C. Weldments: Exposed spot welds or other weld marks on exposed surfaces are not acceptable. Grind exposed welds smooth, and repolish to match specified and surrounding finishes.

2.3 DOORS

A. Fabricate products in accordance with industry standards and with Architects contract documents.

B. Door shall be integrally manufactured using face skins of prime stainless steel.
No cladding will be allowed.

C. All internal components, reinforcements and anchorages, shall be fabricated from
stainless steel, the same type as the face skins.

D. Fabricate in compliance with referenced standards, except where exceeded by the requirements of this specification.

E. Fabricate products with welded joints ground smooth and blend to match existing or adjacent surfaces.

F. Fabricate products with weld, bolt, tab and slot, screwed, adhesives and adhesive tape as approved in accordance with product performance to NFPA 80, HMMA 860, ASTM E152, UL10C and NSF testing as per manufacturer's documented testing approvals.

2.4 STILE & RAIL DOOR FABRICATION:

A. Door stiles and rails to be 16 gauge.

B. Door thickness to be 1 ¾ inches.

C. Door edges beveled 1/8" over 2'.

D. Stiles to be tubing type construction with 6" minimum wide faces.

E. Top Rail to be tubing type construction with 6" minimum faces.

F. Bottom Rail to be tubing type construction 10”.

G. Center Rail (if required) to be tubing type construction with 6" minimum wide face.

H. Tubes shall be joined with face welds ground and polished smooth to blend and match adjacent surfaces. Colored and some textured/patterned stainless steels will have visible hairline face miter seam.

I. All corners, joints, and intersections to be welded, ground smooth, refinished and re-polished to blend and match existing or adjacent surfaces.

2.5 REINFORCEMENT FABRICATION:

A. Reinforcements for stile and rail doors shall be the same type of stainless steel as stiles and rails. Other materials such as galvanized or cold or hot rolled steels will not be acceptable.

B: Door and Frame Reinforcements:
1. Hinge reinforcements - 1 1/4 inches wide x 10 inches long x 3/16 inch thick stainless steel.
2. Pivot reinforcements - shall be 12 gauge and as per hardware manufactures template.
3. Strike reinforcements - 14 gauge stainless steel.
4. Closer reinforcements – reinforce as required.

5. Surface hardware reinforcements - reinforce as required.

C: Weld reinforcements so no weld marks are visible on any exposed surface.

D. Vision Lite Systems: Manufacturer's standard kits consisting of glass lite moldings to accommodate glass thickness and size of vision lite indicated.

2.6 FRAMES

A. Frame Construction, General: Comply with standards referenced for doors, above.
   1. Door frames: Miter or butt trim faces and join with continuous trim face welds. Trim face welds to be ground smooth, refinished and re-polished to achieve specified finish. Miter or butt stops.

B. Frame Gage:
   1. Interior frames, 16 gage; exterior frames, 14 gage.

C. Floor Anchors.: one per jamb, minimum 14 gauge angle with two 3/16-inch diameter holes in floor clip for bolting to floor; secured to back of frame. Weld or burn marks on the exposed faces will not be acceptable.

D. Jamb Anchors in Masonry Partitions: Masonry tee anchors, minimum 16 gage with 2 inch x 10-inch legs.
   1. Up to 60 inches high: 2 jamb anchors.
   2. Over 60 up to 90 inches high: 3 jamb anchors.
   3. Over 90 up to 96 inches high: 4 jamb anchors.
   4. Over 96 inches high: 4 jamb anchors plus 1 for each 24 inches or fraction thereof over 96 inches.

   Note: Weld or burn marks on the exposed faces will not be acceptable.

E. At existing concrete and masonry partitions provide anchors suitable for the wall conditions.

F. Jamb Anchors in Stud Partitions: Zee-shaped clip, minimum 16 gage, secured to back of frame.
   1. Up to 60 inches high: 2 jamb anchors.
   2. Over 60 up to 90 inches high: 4 jamb anchors.
   3. Over 90 up to 96 inches high: 5 jamb anchors.
   4. Over 96 inches high: 5 jamb anchors plus 1 for each 24 inches or fraction thereof over 96 inches.

Note: Weld or burn marks on the exposed faces will not be acceptable.

G. Door and Frame Reinforcements for Builder’s Hardware:
   1. Hinge reinforcements: 1-1/4 inch x. 10 inches long x 3/16-inch thick, stainless steel.
   2. Strike reinforcements: 14 gage stainless steel.
   3. Closer reinforcements: gage stainless steel.
   4. Surface hardware reinforcements: gage stainless steel.
   5. Dust covers: At frame hinge preps, ¼ inch thick closed cell polyurethane foam with acrylic self-adhesive backing or minimum 22

gage stainless steel; minimum 22 gage stainless steel provided behind all other mortised hardware cutouts.
Note: Weld or burn marks on the exposed faces will not be acceptable.

H. Fabricate all components for doors and frames from stainless steel. Other types of steel, or non-stainless steel will not be acceptable.

I. Welding: Execute weldments such that no weld marks are visible on any exposed surface, Comply with AWS D9.1. Perform welding with gas tungsten arc (TIG) equipment, alloyed 308 stainless welding rods. Maintain proper welding temperature to avoid discoloring adjacent metal. Clamp components in appropriate jigs to avoid distortion and warpage. Discolored, distorted, or warped work will not be accepted.

J. Carton or crate doors to prevent damage in shipping and handling. Apply PVC film or equivalent material to protect against damage after delivery and removal from shipping crates.

PART 3 – EXECUTION

3.1 INSTALLATION

A. General: Install steel doors, frames, and accessories according to Shop Drawings, manufacturer's data, and as specified.

B. Placing Frames: Comply with provisions in SDI 105, unless otherwise indicated. Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is completed, remove temporary braces and spreaders, leaving surfaces smooth and undamaged.

1. Except for frames located in existing walls or partitions, place frames before construction of enclosing walls and ceilings.
2. In masonry construction, provide at least three wall anchors per jamb; install adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Acceptable anchors include masonry wire anchors and masonry T-shaped anchors.
3. In existing concrete or masonry construction, provide at least three completed opening anchors per jamb; install adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Set frames and secure to adjacent construction with bolts and masonry anchorage devices.
4. In metal-stud partitions, provide at least three wall anchors per jamb; install adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Attach wall anchors to studs with screws.
5. For existing gypsum board partitions, knock-down, drywall slip-on frames are acceptable.
6. Install fire-rated frames according to NFPA 80.
7. For openings 90 inches (2286 mm) or more in height, install an additional anchor at hinge and strike jambs.

C. Door Installation: Comply with ANSI A250.8. Fit hollow-metal doors accurately in frames, within clearances specified in ANSI A250.8. Shim as necessary to comply with SDI 122 and ANSI/DHI A115.1G.

1. Fire-Rated Doors: Install within clearances specified in NFPA 80.
2. Smoke-Control Doors: Install to comply with NFPA 105.

3.2 ADJUSTING AND CLEANING

A. Protection Removal: Immediately before final inspection, remove protective wrappings from doors and frames.

End of Section

SECTION 08300

OVERHEAD DOORS

PART 1 - GENERAL

1.1 SCOPE. This section includes miscellaneous overhead doors, including sectional, overhead doors, and roll-up or coiling doors and includes all accessories and appurtenances.

Location for sectional overhead doors are indicated on the drawings.

1.2 GENERAL.

1.2.01 Coordination. The anchors installed in masonry for support of overhead door section units are furnished but not installed under this section. Coordinate and schedule the installation of masonry anchors for support of overhead doors with masonry trade.

Furnish setting drawings, templates, and manufacturer's instructions for anchor installation to trades executing the work.

1.2.02 Governing Standards.

AHA (American Hardboard Association) A135.4 – Basic Hardboard.

ANSI/DASMA (Door & Access Systems Manufacturers Association) 102.

ASTM (American Society for Testing and Materials) A36/A36M – Specification for Carbon Structural Steel.

ASTM A47/A47M – Specification for Ferritic Malleable Iron Castings.

ASTM A48 – Specification for Gray Iron Casting.

ASTM A53/A53M – Pipe, Steel, Black and Hot-dipped, Zinc-coated, Welded and Seamless.

ASTM A283/A283M – Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.

ASTM A153/A153M – Specification for Zinc coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A653/A653M – Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvanized) by the Hot-Dip Process.

ASTM A666 – Specification for Annealed or Cold-Worked Austentic Stainless Steel Sheet Strip Plate and Flat bars.

ASTM A924/A924M – Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy with Improved Formability.

ASTM B209 – Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B221 – Aluminum and Aluminum-Alloy Extruded Bar, Rods, Wire, Profiles, and Tubes.

ASTM E330 – Test method for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.

AWS (American Welding Society) D1.1 – Structural Welding Code – Steel.

Fed. Spec. TT-P-25E – Printer Coating, Exterior (Undercoat for Wood, Ready-Mixed, White and Tints).

Fed Spec. TT-P-641G – Primer Coating, Zinc Dust-Zinc Oxide (for Galvanized Surfaces).

NFPA (National Fire Protection Association) 70 – National Electrical Code.

NFPA 80 – Fire Doors and Windows.

PS 1 – Construction and Industrial Plywood.

WCLB (West Coast Lumber Inspection Bureau) – Standard Grading Rules.

NEMA (National Electrical Manufacturers Association) MG 1 – Motors and

Generators.

NEMA (National Electrical Manufacturers Association) 250 – Enclosures for Electrical Equipment (1000 Volts maximum).

NEMA (National Electrical Manufacturers Association) ICS 2 – Standards for Industrial Control Devices, Controllers and Assemblies.

UL (Underwriters Laboratories, Inc.) – Building Materials Directory.

UL 325 – Building Materials Directory.

UL 325 – Door, Drapery, Gate, Louver, and Window Operators and Systems.

WH (Warnock Hersey) – Directory of Listed Products.

1.3 QUALITY ASSURANCE. Furnish overhead door units by one manufacturer for entire project for each type of overhead door specified. Perform work in accordance with ANSI A216, for sectional doors and in accordance with manufacturer's instructions for roll-up or coiling doors.

Sectional overhead doors shall comply with ANSI/DASMA 102.

For wind loading sectional overhead doors shall comply with ANSI/DASMA 102 wind loading criteria. Roll-up or coiling doors shall be designed to withstand wind/suction load of 20 psf (97.6 kg/sq m), with maximum deflection of 1/20, and without damage to door or assembly components.

Doors with motor operators shall comply with requirements of UL 325.

1.3.01 Manufacturer Qualifications. Company specializing in manufacturing products specified in this section with minimum five years experience.

1.3.02 Installer Qualifications. Company specializing in performing work of this section with minimum five years experience approved by manufacturer.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit fully dimensioned and detailed drawings showing complete installation with components, materials and finishes, and accessories indicated, including wiring diagnosis, control items and wiring.

Submit manufacturer's technical information and installation instructions to demonstrate that precuts comply with contract documents.

Submit door operation instructions and maintenance data for each door type.

1.4.02 Certifications. Manufacturer shall submit written certification, indicating doors comply with specified design criteria in ANSI/DASMA 102 for sectional overhead doors and requirements specified herein for roll-up or coiling doors and defining thermal performance.

1.4.03 Samples. Submit two door slots 12 x 12 inch (30.5 x 30.5 cm) in size illustrating shape, color and finish texture.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide products from Cornell Iron Works, Inc., Mahon Door Corp, Overhead Door Corp., Raynor Garage Doors, Wayne-Walton Corp. or an approved equal.

2.2 MATERIALS. Galvanized Steel shall be ASTM A653 or ASTM A446 Class A or commercial quality steel sheets, ASTM A526; minimum yield point, 33,000 pounds per square inch; gage as indicated.

Steel bars and structural shapes shall be hot-rolled from new billet steel complying with ASTM A36.

Galvanized coating shall be ASTM A525; minimum G90 zinc coating where indicated.

Paint shall be metal primer; Manufacturer's standard epoxy primer.

2.2.01 Steel Sectional Overhead Door. Shall be "Thermacore Insulated Steel Door" from Overhead Door Corporation or approved equal.

Wind resistance shall comply with ANSI/DASMA 102. Thermal resistance shall have R-value of 14.86. Insulation shall be polyurethane foam. Door section material shall be 20 gage (1.0 mm) galvanized steel. Door section design shall be a flush profile. Galvanized coating shall be G90, minimum. Door finish shall be manufacturer's standard baked-on epoxy primer with polyester finish coating. Color shall be selected from Manufacturer's standard color range. Interior surface shall be painted galvanized steel.

Counterbalancing mechanism shall be torsion spring type. Rollers shall be case-hardened steel single rollers installed. Standard lift vertical and horizontal tracks.

Provide head and jamb weatherstripping.

2.2.02 Components. Tracks shall be manufacturer's standard galvanized steel racks and accessories designed to accommodate door size, width and clearances indicated from adjacent construction. Provide brackets and reinforcing for rigid support of roller guides, for door type and size. Fabricate vertical track sections with slots for door drop safety device at 2 inches (5.1 cm) on center. Tilt tracks from vertical to achieve closure at jambs when sectional door is closed. Weld or bolt to track supports. Support tracks with manufacturer's standard anchors and brackets for size and weight of door, to provide strength and rigidity, and smooth and continuous operation. Provide continuous angle anchored to wall and welded to track in accordance with manufacturer's instructions.

For overhead support, provide continuous angle welded to horizontal tracks and braced laterally to overhead structural members at each end of the tracks.

Counterbalancing Mechanisms shall be tempered steel torsion springs mounted on and secured to a hardened tubular steel shaft, with cable drums attached at each end of the shaft. Cable drums shall be grooved cast aluminum or gray iron castings, wrapped with cable attached to door. Counterbalance supports shall be one ball-bearing bracket at each end of shaft and at midpoint, for shafts up to 16 feet (4.9 m) long. Provide two additional brackets at third points to support shafts over 16 feet (4.9 m) long.

Emergency doorstop shall be Spring-loaded steel or bronze cam secured to bottom door rollers at each track. To cushion doorstop, provide spring bumper attached at end of each horizontal track.

2.2.03 ELECTRIC MOTOR AND CONTROLS. Electric door operators shall be manufacturer's standard electric operator sized as indicated, complete with gear reduction mechanism and control devices.

For emergency disconnect, provide mechanism to allow transfer to manual hand chain operation, with safety device to lock out use of motor when chain is in use.

Door operator type shall be trolley or drawbar type, V-belt and roller chain primary drive.

Electric motors shall be reversible constant duty, Class A insulated motor protected against overload; with capacity to move door at rate of 2/3 foot (162.6 cm) to 1 foot (30.5 cm) per second.

Provide open drip-proof type motor, complying with NEMA MG 1 and controller with enclosure of type indicated, complying with NEMA ICS 6.

Provide control stations of type indicated complete with enclosure complying with

NEMA ICS 6.

Provide remote door control panel, with open-close-stop function for each individual door.

Provide hand held remote control unit for each door, with different signal for each door.

Automatic reversing control shall be provided through automatic safety switch that complies with UL 325, installed within neoprene or rubber astragal located along full width of door bottom. Safety switch type shall be electric; where indicated. Weather Seals shall be continuous rubber, neoprene, or flexible vinyl adjustable weatherstrip gasket at head and jambs of overhead door, for weathertight installation.

Provide manufacturer's standard vision panels of materials indicated, located where shown on the drawings.

Install vision panels in metal framed doors with manufacturer's standard dry glazing gasket.

Glazing stops shall be removable; made from door section frame material.

2.2.04 Accessories. Hardware shall be heavy duty made from noncorrosive metal and provided with noncorrosive fasteners, as required for door type.

Provide heavy steel hinges at each end and intermediate stile, of type recommended by manufacturer for size of overhead door. Thru-bolt hinges to door sections at stiles and rails using lock washers and nuts, or rivets where access to nuts is not available.

Provide heavy duty ball-bearing rollers, in steel races. Mount rollers with projections from door surface as required to suit slop of track.

Roller tires shall be type indicated; 3 inch (7.6 cm) diameter tires for 3 inch (7.6 cm) track, 2 inch (5.1 cm) diameter tires for 2 inch (5.1 cm) track; track size as recommended by door manufacturer for required door size.

2.3 MANUFACTURER AND FABRICATION.

2.3.01 Steel Door Sections. Fabricate from galvanized steel sheet, maximum 24 inch (61.0 cm) high section, nominal 2 inches deep (5.1 cm), and in profile indicated on the drawings.

Provide 16 gage (1.6 mm) galvanized steel channel end closures, and intermediate 16 gage (1.6 mm) channel reinforcing at 48 inches (1.22 m) on center, maximum along interior surface of section.

