, reduced voltage, or across-the-line type. Starters shall have interrupting ratings as required. Starters shall be provided with the following features:

> Starters shall be 3 phase, 60 Hz contactors with overloads, a 120 volt ac coil, a dry type control transformer, and a molded-case circuit breaker. Control transformers shall be mounted with the removable starters and shall have capacity for all simultaneous loads. Control transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded.
>
> Contactors shall be NEMA rated and have an 8 hour current rating in accordance with the latest NEMA standards. Contactors of reversing or

multispeed starters shall be mechanically and electrically interlocked.

Spare interlock contacts, whether on the starter or a relay, shall be wired separately to the unit terminal board. One NO and/or one NC contact shall be furnished on each starter.

When indicated, a 3 phase ambient-compensated bimetallic or eutectic alloy style thermal overload relay with external manual reset shall be furnished with each starter.

When indicated, heaterless overload protection shall be provided by three current sensors monitored by a microprocessor. The overload device shall also include phase loss and unbalance protection, trip class selection, Class II ground fault protection, and manual reset.

An external manual breaker operating handle with provisions for up to three padlocks shall be provided on each starter. The access door shall be interlocked with the circuit breaker so that the door cannot be opened, except by an interlock override, while the breaker is closed.

Contractor shall match control transformers, overloads, heaters, and minimum sizes of starters to equipment furnished, which may differ from the estimated values indicated on the drawings. Overload relay elements shall be sized to reflect reduced motor current caused by load-side power factor correction capacitors.

Unless otherwise specified, spare starters shall have breakers and overloads sized for the largest rated motor and 100 watts extra transformer capacity.

2.2.08 <u>Combination Solid-State Starters</u>. Control center starters, as indicated on the drawings, shall be breaker combination, solid-state, reduced voltage type. Six back-to-back silicon controlled rectifiers shall be used to provide smooth, stepless motor acceleration. When the motor reaches full speed, a bypass contactor shall close and carry the continuous duty motor current. Starters shall have interrupting ratings as required. Starters shall be provided with the following features:

Starters shall be 3 phase, 60 Hz, with overloads, a 120 volt ac bypass contactor coil, a dry-type control transformer, and a molded-case circuit breaker. Control transformers shall be mounted with the removable starters and shall have capacity for all simultaneous loads. Control transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded.

The bypass contactor shall have an 8 hour current rating in accordance with the latest NEMA standards.

Spare interlock contacts, whether on the starter or on a relay, shall be wired separately to the unit terminal board. One NO and/or one NC contact shall be furnished on each starter.

Starters shall include smooth starting and stopping, adjustable starting torque, adjustable ramp time, inverse time overload current trip, current limit, phase loss protection, and adjustable electronic overloads.

An external manual breaker operating handle with provisions for up to three padlocks shall be provided on each starter. The access door shall be interlocked with the circuit breaker so that the door cannot be opened, except by an interlock override, while the breaker is closed.

Contractor shall match control transformers, overloads, and the minimum sizes of starters to equipment furnished, which may differ from the estimated values indicated on the drawings. Overload relay devices shall be adjusted to reflect reduced motor current caused by load-side power factor correction capacitors.

Unless otherwise specified, spare starters shall have breakers and overloads sized for the largest rated motor and 100 watts extra transformer capacity.

When indicated, starters shall include an auxiliary contactor for connection to a load-side power factor correction capacitor. The contactor shall be interlocked to prevent the capacitor from being connected before the bypass contactor has energized.

2.2.09 Variable Frequency Drives. Variable frequency drives shall be provided in the size and quantity shown on the drawings or otherwise indicated. Each variable frequency drive shall be coordinated with the requirements of the driven equipment. Particular attention shall be directed toward the driven equipment torque requirements.

The motor control center supplier shall be responsible for coordinating the VFD with the driven equipment to assure compatibility between the drive and motor. All equipment shall be derated as recommended by the VFD and motor manufacturers for reduced speed operation with an variable frequency controller in addition to any derating requirements specified elsewhere.

Each VFD shall be pulse-width modulated type and shall produce a variable ac voltage/frequency output. Each VFD shall maintain a minimum displacement power factor of 0.95 over the entire speed range, and shall be equipped with an output voltage regulator to maintain correct output V/Hz despite incoming voltage variations.

Each VFD shall be equipped with an input line reactor and a full-wave diode bridge rectifier to convert incoming fixed voltage/frequency to a fixed dc voltage. The pulse-width modulation technology shall be of the space vector type, implemented in a microprocessor, which generates a sine-coded output voltage.

The VFD inverter output shall be generated by insulated gate bipolar transistors (IGBT) that shall be controlled by six identical base driver circuits. The VFD shall not induce excessive power losses in the motor. The worst case RMS motor line current measured at rated speed, torque, and voltage shall not exceed 1.05 times the rated RMS motor current for pure sine wave operation. Each VFD shall be configurable for automatic and manual reset and shall have a variable carrier frequency to at least 6000 Hz.

When indicated on the drawings, a contactor to switch power factor correction capacitors shall be provided.

2.2.10 Contactors. Contactors for control of bus voltage loads other than motors shall be the same as contactors for combination magnetic starters, except overloads will not be required. Mechanically held contactors shall have 120 volt ac coils with disconnecting contacts. Other contactors shall have 120 volt, continuous duty coils and contacts as required.

2.2.11 Relays and Timers. Auxiliary relays and timers shall have 120 volt, 60 Hz coils for continuous duty in 105°F (40°C) ambient, and 10 ampere, 120 volt ac contacts. Auxiliary relays shall be NEMA rated.

2.2.12 Control Switches and Pilot Lights. Control switches and pilot lights shall be heavy-duty, oil tight construction. Pilot lights shall be transformer type with high intensity push to test LED lamps.

2.2.13 Motor Protection Relay. When shown on the drawings or otherwise indicated, a microprocessor based motor protection relay shall be provided. The relay shall protect against phase loss, phase reversal, voltage unbalance, and under voltage on any one or more phases. The relay shall reactivate after power line conditions return to an acceptable level. Trip and reset delays shall prevent nuisance tripping due to rapidly fluctuating power line conditions. The relay shall be Motor Saver Model 102 by SymCom Inc., or approved equal

2.2.14 Circuit Breakers. Control center disconnects shall be three pole, single-throw, 600 volt, molded-case air circuit breakers. Circuit breakers of combination starters shall be magnetic motor circuit protector type. Feeder circuit breakers shall be thermal-magnetic type and shall be manually operated, with quick-make, quick-break, trip-free toggle mechanism. Bimetallic thermal elements shall withstand sustained overloads and short-circuit currents without injury and without affecting calibration. Thermal elements shall trip the breaker at 125 percent of trip rating. The instantaneous elements of 225 ampere frame and larger breakers shall be adjustable and shall be set at 800 percent of trip rating.

When shown on the drawings or otherwise indicated, main circuit breakers and feeder circuit breakers 225 amperes and larger shall be furnished with a solid-state trip unit complete with built-in current transformers. The ampere rating of the trip unit shall be as indicated on the drawings. The trip unit shall have adjustable settings for continuous amperes, and short-time pickup. The trip unit shall be provided with additional short delay trip time adjustment for better system coordination. Where indicated on the drawings, main circuit breakers shall be provided with instantaneous pickup and integral ground fault protection with shunt trip devices.

2.2.15 Incoming Line Metering Compartment. When shown on the drawings. or otherwise indicated, the incoming line section(s) shall be provided with a microprocessor-based, digital power meter. Current transformers and potential transformers shall be provided for input of current and voltage signals to the metering package. Currents, voltages, active power, reactive power, power factor, watt-hours, frequency, and demand values shall be available for display. Total harmonic distortion waveforms shall also be available. The following alarm features shall be provided: undervoltage, power factor leading or lagging, kVAR limit, voltage sequence reversal, under frequency, and overcurrent. The metering package shall be capable of RS 485 serial communication for remote monitoring. The digital power meters shall have built-in face display and shall be Cutler-Hammer "IQ Analyzer", Multilin PQM, Square D PowerLogic Model 2350, Allen-Bradley “Power Monitor II”, Basler “Energy Transducer”, or approved equal.

Sufficient lengths of communication cable shall be provided for connection of metering units within the motor control center and as indicated on the drawings.

When indicated, the metering package shall be compatible with the metering system software and metering system network as indicated in the Contract Documents. Contractor shall furnish and install applications software for origination and display of all metering unit data and microprocessor-based trip-unit data as indicated in the Contract Documents.

The unit shall have two isolated 4-20 ma selectable outputs.

2.2.16 Miscellaneous. Other items indicated on the drawings shall conform to the applicable provisions of NEMA ICS 2 and UL 845.

2.2.17 Lighting Transformers. Lighting and auxiliary power transformers shall be dry type, with at least two full capacity taps.

2.2.18 Panelboards. Panelboards shall have a main circuit breaker, buses, bolted thermal-magnetic breakers, and provisions for breakers in the sizes, quantities, and poles indicated on the drawings. Breakers indicated to be multiple pole shall be common trip. Circuit breakers shall be fully rated, with an interrupting rating of at least 10,000 amperes, and shall be coordinated with the control center short-circuit rating. Each panel shall be provided with a typewritten directory listing the load identities of all circuits. Six breaker handle clips shall be provided to prevent casual tripping.

2.2.19 Special Panels. Instruments, controls, and accessories shall be mounted either on special doors or on sheet steel panels mounted behind hinged doors, as indicated on the drawings. All panels and hinges shall be sufficiently strong to support the mounted items.

2.2.20 Shop Painting. All iron and steel surfaces, except stainless steel and machined surfaces, shall be plated or shop painted with the manufacturer's standard coating. Finish color for both indoor and outdoor equipment shall be ANSI 61. Back plate color shall be white. Field painting, other than touchup painting, will not be required. A sufficient quantity of additional coating material and thinner shall be furnished to permit field touchup of damaged coatings.

When equipment is to be installed in exposed outdoor locations, the underside shall be thoroughly cleaned and coated with an automotive type undercoating material. The coating shall be thick enough to withstand normal handling during shipping and installation. The underside is defined as the surfaces in contact with the floor or pad and other surfaces not readily accessible for field painting. The coating may be factory or field applied.

2.2.21 Space Heaters. Space heaters shall be furnished at the bottom of each vertical section of motor control centers provided with NEMA Type 3R enclosures. The heaters shall be thermally insulated and shall be located to prevent damage or discoloration to painted surfaces. Heaters shall be located where they do not interfere with cable entrances. The heaters shall be controlled by an adjustable thermostat set to cut out when the temperature rises to 90ºF (32ºC) and to cut in when the temperature falls below 85ºF (29ºC) and shall have capacity to maintain the section's interior temperature above dew point. Heaters shall be rated 120 volts ac.

When indicated, space heater wiring, with branch circuit protection, shall be factory installed, with terminals provided for connection of an external power supply.

When indicated, power to space heaters shall be supplied from a panelboard integral to each motor control center. All wiring and branch circuit protection shall be factory installed.

2.3 TRANSIENT VOLTAGE SURGE SUPPRESSION. When shown on the drawings or otherwise indicated, transient voltage surge suppressors (TVSS) shall be provided and installed integral to each motor control center assembly. Units shall be UL 1449 listed for installation into motor control centers. TVSS devices shall be designed, manufactured, tested, and installed in accordance with the following standards:

ANSI/IEEE C62.41-1991 and C62.45-1987.

NEMA LS1-1992 Guidelines.

NFPA 20, 70, 75, and 780.

UL 1449 and 1283.

Each TVSS device shall be configured for permanent connection. In-line, series connected components shall not be acceptable. Each TVSS device shall utilize metal oxide varistors (MOV) connected in parallel.

2.3.01 Device Performance. The minimum surge current capability for each device shall be:

	L-L	L-N	L-G	N-G
Control Centers	200,000 A	200,000 A	200,000 A	200,000 A

The minimum UL 1449 rating shall be (inclusive of disconnect):

	L-L	L-N	L-G	N-G
Control Centers	2000 V	1000 V	1000 V	800 V

Each unit shall have a maximum continuous operating voltage (MCOV) greater than 115 percent of the nominal system operating voltage for L-L, L-N, L-G, and N-G.

Each unit shall be capable of suppressing a Category B3 impulse at less than 500 volts. Each unit shall be UL 1283 listed as an electromagnetic interference filter. Electromagnetic filtering shall provide insertion loss with a system noise attenuation of 55 dB from 100 kHz to 100 MHz when tested per 50 Ohm insertion loss method as defined by MIL 220A.

Each unit shall incorporate 200 kAIC rated fusing and shall monitor all modes of protection inclusive of N-G and provide indicator lights (one green and one red LED) on the front cover of the enclosure and an indicator light on each module (inclusive of N-G) to individually monitor each module for failure.

2.3.02 Testing. The Supplier shall provide the following test data for each unit:

Third party testing from a nationally recognized testing laboratory (NRTL) verifying that the total surge current can be passed through the fuse with no charring, flames, or projection of materials. Testing of the fuse only will not be acceptable for this requirement. Testing shall indicate the lowest possible surge that can disrupt the fusing.

Third party, NRTL testing verifying the fault current withstand rating of the fusing employed. Testing shall be conducted in both a high and low impedance fault condition and shall confirm no charring, flaming, or projection of materials.

Life cycle testing per ANSI/IEEE C62.41 and C62.45 with fusing in place for category C3 transients (20 kV at 1.2 x 50 microseconds and 10 kV at 8 x 20 microseconds).

2.4 ACCESSORIES.

2.4.01 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 SHOP TESTS. The complete control center shall be tested at the factory. All circuits, including power and control, shall be given dielectric tests in accordance with NEMA ICS 2-322.

PART 3 - EXECUTION

3.1 FIELD QUALITY CONTROL.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Parts, and Tools, and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting conduit or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

End of Section

SECTION 16500

LIGHTING

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of all interior and exterior building fixtures, emergency lighting equipment, exit signs, and area lighting as indicated on the Contract Documents, including all associated equipment, devices, and controls necessary for proper operation.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless Engineer notes exceptions.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools, shall apply to all equipment furnished under this section.

1.2.03 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

ANSI	American National Standards Institute
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.2.04 Governing Standards. All lighting equipment furnished under this section shall be designed, constructed, and tested in accordance with applicable ANSI, NEMA, NEC and UL standards. Fixtures shall be listed and labeled by UL or an equivalent testing laboratory acceptable to the Engineer. Fixtures shall also meet the requirements of the latest edition of the National Appliance Energy Conservation Act (NAECA) and all amendments thereto, Federal Communications Commission

(FCC) Rules and Regulations - Part18, and IEEE Standard 587 for transient protection.

All lighting fixtures with plastic lenses shall comply with the Michigan State Fire Safety Board ruling dated July 22, 1970

1.3 SUBMITTALS. Data covering the materials used and the parts, devices, and other accessories forming a part of the equipment furnished shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The equipment submittals shall include the following:

Shop drawings for each type of lighting fixture with identity of each item by fixture specification, type/model number, manufacturer and catalog number.

Fixture photometric curves.

Certification of listing by UL.

1.4 SPARE PARTS. Provide the following spare parts, with quantities rounded up to the nearest whole number, ready to install as direct replacements for the same item included in the work specified in the Contract Documents:

DESCRIPTION	QUANTITY
High Intensity Discharge Lamps.	20% of the number of lamps installed
High Intensity Discharge Ballasts.	25% of the number of ballasts installed
High Intensity Discharge Lenses.	10% of the number of lenses installed
Fluorescent Lamps.	25% of the number of lamps installed.
Fluorescent Ballasts.	25% of the number of ballasts installed
Fluorescent Lenses.	10% of the number of lenses installed
Incandescent Lamps.	25% of the number of lamps installed.
Incandescent Lenses.	10% of the number of lenses installed

All spare parts furnished shall comply with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Submit a list of recommended spare parts in addition to the items listed herein. These spare parts shall be as recommended by the manufacturer for maintenance of each unit. Each item on the list of recommended spare parts shall include a price of the item packaged and delivered to the Owner in Detroit, including all markups, taxes and other costs.

PART 2 - PRODUCTS

2.1 LIGHTING FIXTURES. Lighting fixtures shall be furnished as described in the fixture schedule in the Contract Documents. Lighting fixtures shall be furnished complete with lamps. Pendant fixtures shall have swivel type box covers and threaded conduit pendants unless otherwise specified.

Prismatic lenses on recessed fluorescent fixtures shall be acrylic and shall not be less than 0.125 inch (mm).

Fixtures using metal halide lamps shall have a tempered glass shield below the lamp to contain broken lamp parts and to contain ultra-violet radiation.

Exterior building fixtures shall be factory equipped with waterproof gaskets and dark bronze anodized aluminum frames, unless indicated otherwise on the Contract Documents, and shall be designed to be completely waterproof. The finish shall be free of scratches and other surface blemishes.

Other materials required for the lighting system such as conduit, raceway, wire and cable, support devices, fasteners, and control devices shall be as specified in Master Specification Section 16050, Electrical General Requirements.

2.1.01 Lamps. Provide lamps of the proper type, wattage, voltage, and socket size for all lighting fixtures. Incandescent lamps shall be rated 130 VAC, extended service 2,500 hours rated life. Fluorescent lamps shall be of the energy saving type.

2.1.02 Fuses. Each fixture having a ballast shall be fused according to the ballast manufacturer's recommendations. The fuse shall be wired to the primary ballast lead on the ungrounded side and shall be accessible for replacement.

2-1.03. Ballasts. Provide rapid start, low noise level electronic ballasts for fluorescent type lighting fixtures. Ballasts shall be CBM certified as meeting requirements of ANSI C82.11 with a Total Harmonic Distortion (THD) level of not more than 10 percent.

Ballasts for metal halide fixtures shall be electronic or high power factor , non-PCB regulator type. Ballasts for indoor fixtures shall be rated for operation in 122 F (50 C) ambient. Ballasts for outdoor fixtures shall provide reliable starting down to minus –20 F (-29 C).

Ground ballasts in accordance with NEC and provide in-fixture automatic resetting thermal protection for ballasts and capacitors.

2.2 EMERGENCY LIGHTING UNITS. Emergency Lighting Units shall be self-contained units and shall comply with UL 924. Units shall have a sealed, maintenance-free, lead-acid battery with a 10 year nominal life and special warranty. The battery charger shall be fully automatic, solid-state type with sealed transfer relay. The relay shall automatically turn the lamp on when voltage drops to 80 percent or below and the lamp shall be disconnected when the voltage reaches deep discharge level. When normal voltage is restored, the relay shall disconnect the lamps and the battery shall be recharged and floated on the charger.

2.3 EXIT SIGNS. Exit signs shall be self-luminous type with tritium filled gas tubes rated for 20 year life. Signs shall meet UL 924 and NFPA 101. Signs shall have a completely sealed housing and shall be furnished with tamperproof hardware.

PART 3 - EXECUTION

3.1 GENERAL. All work shall be installed as indicated on the drawings, and in accordance with the manufacturer's diagrams and recommendations, except where otherwise indicated.

3.2 LIGHTING FIXTURE INSTALLATION. The Contract Documents indicate the general locations and arrangements of the lighting fixtures. Fixtures in rows shall be aligned both vertically and horizontally unless otherwise specified. Fixtures shall be clear of pipes, mechanical equipment, structural openings, indicated future equipment and structural openings, and other obstructions.

Conduit and wire for lighting fixture installation that is not shown on the Contract Documents shall be sized, furnished and installed by the Contractor. Circuits to emergency lighting units, exit signs, and fixtures indicated to be night lights shall not be switched. Circuits to fluorescent lighting fixtures indicated to have emergency battery packs shall include an additional un-switched hot conductor. Conductors shall be minimum 12 AWG and conduit shall be minimum 3/4 inch (mm) for lighting fixture installation.

Support recessed fixtures on ceiling system structural elements rather than its surface materials such as tiles, plaster, drywall, etc. Install suitable sealing gaskets where light leaks occur through gaps between the recessed fixture trim and adjacent surface.

Hang suspended fixtures plumb, with continuous rows of fixtures in alignment. Unless indicated otherwise on the Contract Drawings, mount suspended fixtures in each room or area at the same height regardless of varying clear height conditions.

Install Exit Signs directly over doorways, for those doors as indicated on the Contract Drawings. Center fixtures over doorway and install fixtures to clear door and associated hardware.

3.2.01 Fixture Relamping. Lamp those permanent light fixtures, as used for temporary lighting during construction, with Contractor's own lamps. Remove temporary lamps at acceptance of Work and install new proper lamps in each fixture. New lamps shall be in perfect working order.

3.2.02 Fixture Cleaning. Vacuum accumulations of dust from suspended light fixtures, as well as recessed style fixtures. Do not air blow dust from fixtures. Dusting of fixtures with dust cloths may be performed where accumulation of dust is light.

Follow the cleaning procedures as recommended by the fixture manufacturer for new fixture cleaning for construction work practice. Use only those products for cleaning as outlined in the fixture manufacturer's literature.

End of Section

SECTION 16722

CLOSED CIRCUIT TELEVISION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of closed circuit television equipment (CCTV) systems, including all associated equipment, devices, and controls necessary for proper operation.

The Contractor shall furnish the design of the system.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless Engineer notes exceptions.

The design of the system shall provide for CCTV surveillance alarm of the areas, locations, doors, gates etc. indicated. The design shall consist of, but shall not be limited to, an analysis of ambient temperatures, noise levels, light intensities, and environmental conditions (wet, dusty, oily, corrosive, hazardous, etc.) in the various areas; selection of the appropriate cameras, housings, video monitors, and video recorders; and the design of the necessary wiring and mounting configurations.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

The system design, equipment, installation, and installation supervision furnished under this section shall be provided by a manufacturer or supplier who has been engaged in the business of supplying this type of equipment for at least 5 years.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.03 Governing Standards. All wiring and components shall meet the applicable requirements of the NEC.

All components installed in hazardous areas shall be listed by Underwriter's Laboratories or Factory Mutual.

1.2.04 Nameplates. Major components of equipment shall be identified with a permanently affixed nameplate bearing the manufacturer's name and address, and type or style and catalog number of the item. Nameplates shall have black baked enamel letters on anodized aluminum plate.

1.2.05 Tags. Keys and locks, where required, shall be furnished with tags bearing stamped identification number. Cable and conduit runs, wiring circuits, and all spare parts supplied to maintain the system shall be furnished with hard phenolic or stainless steel tags.

1.2.06 Power Requirements. Primary power supply to all system components will be 120 volts, 60 Hz, single phase. Contractor shall be responsible for meeting all additional power supply requirements and shall furnish any transformers or other power supply equipment needed.

1.3 SUBMITTALS. Complete wiring diagrams; assembly and installation drawings; detailed specifications; and data covering the design of the system shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Data covering the materials used and the parts, devices, and other accessories forming a part of the equipment furnished shall also be submitted in accordance with Master Specification Section 01080, Project Submittals. The equipment submittals shall include the following:

A complete description of all system components, including certification of listing by UL or FM.

Complete sequence of operation for all functions of the system.

Complete system wiring diagram for all components and interfaces to equipment supplied under other sections or by the Owner.

Location drawings for all system components.

A listing of the manufacturer's representatives responsible for installation and servicing.

Operation and Maintenance Manuals.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. The security system shall be supplied by Simplex Time Recorder Company, Burle, Wells Fargo Alarm Services, or approved equal.

2.2. CCTV SYSTEM.

2.2.01 CCTV Cameras. CCTV cameras shall be 1/2 inch (12.5 mm) or 2/3 inch (17 mm) format CCD type monochrome cameras and shall be powered from a 120 volt ac source. If necessary, a transformer shall be provided for each camera to step down the supply voltage. Each indoor camera shall be equipped with a motorized auto-iris 8-48 mm (6x) zoom lens, and each outdoor camera shall be equipped with a motorized, auto- iris, 11-110 mm, (10x) zoom lens, all with suitable connectors or adapters. An extruded aluminum indoor/outdoor enclosure shall be provided for each outdoor camera. Cameras installed in chlorine rooms shall be provided with sealed, stainless steel enclosures.

Each camera shall be provided with a pan and tilt drive assembly suitable for outdoor use and capable of 355 degree pan. The pan and tilt assemblies shall operate from the same 120 volt ac source as the camera. Suitable mounting hardware shall be provided for both rooftop and wall-mounted camera assemblies.

2.2.02. Receiver Drivers. A receiver/driver assembly shall be furnished and installed near each camera for remote control of camera pan, tilt, focus, and zoom, based on commands received from the remote control equipment specified in this section. Signals shall be in a serial format that allows receiver/drivers to be arranged in a star or a daisy chain configuration with respect to the control equipment. Receiver/drivers shall be housed in a NEMA Type 4 enclosure and shall operate from 120 volts ac. Outputs for camera control shall be at a voltage suitable for the pan/tilt unit or lens.

2.2.03 CCTV Monitors. CCTV monitors shall be furnished and installed at the locations indicated on the drawings.

When a CCTV monitor is to be mounted in the control room console, mounting requirements shall be coordinated with the console supplier.

Monitors shall be 9 inch (230 mm), 13 inch (330 mm), or 16 inch (405 mm) monochrome units, as indicated, and shall be compatible with the CCTV equipment supplied. The monitors shall have a minimum resolution of 700 lines, and shall be provided with integral controls for adjusting contrast and brightness, and shall operate from a 120 volt ac, 60 Hz power supply.

2.2.04. Video Recorders. Video recorders shall utilize a standard VHS videocassette tape and shall operate from a 120 volt ac source. Recorders shall be time-lapse type that can record up to 700 hours of time-lapse video on a single VHS tape. Recorders shall be capable of accepting an alarm input and automatically initiating recording when the alarm is received and shall be programmable to initiate recording on a time of day/day of week basis.

The recorder shall be provided with a 16-channel multiplexer which allows viewing and recording of up to 16 video channels on a single VCR. The multiplexer shall be compatible with the VCR and monitors provided, and include a decoding mode to recover recorded video from any camera connected to the system.

2.2.05 Switcher/Controller Units. A switcher/controller unit shall be furnished and installed where indicated on the drawings. The switcher/controller unit shall be compatible with all other CCTV components to allow remote operation of cameras and monitors. The switcher/controller shall be suitable for manual and automatic camera sequencing and switching, remote control of camera functions such as pan, tilt, zoom, and focus, and shall transmit video output signals to two, four, or eight monitors as indicated.

Each switcher/controller shall accept 12 or 24 camera inputs, as indicated, and shall allow any of the inputs to be selected for display/control on the attached monitors. The switcher/controller shall allow manual, automatic sequence, or alarm initiated selection of the cameras. Automatic sequences shall allow the user to select a different camera sequence for each monitor output, with programmable dwell time for each camera in the sequence. Active input information shall be output to any monitor connected to the switcher/controller.

The switcher/controllers shall operate from a 120 volt ac, 60 Hz source, and shall be provided with 5 day battery backup. Switcher/controllers shall be suitable for desktop or rack mounting.

2.2.06 Four-Channel Video Multiplexer. The four-channel video multiplexer shall be a microprocessor based device that digitizes inputs from four video sources, reduces the images to one-fourth the original size, and produces a video output of the four images in four quadrants on a single monitor. The multiplexer shall provide on-screen numeric indication of the images and shall allow any image to be selected for full-screen viewing.

2.2.07 Video Compression Units. A video compression transmitter/receiver pair shall be provided when indicated, to interface the CCTV system with remote cameras over a serial communication link. The transmitting unit shall accept up to 10 full video inputs and shall digitize and compress the signals for transmission over a serial communications link with a bit per second transmission rate as indicated. The receiver shall accept compressed video signals from the transmitter and convert the signals to corresponding analog signals for input to the CCTV switcher/controller.

Compression units shall be suitable for operation at 120 VAC. The transmitter shall have at least 10 control outputs that correspond to control inputs at the receiver. Contractor shall coordinate the pan, tilt, and zoom controls of all cameras, with the video compression transmitter/receiver controls, to ensure that remote cameras can be controlled from the switcher/controller.

Video compression units shall be ADPRO "Model VST 10CA", or approved equal.

2.2.08 Power Supplies and Transformers. Power supplies and transformers shall be furnished as needed to provide power to the CCTV equipment. Contractor shall be responsible for coordinating power supply or transformer connections and cable routing.

A dedicated 120 volt ac, 60 Hz power supply shall be provided for powering each camera, receiver/driver, pan/tilt/zoom, and lens.

2.2.09 Enclosures. All components supplied as part of the CCTV system shall be mounted in a NEMA rated enclosure designed for use in the environment indicated on the electrical drawings. All enclosures indicated to be located in hazardous areas shall be FM approved or UL listed for use in the specified environment.

All enclosures shall be fitted for direct connection of conduit and shall be designed for wall or column mounting unless otherwise specified or indicated on the drawings. Any special mounting components or brackets shall be provided by CONTRACTOR.

2.3 CABLE AND RACEWAYS.

2.3.01 Cable . Cable used in the CCTV system shall be multi-conductor cable, at least 18 AWG size, specifically designed for industrial systems and UL listed for indoor/outdoor installations. All cable required for the system, including 120 volt ac power cable, when indicated, shall be furnished by Contractor.

2.3.02 Raceways. All cable shall be installed in conduit furnished under this section. All conduits, including conduit for 120 volt ac power cable, when indicated, shall conform to the applicable paragraphs of Master Specification Section 16050, Electrical General Requirements.

PART 3 - EXECUTION

3.1 GENERAL. All work shall be installed as indicated on the drawings, and in accordance with the manufacturer's diagrams and recommendations, except where otherwise indicated.

Installation of equipment and devices that connect to equipment furnished under Master Specification Section 01180, Equipment, Parts, and Tools, or furnished by Owner, shall be closely coordinated with the suppliers of the equipment and with Owner.

After completion of the installation, Contractor shall clean the inside and the outside of all CCTV equipment and shall remove all dirt and debris from the site.

Contractor shall provide on-site supervision of installation.

3.1.01 Cable. Cable shall be installed as described in the cable installation paragraphs in Master Specification Section 16050, Electrical General Requirements. The system conductors shall be installed in conduits or junction boxes separate from conductors of other systems. Conduit fill shall meet applicable NEC requirements.

3.1.02 Raceways. Conduit shall be installed as described in the conduit installation paragraphs in Master Specification Section 16050, Electrical General Requirements.

3.1.03 Testing. Contractor shall notify Engineer at least 30 days before the performance and acceptance tests are to be conducted. The tests shall be conducted in the presence of Engineer and Owner. Contractor shall furnish all instruments and personnel required for the tests. A complete test report and letter of completion shall be submitted to Engineer. The testing shall be conducted by, or under the supervision of, a qualified representative of the system manufacturer and shall include each system component and its interaction with other components. Contractor shall submit the proposed testing procedure with the preliminary operation and maintenance manuals.

End of Section

SECTION 16740

TELEPHONE (PAX) SYSTEM

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of an inward direct dial, inside voice, Private Automatic Exchange (PAX) telephone system including, but not limited to, an attendant's console, a switching system, inside wiring, telephone sets, and all associated equipment, devices, and controls necessary for proper operation.

The telephone system components shall be designated and shall be located as shown on the drawings.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Stipulations. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

1.2.03 Contractor's Qualifications. In the acquisition, installation, and follow-up of the telephone system, the firm selected shall be fully capable and experienced in the services offered. To assure Owner of a system having long life and long-term vendor support, this system shall be provided by a manufacturer or supplier who has been engaged in the business of supplying this type of equipment for at least 5 years.

Contractor shall be capable of providing full system warranty and immediate maintenance service for at least one year following system acceptance by Owner.

1.2.04 Governing Standards.

EIA	Electronic Industry Association
FCC	Federal Communications Commission

FM	Factory Mutual
ICEA	Insulated Cable Engineers Association
NEC	National Electric Code, NFPA-70
NEMA	National Electrical Manufacturers Association
NFPA	National Fire Protection Assocation
UL	Underwriters Laboratories

1.2.05 Power Supply. Power supply to equipment will be 120 volts, 60 Hz, single phase.

1.3 SUBMITTALS. Complete wiring diagrams; assembly and installation drawings; detailed specifications; and data covering the materials used and the parts, devices, and other accessories forming a part of the equipment furnished shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The equipment submittals shall include the following:

Complete sequence of operation for all functions of the system.

A listing of the manufacturer's representatives responsible for installation and servicing.

Operation and Maintenance Manuals.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and products shall be as specified herein, or shall be equivalent products of manufacturers regularly producing digital telephone systems and equipment.

2.2 TELEPHONE SYSTEM. The telephone system shall consist of a digital electronic modular switching system with capacity for at least three central office (CO) lines and twelve stations. The system shall support standard telephone stations, personal computer modems, and facsimile machines, or any other device that works with conventional telephone lines.

The system shall have, at a minimum, the capabilities of call hold, call transfer, and three-way conference calling. The system console shall be Panasonic KX-T7235, or approved equal, and shall be located as indicated on the drawings.

The electronic modular switching system shall be Panasonic "Model KX-TD308", or approved equal, and shall have capability for caller ID, call forwarding, and automatic redial features.

2.2.01. Handsets. All single-line telephone instruments shall be metal-based and the shells shall be composed of a durable, industry-standard, hard-finish plastic material. All single-line telephones shall be fully modular. All instruments provided shall be equipped with adjustable ringers. The color of all instruments shall be ivory.

Contractor shall furnish eight single-line telephones, four desk type and four wall-mounted type.