Section reinforcing shall be continuous horizontal and diagonal steel reinforcing, as necessary to comply with wind loading performance criteria. Bottom section reinforcements shall be continuous channel or angle matching section profile.

2.3.02 Door Insulation. Shall be manufacturer's standard polyurethane foam insulation. Conceal insulation with manufacturer's standard interior steel facing sheet.

2.3.03 Steel Door Finishes. Clean zinc-coated steel and apply zinc phosphate conversion coat. Use factory paint system to apply prime and finish coats to interior and exterior surfaces of door faces.

2.3.04 Roll-up or Coiling Door. Construct doors of interlocking roll-formed galvanized steel sheet slats of 20 USS gage (1.0 mm) minimum thickness, unless otherwise specified, and nominal height of 2 5/8 inches (6.7 cm). Fit bottom of door with two steel angles back to back to make contact with floor when closed.

Fit ends of alternate slats with malleable iron end locks, acting to form wearing surface in the guide and prevent lateral movement of slats. Provide doors over 16 feet (4.9 m) in width with windlocks.

Minimum thickness of slats for doors wider than 19 feet, 6 inches (5.9 m) shall be18 USS gage (1.3 m).

Guide shall be steel structural shapes not less than 3/16 inch (4.8 mm) thick and of size to retain door in place under normal conditions, fitted at top into slots cast in mouth of roller shaft brackets.

Manufacturer roller shaft form steel pipe of size and weight to prevent deflection under weight of door in excess of 0.03 inch per foot (2.5 mm per meter) of span; fitted with machined cast iron plugs; and house oil-tempered helical spring counterbalancing mechanism capable of producing sufficient torque to assure easy operation of door at any position, with spring tension adjustable by means of wheel on outside of end bracket.

Brackets shall be cast iron or steel, designed to form an end closure and support for roller and hood; have bronze journal to receive shaft bearings; bracket hub and plug at the spring end of shaft fitted with self-lubricating bronze bearings or permanently lubricated seal ball bearings.

Hood shall be of 24 USS gage (0.7 mm) galvanized steel sheet, formed to fit contour of door coil and reinforced at top and bottom edges.

Design exterior doors to resist a wind pressure of 20 psf (97.6 kg/sq m), with an allowable fiber stress of 27,000 psi (186,165 kPa). Design bottom bar to withstand specified wind pressure without exceeding a deflection of 1/120 of the span.
For exterior doors, provide slats having a flat surface, tubular shaped and filled with insulation. Doors with insulated slats: of thickness to provide a "U" value of 0.2 Btu, hour, square feet, degree F or less.

For exterior doors, provide weatherstripping at jambs and neoprene astragal at bottom of door. Fit hoods for exterior doors with neoprene baffle at top of door barrel full width of door.

Construct fire doors in accordance with UL-approved specifications. Fit the ends of each slat with malleable iron end locks. Provide automatically released flame baffle to close space between hood and roller shaft. Furnish labels or certificates for each door as follows:

> If labeled fire door is indicated, furnish the UL classification marking for hourly rating and classification of wall opening indicated. Where labeled fire door exceeds 120 square feet of area (11.15 sq m) or a maximum dimension of 12 feet (3.7 m), furnish UL certificate of inspection.
>
> If non-labeled fire door is indicated, furnish manufacturer's certification that door has been constructed in accordance with UL approved specifications.

Equip fire doors with automatic closing mechanism designed to close door and release hood flame baffle if ambient temperature reaches 160 degrees F (71.1 degrees C), control closing speed to prevent injury to personnel and impact damage to door, to hold door in closed position until mechanism is reset, and not in any way affect operation of the door in general service.

Finish for door slats shall be chemically cleaned, bonderized and given a shop coat of baked on prime paint. For other surfaces of door parts apply a shop coat of prime paint.

2.3.05 <u>Operating Equipment for Power Operated Doors</u>. Power operator components shall comply with MFPA.

Provide totally enclosed, non-ventilated, instantly reversible, ball bearing motor in standard NEMA frame, manufactured by General Electric, Howell, Westinghouse, or as approved, design to operate on 480 volts, 3 phase, 60 hertz, alternating current, to be removable without affecting manual operation or limit switch setting, and to have sufficient capacity to operate door at speed of one foot per second without exceeding a temperature rise of 131 degrees F (55 degrees C) above 104 degrees F (40 degrees C) ambient, but not less than 1/2 hp.

Provide three-button push control for power operators. Momentary pressure on the “open” button shall cause the door to travel to the full open position, stop and remain open. Constant pressure on the “close” button causes the door to travel toward the closed position. When the door is in closing motion, it stops and immediately returns to the full open position if the safely edge switch is actuated before reaching the closed-position limit switch. The door stops upon release of the “close” button, or upon reaching the closed-position limit switch. Momentary pressure on the “stop” button stops the door in any position during opening.

2.3.06 Control Equipment. Power from the electrical system to control panels shall be provided as defined in Master Specifications Division 16, Electrical.

Provide all components, including conduit, interconnecting power and control wiring, control devices and control panels, necessary for a complete and operative installation, complying with NFPA 70.

Provide controls, which operate at a voltage not to exceed 120 volts. Provide necessary control transformer, with primary and secondary overcurrent protection, with control transformer secondary effectively grounded per NFPA 70.

Provide reduction gears that operate in oil bath in an enclosed gear box.

Friction clutch shall be set to allow only slightly more power to reach the operator than is required to operate the door, designed to slip free if door becomes stalled and adjusted to cushion the starting, stopping and reversing loads.

Solenoid brake shall prevent door from coasting and hold door locked when closed.

Provide power operated doors with auxiliary hand chain operation with a device to disconnect the door from power operation, release the brake and allow manual operation in case of power failure or if motor is removed from the operator.

Control door movement by a limit switch, easily adjustable to stop in any position and enclosed in a cast iron or steel box, General Electric CR115E or G, or as approved.

Equip bottom weatherstripping astragal running full width of door with a foil-safe type safety switch, consisting of a stainless steel contact plate and phosphor-bronze coiled contact spring. Provide coil cord connection as required.

Finish exposed ferrous metal parts of operating equipment with factory applied machinery enamel.

Design operators to be bracket mounted.

Enclose each control panel in a NEMA 12 enclosure. Provide items, transformers, fuse blocks, reversing starter, reversing relays, and other electrical equipment as an integral part of the control panel and so mounted as to enable easy replacement. Mount on the door of the control panel, the selector switch for automatic or manual operation.

Provide heavy-duty type; push button stations, NEMA 12 oiltight for indoor use and NEMA 4 weatherproof for outdoor use. Locate push button stations adjacent to door as indicated or as otherwise directed.

PART 3 - EXECUTION

3.1 INSPECTION. Examine openings to receive overhead doors for conditions that will prohibit proper installation. Correct unacceptable conditions before start of installation.

3.2 PREPARATION. Prepare surfaces at openings where sectional overhead doors will be installed in accordance with manufacturer’s recommendations.

3.3 INSTALLATION. Install complete overhead door assembly in compliance with manufacturer’s instructions.

Anchor vertical tracks to rough opening perimeter at minimum 24 inches (61.0 cm) on center.

Support horizontal tracks from overhead framing with welded or bolted steel angles or channels, including diagonal bracing as necessary for secure installation.

Anchor guides to steel door frame. Furnish anchor bolts and install them or supervise their installation.

3.4 FIELD QUALITY CONTROL.

3.4.01 Inspection. After door installation is complete, examine door performance, test operation, and adjust installation to provide smooth and quiet operation. Adjust door operators for proper performance in accordance with manufacturer’s instructions.

3.5 MAINTENANCE.

3.5.01 Protection. After installation and until final acceptance, protect door, equipment, and accessories from damage, and maintain in clean condition and operating properly.

3.5.02 Cleaning. Clean all door surfaces, tracks, springs, and operators, before final acceptance.

End of Section

SECTION 08342

FIBERGLASS DOORS AND FRAMES

PART 1 – GENERAL

1.1 SCOPE. This section includes fiberglass reinforced plastic doors, frames, and light openings.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM C 365 - Standard Test Method for Flatwise Compressive Strength of Sandwich Cores.

ASTM C 518 - Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.

ASTM D 256 - Test Methods for Impact Resistance of Plastics and Electrical Insulation Materials.

ASTM D 638 - Standard Test Method for Tensile Properties of Plastics.

ASTM D 696 - Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between -30 degrees C and 30 degrees C.

ASTM D 790 - Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

ASTM D 792 - Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.

ASTM D 1622 - Standard Test Method for Apparent Density of Rigid Cellular Plastics.

ASTM D 2583 - Standard Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impressor.

ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials.

ASTM E 152 - Standard Methods of Fire Tests of Door Assemblies.

SDI 107 - Hardware on Steel Doors (Reinforcement - Application).

SDI 117 - Manufacturing Tolerances for Standard Steel Doors and Frames.

Certification Listings; Warnock Hersey.

1.3 SUBMITTALS. Submit in accordance with Section 01300.

1.3.01 Product Data.

Manufacturer's installation instructions.

Manufacturer's care and maintenance instructions.

Color charts for selection of door colors.

1.3.02 Shop Drawings. Dimensions, elevations, assembly methods, hardware reinforcement locations and preparations, wall conditions, and opening identification.

1.3.03 Samples. Submit samples representing specific construction of doors and frames required for this project.

Doors: Show stiles, core, and fiberglass-encapsulated reinforcements.

Frame: Show profile with corner joint, core, and fiberglass-encapsulated reinforcements.

1.3.04 Calculations. Submit calculations for fiberglass composite door, verifying theoretical limits of thermal warpage based upon the exposure temperature differential.

1.4 DELIVERY, STORAGE, AND HANDLING. Deliver, store, and handle doors and frames with care to prevent damage and deformation.

Identify doors and frames with the manufacturers name tag, location, door type, color, and weight.

Inspect doors and frames upon delivery for damage. Minor damage may be repaired provided refinished items are equal in all respects to new Work, and are acceptable to the Architect. Otherwise remove and replace damaged items as directed.

Store on pallets in the original carton at the job site.

1.5 WARRANTY. The manufacturer shall warrant the fiberglass reinforced plastic doors and frames:

From failure due to workmanship and materials for 5 years from date of installation.

Against corrosion failure caused by the environment specified for 10 years from date of installation.

From thermal warpage as determined by the theoretical limits for a structurally steel reinforced fiberglass composite door.

This guarantee shall not extend to failure caused by physical abuse and shall not cover costs for dismounting or reinstallation, labor, crating, or freight.

PART 2 – PRODUCTS

2.1 MANUFACTURER. Subject to compliance with requirements, provide products by one of the following:

Fenestra

Warminster Fiberglass Company

Chemproof

Or Approved Equal

2.2 FIBERGLASS DOORS. Produce doors seamlessly by molding in place all mortises, openings, recesses, pockets, and steel encapsulated reinforcements to receive finish hardware, including drilling and tapping, in accordance with finish hardware schedule and templates provided by hardware supplier.

2.2.01 Fiberglass Reinforced Plastic Doors. Thickness: 1-3/4 inches.

Height, width, and other features as indicated.

Resin transfer molded in matched metal molds to produce industrial quality doors which have a smooth finish.

Mold in one piece creating a seamless monolithic composite consisting of gel-coat, fiberglass reinforcement, polyester resin, insulating core, and internal reinforcements.

2.2.02 Exterior Surface. Gel-coat with a smooth low luster finish free from fiber pattern, roughness, or other irregularities.

Gel-coat thickness: 0.025 inch.

Resistant to moisture and ultraviolet degradation.

F.D.A. approved Gel coat.

2.2.03 Exterior Laminate. Chemically bonded with gel-coat; minimum 1/8 inch thick.

Composition: Halogenated polyester resin and continuous strand fiberglass reinforcement; minimum glass content of 25%.

Fire retardant rating (ASTM E 84): Class I.

2.2.04 Core. 1-1/2 inch thick; minimum insulating value of R-11.5.

Rigid closed cell, self-extinguishing polyisocyanurate foam; density of 1.9 pounds per cubic foot.

Perforated to form resin posts during the molding process which tie the exterior laminates together.

2.2.05 Internal Reinforcements. Provide reinforcements to SDI 107 thickness standards, and block-outs as required by templates for hardware specified in hardware section.

Combination of 1-9/16 inch thick structural end grain Balsa core, 1/8 inch thick steel flats, and 1/8 inch thick fiberglass ribs and 2 pieces of steel tubing, 1-1/2 inch x 1 inch x 14 gage by door height.

Incorporate reinforcements into the doors during the resin transfer molding process.

Provide structural Balsa core on latch side.

Provide structural Balsa core with steel flats where high stress loads are induced by surface applied hardware such as closers and surface bolts.

Provide a continuous steel flat on the hinge side for optimum screw retention for mortised or continuous hinges.

Provide vertical fiberglass rib reinforcements surrounding steel tubing stiles 6 inches from the door sides to structurally rigidize the door and limit thermal warpage to theoretically determined tolerances for specified door size. The vertical reinforcing ribs and tubing will leave an insignificant shrink line the full length on both sides of the door, which is acceptable.

2.3 FIBERGLASS FRAMES. Produce frame, jambs, and head seamlessly by molding in place all mortises, openings, recesses, pockets, and steel encapsulated reinforcements to receive finish hardware, including drilling and tapping, in accordance with finish hardware schedule and templates provided by hardware supplier.

2.3.01 Fiberglass Reinforced Plastic Frames.

5-3/4 inch jamb with a 2 inch face, 5/8 inch stop and 5/8 inch return.

Resin transfer molded in matched metal molds to produce a knocked down profile with a smooth finish.

Monolithic composite consisting of gel-coat, fiberglass reinforced laminate, structural end grain Balsa core, and internal reinforcement.

Provide mitered corners and molded pockets for corner reinforcement.

Head profile with molded corner tabs for head to jamb alignment during assembly.

During the molding process, mold in place mortises, recesses, and openings to produce a totally seamless profile.

2.3.02 Exterior Gel Coat Surface. Match gel coat of doors.

2.3.03 Exterior Laminate: Chemically bonded with gel-coat; minimum 1/8 inch thick.

Composition: Halogenated polyester resin and continuous strand fiberglass reinforcement; minimum glass content of 25%.

Fire retardant rating: Class I.

2.3.04 Structural Core. Provide ½ inch thick end grain Balsa core with a density of 8 pounds per cubic foot.

Core porosity to allow resin to penetrate the surface during molding and to develop a high strength bond between the core and laminate.

2.3.05 Internal Reinforcements. Provide reinforcements to SDI 107 gage thickness standards, and block-outs as required by templates for hardware specified in hardware section.

1/8 inch thick steel flats, totally encapsulated in the fiberglass laminate.

Incorporate steel reinforcement into the frame profile during the resin transfer molding process.

Encapsulate a continuous steel flat in the hinge side jamb profile for optimum screw retention for mortise or continuous hinges.

Reinforce head profile with steel flats located in the face and stop for surface applied hardware.

Corner reinforcement: Steel angle 0.094 inch thick x 1-1/2 inch wide x 3-1/2 inch long which slips into molded corner pockets to ensure accurate location and prevent corner separation.

2.4 Transoms and Lights. Provide transom panels where indicated.

Provide borrowed lights where indicated.

Provide side lights where indicated.

2.5 Color Selection. The selected color shall pigment both the gel-coat and exterior laminate.

Color as selected by the Architect from the manufacturer's color chart.

2.6 ANCHORS. Provide jamb anchors within 18 inches of top and bottom each frame and at 24 inches on center in between, unless otherwise required for fire-rated frames.

New Masonry: Butt mounting jamb anchors, 18 gauge flat "T" anchors to suit frame size with legs a minimum of 1 inch x 6 inch.

2.7 SOURCE QUALITY CONTROL. The manufacturer shall maintain a continuous quality control program, and upon request shall furnish to the Architect certified test results of physical properties.

Minimum physical properties of the laminate:

Tensile Strength (ASTM D 638): 9,000 PSI.

Flexural Strength (ASTM D 790): 20,000 PSI.

Barcol Hardness (ASTM D 2583): 40 Min. Average.

Impact Resistance (ASTM D 256): 12 ft-lbs/inch.

Heat Distortion Point (ASTM D 384): 175 F.

Density/Specific Gravity (ASTM D 792): 93.6 PCF/1.5.

Burning Characteristics (ASTM E 84): Flame Spread, less than 25; Smoke Density, less than 200.

Thermal Expansion (ASTM D 696): 8 x 10-6 in/in degree F.

Minimum physical properties of the urethane foam core:

Thermal Conductivity (ASTM C 518): 0.13.

Density/Specific Gravity (ASTM D 1622): 1.9 PCF/.03.

Burning Characteristics (ASTM E 84): Flame spread, less than 35; smoke density, less than 240.

Minimum physical properties of end grain Balsa core:

Thermal Conductivity (ASTM C 518): 0.45.

Density/Specific Gravity (ASTM D 1622): 9-1/2 PCF/.128.

Compressive Strength (ASTM C 365): 1870 PSI. E. Prepare tests in accordance with ASTM D 618.

PART 3 - EXECUTION

3.1 FRAME INSTALLATION. Install frames plumb, level, square, and rigidly secured in the opening.

Use field applied bottom and center spreader to maintain opening dimensions.

Fabricate spreader from lumber at least 1 inch thick and approximately as wide as frame depth.

Cut clearance notches for frame stops.

Install anchors in appropriate positions; type as indicated by construction.

After frame is installed and secure, remove spreaders, leaving surfaces smooth and undamaged.

3.2 Door Installation. Install doors plum, level, and square.

Apply hardware and adjust to achieve quiet and smooth operation.

Adjust doors to fit snugly and close without sticking or binding.

Maximum clearances:

1/8 inch at jambs and heads.

1/4 inch at meeting stiles of pairs of doors.

1/4 inch between door bottom and finished floor or threshold.

3.3 Cleaning and Protection. Wrap doors and frames after installation and keep free of paint, plaster, cement, scratches, etc.

Leave Project site clean and free of debris.

End of Section

SECTION 08410

ALUMINUM ENTRANCES AND STOREFRONTS

PART 1 – GENERAL

1.1 SCOPE. This section covers exterior aluminum entrance doors and frames, interior aluminum vestibule doors and frames, storefront framing systems, and incidental services and accessories related to completion of this work.

1.2 GENERAL.

1.2.01 Governing Standards. Products furnished under this section shall comply with the applicable requirements of the following:

ASTM (American Society of Testing and Materials) B221 – Specification for Aluminum and Aluminum Alloy Extruded Bars, Rods, Wire, Shapes and Tubes

ASTM E283 – Test Method for Determining the Rate of Air Leakage through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen

ASTM E330 – Test Method for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference

ASTM E331 – Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Differences

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer's Qualifications. Provide entrances and storefronts produced by a single manufacturer with not less than 5 years of documented experience in the fabrication of assemblies of the type and quality required.

1.3.02 Contractors Qualifications. Entrances and storefronts shall be installed by a firm that has not less than 5 years of documented experience in the installation of systems similar to those required.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit manufacturer product specifications, technical product data, standard details, and installation recommendations for each type of entrance and storefront product required. Include information on fabrication methods, finishing, hardware, and accessories.

Submit shop drawings for fabrication and installation of entrances and storefronts, including elevations, detail sections of typical composite members, hardware, mounting heights, anchorages and reinforcements, expansion provisions, and glazing details.

1.4.02 Certification. Provide certified test results showing that entrance and storefront systems have been tested by a recognized testing laboratory or agency and comply with specified performance characteristics.

1.4.03 Samples. Submit 2 samples of each type and color of aluminum finish, on 12 inch (30.5 cm) long sections of extrusions or formed shapes and on 6 inch (15.2 cm) square sheets. Where color or texture variations are anticipated, include 2 or more units in each set of samples indicating extreme limits of variations.

1.5 WARRANTY. Submit a written warranty, executed by the Contractor, Installer and Manufacturer, agreeing to repair or replace units (including reglazing) which fail in materials or workmanship within the specified warranty period. Failures include, but are not necessarily limited to, structural failures including excessive deflection, excessive leakage or air infiltration, faulty operation, and deterioration of metals, metal finishes and other materials beyond normal weathering. This warranty shall be in addition to and not a limitation of other rights the Owner may have against the Contractor under the Contract Documents.

Warranty period for aluminum entrances and storefronts is 5 years from the date of substantial completion.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS.

2.1.01 Field Measurements. Check openings by field measurement before fabrication to ensure proper fitting of work; show measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay in the work. Where necessary, proceed with fabrication without field measurements, and coordinate fabrication tolerances to ensure proper fit.

2.2 PERFORMANCE AND BASIS OF DESIGN. Drawings indicate typical sizes, spacings of members, profiles and dimensional requirements of entrance and storefront Work. Minor deviations will be accepted in order to utilize manufacturer standard products when, in the Engineer's judgment, such deviations do not materially detract from the design concept intended performances.

2.2.01 Performance Requirements. Provide aluminum entrance and storefront assemblies that comply with specified performance characteristics. Each system shall be tested by a recognized testing laboratory or agency in accordance with specified test methods. Provide certified test results.

2.2.02 Thermal Movement. Provide systems capable of withstanding thermal movements resulting from an ambient temperature range of 120 deg. F (48.9 deg. C), that could cause a metal surface temperature range of 180 deg. F (82.2 deg. C) within the framing system.

2.2.03 Wind Loading. Provide assemblies capable of withstanding a uniform pressure of 25 psf (122.0 kg/sq m) inward and 25 psf (122.0 kg/sq m) outward when tested in accordance with ASTM E 330, with deflection not to exceed 1/240.

2.2.04 Fixed Framing Transmission Characteristics. Provide aluminum entrance and storefront framing system that complies with requirements indicated for transmission characteristics.

2.2.05 Air Infiltration. Provide framing system with an air infiltration rate of not more than 0.06 cfm per sq. ft. (1.83 cu cm per sq cm) of fixed area (excluding operable door edges) when tested in accordance with ASTM E 283 at an inward test pressure differential of 6.24 psf (0.04 kg/sq m).

2.2.06 Water Penetration. Provide framing systems with no water penetration (excluding operable door edges) as defined in the test method when tested in accordance with ASTM E 331 at an inward test pressure differential of 6.24 lbf per sq ft (0.40 kg/sq m).

2.2.07 Condensation Resistance. All framing systems shall be "thermal-break" construction, with units tested for thermal performance in accordance with AAMA 1502 showing condensation resistance factor (CRF) of not less than 45.

2.2.08 Thermal Transmittance. Provide framing systems that have an overall U-value of not more than 0.65 BTU/(hr. x sq. ft. x deg. F) at 15 mph (24.1 kph) exterior wind velocity when tested in accordance with AAMA 1503.

2.2.09 Weep System. Provide system for positive drainage to exterior.

2.3 ACCEPTABLE MANUFACTURERS.

2.3.01 Frames and Stile and Rail Doors. Subject to compliance with requirements, provide products from Kawneer Company, Inc., PPG Industries, Inc., Tubelite Div., Indal Inc., Amarlite Engineerural Products, or others as approved.

2.4 MATERIALS.

2.4.01 Aluminum Members. Provide alloy and temper recommended by the manufacturer for strength, corrosion resistance, and application of required finish; comply with ASTM B 221 for extrusions and ASTM B 209 for sheet or plate.

2.4.02 Fasteners. Provide fasteners of aluminum, nonmagnetic stainless steel, or other materials warranted by the manufacturer to be noncorrosive and compatible with aluminum components, hardware, anchors and other components.

2.4.03 Reinforcement. Where fasteners screw-anchor into aluminum less than 0.125 inches (3.2 mm) thick, reinforce the interior with aluminum or nonmagnetic stainless steel to receive screw threads, or provide standard noncorrosive pressed-in splined grommet nuts.

2.4.04 Exposed Fasteners. Except where unavoidable for application of hardware, do not use exposed fasteners. For the application of hardware, use fasteners that match the finish of member or hardware being fastened. Provide Phillips flat-head machine screws for exposed fasteners.

2.4.05 Concealed Flashing. Provide 26 gage (0.55 mm) minimum dead-soft stainless steel, or 0.026 inch (0.66 mm) minimum extruded aluminum of alloy and type selected by manufacturer for compatibility with other components.

2.4.06 Brackets and Reinforcements. Where feasible, provide high-strength aluminum brackets and reinforcements; otherwise provide nonmagnetic stainless steel or hot-dip galvanized steel complying with ASTM A 386.

2.4.07 Concrete/Masonry Inserts. Provide concrete and masonry inserts fabricated from cast-iron, malleable iron, or hot-dip galvanized steel complying with ASTM A 386.

2.4.08 Compression Weatherstripping. Provide the manufacturer's standard replaceable compressible weatherstripping gaskets of molded neoprene complying with ASTM D 2000 or molded PVC complying with ASTM D 2287.

2.4.09 Sliding Weatherstripping. Provide the manufacturer's standard replaceable weatherstripping of wool, polypropylene, or nylon woven pile, with nylon fabric or aluminum strip backing, complying with AAMA 701.2.

2.4.10 Glass and Glazing Materials. Glass and glazing materials shall comply with requirements of Master Specification Section 08800, Glazing.

2.5 CONSTRUCTION. Sizes of door and frame units, and profile requirements, are indicated on drawings. Nominal dimensions are indicated, to achieve design requirements and co-ordination with other work. Significant variations shall be subject to approval.

2.5.01 Thermal-Break Construction. Fabricate storefront framing system with integrally concealed, low conductance thermal barrier, located between exterior materials and exposed interior members to eliminate direct metal-to-metal contact. Use manufacturer's standard construction that has been in use for similar projects for period of not less than 3 years.

2.5.02 Aluminum Door Frames. Fabricate tubular and channel frame assemblies, as indicated, with welded or mechanical joints in accordance with manufacturer's standards; reinforce as necessary to support required loads.

2.5.03 Stile and Rail Type Aluminum Doors. Provide tubular frame members, fabricated with mechanical joints using heavy inserted reinforcing plates and concealed tie-rods or j-bolts. Provide 1-3/4 inch (4.4 cm) thick doors of design indicated. Door stile and rail sections to be a minimum.125 inch (3.2 mm) wall thickness. Wide stile should have minimum 5 inches (12.7 cm) width. Overall width of top rail to be a minimum of 5 inches (12.7 cm). Overall width of bottom rail to be a minimum of 12 inches (30.5 cm).

Fabricate doors to facilitate replacement glass or panels, without disassembly of stiles or rails. Provide snap-on extruded aluminum glazing stops, with exterior stops anchored for non-removal.

2.6 MANUFACTURE AND FABRICATION.

2.6.01 Prefabrication. Before shipment to the project site, complete fabrication, assembly, finishing, hardware application, and other work to the greatest practicable extent. Disassemble components only as necessary for shipment and installation.

Preglaze door and frame units to greatest practicable extent at contractor option.

Do not drill and tap for surface-mounted hardware items until time of installation at project site. Coordinate with hardware supplier.

Perform fabrication operations, including cutting, fitting, forming, drilling and grinding of metal work to prevent damage to exposed finish surfaces. For hardware, perform these operations prior to application of finishes.

2.6.02 Welding. Comply with AWS recommendations; grind exposed welds smooth and restore mechanical finish.

2.6.03 Reinforcing. Install reinforcing as required for hardware and necessary for performance requirements, sag resistance and rigidity.

2.6.04 Dissimilar Metals. Separate dissimilar metals with zinc chromate primer, bituminous paint, or other separator that will prevent corrosion.

2.6.05 Continuity. Maintain accurate relation of planes and angles, with hairline fit of contacting members.

2.6.06 Uniformity of Finish. Abutting extruded aluminum members shall not have an integral color or texture variation greater than half the range indicated in the sample pair submittal.

2.6.07 Fasteners. Conceal fasteners wherever possible.

2.6.08 Weatherstripping. For exterior doors, provide compression weatherstripping against fixed stops; at other edges, provide sliding weatherstripping retained in adjustable strip mortised into door edge.

Provide EPDM or vinyl blade gasket weatherstripping in bottom door rail, adjustable for contact with threshold.

At interior doors and other locations without weatherstripping, provide neoprene silencers on stops to prevent metal-to-metal contact.

2.6.09 Natural Anodized Finish. Provide NAAMM Class 1 (non-specular as fabricated mechanical finish; chemical etch, medium matte; minimum thickness 0.7 mil (0.18 mm)) anodic coating, Clear AA-M12C22A41.

2.6.10 Hardware. Refer to Master Specification Section 08710, Finish Hardware for requirements for hardware items other than those indicated to be provided by the aluminum entrance manufacturer.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Comply with manufacturer instructions and recommendations for installation, unless higher standards are required.

Set units plumb, level, and true to line, without warp or rack of framing members, doors, or panels. Provide proper support and anchor securely in place.

Separate aluminum and other corrodible metal surfaces from sources of corrosion due to electrolytic action at points of contact with other materials. Comply with requirements specified under paragraph "Dissimilar Materials" in the Appendix to AAMA 101-85.

Drill and tap frames and doors and apply surface-mounted hardware items. Comply with hardware manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.

Set sill members and other members in bed of sealant as indicated, or with joint fillers or gaskets as indicated to provide weathertight construction.

3.1.02 Final Adjustments. Adjust operating hardware to function properly, for smooth operation without binding, and for weathertight closure.

3.1.03 Cleaning. Clean the completed system inside and out, promptly after installation, exercising care to avoid damage to coatings.

Clean glass surfaces after installation, complying with requirements contained in Master Specification Section 08800, Glass and Glazing for cleaning and maintenance. Remove excess glazing and sealant compounds, dirt and other substances from aluminum surfaces.

3.1.04 Protection. Institute protective measures required throughout the remainder of the construction period to ensure that aluminum entrances and storefronts will be without damage or deterioration, other than normal weathering, at time of acceptance.

3.2 MAINTENANCE. Submit manufacturer’s Maintenance Instructions for each type of system required.

End of Section

SECTION 08520

ALUMINUM WINDOWS

PART 1 - GENERAL

1.1 SCOPE. This section covers fixed type, stick-framed aluminum windows complete with all necessary hardware, anchors, accessories, and miscellaneous equipment as specified and indicated.

1.2 GENERAL.

1.2.01 Governing Standards.

AWS (American Welding Society) A.5.3-62 - Aluminum and Aluminum-Alloy Arc Welding Electrodes.

ASTM (American Society of Testing and Materials) A167 - Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

ASTM B221 - Standard Specification for Aluminum-Alloy Extruded Bar, Rod, Wire, Profile, and Tube.

ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM C509 - Standard Specification for Elastomeric Cellular Preformed Gasket and Sealing Material.

ASTM E283 - Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.

ASTM E330 - Test Method for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.

ASTM E331 - Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference.

FS (Federal Specifications) TT-C-494 - Coating Compound, Bituminous, Solvent Type, Acid-Resistant.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturers Qualifications. Manufacturers shall have not less than five years documented experience in manufacture of aluminum windows of the type specified.

1.3.02 Contractors Qualifications. Erector shall have not less than five years documented experience in the installation of aluminum windows of the type specified.

1.3.03 Tolerances. Dimensions shall be within ±1/16 inch (1.6 mm).

Air infiltration test shall be conducted per ASTM E283 with a maximum infiltration of 0.06 cfm per square foot (1.83 cu cm per sq cm).

Water penetration test shall be conducted per ASTM E331 with no water penetration for 15 minutes when window is subjected to rate of flow of 5 gal/hr/sq ft (244.71/hr/sq m) with differential pressure across the window unit of 6.24 psf (30.5 kg/sq m).

Wind load test shall be conducted per ASTM E330 using a minimum 60 psf (292.9 k/sq m) positive and negative load for 10 sec. with a maximum deformation of frame member 1/175 of span length and no damage to fasteners or hardware.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Shop drawings are required to show construction of all parts, metal thicknesses, installation and erection details including connections, anchorage, fastening, and sealing methods. Also show sections of typical members, dimensioned elevations, frame sizes, spacing of anchors and fasteners, and details of accessories.

Provide manufacturer’s color chart showing interior and exterior surface colors and manufacturer's recommended Installation and Maintenance Procedures.

1.4.02 Test Reports. Provide reports of source quality control tests.

1.5 DELIVERY, STORAGE, AND HANDLING. Handle windows carefully during transportation and at the job site. Store windows upright on pieces of lumber in a dry, covered location.

1.6 WARRANTY. Provide 5 year manufacturer warranty for insulated glass units from seal failure, interpane dusting or misting, and replacement of same. Warranty shall include coverage for degradation of color finish.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide "Isoglaze 45OT" Windows by Kawneer Company, Inc., Norcross, GA; or approved equal by Alumiline/Aldora, Lincoln, RI; Amarlite Corp., GA; PPG Industries, Inc., Pittsburgh, PA; Wausau Metals Corp., Wausau, WI; “3900 Series Windows by EFCO”.

2.2 MATERIALS. Screws, bolts, washers, nuts, rivets, and other fastening devices shall be aluminum, nonmagnetic stainless steel or other noncorrosive materials compatible with aluminum.

Horizontal Mullions shall be extruded aluminum members similar in size and shape to perimeter framing and designed to withstand uniform wind pressure of 20 psi (137.9 kPa) without deflection more than 1/175 of mullion span.