2.2.02 Cables. Cables which interconnect interior distribution centers shall conform to ICEA S-80-576. Where required, cable shall be UL classified low smoke and low flame for use in air plenums in accordance with NFPA 70. Cables which terminate at each station jack shall conform to ICEA S-80-576. Each cable shall be a minimum of four copper pairs of 22 or 24 AWG or two optical fibers.

2.2.03 Raceways. Unless indicated otherwise, all cables shall be installed in conduit furnished under this section. All conduit shall conform to the applicable paragraphs of Master Specification Section 16050, Electrical General Requirements.

2.2.04 Station Jacks. Station jacks shall be modular four-wire type and conform to FCC Part 68.

2.2.05 Station Line Cord. Station line cord shall be modular between the station jack and the base of the instrument, at least 6 feet in length, and shall conform to FCC Part 68.

PART 3 - EXECUTION

3.1 GENERAL. All work shall be installed as indicated on the drawings and in accordance with the manufacturer's diagrams and recommendations except where otherwise indicated.

Installation of equipment and devices that connect to equipment specified in Master Specification Section 01180, Equipment, Parts, and Tools, or furnished by the Owner, shall be closely coordinated with the suppliers of such equipment or with the Owner.

Contractor shall provide on-site supervision of installation.

3.1.01 Cable. Cable shall be installed as described in the cable installation paragraphs in Master Specification Section 16050, Electrical General Requirements.

The system conductors shall be installed in conduits or junction boxes separate from conductors of other systems. Conduit fill shall meet applicable NEC requirements.

3.1.02 Raceways. Conduit shall be installed as described in the conduit installation paragraphs in Master Specification Section 16050, Electrical General Requirements.

3.1.03 Testing. The Contractor shall notify Engineer at least 30 days before the performance and acceptance tests are to be conducted. Contractor shall submit the proposed testing procedure prior to the notification. The tests shall be conducted in the presence of Engineer and Owner. The System Supplier shall furnish all instruments and personnel required for the tests. A complete test report and letter of completion shall be submitted to the Engineer. The testing shall be conducted by, or under the supervision of, a qualified representative of the system manufacturer and shall include each system component and its interaction with other components.

3.1.04 User Training. At the convenience of Owner, Contractor shall provide operational training for all user personnel. Contractor shall provide skilled personnel, materials, and training devices necessary for such training during a one day seminar at a location designated by the Owner. The training seminars shall be conducted so that all user personnel will learn the function and operation of the equipment and features assigned for general use. This on-the-job training shall include all the communication equipment supplied under this specification. All applicable feature-related terms and conditions shall be fully defined, explained, and demonstrated. User training shall be scheduled not more than 14 calendar days prior to completion of system installation.

End of Section

INDEX

DIVISION 17 – INSTRUMENTATION AND CONTROLS

PAGE NO.

SECTION 17100

COMPUTER CONTROL SYSTEM

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of a computer control system as designated and as required.

The system shall be furnished as specified, complete with all software, human machine interface (HMI) hardware, input/output hardware, instrumentation, and all devices, accessories, appurtenances, testing, and training required for proper operation.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. When required, the General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

The supplier shall have as a minimum 5 years in the design, coordination and supply of computer-based monitoring, control, and data acquisition systems.

1.2.02 Drawings. The drawings indicate locations and arrangements of equipment and may include input/output lists and block and one-line diagrams showing connections and interfaces with other equipment. The input/output (I/O) lists are included as required.

1.2.03 Codes, Permits and Agency Approvals. All work performed and all materials used shall be in accordance with the National Electrical Code, and with applicable local regulations and ordinances. Where required by codes, panels, assemblies, materials, and equipment shall be listed by Underwriters' Laboratories or other testing organizations acceptable to the governing authority. Contractor shall, as part of their work, arrange for and obtain all necessary permits, inspections, and approvals by the authorities having local jurisdiction of such work. This shall include any third-party inspections and testing of panels and equipment required by the authorities.

1.2.04 Coordination. Systems supplied under this section shall be designed and coordinated for proper operation with related equipment and materials furnished by other suppliers under other sections of these specifications, under other contracts, and, where applicable, with related existing equipment. All equipment shall be designed and installed in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the manufacturer, and the manufacturer of the related equipment.

1.2.05 Related Equipment and Materials. Related equipment and materials may include, but will not be limited to, instrumentation, motor controllers, valve actuators, chemical feeders, analytical measuring devices, conduit, cable, and piping as described in other sections or furnished under other contracts.

1.3 GENERAL REQUIREMENTS. The drawings and specifications indicate the extent and general arrangement of the systems. If any departures from the drawings or specifications are deemed necessary by Contractor, details of such departures and the reasons shall be submitted to Engineer for review with or before the first stage submittal. No departures shall be made without prior written acceptance.

The specifications describe the minimum requirements for hardware and software. Where Contractor's standard configuration includes additional items of equipment or software features not specifically described herein, such equipment or features shall be furnished as a part of the system and shall be warranted as specified herein.

1.3.01 Governing Standards. When required, all equipment furnished under this section shall be designed, constructed, and tested in accordance with IEEE 519, ANSI C37.90, FCC Part 15 - Class A, and NEMA ICS-1-109.60.

1.3.02 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications required for proper installation subject to acceptance by Engineer. At least three feet of clear access space shall be provided in front of all components of the computer control system components.

1.3.03 Workmanship and Materials. Equipment supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1.3.04 Abbreviations. Reference to standards and organizations in the Specifications shall be by the following abbreviated letter designations:

ANSI	American National Standards Institute
ASTM	American Society for Testing and Materials
AWG	American Wire Gage
FCC	Federal Communications Commission
IEEE	Institute of Electrical and Electronics Engineers
ISA	Instrument Society of America
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
UL	Underwriters' Laboratories

1.4 SUBMITTALS. Complete dimensional, assembly, and installation drawings, wiring and schematic diagrams; and details, specifications, and data covering the materials used and the parts, devices and accessories forming a part of the system furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal data shall be grouped and submitted in three separate stages. The submittal for each stage shall be substantially complete. Individual drawings and data sheets submitted at random intervals will not be accepted for review. Equipment tag numbers or identifications used on the drawings shall be referenced where applicable.

1.4.01 First Stage Submittal. The first stage submittal shall include the following items.

A detailed list of any exceptions, functional differences, or discrepancies between the system proposed by Contractor and this specification.

Product catalog cut sheets on all hardware items, clearly marked to show the model number, optional features, and intended service of each device.

A brief, concise description of the proposed system, including major hardware and software components, field services, and personnel training.

A block diagram or schematic drawing showing the principal items of equipment furnished, including model numbers, and their interrelationships.

Drawings showing floor space or desktop area requirements for all equipment items, including allowances for door swings and maintenance access.

Environmental and power requirements, including heat release information for each equipment item.

Standard system engineering and user manuals describing the use of the system and application programming techniques for creating reports, graphics, database, historical records, and adding new process I/O nodes to the system.

Standard field termination drawings for all process input/output equipment, showing typical terminations for each type of point available in the system.

A copy of the proposed software licenses for all software associated with the system.

1.4.02 Second Stage Submittal. Before any equipment is released for shipment to the jobsite and before factory testing is scheduled, the following data shall be submitted.

At Contractor's option, the first and second stage submittals may be combined.

Detailed functional descriptions of all software modules specified and furnished as part of Contractor's standard system. The descriptions shall be identified with the applicable specification paragraph.

Complete panel fabrication drawings and details of panel wiring, piping, and painting. Panel and subpanel drawings shall include overall dimensions, metal thickness, door swing, mounting details, weight, and front of panel arrangement to show general appearance, with spacing and mounting height of instruments and control devices.

Wiring and installation drawings for all interconnecting wiring between components of the system and between related equipment and the equipment furnished under this section. Wiring diagrams shall show complete circuits and indicate all connections. If panel terminal designations, interdevice connections, device features and options, or other features are modified during the fabrication or factory testing, revised drawings shall be submitted before shipment of the equipment to the jobsite.

Review of drawings submitted prior to the final determination of related equipment shall not relieve Contractor from supplying systems in full compliance with the specific requirements of the related equipment.

Input/output listings showing point names, numbers, and addresses. Input/output identification numbers from the contract documents shall be cross-referenced in this submittal.

Proposed lesson plans or outlines for all training courses specified herein, including schedule, instructors' qualifications and experience, and recommended prerequisites.

1.4.03 Third Stage Submittal. Complete system documentation, in the form of Operation and Maintenance Manuals, shall be submitted before the commencement of field acceptance testing. Operation and Maintenance Manuals shall include complete instruction books for each item of equipment furnished. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Where instruction booklets cover more than one specific model or range of device, product data sheets shall be included which indicate the device model number and other special features. A complete set of "as-built" wiring, fabrication, and interconnection drawings shall be included with the manuals. If field-wiring modifications are made after these drawings are submitted, the affected drawings shall be revised and resubmitted.

1.5 PREPARATION FOR SHIPMENT. All electronic equipment and instruments shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements, shall be kept dry at all times, and shall not be exposed to adverse ambient conditions.

Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of Engineer.

Each shipment shall include an appropriate shipping list that indicates the contents of the package, including the specific instrument tags. The shipping list shall be accessible without exposing the instruments to the atmosphere. The shipping list shall also contain any cautionary notes regarding storage of the instruments, including requirements to protect the instrument from static discharge, desensitizing chemicals (solvents, paints, etc.), or ambient atmospheric conditions.

Individual instruments shall be appropriately tagged or labeled to positively identify the device. All identification shall be visible without the need to unpack the instrument from its protective packaging.

Instrument shipment and storage requirements shall be coordinated with Engineer or Owner prior to shipment. Contractor shall provide adequate storage and be ready to accept the shipment before shipping any equipment to the Work Site. Additional shipping and storage requirements shall be as detailed in the individual instrument specifications.

Components which are shipped loose due to transportation limitations shall be assembled and disassembled by the manufacturer prior to shipment to assure that all components fit together and are adequately supported.

1.6 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.7 SPARE PARTS. Spare parts and consumable items shall be provided as required.

1.7.01 Packaging. All spare parts shall be delivered to Owner before final acceptance of the system. Packaging of spare parts shall provide protection against dust and moisture and shall be suitable for storage. Circuit boards and other electronic parts shall be enclosed in anti-static material. All packages shall be clearly marked with the manufacturer's name, part number or other identification, date of manufacture, and approximate shelf life.

1.7.02 Replacement. Contractor may utilize spare parts and supplies during system installation, de-bugging, startup, or training, but shall restore all such materials and supplies to the specified quantities before final acceptance of the systems.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS. All equipment furnished under each attached section referenced in SCOPE is a part of this section and shall be selected by Contractor for its superior quality and intended performance. Equipment and materials used shall be subject to review.

2.1.01 Standard Products. The systems furnished shall be standard products of Contractor. Where two or more units of the same type of equipment are required, they shall be the products of the same manufacturer; however, all components of the systems furnished hereunder need not be the products of one manufacturer unless specified herein.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The design of the systems furnished hereunder shall utilize concepts, techniques and features that provide maximum reliability and ease of maintenance and repair. The systems shall include board-level devices such as light emitting diodes or other indicators to facilitate quick diagnosis and repair. Diagnostic software shall be furnished to facilitate system-level troubleshooting.

Where redundant hardware is provided, the system shall be capable of performing all specified functions, without reconfiguring hardware or software, with only one device of each category in service.

2.2.01 Y2K Compliance. All hardware, software, and firmware, furnished as stand alone components, or as embedded portions of other systems, shall process information related to dates in a manner so that information for dates beyond December 31, 1999, does not cause false operation, require operator intervention, or otherwise impact the function of the device.

2.2.02 Factory Assembly. Equipment shall be shipped completely factory assembled, except where its physical size, arrangement, configuration, or shipping and handling limitations make the shipment of completely assembled units impracticable.

2.2.03 Expandability. The system shall be capable of expansion as required.

2.3 POWER SUPPLY. Unless otherwise required, power supply to all equipment will be 120 volts, 60 Hz, single phase. Contractor shall be responsible for distribution of power among enclosures, consoles, peripherals, and other components of the system from the power supply receptacles and junction boxes indicated on the drawings. Power distribution hardware shall include cables and branch circuit overcurrent protection installed in accordance with Master Specification Section 16050, Electrical.

2.3.01 Facility Distribution System. Equipment not indicated to be powered from an uninterruptible power source shall be suitable for being supplied from the facility distribution system and shall be capable of withstanding voltage variations of ±10 percent and harmonics up to the limits of IEEE 519 without affecting operation. Contractor shall provide voltage conditioning or filtering equipment if necessary to meet the requirements specified.

2.3.02 Power Supplies. Power supplies for voltages other than those listed above shall be an integral part of the equipment furnished. Internal power supplies shall be regulated, current limiting, and self-protected.

2.3.03 Surge Withstand. All equipment shall meet all surge withstand capability tests as defined in ANSI C37.90 without damage to the equipment.

2.3.04 Uninterruptible Power Supply. When required, an uninterruptible power supply (UPS) will be furnished hereunder to power the equipment indicated on the drawings or will be furnished under another section. Contractor shall be responsible for coordinating the size of the UPS unit with the equipment furnished hereunder, and shall advise Contractor if a unit of higher capacity is required.

2.4 SERVICE CONDITIONS AND ENVIRONMENTAL REQUIREMENTS. The equipment provided for the computer control system shall be suitable for the service conditions required by the applicable equipment section.

All equipment shall be designed and selected to operate without degradation in performance throughout the environmental extremes specified. Equipment shall be designed to prevent the generation of electromagnetic and radio frequency interference and shall be in compliance with FCC Rules and Regulations, Part 15, for Class A computing devices.

2.4.01 Ambient Temperature. All system equipment located in air conditioned rooms shall be suitable for operation in ambient temperatures from 50°F to 95°F (10°C to 35°C) and a relative humidity of 10 to 80 percent, noncondensing. All equipment located in non air conditioned indoor areas shall be suitable for an ambient temperature range of 32°F to 122°F (0°C to 50°C) and a relative humidity of 10 to 95 percent, noncondensing. All equipment located outdoors shall be suitable for operation in an ambient temperature range as required and a relative humidity of 5 to 100 percent. Heaters and air conditioning/cooling equipment shall be provided where required.

2.4.02 Deleterious Effects. All system equipment will be installed in areas without anti-static floor construction and without any provisions for control of particulates or corrosive gases other than ordinary office-type HVAC filtering. Contractor shall furnish any additional air cleaning equipment, anti-static chair pads, or other protective measures necessary for proper operation of the system.

All input/output hardware shall meet or exceed, without false operation, all requirements of NEMA ICS-1-109.60, Electrical Noise Tests.

2.4.03 Noise Level. The equivalent "A" weighted sound level for any system equipment located in the control room, except printers, shall not exceed 35 dBA. The sound level for printers shall not exceed 65 dBA. Sound reduction enclosures shall be provided where necessary to comply with these limits.

2.4.04 Lightning Protection. In addition to other environmental protection specified herein, the entire system shall be provided with lightning protection. Lightning protection measures shall include the following.

2.4.05 Grounding. All major components of the system shall have a low resistance ground connection. Grounding system provisions indicated on the drawings shall be modified as recommended by Contractor.

2.4.06 Surge Arresters. Surge and lightning arresters shall be non-faulting, non-interrupting, and shall protect against line-to-line and line-to-ground surges. Devices shall be solid-state metal oxide varistor (MOV) or silicon junction type, with a response time of less than 50 nanoseconds. Surge protective devices shall be applied for the following:

All power connections to RTUs, PLCs, DCUs, instruments and control room equipment. Surge arresters shall be similar to Transtector "ACP-100-BW".

All analog signal circuits where any part of the circuit is outside of the building envelope. Circuits shall be protected at both the transmitter and the control system end of the circuit. Surge protection devices shall not impede or interfere with the use of smart transmitter calibration/communication.

All metallic conductor local area network and data highway termination points, where any part of the data highway cable is routed outside of the building envelope.

All radio antenna leads.

All telephone lines at points of connection to the system. Protection devices shall be similar to Transtector FSP/LMP series.

2.5 SYSTEM SOFTWARE CONFIGURATION. The system software will be configured by Engineer, Owner, or a Configuration Contractor. Contractor shall be responsible for the following configuration support tasks:

Furnish and install the necessary operating system software, utilities, and all standard software packages. All software provided shall be fully configured for use as required by this contract. This configuration should include but not limited to, security access from the Administrator functionality to the Operator functions, printing functions (including graphics, reports, system documentation parameters, etc.), reporting functions, and historical interface and historical data accessibility.

Furnish and apply all standard communications software and develop any custom communications software needed for the components of the system to communicate information as indicated on the functional block diagram on the drawings.

Configure the hardware and provide any required firmware or software programming associated with the hardware, configuration such as DCU, PLC, and RTU device address assignments.

Provide the services of an experienced applications engineer for the number of 8-hour day visits as required, at Owner's or Engineer's facilities, to assist with the configuration. One of these visits shall be scheduled to coincide with the delivery of equipment for configuration. The remaining visits shall be scheduled with Engineer and Owner.

Provide the services of the Applications Engineer for telephone consultation and trouble shooting from Contractor's facility for the total number of hours as required.

Provide early shipment of the terminal and hardware equipment required for configuration of the system as defined herein. This equipment shall be delivered to Owner's or Engineer's offices as required, but not before submittal information and drawings for the equipment have been approved. Contractor shall also be responsible for subsequent retransport of this equipment to the project site.

Provide configuration information to Engineer at least two weeks before the shipment of equipment. Include specific I/O address numbering schemes for all field I/O points, database tag numbering format, address numbers of points required for internal use, and other information required to begin database, HMI, and PLC, RTU, or DCU programming.

Provide complete startup, checkout, and calibration of all system hardware and I/O specified herein.

Provide any programming required to implement the features and functions described herein that are not a standard part of the system software. Software that must be Engineer-Owner produced custom programming code is unacceptable.

2.6 SOFTWARE DOCUMENTATION. Contractor shall furnish complete documentation on all software supplied with the systems specified herein. Operating systems, compilers, assemblers, and utility and diagnostic programs that are standard commercial products of third parties need not be included in the magnetic media backup. Software documentation shall consist of the following principal items.

One backup set of any integrated circuit or solid-state memory-based plug-in firmware used.

Two complete back up copies of system and application software in executable format on magnetic media compatible with the system furnished.

Three sets of user reference manuals for all standard system and application software.

One set of user reference manuals for all operating system software.

Three sets of printed as-built reference documentation for any special software provided specifically for this contract.

For each licensed software product, all documentation provided by the product manufacturer shall be provided. This includes all reference manuals and any other documents that were provided by the manufacturer. There should be one set of this documentation for each and every piece of equipment provided. Multiple pieces of similar equipment or software require multiple copies of this documentation.

2.7 SOFTWARE LICENSE. All software programs supplied as a standard part of Contractor's products for this project shall be licensed to Owner for use on the system specified herein. Such license shall not restrict Owner from using the software on the system provided hereunder or its replacement. Owner shall have the right to make copies of the software for use on the system provided. Specific requirements of Contractor's software license are subject to review and approval by Owner and Engineer.

2.8 INSTALLATION TEST EQUIPMENT. All necessary testing equipment for calibration and checking of system components shall be provided by Contractor. Contractor shall also furnish calibration and maintenance records for all testing and calibration equipment used on the site if requested by Engineer.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS. The installation of equipment furnished hereunder shall be the responsibility of Contractor or his subcontractors.

3.1.01 Field Wiring. Field wiring materials and installation shall be in accordance with Master Specification Section 16050, Electrical.

3.1.02 Instrument Installation. Additional requirements for mounting, piping, and calibration of field instruments are described in Master Specification Section 17500, Instrumentation General Requirements.

3.1.03 Salvage of Existing Equipment. Existing equipment and materials removed or replaced under this contract shall be delivered to Owner at a location designated by Owner, or shall be properly disposed of at Owner's discretion. Care shall be taken to avoid damage to equipment delivered to Owner.

Any mounting brackets, enclosures, stilling wells, piping, conduits, wiring, or openings that remain after removal of equipment and support hardware shall be removed or repaired in a manner acceptable to Owner and Engineer. Transmitters or switches containing mercury shall be removed and disposed of by personnel trained in the handling of hazardous materials and using approved procedures.

3.2 SYSTEMS CHECK. When required, Contractor shall provide the services of a field manager and a trained and experienced field supervisor to assist the installation Contractor during installation, and to calibrate, test, and advise others of the procedures for installation, adjustment, and operation.

3.2.01 Field Manager. When required, Contractor shall appoint a field services manager who shall be responsible for the coordination of all system check-out and startup activities, and who shall be immediately available to Engineer and Owner by phone or on site for the duration of this project.

3.2.02 Field Inspection at Delivery. When required, the field supervisor shall inspect major equipment items within five working days of delivery, to assure that the equipment was not damaged during shipment and shall supervise or assist with unpacking, initial placement, and initial wiring of the system.

3.2.03 Training for Installation Personnel. When required, the field supervisor shall train the installation personnel in reading and understanding submittal drawings, and in the correct installation and wiring procedures for the equipment.

3.2.04 Field Inspection Prior to Start Up. After installation and wiring connections are complete, the field supervisor, with additional Contractor and Contractor personnel as required, shall verify that each external connection to the system is correctly wired and field process components and devices are functioning as intended.

3.2.05 Analog Signals. Analog input signals shall be simulated at the transmitting source, and verified to be received at the proper register address in the control system. Analog outputs shall be generated at the control system, and verified to be received with the correct polarity, at the respective receiving device.

3.2.06 Discrete Signals. Discrete input and output signals shall be simulated and verified that they are received at the respective receiving device, and at the proper voltage.

3.2.07 Devices by Other Suppliers. If interrelated devices furnished by other suppliers or under other contracts, such as valve actuators, motor controls, chemical feeders, and instruments, do not perform properly at the time of system checkout, the field supervisor shall use suitable test equipment to introduce simulated signals to and/or measure signals from these devices to locate the sources of trouble or malfunction.

3.2.08 System Check Out Report. A written report on the results of such tests shall be submitted to Engineer. Additional documentation shall be furnished as requested by Engineer to establish responsibility for corrective measures. Contractor shall verify, in writing, to Engineer or Owner that Contractor has successfully completed the external connection check before beginning system startup or field acceptance testing.

3.2.09 Start Up Assistance. After the field supervisor has completed the system check and submitted his report, Contractor shall supply a factory-trained engineer and a programmer to provide on site start up assistance for the number of days as required. During the startup period, these personnel shall thoroughly check all equipment, correct any deficiencies, and verify the proper operation of all components.

3.3 TESTING. The system shall be acceptance tested at the factory and on site.

Contractor shall prepare a testing procedure to be approved by Owner and Engineer that shall demonstrate that the system conforms to the specifications. The testing procedure shall be submitted at least 30 days in advance of testing. The testing shall be conducted by Contractor and witnessed by Owner and/or Engineer.

Contractor shall notify Engineer and Owner in writing at least 14 days before the proposed testing date. If the factory acceptance test is concluded unsuccessfully, the test shall be repeated. Contractor shall reimburse Owner and Engineer for all expenses incurred in connection with attending repeated factory or on-site testing necessitated by system failure or inadequate preparation.

3.3.01 Factory Acceptance Testing. After system assembly and debugging at Contractor's facility, the system shall be tested before the system is shipped to the project site. When required, the factory test shall be conducted on the complete system, including all field I/O devices, communications equipment, and peripherals;

or when required, using at least the minimum system consisting of computer hardware, software, printer, and one field I/O device.

The entire system, including all peripherals and associated software, shall be factory tested under simulated operating conditions. Both normal operating sequences and fault conditions shall be simulated. The results shall be noted on the CRT displays and the logging printer for hard copy. The testing procedures for hardware and software are described below.

All basic functions shall be demonstrated, including I/O processing, communications, alarm handling, HMI display functions, alarm logging, report generation, and historical data storage, as well as the specific functions listed herein. The system shall operate continuously for at least a 72 hours without faults. This operational test may run concurrently with the demonstration of hardware and software functions. The test procedure shall also include at a least four-hour period for discretionary tests to be conducted by Engineer or Owner.

For systems with software configuration by Engineer/Owner, a preliminary version of such configured software may be used as part of the factory acceptance test.

3.3.02 Hardware Test. Processors, processor modules, and peripheral devices associated with the system shall be assembled together as they will be installed in the field and shall be tested. The test shall demonstrate proper operation of each hardware device and communications among devices, and shall include verification of selected analog and discrete inputs and outputs.

3.3.03 Software Test. All system software modules specified herein shall be demonstrated. Software tests shall include running all diagnostics, debugging routines, and system test routines. The operating system, advanced process control language compiler, and all associated drivers shall be fully tested and operable for the system test. Software "patches" or changes to bypass failed or flawed modules during the test will not be acceptable.

3.3.04 Site Acceptance Testing. After installation and checkout by Contractor's personnel, the system shall be subjected to an acceptance test.

Site acceptance testing shall be scheduled after receipt of the System Check Out Report and Contractor shall verify that all field signal changes are reflected in the proper address locations in the system database.

The site acceptance testing shall follow the same procedure as the factory testing and shall operate without loss of basic functions. The number of days of continuous operation required for the test shall be as required. The operational demonstration shall confirm that the status, alarm, and process variable signals are valid and are being updated appropriately, and that the discrete and analog output signals from the control system are being correctly transmitted and implemented. Any errors or abnormal occurrences shall be recorded by Contractor's field representative. Contractor's field representative need not be continuously present during the site acceptance testing, but shall be available to respond to the site within one hour of notification. The representative shall inspect the system for faults at least once every 24 hours and shall log or record any noted problems. The log shall include a description of the problem, its apparent cause, and any corrective action taken.

3.3.05 Failure of Redundant Equipment. Failure of redundant equipment shall not be considered downtime provided that automatic failover occurs as specified and, in the opinion of Engineer, the failure was not caused by deficiency in design or installation. In the event of repeated failure of any hardware component or software module, the acceptance test shall be terminated and re-started.

3.3.06 Completion of Test. Successful completion of the site acceptance test, including the operational demonstration, is prerequisite to Substantial Completion as specified in the Supplementary Conditions.

3.4 TRAINING. Contractor shall conduct training courses for personnel selected by Owner. Seven categories of training, instrument, control system maintenance, operator (pre-installation), operator (post-installation), programmer (HMI software), programmer (PLC software), and supplemental shall be provided as required. Training shall be conducted by experienced instructors who are familiar with the specific system supplied.

3.4.01 General Training Requirements. In general, Contractor's standard training courses may be used to meet the training objectives specified. Where standard courses do not meet these objectives, additional coursework shall be developed. Clock hour requirements for each level of training are as indicated in the Contract Documents. A "clock hour" is defined as one hour of instruction or supervised training exercise. Minimum requirements listed for each training category shall be as required. Training hour requirements noted in the data sheet are the number of hours of training to be provided for each student. Additional training time shall be provided if considered necessary to meet the training objectives.

3.4.02 Training Costs. All costs associated with the training program; excluding travel, lodging, and per diem expenses for Owner's and Engineer's personnel to attend off-site training programs; shall be the responsibility of Contractor and shall be included in the contract price.

3.4.03 Lessons. Training lesson plans and other information for the second stage submittal as defined herein shall be submitted at least 30 days prior to the start of training.

3.4.04 <u>Video Taping</u>. When required by the Contract Documents, all training sessions shall be videotaped for Owner's future use in training other personnel. Videotapes of Contractor's standard training programs may be substituted if they cover the same topics and are developed for the same versions of hardware and software. Furnishing videotapes of standard training programs shall not relieve Contractor from any of the training requirements specified herein. Videotapes shall be 1/2 inch VHS standard.

3.4.05 <u>Instrument Training</u>. Training on the calibration, maintenance, troubleshooting, and repair for the instrument devices provided under this project shall be provided. Training shall be conducted at the Contractor's or Owner's facilities as required. Training shall also be provided for any hand-held or computer-based calibration devices and their associated software.

3.4.06 <u>Control System Maintenance Training</u>. System maintenance training shall be provided to enable Owner's personnel to perform routine and preventive maintenance, troubleshoot, and repair all hardware furnished with the system, except equipment provided by the HMI computer manufacturer. Maintenance and repair instruction shall assume that Owner's personnel will repair equipment by replacing circuit boards and modules, and shall not include instruction on circuit board level repair.

3.4.07 <u>Classes</u>. All maintenance training shall be conducted at Owner's facilities. Each training session shall consist of the number of hours and for the number of Owner's personnel as required.

3.4.08 <u>Content of Classes</u>. The training shall cover at least the following topics:

Preventive, scheduled maintenance for all equipment.

Function and normal operation of circuit boards and modules.

Diagnosis of hardware failures to the faulted board or module.

Removal and replacement of removable circuit boards and modules.

Emergency maintenance and restoration procedures.

The maintenance-training program shall be developed for personnel who have experience in electronics maintenance and repair and a general knowledge of computer systems, but not necessarily any familiarity with the specific hardware furnished.

3.4.09 <u>Operator Training</u>. Owner's operators will utilize the system for day-to-day monitoring and/or control of the facilities. The training program shall provide operators with sufficient knowledge to move from screen to screen within the system, understand the contents of group and detailed point displays, react to and acknowledge alarms, adjust control setpoints and alarm limits, configure and print shift reports, print preconfigured reports on demand, control equipment connected to the system, and react to and resolve minor system errors.

3.4.10 Classes. Operator training may include both pre-installation and post-installation sessions as required.

3.4.11 Pre-installation Session. Each pre-installation training session shall consist of the number of hours and for the number of Owner's personnel as required.

3.4.12 Post-installation Session. The post-installation training shall include three separate, but identical, sessions for three shifts of personnel and shall be conducted at Owner's facilities. Each class shall consist of the number of hours as required of instruction using the same lesson plan as the pre-installation training. The post-installation sessions may have to be conducted outside normal working hours to accommodate the working schedule of Owner's personnel. The post-installation training sessions shall be conducted for the number of Owner's operating personnel as required.

3.4.13 Content of Classes. Each session shall cover at least the following topics.

Power-up, "bootstrapping", and shutdown of all hardware devices.

Logging on and off the system and the use of passwords.

Access and interpretation of standard displays and diagnostics.

Use and care of operator workstations, servers, video displays, printers, and other control room hardware, including replenishment of supplies and replacement of ribbons and ink cartridges.

Moving from screen to screen within the graphic display environment.

Interpretation of preconfigured group and detailed point or database displays.

Response to and acknowledgment of alarms.

Adjustment of control set points and alarm limits.

Configuration and printing of shift and other reports by schedule or on demand.

Control of field equipment and devices connected to the system.

Manual entries to database points.

Generation of current (real-time) and historical custom and predefined reports and trend displays.

Appropriate responses to software and hardware errors.

Enabling and disabling individual inputs and outputs.

The operator-training program shall be developed for personnel with no prior computer experience.

3.4.14 Programmer Training (HMI Software). The programmer training shall be furnished as described in this section.

System programming training shall be provided to enable Owner's and Engineer's personnel to initially configure and later reconfigure the system. Programming tasks shall include addition or modification to the system database; modification or creation of graphic and tabular display and report formats; and creation and modification of historical archiving groups and data reduction algorithms.

3.4.15 Classes. Programmer training shall be conducted in two sessions. The first session shall consist of the number of hours as required of instruction for the number of programmers as required and shall be conducted at Owner's or Engineer's facilities within 30 days of delivery of the configuration hardware and software. The second session shall consist of the number of hours as required of instruction for the number of programmers as required and shall be conducted at Owner's facility.

3.4.16 Content of Classes. Programmer training shall include, but shall not be limited to the following topics:

Loading of any required software into the system.

Use of basic operating system commands for file management, system startup, and creation and editing of batch files.

Creation and editing of database.

Configuration of printed report formats.

Creation and editing of tabular and graphic HMI interface display screens.

Diagnostic routines.

Creation and modification of control algorithms.

Addition of new I/O points and new RTUs, PLCs or DCUs to the system.

Historical record retrieval, data reduction, archiving, and disk housekeeping.

System backup procedures and reloading from backup.

Programmer training shall be designed for personnel who have a general familiarity with computer control system operation and high-level application programs, but not necessarily with the specific hardware or software furnished for this project.

3.4.17 Hardware and Software. The first session of training shall be conducted using hardware and software of the same versions as provided for the system specified. Programmer training for the second session shall be conducted using equipment and software installed at the site.

3.4.18 Programmer Training (PLC Software). Programmer training shall be provided for the PLC software furnished. Programmer training shall minimally be provided on the following topics.

File management and backup procedures.

Documentation printing options.

Entering I/O and database points.

Logic function programming.

PID loop programming and tuning.

Error recovery and interpretation of errors.

Communication protocol set-up and diagnostics.

PLC software programmer training shall be conducted at Owner's or Engineer's facilities within 30 days of delivery of PLC's. The number of hours as required of instruction for the number of programmers as required shall be provided.

3.4.19 Supplemental Training. When required Contractor shall provide additional training to Owner's personnel on topics of Owner's choosing. Supplemental training shall be conducted in one session at Owner's facilities using the hardware and software installed for this project. The number of hours as required of supplemental instruction shall be provided.

End of Section

SECTION 17200

COMPUTER SYSTEM HARDWARE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of standard computer hardware fully configured to work with the software specified in another section. Principal items of the computer and peripheral hardware to be furnished as specified or are indicated on the control system block diagram on the drawings.