Aluminum extrusions shall comply with ASTM B221 and be Alloy 6063 with Temper T-5.

Provide one piece aluminum framed screens with aluminum or fiberglass screen cloth for each operating window.

Fasteners and hardware shall be Manufacturer's Standard non-corrosive.

Provide protective coatings. For bituminous coating compound, use SSPC-Paint 12 (cold-applied asphalt mastic). For Zinc Chromate Primer, use FS TT-P-645. For sealant compounds, use FS TT-S-00230.

2.3 MANUFACTURE AND FABRICATION. Fabricate framing of extruded aluminum sections to enable outside glazing with snap-on outside trim, provide thermal breaks; weep leakage to exterior; glass set back maximum of 3/4 inches (1.9 cm) from outer face; framing depth 4-1/2 inches (4.4 cm) maximum; jamb, head and horizontal mullion frames 1-3/4 inches (5.7 cm) minimum and 2 1/4 inches (11.4 cm) maximum Widths; and completely without exposed fastenings.

2.3.01 Mechanical Assemblies. Fit corner joints rigid and weather tight. Fasteners shall be concealed when window is installed and closed. Join frame members by mechanical means.

2.3.02 Sills. Furnish in full length, for single windows in single openings.

2.3.03 Mullions. Provide horizontal mullions between multiple window units. Fasten to adjacent window units. Permit expansion and contraction. Form watertight joints.

Provide extruded aluminum trim angles where indicated at interior face of windows. Finish to match windows, including flat head screw fastenings.

2.3.04 Shop Painting. Provide spray-applied, medium gloss finish applied during manufacture for exposed aluminum surfaces in accordance with AAMA 605.2, equal to PPG industries, Inc. “Duranar” – a 2 coat, factory-applied fluropolymer coating system based on Elf Atochem North America, Inc. “Kynar 500” or Ausimont USA, Inc. “Hylar 5000” polyvinylidene fluoride (PVF2) resin, with a minimum dry film thickness of 1.2 mils (0.03 mm).

Employ an applicator licensed by coating system manufacturer to apply the finish in accordance with manufacturer’s specifications for application and quality control.

Insulate aluminum which will come in contact with concrete, masonry wood, or dissimilar metals (except stainless steel, white bronze, or solid zinc) by application of heavy brush coat of alkali resistant bituminous paint.

Clean and remove scratches and tool marks from exposed surfaces.

Ensure that aluminum surfaces are free from blemishes and defects.

PART 3 - EXECUTION

3.1 INSTALLATION. Install fastenings, clips, anchors, and other appurtenances.

3.1.01 Application. Install and adjust windows in accordance with the manufacturer's accepted shop and erection drawings.

Install windows plumb, square, level, and in the correct horizontal and vertical alignment, in prepared openings without forcing.

Anchor windows, as indicated or accepted, with aluminum, nonmagnetic stainless steel, or other noncorrosive materials compatible with aluminum.

Set metal-to-metal joints between members of window frames and mullions, and mullion coverplates in a mastic sealant of a type recommended by the window manufacturer to provide completely weather tight joints. Remove excess mastic before it hardens.

3.1.02 Protection. After installation, protect windows from damage during subsequent construction activities.

3.1.03 Cleaning. Clean mortar, paint and other foreign matter from both the inside and outside metal surfaces of the windows in accordance with window manufacturer's' recommendations.

End of Section

SECTION 08710

FINISH HARDWARE

PART 1 - GENERAL

1.1 SCOPE. Furnish, install and adjust finishing hardware, as scheduled under the enclosed list of hardware sets.

1.2 GENERAL.

1.2.01 Coordination. Prior to development of the Hardware Schedule, arrange a Finish Hardware Meeting to be attended by the Engineer and the hardware supplier's personnel directly responsible for preparing the Hardware Schedule. Attendance at this meeting is mandatory.

The purpose of the meeting is to review the hardware schedule requirements identified in the Contract Documents. The participants shall review the specification requirements for the hardware schedule, formats, hardware locations, opening descriptions, products specified versus products proposed, and other information specified.

The Engineer shall approve the format and content of the hardware schedule. Before the installation of finish hardware begins, a hardware installation seminar for the installation of door closers, and exit devices, and locksets shall be conducted by the manufacturer's representative of these products. The seminar to be held at job site and attended by all installers of hardware. Examples include aluminum doors and carpentry installers. Seminar shall address proper coordination and installation of exit devices, door closers, and weatherstripping, as detailed in the finish hardware schedule for this Project, with the use of installation manuals, hardware schedule, templates, physical product samples, and exit device installation videos.

1.2.02 Governing Standards.

ANSI (American National Standards) A 156.1 - Butts and Hinges.

ANSI A 156.2 - Locks and Lock Trim.

ANSI A 156.3 - Exit Devices.

ANSI A 15-6.4 - Door Controls (Closers).

ANSI A 156.5 - Auxiliary Locks and Associated Products.

ANSI A 156.6 - Architectural Door Trim.

ANSI A 156.7 - Template Hinges.

ANSI A 156.8 - Door Controls (Overhead Holders).

BHMA (Builders Hardware Manufacturers Association) 1301, Material and Finishes Standard.

1.3 QUALITY ASSURANCE.

1.3.01 Supplier's Qualifications. An established finish hardware supplier who is a factory authorized distributor for supplier shall be all products required, and has display samples, inventory, and qualified personnel trained and experienced in preparing Hardware Schedules, issuing templates, and ordering, furnishing, and servicing hardware for architecturally designed projects. Supplier shall employ an experienced Architectural Hardware Consultant who is available to Engineer, at reasonable times during the course of the Work, for consultation about the Project's hardware requirements.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit for review complete hardware schedule, giving illustrations, descriptive data, manufacturer's specifications.

Furnish complete hardware location diagrams and templates to the door and frame manufacturer's and other suppliers of work requiring hardware. Ensure accurate location, coordination and proper installation of finishing hardware.

Submit elevation and wiring drawings for electrical and pneumatic hardware showing relationship of all electrical and pneumatic hardware components to door and frame. Indicate number and gage of wires required. Indicate size of air tubing required. Indicate psi requirements or wiring drawing showing point to point wire hook up and air tubing for all components. Submit system operations descriptions for each type of opening and describe each possible condition.

Submit product data concurrently with hardware schedule, in booklet form, using supplier's schedule covers as binders, Product Data of items of hardware listed in supplier's schedule that are other than those specified. Identify in cover letter, stating changes and reasons.

1.4.02 Samples. Provide samples when requested by the Engineer. If samples are requested for proposed substitution, submit both specified hardware and proposed substitution samples.

1.4.03 Test Reports. Submit inspection report specified for closers.

1.5 DELIVERY, STORAGE AND HANDLING. Provide packages or containers having labels, identifying each hardware set according to acceptable sets listed.

1.6 WARRANTY. Closers shall have furnished manufacturer's 10-year warranty against manufacturing defects and workmanship.

Exit devices shall have furnished manufacturer's 3-year warranty against manufacturing defects and workmanship.

Replace defective work during warranty period to include but not limited to materials, labor and other costs incidental to the Work. Inspect the Work within 24 hours after receipt of notice from the Engineer. Replace Work found to be defective as defined in the Contract Documents.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.1.01 Regulatory Requirements. Furnish finish hardware that complies with the requirements of laws, codes, ordinances and regulations of the governmental authorities having jurisdiction where such requirements exceed the requirements of the Specifications.

Furnish finish hardware to comply with the requirements of the regulations for the public building accommodations for physically handicapped persons of the governmental authority having jurisdiction and to comply with Americans with Disabilities Act.

2.1.02 Fire-Rated Openings. Provide hardware for fire-rated openings in compliance with NFPA 80 and local building code requirements. Provide only hardware which has been tested and listed by UL for types and sizes of doors required and complies with requirements of door and door frame labels.

Emergency exit devices are to include but not limited to “Fire Exit Hardware” required on doors in compliance with applicable codes. Provide UL label on exit devices indicating "Fire Exit Hardware".

2.2 ACCEPTABLE MANUFACTURERS. Requirements for design, grade, function, finish, size and other distinctive qualities of each type of finish hardware shall be provided indicated in Hardware Schedule at the end of this section.

2.2.01 Hinges. Acceptable manufacturers include Hager, Lawrence McKinney, Stanley, or equal.

2.2.02 Locksets. Acceptable manufacturers include Corbin-Russwin, Yale, Sargent, or equal.

Provide Best Peaks Patented cores by Stanley Security Solutions, Inc.

2.2.03 Cylinders. The only acceptable manufacturer is Best (No Substitutions).

2.2.04 Kickplates. Acceptable manufacturers include Baldwin, Burns, Rockwood, or equal.

2.2.05 Flush Bolts & Coordinator. Acceptable manufacturers include Glynn-Johnson, Ives, or equal.

2.2.06 Closers. Acceptable manufacturers include LCN, Norton, or equal.

2.2.07 Bumpers & Holders. Acceptable manufacturers include Glynn-Johnson, Ives, or equal.

2.2.08 Thresholds & Weatherstripping. Acceptable manufacturers include Reese Zero, Pemko, National Guard, or equal.

2.2.09 Panic Hardware. Acceptable manufacturer include Von Duprin, Locknetics, IR dor-OMatic, Monarch.

Contractor must certify to Engineer that all Locksets, exit devices, and security devices are compatible. If such certification is impossible, Contractor must notify Engineer immediately of areas of incompatibility. If certification is not made before receipt of bids, all subsequent changes in locksets, exit devices, and security devices resulting from incompatibility will be made at the expense of the Contractor.

2.3 MATERIALS.

2.3.01 Hinges, Butts, and Pivots. Except for hinges and pivots to be installed entirely (both leaves) into wood doors and frames, provide only template-produced units.

Furnish Phillips flat-head or machine screws for installation of units, except furnish Phillips flat-head or wood screws for installation of units into wood. Finish screw heads to match surface of hinges or pivots.

Except as otherwise indicated, provide non-removable stainless steel hinge pins. Provide number of hinges indicated but not less than 3 hinges for door leaf for doors 90 inches (228.6 cm) or less in height and one additional hinge for each 30 inches (76.2 cm) of additional height.

2.3.02 Lock Cylinders and Keying. Supplier will meet with Contractor to finalize keying requirements and obtain final instructions in writing.

All-locks shall be provided with approved cylinders and construction cores. At the completion of construction, construction cores shall be removed and final 6 pin cores keyed to the Owner's existing master system shall be provided by the Contractor. A minimum of 3 keys (or equivalent within the master system) shall be provided for each cylinder.

Construct lock cylinder parts from brass/bronze, stainless steel or nickel silver.

Permanently inscribe each key with number or lock that identifies cylinder manufacturer key symbol, and notation "DO NOT DUPLICATE". Provide keys of nickel or silver only.

The control (core) key for the new locks shall be given to DWSD mechanical maintenance."

2.3.03 Locks, Latches, and Bolts. Provide manufacturer's standard wrought box strike for each latch or lock bolt. Provide curved lip extended to protect frame and finished to match hardware set.

2.3.04 Closers and Door Control Devices. Except as otherwise specifically indicated, comply with the manufacturer's recommendations for size of door control unit, based size of door and anticipated frequency of use.

Furnish regular or parallel arm as required to mount closers on side of doors away from primary circulation space (lobby, corridor, or open area).

2.3.05 Miscellaneous. Provide manufacturer's standard exposed fasteners for door trim units (kickplates, edge trim and similar units); either machine screws or self-tapping screws.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Hand of Door. Drawings show direction of slide, swing or hand of each door leaf. Furnish each item of hardware for proper installation and operation of door movement as shown.

2.4.02 Base Metals. Produce hardware units of base metal and forming method indicated. Use manufacturer's standard metal alloy, composition, temper and hardness, but no case of lesser (commercially recognized) quality than specified for the applicable hardware units by applicable ANSI A156 series standard for each type hardware item indicated. Do not provide hardware which has been prepared for self-tapping sheet metal screws, except as specifically indicated.

2.4.03 Fasteners. Provide hardware manufactured to conform to published templates, generally prepared for machine screw installation. Do not provide hardware which has been prepared for self-tapping sheet metal screws, except as specifically indicated.

Furnish screws for installation, with each hardware item. Provide Phillips flathead screws except as otherwise indicated. Finish exposed (exposed under any condition) screws to match hardware finish or, if exposed in surfaces of other work, to match finish of such other work as closely as possible, including "prepared for paint" in surfaces to receive painted finish.

2.4.04 Finish. Hardware Finish US26D, (BHMA626) unless otherwise indicated. At hinge butts, provide US26D plating over stainless steel. Spray finish cases of surface-applied closers to match metal finishes.

2.5 HARDWARE SETS. *Note: Below are some typical sets of hardware for typical situations. Please note that each design will require a specific list of hardware sets tailored to the exact doors included in the project. Additionally, the manufacturers and part numbers are changing continuously and will need to be provided by the designer at the time of design.*

Set No. 1 – *Single interior door with emergency egress, possibly in corridor*

1 1/2 pr Butts
1 Exit Device
1 Cylinder
1 Closer
1 Wall Bumper

Set No. 2 – *Single interior door, locking with closer, possibly to office area*

1 1/2 Pr Butts
1 Lockset
1 Cylinder
1 Closer
1 Wall Bumper

Set No. 3 – *Single non-locking interior door, possibly to bathroom or closet*

1 1/2 Pr Butts
1 Latchset
1 Closer
1 Kickplate
1 Wall Bumper

Set No. 4 – *Single exterior door without emergency egress equipment*

1 1/2 pr Butts
1 Lockset
1 Cylinder
1 Wall Bumper
1 Threshold
1 Weatherstrip Set

Set No. 5 – *Interior double door, fire rating labeled, possibly in corridor at fire wall*

3 pr Butts
1 Lockset
1 Cylinder
1 Automatic Flush Bolt Set
2 Closers
1 Coordinator
2 Wall Bumper

Set No. 6 – *Heavy duty interior door, possibly industrial area in fire or smoke wall*

4 pr Butts
1 Lockset
2 Cylinder
1 Automatic Flush Bolt Set
2 Closer
1 Coordinator
1 Threshold

Set No. 7 – *Light weight interior single door, possibly to private bathroom*

1 pr Butts
1 Privacy set
1 Wall Bumper

Set No. 8 – *Exterior double door without emergency egress or closers*

3 pr Butts
1 Lockset
1 Cylinder
1 Manual Flush Bolt Set
2 Door Holders

1 Threshold
1 Sweep
1 Weatherstrip Set

PART 3 - EXECUTION

3.1 INSTALLATION. Install hardware in accordance with manufacturer's templates and instructions. Fit hardware accurately and properly, then fasten fixed parts securely for smooth, trouble-free and non-binding operation. Fit faces of mortised parts snug and flush. Install operating parts for free and smooth operation without binding, sticking, or excessive clearance.

Install locksets and latchsets such that bolts automatically engage in keeper, whether activated by closer or by manual push and in no case shall additional manual pressure be required to engage bolts in keeper.

3.1.01 Adjustments. After installation, examine hardware in place for complete and proper installation. Adjust and lubricate bearing surfaces of moving parts. Adjust latching and holding devices for proper function. Adjust door control devices for speed and power. Adjust closers to operate evenly and noiselessly. Have manufacturer's representative regulate closers prior to acceptance.

3.1.02 Protection. Protect hardware from marring and damage of finish during construction. Use removable tapes, strippable coatings, or other means acceptable to Engineer. If hardware is found marred, damaged or defective, then it should be replaced, reworked and corrected.

3.1.03 Cleaning. Make provision for complete removal of protective materials and for thorough cleaning of exposed surfaces of hardware. Prior to final cleaning for acceptance, check hardware for surface damage.

End of Section

SECTION 08800

GLAZING

PART 1 - GENERAL

1.1 SCOPE. This section covers glass and glazing for store front systems, skylights, windows, doors, and other openings having glass as indicated on the drawings and as stipulated herein.

1.2 GENERAL.

1.2.01 Governing Standards.

AAMA (American Architectural Manufacturers Association) 804.1 - Specification for Back Bedding Mastic Type Glazing Tapes.

ASTM (American Society for Testing and Materials) C236 - Test Method for Steady-State Thermal Performance of Building Assemblies by Means of a Guarded Hot Box.

ASTM C509 - Specification for Elastomeric Cellular Preformed Gasket and Sealing Material.

ASTM C864 - Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks, and Spacers.

ASTM C920 – Specification for Elastomeric Joint Sealants.

ASTM C963 - Specification for Packaging, Identification, Shipment, and Storage of Lock-Strip Gaskets.

ASTM C964 - Guide for Lock-Strip Gasket Glazing.

ASTM C1021 - Practice for Laboratories Engaged in the Testing of Building Sealants.

ASTM C1036 - Specification for Flat Glass.

ASTM C1048 - Specification for Heat Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass.

ASTM C1087 - Test Method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems.

ASTM C1193 – Standard Guide for Use of Joint Sealants.

ASTM D1784 - Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds.

ASTM E631 - Terminology of Building Constructions.

ASTM E774 - Specification for the Classification of the Durability Sealed Insulating Glass Units.

ANSI (American National Standards Institute, Inc.) Z97.1 - USA Standard Performance Specification and Methods of Test for Transparent Safety Glazing Material Used in Buildings.

16 CFR (Code of Federal Regulations) 1201 – Consumer Product Safety Commission (CPSC) Standard on Architectural Glazing Materials.

FGMA (Flat Glass Marketing Association) Glazing Manual.

FGMA Sealant Manual.

IGCC (Insulating Glass Certification Council) Certified Products Directory.

SGCC (Safety Glazing Certification Council) Certified Products Directory.

SIGMA (Sealed Insulating Glass Manufacturers Association) Practices for Vertical Field Glazing of Organically Sealed Insulating Glass Units.

UL (Underwriters Laboratories Inc.) 9 - Fire Tests of Window Assemblies.

UL 263 – Fire Tests of Building Construction and Materials.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. The work shall be performed by a glazing contractor with 5 years documented experience in store front systems, skylights, and other openings. If requested by Engineer, submit evidence of successful experience on projects similar in size and scope to the Work.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit glass manufacturer's product description with instructions, including limitations, for storage, handling, installation and maintenance of specified glass products, sealants, gaskets, setting blocks, shims, reglets, protective tape and other accessories.

For exterior glazing, submit glass product manufacturer's statement that products meet the specified glass breakage probability requirements for indicated applied loads, that expected thermal stressing of products is acceptable and that glazing details have been reviewed and are approved.

Submit shop drawings of glazing details. Draw details at least full size (twice full size preferred) and indicate dimensions, tolerances, and materials. Submit shop drawings for structural sealant glazing after review and approval of shop drawings by sealant and glass product manufacturers.

1.4.02 Certifications. Submit statement, written on glazing product manufacturer's official letterhead and signed by the responsible representative, stating that glazing products meet the requirements of the specified standards.

1.4.03 Samples. Submit sample for each style of monolithic and laminated glass no less than 3 by 6 inches (7.6 x 15.2 cm), and each style of insulating glass unit no less than 12 by 12 inches (30.5 x 30.5 cm). Include type of edge seal, spacer, and corner construction of spacer. Identify specific type of reflective and low-emissivity coated glasses, coated surfaces, and exterior face of unit.

Submit sample of corner construction of compression gasket for dry glazing with each leg approximately 6 inches (15.2 cm) long. Submit samples, each 6 inches (15.2 cm) long, of tape sealant, compression wedge, channel gasket, reglet, and bed gaskets to be used. Also provide samples of the cured sealant (after color selection has been made). The face shim or spacer, setting block, edge block, protective tape, compressible filler and open cell filter that will be used.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver products to the Project site in original, unopened containers bearing label clearly identifying manufacturer name, brand, and grade.

Store and handle products as recommended by the manufacturer to prevent damage and deterioration. Additionally, store glass products in a cool, dry, shaded, well-ventilated area not subject to condensation, rain, snow or direct sun.
Affix labels to each pane of glass indicating thickness and type. Labels shall remain on glass until final cleaning.

1.6 WARRANTY. Fire resistant glass shall be warranted for 5 years against vision through the unit being adversely affected.

Insulating glass units, glazed no more than 15 degrees from vertical shall be warranted for 10 years against faulty materials and workmanship, including material obstruction of vision as a result of fogging, film formation, dust, or condensation on internal glass surfaces.

Monolithic reflective glass shall be warranted for 10 years against deterioration or peeling of the coating.

Glazing systems installation shall be warranted for a period of 5 years against defective materials and workmanship.

During the warranty period, restore defective Work to the standard of the Contract Documents, including all labor, materials, refinishing and other costs incidental to the Work. Inspect the Work within 24 hours after receipt of notice from the owner and immediately repair leaks. Restore Work found to be defective within 2 weeks.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Take field measurements to verify or supplement required dimensions.

Do not install sealant in damp or dusty weather, when ambient temperature is below 40 degrees F (4.4 degrees C), or when joint substrates are damp or wet due to rain, frost, condensation or other causes.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.2.01 Monolithic Glass. Style M1 shall be Clear - Type I, Class 1, Condition A, Kind HS, 1/4 inch (6.4 mm) thick glass. Winter nighttime U-value shall be a maximum of 1.13. Summer daytime U-value shall be a maximum of 1.03. Shading coefficient shall be maximum of 0.96. Visible light transmittance shall be a minimum of 88 percent.

Style M2 shall be Tinted - Type 1 Class 2, Kind HS, gray tint, 1/4 inch thick (6.4 mm). Winter nighttime U-value shall be a maximum of 1.13. Summer daytime U-value shall be a maximum of 1.10. Shading coefficient shall be a maximum of 0.71. Visible light transmittance shall be a minimum of 37 percent.

Style M3 shall be Wired - Type II, Class 1, Form 1, Mesh M1, 1/4 inch (6.4 mm) thick glass.

Style M4 shall be Patterned - Type II, Class 1, Form 3, Finish f1, nominal 1/4 inch (6.4 mm) thick glass.

2.2.02 Insulating Glass. Shall be Tinted - Both panes of Type I, Class 2, condition A, Kind HS, gray tint, 1/4 inch (6.4 mm) thick glass with both panes Condition A, Kind HS. Winter nighttime U-value shall be the maximum of 0.50. Summer daytime U-value shall be the maximum of 0.59. Shading coefficient shall be the maximum of 0.58. Visible light transmittance shall be the minimum of 36 percent.

2.3 ACCEPTABLE MANUFACTURERS.

2.3.01 Monolithic Glass, Types M1 and M2. Acceptable manufacturers include Guardian Industries Corp; Libbey-Owens-Ford Co.; PPG Industries, Inc., or equal.

2.3.02 Monolithic Glass, Type M3. Acceptable manufacturers include Hordis Brothers, Inc.; AFG Industries, Inc.; or equal.

2.3.03 Monolithic Glass Type M4. Acceptable manufacturers include AFG Industries, or equal.

2.3.04 Insulating Glass. Acceptable manufacturers include Cardinal IG; PPG Industries, Inc.; Guardian Industries Corp.; or equal.

2.3.05 Single Sources. Provide glass products produced by a single manufacturer for each condition and kind of glass and composed of primary glass obtained from a single source for each type and class specified.

2.3.06 Sealants. Acceptable manufacturers include Dow Corning, General Electric, Trevco, Proglaze, Spectrin, or equal.

2.3.07 Gaskets and Accessories. Acceptable manufacturers include D.S. Brown Co., Cadillac Rubber and Plastics, Inc., Variseal, Inc., or equal.

2.4 MATERIALS.

2.4.01 Glass. Provide products conforming to references and as specified.

2.4.02 Primary Glass. Shall comply with ASTM C1036 and be fully annealed unless otherwise specified. Float glass shall have a quality of q3. Wired and patterned glass shall have a quality of q8.

Do not exceed a probability of 8 glass breakages per 1000 units for monolithic and laminated glass and 8 per 1000 units or openings for insulating glass units, when glazed no more than 15 degrees from vertical based on listed glass usage, when designed to resist wind loads, thermal stressing, and snow loads where applicable.

Do not exceed a probability of 1 glass breakage per 1000 for glass products glazed more than 15 degrees from vertical, based on listed glass usage, when designed to resist wind loads, thermal stressing, and snow loads where applicable.

2.4.03 Heat-Treated Glass. Shall comply with ASTM C1048; except the surface compression stress level for Kind HS glass shall be not less than 3500 psi (24.1 MPa) or greater than 7500 psi (51.7 MPa). Glass shall be heat-treated by horizontal roller process with roll wave distortion parallel to bottom edge of glass when installed, unless otherwise specified.

2.4.04 Insulating Glass. Shall be hermetically sealed with 1/2 inch (1.3 cm) air space, listed in the IGCC Certified Products Directory and with appropriate IGCC Certification mark on spacer or at least one pane of unit, certified as passing Class CBA performance as determined by ASTM E774.

Units for non-structural sealant glazing applications shall be of dual seal construction with a polyisobutylene primary seal and a polysulfide, polyurethane or silicone secondary seal.

Units which will be shipped through or glazed at altitudes of 5000 feet (1524.0 m) or more above sea level shall be fabricated with breather or capillary tubes, to permit air space pressure equalization. Provide same warranty as for non-breather or capillary tube units. Pinch tubes during glazing if required by glass manufacturer.

2.4.05 Safety Glass. Shall comply with ANSI Z97.1 and testing requirements of CPSC 16 CFR part 1201, and listed in the SGCC Certified Products Directory with appropriate SGCC certification mark or label permanently affixed.

Furnish safety glass for glass occurring in doors and sidelights, and where required by authorities having jurisdiction.

2.4.06. Wired Glass. Shall be fire resistance rated, tested per ASTM E163 or UL 9 and labeled and listed by UL or other agency acceptable to authorities having jurisdiction.

2.5 GLAZING PRODUCTS. Glazing products such as sealants, tapes, gaskets and accessories shall be compatible with each other and with other products with which they will come into contact, including glass products, seals of insulating glass units, polyvinyl butyl interlayer of laminated glass, and glazing channel substrates, under conditions of installation and service, as demonstrated by testing and experience. Submit proof of compatibility where specified.

Comply with recommendations of sealant, tape, glass, and gasket manufacturers, unless otherwise specified, for selection of glazing products and glazing systems which have performance characteristics suitable for applications indicated and conditions at time of installation. Submit glazing system for review.

2.5.01 Sealants. For non-structural exposed and concealed locations, use single-component, silicone sealant complying with ASTM C920, Type S, Grade NS, Class 25, Use NT, Uses A, G and O; Dow Corning, 795 or 999-A; General Electric, Gesil-N or Construction 1200; Tremco, Proglaze or Spectrem 2; or equal. Color shall be black.

2.5.02 Tape Sealants. For openings up to 75 united inches (190.5 cm), use preformed, solvent free, 100 percent solids, unshimmed, butyl-polyisobutylene tape that is non-staining and non-migrating when in contact with nonporous surfaces and that complies with AAMA 804.1; Pecora, Extru-Seal; PTI, 303 Glazing Tape; Tremco, 440 Tape; or equal.

For openings over 75 united inches (190.5 cm), use a preformed, solvent free, 100 percent solids, pre-shimmed, butyl-polyisobutylene tape that is non-staining and non-migrating when in contact with nonporous surfaces and that complies with AAMA 804.1; Pecora, Shim-Seal; PTI, 303 Shim Tape; Tremco, Pre-Shimmed 440 Tape; or equal.

2.5.03 Gaskets. Shall be extruded, closed cell, neoprene, EPDM or silicone rubber, in compliance with ASTM C509, as recommended by glazing and sealing systems manufacturer.

Bed gasket for wet glazing system shall be continuous with pressure sensitive adhesive one side, designed to be compressed 25-40 percent in the opening.

Compression gasket for dry glazing system shall be shaped as required to be compressed in place a minimum of 25 percent and of one-piece construction with factory-assembled frames with injection-molded, vulcanized corners; produced oversize in opening dimension, as determined by measurements, to insure compression at corners but within limits so that compression does not create a "pucker".

Channel gasket shall be continuous channel of shape and dimensions for application in the opening with specified glazing, constructed of extruded dense neoprene EPDM or silicone rubber.

Compression wedge for dry glazing system shall be 70 plus/minus 5 Shore "A" durometer, of shape and size to compress the exterior compression gasket a minimum of 25 percent, and as recommended by glazing and sealing systems manufacturer.

2.5.04 Accessories. Setting block shall be 85 plus/minus 5 Shore "A" durometer, each block properly sized for load, as wide or wider than glazing, no less than 4 inches (10.2 cm) long, except in lock-strip gaskets no less than 6 inches (15.2 cm) long; profile to permit friction fit, dart insertion into metal chair, or pressure sensitive adhesive one side to fix block in glazing opening.

Edge block shall be 40 to 60 Shore "A" durometer, each block a minimum of 4 inches (10.2 cm) long, as wide as glazing, placed in the vertical glazing channel, and sized to allow a nominal 1/8 inch (3.2 mm) clearance between glass edge and installed block; profile to permit friction fit or pressure sensitive adhesive one side to fix block in glazing opening.

Face shim or spacer shall be 40 to 60 Shore "A" durometer, continuous in glazing opening; profile to permit friction fit, dart insertion or pressure sensitive adhesive one side to fix shim or spacer in location.

Oil-free cleaning solvents (for example: toluene, xylene, methyl ethyl ketone, acetone and mineral spirits) and use as recommended by the sealant manufacturer; furnished in containers for cleaning solvent storage that are clean, oil-free and suitable for use with the solvent.

Primer shall be a nonstaining product of sealant manufacturer for use when recommended and as specified for the application by the sealant manufacturer.

Compressible filler shall be expanded open cell polyurethane shape compressed a minimum of 25 percent of its dimension at time of installation in the opening; plateau supply Co., Denver Foam; Industrial Thermo Polymers Limited, Tundra Foam; or equal.

Expanded closed cell polyethylene shape compressed no more than 25 to 33 percent of its dimension at the time of installation in the opening; Industrial Thermo Polymers Limited, ITP Standard Backer Rod; Nomaco, Inc., Green Rod; W.R. Meadows, Inc., Sealtight Backer Rod; or equal.

Open cell filter shall be reticulated flexible polyester urethane foam having 20 pores per inch (2.5 cm), sized at least 1 inch (2.5 cm) larger in dimension then weephole, of cross section to provide 15 to 25 percent compression for friction fit and as manufactured by Foam Division, Scott Paper Co.; or equal.

Bond breaker shall be heavy duty, 14 mil (0.36 mm) minimum thickness, colored, polyethylene or teflon, self-adhesive bond breaker of type recommended by sealant manufacturer and suitable for conditions of usage. Liquid bond breaker is not permitted.

2.6 MANUFACTURE AND FABRICATION. Sizes required for glazing openings shall meet glass edge clearances, tolerances, and edge conditions complying with recommendations of glass manufacturer, be of thicknesses required or as recommended by glass manufacturer.

PART 3 - EXECUTION

3.1 PREPARATION. Protect the Work and adjacent construction against damage during progress of the Work.

Protect glass surfaces and edges from damage during storage, handling and installation. Use a rolling block in rotating glass units to prevent damage to glass corners. Do not impact glass with metal framing. Use suction cups to shift glass within openings; do not raise or drift glass with a pry bar. Rotate glass with flares or bevels along one horizontal edge which would occur in vicinity of setting blocks so that these are located at top of opening. Remove from Project and dispose of glass with edge damage or other imperfections that exceed glass manufacturer's recommendations or of type that, when installed, weakens glass and impairs performance and appearance.

3.2 INSTALLATION.

3.2.01 Application. Inspect Work of window or glass framing erector for compliance with manufacturing and installation tolerances, including those for size, squareness, offsets at corners; for presence and functioning of weep system; for existence of minimum required face or edge clearances; and for effective sealing of joinery. Do not allow glazing work to proceed until unsatisfactory conditions, as required in writing by glazier, have been corrected.

Installation, including preparation, definition of terms, glass positioning, edge clearances and tolerances, setting and application of glazing materials shall comply with the minimum requirements of listed references of the FGMA, SIGMA and ASTM. Support and cushion glass in the glazing channel to prevent point loading, rotational forces and excessive clamping pressure.

Comply with combined printed recommendations of glass manufacturers, of manufacturers of sealants, gaskets and other glazing materials, except where more stringent requirements are indicated, including those of referenced glazing standards.

Do not install insulating, laminated or wired glass, that is exposed to moisture, in glazing channels that are not provided with weepholes. Do not allow glazing work to proceed until corrected.

Apply primers to joint surfaces if required for adhesion of sealants, as determined from preconstruction testing by sealant manufacturer.

Clean glazing channels and other framing members that receive glass, immediately before glazing. Remove coatings which are not firmly bonded to substrates. Remove lacquer from metal surfaces where elastomeric sealants are required.

Do not install exterior glass until sand-blasting, bushhammering, grouting, waterproofing and similar work on surrounding concrete is completed.

Install setting blocks of proper size in glazing channel, located one quarter of glass width from each corner, but with block edge nearest corner no closer than 6 inches (15.2 cm) from corner, unless otherwise specified or required by glass manufacturer.