Contractor shall furnish all necessary interconnecting cables, accessories, and appurtenances as well as additional computer or peripheral hardware required for proper operation and to meet the functional requirements indicated on the drawings and specified herein.

All equipment shall be capable of tolerating and "riding through" a power interruption of 8 milliseconds or less without interruption of normal operation.

1.1.01 Control System. Master Specification Section 17100, Computer Control System, shall apply to all computer hardware furnished under this section.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, Engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. When required, the General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.3 SUBMITTALS. Submittals shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts and consumable items shall be provided as required.

All consumables and spares shall be supplied by the computer or printer manufacturer or by a vendor expressly recommended by the manufacturer.

Contractor shall replace any consumables or spares that are spent during setup, testing, and commissioning of the system.

PART 2 - PRODUCTS

2.1 SYSTEM COMPUTERS. Contractor shall ensure that all computers are configured to operate properly with all software, input/output devices, and peripherals supplied.

2.1.01 Server Computers. When required each Server Computer shall be comprised of the following configuration. This configuration is to be provided as a minimum:

Two 8 GB SCSI Wide Ultra 2/3 hard drives with integrated RAID controller

Single CPU (with dual CPU capabilities)

32X CD-ROM

Integrated VGA compatible video controller

256 kB Cache

Six hot-pluggable hard drive bays

Standard 3.5 inch (8.9 cm) 1.44 MB diskette drive

Redundant power supplies

One or two 10/100 Mbps RJ-45 connectivity ethernet cards as required

19 inch rack mount or tower enclosure as required

Mouse

Standard Windows keyboard

2 Serial Ports standard

1 Parallel Ports standard

Monitor as required

2.1.02 Magnetic Storage Device. One 120 MB, 3.5 inch, or one 250 MB, Iomega Zip fixed-mounted floppy drive shall be supplied and mounted in the computer enclosure as required. The floppy drives shall be manufactured by Imation, Panasonic, or equal. An internal IDE floppy drive controller shall be supplied to control the drive.

2.1.03 Removable Hard Drive. When required a removable hard drive shall be capable of storing a minimum of 2 GB of data on a removable cartridge. The drive shall be internally or externally mounted as required. The drive shall be Iomega Jaz, Castlewood Orb, or equal.

2.1.04 DLT Tape. When required a Digital Linear Tape (DLT) drive shall provide at least 20 GB of uncompressed data storage per single cartridge. The tape drive shall be supplied with spare tapes as required. The drive shall be HP SureStore, Quantum, Compaq or equal,

2.1.05 CD-RW Drive. When required a CD-RW (read/write) drives shall be capable of meeting the latest Phillips and Sony's recordable CD standard, also known as the Orange Book standard for CD/RW with a minimum of 8x read and 4x record. CD drive shall be manufactured by HP, Sony, Panasonic or equal. CD drives shall be supplied with spare disks as required.

2.1.06 Serial Communications Port Expander. When required, one 8-port RS232 board shall be supplied, installed in the host computer, and configured to allow communications between the computer and all peripheral serial devices. The communications board shall be a Digi International "DigiBoard PC/8e." An 8-port, male DTE, DB25 I/O cable shall be supplied to connect the DigiBoard to all peripheral serial devices specified and shown on the drawings.

2.1.07 Modem. When required, an internal fax-modem, rated 33.6kBPS or 56kBPS, shall be supplied with the computer. The fax-modem shall support ITU-T V.17, V.29, V.27, ITU Group III standards for fax transmissions and ITU-T V.34, V.32bis, Bell 212 and 103 standards for data transmissions. A 56kBPS modem shall also support V.90 standards. The fax-modem shall be US Robotics or equal.

2.1.08 Workstation Computers. When required by the Contract Documents each Workstation Computer shall be comprised of the following configuration. This configuration is to be provided as a minimum:

2 GB hard drive

Single CPU

40X CD-ROM

16 MB AGP video card

256 kB Cache

Standard 3.5” 1.44 MB diskette drive

One 10/100 Mbps RJ-45 connectivity ethernet cards as required

3 button Intellimouse

Standard Windows keyboard

2 Serial Ports standard

1 Parallel Ports standard

Sound Card and speakers

Monitor as required

2.1.09 Magnetic Storage Device. One 120 MB, 3.5 inch (8.9 cm), or one 250 MB, Iomega Zip fixed-mounted floppy drive shall be supplied and mounted in the computer enclosure as required. The floppy drives shall be manufactured by Imation, Panasonic, or equal. An internal IDE floppy drive controller shall be supplied to control the drive.

2.1.10 CD-RW Drive. When required a CD-RW (read/write) drives shall be capable of Orange Book standard with a minimum of 8x read and 4x record. CD drive shall be manufactured by HP, Sony, Panasonic or equal. CD drives shall be supplied with spare disks as required.

2.1.11 Notebook Computer. When required a notebook computer shall be provided. The notebook computer shall be configured as a minimum of a Pentium III processor with a 14.1” TFT display, 256Mb of RAM, one 10GB EIDE hard drive, 24X CD-ROM, video controller with 8 MB of memory, standard 3.5 inch (8.9 cm) 1.44 MB diskette drive, and ethernet card that supports 10/100 Mbps RJ-45 connectivity, integrated sound, and V.90/K56 modem. The notebook computer shall be provided with a lithium/metal-halide battery to provide a minimum of three hours of use. The notebook computer shall be a Dell Latitude, Hewlett Packard Omnibook, Toshiba Tecra, Compaq Armanda, or equal.

When required each notebook computer will be provided with a docking station with the following features:

Integral 10/100 Base-TX ethernet connection

Two (2) 3.3V and 5V PCI expansion slots

Monitor and monitor stand as required by the Contract Documents

Locking mechanism

Standard I/O ports – serial, parallel, video, mouse, keyboard, USB

Standard Windows keyboard

Two/Three button Intellimouse

2.2 SYSTEM PRINTERS. When required, a dot matrix printer shall be supplied for logging system alarms and events, a laser printer shall be supplied for generating system reports, and a color graphics printer shall be supplied for producing color plots of process graphic screens, trends, and charts.

2.2.01 Alarms and Events Printers. Each alarms or events printer shall be 24-pin impact dot matrix type designed for use in 100 percent duty-cycle applications and shall have tractor feed mechanisms suitable for continuous forms up to 14-7/8 inches (37.8 cm) wide.

Printers requiring thermally sensitive, chemically treated, or other special paper will not be acceptable. The alarms printer shall meet the following minimum requirements:

The printer shall contain an 8 kilobyte internal print buffer.

The printer shall support the standard ASCII character set.

The printer shall be capable of printing 200 characters per second in draft mode and 65 characters per second in near-letter quality mode.

The printer shall contain a serial interface card with an internal print buffer.

The printer shall be an Epson "LQ2180" or equal.

2.2.02 Report Printer. The report printer shall be laser type, capable of printing on letter or legal sized sheets of standard paper. The printer shall accept paper fed manually or from one of two paper trays, each with a minimum capacity of 200 sheets.

The report printer shall print at least 10 pages of text per minute at a resolution of 1200 dpi or greater. The printer shall contain a minimum of 8 MB of on-board RAM, expandable to 40 MB. The report printer shall be a Hewlett Packard LaserJet 2100 series or equal.

When required the color graphics printer must be provided with a 10/100Base-TX interface to provide connectivity to the computers over the ethernet network.

The reports printer shall be supplied with at least three spare toner kits and 3,000 sheets of paper.

2.2.03 Color Graphics Printer. The color graphics printer shall be of color inkjet type, shall not require the use of thermally sensitive, chemically treated, or other special paper, and shall meet at least the following minimum requirements:

> Shall be capable of delivering 1.5 pages per minute at the best color quality print speed.
>
> Shall utilize at least four separate color print heads for accurate color reproduction.
>
> Shall have a print quality of 1200 x 600 dpi in the color print mode.

The color graphics printer shall be a Hewlett Packard HP Business Inkjet 2200/2250 Series or equal.

When required the color graphics printer must be provided with a 10/100Base-TX interface to provide connectivity to the computers over the ethernet network.

2.3 NETWORK HARDWARE. Network hardware shall be furnished when required.

2.3.01 Ethernet Switches. When required the ethernet switch shall provide isolation between the various segments of the network to minimize traffic and to prevent failure of one segment from disrupting the entire network. Each switch shall have UTP (Ethernet) ports with RJ-45 connectors. Each switch connection shall automatically sense the network speed of the devices to which it is connected. Switches shall be Cisco “Catalyst Series”, Hewlett Packard “Procurve Switch” series, 3Com “SuperStack II” series, or equal. All necessary memory upgrades, software feature sets, and cables needed for proper operation of these switches shall be furnished with each switch.

2.3.02 Network Routers. When required routers shall be provided to allow connection of a Wide Area Network (WAN) to Local Area Networks (LAN). These routers must provide the flexibility to adapt to changing requirements, features and performance to support new WAN services, and integration of multiple network functions to simplify deployment and management operations. These routers shall be manufactured by Cisco 1700 series Modular Access Routers, Hewlett Packard ProCurve Routing Switches, 3Com “SuperStack II” series or equal.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS. Installation, field check, testing and training shall be as described in Master Specification Section 17100, Computer Control System.

End of Section

SECTION 17250

COMPUTER SYSTEM SOFTWARE

PART 1 - GENERAL

1.1 SCOPE. This section covers computer software to be furnished and installed by Contractor on computer hardware specified in another section.

Contractor shall furnish standard, field proven, fully developed and supported software packages for this application with a minimum of additions or changes. The number of input/output points should be 50% beyond the number required or the maximum available, whichever is lesser. Customized or specially written software shall be furnished only if required to meet all functional requirements specified herein.

Software is described in functional categories. Contractor shall furnish a complete software package including the functional requirements specified, along with any additional software required for proper and efficient operation of the system.

No attempt has been made to list all software or all characteristics of software required by Contractor to meet the functional requirements specified, nor to determine the location of the software modules within the system.

The computer control software shall meet the design conditions and performance as required.

1.1.01 Control System. Master Specification Section 17100, Computer Control System, shall apply to all software furnished under this section. Additional software requirements indicated in Master Specification Section 13500, Information Data Centers shall also apply.

1.2 GENERAL. Software packages shall control computer system level activities as well as higher level process control activities, allowing the process to be monitored and controlled through an interactive operator interface.

1.2.01 Interface. Users shall be able to interface to all process control activities through fully interactive software modules initiated and operated using easily recognized icons or custom symbols or driven by full-screen and pull-down menus. Selection of icons or menus shall be through pointing devices and shall not normally require the use of an alphanumeric keyboard. Systems that require the use of typed commands to move from module to module or from display to display are not acceptable.

1.2.02 Execution. Throughout the execution of all software modules, the operator shall be presented with all command or operation choices available at that point in the program to make the choices self-explanatory and unambiguous. Question-and-answer or fill-in-the-blank requests are acceptable only where file names, tag names, or other unique text or numerical information is required.

1.2.03 Configuration. All programs shall be self-configuring to obtain the size and configuration of the system from parameters contained in the various files created during system generation. No parameters related to the hardware configuration shall be hard coded into any of the software.

1.2.04 Version. All programs shall be the latest version commercially available at the time the system is delivered to Owner. Superseded versions, revisions, or releases are not acceptable.

1.2.05 Y2K Compliance. All software shall be year 2000 compliant.

1.2.06 General Equipment Requirements. When required, the General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.07 Drawings. Supplementing this section, the drawings indicate locations and arrangement of computer enclosures and provide one-line and block diagrams regarding the connection and interaction with other equipment.

1.3 SUBMITTALS. In addition to the requirements of Master Specification Section 13500, Information Data Centers, a complete description of the software packages and modules shall be submitted to verify compliance with this section. Submittals shall be submitted in accordance with Master Specification Section 01080, Project Submittals

1.4 DELIVERY AND SHIPPING. Delivery and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 OPERATING SYSTEM SOFTWARE. Operating system software shall be as required and shall include a complete and unmodified operating system that provides system level functions. A Graphical User Interface (GUI) shall also be provided to enhance the usability of the operating system.

2.2 PROCESS CONTROL SYSTEM APPLICATION SOFTWARE. Process control software shall be as required and shall enable the operator to monitor and control field devices connected to PLCs, RTUs, or other input/output hardware. The process control system application software shall meet the following minimum requirements and shall exceed these requirements where necessary to comply with the functional requirements of the project.

A license shall be issued for each machine loaded with process control software.

2.2.01 Approved Software. The process control system application software shall be as required. The control system hardware is specified in Master Specification Section 17200, Computer System Hardware.

When required, a dual network shall be provided to insure LAN redundancy.

2.2.02 Password Protection. Operator access within the control system software shall be controllable through a password-based security scheme. Each operator shall be assigned their own user account and password. A number of levels of security protection shall be provided as required by the Contract Document. Each system display, database block, control action, and software module shall be assigned its own security levels and shall be inaccessible to users without proper security clearance. After initial creation, passwords shall be field alterable, but only by the assigned user or a system administrator.

2.2.03 System Response. All responses to the operator shall be clear, unambiguous, and complete. Every operator menu, target selection, or request shall generate a response providing the range of choices for the next step in the process, or indicating that the request or chosen operation has been completed, is being processed, or cannot be performed. Every operator menu or target pick shall generate a graphic or text message response, even if it is a negative one.

2.2.04 Interactive Software Commands. The software's interactive command structures, user interface, menu organization, and procedures shall be consistent and predictable for all software modules throughout the system. Similar operations shall be performed in a similar manner, so that an operator will not need to learn different techniques for initiating the same operation in different software modules.

2.2.05 Operator Commands. The software shall accept each operator command or selection, decode it, and check its validity and correctness in the sequence of data and operations previously presented. Invalid or incorrect commands or menu selections shall not be processed; instead, a message shall be generated which explains why the command or menu selection is invalid. When a command or selection is canceled prior to being fully processed, the software shall clear all pending sequences and shall not initiate any system control commands.

2.2.06 Database. The software shall include a comprehensive interactive database system for creating, sorting, editing, and monitoring all process inputs and outputs and internally used variables and control blocks. The system shall request, receive, process, and store all real-time data according to the information contained in the database. Database points shall be enabled or disabled individually at any time by an operator working at the proper security level. When required, all internal database point information shall be accessible to other external database software applications through an SQL-compliant interface.

2.2.07 Interactive Database Editor. An interactive database editor software module shall be provided for creation, inspection, and modification of database entries. Modification, addition, or deletion of database information shall not require direct changes to the program source code. Changes made in the database contents or formatting shall automatically update all locations at which the information is stored or used.

2.2.08 Custom Algorithms. The software shall enable the users to create their own custom algorithms or command sequences through accessing database points, internal pseudo-point variables, math and logic comparisons, and standard system functions. Each algorithm and command sequence shall run independently and shall be configurable to be executed on demand, based upon an event or condition, on a timed-interval, or at a set time of day.

2.2.09 Programming Language. A programming-type language or environment shall be considered acceptable if it is integrated into the base control system software product; if any compilers, linkers, and other necessary software modules are either included with the base software or supplied and configured by Contractor; if technical support is provided directly by the control software vendor; and if all control system database points and variables are accessible to the programmer.

2.2.10 Alarm Processing. Alarm processing software shall be provided to recognize and report alarms to the operator in an organized, unambiguous, clear, and convenient manner. Alarms shall be classified into at least five priority levels and at least two independent classes. System events shall be considered alarms classified by their own specific priority or class.

2.2.11 Alarms. Alarm processing software shall generate alarms for at least the following conditions.

> Discrete input or output change of state if defined as an alarm in the database.
>
> Analog value exceeding the alarm limits defined in the database.
>
> Analog rate of change exceeding the limits defined in the database.
>
> Failure of any process input/output hardware, communications link, or other major hardware component.

2.2.12 Acknowledgment. Alarms shall be generated as they occur and shall not be cleared until they have been acknowledged and conditions have returned to normal. When required, an alarm shall not clear from a specific operator workstation until it has been acknowledged from that workstation, regardless of whether it has been acknowledged at other workstations in the system.

2.2.13 Alarm Summary Display. An alarm summary display shall be provided which lists at least 100 of the most recent alarms in all classes, with the most recent alarm listed first. Alarms shall appear flashing or in a unique color until they are acknowledged by the operator. Alarms of different priorities shall be easily distinguished on all alarm displays through the use of unique colors or similar methods.

When required, each operator workstation in the system shall be configured to display only certain alarms, alarm classes, and alarm priorities based on the preferences of Owner and Engineer.

2.2.14 Alarm Logging. Alarm logs shall constitute a hard-copy record of all alarms, events, and significant operator actions. Alarm displays and alarm log entries shall include the date and time that the alarm was detected, the tag name and description of the alarmed point, and an entry describing the nature of the alarm. Alarms shall be logged on an alarm and event printer as they occur.

2.2.15 Responses to Alarms. An audible alarm shall sound at the operator's console at each occurrence of a new alarm event. The audible alarm shall be silenced when it is acknowledged by the operator.

When required, voice annunciation shall be used to annunciate alarm events.

The audible alarm shall use an external sound system, such as a sound card and external speakers.

2.2.16 Alarm Enabling. Alarms originating from database entries such as discrete change of state or analog limit violations shall be enabled or disabled on a point-by-point basis.

2.2.17 Alarm Processing Software. An external alarm processing software package shall be provided to generate alarms for a paging system. Two licensed copies of the software shall be provided. The software shall be Win911 or SCADAlarm, or equal,

2.2.18 Operator Interface. System software shall be suitable for creation and modification of alphanumeric and graphic displays and linking of dynamic fields to database variables.

2.2.19 System Storage. The system shall be capable of storing and utilizing full-screen user displays and pop-up windows, as required, each containing any number of the following components.

Static and dynamic alphanumeric information.

Static and dynamic or object-based graphics.

Dynamic bar graph displays.

Dynamic analog real-time and historical trends displays.

Static and dynamic bitmap (Windows .BMP compatible) graphics.

2.2.20 Component and Configuration Information. The software shall enable the user to reuse components and configuration information from any screen or pop-up window with or without modification. All configuration information shall be displayed in any of 256 colors, flashing or non-flashing. Dynamic fields shall change color or from flashing to non-flashing and back in response to a change in value, state, or alarm condition of the linked variable. Dynamic objects linked to process inputs and outputs shall be capable of displaying at least three equipment states, such as on/off/alarm for pumps, or open/close/intermediate for valves.

2.2.21 Communications. System software shall support communications among computers and PLCs as indicated on the drawings and as specified herein. Contractor shall be responsible for any device driver development required to support the communications indicated.

2.2.22 Data Retrieval and Transmission. The software shall retrieve and send data from and to all remote field devices indicated on the drawings. The software shall perform all required error checking to ensure the validity of all data transactions and proper completion of the scan sequence. All communication system malfunctions, including "no response", shall be reported to the system as alarms. Re-transmission shall be utilized to correct or overcome communication errors.

2.2.23 Communications Driver. The software shall be supplied with communications drivers capable of communicating with any existing remote field devices indicated on the drawings as well as all software input/output drivers required to communicate with all field devices and system hardware that are furnished as part of the control system.

2.2.24 Reports. Report logs shall constitute a hard-copy summary of user-selected process data. At least 30 report formats shall be available in the system. Report printing software shall include a user-interactive, on-line report editor to allow the operator to select the following parameters for each report.

Data consisting of measured variables, calculated variables, and manually entered data.

Starting and ending time of data to be included in the report.

Print format for each variable.

Titles and subtitles to appear on each page of the report, including report name, current time, and date.

Paper width (from 8 to 14 inches).

Print pitch (from 5 to 16.5 characters per inch).

Number of columns on each page.

Number of lines per page and number of pages per report.

2.2.25 Database Points. All database points in the system, including all input/output points, manually entered points, and calculated points, shall be available for use in reports. Reports shall include sample, average, minimum, and maximum values for analog variables and the time of occurrence for minimum and maximum values. Information printable for discrete variables shall include running time, state, and transition count.

2.2.26 Report Formats. Report logs shall constitute a file or a hard-copy summary of user-selected process data. All historical data for points in the history database shall be available for reporting from a Structured Query Language (SQL) and Open Data Base Connectivity (ODBC) compliant database. Reporting software shall have the following features.

Creation and modification of report formats or content shall not require direct modification of system source code. Reports shall have the ability to be created in third party software packages such as Microsoft Excel and Microsoft Access.

All database points in the system, including all input/output points, manually entered points, and calculated points, shall be available for use in reports. Reports shall have the ability to include actual value, average, minimum, and maximum values for analog variables and the time of occurrence for minimum and maximum values. Information printable for discrete variables shall include running time, state, and transition count.

2.2.27 Historical Data Storage. The software shall include modules for historical data gathering, data reduction, and reporting. Real-time analog signal values shall be collected and stored in the historical database based on a user defined time interval of 1 second to 1 day, or on a change of state deadband configured for each database point. The historian shall support the following features.

The historical database shall be a real-time relational database. The database shall be an extension of Microsoft SQL Server. The historical database shall acquire point information from the graphical user database.

Access to data shall be by any SQL or ODBC compliant software package, such as Crystal Reports, Oracle database applications, Microsoft Excel, or Microsoft Access.

Database shall allow the use of a separate I/O server for data from the programmable logic controller system.

2.2.28 Data Reduction Capabilities. Data reduction capabilities shall be provided to average and reduce data to hourly records, and the hourly records to daily records. Entries for all hourly and daily averaged records shall include sample, average, minimum and maximum values as defined by Owner. Both hourly and daily averages for each day shall be stored in the historical database.

2.2.29 Retrieval Software. Data retrieval software shall be provided to allow access to historical data files for the following uses:

Tools shall be provided for remote trending and display of the data on all user workstations. Trend displays shall allow up to eight tags to be graphed in the window. Graphs shall allow stacking or separate display of each tag. Displays shall allow save functions for retrieval from the computer hard drive. Trends shall display real-time data, or display data from the history files. The trend display shall show the time frame of stored data.

Import/export of data from/to ASCII files.

Inclusion in user-generated reports.

Tools for Microsoft Excel display of data shall be included. Tools shall allow the retrieval and display of real-time data, or historical data.

2.2.30 Off-line Storage. The software shall include provisions for copying to backup media any or all of the historical data currently stored on the hard drive. The software shall support archival of data to tape and to any other backup devices specified in Master Specification Section 17200, Computer System Hardware. Archival of data shall be intuitive and the archival software shall guide an operator through the backup process.

2.2.31 Backup Data. Once historical data is copied to back-up media, the software shall allow the operator to delete it without negative consequences to free space on the hard drive. Archived historical data shall be re-loadable and usable in all the same ways as historical data that has not been removed from the local hard drive.

2.2.32 Logical Disk Drive. If the backup device is on-line and addressable by a logical disk drive letter (e.g., an optical disk drive defined as "D:"), historical data archived to that device shall be accessible directly without restoration to a local hard drive.

2.2.33 Internet/Intranet Connectivity. When required, the software shall include provisions for making connections to the process data through the existing corporate Intranet or through a connection made on the Internet. This "thin client" solution shall provide authorized users access to all displays and process information by utilizing any standard Internet browser.

The application software shall include software for development for web browser based interface. Features shall include the following:

The software shall allow access to the real-time process operations through any web browser without special software on the computer.

The software shall provide security to prevent unauthorized use.

The software shall allow the user to view alarms through the browser.

The software shall allow the user to view historical data through the browser.

2.3 SOFTWARE DOCUMENTATION. Contractor shall relinquish all documentation supplied with the software furnished, such as user manuals, programmer guides, reference cards or keyboard templates, and related materials. In addition, Contractor shall generate and submit to Owner and Engineer written documentation of any configuration work, modifications of the system, or setup of software done before or after installation of equipment on the site. Documentation shall be electronic or written as required. This includes any and all information on the development of any "wizards" or "scripts" created for the use in this project.

2.4 PLC SOFTWARE. The requirements for PLC software are indicated inthe Contract Documents.

2.5 EXTENDED SUPPORT OR WARRANTY. The process control system software shall include the extended or comprehensive support service of the manufacturer. The service shall include all software updates and phone and personal support when needed. The service shall be for a period of one year after final acceptance and shall cover all software packages supplied under this contract.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS. The Contractor shall install the process control software on the control system hardware specified in Master Specification Section 17200, Computer System Hardware.

3.1.01 Configuration. Contractor shall install and properly configure any supplemental programs, modules, and software packages necessary to meet the functional requirements of the project as indicated in the Contract Documents.

3.1.02 Quantity. The Contractor shall install a full development software package on each control system server and runtime software packages, one on each of the operator workstations as required.

End of Section

SECTION 17300

PROGRAMMABLE LOGIC CONTROLLERS

PART 1 - GENERAL

1.1 SCOPE. This section covers programmable logic controllers (PLCs) as designated and as required, including associated input/output hardware to control process equipment and serve as the interface to field devices.

1.1.01 Control System. Master Specification Section 17100, Computer Control System, shall apply to all equipment furnished under this section. Additional PLC software requirements are indicated in Master Specification Section 17250, Computer System Software.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.02 Drawings. Supplementing this section, the drawings indicate the number and sizes of PLCs, locations of PLCs, and provide diagrams and schematics regarding connection and interaction with other equipment. All hardware, including power supplies, special cables, and other appurtenant equipment, shall be provided to meet the functional requirements described herein and indicated on the drawings.

1.2.03 I/O List. An input/output (I/O) field device signal listing is included in the Contract Documents.

1.3 SUBMITTALS. Submittals shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare processor modules, spare power supply modules, spare I/O cards, and spare communications modules shall be supplied in the numbers as required. Additional spare parts shall be provided as required.

PART 2 - PRODUCTS

2.1 GENERAL. All equipment furnished under this section shall be expressly selected by Contractor for its superior quality for the intended purpose and shall comply with the following requirements.

2.1.01 Interchangeability. All programmable logic controller systems shall be products of the same manufacturer and of the same series or product line. Processors, local and remote input/output hardware, communications modules, and specialty modules such as coprocessors and ASCII modules shall be interchangeable among all I/O panels and systems. PLC modules and hardware by other manufacturers will be acceptable only if the PLC manufacturer does not offer suitable modules and hardware for the same functions.

2.1.02 Initial, Spare, and Future Memory (RAM). Contractor shall provide adequate memory for the amount of I/O, control algorithms, and communications in the initial system.

Each programmable logic controller shall include provisions for future expansion and shall have 100 percent spare memory capacity and 100 percent spare data capacity installed. The spare memory capacity shall be documented by submitting to Engineer, during factory testing, a statement indicating the amounts of memory of all types being utilized and the total amount available in each system. The statement shall include an estimate of the total program and data memory necessary, including spare memory, based on the I/O hardware for the system, and previous programming experience.

Each programmable logic controller shall have 31 days data retention and downloaded at the end of the end of each period.

2.1.03 Spare I/O. Each PLC input/output enclosure shall be provided with at least 20 percent spare inputs and outputs of each type. Spare I/O shall be installed, wired, and interfaced properly to the terminal strip. The spare I/O shall be in addition to any I/O installed and reserved for future process signals as may be indicated on the I/O list. In addition, each PLC input/output enclosure shall be capable of accommodating 25 percent of additional input/output capacity of each type as originally assembled, without the need for additional expansion racks or PLC power supplies.

2.1.04 Expandability. Each PLC processor and associated I/O shall have a future expandability of at least 50 percent of the provided system or as required, whichever is greater.

2.1.05 Acceptable Manufacturers. The PLCs shall be Modicon, Allen-Bradley, GE Fanuc, or Siemens as required.

2.1.06 Signal Power Supplies. A regulated dc power supply for analog output and for analog input loops shall be provided for each I/O rack when required. Power supplies shall be suitable for an input voltage variation of ±10 percent, and the supply output shall be fused or protected against short-circuiting. Output voltage regulation shall be as required by the instrumentation equipment supplied under another section.

The loop power supply shall be separate from the power supply circuit for the processor and racks.

A separately fused 120 Vac or 24 Vdc power source shall be provided for all digital inputs from field devices as required. Unless otherwise noted, all field devices will be provided with dry contacts that close to provide an input to the PLC.

2.1.07 Appurtenances. The PLC processor and I/O hardware shall be provided as complete systems, as shown on the block diagram drawings. The PLCs shall include all necessary hardware and software for a complete working system. All special rack or panel mounted power supplies, special interconnecting and programming cables, special grounding hardware, or isolation devices shall be furnished as required for proper operation of the equipment. Signal converters, signal boosters, amplifiers, special power supplies, special cable, special grounding, intrinsically safe relays and current repeaters, surge suppression devices, and isolation devices shall be furnished and installed as required for proper operation of the equipment.

2.1.08 PLC Arrangement. The PLCs shall be distributed and arranged as indicated in the Contract Documents.

2.1.09 Master Plant Control PLC. A master plant control PLC and enclosure shall be provided. The PLC shall be programmed to accumulate all plant monitoring data from all other PLCs, and will be the primary communications point for data exchange with the SCADA system over the radio communications link.

2.1.10 Each Major Treatment Building. A separate PLC and enclosure, installed and wired under this contract, shall be provided for each major treatment process building.

2.2 LARGE PLC PROCESSOR. The programmable logic controller processor shall be an industrial-type rack-mounted unit that utilizes battery-backed Complementary Metal Oxide Semi-Conductor (CMOS) type or nonvolatile type memory. Battery backed memory shall include integral batteries with sufficient capacity for at least 6 months' memory retention without power to the processing unit. Standby and shelf life of the batteries shall be at least 5 years. PLC unit shall be capable of 31 days of data retention and be downloadable at the end of the period.

The system shall include an Erasable Programmable Read Only Memory (EPROM) card for storage of the user program. The processor shall automatically download the user program from the EPROM upon startup after a power loss. The EPROM shall be programmable by the PLC or PLC software, without the use of external PROM programmable equipment.

2.2.01 Diagnostics. The processor shall utilize self-monitoring diagnostic techniques and shall contain easily visible LED diagnostic indicators for "run" and "halt" conditions as well as memory and input/output error conditions. Diagnostic codes shall also be available through the programming device to facilitate troubleshooting.

2.2.02 Programming Port. The processor shall include a programming port that is available for programming and monitoring on-line after the system is fully functional, and after all communications, human machine interface (HMI), and network connections have been made. Removal or disruption of network communications, remote I/O communications, and HMIs to allow for on-line programming and monitoring will not be acceptable. A key switch shall be provided on the processor for selection of the operating mode and as a security measure.

2.2.03 Communications. The processor shall be programmed to operate autonomously, regardless of communications status with other units. Each programmable controller shall be furnished complete with communication modules for local and remote input/output hardware communications, communications with other programmable controllers, and communication with host computers as shown on the block diagram.

The unit shall be capable of HART digital communication protocol with the necessary circuitry installed.

2.2.04 Environment. The processor shall be suitable for operation in the environments specified in another section.

2.2.05 Programming. The processor shall be programmable using the International Electrotechnical Commission (IEC 1131) international programming standards and ladder logic programming. IEC 1131 programming shall include the following:

Functional Block Diagram

Sequential Function Chart.

Instruction List.

Structured Text.

Ladder Diagram.

Ladder logic programming shall include a minimum of the following capabilities:

Contacts, coils, branching.

Data comparisons.

On-delay and off-delay timers.

Counters with comparators.

Floating point Math and Logical instructions.

PID loop control.

Jumps and Subroutine functions.

Master control relay.

Transitional or one-shot outputs.

Standard and user-defined data tables for discrete and analog value storage.

Remote I/O capability.

Fault-mode subroutine.

2.2.06 Programming Capabilities. The processor shall include the following capabilities for programming, debugging of programs, and troubleshooting.

Off-line programming.

On-line programming.

On-line status of coils and registers.

Input/output forcing.

2.2.07 Hardware Configuration. Processors shall be configured for standard rack mounting. Each programmable logic controller processor shall include integral communications ports for the programming device, remote input/output, HMI device, or remote communications interfaces as required.

2.2.08 Input/Output Hardware. Input/output hardware shall be entirely contained within the PLC enclosure. Programmable logic controllers having fixed, non-removable input/output hardware will be acceptable if spare and future input and output points described elsewhere in this section are furnished as required. Programmable logic controller systems shall support the following types of input/output modules.

120 volt ac discrete input and output.

4-20 mA dc analog input and output.

24 volt dc discrete input and output.

High speed pulse accumulator input.

Platinum RTD analog input.

Binary-Coded-Decimal (BCD) thumb wheel input.

All digital input/output hardware shall include isolation against surges of at least 1500 volts. All output hardware connected to inductive loads shall be supplied with surge suppression devices as required and recommended by the PLC manufacturer to prevent damage to output hardware. Combination input/output modules will be acceptable if they meet the following requirements.

2.2.09 Wiring Terminals. All input/output modules shall utilize easily removable plug-in or hinged field wiring terminals to allow removal of modules without disconnecting individual wires.

2.2.10 I/O Circuit Power Supply. Outputs for motor driven equipment will typically be powered from the driven equipment. Discrete outputs for miscellaneous equipment shall be powered either from the controlled equipment or the PLC enclosure as indicated on the drawings or as coordinated with the controlled equipment supplier. Outputs that control process equipment specified under other sections or provided under other contracts shall be fully isolated or shall operate either interposing relays or relay-type discrete output modules in the PLC cabinet.

2.2.11 Discrete Input Modules. Discrete input modules shall sense voltages between 100 and 130 volts ac or 20 and 28 volts dc and shall have LED indicators for each point to display the status of the field contact. Each input module shall be suitable for being connected to a separate voltage source and return. Return voltage may be common to the entire input module. Discrete input modules shall have multiple inputs.