Install spacer where required of correct size to preserve required face clearances except where gaskets or preshimmed glazing tapes are used for glazing. Provide 1/8 inch (3.2 mm) minimum bite of spacer on glass and use thickness equal to sealant width.

Install edge blocking to comply with requirements of referenced glazing standards, except where otherwise specified or required by glass manufacturer.

Install compressible filler rods or equivalent back-up material, as recommended by sealant and glass manufacturers, to prevent sealant from extruding into glazing channel or weep systems as well as to control depth of sealant for optimum performance, unless otherwise specified.

Install sealants in compliance with ASTM C804 and C962. Force sealant into glazing channels to eliminate voids and to ensure complete "wetting" or adhesion of sealant to glass and channel surfaces. Tool exposed surface of sealant to provide a 1/16 inch (1.6 mm) high watershed away from glass.

Drive wedge-shaped gaskets into one side of glazing channel to compress sealant or gasket on opposite side, provide adequate anchorage to ensure that gasket will not "walk" out when installation is subjected to movement. Miter cut wedge-shaped gaskets at corners and install in manner recommended by gasket manufacturer to prevent pull away at corners; seal corner joints and butt joints with sealant recommended by gasket manufacturer.

For dry pressure glazing, install glass in metal windows or framing with compression gasket applied to stationary stop and compressed a minimum of 25 percent, edge blocking at jambs, open cell filter foam centered behind weep holes, and compression wedge locked into removable stop. Clamping pressure of glazing system shall be a uniform 4 to 6 pounds per lineal inch (0.7 – 1.1 kg per lineal cm), and in no case to exceed 10 pounds per lineal inch (1.8 kg per lineal cm).

For glazing hollow metal moors and frames, install glass with tape sealant full depth of stop, with setting blocks and metal stops.

For glazing aluminum doors and frames, install glass in aluminum doors and frames with gaskets and metal stops furnished with doors and frames and installed in accordance with door and frame manufacturer's recommendations. Glaze doors in closed position.

3.2.02 Cleaning. Examine glass surfaces adjacent to or below exterior concrete, other masonry surfaces, and weathering steel at frequent intervals during construction, but not less than once a month, for build-up of dirt, scum, alkali deposits or staining. When examination reveals presence of these forms of residue, remove by method recommended by glass manufacturer.

Remove nonpermanent labels and clean glass surfaces, by cleaning both faces using non-abrasive cleaners and procedures, not more than 4 days prior to date scheduled for inspections that are intended to establish date of substantial completion, in each area of Project. Clean glass by method recommended by glass manufacturer.

3.2.03 Protection. Protect exterior glass from breakage immediately upon installation by use of crossed streamers attached to framing and held away from glass. Do not apply markers to surfaces of glass.

Remove and replace glass which is broken, chipped, cracked, abraded or damaged in other ways during construction, including natural causes, accidents and vandalism.

Protect glass with screens of appropriate barrier material wherever welding, cutting or other potentially damaging work is performed.

Protect glass from contact with contaminating substances resulting from construction operations. If, despite such protection, contaminating substances come into contact with glass, remove immediately by method recommended by glass manufacturer.

End of Section

INDEX

DIVISION 9 – FINISHES

SECTION 09100

FRAMING SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. Section includes non-loading metal stud framing and accessories for partition walls at interior locations.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) A123/A123M – Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A653/A653M – Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM A591/A591M – Steel Sheet, Electrolytic Zinc-Coated, for Light Coating Mass Applications.

ASTM C645 – Specification for Nonstructural Steel Framing Members.

ASTM C754 - Installation of Steel Framing Members to Receive Screw-Attached Gypsum Board.

ASTM C1002 – Specification for Steel Self – Piercing Tapping Screws for the Application of Gypsum Panel Products for Metal Plaster Bases to Wood Studs or Steel Studs.

ML/SFA 540 - (Metal Lath/Steel Framing Association, Division of National Association of Architectural Metal Manufacturers) – Lightweight Steel Framing Manual.

SSPC Paint 20 (Steel Structures Painting Council) – Zinc Rich Primers.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer's Qualification. Company shall be manufacturer specializing in products with minimum of 5 years documented experience.

1.3.02 Contractor's Qualifications. Company shall have a minimum of 5 years documented experience performing Work of this type and scope.

1.3.03 Tolerances. Maximum Variation from True Position shall be 1/8 inch (3.2 mm) in 10 feet (3.0 m). Maximum Variation from Plumb shall be 1/8 inch (3.2 mm) in 10 feet (3.0 m).

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings that indicate prefabricated work, component details, stud layout, framed openings, anchorage to structure, type and location of fasteners, and accessories required for related work. Submit data describing standard framing member materials and finish, product criteria, load charts, and limitations. Submit manufacturer's installation instructions as well as special procedures or perimeter conditions requiring special attention. Describe method for securing stud to tracks, splicing, blocking, and reinforcing to framing connections.

Provide calculations for loadings and stresses of exterior walls or specially fabricated framing. Design structural elements under direct supervision of a professional engineer experienced in design of this type of Work and licensed in the State of Michigan.

1.4.02 Mock-Up. Provide mock-up of stud wall framing including insulation, sheathing, door frame, or other opening and interior and exterior finish. Mock-up size shall be 12 feet (3.7 m) long and full height including corner. Mock-up may remain as part of the Work.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Shall include Clark Steel Framing Systems, Dietrich Industries, Inc., Harrison Manufacturing Co., Marino/Ware, Unimast Incorporated, or approved equal.

2.2 MATERIALS. Non-load bearing studs shall be AS2S, galvanized to C-90 coating class, ANSI/ASTM A591, rolled steel, channel shaped, punched for utility access, as required.

Tracks and Headers shall be same material and thickness as studs. Furring and Bracing Members shall be of same material as studs with thickness to suit purpose. Sheet Metal Backing shall be 20 gauge (1.0 mm) galvanized steel for reinforcement. Touch-Up Primer for Galvanized Surfaces shall be FSTT-P-645.

Fasteners shall be ASTM C1002, self drilling and self tapping screws. Anchorage Devices shall be screws with sleeves.

2.3 MANUFACTURE AND FABRICATION. Fabricate assemblies of framed sections to sizes and profiles required. Fit, reinforce, and brace framing members to suit design requirements.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that all conditions are ready to receive Work. Verify that all field measurements are as shown on approved architectural drawings. Verify that rough-in utilities are in proper location.

3.2 INSTALLATION.

3.2.01 Erection. Perform Work in accordance with ASTM C754 and ML/SFA 540. Form, fabricate, install, and connect components in accordance with ML/SFA 540.

Align and secure top and bottom runners at 24 inches (61.0 cm) on center. Place two beads of acoustic sealant between runners and substrate to achieve a vapor seal. Fit runners under and above openings; secure intermediate studs to same spacing as wall studs.

Install studs vertically at 16 inches (40.6 cm), on center. Align stud web openings horizontally.

Secure studs to tracks using clip and tie method. Do not weld studs.

Stud splicing is permissible. Splice studs with 8 inch (20.3 cm) nested overlap, secure each stud flange with flush head screw.

Brace stud framing system as required.
Coordinate erection of studs with requirements of door frames, window frames, installation supports, and attachments (Fabricate corners using a minimum of three studs). (Double stud at wall openings, door and window jambs, not more than 2 inches (61.0 cm) from each side of openings.).

Coordinate installation of wood bucks, anchors, and wood blocking with electrical and mechanical work to be placed within or behind stud framing.

Install blocking for support of plumbing fixtures, toilet partitions, wall cabinets, toilet accessories, and hardware.

End of Section

SECTION 09260

GYPSUM BOARD ASSEMBLIES

PART 1 – GENERAL

1.1 SCOPE. This section covers gypsum wallboard partitions and ceilings to be furnished and installed at the locations indicated on the drawings. Other accessories include metal furring, framing, ceiling suspension system and accessories,

1.2 GENERAL.

1.2.01 Governing Standards.

ADA (Americans With Disabilities Act) 36 CFR 1191 – Accessibility Guidelines for Buildings and Facilities; Final Guidelines.

AIAFRR (American Insurance Association Fire Resistance Ratings).

AMA (Acoustical Materials Association) 1-II – Ceiling Sound Transmission Test by Two-Room Method.

ASTM (American Society for Testing and Materials) A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

ASTM C36/C36M – Specification for Gypsum Wallboard.

ASTM C475 – Specification for Joint Compound and Joint Tape for Finishing Gypsum Board.

ASTM C630/C630M – Specification for Water-Resistant Gypsum Backing Board.

ASTM C645 – Specification for Nonstructural Steel Framing Members.

ASTM C665 – Specification for Mineral Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.

ASTM C754 – Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Board.

ASTM C840 – Specification for Application and Finishing of Gypsum Board.

ASTM C1047 - Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base.

ASTM E84 - Test Method for Surface Burning Characteristics of Building Materials.

ASTM E90 - Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions.

ASTM E119 – Test Method for Fire Tire Tests of Building Construction and Materials.

Fire Resistance Directory – Specified gypsum wallboard materials manufacturer's printed specifications and product data.

GA (Gypsum Association) – GA-214 – Levels of Gypsum Board Finish.

UL (Underwriters Laboratories Inc.) – Building Materials Directory.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor's Qualifications. Work shall be performed by a Company specializing in gypsum board systems work with a minimum of 5 years experience.

1.3.02 Tolerances. Maximum variation from true flatness shall not exceed 1/8 inch (3.2 mm) in 10 feet (3.0 m) in any direction.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit Shop Drawings for reinforced gypsum showing details of fabrication and installation.

Submit product data for ceiling hangers attachment devices showing description of proposed use and safe working loads.

1.4.02 Certification. Contractor shall submit a statement of compliance for materials and methods of installation for fire-rated construction and sound-attenuating construction.

The Contractor shall submit in triplicate a notarized certificate, addressed to the State Fire Marshal or other authority having jurisdiction over the Project, stating that the materials for fire-rated assemblies for the Project have been installed in accordance with the UL design number or other testing authority number submitted.

1.4.03 Test Reports. Submit in duplicate a testing laboratory report for fire-rated assemblies, showing details of construction, including control joints. One will be returned for use by the Contractor.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver manufactured materials to job in their original packages, containers or bundles with manufacturer's name, brand name, grade, UL listing, and other pertinent data clearly marked.

Store materials in a dry place providing protection from damage and exposure to the elements. Stack gypsum board flat, supported along its full width and length to prevent sagging, and neatly to prevent damage to edges, ends and surfaces.

Store reinforced gypsum shapes in an approved area free from excessive moisture in manufacturer's crates, or in crated position with duplicate supports as originally crated.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Provide appropriate heat, ventilation and humidity control as required in gypsum board application areas prior to, during and following application of gypsum board, joint finishing materials or bonding adhesives. Maintain temperatures within the building at the application areas between 55 and 70 degrees F (12 and 21 degrees C).

2.2 PERFORMANCE REQUIREMENTS.

2.2.01 Horizontal Load Resistance. Except for cavity shaft wall for elevator shafts, when a uniformly distributed horizontal load of 5 pounds per square foot (24.4 kg per m^2) is applied normal to one side of the wall, limit the maximum deflection in the studs or furring to 1/360 of the unsupported span.

2.2.02 Fire-Rated Construction. Provide materials and methods of installation for fire-rated construction which comply with requirements of American Insurance Association "Fire Resistance Ratings" publication, UL "Fire Resistance Directory", or other test authority: specify fire resistance classification, UL design number, or other authority test number as appropriate.

The Contractor shall submit requests for deviations from the approved test assembly and obtain written approval of the State Fire Marshal and the Engineer.

2.3 ACCEPTABLE MANUFACTURERS.

2.3.01 Steel Framing and Furring. Utilize products of Dietrick Industries, Inc.; Gold Bond Building Products Div.; National Gypsum Co.; Unimast Inc.; or approved equal.

2.3.02 Grid Suspension Assemblies. Utilize products of Chicago Metallic Corp.; National Rolling Mills Co.; USG Interiors, Inc.; or approved equal.

2.3.03 Gypsum Wallboard and Related Products. Utilize products of Georgia-Pacific Corp. (G-P); Gold Bond Building Products Div.; National Gypsum Co. (National); United States Gypsum Co. (USG); or approved equal.

2.3.04 Steel Reinforcing. Utilize products of Metal Lite Inc. or approved equal.

2.4 MATERIALS. The suspension system and metal furring materials shall comply with ASTM C754 and the following:

Carrying channels shall be 1-1/2 inch (3.8 cm) size, cold-rolled steel, galvanized or asphaltum-painted.

Rigid furring channels shall be hat-shaped, minimum 2-5/8 inches (6.7 cm) wide by 7/8 inch (2.2 cm) deep, roll-formed from 25 gauge (0.625 mm) thick electro-galvanized steel sheets.

Adjustable furring brackets shall be formed from 20 gauge (1.0 mm) galvanized steel sheet, 1 inch wide, designed to provide furring depth of up to 2 1/4 inches (5.7 cm) for braced furring attached to masonry or concrete.

Hangers for supporting carrying channels from building construction shall be minimum 9 gage (3.9 mm) galvanized steel wire, soft temper, straightened.

Tie Wire for lacing and attaching rigid furring channels to carrying channels in ceiling construction shall be 16 gauge (1.6 mm) soft temper, galvanized steel wire. Zinc-coated clips of cold drawn spring steel wire not lighter than 12 gage (2.75 mm) may be substituted for tie wire when allowed by fire resistance test.

2.4.01 Metal Wall Framing Studs. Shall be non-load-bearing-channel type, cold-formed from galvanized steel sheet, minimum 25 gauge (0.625 mm), unless otherwise specified or indicated, and complying with ASTM C645. Provide minimum 20 gauge (1.0 mm) studs for the following:

Double studs at door jambs and the first stud in the partition beyond door jamb.

Studs to which cementitious backer units for wet areas, are attached.

Studs to which wall-mounted equipment, including Owner-furnished equipment, is fastened.

Furnish metal studs complete with floor and ceiling tracks, accessories including suitable shapes and connections for framing around openings and elsewhere as may be required for the anchorage of attachments. Other component standards shall be used with the metal stud manufacturer for the type, sizes, and application of studs used.

Accessories shall be galvanized or factory prime coat painted with rust-inhibitive paint.

Except for fire-rated construction, provide standard web cutouts located 12 inches (30.5 cm) from each end, and additional cutouts in width not greater than 75 percent of width of web, located at 24, 36, 48 and 60 inches (61.0, 91.4, 121.9, and 152.4 cm) from bottom of stud.

For fire-rated construction, provide cutouts as in the approved test assembly.

2.4.02 <u>Steel Reinforcing</u>. For handrails and grab bars, comply with ADA, Section 4.26.

2.4.03 <u>Acoustical Sealing Compound</u>. Use an appropriate sealant identified per manufacturer's specifications.

2.4.04 <u>Gypsum Wallboard</u>. Shall be ASTM C36, of thickness indicated, 48 inches (121.9 cm) wide, in lengths as required to suit the application and to minimize joints, with tapered edge and paintable exposed face.

Gypsum wallboard to which ceramic tile will be applied in dry areas shall be water-resistant type complying with ASTM C630.

Gypsum wallboard for fire-rated construction shall be listed in the UL Building Materials Directory and bear the UL classification marking or listing mark.

Exterior gypsum soffit board shall be a gypsum core soffit panel with additives to enhance fire-resistance of the core; surfaced with water repellant paper on front, back and long edges; and complying with ASTM 931, Type X.

2.4.05 <u>Wallboard Accessories</u>. Size wallboard accessories as required for the wallboard thickness and application.

Screws shall be self-drilling, self-tapping, gypsum wallboard screws.

Cornerbeads, edge trims, and control joints shall comply with ASTM C1047.

Flexible dust membrane shall be 4 mil (0.1 mm) polyethylene sheet or as recommended by gypsum wallboard manufacturer.

2.4.06 Finishing Materials. Finishing materials, including joint tape and embedding and finishing types of joint compound shall be the products of a single manufacturer and complying with ASTM C475.

2.4.07 Sound-Attenuating Blanket. Shall be glass or mineral fiber complying with ASTM C665, Type I, 2.5 pcf (40.0 kg per cu m) density, of size to fit from web to web of metal studs, 2 or 2 1/2 inches (5.1 or 16.1 cm) thick and having maximum fire hazard classification, when tested in accordance with ASTM E84, of 25 for flame spread and 50 for smoke developed.

2.4.08 Reinforced Gypsum. Shall be shop fabricated of high strength gypsum cement reinforced with glass fibers, 1/8 inch (3.2 mm) minimum thickness, with tapered edges, as manufactured by DecoForm Corp.; Formglas Inc.; Plasterform, Inc.; Plastrglas, Inc. or approved equal. Provide shapes complete with necessary integral stiffeners and attachment devices. Exposed surfaces shall be smooth and ready to receive field painting.

PART 3 - EXECUTION

3.1 PREPARATION. Protect adjacent construction with suitable covering or other method during progress of the Work until completion. Coordinate this Work with other trades to prevent delays and conflicts in scheduling.

3.2 INSTALLATION SUPPORT SYSTEMS.

3.2.01 Metal Support Systems. Install metal support systems in accordance with ASTM C754 and manufacturer's printed directions, unless otherwise specified.

3.2.02 Ceiling Suspension System. Where required to obtain the indicated ceiling heights or to meet specific conditions, provide carrying channels attached to, or wire hanger suspended from building construction. Provide approved hanger attachment devices. Do not support hangers from roof deck.

Space and support carrying channels will not be more than 48 inches (121.9 cm) each way, unless otherwise required to meet fire resistance ratings.

Brace and secure carrying channels in position, true and rigid and in a manner to prevent deflection. Keep carrying channels free of wall and other building elements.

Install furring channels at right angles to supporting members and secured with wire clips or 2 loops of tie-wire at such intervals that the span of furring channels nowhere exceeds 48 inches (121.9 cm). Secure furring channels to structural members if carrying channels are not used.

Space furring channels not more than 16 inches (40.6 cm) center-to-center. Join furring channels by nesting channels not less than 8 inches (20.3 cm) and securely tying with double loops of tie-wire. Locate the first, last and ends of furring channels approximately 2 inches (5.1 cm) from walls and other building elements.

3.2.03 Vertical Furring. Provide steel shapes, clips, crimped band iron, wire and other attachments necessary to bring wallboard to lines indicated. Install metal furring at maximum spacing of 24 inches (61.0 cm).

Install wall furring vertically and rigidly attached to the substrate, or to furring channels attached to adjustable furring brackets where required to provide furring depth indicated.

3.2.04 Metal Stud Partitions. Position metal studs vertically in tracks, spaced 16 inches (40.6 cm) on centers, or less where otherwise indicated or required. Double studs toe to toe shall be installed at jambs of hollow metal door frames, accurately centered and attached to anchor clips with bolts or screws. The next stud shall be not over 6 inches (15.2 cm) away from the double stud. Over openings, install a cut-to-length section of track, with web flange bent at each end, to receive metal studs over the opening. Construct partitions extending full height from floor to ceiling to interrupt the ceiling system, unless otherwise indicated.

3.2.05 Soffits. Anchor tracks to steel framing. Position metal studs in tracks, spaced 16 inches (40.6 cm) on centers and not more than 2 inches (5.1 cm) from ends of soffit.

3.2.06 Fire Rated Construction. Extend fire-rated construction from floor to underside of floor or roof construction above, unless otherwise indicated. In addition to partitions indicated to be fire-rated, provide fire-rated construction for Smoke barrier partitions, Corridor partitions, and Partitions between sprinklered rooms and non-sprinklered rooms.

Do not enlarge existing holes or provide additional holes in studs.

3.2.07 Metal Stud Chase Walls. For chase wall construction, place a double row of tracks parallel and spaced as indicated, but not more than 24 inches (61.0 cm) on center.

Position a double row of metal studs vertically in the tracks spaced 16 inches (40.6) on center and so that pairs of studs are opposite each other with the flanges pointing in the same direction.

Place cross bracing of one of the following types, at the center of partition height for each pair of studs, but not exceeding 48 inch (121.9) spacing:

Gypsum wallboard, 12 inches (30.5 cm) wide, attached to each stud with a minimum of three Type S screws.

Section of 2 1/2 inch (6.4 cm) metal stud, attached to each stud with a minimum of two sheet metal screws.

3.2.08 Steel Reinforcing. Provide steel reinforcing, or fire-treated wood blocking, for wall-mounted equipment fastened to face of studs at locations indicated and as follows:

For attachment of wall cabinets.

For attachment of surface-mounted toilet and bath accessories.

For attachment of wall-mounted door stops.

At resilient base.

Where toilet compartment door bumpers hit the wall.

At pipe cutouts.

For attachment of handrails.

For attachment of grab bars and urinal screens.

Install reinforcing so that face of studs and face of reinforcing are flush.

3.2.09 Double Stud Assemblies. Provide double stud assemblies where indicated, consisting of two studs back to back, anchored together with sheet metal screws at 12 inch (30.5 cm) spacing, staggered in web.

3.3 INSTALLATION WALLBOARD SYSTEMS.

3.3.01 Gypsum Wallboard. Apply gypsum wallboard in accordance with ASTM C840, unless otherwise specified.

3.3.02 Ceilings and Soffits. Apply wallboard with the long dimension at right angles to furring channels or studs, unless otherwise required by the testing authority for the fire-rated system approved for use on the project. Abutting ends and edges shall occur over a furring channel or stud. Use wallboard of the maximum practicable length to minimize end joints. End joints shall be neatly fitted and staggered. Properly support wallboard around all cutouts. At completion, surface of wallboard shall be flush and level. Do not use felt pens or other marking media on exposed face of wallboard that will bleed through final finishing.

3.3.03 Partitions and Vertical Surfaces. Apply wallboard with long or short dimension against stud flanges and furring channels, with joints on opposite sides of partition arranged to occur on different studs and end joints neatly fitted and staggered. Properly support wallboard around all cut-outs.

For double layer fire-rated partitions, apply second layer of wallboard vertically over the first layer, with joints offset from first layer, and laminated thereto with joint compound, or otherwise secured by a method allowed by the testing authority for the fire-rated system approved for use on this Project.

Maximum variation from true flatness shall be less than 1/8 inch (3.2 mm) in 10 feet (3.0 m) in any direction.

3.3.04 Grouting Frames. Fill hollow metal frames in stud partitions solid with gypsum sand plaster grout, proportioned 1 to 3, to the depth into which the wallboard will be inserted into the frame.

3.3.05 Fastening Wallboard. Space screw fasteners a maximum of 12 inches (30.5 cm) on centers in wallboard field and 8 inches (20.3 cm) on centers staggered along abutting edges and ends. Space fasteners not less than 3/8 inch (9.5 mm) from edges and ends of wallboard. Screws shall be power-driven in accordance with gypsum wallboard manufacturer's directions.

3.3.06 Reinforced Gypsum. Install in accordance with manufacturer’s recommendations and approved shop drawings. Treat joints as specified for wallboard.

3.4 INSTALLATION OF WALLBOARD ACCESSORIES. Set wallboard accessories plumb and level and secure in a substantial manner. Make exposed joints of wallboard accessories close and tight.

3.4.01 Control Joints. Isolate gypsum wallboard from all structural elements except floors, by control joint beads or edge trim. Locate control joints where indicated and as follows:

At all changes in type of substrate.

At control or expansion joints occurring in building construction.

In large ceiling areas, not over 50 feet (15.2 m) in either direction and to divide ceiling into rectangular areas of not over 2,500 square feet (232.3 sq m).

In long partition runs, such as corridors, at maximum spacing of 30 feet (9.1 m).

Where wallboard abuts a wall or ceiling of dissimilar construction.

At door frames in stud partitions and furred walls from top of frame to top of wallboard, at both jambs and both sides of partition.

Construct control joints in fire-rated assemblies as detailed in the submitted testing laboratory report.

3.4.02 Corner Beads. Provide corner beads at vertical and horizontal external corners.

3.4.03 Edge Trim. Provide edge trim at the intersection of wallboard surfaces with exterior walls, including furred wallboard construction.

Provide edge trim where ceiling abuts a structural element, dissimilar wall or partition assembly or other vertical penetration, except interior metal stud and wallboard partitions.

3.4.04 Dust Membrane. Provide flexible dust membrane at internal corner formed by wallboard ceiling and wallboard furring on exterior wall.

3.4.05 Finish. Finish gypsum wallboard, to conceal joints and depressions including sanding of final coat, to comply with ASTM C840. Provide levels of finish, as defined in GA-214.

3.5 QUALITY CONTROL.

3.5.01 Penetrations. Box in items which penetrate fire-rated walls or ceilings with same materials that form the wall or ceiling. Support box from structural system of wall or ceiling and not from the penetrating object.

Provide framing in wall and suspension system for the support of lighting fixtures, grilles, diffusers, and other penetrating items.

3.5.02 Sound-Attenuating Construction. Construct partitions indicated to be sound-attenuating to provide a minimum STC of 45 when tested in accordance with ASTM E90. Attach sound attenuation blanket within the stud space to one side of the partition.

Install sound attenuating blanket between studs from floor to ceiling in partitions, which contain plumbing supply or drain lines.

Apply acoustical sealing compound in two parallel beads, 3/8 inch (.9525 cm) in diameter, at each side of runner tracks at juncture with floors, construction above, dissimilar walls, structural elements, around perimeter or back of outlet boxes, and other items penetrating the wallboard. These beads shall be concealed by subsequent construction.

3.6 CLEANING. At the completion of the Work, leave finished space clean, dust free, and in acceptable condition.

End of Section

SECTION 09300

FLOOR COVERINGS

PART 1 – GENERAL

1.1 SCOPE. This section covers flooring finishes to include vinyl composition tile, ceramic tile, and carpeting. Ceramic tile for walls is also addressed.

1.2 GENERAL.

1.2.01 Governing Standards.

AATCC (American Association of Textile Chemists and Colorists) - Test Method 8 – Colorfastness to Crocking: Crocking Meter Method (Wet and Dry Crock).

AATCC Test Method 16E – Colorfastness to Light: Water-Cooled Xenon-Arc Lamp Continuous Light.

AATCC Test Method 134 – Electrostatic Propensity of Carpets.

ANSI (American National Standards Institute, Inc.) A10.20 – Safety Requirements for Ceramic Tile, Terrazzo and Marble Work.

ANSI A108.1C – Contractor's Option - Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Bed with Dry-Set or Latex Portland Cement Mortar.

ANSI A108.4 – Installation of Ceramic Tile with Organic Adhesives or Water Cleanable Tile Setting Epoxy Adhesive.

ANSI A108.5 – Installation of Ceramic Tile with Dry-Set Portland Cement Mortar or Latex Portland Cement Mortar.

ANSI A108.10 – Installation of Grout in Tile Work .

ANSI A108.11 – Interior Installation of Cementitious Backer Units.

ANSI A118.1 – Specifications for Dry-Set Portland Cement Mortar.

ANSI A118.4 – Specifications for Latex Portland Cement Mortar.

ANSI A118.6 – Specifications for Ceramic Tile Grouts.

ANSI A136.1 – Organic Adhesives for Installation of Ceramic Tile.

ANSI A137.1 – Specification for Ceramic Tile.

ASTM (American Society for Testing and Materials) A185 – Specifications for Steel Welded Wire Fabric, Plain, for Concrete Reinforcement.

ASTM C144 – Specifications for Aggregate for Masonry Mortar.

ASTM C150 – Specification for Portland Cement.

ASTM C206 – Specification for Finishing Hydrated Lime.

ASTM C207 – Specification for Hydrated Lime for Masonry Purposes.

ASTM C1028 – Test Method for Determining the Static Coefficient of Friction of Ceramic Tile and Other Like Surfaces by the Horizontal Dynamometer Pull-Meter Method.

ASTM D2261 – Test Method for Tearing Strength of Woven Fabrics by the Tongue (single rip) Method (Constant-Rate-of-Extension Tensile Testing Machine).

ASTM D2646 – Test Methods for Backing Fabrics Characteristics of Pile Yarn Floor Coverings.

ASTM E648 – Test Method for Critical Radiant Flux of Floor Covering Systems Using a Radiant Heat Energy Source.

Fed. Spec. (Federal Specifications) SS-T-312B – Tile, Floor, Asphalt, Rubber, Vinyl, Vinyl-Asbestos.

Fed. Spec. SS-W-40A – Wallbase, Rubber, and Vinyl Plastic.

Fed. Spec. MMM-A-110B – Adhesive, Asphalt, Cut-back Type (for asphalt and vinyl asbestos tiles).

Fed. Spec DDD-C-0095A – Carpet and Rugs, Wool, Nylon, Acrylic, Modacrylic Polyester, Polypropylene.

RFCI (Resilient Floor Covering Institute) – Recommended Work Practices for the Removal of Resilient Floor Coverings.

MIA (Marble Institute of America, Inc.) - Dimensional Stone Design Manual III.

NFPA 101 – Life Safety Code.

TCA (Tile Council of America, Inc.) Handbook for Ceramic Tile Installation.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor Qualifications. Installer shall a minimum than 5 years experience in the installation of flooring specialty of type required in project.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit product data including specifications, quality, color, and manufacturer installation instructions for each type of flooring to be installed as well as all accessories. Accessories include adhesives, mortar, grout, stair covering, vinyl base, etc.

For ceramic tile, submit shop drawings showing location of expansion joints.

For carpeting, submit shop drawings showing seaming diagrams indicating seams, areas of piecing, dimensions, directions of tufting, and locations of reducer strips and other accessories.

1.4.02 Certifications. For carpeting, prior to first delivery of carpet, submit certified copies of test reports, furnished by an independent testing laboratory, covering minimum requirements for flammability, static control, and tuft bind as specified. Accompanying the test reports, submit a certificate of compliance signed by an officer of the carpet manufacturer’s company stating that future deliveries of this quality carpet will conform to the specifications and test results as submitted

Submit a statement of compliance for materials.

Submit a testing laboratory certificate for test for fire hazard classifications. Date of test shall be within 2 years of date of submittal.

Submit, in triplicate, a notarized certificate addressed to the State Fire Marshal or other authority having jurisdiction over the project, stating that the resilient flooring has been installed as specified and as tested for fire hazard classification.

1.4.03 Samples. Submit 1 sample for carpeting and 3 samples for each type of ceramic and resilient tile showing the full range of color and pattern. Provide 1 sample for accessories such as reducer strips, vinyl base, etc.

1.5 DELIVERY, STORAGE AND HANDLING. Protect materials from damage during handling, delivery and storage at the job site.

Deliver flooring materials to project site in manufacturer's original unopened containers with manufacturer's name, brand name, grade, color, size, pattern, dye lot, and other pertinent information clearly marked thereon.

Store materials in their original containers at minimum temperature of 70 degrees F (21.1 degrees C) for at least 24 hours before installation.

For carpet, store materials up off the ground and cover completely to prevent intrusion of moisture and other damage.

Deliver dry-set and prepared Portland cement mortar and grout in sealed, moisture-proof containers.

Deliver latex mortar and grout additives and organic adhesives in sealed containers.

1.6 WARRANTY.

1.6.01 Carpeting. Warrant carpet to be free from undue wear (less than 10% during the warranty period), shrinkage, color irregularity, delamination, edge raveling, zippering at seams or failure to perform as specified herein, for a period of 3 years after completion of installation.

Warrant the carpet installation to be free from wrinkles, bubbles, puckering or other conditions due to faulty installation for a period of 2 years after completion of installation. During the warranty period, replace any carpet that does not provide an attractive appearance consistent with the above conditions.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Carpet and resilient tile installation shall not occur on a floor until after substantial completion of general construction. This means that the applicable areas, except for carpet, resilient tile, and vinyl base, are complete to the extent that the floor may be occupied or used by the Owner for the purpose for which it is intended.

Maintain ambient temperature and materials at approximately 70 degrees F (21.1 degrees C).

For ceramic tile, the ambient temperature shall be at least 50 degrees F (10.0 degrees C) and rising to build Portland cement setting beds, install leveling coats, and set and grout tile in Portland cement mortar. Comply with minimum temperature recommendations of manufacturers for bonding and grouting materials other than Portland cement.

2.2 PERFORMANCE AND BASIS OF DESIGN.

2.2.01 Carpeting. Provide first quality carpet tufted to produce the desired appearance, matching approved samples, free from blemishes and physical defects and meeting requirements of the specifications. Provide materials or treatment of carpet materials that are non-toxic in the form intended for ordinary carpet use, reasonably non-allergenic and free from other recognized health hazards. Provide carpet having no streaks, missing tufts, poorly dyed areas, or other manufacturing defects and that will not fuzz, bead or pill excessively.

2.3 ACCEPTABLE MANUFACTURERS.

2.3.01 Resilient Tile. Armstrong Floor Division, Azrock Floor Products, GAF Corporation, or approved equal.

2.3.02 Carpeting. Constantine Commercial Carpet, or approved equal.

2.4 MATERIALS.

2.4.01 Resilient Tile. Shall be vinyl composition tile, 12 x 12 inches (30.5 x 30.5 cm) by 1/8 inch (3.2 mm) thick, manufacturer, color and pattern as indicated in finish schedule. Tile shall comply with Fed Spec. SS-T-312B, Type IV, Composition 1 with minimum critical radiant flux of 0.45, when tested in accordance with ASTM E648. Tile shall be dimensionally stable, resistant to alkali, grease and oil, factory-waxed, uniform in thickness and cut with square edges. Color and pattern shall be uniform throughout entire thickness.