2.2.12 Isolated Discrete Input Modules. Isolated input modules cards shall sense voltages between 100 and 130 volts ac or 20 and 28 volts dc and shall have LED indicators for each point to display the status of the field contact. Each point on the input module shall be capable of being connected to a separate voltage source and return. Discrete input modules shall provide complete electrical isolation between individual inputs. Isolated discrete input modules shall have multiple inputs.

2.2.13 Discrete Output Modules. Discrete output modules shall control voltages from 100 to 130 volts ac or 20 to 28 volts dc and shall be rated at least 1 ampere. Outputs shall be individually fused and shall have LED indicators to display output status. Outputs shall withstand a surge of at least 80 amperes for one cycle and shall have an off-state leakage current not to exceed 2 mA. Discrete output modules shall have multiple outputs.

2.2.14 Isolated Discrete Output Modules. Discrete output modules shall control voltages from 100 to 130 volts ac or 20 to 28 volts dc and shall be rated at least 1 ampere. Outputs shall be individually fused and shall have LED indicators to display output status. Outputs shall withstand a surge of at least 80 amperes for one cycle and shall have an off-state leakage current not to exceed 2 mA. Discrete output modules shall provide complete electrical isolation between individual output circuits. Isolated discrete output modules shall have multiple outputs.

2.2.15 Relay Discrete Output Modules. Discrete output modules shall have dry contact relay type outputs suitable to control voltages from 24 to 110 volts dc and 24 to 230 volts ac and shall be rated at least 2 amperes. Outputs have LED indicators to display output status. Digital outputs for motor driven equipment shall be powered by the driven equipment. Outputs shall withstand a surge of at least 80 amperes for 15 milliseconds. Relay discrete output modules shall have multiple outputs.

2.2.16 Analog Input Modules. Analog input modules shall accept linear 4-20 mA dc signals from field transmitters. Analog to digital conversion accuracy shall be at least 12-bit (0-4095 count) resolution. Analog input modules shall have multiple inputs.

2.2.17 Isolated Analog Input Modules. Isolated analog input modules shall accept linear 4-20 mA dc signals from field transmitters. Analog to digital conversion accuracy shall be at least 12-bit (0-4095 count) resolution. Analog input modules shall have multiple inputs. Each input shall be fully isolated from the other inputs.

2.2.18 Analog Output Modules. Analog output modules shall transmit linear 4-20 mA dc signals to field devices. Loop power for all analog outputs shall be provided by regulated power supplies in each input/output enclosure and shall be capable of driving a 0 to 600 ohm load. Digital to analog conversion accuracy shall be at least 12-bit (0-4095 count) resolution. Analog output modules shall have multiple outputs.

2.2.19 Panel Terminations. All PLC input/output signals for field connections shall be terminated through panel enclosure terminal strips. Direct connection of field wiring to the I/O module terminals is not acceptable.

2.2.20 Interposing Relays. Interposing relays shall be incorporated on all I/O circuits as shown on the PLC input/output listing, or as required by the application to isolate foreign power sources, and where the continuous output rating of the PLC relay discrete, or output module is not sufficient to power the connected device or equipment. Interposing relays shall be provided for any discrete output module output signal that leaves the PLC enclosure. Interposing relays shall be mounted in the PLC enclosure containing the output module that activates the relays.

2.3 MINI PLC PROCESSOR. The programmable logic controller processor shall be an industrial type that utilizes battery-backed CMOS type or nonvolatile type memory. Battery-backed memory shall include integral batteries with sufficient capacity for at least 6 months of memory retention without power to the processing unit. Standby and shelf life of the batteries shall be at least 5 years. Mini PLC unit shall be capable of 31 days of data retention and be downloadable at the end of the period.

2.3.01 Diagnostics. The processor shall utilize self-monitoring diagnostic techniques. Easily visible LEDs shall indicate "run" and "halt" status as well as memory and input/output error conditions. Diagnostic codes shall also be available through the programming device to facilitate troubleshooting.

2.3.02 Programming Port. The processor shall include a programming port that is available for programming and monitoring on-line after the system is fully functional. Removal or disruption of network communications, remote I/O communications, or HMIs to permit programming and monitoring will not be acceptable.

2.3.03 Communications. The processor shall be programmed to operate autonomously, regardless of communications status with other units.

2.3.04 Environment. The processor shall be suitable for operation in the environments specified in another section. A key switch shall be provided on the processor to select the operating mode and as a security measure.

2.3.05 Programming. The processor shall be programmable using conventional relay ladder logic, or as required, and shall include the following functions and features.

Contacts, coils, branching.

Data comparisons.

On-delay and off-delay timers.

Counters with comparators.

Floating Point Math and Logical instructions.

Master control relay.

Transitional or one-shot outputs.

Standard and user-defined data tables for discrete and analog value storage.

2.3.06 Capabilities. The processor shall include the following capabilities for programming, debug of programs, and troubleshooting.

Off-line programming.

On-line status of coils and registers.

Input/output forcing.

2.3.07 Configuration. Processors shall be configured for standard rack mounting and shall be of plug-in printed circuit board construction. Each programmable logic controller shall include integral communications ports for the programming device, remote input/output, HMI device, or remote communications interfaces as required.

Programmable logic controller systems shall support the following types of input/output.

120 volt ac discrete input and output.

24 volt dc discrete input and output.

4-20 mA dc analog input and output.

2.4 Input/Output Hardware. For large rack mounted PLCs, input/output hardware shall be supplied in standard modules of 4, 8, 16, or 32 points each for assembly in local and remote input/output enclosures.

All input/output hardware shall be entirely contained within the PLC enclosure.

Programmable logic controllers having fixed, non-removable input/output hardware may or may not be acceptable as required.

All digital input/output hardware shall include isolation against surges of at least 1500 volts. All output hardware connected to inductive loads shall be supplied with surge suppression devices as required and recommended by the PLC manufacturer to prevent damage to output hardware. Combination input/output modules will be acceptable if they meet all of the requirements in the following subparagraphs.

2.4.01 Wiring Terminals. All input/output modules shall utilize easily removable plug-in or hinged field wiring terminals to allow removal of modules without disconnecting individual wires.

2.4.02 I/O Circuit Power Supply. Outputs for motor driven equipment will typically be powered from the driven equipment. Discrete outputs for miscellaneous equipment shall be powered either from the controlled equipment or the PLC enclosure as indicated on the drawings or as coordinated with the controlled equipment supplier. Outputs that control process equipment specified under other sections or provided under other contracts shall be fully isolated or shall operate relay-type discrete output modules or interposing relays in the PLC cabinet.

2.4.03 Discrete Input Modules. Discrete input modules shall sense voltages between 100 and 130 volts ac or 20 and 28 volts dc as required and shall have LED indicators for each point to display the status of the field contact. Each input module shall be suitable for being connected to a separate voltage source and return. Return voltage may be common to the entire input module.

2.4.04 Isolated Discrete Input Modules. Isolated input module cards shall sense voltages between 100 and 130 volts ac or 20 and 28 volts dc as required and shall have LED indicators for each point to display the status of the field contact. Each point on the input module shall be capable of being connected to a separate voltage source and return. Discrete input modules shall provide complete electrical isolation between individual inputs.

2.4.05 Discrete Output Modules. Discrete output modules shall control voltages from 100 and 130 volts ac or 20 and 28 volts dc as required and shall be rated at least 1 ampere. Outputs shall be individually fused and shall have LED indicators to display output status. Outputs shall withstand a surge of at least 80 amperes for one cycle and shall have an off-state leakage current not to exceed 2.0 mA.

2.4.06 Isolated Discrete Output Modules. Discrete output modules shall control voltages from 100 and 130 volts ac or 20 and 28 volts dc as required and shall be rated at least 1 ampere. Outputs shall be individually fused and shall have LED indicators to display output status. Outputs shall withstand a surge of at least 80 amperes for one cycle and shall have an off-state leakage current not to exceed 2 mA. Discrete input modules shall provide complete electrical isolation between individual inputs.

2.4.07 Relay Discrete Output Modules. Discrete output modules shall control voltages from 24 to 110 volts dc and 24 to 230 volts ac and shall be rated at least 2 amperes. Outputs shall be individually fused and shall have LED indicators to display output status. Digital outputs for motor driven equipment shall be powered by the driven equipment. Outputs shall withstand a surge of at least 80 amperes for 15 milliseconds.

2.4.08 Analog Input Modules. Analog input modules shall accept linear 4-20 mA dc signals from field transmitters. Input circuitry shall be floating differential type designed to prevent loop grounding. Analog to digital conversion accuracy shall be at least 12 bit (0-4095 count) resolution.

2.4.09 Analog Output Modules. Analog output modules shall transmit linear 4-20 mA dc signals to field devices. Loop power for all analog outputs shall be provided by regulated power supplies in each input/output enclosure and shall be capable of driving a 0 to 600 ohm load. Digital to analog conversion accuracy shall be at least 12 bit (0-4095 count) resolution.

2.4.10 Panel Terminations. All PLC input/output signals for field connections shall be terminated through panel enclosure terminal strips. Direct connection of field wiring to the I/O module terminals is not acceptable.

2.5 COMMUNICATIONS. Each programmable controller system shall be furnished complete with communication hardware modules for local input/output hardware, remote input/output hardware, other programmable controllers, or for host computers as required.

Communication hardware shall be compatible with the cable, data highway, fiber optic, or radio communication media as required.

2.5.01 Addressability. Each programmable logic controller shall be individually addressable so that only the selected controller responds when queried. At least 30, or a larger number as required, distinct network addresses shall be available. Designation of a controller's network address may be either a software or hardware function.

2.5.02 Communications Hardware. Contractor shall provide all necessary communications hardware. Hardware shall be included for, but not be limited to, remote I/O, data highway, host computer, fiber optics, Ethernet and radio.

2.5.03 PLC to PLC Communications Hardware. Each PLC shall communicate to other PLCs over a data highway communications network. Contractor shall include all rack mounted, enclosure mounted, or desktop mounted communications modules required for a complete working system.

2.5.04 PLC to Remote Communications Hardware. The master PLC shall communicate with the remote PLC rack over a remote I/O communications network. Contractor shall include all rack mounted, enclosure mounted, or desktop mounted communications modules required for a complete working system.

2.5.05 PLC to Host Communications Hardware. Each PLC shall communicate to the host computer over a data highway communications network. Contractor shall include all rack mounted, enclosure mounted, or desktop mounted communications modules required for a complete working system. The computer system hardware is covered in another section.

2.5.06 Fiber Optic Communications Hardware. Contractor shall provide all necessary fiber optics transceivers and modems for the PLC system. Communications hardware shall meet the requirements of the manufacturer of the PLCs.

Fiber optic modems shall meet the following requirements:

Full Duplex four wire.

Point-to-Point configuration.

Data Rate of 19.2 KBS for RS-232.

Data Rate of 5 MBS for RS-422.

LED indicators for power, transmit data, and receive data.

Asynchronous multimode RS-232, RS-422, and RS-485; asynchronous RS-232; or asynchronous RS-422.

2.5.07 Radio Communications Hardware. Each PLC shall communicate over radio equipment. Contractor shall provide all necessary hardware for the PLC to communicate with the radio system modem. Communications hardware shall meet the requirements of the manufacturer of the PLCs. Radio equipment is covered in another section.

2.5.08 Communications Media. Contractor shall provide all necessary cabling for the PLC communications network and PLC remote I/O communications network. Communications cables shall meet the requirements of the manufacturers of the PLCs and communications modules.

2.5.09 Cable. Contractor shall provide all necessary cabling for the PLC system. Communications cables shall meet the requirements of the manufacturers of the PLCs and communications modules.

2.5.10 Data Highway Plus Cabling. Cable shall be shielded pair suitable for installation in conduit. Cable furnished shall meet the requirements of the PLC manufacturer. Cable shall meet the following requirements.

Twinaxial 20 AWG, tinned copper

Polyethylene insulation, color-coded clear, blue

24 AWG stranded tinned copper drain wire

Overall tinned copper braid shield

Blue PVC jacket

Data highway cable shall be Belden "9463".

2.5.11 Modbus Plus Cabling. Cable shall be shielded pair suitable for installation in conduit. Cable furnished shall meet the requirements of the PLC manufacturer. Cable shall meet the following requirements.

24 AWG, tinned copper, one twisted pair

Polyethylene insulation

Overall aluminum/polyester shield

24 AWG stranded tinned copper drain wire

Overall tinned copper braid shield

PVC jacket

Modbus Plus cable shall be Belden "9841".

2.5.12 Metallic LAN Cable. Cable shall be coaxial or shielded pair suitable for installation in conduit. Cable furnished shall meet the following minimum requirements.

Coaxial

Tinned copper center conductor

Cellular polyethylene dielectric

Duobond II Shield

95 percent tinned copper braid

PVC Jacket

Twisted, Shielded pair (STP)

Category 5

Copper conductors

#24 AWG

Aluminum/polyester shield with drain

300 volt rated

Minimum 0.037 inch PVC jacket

Plenum rated

2.5.13 Fiber Optic Cable. Fiber optic cable shall have a loose tube construction with silicon gel filling. The cable shall have at least three pair of multimode fibers. Spare fibers shall be fitted with connectors. Where patch panels or fiber distribution panels are used, all fibers, including spares, shall be properly terminated in the panel. Fiber diameter shall be coordinated with the transceivers or modems supplied. Cables shall be Seicor, Belden, BICCGeneral, or AMP. Cable connectors shall be ST type.

Exposed fiber optic cable within PLC enclosures shall be a jacketed "zip-cord" with industry standard connectors. Single, unjacketed fibers shall not be used for terminations on PLC equipment. Bulk fibers entering a PLC enclosure shall be terminated in a patch panel. Zip-cords shall be run from the patch panel to the PLC components.

Fiber optic terminations shall be performed by Contractor in accordance with the manufacturer's recommendations.

2.5.14 Fiber Optic Communications Hardware. Contractor shall provide all necessary fiber optics transceivers and modems for the PLC system. Communications hardware shall meet the requirements of the manufacturer of the PLCs.

Fiber optic modems shall meet the following requirements:

Full Duplex four wire.

Point-to-Point configuration.

Asynchronous multimode RS-232, RS-422, and RS-485.

Asynchronous RS-232.

Asynchronous RS-422.

Data Rate of 19.2 KBS for RS-232.

Data Rate of 5 MBS for RS-422.

LED indicators for power, transmit data, and receive data.

2.5.15 Radio Communications Hardware. Contractor shall provide all necessary radio communications for the PLC system. Communications hardware shall meet the requirements of the manufacturer of the PLCs. Radio equipment shall be as specified in Master Specification Section 17350, Multiple Address Radio Equipmentand as shown on the drawings.

2.6 PROGRAMMING DEVICE HARDWARE. The programming device shall be a portable notebook computer as specified in another section. Contractor shall provide two interconnecting cables, each 5 meters long, to connect the computer to the programmable logic controller. The cables shall be shielded data cable and shall be terminated on both ends with the appropriate connectors. Connectors shall be labeled to identify the connected equipment.

2.6.01 Special Devices. Contractor shall provide two sets of any special devices (such as null modems, adapter cards, interface converters, etc.) required to establish an operational programming line between the programmable logic controllers and programming device.

2.7 PROGRAMMING SOFTWARE. Contractor shall furnish two licensed copies of PLC programming software; one copy for Owner and one copy for Engineer; or one licensed copy of the PLC programming software for Owner as required. The software shall be functionally identical and shall be suitable for running on the programming device specified elsewhere. A full legal set of programming software documentation shall accompany each copy of the software. Each copy of the programming software shall include all necessary device drivers and add-on software packages.

2.7.01 Standard Product. The programming software shall be personal computer based and a standard product of the PLC manufacturer, or at Contractor's option and with Owner's approval, field-proven third-party software that is functionally equivalent to the PLC manufacturer's software may be provided. The software shall be RS Logix for A-B, or Concept for Modicon.

2.7.02 PLC Emulation. The programming software shall include a PLC emulation feature that allows the program logic of a single PLC to be tested and debugged entirely in the programming device without the PLC.

2.7.03 Programming Software Features. The programming software shall allow off-line development of all PLC-related programming, including user annotation of the program, and creation and printing of application programs and I/O cross-reference lists. Special programming tasks originally provided by Contractor shall also be included.

On-line features shall include IEC-1311 standars program modification, ladder-logic modification, program language modification, monitoring of real-time ladder-logic execution, monitoring of program execution, monitoring and manipulation of timer and counter preset and present values, monitoring and forcing of physical I/O, and monitoring and manipulation of analog (register) and bit (binary) data table values. PLC and I/O hardware diagnostic and status information shall be accessible using the software in on-line mode.

2.8 SYSTEM ENCLOSURES. Programmable logic controllers and input/output hardware shall be housed in shop-assembled panels as indicated on the drawings and as described in another section.

2.9 SYSTEM ENCLOSURES. Programmable logic controllers and input/output hardware shall be housed in existing panels or panels provided by others.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS. PLC installation requirements are specified in Master Specification Section 13500, Information Data Centers, except as described herein.

Field check, testing, and training shall be as described in Section 13500.

3.2 CONFIGURATION.

3.2.01 PLC Programming and Configuration. Configuration services are specified in Master Specification Section 13500, Information Data Centers.

3.2.02 Communications Configuration. The communications shall be fully configured and installed by Contractor, and shall be operational before application software configuration by others. Communications shall be configured as shown on the block diagram drawing.

3.3 FIBER OPTIC CABLE INSTALLATION AND TESTING. The fiber optic cable shall be installed, terminated, and tested by an experienced fiber optic network installer. Each fiber of each fiber optic cable shall be tested after installation. For each fiber with a length of more than 100 ft, an end-to-end power attenuation (insertion loss) test shall be performed. The attenuation test shall utilize a stabilized optical source and an optical power meter calibrated to the appropriate wavelength (850 or 1300 nm).

For each installed fiber the power attenuation shall not exceed the values recommended by the fiber optic transceiver manufacturer. Any fiber optic cables containing one or more fibers not meeting this performance will not be accepted by the Owner. Cable shall be repaired or replaced. All necessary hardware, test equipment, cables and test meters, required for the testing shall be provided. The results of the fiber optic cable testing shall be documented and submitted to the Owner.

End of Section

SECTION 17350

MULTIPLE ADDRESS RADIO EQUIPMENT

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of radio communication equipment for a Computer Control system, including equipment that is common to the Computer Control System and the field devices as required. Field devices may be PLCs, RTUs, DCUs, etc. The equipment shall consist of hot-standby polling remote radios, hot-standby repeater radios, hot-standby base radios, and remote radios as indicated on the drawings and as required.

1.1.01 Control System. Master Specification Section 17100, Computer Control System, shall apply to all equipment furnished under this section.

1.2 GENERAL. Equipment furnished and under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Engineer.

1.2.02 General Equipment Requirements. When required, the General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.03 Drawings. Supplementing this section, the Contract Document drawings show the configuration of the radio system, a location map of the sites, and antennae types with support and cable and mounting details. All hardware, including power supplies, special cables, and other appurtenant equipment, shall be provided to meet the functional requirements described herein and indicated on the drawings.

1.2.04 Accessories. Contractor shall provide all necessary equipment such as channel processors, line buffers, communication couplers, and modems, to transmit commands and receive data via communication channels. Contractor shall also provide all radio transmitters, receivers, antennas, and mounting hardware for a complete operational radio system.

1.3 SUBMITTALS. Submittals shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as required.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Radios and accessories shall be suitable for installation within the field device enclosures or in their own enclosures designed for the environmental conditions as required.

2.2 COMMUNICATIONS EQUIPMENT. Communication equipment (radio transceiver units) shall be furnished as required.

Units shall conform to the following requirements:

	Polling Remote, Repeater, or Base Unit	Remote Unit
Number of channels (per radio)	1	1
Frequency Selection	928/952 MHz	928/952 MHz
Signal Modulation	FM	FM
Modulation Deviation	±3 kHz	±3 kHz
Antenna Gain (db)	9	9
Antenna Vertical Beamwidth	360 degrees	43 degrees
Type of antenna	Omni	Directional

2.2.01 Acceptable Manufacturers. The radio system equipment shall be point-to-multi point UHF radio equipment manufactured by Microwave Data Systems.

2.3 COMMUNICATIONS CHANNEL. The computer control system shall utilize a frequency modulated radio frequency as its communications medium. System transceivers shall operate on a dedicated channel pair in the 950 MHz band in conformance with FCC Rules and Regulations, Parts 22 and 101. Bandwidth shall be 12.5 kHz.

2.4 RADIO EQUIPMENT. The radio equipment necessary for operation of the SCADA system shall be provided by Contractor. The radio system configuration is shown in the Contract Documents. The configuration shall include hot-standby polling remote radios, hot-standby repeater radios, hot-standby base radios, or a remote transceiver radio as shown on the drawings and as required.

Repeater radios shall have direct VF (voice frequency) input/output to accept signals from local field devices. The base radio, polling remote radio, and repeater radio equipment shall be rated for continuous duty. Contractor shall coordinate the radio equipment with the SCADA system.

2.4.01 Mounting Hardware. Mounting hardware for antennae shall be provided by Contractor, and shall be stainless steel to resist corrosion. Towers or other supporting structures provided by others are described in another section.

2.4.02 Digital Interface. When required for field devices, a digital interface shall conform to EIA RS-232 protocol and shall have the following characteristics.

2.4.03 RTS/CTS. Interface shall support RTS/CTS handshaking. CTS shall be granted within 10 msec after RTS. Bit Error Rate shall be 1 x 10^{-6} or better at -111 dBm, kBPS.

2.4.04 Rate. Data rate as required.

2.4.05 Analog Interface. When required, an analog interface shall have the following characteristics.

2.4.06 Audio. Interface shall be 4 wire, 600 ohms impedance, balanced audio, and shall be compatible with all new or existing field devices and computers specified in other sections.

2.4.07 Level. Input audio level shall be adjustable from -16 to +0 dBm. Output audio level shall be adjustable from -20 to +0 dBm.

2.4.08 RTS/CTS. Interface shall support RTS/CTS handshaking. CTS shall be granted within 20 msec after RTS. Bit Error Rate shall be 1 X 10^{-6} or better at -110 dBm, 1.2 kBPS.

2.4.09 Rate. Data rate shall be as required.

2.4.10 Transmitters. The transmitters shall have the following characteristics:

Modulation type	FM
Spurious and harmonic emissions	-65 dBc
Output power at antenna port, "N" type connector	5 watts
Frequency stability	±0.00015 percent, 1.5 PPM (-30 to

	+60°C)
Bandwidth	12.5 kHz
Modulation deviation	±2.5 kHz
Duty cycle	100%, continuous at 5 watts (-30 to +60°C)
Output impedance	50 ohms

After the transmitter is unkeyed, it shall remain on for another 0 to 64 msec. When the transmitter is keyed on, an interval timer shall start with an adjustable 1 to 30 second range that prevents the transmitter from locking up a channel.

2.4.11 Receivers. The receivers shall have the following characteristics.

Type	Dual conversion superhetrodyne
Frequency stability	±0.00015 percent, 1.5 PPM (-30 to +60°C)
Spurious and image rejection	-85 dB minimum
Bandwidth compatibility	12.5 kHz
IF selectivity at adjacent channel	100 dB minimum
RF input impedance	50 ohms
Intermodulation (EIA) (Digital Interface Only)	-75 dB minimum
Desensitization (EIA) (Digital Interface Only)	-60 dB minimum

2.4.12 Power Requirements. When required, each polling remote radio, base radio, or repeater radio equipment shall be designed for continuous operation using a nominal 120 volt, single-phase power source, and shall be provided with an internal battery and battery charger. Each radio battery shall be sized to fully power the radio equipment for at least 2 hours. Each power supply shall be complete with an On-Off switch, indicating light, and input over current protection.

Reliable communication shall be achieved when the equipment is continuously energized at any voltage level from -15 percent to +12.5 percent of nominal, with ambient temperatures as specified.

2.4.13 Voltage Transients. All polling remote radio and repeater radio equipment shall tolerate and ride through the voltage dips, surges, and momentary transients associated with normal power supplies.

2.4.14 Remote Radio Equipment. The remote transceiver radio equipment shall be designed for continuous operation on a nominal 12 V dc source from the field device source or as shown on the drawings.

2.4.15 Test Points. The base radio, polling remote radio, and repeater radios shall have test points for transmitter power and receive signal level. The remote transceiver radio units shall have test points for the transmitter power output, receive signal level, battery voltage and negative supply voltage.

2.4.16 Radio Alarms and Indications. LED indicators shall be provided for local indication of (base radio, polling remote radio, and repeater radio operations) and faults.

2.4.17 Indicators. The units shall have the following indicating lights:

Power On Unit A - Loss of this light shall indicate unit failure or a significant drop in power output (e.g., 3 dB).

Power On Unit B - Loss of this light shall indicate unit failure or a significant drop in power output (e.g., 3 dB).

Transmit Active Unit A - the unit is transmitting.

Transmit Active Unit B - the unit is transmitting.

Receive Active Unit A - the unit is receiving.

Receive Active Unit B - the unit is receiving.

Receive Signal Level - the receiver signal level is above the 20 dB S/N squelch setting. Loss of this light shall indicate low receive levels or unit failure.

Transmitter A failure.

Transmitter B failure.

Local oscillator A failure.

Local oscillator B failure.

2.4.18 Trouble Indication. The base radio, polling remote radio, and repeater radios shall have a relay contact for remote trouble indication for each unit (A and

B). At the repeater radio sites, the contact outputs shall be wired into the field device located at the site as alarm inputs. At the base radio and polling remote radio sites, the contact outputs shall be available for the Owner's use.

2.4.19 Remote Transceiver Radio Indicators. Analog type remote transceiver units shall have the following local indicating lights.

On - Transmitter on; loss of this light shall indicate unit failure or a significant drop in power output (e.g. 3 dB).

Key Line Active.

Transmitter On.

Squelch Open.

Out of Lock.

Radio Disabled.

Digital type remote transceiver units shall have the following local indicating lights.

Request to Send.

Clear to Send.

Carrier Detect.

Transmit Data.

Receive Data.

2.4.20 Cavity Filter Kit. Each base radio or repeater radio shall have a TX-RX dual vari-notch filter including mounting brackets, cable, and connectors. The filter shall pass the received signal from the SCADA remote radios with a maximum power loss of 1.5 dB. The filter shall attenuate signals noise received from paging transmitters by a minimum of 30 dB. The filter shall be mounted in the base or repeater radio enclosure and shall be factory tuned for the radio frequency of the radio. The filter shall be an MDS Model 032144AO1.

2.5 RADIO SYSTEM DIAGNOSTICS. The radios shall include system diagnostics to permit continuous or scheduled automatic monitoring of key operating parameters and alarm conditions.

2.5.01 Communication. The diagnostic package shall communicate data from all remote transceiver radios in the system to the base radio and polling remote radio via the radio's RF channel.

2.5.02 Radio Diagnostic Software. Diagnostic software capable of operation on MS Windows shall be supplied to enable an IBM compatible personal computer or notebook computer to communicate with the radio via a separate RS-232 diagnostic port. The diagnostic software shall support a minimum of 512 remote transceivers per base radio or polling remote radio. The diagnostic software shall support the data/control functions specified herein and shall be fully loaded and operational on the notebook computer furnished hereunder or in another section as required.

2.5.03 Diagnostic Data. Diagnostic data transmitted over the radio frequency channel must use dual tone multi-frequency encoding to eliminate the possibility of diagnostic information being misinterpreted as data being sent from the SCADA system.

2.5.04 Programming Device Hardware. When required, the programming device shall be a portable notebook computer. Contractor shall provide two interconnecting cables, each 5 meters long, to connect the note book computer to the base, repeater, and polling remote radios. The cables shall be shielded data cable and shall be terminated on both ends with the appropriate connectors. Connectors shall be labeled to identify the connected equipment.

2.5.05 Special Devices. Contractor shall provide two sets of any special devices (such as null modems, adapter cards, interface converters, etc.) required to establish an operational programming line between the radios and programming device.

2.5.06 Base Radio or Polling Remote Radio Diagnostic Data/Control Functions. The following functions shall be monitored by the diagnostic system.

The operation and status of redundant transmitter, receivers, and power supplies; including automatic switch over to standby unit upon failure. All modules must be continuously monitored while on line and in standby states.

Remote switch over to the alternate transmitter or receiver to permit remote troubleshooting of radio hardware and software.

Remote testing of the hot standby switch over logic and alarm reporting logic.

Power supply voltage, current, and transmission of power from redundant power supplies and transmitters.

Received signal strength, frequency offset, and FM deviation levels of redundant base radio, polling remote radio, or a repeater radio.

The radio diagnostics shall permit remote adjustment of key parameters in the remote radio transceivers from a personal computer connected to the base radio or polling remote radio. The parameters shall include transmit power, transmit frequency offset, and transmit modulation deviation.

2.5.07 Control and Display Capability. Radio diagnostic software shall include control and display capability of the remote radio transceiver parameters listed below.

Frequency (remote display and control).

Deviation (remote display and control).

Transmit Power Output (remote display and control).

Receiver Signal Strength (remote display).

Power Supply Voltage (remote display).

Internal Voltage Regulator Voltage (remote display).

Phase Lock Loop Voltage (remote display).

Internal Radio Temperature (remote display).

2.5.08 Remote Transceiver Radio Diagnostic Data/Control Functions. The remote transceiver radio shall monitor its internal operation and diagnostic parameters from a hand held terminal or personal computer plugged into the remote transceiver. A loop-back decoder board that operates in conjunction with the base radio or polling remote radio microprocessor to provide signal strength, frequency error, and deviation levels shall be supplied for each remote transceiver radio. The following data/diagnostic functions shall be supplied.

Transmit and Receive Frequencies (display and control).

Time-out Timer Setting (display and control).

Soft-Carrier De-key Setting (display and control).

Loop-Back Code (display and control).

Squelch Tail Eliminator (display and control).

Push-To-Talk Delay (display and control).

Clear-To-Send Delay (display and control).

Frequency (Remote display and control).

Deviation (Remote display and control).

Transmit Power Output (display and control).

Receiver Signal Strength (display).

Power Supply Voltage (display).

Internal Voltage Regulator Voltage (display).

Phase Lock Loop Voltage (display).

Internal Radio Temperature (display).

2.5.09 Remote Transceiver Hand-Held Programmer/Test Set. A Microwave Data Systems hand-held compact programming terminal shall be provided for local programming/testing of all remote transceivers as required. The programming terminal shall provide access to the internal diagnostic and control capabilities of the transceivers and shall be capable of performing the diagnostic and control functions described in this section, including frequency programming and key voltage measurements. The hand-held terminal shall include an interface cable that plugs into the transceiver's external interface connector.

2.6 SURGE SUPPRESSION. Contractor shall provide an in-line surge suppressor on antenna cables at each radio site to protect the radio equipment from damage by lighting. Surge suppressors shall be Polyphaser Series IS-B50LN-C2 or equal.

Two lengths of superflexible Heliax cable shall be supplied for each surge suppressor; one for the connection between surge suppressor and radio antenna port, and one for the connection between the coaxial transmission cable (1/2 inch and larger) and the antenna. The cable shall be terminated with standard N type connectors. The cable shall be Andrew Superflexible Heliax 1/4 inch Type FSS1-50A.

2.7 ANTENNAS. Contractor shall furnish antennas and supporting structures at radio sites as indicated on the drawings.

2.7.01 Omnidirectional Antennas. A 9 dB omnidirectional, full-wave, dipole collinear type antenna with all required mounting hardware, preferably by the antenna manufacturer, shall be provided for each base radio and repeater radio as indicated on the drawings. Radiating elements shall be enclosed in a single length of fiberglass tubing and a brass tube extending from top to bottom, with grounding lug, for lightning protection. A drain plug shall be provided at the bottom of the tube for draining moisture. The antenna shall be mounted as indicated on the drawings. Omnidirectional antennas shall be Decibel DB809 or equal.

2.7.02 Directional Antennas. A 9 dB directional Yagi antenna with a minimum 20 dB front-to-back ratio shall be provided for each remote transceiver radio site and polling remote radio site as indicated on the drawings. Each antenna shall be of heavy-duty design for permanent installation, with gold anodized aluminum support boom and elements and mounting hardware supplied by the antenna manufacturer. The radiating element of the antenna shall be radome protected. Directional Yagi antennas shall be Decibel DB498 or equal.

2.7.03 Wooden Poles. Wooden poles for mounting antennas shall be furnished in the lengths indicated at the locations as indicated in the Contract Documents. The wooden poles shall be burn-branded on the face and the butt. The markings on the face shall be 6 feet (1.8 m) above ground line, assuming standard setting depths. The markings shall be as designated in ANSI 05.1, Paragraph 6.25. Each pole shall have a 15 degree one-way roof.

The poles shall meet the applicable requirements of ANSI 05.1 and AWPA C4.

2.7.04 Radio Towers. Radio towers and foundations shall be furnished in the dimensions indicated at the locations indicated on the drawings. The towers shall meet the applicable standards of AISC, AISI, AWS, EIA and FAA. The towers shall be Rohn BX series and shall be mounted on pre-engineered Rohn recommended foundations for concrete base stubs.

2.7.05 Radio Masts. Self-supporting radio masts shall be furnished of the height at the location indicated on the drawings. The mast shall be of tapered, tubular design, manufactured of high-strength steel, with a galvanized protective coating, grounded to earth, and shall be mounted on a heavy- duty foundation designed and approved by the mast manufacturer. The mast shall be designed for the loading indicated on the drawings and shall be Valmont Industries Model RT, or approved equal.

2.7.06 Grounding Conductors. All ground conductors shall be soft drawn copper cable or bar, not smaller than 12 AWG, bare or green insulated in accordance with the National Electrical Code.

2.7.07 Ground Rods. Ground rods not described elsewhere shall be 5/8 inch (1.6 cm) diameter by 8 feet (2.4 m) long, with a copper jacket bonded to a steel core. Minimum ground rods shall be three (3) per tower and shall be asymmetrical.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS. General installation requirements are described in Master Specification Section 17100, Computer Control System.

3.1.01 Radio Equipment. The radio equipment shall be mounted in field device enclosures or in a separate enclosure if needed. Separate enclosures shall be furnished with the same NEMA rating and color as the field device enclosure.

3.1.02 Functional Testing. As a minimum, the following functional tests shall be performed on the communications equipment.

3.1.03 Antenna Alignment. After each antenna is permanently installed, a power monitor shall be used to properly adjust the antenna for maximum signal strength. A written report on the monitoring results shall be submitted to the Engineer for review before the radios are placed into permanent operation.

3.1.04 Radio Frequency Check. After each radio has been installed but before it is placed into permanent operation, a frequency check shall be conducted to verify conformance with the specified tolerances. The frequency check shall be performed by a radio technician either employed or under subcontract to Contractor. A written report on the results of this check shall be submitted to the Engineer for acceptance.

3.1.05 Surge Suppressor Installation. Surge suppressors shall be bulkheads mounted on the radio enclosures and shall be suitable for the sizes of cable inside and outside the enclosures.

3.1.06 Installation of Grounding Materials. Electrical system grounding and equipment grounding shall be in compliance with the National Electrical Code.

3.1.07 Antenna Installation. Contractor shall provide and supervise the installation of antenna equipment at radio sites as indicated on the drawings. Damage to tanks or reservoirs caused by the installing Contractor shall be repaired to the Owner's satisfaction at Contractor's expense.

3.2. FCC LICENSE. One or more frequency licenses has been granted to the Owner by the FCC. The licensed frequencies and their effective dates are as required.

Because the FCC allows only eighteen months for construction, Contractor shall have at least 4 remote transceiver radios operational and communicating with a base radio or a repeater radio by the date as required.

End of Section

SECTION 17400

SOFTWARE CONTROL BLOCK DESCRIPTIONS

PART 1 - GENERAL

1.1 SCOPE. This section provides functional descriptions of the PLC and computer system software requirements for the plant control system. These descriptions are intended to provide an overview of the operating concept of the treatment plant process equipment rather than describing in detail every operating feature or interlock.

1.1.01 Control System. Master Specification Section 17100, Computer Control System, shall apply to all systems described in this section.

PART 2 - PRODUCTS

2.1 SOFTWARE. The software is specified in Master Specification Section 17250, Computer System Software.

PART 3 - EXECUTION

3.1 FUNCTIONAL REQUIREMENTS. Functional requirements shall be as follows.

3.1.01 Available Process Values. All process alarm, equipment status, and process variable values shall be available at any operator station.

3.1.02 Manual Entry of Data. The operator's station shall allow manual entry of laboratory data and other variables, which shall then be available for display and use in reports. Operator entered commands from any of the operator's station shall be logged at the operator's station.

3.1.03 Flow Values. Flow values shall be integrated, totalized, and stored in the PLC registers so that the values displayed on the operator's station and on the SCADA system will be identical.

3.1.04 System Failure. Failure of a PLC shall result in safe shutdown of associated process equipment. Interposing relays shall be provided where required to assure that equipment will revert to its most fail-safe condition. Failure of any PLC or its communication shall be alarmed on the operator's station.

3.1.05 Personal Computer. The personal computer shall function as a monitoring system, not as a controller, for the process equipment. The computer shall download set points and other information to the PLCs, and the PLCs shall perform all control algorithms, so that a temporary failure of the personal computer will not disrupt plant control.

3.1.06 Change-of-State Alarms. All PLC discrete output commands shall be compared with their respective process feedback status signal, where available, to verify proper execution. If the feedback status does not match the most recent output command (after an adjustable 2 to 90 second time delay), an alarm message shall be displayed on the operator station and the condition shall be logged as an alarm requiring operator acknowledgment.

3.2 SPECIFIC SOFTWARE FUNCTIONAL DESCRIPTIONS. The following paragraphs describe some specific functional requirements for various software control blocks in the plant control system. These descriptions are intended to provide an overview of the operational concept of the treatment plant process equipment rather than describing in detail every operating feature or interlock.

3.2.01 General Monitoring of Analog Input Signals (CB-1). Process variable signals shall be displayed at operator stations in scaled engineering units and shall be historically archived. Values shall be available for use in reports. Inputs which represent flow values shall be integrated by the computer software and the "totalized" flow value shall be available for display and use in reports. High and low alarms shall be assigned to process values, where appropriate.

3.2.02 General Monitoring of Discrete Input Signals (CB-2). Discrete input signals which represent equipment status shall be displayed on the operator stations. The running time for all motorized equipment shall be totalized and stored for use reports and maintenance programs. Alarm inputs shall be displayed and shall actuate the station audible alarm device, which requires local acknowledgment by a plant operator. Alarms shall be printed on the alarm printer, with the time and date of occurrence, and shall be archived.

3.2.03 RO Feed Control (CB-3). The RO feed pump shall be manually started, either locally or through the operator's station. The pump shall start at minimum speed and shall accelerate as required to maintain the preset product water flow rate. The flow set point shall be adjustable through the operator's station. High discharge pressure, high differential pressure across any stage, or low suction pressure shall be alarmed and shall cause the pump and the RO unit to shut down. High product conductivity or loss of chemical feed shall also shut down the unit. The pump discharge valve shall be interlocked as required to operate with the pump.

3.2.04 RO Brine Flow Control (CB-4). The brine (concentrate) valve shall remain open when the RO unit is off-line, but ready to operate. Upon sensing the RO feed pump running, the brine valve shall begin closing to maintain the brine flow rate at a preset ratio to the product flow rate. The ratio of brine to product water shall be adjustable through the operator's station.

3.2.05 RO Chemical Feed Control (CB-5). The acid and antiscalant feed systems shall be started manually, either locally or, preferably, through the operator's station. The acid metering pump feed rate shall be controlled to maintain the RO influent pH at the set point value (adjustable through the operator's station). The antiscalant metering pump feed rate will be paced from the plant influent flow signal. The ratio of antiscalant to water shall be adjustable through the operator's station. Low level in the acid day tank or antiscalant storage tank shall cause an alarm, and at low-low level the respective metering pumps shall shut down. High discharge pressure in a chemical feed line shall cause an alarm and shall cause the respective metering pump to shut down. The RO feed pumps shall not operate unless the chemical feed systems are operating.

Transfer of acid to the day tank shall be semiautomatic. A plant operator will initiate the transfer by pressing a momentary push button located near the day tank. The transfer pump shall then operate until the day tank is full. Low level in the day tank shall initiate an alarm and alert the operator to initiate a transfer before the low-low level switch stops the metering pump.

3.2.06 Product Water Pumping Control (CB-6). The product water pumps shall automatically start and stop based on water level in the product water storage reservoir. Each pump shall start and stop at different water levels, which will be determined later. Controls shall be designed to alternate the pumps in service. The pumps shall be stopped in a "first-on first-off" sequence.

High and low water levels in the reservoir shall be alarmed. Hard-wiring of pump controls to stop operation on low reservoir level will be provided under another contract.

End of Section

SECTION 17500

INSTRUMENTATION GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of all instrumentation equipment required for the Computer Control System as indicated in the Contract Documents.

Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedule drawings; as indicated on the instrument device schedules attached to this section, or to Sections 17510 through 17550, as required.

1.1.01 Control System. All applicable requirements defined in Master Specification Section 17100, Computer Control System, shall apply to equipment and services provided under this section.

1.2 GENERAL. Contractor shall select equipment furnished under this section for its superior quality and the intended performance. An Installation Contractor will install all equipment in accordance with manufacturer's instructions. Equipment and materials used shall be subject to review and comply with following requirements.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.02 Drawings. Supplementing this section, the drawings indicate locations and arrangement of instruments and enclosures, provide mounting details, and may show device schedules and other information regarding the connection and interaction with other equipment.

1.2.03 Governing Standards. Governing Standards for instruments shall be as indicated in Master Specification Section 17100, Computer Control System.

1.2.04 Corrosive Fluids. All parts, which are exposed to corrosive conditions, shall be made from corrosion resistant materials. Contractor shall submit certification that the instrument manufacture approves the selection of materials of primary elements which are in contact with the specified process fluid to be inert to the effects of the process liquid.

1.2.05 Elevation and Temperature. All instruments shall be designed to operate within a range of elevation and temperature as required.

1.2.06 Power and Instrument Signals. Unless otherwise indicated, electric power supply to the instrumentation equipment will be unregulated 120 volts ac. Unless otherwise indicated, all transmitted electronic analog instrument signals shall be 4-20 mA dc and shall be linear with the measured variable.

1.2.07 Appurtenances. Signal converters, signal boosters, amplifiers, special power supplies, special cable, special grounding, and isolation devices shall be furnished as needed for proper performance of the equipment.

1.2.08 Interchangeability and Appearance. To the extent possible, instruments used for similar types of functions and services shall be of the same brand and model line. Similar components of different instruments shall be the products of the same manufacturer to facilitate maintenance and stocking of repair parts. Whenever possible, identical units shall be furnished.

1.2.09 Programming Devices. A programming or system-configuring device shall be provided for systems that contain any equipment that requires such a device for routine calibration, maintenance, and troubleshooting. The programming device shall be complete, newly purchased for this project, and shall be in like-new condition when turned over to Owner at completion of startup.

1.2.10 Device Tag Numbering System. All devices shall be provided with permanent identification tags. The tag numbers shall agree with Contractor's equipment drawings and shall be as close as practical to the tag numbers used on the project drawings and device schedules. All field-mounted transmitters and devices shall have stamped stainless steel identification tags. Panel, subpanel, and rack-mounted devices shall have laminated phenolic identification tags securely fastened to the device. Hand-lettered or tape labels will not be acceptable.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as specified.

PART 2 - PRODUCTS

2.1 INDIVIDUAL DEVICE SPECIFICATIONS. Individual instruments and related devices shall be provided as specified in one or more of the following Master Specification sections, as required:

17510 Panel Mounted Instrument Specifications

17520 Flow Instrument Specifications

17530 Pressure and Level Instrument Specifications

17540 Analytical Instrument Specifications

17550 Miscellaneous Instrument Specifications

PART 3 - EXECUTION

3.1 INSTRUMENTATION INSTALLATION REQUIREMENTS. Additional instrumentation installation requirements are specified in Master Specification Section 17100, Computer Control System. Instruments shall be installed and calibrated in accordance with the following requirements.

3.1.01 Field Calibration. After each instrument has been installed, a technical representative of Contractor shall calibrate each instrument and shall provide a written calibration report for each instrument, indicating the results and final settings. The adjustments of calibrated instruments shall be sealed or marked, insofar as possible, to discourage tampering. Instrument calibration shall be done before checkout of the system operation. Refer to typical Instrument Calibration Report at end of this section.

3.1.02 Systems Check. A technical representative of Contractor shall participate in the checkout of instrumentation systems. Systems check requirements shall be as specified in Master Specification Section 17100, Computer Control System.

3.1.03 Installation Test Equipment. Unless specified otherwise, all test equipment for the calibration and checking of system components shall be provided by Contractor for the duration of the testing work and this test equipment will remain the property of Contractor.

3.1.04 Mounting of Field Instruments. Instruments shall be mounted so that they can be easily read and serviced and so that all appurtenant devices can be easily operated. Installation details for some instruments are indicated on the drawings.

3.1.05 Leads into Buildings, Panels, and Housings. Arrange leads into buildings, panels, and housings so as to prevent water infiltration.

3.2 CUSTOMER TRAINING. Instrumentation training as specified in Master Specification Section 17100, Computer Control System.

SECTION 17510

PANEL MOUNTED INSTRUMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of instrumentation equipment required for the Computer Control System as indicated on the drawings and as required.

Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedule drawings; as indicated on the instrument device schedules attached to Master Specification Section 17500, Instrumentation General Requirements or as required.

1.2 GENERAL. Contractor shall select the equipment furnished under this section for its superior quality and the intended performance. An Installation Contractor will install all equipment in accordance with the manufacturer's instructions. Equipment and materials used shall be subject to review and shall comply with the requirements specified in Master Specification Section 17500, Instrumentation General Requirements.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 INDIVIDUAL DEVICE SPECIFICATIONS. Individual instruments and related devices shall be provided as specified herein, and as required.

PART 3 - EXECUTION

3.1 INSTRUMENTATION INSTALLATION REQUIREMENTS. Instrumentation installation requirements shall be as specified in Master Specification Section 17500, Instrumentation General Requirements.

3.2 PANEL MOUNTED INSTRUMENT SPECIFICATIONS. The following instrument specifications shall be followed:

3.2.01 Recorder Station

Instrument Category:	Panel
Instrument Type:	Recorder station
Power Supply:	24 V dc or 120 V ac, 60 Hz with cord set and plug 120 V ac, 60 Hz for chart drive
Signal Input:	Standard panel instrument voltage signal into 250 ohms minimum
Signal Output:	N/A
Process Connection:	N/A
Classification:	NEMA 1
Description:	Station shall be miniature-case drawout type, nominally 6 inches (15.2 cm) high by 3 inches (7.6 cm) wide by not more than 25 inches (63.5 cm) deep. Split architecture systems in which display stations and electronic function modules are separately mounted in equipment racks are acceptable. Operator adjustments shall be accessible without disconnecting station from the process. Process variable indicating scales shall be readily exchangeable. Each station shall be individually fused. Recorder shall provide for one to three pens on a 4 inch (10 cm) thermal chart with an accuracy of 0.1 percent or better current or voltage. Chart shall provide not less than 15 days recording at .75 inches per hour (19 mm per hour). Chart system shall permit easy inspection and return to the recorder of previously recorded data. Recorders shall display not less than 4 hours of recorded data without withdrawing either the chart or the recorder from the case.
Manufacturer:	Westronics or approved equal
Special Requirements:	N/A

3.2.02 Indicator

Instrument Category:	Panel
Instrument Type:	Indicator
Power Supply:	120 V ac, 60 Hz
Signal Input:	4-20mA
Signal Output:	Dual 2 AMP Alarm Relays
Process Connection:	N/A
Classification:	N/A
Description:	Provide a Microprocessor based 3-1/2 or 4-1/2 digit panel mounted indicator with LED or LCD display, negative value and alarm indication. The indicator shall be keypad configurable to display the process variable in engineering units and provide monitoring and display of the minimum and maximum process value. Accuracy shall be 0.5 percent of reading 0.1 percent full scale with a response time less than 3.5 secs.
Manufacturer:	Red Lion, Newport or approved equal
Special Requirements:	Provide 4-1/2 digit indicator as required, where process range and accuracy demands it. For areas exposed to direct sunlight, displays shall have sunshades or movable covers.

3.2.03 CMAT

Instrument Category:	Panel
Instrument Type:	Single Loop Digital Control (CMAT)
Power Supply:	24 V dc or 120 V ac, 60 Hz
Signal Inputs:	Number: Analog - 2 Discrete - 3
Signal Output:	Voltage: 1-5 V dc std. calibration (1M ohm min.) non-isolated
Current:	4-20 mA (with 250 ohm dropping resistors)

Low Level:	T/C, mv-isolated
Digital:	opto-coupler, 24 V dc at 10 mA (max.)
Process Connection:	N/A
Classification:	NEMA 12
Description:	The single loop digital controller shall be a completely self-contained, stand-alone, microprocessor-based industrial PID loop controller capable of local manual, local automatic, or external control system control. It shall coordinate analog loop control between external control system control, local manual control, and local automatic control (computer/ manual/automatic/transfer or CMAT).

It shall be user configurable through the use of software. The software shall use function blocks that can be arranged by the user through simple commands. Organizing the function blocks into an operational program shall be a simple task and not require the operator to have previous programming experience. The CMAT shall programming keys or pushbuttons for directly entering programming commands, without the use of external programming equipment. The function blocks shall be internal to the controller, and allow the controller to be configured for any combination of control algorithms including feedback, feedforward, proportional, integral, derivative, ratio, and speed-floating.

The function blocks shall provide mathematical functions, Boolean functions, timers, internal transfer switches, alarms, track and hold functions, storage registers, analog to pulse converters, and a square root extractor. The software shall provide fully adjustable output limiting, prevent reset wind-up, and provide standard PID tuning parameters, including setpoint tracking without overshoot.

The loop controller shall allow direct digital control (DDC) of its output from an external control system. Under DDC control, the loop controller shall pass the control signal to the output without acting upon it with its own internal algorithm. The loop controller shall track the signal and provide bumpless switching between local and external control. The loop controller shall be capable of external setpoint control.

The loop controller shall be a miniature-case drawout type, nominally 6 inches (15.2 cm) high by 3 inches (7.6 cm) wide by not more than 25 inches (63.5 cm) deep. Operator adjustments and programming facilities shall be accessible from the front without disconnecting the station from the process.

The loop controller shall have a solid state vertical scale for displaying the process variable, setpoint, and output. This display shall clearly indicate the deviation from setpoint, process deviation alarms, and diagnostic alarms. Manual setpoint adjuster, manual output adjuster and mode selector shall be provided on the loop controller faceplate.

The loop controller shall provide control actions specified in the instrument schedule when in automatic mode. Control actions shall be as defined in ANSI/ISA S51.1. Where specified, proportional action shall be adjustable from 2 to 500 percent; integral action adjustable from 0.01 to 60 minutes per repeat; derivative action adjustable from 1 to 100 percent.

Controller accuracy shall be 0.5 percent of span or better.

Controller front panel shall be capable of being remotely mounted from controller body. Interconnection shall be via ribbon cable. Where the controller front panel is mounted separate from the controller body the Contractor shall provide an interconnecting ribbon cable.

Manufacturer: Moore Product Co., Mycro 352E, Foxboro 742, or approved equal.

Special The loop controller shall provide digital interface

Requirements:	signals for mode coordination with the external control system. The status of the signals, one digital input and one digital output, shall indicate whether the control system or the loop controller is available for control. Loss of the control system ready signal at the loop controller shall cause the loop controller to switch to local automatic mode using the last tracked setpoint value or process variable value as setpoint, and to not accept commands from the control system. Conversely, lack of the ready signal from the loop controller at the control system shall cause the control system to take control and notify the operator. Programming of the loop controller is the responsibility of the Contractor. The Contractor shall supply software for loading programs from personal computers. This software shall allow CMAT configuration programs to be stored, uploaded, downloaded, and edited.

3.2.04 Annunciator

Instrument Category:	Panel
Instrument Type:	Annunciator
Power Supply:	24 V dc/120 V ac, 60 Hz
Signal Input:	Dry Contact, 24 V dc; see Contract Drawings
Signal Output:	Dry Contact (2 amp @ 120 V ac)
Process Connection:	N/A
Classification:	NEMA 1
Description:	The annunciator shall be prewired so only power and external wiring need be connected to operate the system. All cables leading to and from the annunciator and plug-in components shall withstand an insulation test at a specified voltage and frequency to ground. The removal of individual active or spare stations shall not affect the operation of the other units nor shall live electrical leads become exposed. All annunciator

components shall be capable of withstanding transient voltage surges, from any possible source. Terminals and wires on or within the annunciator shall be clearly identified and shall relate directly to the schematics and wiring diagrams.

Auxiliary contacts shall be provided to facilitate all functions indicated on the Contract Drawings, such as providing a common alarm from multiple alarm inputs. The number of rows and columns is shown on the panel schedules. Mounting to be either panel front or wall as shown on the drawings. ISA Sequence AS shall be Windows shall be single or dual point as required. Logic shall be solid state, and located behind the panel with contact voltage of 24 V dc and contact type NO/NC to be switch selectable. The audible alarm shall be a solid state horn with volume control. Annunciator shall be complete with alarm acknowledge, reset and test push buttons.

Manufacturer:	AMETEK, Panalarm Series 90, BETA, RIS or approved equal.
Special Requirements:	N/A

End of Section

SECTION 17520

FLOW INSTRUMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of instrumentation equipment required for Master Specification Section 17100, Computer Control System, as indicated on the drawings and as required.

Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedule drawings; as indicated on the instrument device schedules attached to Master Specification Section 17500, Instrumentation General Requirements, or as required.

1.2 GENERAL. Contractor shall select the equipment furnished under this section for its superior quality and the intended performance. An Installation Contractor will install all equipment in accordance with the manufacturer's instructions. Equipment and materials used shall be subject to review and shall comply with the requirements specified in Master Specification Section 17500, Instrumentation General Requirements.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 INDIVIDUAL DEVICE SPECIFICATIONS. Individual instruments and related devices shall be provided as specified herein and as required.

PART 3 - EXECUTION

3.1 INSTRUMENTATION INSTALLATION REQUIREMENTS. Instrumentation installation requirements shall be as specified in Master Specification Section 17500, Instrumentation General Requirements.

3.2 FLOW INSTRUMENT SPECIFICATIONS. The following flow instrument specifications shall be followed:

3.2.01 Pitot Tube.

Instrument Category:	Flow
Instrument Type:	Pitot Tube, Averaging
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	As specified on drawings, schedule or manufactured design
Classification:	N/A
Description:	Pitot Tube Flow element shall be a differential producer of the impact pressure type with integral static and transverse averaging elements that eliminate the affects of pipe surface roughness. Differential pressure shall be proportional to flow rate squared with an accuracy of ±1 percent of actual flow or better. The flow element shall be selected to best fit the application while minimizing unrecovered head loss. The tube shall be Type 316 stainless steel, mounted through a single tap into the process line. The Contractor shall properly size the flow element based on actual flow conditions.
Manufacturer(s):	Dieterich Standard, Meriam Instrument or approved equal.

3.2.02 Flow Indicator/Switch.

Instrument Category:	Flow
Instrument Type:	Flow Indicator/Switch
	This technology may not be preferred by the Owner for some applications. In those instances, the DBM Contractor shall recommend available alternative technology in the design workshops, to the Owner for its review and acceptance.
Power Supply:	N/A

Signal Input:	N/A
Signal Output:	2 SPDT rated at 6 amps at 125 V ac
Process Connection:	3/4 inch NPT - female
Classification:	N/A
Description:	Flow indicator shall be of rugged construction, all electronic, using thermal mass technology. The unit shall have an all welded Type 316 stainless steel sensor head. The indicator shall have a temperature compensation circuit. Display shall be calibrated in gallons per minute. The switch shall have (2) SPDT relays.
Manufacturer(s):	FCE FLT93x series thermal flow switch with display or approved equal.
Special Requirements:	The Contractor to select range based on flow requirements of the application. Determine pipe size and select correct insertion length for each application. Submit a schedule or list for each application, that provides this information including a letter from the manufacturer verifying that the units are sized properly for the application.

3.2.03 Flow Switch – Paddle Type.

Instrument Category:	Flow
Instrument Type:	Flow Switch
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	Socket mount single channel rated at 2A 115 V ac
Process Connection:	1/2 inch NPT Female
Classification:	NEMA 4
Description:	Flow Switch shall be in line paddle type sensor with 316 ss paddle, bronze body, suitable for mounting in process streams without the need for expansion

	fittings or Tee's. This switch shall be used for installations in process piping of 1 inch or less.
Manufacturer(s):	W. E. Anderson, Flotect model V6 or approved equal.
Special Requirements:	The Contractor shall determine mounting and location requirements and submit to Contracting Officer for review and approval.

3.2.04 Flow Switch – Thermal Type.

Instrument Category:	Flow
Instrument Type:	Flow Switch
	This technology may not be preferred by the Owner for some applications. In those instances, the DBM Contractor shall recommend available alternative technology in the design workshops, to the Owner for its review and acceptance.
Power Supply:	24 V dc or 115 V ac
Signal Input:	N/A
Signal Output:	2 SPDT relays rated at 6 Amps @ 115 V ac
Process Connection:	1 inch NPT, 1-1/4 inch for packing gland assembly
Classification:	Explosion Proof or NEMA 4X
Description:	Provide bi-directional thermal type flow switch for FLOW - NO FLOW - REVERSE FLOW indication. The switch shall be made of 316 stainless steel with a pressure rating of 2000 psi. Operating temperature range shall be -100°F to +350°F.
Manufacturer(s):	GEMS, Model RF83 or approved equal.
Special Requirements:	As required, install switch with a retractable probe through a packing gland/ball valve assembly. Packing gland shall be constructed of Type 316 stainless steel. Include packing compression collar and nut. The ball valve shall be 1-1/4 inch full bore stainless steel. The valve can be threaded or flanged in accordance with Contracting Officer's

instructions. Size the assembly to accommodate the pipe. Use LPG assembly for 50 psi or less. Use MPG for 500 psi or less.

3.2.05 Ultrasonic.

Instrument Category:	Flow
Instrument Type:	Flow Element (Ultrasonic)
Power Supply:	Ultrasonic Transceiver
Signal Input:	Ultrasonic Transceiver
Signal Output:	N/A
Process Connection:	N/A
Classification:	NEMA 4X
Description:	Transducer shall be non-contacting ultrasonic sensor compatible with specified level/flow indicating transceiver. Transducer shall have integral temperature compensation and be constructed of Tefzel with a NEMA 4X rating. Ambient operating temperature range shall be -40°F to 160°F. Maximum range shall be 33 feet and maximum separation of transducer from transmitter shall be 1200 feet.
Manufacturer:	Milltronics STH or approved equal.
Special Requirements:	To ensure compatibility, the Contractor shall supply transducer in conjunction with a Milltronics HydroRanger or equal ultrasonic level transmitter.

3.2.06 <u>Flow Indicating Transmitter</u>.

Instrument Category:	Flow
Instrument Type:	Flow Indicating Transmitter
Power Supply:	120 V ac, 60 Hz
Signal Input:	Ultrasonic Transducer
Signal Output:	4-20 mA, 5-SPDT Form C Relays
Process Connection:	N/A
Classification:	NEMA 4X
Description:	Transmitter shall be a microprocessor based, ultrasonic level/flow monitor, and shall communicate with the specified ultrasonic transducer to produce a flow reading relative to process level. Unit shall be housed in a NEMA 4X enclosure and shall have front panel digital display of operating parameters and process conditions in operator selectable units. Programming and calibration shall be performed by a removable, magnetically mounted, infrared coupled, handheld programmer.
Manufacturer:	Milltronics HydroRanger, or approved equal.
Special Requirements:	To ensure compatibility, the Contractor shall supply flow transmitter in conjunction with a Milltronics model STH ultrasonic transducer.

3.2.07 <u>Flow Element/Transmitter</u>.

Instrument Category:	Flow
Instrument Type:	Flow Element/Transmitter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4 - 20 mA, 5-SPDT Form C Relays
Process Connection:	N/A

Classification:	See Description
Description:	Primary Flow Element shall be "H" type flume with fabricated mounting for circular sewers as needed for use in open channel sewage flow. Flume shall contain integrally mounted brackets spaced to support the secondary element.
	Secondary element shall be an ultrasonic transducer indicating transmitter configured for owner specified flows. The transducer shall contain integral temperature compensation, and be constructed of seamless Tefzel material in a NEMA 4X enclosure. Ambient operating temperature range shall be -40°F to 160°F. Maximum separation, transducer to transmitter, shall be at least 1200 feet.
	Transmitter shall be housed in NEMA 4X enclosure and shall have front panel digital display of operating parameters and process conditions in operator selectable units. Programming and calibration shall be performed by a removable, magnetically mounted, infrared coupled, hand held programmer. Transmitter shall accept the input of flume configurations and convert level measurement to an accurate flow reading.
Manufacturer:	Flume - Hinde Engineering or approved equal.
	Ultrasonic Transducer/Transmitter - Milltronics HydroRanger with STH transducer.
Special Requirements:	The Contractor is responsible for sizing and installation of the flume and mounting of the ultrasonic transducer in accordance with manufacturer’s recommended specifications and existing owner installations.

3.2.08 Flow Indicating Transmitter (PDT).

Instrument Category:	Flow
Instrument Type:	Flow Indicating Transmitter-(PDT)
Power Supply:	24 V dc for 0 to 600 ohms loading
Signal Input:	N/A
Signal Output:	4-20 mA dc, current regulated to drive loads of 0 to 550 ohms at 23 V dc
Process Connection:	1/2 inch NPT on 2-1/8 inch centers
Classification:	Explosion proof, corrosion resistant
Description:	The transmitter shall be a differential pressure device. The transmitter shall be a smart microprocessor-based unit capable of square root extraction and onboard integration. The transmitter shall be capable of communication with a hand held remote transmitter interface using HART digital communication protocol over its 24 V dc loop powered two wire system. The Transmitter shall be available in adjustable ranges from 5 inch wc to 2000 psi. Static pressure rating shall be 2000 psig or greater. External adjustable zero and span shall be provided, adjustable over a 400:1 range or greater. Volumetric displacement at maximum span shall not exceed 0.01 cubic inch. Fill fluid shall be silicone oil. Adjustable damping shall be provided. Transmitter shall have a digital indication of process measurement in appropriate flow units on a 4-1/2 digit LCD display. Unless otherwise specified, wetted parts shall be Type 316 stainless steel. Accuracy shall be ±0.25 percent of span. Housing shall have separate electronic assembly and wiring compartments. Temperature limits shall be -40°F to 185°F.
Manufacturer:	Rosemount3051, SMAR, LD-301, ABB or approved equal.
Special	Provide block/isolation valves three-valve manifold

Requirements:	type instrument valves, mounting brackets and accessories. Provide isolation diaphragm where necessary.

3.2.09 Flow Indicating Transmitter (PDT).

Instrument Category:	Flow
Instrument Type:	Flow Indicating Transmitter - (PDT)
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	1/2 inch NPT on 2-1/8 inch centers
Classification:	NEMA 7
Description:	Transmitter shall be a two-wire system, and measure pressure by detecting the force on an integral capacitance diaphragm capsule. Transmitter shall be capable of square root extraction. Transmitter shall be available in adjustable ranges from 5 inch wc to 6000 psi. Static pressure rating shall be 2000 psig or greater. External adjustable zero and span shall be provided, adjustable over a 5:1 range or greater. Volumetric displacement at maximum span shall not exceed 0.01 cubic inch. Fill fluid shall be silicone oil. Adjustable damping shall be provided. Transmitter shall have integral digital LCD display of process measurement in appropriate flow units. Display shall have 3-1/2 or 4-1/2 digit resolution. Unless otherwise specified, wetted parts shall be Type 316 stainless steel. Accuracy shall be ±0.25 percent of span. Housing shall have separate electronic assembly and wiring compartments. Temperature limits shall be -40°F to 185°F.
Manufacturer:	Rosemount 3051DP, SMAR LD-301, Foxboro, Honeywell or approved equal.

3.2.10 Magnetic Flow Meter.

Instrument Category:	Flow
Instrument Type:	Magnetic Flow Meter (Wafer Style)
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA into 600 ohms at 24 V dc
Process Connection:	As specified on drawings and schedules, or as required to meet the requirements of the application.
Classification:	NEMA 4, 4X for corrosive atmosphere, Provide instrument systems rated for Class 1, Division 1; or Class 1, Division 2 environment where applicable.
Description:	Flow metering system shall include a wafer style flow tube and a Transmitter. Transmitter shall include a separate converter complete with all necessary interconnecting cables. Transmitter shall be suitable for full scale flow rates from 0.3 to 33 feet per second. Provide system accuracy of 0.5 percent of indicated flow. Power supply shall be 120 volts ±10 percent, 60 Hertz ±3 Hertz.
FLOW TUBE:	Unless incompatible with process fluid or otherwise specified, flow tube shall be Teflon PFA liner molded on stainless steel punch plate assembly, wafer style body from 1/2 inch to 6 inch, ANSI 150 lb bond rating. Electrodes shall be Type 316 stainless steel or Hasteloy C standard. Provide special electrodes if application requires. Provide each meter with grounding rings, electrodes will not be acceptable. Flow tube power shall be supplied by transmitter. Flow tube shall be painted with corrosion resistant epoxy paint.
TRANSMITTER:	Transmitter shall provide 4-20 mA as specified above. Provide HART protocol communication capabilities. Span adjustments, PV signal selection, damping, flow unit selection, and all other adjustments shall be by menu selectable field communicator, or local display.

	Transmitter shall be provided with an integral indicator with LED or LCD display. The transmitter shall allow for the selection of percent of span, flow rate, or totalization.
Manufacturer(s):	Krohne, ABB, or approved equal
Special Requirements:	The Contractor is responsible for sizing flow tube and selecting materials to be compatible with the process.

3.2.11 Transmitter.

Instrument Category:	Flow
Instrument Type:	Transmitter
Power Supply:	As Required
Signal Input:	As Required
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	N/A
Description:	The Contractor shall determine and provide transmitter or conversion module compatible with existing primary elements to provide scalable 4-20 mA output in engineering units. Transmitter shall conform to the classification of the area in which it shall be located. Existing instruments and process shall remain in tact unless otherwise annotated on schedules or drawings.
Manufacturer(s):	As Required
Special Requirements:	Upon selection of appropriate instrument, the Contractor shall submit all drawings and specifications for Contracting Officer's review prior to purchase.

3.2.12 Flow Switch – Indicating.

Instrument Category:	Flow

Instrument Type:	Flow Switch - Indicating
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	2 Switch Contacts 15A/125 V ac SPDT Field Adjustable
Process Connection:	1/8 inch to 2 inch NPT
Classification:	NEMA 4, NEMA 4X for Corrosive Areas
Description:	Variable area flow meter with indicator and switches. Indicator and switches actuated by swinging vane in a variable area. Low flow units actuated by piston and linkage. Pressure rating of housing 150 psi minimum.
Manufacturer(s):	Gems or approved equal.
Special Requirements:	The Contractor shall size unit for flow application. Scale to be selected based on flow requirements. Note: These units to be used only in potable or secondary water applications. In lines subject to scale or other particulate an upstream strainer shall be used. The Contractor shall select and size to fit application.

3.2.13 Magnetic Flow Meter.

Instrument Category:	Flow Measurement
Instrument Type:	Magnetic Flow Meter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA dc, isolated with damping. Optional pulse or scaled frequency
Process Connection:	Mounting between ANSI, AWWA, DIN, BS Flanges; 1/10 inch to 4 inch nominal sizes
Classification:	NEMA 7

Description:	Microprocessor based with aluminum oxide (ceramic) liner and selectable electrode material. Built-in grounding electrodes. Ultra high impedance measurement circuitry. No external electrode cleaning required. Bi-polar pulsed DC coils. Low flow cut off. Minimum velocity 0.3 fps. Accuracy ±1 percent of rate from 1-33 fps. Automatic rezero.
Manufacturer(s):	Krohne, Endress & Hauser, ABB, Sparling Instruments Co. or approved equal.
Special Requirements:	The Contractor to size flow tube according to flow application. Manufacturer to provide application performance guarantee. Manufacturer to provide certified wet calibration.

3.2.14 Magnetic Flow Meter.

Instrument Category:	Flow
Instrument Type:	Magnetic Flow Meter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA dc, isolation and damping included. Optional pulsed or scale frequency output.
Process Connection:	125/150 1b. ANSI Flanges, 1/4 inch to 72 inch diameter
Classification:	NEMA 4, 4X for corrosive atmosphere
Description:	Bipolar DC pulsed coil excitation with auto zero, low flow cut off and empty pipe detection. Ultra high impedance measurement circuitry. No external electrode cleaning required. Minimum conductivity of 1 micromho/cm. Minimum velocity of 1.0 fps. Accuracy ±0.5 percent of rate. Accidental submergence proof. Operating temperature range minimum: -20° to +120°F.
Manufacturer(s):	Krohne, Endress & Hauser, ABB or approved equal.

Special Requirements:	The Contractor shall size flow tube and select liner material and electrodes according to flow application. Manufacturer to provide application performance guarantee and certified wet calibration.

3.2.15 Rotometer.

Instrument Category:	Flow
Instrument Type:	Variable Area Flow Meter (Rotometer)
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	150 # ANSI Flat Face Flange or to fit existing process piping
Classification:	NEMA 4X Meter Enclosure
Description:	Variable area flow meter unit to be straight through flow construction with PVC (Type 1, Grade 1) wetted parts (except float). Float material shall be compatible with process fluid and shall be factory sized for flow parameters of the application. Full scale, maximum flow shall be 100 percent.
Manufacturer(s):	Brooks, Wallace & Tiernan, or approved equal.
Special Requirements:	The Contractor shall provide flow material and line information for the vendor to properly size each unit for its application.

End of Section

SECTION 17530

PRESSURE AND LEVEL INSTRUMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of instrumentation equipment required for Master Specification Section 17100, Computer Control System, as indicated on the drawings and as required.

Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedule drawings; as indicated on the instrument device schedules attached to Master Specification Section 17500, Instrumentation General Requirements, or as required.

1.2 GENERAL. Contractor shall select the equipment furnished under this section for its superior quality and the intended performance. An Installation Contractor will install all equipment in accordance with the manufacturer's instructions. Equipment and materials used shall be subject to review and shall comply with the requirements specified in Master Specification Section 17500, Instrumentation General Requirements.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 INDIVIDUAL DEVICE SPECIFICATIONS. Individual instruments and related devices shall be provided as specified herein, and as required.

PART 3 - EXECUTION

3.1 INSTRUMENTATION INSTALLATION REQUIREMENTS. Instrumentation installation requirements shall be as specified in Master Specification Section 17500, Instrumentation General Requirements.

3.2 PRESSURE AND LEVEL INSTRUMENT SPECIFICATIONS. The following pressure and level instrument specifications shall be followed:

3.2.01 Bubbler Assembly.

Instrument Category:	Level
Instrument Type:	Bubbler Assembly
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	N/A
Classification:	N/A
Description:	Air Purge Rotameter Assembly: Air purge rotameter assembly shall consist of a constant-differential relay, needle valve, check valve and 0.2 to 2.0 standard cubic feet per hour (scfh) rotameter. High Pressure Purge Valve: Valve shall be a 3/8 inch, three-way, three-position solenoid valve with Type 316 stainless steel body and ball and teflon seats. In the "normal" position, back pressure from the bubble pipe shall be passed to the pressure instrument. In the "bleed" position, all ports shall be sealed. In the purge position, the instrument port shall be sealed and air sent to the bubble pipe. Nameplates shall be provided to define each position. Nameplates shall have black baked enamel letters on anodized aluminum plate. Bubble Pipe: Bubble pipe shall be 3/4 inch, Schedule 80, PVC. Bubble pipe shall be provided with two pipe tees at the top for connection of air purge supply line and static line. Top opening shall be provided with threaded plug for rodding out the bubble pipe. The bottom end of the bubble pipe shall be notched approximately 3/4 inch deep by 1/2 inch wide.
Manufacturer(s):	Conoflow, Model DH21-12 Rotometer, Conant or equal three-way valve. or approved equal
Special Requirements:	N/A

3.2.02 Level Sensor with Temperature Compensation.

Instrument Category:	Level
Instrument Type:	Level Sensor w/Temperature Compensation
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	N/A
Description:	The unit shall consist of a submersible level sensor/transmitter utilizing silicon piezoresistive sensing technology. The sensor head shall be a non-clogging design constructed of 316 stainless steel. The sensor assembly shall be oil filled with a stainless steel diaphragm isolating the sensor from the process media.
Manufacturer:	Ametek Model 575, Druck, or approved equal.
Special Requirements:	The Contractor shall provided stilling pipes or wells for mounting and protection of the sensor based on the application and manufacturer’s recommendations. The Contractor shall select the proper sensing range and cable length, and shall mount the sensor such that it may be easily removed from the process for maintenance.

3.2.03 Level Indicating Transmitter (Diaphragm) .

Instrument Category:	Level
Instrument Type:	Level Indicating Transmitter (Diaphragm)
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA dc, current regulated to drive loads of 0 to 550 ohms at 23 V dc

Process Connection:	3 inch flange, Class 1500, raised face
Classification:	Explosion proof, Corrosion resistant
Description:	Transmitter shall measure level by detecting the force on a diaphragm flange mounted to the side of a vessel. Provision shall also be made for connecting an equalizing connection to the backside of the diaphragm to permit level measurement in pressurized vessels. Transmitter shall provide visual indication of percent (percent) filled on a 4-1/2 character display. Extended diaphragms shall be provided where specified to place the diaphragm flush with the interior wall of the vessel. Unless otherwise specified or incompatible with the process fluid, wetted parts shall by Type 316 stainless steel. Accuracy shall be 0.5 percent and repeatability 0.1 percent of span. Provide unit with Hart Protocol communication circuitry installed.
Manufacturer:	Rosemount 3051LT, SMAR, Endress and Hauser, ABB or approved equal.
Special Requirements:	Flange static pressure to be determined by The Contractor.

3.2.04 Level Switch (Radio Frequency).

Instrument Category:	Level
Instrument Type:	Level Switch (Radio Frequency)
	This technology may not be preferred by the Owner for some applications. In those instances, the DBM Contractor shall recommend available alternative technology in the design workshops, to the Owner for its review and acceptance.
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	Contacts as specified below
Process Connection:	3/4 inch male NPT

Classification:	N/A
Description:	Switch shall be the radio frequency admittance type resistant to buildup of material on the probe surface. Wetted materials shall be Type 316 stainless steel and Teflon unless otherwise specified. Setpoint and reset point shall be fully adjustable. Sensitivity and repeatability shall be 0.1 inch or better. Include level sensor, level control and receiver as required to provide the appropriate number of single pole double throw alarm/control contacts. Each contact shall be rated for 5 amps at 120 V ac.
Manufacturer(s):	Drexelbrook 506 Series, Endress and Hauser or approved equal.
Special Requirements:	N/A

3.2.05 Level Indicating Transmitter.

Instrument Category:	Level
Instrument Type:	Level Indicating Transmitter
	This technology may not be preferred by the Owner for some applications. In those instances, the DBM Contractor shall recommend available alternative technology in the design workshops, to the Owner for its review and acceptance.
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	3/4 inch NPT or as appropriate for the application.
Classification:	NEMA 4
Description:	Capacitance level indicating transmitter shall be a two wire unit that monitors changes in level by converting media movement on its sensing probe into a 4-20 mA analog output proportion to change

	in level. Transmitter shall provide digital indication of percent full. Operating temp shall be -40° to 75°C with ±1 percent accuracy.
Manufacturer(s):	Magnetrol Kotron, Drexelbrook Engineering Series 508, or approved equal.
Special Requirements:	Probe shall be PTFE coated or Owner approved equal. The Contractor shall determine appropriate probe length, material and configuration for each specified application.

3.2.06 Level Switch (Capacitance).

Instrument Category:	Level
Instrument Type:	Level Switch (Capacitance)
	This technology may not be preferred by the Owner for some applications. In those instances, the DBM Contractor shall recommend available alternative technology in the design workshops, to the Owner for its review and acceptance.
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	DPDT, 115 V ac, 10 A, Noninductive
Process Connection:	3/4 inch NPT
Classification:	NEMA 1 through 5 and NEMA 12. Explosion Proof for all groups Division 1 & 2 or otherwise as required to meet the requirements of the area in which the instrument is being installed.
Description:	Level Switch shall be capacitance type utilizing solid state circuitry designed to compensate for build up of conductive material on the probe. Switch electronics shall have versatility of using either rigid or flexible probe, dependant on depth of measured media. Switch design shall provide for single, dual or triple setpoints functionality, with associated zero span and differential adjustments. Ambient operating temperature range shall be -40° to 60°C.

Manufacturer:	Endress & Hauser; Drexelbrook Engineering, Series 506; Magnetrol Kotron or approved equal.
Special Requirements:	The Contractor is responsible for determining application specific options and probe length. Submit selected unit complete with all options to the Contracting Officer for review and approval.

3.2.07 Level Switch (Ultrasonic).

Instrument Category:	Level
Instrument Type:	Level Switch (Ultrasonic)
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	SPDT, 120 V ac
Process Connection:	3/4 inch NPT
Classification:	NEMA 7/9
Description:	Level Switch shall be an ultrasonic tip sensitive design with built-in signal averaging circuit to reject effects of turbulence and effervescence. Repeatability shall be not less than 0.078 inch typical. Transducer shall be 316 stainless steel with activation lengths available from 1 to 100 inch. Transducer shall operate in an environment of up to 1500 psi at -40° to 250°F. Ambient operating temperature range for electronics shall be -40° to 160°F.
Manufacturer:	Endress & Hauser; Magnetrol, Series 910 or approved equal.
Special Requirements:	The Contractor is responsible for determining activating lengths as per drawings and field surveys.

3.2.08 Level Transducer (Ultrasonic).

Instrument Category:	Level

Instrument Type:	Level Transducer (Ultrasonic)
Power Supply:	Ultrasonic Transducer
Signal Input:	Ultrasonic Transducer
Signal Output:	N/A
Process Connection:	N/A
Classification:	NEMA 4X
Description:	Transducer shall be non-contacting ultrasonic sensor compatible with specified level indicating transmitter. Transducer shall have integral temperature compensation and be constructed of Kynar with a NEMA 4X rating. Ambient operating temperature range shall be -40°F to 203°F. Maximum range shall be 100' and maximum separation of transducer from transmitter shall be 1200'.
Manufacturer:	Milltronics XPS-30, or approved equal.
Special Requirements:	To ensure compatibility, the Contractor shall supply transducer in conjunction with a Milltronics AiRanger ultrasonic level transmitter.

3.2.09 Level Inidicating Transmitter (Ultrasonic).

Instrument Category:	Level
Instrument Type:	Level Indicating Transmitter (Ultrasonic)
Power Supply:	120 V ac, 60 Hz
Signal Input:	Ultrasonic Transducer
Signal Output:	4-20 mA, 750 ohm max.
Process Connection:	N/A
Classification:	NEMA 4X
Description:	The level indicating transmitter shall be microprocessor based and compatible with the level transducer selected per Instrument Specification Sheet 17530-3.19. Transmitter shall have an LCD digital display and indicate in user selectable units. At least 4, Form C, SPDT, user programmable, alarm relays shall be supplied. Programming and calibration shall be performed by a removable, magnetically mounted, infrared coupled, handheld programmer. Accuracy shall be ±0.25 percent of range, and operating temperature range shall be -20°F to 130°F.
Manufacturer:	Milltronics AiRanger SPL, or approved equal.
Special Requirements:	To ensure compatibility, the Contractor shall supply level transmitter in conjunction with a Milltronics XPS-30 ultrasonic transducer.

3.2.10 Level Switch (Float).

Instrument Category:	Level
Instrument Type:	Level Switch (Float)
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	N/A

Process Connection:	N/A
Classification:	NEMA 4X
Description:	Level switch shall be hermetically-sealed, axially non-position sensitive mercury switch housed inside polypropylene float. Switch operating angle shall not be greater than 18 degrees activating a SPDT 15A contact. Tether length to be determined by application.
Manufacturer:	Consolidated, B & W Controls, FLYTE, Anchor Scientific or approved equal.
Special Requirements:	The Contractor shall determine tether length for each application by drawings, schedules, or field verification of operating conditions. Provide intrinsic barriers or isolation as required by area classification.

3.2.11 Level Indicating Transmitter (PDT).

Instrument Category:	Level
Instrument Type:	Level Indicating Transmitter-(PDT)
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA, current regulated to drive loads of 0 to 550 ohms at 23 volts DC
Process Connection:	1/2 inch NPT on 2-1/8 inch centers
Classification:	Explosion Proof, corrosion resistant
Description:	Transmitter shall be a smart two-wire system, and measure pressure by detecting the force on an integral capacitance diaphragm capsule. The smart transmitter shall be available in adjustable ranges from 5 inch wc to 2000 psi. Static pressure rating shall be 2000 psig or greater. External adjustable zero and span shall be provided, adjustable over a 5:1 range or greater. Volumetric displacement at maximum span shall not exceed 0.01 cubic inch.

	Fill fluid shall be silicone oil except where incompatible with the process. Adjustable damping shall be provided. Transmitter shall have integral Digital LCD Display of process measurement in appropriate engineering units. Display shall have 4-1/2 digit resolution. Unless otherwise specified, wetted parts shall be Type 316 stainless steel. Accuracy shall be ±0.25 percent of span. Housing shall have separate electronic assembly and wiring compartments. Temperature limits shall be -40°F - 185°F. Provide unit with Hart Protocol communication circuitry installed.
Manufacturer:	**Rosemount 3051 DP, SMAR**, , Endress and Hauser, ABB, Honeywell or approved equal
Special Requirements:	Provide block/isolation valves, mounting brackets and accessories. Provide an isolation diaphragm where necessary.

3.2.12 Float Type Liquid Level Switch.

Instrument Category:	Level
Instrument Type:	Float Type Liquid Level Switch
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	Two DPDT Switch Rated for 15 amp, 125 V ac
Process Connection:	1 inch NPT
Classification:	NEMA 4
Description:	Liquid level switch designed for vertical mounting in a tank or vessel. Switch mechanism is activated by magnetic field of a magnet positioned by the float. Non-magnetic barrier isolates process liquid from switch mechanism. This unit intended for use in clean liquids that will not cause fouling of hinge mechanism. Activation travel approximate 1.5 inch.
Manufacturer:	Magnetrol International Model T20 or approved equal.

Special Requirements:	The Contractor shall select proper switch based on installation application. Float placement shall be determined by activation and desired level limits.

3.2.13 Level Switch – Vibrating

Instrument Category:	Level
Instrument Type:	Level Switch - Vibrating
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	SPDT Relay - Contacts 2A at 120 Vac
Classification:	NEMA 4 (min)
Description:	Single point level switch for granular or bulk solids and powders using damped oscillation method of measurement. Materials touching media shall be 316 stainless steel unless stated otherwise. Switch must tolerate operation in vessels or silos equipped with vibrators (electronics may be mounted off vessel). Maximum operating temperature shall be 200°F. Unit shall be provided with adjustable time delay.
Manufacturer(s):	Dynatrol (Automation Products, Inc.) CL-10DJ Series, Endress & Hauser LSM-1700 Series or approved equal.
Special Requirements:	The Contractor shall be responsible for determining the correct installation requirements for each application. Special information required by the vendor shall be provided to the vendor by the Contractor.

3.2.14 Level Indicating Transmitter (Continuous).

Instrument Category:	Level
Instrument Type:	Level Indicating Transmitter (continuous)
Power Supply:	24 V dc

Signal Input:	N/A
Signal Output:	4-20 mA dc
Process Connection:	1 inch max
Classification:	NEMA 4
Description:	This level transmitter shall be a two wire transmitter that provides an adjustable 4-20 mA output proportional to the change of granular or dry bulk materials in a vessel or silo. Included shall be compensation circuitry that corrects for changes in material composition, moisture and material build up on the probe. Operating temperature shall be from -40°F to +160°F. Maximum temperature effects shall be 2 percent/100°F change. Local indication shall be provided. Span shall be adjustable from 3 feet to 200 feet (minimum). Temperature rating shall be 250°F.
Manufacturer(s):	Milltronic Multiranger or approved equal
Special Requirements:	If the sensor utilizes contact type technology, the probe assembly (sensor) shall be coated to minimize the effects of abrasion, contamination, or build-up. The Contractor shall be responsible for determining the correct instrument configuration, for each installation. Venders application/technical data forms for each measurement location shall be completed by the Contractor and submitted to the Contracting Officer for approval. A letter from the manufacturer is required for each application of this instrument. The letter will stipulate that the product selected is appropriate for the application.

3.2.15. Level Switch.

Instrument Category:	Pressure
Instrument Type:	Level switch
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	1/2 inch NPT - male
Classification:	NEMA 1 (or better)
Description:	Level switch shall be a pressure type modular unit consisting of a pressure transducer that shall be the diaphragm piston type with wetted materials as recommended by the switch manufacturers. Switch assembly shall be a hermetically sealed snap action with fully adjustable set and reset points. Setpoint shall be between 50 and 75 percent of maximum range. Switches shall be SPST or SPDT rated 5 amps at 115 volts; 2 amps at 230 volts AC. Setpoints shall be indicated on calibrated scales visible and adjustable from outside the housing. Scale accuracy shall be within 3 percent and repeatability within 1 percent of full scale. Bottom pressure connection and mounting bracket.
Manufacturer:	United Electric, Ashcroft, Automatic Switch Co., Tripoint, SOR or approved equal.
Special Requirements:	N/A

3.2.16 Differential Pressure Switch.

Instrument Category:	Pressure
Instrument Type:	Differential Pressure Switch
Power Supply:	N/A

Signal Input:	N/A
Signal Output:	DPDT switch rated for 5 AMP res. 250 Vac minimum
Process Connection:	1/4 inch NPT
Classification:	NEMA 4
Description:	Differential pressure switch for general service. Switch may be mounted in any position. Repeatability of $\pm$1 percent of full operating range. Adjustable deadband: maximum full range, minimum less than 10 percent of full operating range. Adjustments shall be external with scale. Temperature rating of unit shall be -4ºF to 140ºF minimum. 3/4 inch conduit hub to be provided.
Manufacturer:	Automatic Switch Company (Tripoint); United Electric; S.O.R. or approved equal.
Special Requirements:	The Contractor shall select proper range for application. The Contractor shall determine whether direct mounting (on process line or device) or remote mounting with tubing connections is appropriate. Selection of "wetted" part material shall be the Contractor’s responsibility.

3.2.17 Pressure/Differential Pressure Transmitter.

Instrument Category:	Pressure
Instrument Type:	Pressure/Differential Pressure Transmitter
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA dc, current regulated to drive loads of 0 to 550W at 23 V dc
Process Connection:	1/2 inch NPT on 2-1/8 inch centers
Classification:	Explosion proof, corrosion resistant
Description:	Transmitter shall be a two wire system, and

	measure pressure by detecting the force on an integral capacitance diaphragm capsule. Static pressure rating shall be 2000 psig or greater. External adjustable zero and span shall be provided, adjustable over a 5:1 range or greater. Volumetric displacement at maximum span shall not exceed 0.01 cubic inch. Fill fluid shall be silicone oil except where incompatible with the process. Adjustable damping shall be provided. Transmitter shall have integral Digital LCD Display of process measurement in appropriate engineering units. Display shall have 4-1/2 digit resolution. Unless otherwise specified or incompatible with the materials of the process, wetted parts shall be Type 316 stainless steel. Accuracy shall be ±0.25 percent of span. Housing shall have separate electronic assembly and wiring compartments. Temperature limits shall be -40°F -185°F. Provide unit with Hart Protocol communication circuitry installed.
Manufacturer:	**Rosemount 3051, SMAR,** Endress and Hauser, ABB, Honeywell, or approved equal.
Special Requirements:	Provide block/three-valve manifold isolation valves, mounting brackets and accessories. Provide isolation diaphragm where necessary.

3.2.18 Pressure Switch.

Instrument Category:	Pressure
Instrument Type:	Pressure switch
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	1/2 inch NPT - male
Classification:	NEMA 1 or as required based on environmental conditions
Description:	Pressure switch shall be a modular unit consisting

	of a pressure transducer that shall be the diaphragm piston type with wetted materials as recommended by the switch manufacturers. Switch assembly shall be a hermetically sealed snap action with fully adjustable set and reset points. Setpoint shall be between 50 and 75 percent of maximum range. Switches shall be SPST or SPDT rated 5 amps at 115 volts; 2 amps at 230 volts AC. Setpoints shall be indicated on calibrated scales visible and adjustable from outside the housing. Scale accuracy shall be within 3 percent and repeatability within 1 percent of full scale. Bottom pressure connection and mounting bracket.
Manufacturer:	Automatic Switch Co., Tripoint, SOR, United Electric or approved equal.
Special Requirements:	N/A

3.2.19 Pressure Transmitter.

Instrument Category:	Pressure
Instrument Type:	Pressure Transmitter
Power Supply:	24 V dc
Signal Input:	0-3 to 0-5000 psi (8 ranges)
Signal Output:	4-20 mA (600 ohms at 24 V dc supply)
Process Connection:	1/2 inch NPTF
Classification:	FM & CSA Explosion proof
Description:	General purpose, low cost pressure transmitter featuring all stainless steel construction. Turndown ratio, 5:1. Temperature compensation from -20°F to 180°F, relative humidity to 100 percent. Accuracy $\pm$0.25 percent of calibrated span. Fluid fill is DC 200 Silicone.
Manufacturer:	**Rosemount, SMAR,** Ametek Model 88C or approved equal.
Special	The Contractor shall select proper range to cover

Requirements:	expected operating conditions allowing adequate turndown and range adjustment. The Contractor shall confirm compatibility of 316 stainless steel with process medium.

3.2.20 Pressure Indicating Switch.

Instrument Category:	Pressure
Instrument Type:	Pressure Indicating Switch
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA, 2 Independent SPDT Relays
Process Connection:	1/4 inch Female NPT
Classification:	NEMA 4X
Description:	The pressure switch shall be electronic with at least seven selectable input ranges from 0-15 to 0-3000 psig. The pressure switch shall have at least two field selectable setpoints. The indicator shall be LCD for process indication and red and green LED for setpoints 1 and 2, user selectable. The pressure switch shall employ jumper selectable rising/falling pressure setpoint energize/de-energize in addition to fail safe mode for loss of supply power. External adjustment shall be provided for setpoint calibration, zero offset and span movement such that neither process nor supply isolation is required. The electronics and power/output terminal shall be isolated in separate compartment shielded from RFI and EMI Operating ambient temperature shall be -29 to 71°C. Temperature effect shall be 61 percent per 100°F. Zero shall be 0-40 percent of range; span 20-100 percent of range; setpoint(s) 0-100 percent of range.
Manufacturer:	United Electric, SOR EPSII or approved equal.
Special Requirements:	4-20 mA output from an analog sensor may be used.

3.2.21 Pressure Indicator.

Instrument Category:	Pressure
Instrument Type:	Pressure Indicator
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	1/2 inch NPT Bottom or back connection as applicable for installation.
Classification:	N/A
Description:	Provide 6 inch dial, stainless steel case, stainless steel polished ring, and 316 stainless steel Bourdon tube, tip and socket. Dial range calibration shall be in PSIG, INHG or FTWC of appropriate ranges. Accuracy shall be accuracy grade 2A ($\pm$0.5 percent of span). The Contractor to provide dial calibration in accordance with drawings, or Contracting Officer approved range based on field calibration.
Manufacturer:	Ashcroft, Ametek-U.S. Gauge, Marshalltown, Trerice, or approved equal.
Special Requirements:	Liquid fill required for all gauges used at process points subject to pressure pulsations or surges.

3.2.22 Pressure Indicator.

Instrument Category:	Pressure
Instrument Type:	Pressure Indicator
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	1/2 inch NPT, Bottom Connection
Classification:	General for corrosive environments

Description:	4-1/2 inch white coated dial with black scales, Turret style glass filled polypropylene, or fiberglass reinforced thermoplastic case, threaded ring front, 316 stainless steel internal movement, tube assembly, and socket. Calibration adjustment shall be provided. Safety blowout to rear of gauge shall be included. Gauge shall be made in accordance with ANSI B40.1, accuracy grade 2A (±0.5 percent of span) or better. The Contractor to provide dial calibration in accordance with drawings, or Contracting Officer approved range based on field calibration.
Manufacturer:	Ametek-U.S.Gauge, Aschroft, Marshalltown, Trerice, Wika, or approved equal
Special Requirements:	Liquid fill required for all gauges used at process points subject to pressure pulsations or surges.

3.2.23 Vacuum Switch.

Instrument Category:	Pressure
Instrument Type:	Vacuum Switch
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	DPDT, switch rated for 5 AMP res. 250 V ac minimum
Process Connection:	1/4 inch NPT
Classification:	NEMA 1 or classification compatible with environmental conditions
Description:	Vacuum switch for general service. Switch may be mounted in any position. Repeatability of ±1 percent of full operating range. Adjustable deadband: maximum full range, minimum less than 10 percent of full operating range. Adjustments shall be external with scale. Temperature rating of unit shall be -4°F to 140°F minimum. Three-fourth inch conduit hub to be provided.

Manufacturer:	Automatic Switch Company, Tripoint, United Electric or approved equal.
Special Requirements:	The Contractor shall select proper range for application. The Contractor shall determine whether direct mounting (on process line or device) or remote mounting with tubing connection is appropriate. Selection of "wetted" part material shall be the Contractor's responsibility.

End of Section

SECTION 17540

ANALYTICAL INSTRUMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of instrumentation equipment required for Master Specification Section 17100, Computer Control System, as indicated on the drawings and as required.

Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedule drawings; as indicated on the instrument device schedules attached to Master Specification Section 17500, Instrumentation General Requirements, or as required.

1.2 GENERAL. Contractor shall select the equipment furnished under this section for its superior quality and the intended performance. An Installation Contractor will install all equipment in accordance with the manufacturer's instructions. Equipment and materials used shall be subject to review and shall comply with the requirements specified in Master Specification Section 17500, Instrumentation General Requirements.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 INDIVIDUAL DEVICE SPECIFICATIONS. Individual instruments and related devices shall be provided as specified herein and as required.

PART 3 - EXECUTION

3.1 INSTRUMENTATION INSTALLATION REQUIREMENTS. Instrumentation installation requirements shall be as specified in Master Specification Section 17500, Instrumentation General Requirements.

3.2 ANALYTICAL INSTRUMENT SPECIFICATIONS. The following analytical instrument specifications shall be followed:
3.2.01 Dissolved Oxygen.

Instrument Category:	Analyzers
Instrument Type:	Dissolved oxygen
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4 to 20 mA, current regulated to drive any load between 0 and 550 ohms at 24 V dc.
Process Connection:	Immersion in process fluid
Classification:	NEMA 4 enclosure
Description:	Dissolved oxygen measuring unit shall consist of a Galvanic cell (probe) immersed in the process, a field mounted calibration unit located near the probe, and a remotely mounted indicating analyzer. The probe shall contain a motorized cleaning mechanism that continuously scrapes the electrodes during operation. The probe electrodes shall be mounted by suspension in a vertically reinforced standoff bracket provided by the manufacturer. The calibration unit shall contain a 4-1/2 inch dual-scale (0-5, 0-10 PPM) meter calibrated in process units and be housed in a NEMA 4 enclosure. The calibration unit shall be connected to the probe via a weather proof cable and quick disconnect plug/jack assembly at the probe. The analyzer shall be panel mounted with a dual-scale 4-1/2 inch panel meter. The analyzer shall be equipped with two switch selectable ranges (0-5, 0-10 PPM) and generate an isolated 4 to 20 mA dc signal linearly proportional to the measured DO over the range selected.
Manufacturer(s):	Zullig Model 76, Great Lakes Instruments, Inc., or approved equal.
Special Requirements:	The analyzer shall be powered by 120 V ac and provide all power required by the calibration unit and the probe via the manufacturer supplied cables interconnecting the three units.

3.2.02 Turbidity surface Scatter.

Instrument Category:	Analyzers
Instrument Type:	Turbidity Surface Scatter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	Selectable for 0-10 mV, 0-100 mV, 0-1V or 4-20 mA. Output span programmable over any portion of range.
Process Connection:	3/4 inch NPT, Sample, 3/4 inch NPT Drain, 1 inch NPT Overflow
Classification:	NEMA 12 Clear Industrial Plastic Enclosure
Description:	The Turbidimeter shall be a continuous-reading, on-line instrument using the nephelometric method of measurement. It shall be an EPA-Approved design utilizing a single silicon photodiode to detect 90 degrees side-scattered light. An auto-ranging digital display shall read from 0-9999 NTU. Accuracy shall be better than $\pm$5 percent from 0-2000 NTU and $\pm$10 percent from 2000-9999 NTU. Resolution shall be 0.01 NTU. Calibration shall be based on formazin, the primary turbidity standard. The Turbidimeter shall consist of two main component parts: a sample unit and a control unit.

All optical and hydraulic components shall be housed in the sample unit. The light source shall be directed on the surface of the water sample, eliminating the use of a glass window or flow cell. The sample unit shall be constructed of corrosion-resistant structural plastic. It shall be powered from the control unit and require no separate power source.

The control unit shall provide a digital LED display with four digits and automatic decimal positioning. The control unit also shall provide a linear output signal that can be programmed to span all, or any portion, of the 0-9999 NTU range.

A bubble reject circuit shall be provided to eliminate

	spikes in measurement due to transient sample conditions. Self-test diagnostics shall be provided to automatically indicate possible instrument malfunctions.
Manufacturer(s):	HACH Company Surface Scatter Turbidimeter, no equal.
Special Requirements:	Wall Mount

3.2.03 Chlorine.

Instrument Category:	Analyzers
Instrument Type:	Chlorine
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	Selectable 0-10 mV, 0-100 mV, 0-1 V, or 4-20 mA. Output span programmable over any portion of range.
Process Connection:	1/8 inch NPT Sample, 3/4 inch NPT drain
Classification:	NEMA 12 Clear Industrial Plastic Case
Description:	The Chlorine analyzer shall be a continuous reading on-line microprocessor based analyzer capable of measuring free or total residual chlorine in the range of 0 to 5 mg/l and producing an output proportional to the sample concentration of chlorine. The analysis method used shall be DPD colorimetric method. Accuracy shall be better than ±5 percent of reading or ±0.04 mg/l with a resolution of 0.01 mg/l, a repeatability of ±0.05 mg/l and a response time of 90 percent in two minutes, 100 percent in four minutes. The control unit shall provide a 3-digit LED display in mg/l.
Manufacturer(s):	HACH Company, Model CL 17, Capital Controls or approved equal.
Special Requirements:	Wall Mount

3.2.04 pH Transmitter and pH Probe.

Instrument Category:	Analyzers
Instrument Type:	pH Transmitter and pH probe
Power Supply:	120 V ac, 60 Hz
Signal Output:	4-20 mA into 1000 ohms max, 2 DPDT setpoint relays
Process Connection:	3/4 inch FNPT Inlet and Outlet
Classification:	NEMA 4X
Description:	The pH transmitter shall be a microprocessor based unit capable of receiving a signal from a compatible probe and indicating pH in a range of 0 to 14. The transmitter shall provide a 4 digit LED display that gives a selectable indication of pH, maximum reading, minimum reading, average reading, setpoint levels, and temperature. LED indicators shall display the selected mode. The unit shall be capable of calculating, storing, and displaying the minimum, maximum, and average pH reading over the previous 24 hours. All display, function and power switches shall be located on the front panel. The unit shall be housed in a NEMA 4X enclosure and shall be supplied with a signal conditioning pre-amp compatible with the specified pH probe. The pH element shall be comprised of a double junction electrode with temperature compensation, and a CPVC flow through mounting cell. The element shall be of a flat surface design, having no protruding glass bulbs, and shall incorporate both the measuring and reference electrodes built into a single CPVC body. The unit shall be supplied with 15 feet of cable for connection to a signal conditioning pre-amp.
Manufacturer:	Rosemount, Capital Controls Co. Series 9410, or approved equal

3.2.05 pH Element (Flow).

Instrument Category:	Analyzers
Instrument Type:	pH Element (Flow)
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	Compatible with pH transmitter
Process Connection:	3/4 inch FNPT Inlet and Outlet
Classification:	NEMA 4X
Description:	The pH element shall be comprised of a double junction electrode with temperature compensation, and a CPVC flow through mounting cell. The element shall be of a flat surface design, having no protruding glass bulbs, and shall incorporate both the measuring and reference electrodes built into a single CPVC body. The unit shall be supplied with 15 feet of cable for connection to a signal conditioning pre-amp.
Manufacturer:	Rosemount**,** Capital Controls Co. model #R-3973, or approved equal
Special Requirements:	To assure compatibility the pH element shall be supplied with a Capital Controls series 9410 pH indicator/transmitter, as described in Instrument Specification Sheet 17540-1.11 or respective Rosemount transmitter if Rosemount is used.

3.2.06 Chlorine Multipoint Detector/Alarm.

Instrument Category:	Analyzers
Instrument Type:	Chlorine Multipoint Detector/Alarm
Power Supply:	120 V ac, 60 Hz
Signal Input:	4-20 mA
Signal Output:	4-20 mA; 2 SPDT or 1 DPDT (user selectable) alarm relays.
Process Connection:	N/A
Classification:	NEMA 4X
Description:	The Gas Detector shall consist of one to eight sensors and one receiver. The sensor(s) shall be of a sealed solid state, electrochemical, micro-redox design, and shall be housed in a wall mounted NEMA 4X enclosure. The sensor shall receive a 18-24 V dc signal, generate 4-20 mA dc in proportion to chlorine level, provide 80 percent response in less than 30 seconds, and recover to 90 percent in less than 3 minutes. Minimum detectable concentration shall be 0.5 ppm, with an operating temperature range of -2°F to 131°F, and a maximum sensor to receiver separation of 1000 feet. The receiver shall process and display signals from 1 to 8 sensors, shall be housed in a NEMA 4X enclosure, and shall contain the following components: a power switch; LED indicators for power, ready, setpoint level, alarm level, alarm status, and malfunction; pushbutton controls for setpoint level, alarm acknowledge, alarm reset, and auto and manual scan; and an LED digital indication of sensor being scanned. The receiver shall produce a 4-20 mA signal proportional to scanned levels, and shall provide a relay contact closure when the gas level exceeds the setpoint or if a sensor malfunction occurs. Sensor scanning rate shall be adjustable via movable jumpers.
Manufacturer:	Capital Controls Co Model 1620B, Wallace & Tiernan, or approved equal.

3.2.07 Density (Solids) Indicating Transmitter.

Instrument Category:	Analytical
Instrument Type:	Density (Solids) Indicating Transmitter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA into 600 ohm max. load
Process Connection:	N/A
Classification:	NEMA 4X
Description:	The purpose of this instrument is to detect and track a sludge blanket level in a tank. The unit shall consist of an electronic control unit, measuring probe, drive mechanism and cable spool assembly. The detection method shall be a four beam, infrared sensor designed to measure the suspended solids concentration. The instrument shall track blanket depth by comparing the concentration at the probe position to an operator-adjustable concentration setpoint. The probe shall be automatically raised or lowered based on difference between setpoint and measured value until the setpoint concentration is detected. A 4-20 mA output signal shall be generated proportional to the depth at which the setpoint concentration is detected. The position of the probe shall be controlled by an AC motor driving the cable spool. The DC motor, measurement and control circuitry shall be housed in a NEMA 4X enclosure. The spool shall be constructed of PVC with a polyurethane painted steel frame. The unit shall have a digital display of level for a minimum span of 0-10 meters and an accuracy of $\pm$0.5 percent for a solids concentration of 0.1-10 g/l with auto compensation for build-up on probe.
Manufacturer:	BTG Polymetron Model SLM-3000, no equal.
Special	Units used in clarifiers with moving collector arms

Requirements:	shall have circuity that retracts the probe and holds reading during retraction. Action shall be switch initiated.

3.2.08 Combustible Toxic Gas Detector.

Instrument Category:	Analytical
Instrument Type:	Combustible Toxic Gas Detector
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 MA
Process Connection:	N/A
Classification:	Sensor shall be suitable for NEMA 7, Division 1, Class 1, Groups A, B, C, D. Transmitter shall be suitable for Class 1, Division. 1, Groups B, C, D, and Class II, Groups E, F & G. NEMA 4X Dust Tight and Water Tight.
Description:	Detector consists of a solid-state monitor and depending on the gas/application an infrared or an electrochemical gas sensor. Where alarm relays are required, Provide High, Low, and Failure relays. Setpoints of alarm relays shall be field adjustable. Provide a transmitter with an eight character alphanumeric LCD display. The Transmitter display shall indicate the following; power on status, gas concentration, alarm and fault conditions. Detector ambient operating temperature range shall be -40° to 75°C. Sensor shall be specific to the gas/condition being monitored. Two types of sensor will be acceptable. Provide Infrared sensor for Hydrocarbon gas detector. Provide Electrochemical sensor for Hydrogen Sulfide, Oxygen, Carbon Monoxide, Sulfur Dioxide, and oxides of Nitrogen. Infrared sensor shall be temperature stable over a range of -40° to 75°C. The Infrared sensor shall operate over a range of 0 to 99 percent relative humidity. Sensor housing shall be manufactured of a material

	suitable for the atmosphere in which it is installed. Where electrochemical sensors are to be used, provide electrochemical sensors that are specific to the gas being sensed. Provide electrochemical sensors that are suitable for operation in temperatures of -20° to 50°C.
Manufacturer:	Det Tronics, MSA or approved equal.
Special Requirements:	The Contractor shall wire so as to “gang” alarm output to provide single relay contact closure depicting a unified alarm condition on any area. The Contractor is responsible for determining sensor application type and front panel display calibration. Provide sensor to meet area classification as required for each location.

3.2.09 <u>Density (Solids) Indicating Transmitter</u>.

Instrument Category:	Analytical
Instrument Type:	Density (Solids) Indicating Transmitter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA into 600 ohm Max load
Process Connection:	N/A
Classification:	NEMA 4X
Description:	The unit shall determine solids concentration by measuring backscattered light from a pulsed, infrared LED source. Measuring range shall be 0.5 percent to 10 percent sludge density. Minimum accuracy shall be 2 percent of instrument span. The unit shall consist of a sensing element (see Instrument Specification Sheet 17540 1.18) and transmitter. The transmitter shall be front panel configurable via integrated keypad and LCD information display. Configuration and calibration shall be retained in non-volatile memory.
Manufacturer:	BTG Polymetron, Model HCT-3000, no equal.

Special Requirements:	Some locations will require enclosures and fittings designed for installation and operation in classified areas - rating for each area to be determined.

3.2.10 Density (Solids) Measuring Probe.

Instrument Category:	Analytical
Instrument Type:	Density (Solids) Measuring Probe
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	Compatible with BTG Model HCT-3000 density indicating transmitter (Instrument Specification Sheet 17540 1.17)
Process Connection:	2 inch NPT
Classification:	NEMA 4X w/316 stainless steel Fittings
Description:	Fiber optic sensor with special extraction assembly for ease of sensor replacement and cleaning. Model to interface with HCT-3000 transmitter.
Manufacturer:	BTG Polymetron HC-300, no equal
Special Requirements:	Probe sensitivity to be selected for each application based on sludge concentration, subject to review by the Contracting Officer. Design for installation and operation in classified areas - area rating to be determined.

3.2.11 Conductivity Analyzer.

Instrument Category:	Analytical
Instrument Type:	Conductivity Analyzer
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA into 1000 ohms max, 2 DPDT setpoint relays

Process Connection:	N/A
Classification:	NEMA 4X
Description:	The conductivity transmitter shall be a microprocessor based unit capable of receiving a signal from a compatible probe and indicating conductivity in selectable ranges of 1-10 or 10-100 uS/cm, or 0.1-1, 1-10 or 10-100 mS/cm. The transmitter shall provide a 4 digit LED display that gives a selectable indication of conductivity, maximum reading, minimum reading, average reading, and setpoint levels. LED indicators shall display the selected mode. The unit shall be capable of calculating, storing, and displaying the minimum, maximum, and average conductivity reading over the previous 24 hours. All display, function and power switches shall be located on the front panel. The unit shall be housed in a NEMA 4X enclosure and shall be supplied with a compatible conductivity probe.
Manufacturer:	Rosemount**,** Capital Controls Co. Series 9510, Great Lakes, or approved equal
Special Requirements:	The Contractor shall be responsible for proper placement of conductivity cell.

End of Section

SECTION 17550

MISCELLANEOUS INSTRUMENTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of instrumentation equipment required for Master Specification Section 17100, Computer Control System, as indicated on the drawings and as required.

Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedule drawings; as indicated on the instrument device schedules attached to Master Specification Section 17500, Instrumentation General Requirements, or as required.

1.2 GENERAL. Contractor shall select the equipment furnished under this section for its superior quality and the intended performance. An Installation Contractor will install all equipment in accordance with the manufacturer's instructions. Equipment and materials used shall be subject to review and shall comply with the requirements specified in Master Specification Section 17500, Instrumentation General Requirements.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 INDIVIDUAL DEVICE SPECIFICATIONS. Individual instruments and related devices shall be provided as specified in the Contract Documents, and as required.

PART 3 - EXECUTION

3.1 INSTRUMENTATION INSTALLATION REQUIREMENTS. Instrumentation installation requirements shall be as specified in Master Specification Section 17500, Instrumentation General Requirements.

3.2 MISCELLANEOUS INSTRUMENT SPECIFICATIONS. The following miscellaneous instrument specifications shall be followed:

3.2.01 Low Range Tachometer.

Instrument Category:	Speed
Instrument Type:	Low Range Tachometer
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	Drive Shaft
Classification:	NEMA 4
Description:	Sensing heads shall be mounted near motor shaft. The sensor body material shall be constructed from aluminum, and provided with a steel mounting bracket. The sensor shall be supplied with an integral three wire shielded conductor. The sensors shall be capable of monitoring speeds as low as 0.1 RPM. All incoming sensor leads shall be wired into terminal strips located on the signal conditioner in a wall mounted enclosure. The electronics shall provide 4-20 mA and 0-10 V dc out proportional to shaft speed. Located on the front of the enclosure shall be a digital indicator to indicate the shaft speed. Mounted on each shaft shall be a pulsar disk constructed of PVC with sixteen magnets. The disk shall mount on the shaft end and the disk shall be 1/2 inch (12.7 mm) thick.
Manufacturer:	Electro-Sensors Model 960 sensor head and standard disk with DSC-10C signal conditioner or approved equal.
Special Requirements:	The Contractor is responsible for verifying the shaft diameter.

3.2.02 Variable Speed Shaft Monitoring Transmitter.

Instrument Category:	Speed
Instrument Type:	Variable speed shaft monitoring transmitter
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	Drive Shaft
Classification:	NEMA 4 and 12
Description:	The variable speed shaft monitoring transmitter shall consist of the sensor, electronics, and pulsar wrap. The sensing head shall be mounted near each motor shaft. The sensor body material shall be constructed from aluminum and provided with a steel mounting bracket. Each sensor shall be supplied with an integral three wire shielded conductor. The electronics shall be mounted in a NEMA 12 enclosures. The incoming sensor leads shall be wired into terminal strips located in the enclosure. The electronics shall provide an output proportional to the speed. The system shall be adjustable for ranges from 20-7500 RPM. Mounted on to each shaft shall be a pulsar wrap constructed of Aluminum with sixteen magnets.
Manufacturer:	Electro-Sensors, Model DSC10CA or approved equal
Special Requirements:	The Contractor is responsible for verifying the exact shaft diameter.

3.2.03 Shaft Reverse Detector.

Instrument Category:	Speed
Instrument Type:	Shaft Reverse Detector
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	SPDT 5A Relay
Process Connection:	Pump Shaft (See Special Requirements)
Classification:	NEMA 4
Description:	The Shaft Reversal Detector shall consist of the sensor, electronics, and pickup. The sensor shall be mounted near the shaft. The sensor/electronics shall be housed in a stainless steel housing and provide an alarm condition upon not more than 1 complete reverse shaft rotation. The mounting bracket shall be constructed of stainless steel. Electrical connection to sensor/electronics shall be hand spliced with 12 inch (30.5 cm) min lead length and connected via flexible conduit to a terminal junction box. The pickup shall be mounted on the shaft. The range of operation shall be 0-5000 RPM. The construction material shall be PVC or stainless steel with operating temperature -104°F to 140°F (40°C to +60°C).
Manufacturer:	Electro-Sensors Model D100, Airpax-Tachtrol-3 or approved equal.
Special Requirements:	The Contractor is responsible for verifying the exact shaft diameter.

3.2.04 Indicating Transmitter.

Instrument Category:	Temperature
Instrument Type:	Indicating Transmitter

Power Supply:	24 V dc
Signal Input:	RTD, 200 ohm Max.
Signal Output:	4-20 mA
Process Connection:	Three-Wire, screw terminals
Classification:	NEMA 4X
Description:	Transmitter shall be manufactured using a zinc alloy condulet. The span and zero shall be field selectable. The span shall be as narrow as 180°F (100°C) to as wide as 1710°F (950°C) located between 392°F (-200°C) and 1562°F (850°C) DIN maximum of RTD's. Repeatability shall be at least ±0.4°F (±0.2°C) ±0.1 percent of span. Indicator shall be at least a 3-1/2 digit LCD integral to the transmitter housing (see special requirements. Operating range shall be -40°F to 185°F (-40°C to 85°C), 0-100 percent RH.
Manufacturer:	Wilkerson Instrument Company Inc., Model TW8300, or approved equal.
Special Requirements:	N/A

3.2.05 RTD.

Instrument Category:	Temperature
Instrument Type:	RTD
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	Thermowell-Epoxied-Screwed Eyelet
Classification:	N/A
Description:	RTD shall be a three-wire type with separate ground connection, made of platinum with a 100 ohm resistance at 25°C. The accuracy shall be at

	least ±0.1 percent. The range shall be 355°F to 500°F (-215°C to 260°C) with a repeatability of 0.2°F (0.1°C) after ten cycles over full temperature range. Insulation resistance from element to sheath shall be at least 100 megohms at 50 percent RH, 68°F (20°C), 100 V dc.
Manufacturer:	GIC Thermodynamics Inc. or approved equal.
Special Requirements:	The Contractor shall determine type of RTD connection to be used in each application. Consideration shall be given to expected in-service conditions.

3.2.06 Temperature Switch.

Instrument Category:	Temperature
Instrument Type:	Temperature Switch
Power Supply:	24 V dc
Signal Input:	0°F to 100°F (18°C to 38°C)
Signal Output:	4-20 mA
Process Connection:	1/2 inch NPT
Classification:	NEMA 4X
Description:	Provide field mounted temperature transmitter with integral indicator scaled in engineering units. The transmitter measuring element shall be a thermocouple or RTD dependent on measured variable range the element shall be enclosed in 316 stainless steel probe. The probe shall be isolated from the process by a 316 stainless steel thermowell. Transmitter shall have an accuracy/repeatability of ±0.2 percent. The electronics and indicator shall be removable modular type with zero and span adjustment.
Manufacturer:	United Electric, Automatic Switch Company (ASCO), S.O.R., Tripoint or approved equal.
Special Requirements:	The Contractor shall select proper range and mounting style to fit application. Bulb type units

shall use a thermowell of material compatible with process fluid. The Contractor shall determine insertion depth of well. Connection of bulb to well shall be 1/2 inch (1.3 cm) NPT. Connection of well to process shall be 3/4 inch (1.9 cm) NPT.

3.2.07 Temperature Transmitter.

Instrument Category:	Temperature
Instrument Type:	Temperature Transmitter
Power Supply:	24 V dc
Signal Input:	Thermocouple or RTD
Signal Output:	4-20 mA Linearized
Process Connection:	N/A
Classification:	NEMA 4X, NEMA 7
Description:	Temperature transmitter for converting a thermocouple or RTD signal to a proportional, linearized 4-20 mA Signal. Load at 24 V dc = 600 ohms. Accuracy $\pm$0.1 percent of span or better. Minimum input/output isolation = 600 V ac rms. Minimum isolation to ground 1000 V dc. Common mode rejection 120 dB min., DC-60Hz. Normal mode rejection 60 dB min. at 50/60 Hz. Ambient temperature range -40°F to 185°F) -40°C to 85°C. Temperature effect $\pm$0.01 percent of span/°F ($\pm$0.02 percent of span/°C). RFI protection shall meet SAMA standard PMC 33.1C, less than 0.5 percent of span at 10V/meter.
Manufacturer:	Rosemount, SMAR**,** Newport series 500, Transmation series 2800, Rochester Instrument Systems SC43000 series or approved equal.
Special Requirements:	Any unit applied in an area classified hazardous shall be supplied in an explosion proof enclosure.

3.2.08 Indicating Transmitter.

Instrument Category:	Temperature

Instrument Type:	Indicating Transmitter
Power Supply:	24 V dc
Signal Input:	RTD or Thermocouple
Signal Output:	4-20 mA
Process Connection:	3/4 inch NPT
Classification:	NEMA 4,7
Description:	Provide temperature system assembly that includes thermowell, RTD or thermocouple, transmitter and indicator in an integrally housed unit. Thermowell shall be standard duty straight thermowell constructed of 316SS. RTD shall be 2 wire, 100 ohm platinum sensor, spring loaded. Transmitter shall be loop powered, condolet styled providing linear 4-20 mA output accurate to 0.05 percent of span with accessible non-interacting zero and span calibration. Indicator shall be 3-1/2 active digit LCD display with field selectable scaling in appropriate engineering units.
Manufacturer:	Rosemount, SMAR**,** Moore Industries, Foxboro, or approved equal
Special Requirements:	The Contractor shall determine enclosure classification requirements and provide enclosure for required application. The Contractor shall be responsible for determining insertion length for each individual application.

3.2.09 Thermocouple Assembly.

Instrument Category:	Temperature
Instrument Type:	Thermocouple Assembly

Power Supply:	N/A
Signal Input:	N/A
Signal Output:	Millivoltage (against Std. reference junction) for type J, K, T, S per IPTS 68 calibrations
Process Connection:	1/2 inch (1.3 cm) NPT T/C assembly; 3/4 inch (1.9 cm) for thermowell
Classification:	General Purpose
Description:	Temperature element shall consist of type (J,K,T,S) consistent with application. Element shall be encased in magnesium oxide within a 1/4 inch (63 mm) swaged 316 stainless steel sheath. A 1/2 inch x 1/2 inch (1.3 x 1.3 cm) NPT nipple shall be affixed and sealed to upper end of sheath. Junction shall be ungrounded. Assembly shall be affixed to an aluminum or cast iron head complete with terminal strip and screw on cover. Cover shall be chained to head. A 3/4 inch (1.9 cm) NPT conduit opening shall be provided. Assemblies for use with thermowells shall be spring loaded to ensure positive contact between T/C element and thermowell.
Manufacturer:	Thermoelectric, GIC Thermodynamics or approved equal
Special Requirements:	The Contractor shall correctly size length of element, lagging fittings, and thermowell as required. Sheath and well material must be compatible with process fluid. Mechanical mounting and protection of directly inserted element, as necessary, shall be provided by the Contractor. Thermowell shall be provided where process cannot be shutdown to change thermocouple assembly, (e.g. tanks, filled pipes, etc.). Thermowell shall be spun or turned bar stock tapered from threaded end to tip. It shall accept 1/4 inch (63 mm) swaged element. Thermocouple assembly connection shall be 1/2 inch (1.3 cm) NPT. Process connection shall be 3/4 inch (1.9 cm) NPT with HEX wrench head.

3.2.10 RTD Assembly, 3 Wire.

Instrument Category:	Temperature
Instrument Type:	RTD Assembly, 3 wire configuration
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	Platinum resistance element calibrated to International Resistance vs. Temperature curve (DIN 43760); 100 ohm at 0°C.
Process Connection:	1/2 inch NPT RTD assembly; 3/4 inch NPT for thermowell
Classification:	General Purpose
Description:	Temperature element shall be a 100 ohm at 32°F (0°C) RTD. Element shall be encased in magnesium oxide within a 1/4 inch (63 mm) swaged 316 stainless steel sheath. A 1/2 inch x 1/2 inch (1.3 cm x 1.3 cm) NPT nipple shall be affixed and sealed to upper end of sheath. Element shall not contact sheath. Assembly shall be affixed to an aluminum or cast iron head complete with terminal strip and screw on cover. Cover shall be chained to head. A 3/4 inch (1.9 cm) NPT conduit opening shall be provided. Assemblies for use with thermowells shall be spring loaded to ensure positive contact between RTD element and thermowell.
Manufacturer:	Thermoelectric, GIC Thermodynamics or approved equal
Special Requirements:	The Contractor shall correctly size length of element, lagging fittings, and thermowell as required. Sheath and well material must be compatible with process fluid. Mechanical mounting and protection of directly inserted element, as necessary, shall be provided by the Contractor. Thermowell shall be provided where process cannot be shutdown to change RTD assembly, (e.g. tanks, filled pipes, etc.).

Thermowell shall be spun or turned bar stock tapered from threaded end to tip. It shall accept 1/4 inch (63 mm) swaged element. RTD assembly connection shall be 1/2 inch (1.3 cm) NPT. Process connection shall be 3/4 inch (1.9 cm) NPT with HEX wrench head.

3.2.11 Pinch Valve.

Instrument Category:	Valves
Instrument Type:	Pinch Valve
Power Supply:	120 V ac, 60 Hz
Signal Input:	4-20 mA
Signal Output:	N/A
Process Connection:	2 inch NPT
Classification:	N/A
Description:	Pinch valve shall employ electrically actuated control with input from a single loop controller. Valve shall be constructed of cast iron, ANSI 125. Sleeves shall be a material selected to be compatible with controlled media. An equal percent cam shall be employed in order to provide near linear control over the entire valve operating range. Positioner shall employ true feedback for accuracy. Position indicator will be provided. Limitorque or Rotork actuators will be used.
Manufacturer:	Red Valve or approved equal.
Special Requirements:	The Contractor is responsible for selecting sleeve material according to expected service conditions. The Contractor shall determine correct valve sizing for proper control in the specified application.

3.2.12 Weir Valve.

Instrument Category:	Valves
Instrument Type:	Weir Valve

Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	150 psi flanged (ANSI)
Classification:	N/A
Description:	Valve shall be weir type diaphragm, electrically actuated for on/off control. Position switches shall provide positive indication of completely closed or open status of valve. Control solenoid(s) are to be part of the furnished valve assembly. The pneumatic actuator shall be configurable for either fail open or fail closed operation. Actuator shall operate from 60 psig minimum air supply. Body of valve shall be glass reinforced, chemical resistant PVC. Diaphragm shall be chemical resistant TFE. Bonnet shall be sliding stem type compatible with the specific pneumatic actuator used. Valve assembly shall be delivered fully assembled and tested.
Manufacturer(s):	Saunders Valves, Inc. or approved equal.
Special Requirements:	The Contractor shall be responsible for selecting the proper sizing to fit the application and flow conditions. The Contractor is also responsible for ensuring correct material is chosen for chemical compatibility.

3.2.13 Butterfly Valve.

Instrument Category:	Valves
Instrument Type:	Butterfly Valve
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	150 psi flanged (ANSI)

Classification:	N/A
Description:	Valve shall be resilient seated butterfly valve for wastewater applications, electrically actuated for on/off control. Position switches shall provide positive indication of completely closed or open status of valve. Control solenoid(s) are to be part of the furnished valve assembly. The pneumatic actuator shall be configurable for either fail open or fail closed operation. Actuator shall operate from 60 psig minimum air supply. Valve body shall be cast with Epoxy coating for corrosion resistance. Wetted metal parts shall be 316 stainless steel. Valve assembly shall be delivered fully assembled and tested.
Manufacturer(s):	DeZurik, Keystone, Bray or approved equal.
Special Requirements:	The Contractor shall be responsible for selecting the correct valve size and actuator configuration for the application and flow conditions.

3.2.14 Solenoid Valve.

Instrument Category:	Valve
Instrument Type:	Solenoid Valve
Power Supply:	120 V ac, 60 Hz, 24/125 V dc
Signal Input:	N/A
Signal Output:	N/A
Process Connection:	As directed per drawings
Classification:	See Description
Description:	Solenoid shall be two way, three way or four way with piped exhaust for pipe or tubing size 1/4 inch (6.3 cm) through 2 inch (5 cm), and have Teflon seats with zero leakage. Coil operation shall be 125 V dc/120 V ac, 60Hz, Class H molded type. Panel mounted valves shall be open frame, spade terminal type. Field mounted valves for non hazardous areas shall be housed in NEMA 4x

	enclosures with not less than 18 inch (30 cm) leads. Field mounted valves in hazardous areas shall be housed in NEMA 7 enclosures with not less than 18 inch (30 cm) leads.
Manufacturer:	Automatic Switch Company, Inc. (ASCO) Red Hat, Magnetrol International, Honeywell Skinner or approved equal.
Special Requirements:	The Contractor shall determine 2, 3, or 4 way operation to provide proper operational function as per drawings, and schedules. The Contractor shall determine required coil operating voltage from existing electrical drawings. The Contractor shall make all necessary alterations to existing piping or tubing to assure correct installation and operation of the new solenoid valves.

3.2.15 Potentiometric Position Transmitter.

Instrument Category:	Miscellaneous
Instrument Type:	Potentiometric Position Transmitter
Power Supply:	12-60 V dc
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	As specified on drawings
Classification:	NEMA 4X
Description:	This two-wire transmitter shall be a rotary position transmitter enclosed in a watertight, industrial type enclosure. Unit shall be capable of 1/4 minimum to 104 maximum input turns for a proportional 4-20 mA output, with built in zero and span adjustments. Output linearity shall be within 0.5 percent full scale unit shall have optional SPDT switches when specified by drawings or application. Ambient operating temperature range shall be 32°F to 126°F (0°C to 52°C).
Manufacturer:	Jordan or approved equal.

Special Requirements:	The Contractor is required to specify input turns for each application.

3.2.16 Chlorine Container Scale.

Instrument Category:	Miscellaneous
Instrument Type:	Chlorine Container Scale
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	NEMA 4X (Display)
Description:	The scales shall be designed specifically for chlorine use, and shall incorporate electronic, stainless steel, shear beam load cells with shock isolators and overload stops. The frame shall be constructed from cold rolled steel and be coated with an acrylic urethane enamel finish. The scale shall have a low profile design, shall use integral roller trunnions, and shall have no other moving parts such as pivots or bearings. The display shall be a microprocessor based digital unit, capable of displaying gross, net and tare weights. All display functions shall be accessible from the front panel of the display. The display unit shall have RFI/EMI filtering, and provide 4-20 mA output proportional to weight.
Manufacturer:	Scale: Eagle Microsystems model C3600P, Display- Eagle Microsystems model UMC555 or equal product by Force Flow Equipment company.
Special Requirements:	To ensure compatibility, the Contractor shall ensure that the scale and display are provided by the same manufacturer.

3.2.17 Vibration Transmitter/Switch.

Instrument Category:	Miscellaneous
Instrument Type:	Vibration Transmitter/Switch
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA, and Dual Trip Switches
Process Connection:	3-1/4 inch-inch Mounting Holes
Classification:	Explosion Proof or NEMA 4X
Description:	The vibration unit shall utilize a solid state crystal that provides a 4-20 mA analog output proportional to the vibration. The unit shall also have dual trip switches for vibration alarm and trip. The unit shall have an accuracy of $\pm$10 percent with a repeatability of $\pm$2 percent. Provisions for self-test and calibration shall be provided.
Manufacturer:	Bently Nevada, PMC/BETA Model 440D-R, or approved equal.
Special Requirements:	N/A

3.2.18 Loop Signal Conditioner (Current Trip).

Instrument Category:	Miscellaneous
Instrument Type:	Loop Signal Conditioner (Current Trip)
Power Supply:	24 V dc
Signal Input:	4-20 mA
Signal Output:	Two SPDT Contacts (3 AMP Rating)
Process Connection:	N/A
Classification:	NEMA 1
Description:	The device shall be a rack mounted, current alarm, dual trip with LED alarm setpoint display and trip indication. The unit shall have a repeatability and

	deadband of 0.05 percent with upscale/downscale burn out. The operating range shall be 0°F to 140°F (-17.8°C to 60°C).
Manufacturer:	AGM, Rochester Instrument Systems (RIS), Adtech, Acromag or approved equal.
Special Requirements:	N/A

3.2.19 Proximity Switch.

Instrument Category:	Miscellaneous
Instrument Type:	Proximity Switch
Power Supply:	N/A
Signal Input:	N/A
Signal Output:	SPDT Form C Contacts 125w
Process Connection:	N/A
Classification:	Explosion Proof or NEMA 4X
Description:	The Proximity Switch shall be a magnetically actuated device housed in a 304 stainless steel enclosure. The sensing range shall be not more than 0.562 inch (14.3 mm) with 0.002 inch (0.05 mm) repeatability. The response time shall not exceed 8 ms. The ambient temperature operating range shall be -40°F to 205° F (-40°C to 121°C). Contacts shall be environmentally sealed.
Manufacturer(s):	General Equipment Manufacturers, Go Switch Series, no equal.
Special Requirements:	N/A

3.2.20 Loop Signal Conditioner (I/P).

Instrument Category:	Miscellaneous
Instrument Type:	Loop Signal Conditioner (I/P)

Power Supply:	24 V dc
Signal Input:	4-20 mA
Signal Output:	3-15 psi (0.21 to 1.05 kg/cm^2)
Process Connection:	N/A
Classification:	NEMA 1
Description:	The device shall be a rack mounted transducer with adjustable zero and span and a repeatability/deadband of 0.05 percent with upscale/downscale burn out. The ambient temperature tolerance shall be 0°F to 140°F (-17.8°C to 60°C).
Manufacturer:	Brandt, Rochester Instrument Systems (RIS), Moore Industries, or approved equal
Special Requirements:	N/A

3.2.21 Loop Signal Conditioner (R/I).

Instrument Category:	Miscellaneous
Instrument Type:	Loop Signal Conditioner (R/I)
Power Supply:	24 V dc
Signal Input:	0-1000/2000/5000 or 10,000 ohms
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	NEMA 1
Description:	The device shall be a rack mounted transducer with adjustable zero and span and a repeatability/deadband of 0.05 percent with upscale/downscale burn out. The ambient temperature tolerance shall be 0°F to 140°F (-17.8°C to 60°C).

Manufacturer:	AGM, Rochester Instrument Systems (RIS), Adtech, Acromag or approved equal.
Special Requirements:	N/A

3.2.22 Limit/Proximity Switch.

Instrument Category:	Miscellaneous
Instrument Type:	Limit/Proximity Switch
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	500 mA, Reed
Process Connection:	N/A
Classification:	NEMA 12
Description:	Limit switch shall be a 2 piece, magnetic reed operated device to provide a dry contact for sensing door/window open/close application. Ambient temperature operating range shall be -13°F to 185°F (-25°C to 85°C).
Manufacturer:	General Equipment Manufacturers, Go Switch Series, Microswitch, Square "D", Cutler-Hammer, or approved equal.
Special Requirements:	N/A

3.2.23 Humidity/Temperature.

Instrument Category:	Miscellaneous
Instrument Type:	Humidity/Temperature
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	4-20 mA

Process Connection:	N/A
Classification:	NEMA 4
Description:	Unit shall measure both humidity and temperature. Measuring range shall be 0-100 percent relative humidity with ±2 percent relative humidity accuracy over the range of 0 to 90 percent relative humidity, and ±3 percent accuracy over the range of 90 to 100 percent relative humidity at 68°F (20°C), and shall have a 90 percent response within 15 seconds. Linearity shall be better than 0.2°F (0.1°C). The unit shall be housed in an industrial type enclosure suitable for rugged environments. Ambient operating temperature range shall be -4°F to 176°F (-20° to 80°C).
Manufacturer:	Vaisala Model HMD 20/u/HMP 111 A, or approved equal.
Special Requirements:	The Contractor shall provide manufacturer approved field calibrator.

3.2.24 Weather Station.

Instrument Category:	Miscellaneous
Instrument Type:	Weather Station
Power Supply:	120 V ac, 60 Hz
Signal Input:	N/A
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	NEMA 4X

Description: The weather station shall be a complete weather monitoring system capable of measuring wind speed, wind direction, temperature, relative humidity and precipitation. The station shall be composed of sensors and electronic translator modules that provide accurate and reliable data. The translator modules shall have precise zero and span adjustments and shall output 4-20 mA for each sensor. The sensors shall have the following accuracy after conversion through the translator:

Measurement:	**Accuracy:**
Wind Direction	3°
Wind Speed	0.5 mph
Temperature	0.5°F
Relative Humidity	20 to 100 percent
Rainfall	0.01 inch or 1 percent
Barometric Pressure	±5 percent of Full Scale

Manufacturer: Met One or approved equal.

Special Requirements: N/A

The following sensors shall be provided as part of the weather station:

Wind Direction: Wind direction shall be measured with a lightweight air-foil vane and a micro-torque potentiometer. The wind direction translator shall eliminate the 0/360 degrees crossover transition by offsetting the transition when it occurs.

Wind Speed: Wind Speed shall be measured with a rotating three-cup anemometer that operates a magnetic reed switch. The translator module shall convert the switch pulses into a 4-20 mA signal representing wind speed from 0 to 100 mph. The anemometer shall be mounted on a 5 feet wing instrument arm.

Temperature: A three-element linear thermistor shall measure temperature. The sensor shall be housed in a vane aspirated radiation shield. The sensor shall measure temperature from –40° to + 120°F.

Relative Humidity: Relative humidity shall be sensed with a solid-state capacitor. A radiation shield shall be provided to house the sensor.

Precipitation: Precipitation shall be measured with a tipping-bucket rain gauge. The gauge shall tip for every 0.01 inch of rainfall. The rain gauge shall be heated for use at below freezing temperatures for measuring snowfall.

Barometric Pressure: Barometric Pressure shall be measured in inches of mercury. The sensor shall be temperature compensated.

Tower: All sensors shall be mounted per manufacturer's instructions on a tower designed for weather station instruments. Translators and power supply shall be mounted in a weatherproof cabinet. Power source shall be 120 V ac.

3.2.25 Ultrasonic Position Transmitter.

Instrument Category: Miscellaneous

Instrument Type: Ultrasonic Position Transmitter

Power Supply: 120 V ac, 60 Hz

Signal Input: N/A

Signal Output: 4-20 mA

Process Connection: N/A

Classification: NEMA 4X

Description: Provide ultrasonic position system to include ultrasonic transducer, transmitter, and target. The transducer shall contain integral temperature compensation, and be constructed seamless Tefzel material. Ambient operating temperature range shall be -40°F to 160°F. Allowable separation, transducer to transmitter, shall be at least 1200 feet.

Transmitter shall have a front panel digital display of operating parameters and process conditions in operator selectable units. Programming and

	calibration shall be by way of a removable, magnetically mounted, infrared coupled, handheld programmer.
	Target shall be field fabricated design using a metal plate capable of withstanding a harsh corrosive environment.
Manufacturer:	Milltronics HydroRanger, with STH transducer.
Special Requirements:	The Contractor shall provide units capable of interchange with other ultrasonic applications. The Contractor is responsible for fabrication and placement of targets, to ensure an accurate representative signal.

3.2.26 Rain Gauge.

Instrument Category:	Miscellaneous
Instrument Type:	Rain Gauge
Power Supply:	24 V dc
Signal Input:	N/A
Signal Output:	Pulse
Process Connection:	N/A
Classification:	N/A
Description:	Provide Tipping Bucket Type Rain Gauge that tips every 0.01 inch of accumulated precipitation. The rain gauge shall be heated to enable snowfall measurement at temperatures down to 0°F.
Manufacturer:	Met One, Inc. or approved equal
Special Requirements:	The Contractor shall determine optimum conditions for placement of rain gauge to ensure accurate measurement of rain data.

3.2.27 Signal Converter-Isolator.

Instrument Category:	Miscellaneous

Instrument Type:	Signal Converter-Isolator
Power Supply:	120/208/240 V ac 60 Hz (24 V ac optional)
Signal Input:	Choice of current or voltage
Signal Output:	Choice of current or voltage
Process Connection:	Screw terminals with access holes for testing with meter probes with cover in place
Classification:	N/A
Description:	Process signal converter-isolator with the capability to select inputs and outputs. The input or output signals may be the same signal where isolation is desired or different signals where signal conversion is required. Combinations of inputs/outputs 0-1, 0-5, 1-5, 0-20, 4-20 mA and 0-1, 0-5, 0-10, 0-15 volts. Input/Output isolation 1500 VRMS AC or DC. Linearity ±025 percent. Ambient temperature range 35-140°F (12°C to 60°C). Fused input and output protection. Common mode rejection greater than 120 dB at 60 Hz.
Manufacturer:	Love Control Corporation Model 116, or approved equal.
Special Requirements:	Surface or Snap Track (2.75 inch) mounting.

3.2.28 Position Transducer/Transmitter.

Instrument Category:	Miscellaneous
Instrument Type:	Position Transducer/Transmitter
Power Supply:	25 Volts Max ac or dc
Signal Input:	N/A
Signal Output:	4-20 mA Proportional to Cable Travel
Process Connection:	N/A
Classification:	NEMA 4

Description:	Displacement transducer for measuring linear travel of an object by means of a direct connected stainless steel cable. Resolution 0.008 percent F.S. max. (10 inch [25.4 cm] or greater travel), accuracy $\underline{+}$10 percent F.S. typical for 20 inches (50.8 cm) or greater. Sensitivity based on measurement range. Operating temperature range -20°F to 125°F (-29°C to 50.7°C) minimum. Model PT801 to be used where effective range is less than 150 inches and full exposure is required. Model PT420 may be used if protected to prevent exposure to temperatures of less than 0°F (-17.8°C) or if linear travel greater than 150 inches (381 cm) is required.
Manufacturer:	Celesco Transducer Products, Inc., or approved equal.
Special Requirements:	This instrument is part of a fabricated assembly for detecting sluice gate position and transmitting a proportional position signal (4-20 mA). Fabrication of associated equipment is responsibility of the Contractor.

3.2.29 Signal Conditioner (Summation).

Instrument Category:	Miscellaneous
Instrument Type:	Signal Conditioner (Summation)
Power Supply:	24 V dc
Signal Input:	4-20 mA
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	NEMA 4
Description:	Signal conditioner shall accept at least three Analog inputs and provide the linear sum of all inputs. Unit shall have front panel zero and span adjustment ambient operating temperature range -20°F to 180°F (-29°C to 82.3°C).

Manufacturer:	Moore Industries, Wilkerson Instruments, or approved equal.
Special Requirements:	N/A

3.2.30 Signal Conditioner (P/I).

Instrument Category:	Miscellaneous
Instrument Type:	Signal Conditioner - P/I
Power Supply:	24 V dc
Signal Input:	3-15 psi
Signal Output:	4-20 mA
Process Connection:	N/A
Classification:	NEMA 4
Description:	Signal conditioner shall accept standard Pneumatic 3 to 15 psi (0.21 to 1.05 kg/cm^2) signal and convert to a linear 4-20 mA process signal with linearity error $\leq$0.05 percent, hysteresis $\leq$0.1 percent, overload protection to at least 25 psi. Signal conditioner shall be standard DIN rail mount. Ambient operating temperature range -4°F to +140°F (-20°C to 60°C) 369and relative humidity range 0 percent to 90 percent noncondensing.
Manufacturer:	VDO Instruments, Moore Instruments Rochester Instruments (RIS) or approved equal.
Special Requirements:	N/A

End of Section

SECTION 17600

PANELS, CONSOLES, AND APPURTENANCES

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing free standing vertical panels for instruments and controls and for PLCs, filter consoles, wall mounted cabinets, control system consoles and enclosures for computer hardware and building monitoring equipment, and printer stands as indicated on the drawings and as required.

1.1.01 Control System. Master Specification Section 17500, Instrumentation General Requirements, shall apply to all equipment furnished under this section.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. When required, the General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.02 Drawings. General dimensions and arrangements are indicated on the drawings. Contractor shall be responsible for coordinating the console and enclosure sizes and arrangements to accommodate the equipment provided.

1.3 SUBMITTALS. Submittals shall be as required in Master Specification Section 01080, Project Submittals.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as required.

PART 2 - PRODUCTS

2.1 PANEL DESIGN AND FABRICATION FEATURES. All panels furnished shall conform to the requirements of NEMA ICS-6-1988. Unless indicated otherwise on the drawings, the following paragraphs describe general fabrication requirements for the PLC cabinets, instrument panels, consoles, enclosures, and subpanels.

2.1.01 Piping. Pneumatic tubing shall be 1/4 inch (63.5 cm) OD, soft annealed copper with compression fittings. Tubing and fittings shall be as specified in Master Specification Section 15020, Miscellaneous Piping and Accessories - Construction.

2.1.02 Fittings. Compression type bulkhead fittings shall be provided near the bottom or the top of the panel for all field connections. Compression nuts and sleeves shall be provided for the field connections. Indicators, recorders, controllers, and other pneumatic devices shall be provided with plugged test connections and shutoff valves for isolation.

2.1.03 Valves. All devices shall have separate air supply shutoff valves. Valves and compression fittings shall be as manufactured by Nupro, Parker Hannifin, Swagelock, Tylok, or Whitey.

2.1.04 Instrument Wiring. All internal instrument and component device wiring shall be as normally furnished by the manufacturer. Annunciator and indicating light circuits shall be minimum 16 AWG. Electronic analog circuits shall be 16 AWG twisted and shielded pairs rated not less than 300 volts. Analog circuits shall be separated from ac power circuits.

2.1.05 Power Entrance. The power entrance to each panel shall be provided with a surge protection device. Surge protectors shall be nominal 120 volts ac with a nominal clamping voltage of 200 volts. Surge protectors shall be of a nonfaulting and noninterrupting design, with a response time of not more than 5 nanoseconds. Surge protectors shall be Innovative Technology "SP-120V", Power Integrity Corporation "ZTAS", or Transtector "ACP 100 BW".

2.1.06 Power Wiring. Power distribution wiring on the line side of panel fuses shall be minimum 12 AWG. Secondary power distribution wiring and wiring for control circuits shall be minimum 14 AWG. Wiring for ac power distribution, dc power distribution, and control circuits shall have different colors and shall agree with the color-coding legend on Contractor's panel wiring diagrams. With the exception of electronic circuits, all interconnecting wiring and wiring to terminals for external connection shall be stranded copper, insulated for not less than 600 volts, with a moisture resistant and flame retardant covering rated for not less than 195°F (90°C).

2.1.07 Terminal Blocks. Terminal blocks for external connections shall be suitable for 12 AWG wire and shall be rated 30 amperes at not less than 300 volts. Terminal blocks shall be fabricated complete with marking strip, covers, and pressure connectors. Terminals shall be labeled to agree with identification shown on the supplier's submittal drawings. A terminal shall be provided for each conductor of external circuits, plus one ground for each shielded cable. Not less than 8 inches (20.5 cm) of clearance shall be provided between the terminal strips and the base of vertical panels for conduit and wiring space. Not less than 25 percent spare terminals shall be provided. Each control loop or system shall be individually fused, and all fuses or circuit breakers shall be clearly labeled and located for easy maintenance.

2.1.08 Device Tag Numbering System. All devices shall be provided with permanent identification tags. The tag numbers shall agree with the instrument device schedules and with the supplier's equipment drawings. All field-mounted transmitters and devices shall have stamped stainless steel identification tags. Panel, subpanel, and rack-mounted devices shall have laminated phenolic identification tags securely fastened to the device. Hand-lettered labels or tape labels will not be permitted.

2.1.09 Nameplates. Nameplates shall be provided on the face of the panel or on the individual device as required. Panel nameplates shall have approximate dimensions and legends, as indicated on the drawings, and shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/16 inch (5mm) high. Nameplates shall be secured firmly to the panel. Panel face nameplates do not replace the requirement for device identification tags as specified under the Device Tag Numbering System paragraph.

2.1.10 Painting. Interior and exterior surfaces of all panels shall be thoroughly cleaned and painted with rust inhibitive (universal) primer. The panel interior shall be painted white with the manufacturer's standard coating. All pits and blemishes in the exterior surface shall be filled. Exterior surfaces shall be painted with one or more finish coats of the manufacturer's standard coating. Finish coats shall have a dry film thickness of at least 4 mils (100 mm). Color samples shall be submitted to Engineer for color selection. One quart (1 liter) of paint shall be furnished with the panels for future touchup painting.

2.1.11 Factory Test. Panels shall be factory tested electrically and pneumatically by the panel fabricator before shipment.

2.2 FREESTANDING VERTICAL PANELS. The following paragraphs describe specific requirements for the freestanding vertical panels:

2.2.01 Construction. Panel construction shall be an indoor, dusttight, completely enclosed cubicle formed from steel structural members and steel plates. The base shall be formed of steel channels, with flanges extending upwards. The base shall be provided with 1/2 inch (12.5 mm) diameter holes at 12 inch (300 mm) centers so that the base can be bolted to the concrete equipment base. Welds, seams, and edges on all exposed surfaces shall be ground smooth. Suitable lifting facilities shall be provided for handling and shipment.

2.2.02 Structure. Panel structure shall be suitably braced and of sufficient strength to support all equipment mounted on or within, to withstand handling and shipment, to remain in proper alignment, and to be rigid and freestanding. Top, sides, and back shall be fabricated from USS 10 gage (3.42 mm) thick or heavier carbon steel sheets, with stationary back suitable for back to wall installation, or designed for rear access with hinged back doors as required. Doors shall not be greater than 24 inches (610 mm) wide or spaced not greater than 36 inches (915 mm) center to center as required. Rear access doors shall be fabricated from USS 14 gage (1.9 mm) thick or heavier carbon steel.

2.2.03 Panel Front. When required, the front shall be a hinged door, or doors, with mounted instruments and control devices, fabricated from USS 10 gage (3.42 mm thick) carbon steel sheet and suitably braced and supported to maintain alignment. Panels with hinged fronts shall be of sufficient width to permit door opening without interference with rear projection of flush mounted instruments.

2.2.04 Doors. Doors shall be essentially full height, having turned back edges and additional bracing to ensure rigidity and prevent sagging. Doors shall be mounted with strong, continuous, piano type hinges. Positive latches, acting from a common door handle, shall hold doors securely compressed at top, side, and bottom against rubber gaskets. Door keys shall be Master 2246.

2.2.05 Mounted Instruments. When required, the front shall be stationary, with mounted instruments and control devices, fabricated from 3/16 inch carbon steel plate. Panel fronts shall be suitably reinforced between mounting cutouts and drilling to support instruments and devices without deformation and shall be free from waves and other imperfections. When required, panel fronts shall be recessed at the base. Adjoining panel sections shall be accurately shop fitted to assure satisfactory assembly in the field.

2.2.06 Instrument Arrangement. Panel instruments and control devices shall be arranged in a logical configuration for the plant operators. The centerline of recorders shall be within 3 feet (0.9 m) and 5'-9" (1.75 m) above the base of the panel for convenient reading and chart replacement. Control switches shall be within 6 feet (1.83 m) and 2'-6" (0.25 m) above the base of the panel. Indicators may be located within 2'-6" (0.75 m) and 6'-6" (2 m) above the base of the panels. Annunciators and clocks may be mounted near the top of the panels.

2.2.07 Conduit Entrance. When required, the bottom shall be open, and components shall be arranged for external wiring conduit and piping to enter from below. When required, the top shall be provided with nominal 1 square foot (0.09 m^2) removable access plates, which may be drilled to accommodate external wiring and conduit to be installed from above.

2.2.08 Size and Arrangement. Panel dimensions and general instrument arrangement shall be as indicated on the drawings.

2.2.09 Interior Lighting. Illumination of panel interiors shall be provided by ceiling mounted lamp fixtures spaced at approximately 2'-6" (0.75 m) and near the door. Fixtures shall be 100 watt, incandescent or fluorescent tube type, with a common "On-Off" switch near each end door. Duplex-GFIC receptacles shall be provided for service and maintenance tools at spacing not greater than 5 feet (1.5 m) throughout the length of a panel. The lighting and receptacle circuit shall be fused separately from the instrumentation systems.

2.3 FILTER CONSOLES. The following paragraphs describe specific requirements for the filter consoles:

2.3.01 Construction. When required, each filter console shall be fabricated from structural steel members and USS 10 gage (3.42 mm) thick carbon steel sheet to provide a rigid and freestanding structure of sufficient strength to support all equipment, withstand handling and shipment, and maintain alignment. All exposed welds, seams, or edges shall be ground smooth. Edges shall be slightly rounded.

When required, fiberglass reinforced plastic filter consoles will also be acceptable. Consoles shall be constructed from fiberglass reinforced polyester resin laminate having a tensile strength of at least 15,000 psi (107,000 KN/m^2). Dimensions, access, and wiring shall be the same as specified herein for the steel filter consoles.

Fiberglass console wall thickness shall be at least 1/8 inch (3 mm), with instrument mounting surface thickness not less than 1/4 inch. Console bodies shall be laminated and bonded to form a one-piece unit requiring no metal strips to form mechanical seams. There shall be no exposed glass fibers. Consoles shall be painted or fabricated using pigmented resin.

2.3.02 Mounting. Consoles shall be designed for mounting directly on the filter operating floor, or on a raised concrete curb when required, with conduit entrance through a floor slab opening under the console. Consoles shall be provided with heavy channel iron bases, flanges up, so that they may be anchored to the floor.

2.3.03 Access Panels. Consoles shall have removable front access panels with flush mounted latches. Hinged rear access doors shall be provided. Latches and panel fasteners shall be easily operated by hand without the use of a screwdriver or other tool. Latches and other hardware shall be chromium-plated or stainless steel. The consoles shall be completely shop assembled, and shipped as complete units. Access panels may be fabricated from USS 14 gage (1.9 mm thick) or heavier carbon steel. Access panels shall be gasketed.

2.3.04 Size and Arrangement. Nominal console dimensions and device arrangements are indicated on the drawings. Installed console height shall not exceed 54 inches (1.35 m) from the operating floor or as required. A separately fused duplex receptacle shall be provided in each filter console for service and maintenance tools.

2.3.05 Grounding. An electrical ground conductor shall be connected to all instruments in fiberglass consoles.

2.4 WALL-MOUNTED CABINETS. Cabinets, which contain the system components indicated on the drawings, shall be NEMA Type 12, 3R, 4, or 4X enclosures as required, suitable for wall mounting. The enclosures shall be fabricated from USS 14 gage (1.9 mm) thick, or heavier, carbon steel, stainless steel, or fiberglass as required. Cabinets shall be equipped with full size gasketed doors with hinges and a chromium-plated or stainless steel three-point latch. A screened vent shall be provided in the bottom of enclosures that contain pneumatic devices.

All wall-mounted cabinets shall meet the requirements of the panel fabrication paragraph of this section.

Outdoor cabinets shall be provided with sunshades as indicated on the drawings and as required.

2.5 WALL MOUNTED INSTRUMENT SUBPANELS. Instrument subpanels shall be constructed from 1/8 inch (3 mm) thick carbon steel and shall be reinforced and braced as required to form a rigid assembly. Panels designed for wall mounting shall have 1 inch (25 mm) turned back edges and a minimum 2 inch (50 mm) air space between the panel and the wall surface. All components on wall-mounted panels shall be mounted so as to be easily removable without requiring rear access to the subpanel.

2.6 CONTROL SYSTEM CONSOLES AND ENCLOSURES. A main control system console, printer enclosures, and printer stands shall be provided as indicated on the drawings and as required.

2.6.01 Control System Console. The control system console shall be a modular system consisting of straight, angular, and corner sections to provide an arrangement as indicated on the drawings. Console sub-structure shall consist of a welded steel frame and extruded aluminum horizontal supports. Structural arrangement shall allow connection of modular sections to produce a seamless equipment mounting enclosure.

2.6.02 Internal Wiring. Integral wireways and surge-protected receptacles shall be provided throughout the console structure. Contractor shall coordinate the receptacle spacing and number to ensure adequate power connections are available for the equipment to be located in the console. When required, Contractor shall coordinate with the CCTV, Security, Intercom, and Radio Suppliers and install receptacles as required for powering the associated equipment.

2.6.03 Equipment Mounting. Equipment mounting kits shall be provided to support the equipment items to be located in the console. This shall include, but not be limited to, operator CRTs, operator workstation computers, workstation servers, historical/data collection components, and printers. When required, kits shall be provided for closed circuit television (CCTV) equipment, security equipment, intercom equipment, and radio equipment. CRT support shelves shall be adjustable to allow CRTs of various sizes to be centered in the front panel. Central processing unit (CPU) support shelves shall be of the fixed or slideout type as required.

2.6.04 Exterior Panels. Console exterior panels shall be attached to the console structure with concealed hardware and shall be removable without the need for tools. Where indicated on the drawings, hinged access panels shall be provided. Exterior panels shall be constructed of rift cut domestic red oak veneer over composite core, plastic laminate over composite core or formed, painted metal as required.

2.6.05 Work Surface. Work surface shall be 1 inch core, with high-pressure laminate surface and backing. Work surface nosing and edge shall be solid oak, finished to match the exterior panels or shall be soft urethane with plastic laminate edges. Base trim shall be high-pressure laminate over composite core to match work surface.

2.6.06 Console Front. When required, the front surfaces of the console shall be wood veneer or plastic laminate over composite core; or shall be formed, painted metal; with window cutout sized to accommodate the CRTs provided. Hinged, glare control glass and shall be provided for access to the CRT. Continuous task lighting shall be provided along the length of the CRT mounting area valance or retractable task lights shall be provided on each end section of the console as required.

2.6.07 Color Samples. Contractor shall submit color samples for all exterior panel, work surface, equipment front, and edge surfaces to Engineer for color selection.

2.6.08 Manufacturers. The console shall be Evans Consoles, "Series 200" or Tresco.

2.6.09 Printer Enclosures. When required, printer enclosures shall be of a noise buffering type, furnished in the quantities indicated on the drawings. The printer enclosure shall be of the same general construction and finish as the control system console. The enclosure shall be provided with a hinged glass cover with pneumatic supports to hold the cover in the raised position. The enclosure shall have a support shelf with paper access slot as required for the printer provided. Under shelf storage space shall be sufficient to store a standard carton of 11x14 inch computer paper. The paper storage area shall be accessible through hinged access doors on the enclosure front.

2.6.10 Printer Stands. When required, the printer stand shall be an open shelf design, sized to support the report printer provided. The stand shall be provided with shelved storage space under the printer-mounting surface. Access to the storage space will be through lockable doors. The cabinet shall be constructed of materials to match the control system console exterior panels. Printer mounting surface height shall be approximately the same as the work surface of the control console. The printer stand shall be provided by the control console manufacturer.

2.7 CONTROL SYSTEM FURNITURE. When required a main control system desk, a control system desk, printer enclosure(s), a printer stand(s) shall be provided as indicated on the drawings.

2.7.01 Control System Desk. The control system desk shall be a freestanding desk-based system consisting of linked work surfaces on pedestals in the general arrangement indicated on the drawings. Contractor shall coordinate the types and quantities of console components required, and shall furnish and install all additional components, including supports and connecting brackets.

2.7.02 Work Surfaces. Work surfaces shall of be high-pressure plastic laminate over a high-density wood composite and shall be 1-1/4 inches (32 mm) thick, 30 inches (760 mm) wide, and of the length required. Special corner work surfaces shall be provided where required. Back panels at least 19 inches (480 mm) high shall be provided for all work surfaces. Work surface dimensions shall be coordinated with the pedestals to ensure proper stability and access to wireways. Where indicated on the drawings, work surfaces shall be provided with hinged corner access channels for wire and cables.

2.7.03 Pedestals. Pedestals shall be provided as indicated on the drawings or as required to support the work surface arrangement. Pedestals shall be of painted steel, with integral, double-walled desk drawers.

2.7.04 Internal Wiring. The console shall be provided with a concealed wireway system, mounted near the back edge of the work surface and accessible from the console back without the use of special tools. An integral power raceway system shall be provided to distribute power to the control system components. The power system shall consist of sufficient receptacles and wiring to accommodate the control system components and task lighting.

2.7.05 Task Lighting. Task lighting for work surfaces shall be installed along the back panels. Lighting shall consist of continuous track lighting or articulating lamps mounted on brackets.

2.7.06 CPU Mounting. When required mounting kits shall be provided for installing CPUs under the work surfaces. The numbers and locations of the CPUs are indicated on the drawings.

2.7.07 Color Samples. Contractor shall submit color samples for all work surfaces, back panels, and pedestals to the Engineer for color selection.

2.7.08 Manufacturers. The console shall be Allsteel "Syntrax II" or equal.

2.7.09 Printer Stands. The printer stand shall be of open shelf design, with lockable doors, sized to support the report, alarm, or color printer furnished, and with shelved storage space under the mounting surface. The control console manufacturer shall provide the printer stand.

2.7.10 Cabinet. The cabinet shall be constructed of materials to match the control system console exterior panels. Printer mounting surface shall be of approximately the same height as the work surface of the control console.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS. Installation requirements are specified in Master Specification Section 17500, Instrumentation General Requirements. In addition, equipment furnished under this section shall conform to the following manufacturing requirements.

3.1.01 Piping. All tubing shall be run in horizontal and vertical planes and shall be rigidly supported to withstand handling and shipment. Flexible polyethylene tubing shall be used to connect devices mounted on hinged doors.

3.1.02 Wiring. All wiring shall be grouped or cabled and firmly supported inside the panel. Wiring shall be bundled in groups and bound by nylon cable ties or shall be routed in Panduit or similar nonmetallic slotted ducts. Ducts shall be readily accessible within the panel with removable covers and shall have a space of at least 40 percent of the depth of the duct available for future use after installation is complete and all field wiring installed. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables.

3.1.03 More Than One Panel. Where signal or loop wiring must be routed to more than one panel or device, the required circuit routing shall be as indicated on the one-line diagrams. The panel fabricator shall provide such additional circuits as may be indicated on the electrical schematic drawings.

End of Section

SECTION 17700

UNINTERRUPTIBLE POWER SUPPLY

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of a complete on-line uninterruptible power supply (UPS) for The Computer Control System as indicated on the drawings and as required.

The system shall convert incoming single phase, 60 Hz, power into dc power, maintain and charge backup batteries and reconvert outgoing power into a sinusoidal single phase, 60 Hz, ac power source. The system shall consist of a rectifier, battery charger, batteries, inverter, and integral static bypass switch. When required, a maintenance bypass switch shall be provided such that UPS can be disconnected from power and maintenance can be performed.

Additional accessories and appurtenances shall be provided as specified herein and as required to provide a complete and properly operating system.

1.1.01 Control System. Master Specification Section 17500, Instrumentation General Requirements, shall apply to all equipment furnished under this section.

1.1.02 Control System Loads. The UPS shall supply Control System and other loads located in or external to the control room as shown on the drawings or as listed herein.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.02 General Equipment Requirements. When required, the General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment provided under this section.

1.2.03 Drawings. Supplementing this section, the drawings indicate locations and arrangement of enclosures and provide one-line diagrams regarding the connection and interaction with other equipment.

1.2.04 Nameplates. Each UPS shall be identified with a suitable engraved nameplate mounted on the top front and when required, a nameplate shall also be provided for each of the external manual bypass switches. Nameplates shall have black baked enamel letters on anodized aluminum plate. The lettering shall be bold, not less than 1/4 inch [6 mm] square.

1.3 SUBMITTALS. In addition to the requirements of Master Specification Section 17500, Instrumentation General Requirements, all material and equipment documentation shall be submitted for review in accordance with Master Specification Section 01080, Project Submittals. Each sheet of descriptive literature submitted shall be clearly marked to identify the material or equipment as follows:

Equipment and materials descriptive literature and drawings shall show the specification paragraph for which equipment applies.

Sheets or drawings showing items not applicable to this system, or not requiring review, shall contain clear indication as to which section or sections require review.

Functional line diagrams showing all major system components and external connection diagrams for all electrical equipment shall be submitted for review. A manufacturer's standard connection diagram or schematic showing more than one scheme of connection will not be accepted, unless it is clearly marked to show the intended connections.

A report certifying that the UPS will provide the required backup time at the specified UPS loading and UPS ambient temperature. The report shall include anticipated continuous electrical load calculations, backup time calculations and shall indicate the battery end-voltage used in the analysis.

1.4 DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as required.

PART 2 - PRODUCTS

2.1 GENERAL. All equipment, enclosures, and accessories shall be designed, assembled and connected in accordance with the requirements of these specifications and the drawings.

2.1.01 System Design Requirements. The UPS system shall conform to the following standards and features and other features as required:

Capacity	__._KW
Capacity, peak (minimum)	150 percent of continuous

	power rating for 10 seconds.
Frequency stability, battery mode	±0.5 percent.
Harmonic distortion (max)	5 percent.
Efficiency, overall on-line	75 percent minimum.
Operating temperature-humidity	32°F to 104°F (0°C to 40°C) 0 to 95 percent relative humidity, non-condensing.
Recharge time (max)	4 hours.
Input Voltage at 60Hz +10 – 15 percent	120 240 120/240
Output Voltage at 60Hz AC	120 120/240

2.1.02 Acceptable Manufacturers. All systems supplied under this contract shall be of the same manufacturer. The uninterruptible power supply systems shall be MGE EXL series, Powerware 9170 series, APC Symmetra, or equal.

2.1.03 Terminal Blocks. Wiring for external circuits, including all alarm contacts, shall be brought to grouped terminal blocks located for convenient connection. Provisions shall include suitable marked terminal blocks for connection of No. 12 AWG control wiring and for input/output power conductors as sized on the drawings. Terminal designations shall agree with manufacturer's wiring diagram.

2.2 BATTERY CHARGER/RECTIFIER AND BATTERIES. The battery charger and the rectifier shall have the following characteristics:

The rectifier shall convert the incoming ac power to dc power to energize the static inverter.

The battery charger shall supply a float current to the batteries to maintain them at a fully charged state while incoming power is being provided. The charging voltage shall be temperature-compensated over the entire operating temperature range to avoid overcharging or undercharging the batteries. The battery charger shall automatically apply an elevated voltage (equalization charge) to the batteries if and as required by the battery manufacturer.

The batteries shall provide backup power for the UPS when incoming commercial power is not available. The batteries shall be valve-regulated or gelled-electrolyte lead-acid type. The batteries shall be integral to the UPS; or may be externally mounted when required. Batteries shall have capacity to supply the dc power to the UPS while operating at full load for a period of not less than 4 hours at 75°F (25°C). The batteries shall have an expected life of 5 years and shall carry a one-year warranty.

2.3 STATIC INVERTER. The solid-state inverter shall employ silicon-controlled rectifiers (SCRs) and other devices for converting direct current power to essentially sinusoidal alternating current power. The static inverter shall conform to the following characteristics and requirements.

Automatic Synchronization: During normal operation, the inverter shall provide power to critical loads. The utility electric system will act as an alternate supply. Inverter equipment shall include stable solid-state devices designed to automatically maintain inverter output in phase with the utility electric system.

Overload, Short Circuit, and Load Loss: The inverter shall have input and output fuses and other equipment necessary to protect from overload, short circuit, and 100 percent loss of load. Current limiting features shall also be provided.

Loss of Supply Voltages: The inverter shall include protective devices to prevent damage resulting from excursion, loss, or restoration of its synchronization voltage and its dc input voltage and any inrush current occurrences associated with such conditions.

2.4 STATIC TRANSFER SWITCH. When required, the static transfer switch shall use SCRs and other static devices required to automatically transfer loads from the off-line (bypass) to the on-line operating condition and back again. In off-line mode, the static transfer switch shall connect clean filtered power to the load. The primary ac line shall be monitored and the load shall be transferred to the inverter if the voltage drops below 85 percent. During on-line mode operation, any inverter problem shall cause an instantaneous transfer to the bypass mode.

2.5 MAINTENANCE BYPASS SWITCH. When required, a maintenance bypass switch shall be provided so maintenance can be performed on the UPS without disrupting control system operation. The bypass switch shall be independent of the UPS electronics.

2.6 OUTPUT RECEPTACLE PANEL. An output receptacle panel with a variety of NEMA 5, 6, L5, and/or L6 receptacles shall be furnished on the rear of the UPS. The SYSTEM SUPPLIER shall coordinate the size, number, and type of the receptacles with the equipment as required or as indicated on the drawings.

2.7 CONTROL, INDICATION AND ALARM. Controls, indicators and alarms shall be provided as a part of the UPS. Control buttons and LED indicators shall be provided on the UPS panel and shall be permanently labeled.

2.7.01 Controls. A dc battery circuit breaker, a mode selector switch, and system "ON" and "OFF" buttons shall be provided.

2.7.02 Indication. A digital display for selection and indication of input, output, and battery voltages shall be provided.

LED indicators for inverter ready, frequency, battery voltage, overload, over temperature, and impending shutdown conditions shall be provided.

When required, LED indicators for bypass ready, bypass mode, and on-line mode shall be provided.

2.7.03 Remote Alarms. The UPS shall have the following provisions for remote alarms.

2.7.04 General Alarm. A common, isolated, dry, alarm contact rated 3 amperes at 120 volts ac shall be provided with the UPS for indication of general alarm. The contact shall close under any UPS fault condition.

2.7.05 Power Failure. An isolated, dry, alarm contact rated 3 amperes at 120 volts ac shall be provided with the UPS for remote indication of power failure. The contact shall open upon loss of commercial power to the UPS.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS. Installation requirements are specified in Master Specification Section 17500, Instrumentation General Requirements.

3.2 OWNER TRAINING. Contractor shall provide a qualified representative at the jobsite to train Owner's personnel in operating, maintaining, and repairing the equipment. The training shall consist of one full 4 hour session and the schedule shall be arranged and coordinated with Owner.