2.4.02 Resilient Tile Adhesive. Adhesive shall be alkali-resistant and moisture-resistant cut-back type asphaltic cement suitable for use on below-grade concrete subfloor, and shall conform to Fed. Spec. MMM-A-110A.

2.4.03 Resilient Stair Covering Materials. Coverings shall be rubber as manufactured by NORA Rubber Flooring. Adhesive for resilient stair covering shall be waterproof adhesive recommended by manufacturer. Caulking compound shall be epoxy type recommended by manufacturer.

One-piece molded pattern tread and risers shall meet Fed. Spec. RR-T-650, Composition A. Molded rubber, long nose style, 12 1/2 inches (31.8 cm) deep, 5/16 inch (7.9 mm) thick at front tapering to 3/16 inch (4.8 mm) at back, smooth surface, size required to fit indicated tread and riser dimensions.

Rubber tile shall be used as resilient covering for stair landings and other floor surfaces so indicated in stairwells. Rubber tile shall be 3/16 inch (4.8 mm) thick and in same color and pattern as selected for rubber treads.

2.4.04 Resilient Tile Accessory Materials. Transition accessories shall be vinyl as manufactured by the manufacturer of the resilient tile. Color shall be shown in finish schedule or to match surrounding. Adhesive shall be waterproof adhesive recommended by the manufacturer of the resilient tile.

Resilient base shall be vinyl as manufactured by the manufacturer of resilient tile flooring. It shall meet Fed. Spec. SS-W-40A, shall be 4 inches (10.2 mm) high and of topset cove style with premolded smooth top and cove, provided in as long lengths as practicable to suit conditions of installation. Color as indicated in the finish schedule. Adhesive for resilient base shall be waterproof adhesive recommended by the manufacturer of the base.

Concrete Slab Primer shall be non-staining type as recommended by flooring manufacturer.

Leveling and patching compounds shall be latex types as recommended by flooring manufacturer.

2.4.05 Ceramic Tile. Do not use tiles mounted in sheets with paper backing or other backing secured to tiles with water soluble adhesive.

Ceramic tile shall meet ANSI A137.1, standard grade as manufactured by a current member of the Tile Council of America or other approved manufacturer, color and pattern as indicated in the finish schedule.

Ceramic wall tile shall be glazed, impervious ceramic tile, cushion edge, 1/4 inch (6.4 mm) thick by 8 x 8 inch (20.3 x 20.3 cm) size, factory mounted on manufacturer's standard sheets in pattern with straight joints and color as indicated in finish schedule.

Provide coved internal corners, bullnose external corners and other trip shapes shown and required. Trim shall be same material and size as wall tile.

Base shall be the same material and size as wall, unless otherwise specified, straight.

Ceramic floor tile shall be ceramic mosaic tile, unglazed, impervious body, cushion edge, 1/4 inch (6.4 mm) thick by 1 x 1, 1 x 2, 2 x 2 inch (2.5 x 2.5, 2.5 x 5.1, 5.1 x 5.1 cm) nominal size, factory mounted on manufacturer's standard sheets in pattern with straight joints.

Colors shall be as indicated in finish schedule.

Floor tile for shower rooms, including top of curbs, shall be non-slip, containing 7% abrasive mixture.

2.4.06 Ceramic Tile Setting and Grouting Materials. Grout materials shall meet ANSI A118.6. Pigments for use in colored grouts shall be pure, lime proof and non-facing mineral pigments of the type recommended by the grout manufacturer. Water shall be clean and potable. Sand shall comply with ASTM C144 and ANSI A108.10, white where used in white mortar or grout.

Portland cement mortar and grout shall be as follows based on application and location:

Portland cement shall be ASTM C150, Type I, integrally waterproofed where used for floor and wall mortar beds in wet areas.

Hydrated lime shall be ASTM C206 or C207, Type S.

Portland cement grout shall be prepared non-shrinking grout, not field mixed and color as indicated in finish schedule.

Dry-Set Mortar shall be ANSI A118.1, of a color that will not show thru grout joints, and prepared under TCA formula 759 for ceramic wall tile.

Latex Portland cement mortar and grout shall be ANSI A118.4, using only latex additive and prepared mortars or grouts recommended by the manufacturers for use together and for compatibility.

Grout color for floors, walls and bases as indicated in finish schedule.

2.4.07 Organic Adhesives. Shall be ANSI A136.1, Type I or II as recommended by the manufacturer for type of tile and grout and type of installation being used. Organic adhesives used for wall setting of quarry and paver tile shall be a type that will not permit tile to slip.

2.4.08 Ceramic Tile Miscellaneous Materials. Cementitious backer unit shall be Modulars, Inc. “Wonder-Board”, United States Gypsum Co “Durock”, or as approved, 7/16 or 1/2 inch (11.1 or 12.7 mm) thick, 36 inches (91.4 cm) wide, in lengths to suit the application and minimize joints and shall comply with ANSI A118.9.

Waterproof membrane for thin-set installation shall be either Laticrete International, Inc. “Laticrete 301/335”, latex paste with a glass cloth reinforcing, or Noble Co. “Nobleseal TS”, 30 mil nominal CPE Elastomeric sheet laminated to spun-bond polyester.

Metal lath shall be cut from zinc coated steel sheets and weigh not less than 3/4 lbs per sq yd (0.41 kg per sq m), self-furring type.

Reinforcement shall be 2 x 2 inch (5.1 x 5.1 cm) 16/16 gauge (1.4 per 1.4 mm) welded wire fabric complying with ASTM A185.

Expansion joint filler shall be non-extruding type, width to match exposed expansion joint width.

Primer-sealer for gypsum plaster or gypsum wallboard shall be as recommended by the manufacturer or the organic adhesive used.

Latex underlayment shall be type intended for leveling minor depressions and imperfections in concrete floors and masonry walls.

2.4.09 Accessories. Duplex soap holder and rail shall be American Olean Tile Company #591 for thick setting beds or #594 for thin-set applications or as approved.

Marble thresholds shall be MIA group “A”, home finish, 3/4 inch (1.9 cm) thick, unless otherwise indicated. Furnish width and length as required to suit door opening, with beveled edges. Color as selected by Contractor.

Metal divider strips shall be white alloy zinc, 1/8 inch (3.2 mm) thick, heavy top type, depth as required, with suitable anchorage devices.

2.4.10 Carpet Accessories. Adhesive and edge sealers shall be water resistant, non-allergenic, non-flammable, non-toxic type as recommended by the carpet manufacturer for on-grade and above grade installations.

Reducer strips shall be preformed plastic equal to those manufactured by base manufacturer unless otherwise indicated. Acceptability of manufacturer shall be predicated in part on his ability to meet color requirements.
Colors are as indicated in finish schedule.

2.5 MANUFACTURE AND FABRICATION.

2.5.01 Carpet Construction. Yarn material for CPT-01 shall be 100% BASF Zeftron Nylon and for CPT-02 shall be 100% Ultron VIP type 6,6 nylon.

Texture and style for CPT-01 shall be loop and for CPT-02 shall be tip sheared loop.

Tufts per square inch (6.5 sq cm) for CPT-01 shall be 160 and for CPT-02 shall be 112.

Pile height for CPT-01 and CPT-02 shall be 0.2

Yarn face weight for CPT-01 shall be 41 oz., and for CPT-02 shall be 33 oz.

Backing system for CPT-01 and CPT-02 shall be Woven ActionBac.

Widths for CPT-01 and CPT-02 shall be 12 feet.

Carpet dye lots and runs shall be in sequence and clearly identified.

PART 3 – EXECUTION

3.1 INSPECTION.

3.1.01 Resilient Floor and Carpet.

Verify dimensions in the field and supplement or modify the approved shop drawing layout dimensions as required. Report to the Contractor in writing changes from what is shown on the approved drawings and obtain direction before proceeding with the work.

Verify that concrete subfloors are level within 1/4 inch in 10 feet (6.4 mm in 3.0 m) as determined by a 10 foot (3.0 m) straight edge placed anywhere on the surface in any direction, are troweled smooth and level, and will be visibly dry and clean and otherwise acceptable to the applicator before commencing the work.

Perform bond and moisture tests on concrete subfloors to determine if surfaces are sufficiently cured and dry as well as to ascertain presence of curing compounds. Verify that they are acceptable for installation of adhesive and resilient tile or carpeting as determined by manufacturer's moisture testing procedures for concrete slabs.

Do not allow resilient flooring or carpeting work to proceed until subfloor surfaces are satisfactory.

3.1.02 Ceramic Tile. Examine substrates, areas and conditions where tile will be installed with installer present. Check for compliance with tile and tile-setting material manufacturers' written requirements for installation tolerances and other conditions affecting performance of installed tile.

Verify that substrates for setting tile are firm, visibly dry, clean, free from oil, waxy films and curing compounds. Verify substrates are within flatness tolerances required by referenced ANSI A108 series of tile installation standards for installations indicated.

Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work and similar items located in or behind tile has been completed before installing tile.

Verify that joints and cracks in tile substrates are coordinated with tile joint locations. If not coordinated, adjust latter in consultation with Engineer.

To preclude an unacceptable level of moisture in or being emitted from substrates, verify that substrate is acceptable for installation of setting bed and tile as determined by respective manufacturer's moisture testing procedure for concrete slabs, or other substrates.

Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 PREPARATION.

3.2.01 Resilient Tile and Carpeting. Use leveling and patching compounds as recommended by resilient flooring manufacturer for filling small cracks, holes and depressions in subfloors.

Remove coatings from subfloor surfaces that would prevent adhesive bond or be detrimental to the proper installation of carpeting including curing compounds, paint, oils, waxes and sealers. Follow manufacturer's instructions.

Thoroughly clean floor to remove foreign materials and inspect subfloor.

Apply concrete slab primer, if recommended by flooring manufacturer, prior to application of adhesive or installation of carpet. Apply in compliance with manufacturer's directions.

3.2.02 Ceramic Tile. Remove coatings, including curing compounds, and other substances that contain soap, wax, oil or silicone and are incompatible with tile-setting materials by using a terrazzo or concrete grinder, a drum sander or a polishing machine equipped with a heavy-duty wire brush.

Provide concrete substrates for tile floors installed with dry-set or latex-Portland cement mortars that comply with flatness tolerances specified in referenced ANSI A108 series of tile installation standards for installations indicated.

Use trowelable leveling and patching compounds per tile-setting material manufacturer's written instructions to fill cracks, holes and depressions.

Remove protrusions, bumps and ridges by sanding or grinding.

For tile exhibiting color variations within the ranges selected during sample submittals, verify that tile has been blended in the factory and packaged so tile units taken from one package show the same range in colors as those taken from other packages and match approved samples. If not factory blended, either return to manufacturer or blend tiles at project site before installing.

Protect the work and adjacent construction against damage during process of the work until completion.

3.3 INSTALLATION.

3.3.01 Resilient Tile. Install materials in accordance with the manufacturer's printed directions, unless otherwise specified.

Lay tile from the contents of at least two different containers so that the color, or pattern will be uniform and not spotty, as caused by the variances sometimes found in the different containers. If necessary, sort the tile from different containers to provide uniform appearance in the area being laid. Spotty work will be cause for rejection of the work.

Lay tile so as to insure good contact with floor, with close even joints and with finished surfaces in true and smooth plane.

Lay tiles square with room axis and with pattern or grain in one direction, unless otherwise required. Tile at walls shall be not less than half full size.

Fit tile neatly against wall at base, into breaks and recesses and around pipes and other penetrations. Cut, fit and scribe as required by field conditions.

3.3.02 Flooring Transition Accessories. For resilient edge strips (reducers), provide resilient edge strips where floor covering terminates exposing the edge of the covering. Center under door where floor covering terminates at a door opening.

Fit resilient materials to finish flush with abutting flooring and against flooring and other abutting materials, with no joint greater than 1/64 inch (0.40 mm). Scribe to configuration of door frames and other abutting construction.

Bond resilient materials securely to substrate in full bed of adhesive.

3.3.03 Resilient Base. Cut base material into accurate lengths as required for minimum number of joints. Match edges at all seams or double-cut adjoining lengths.

Bond base to substrates in full bed of adhesive. Install with tight butt joints with no joint widths greater than 1/64 inch (0.40 mm). Press down so that bottom cove edge follows floor profile. Top and bottom edges shall have firm contact with floor and wall surfaces.

Form internal corners by mitering. Form external corners by coping and bending material sufficient length around corner for anchorage.

Scribe base accurately to abutting materials.

3.3.04 Resilient Stair Covering. Install resilient materials securely to substrates in full bed of adhesive. For treads, fit integral nosing and cut back edge to profile of stair. Fill with caulking compound the open space at nosing between stair and resilient tread.

On landings, allow rubber tile material to flatten prior to installation. Fit material to finish flush with tread and against riser and other abutting materials with no joint width greater than 1/64 inch (0.40 mm). Match grain and color between adjacent pieces.

3.3.05 Ceramic Tile. Preferred order of work where applicable is installation of base and walls followed by floors.

When fitting tile, cut and drill tile for proper fitting around equipment in place without damaging work. Rub down the exposed sharp edges of cuts with an abrasive stone. Grind and fit carefully at intersections, against trim, finish, and built-in items. Fit tile closely around outlets, pipes, fixtures and fittings, so plates, collars and escutcheons will overlap cuts.

Set tile in a pattern indicated as factory mounted in sheets. Grout joints in ceramic tile with latex Portland cement grout. Grout joint shall be consistent and no wider than 1/8 inch (3.2 mm).

Mix and use proprietary or trade marked setting and grouting materials in strict accordance with manufacturer’s instructions, unless otherwise specified.
When laying out walls, where possible, lay out work so that no tile less than half size occurs. Unless tile work is required to fill vertical spaces exactly, maintain heights indicated in full courses to produce nearest attainable heights without cutting.

When laying out floors, center field work in both directions to permit laying pattern with minimum of cut tiles. Lay floor without borders from center lines outwards. Make necessary adjustments at walls.

Set wall and base tile firmly in bond coat, with joints at jambs, returns and the like level and true with joints in main field. Align vertical joints with joints in floor wherever possible. Set tile with joints straight, level, perpendicular and of even width not to exceed 1/16 inch (1.6 mm) for ceramic tile.

When setting floor tile where an area is over 100 square feet (9.3 sq m), lay the tiles or sheets of tile to a straight edge. Reset straight edge at suitable intervals. Take care in setting tile so that all units and joints are straight and that they intersect uniformly with the units and joints running in the opposite direction. Set tile with joints perpendicular, parallel with room axis, and of even width not exceeding 1/16 inch (1.6 mm) for ceramic tile.

For expansion joints, form expansion joints thru mortar leveling and setting beds, bond coats or adhesive and tile with joint filler and removable wood strips over all control and construction joints in horizontal or vertical surface. Form expansion joints where backing materials change and where tile work abuts restraining surfaces such as perimeter walls, curbs, columns and pipes, and elsewhere as indicated. Form expansion joints in ceramic tile to match width of grout joints in tile field.

Clean tile in accordance with grout manufacturer's instructions and applicable reference specification.

Wet cure walls in wet areas and floors in all areas a minimum of 72 hours in accordance with grout manufacturer's instructions. Cover with polyethylene film as required to keep surfaces constantly damp during curing.

3.3.06 <u>Ceramic Tile Installation on Walls and Bases</u>.

Walls and bases in wet areas on metal studs: Secure membrane of #15 asphalt-impregnated felt or 4 mil (0.10 mm) polyethylene film to metal studs.

Fasten cementitious backer unit to metal studs in accordance with ANSI 108.11, with joints fitted closely, filled solid with latex mortar and taped with glass fiber tape embedded in and covered with latex mortar. Properly support backer unit at cut-outs.

Apply a skim coat of latex mortar, minimum of 1/16 inch (1.6 mm) thick over entire surface and allow to harden.

Set tile on skim coat in a bond coat of dry-set mortar or latex Portland cement mortar in compliance with ANSI A108.5 and mortar manufacturer's instructions.

Walls and bases in wet areas on gypsum wallboard (or gypsum plaster): Apply membrane of #15 asphalt-impregnated felt or 4 mil (0.10 mm) polyethylene film over surface of gypsum wallboard (or plaster).

Apply a layer of metal lath, securing to studs and to gypsum board (or plaster). Cut lath at control joints.

Set tile on fresh mortar bed in a bond coat of neat Portland cement in a bond coat of dry-set mortar or latex Portland cement mortar in compliance with ANSI A108.1.

Walls and bases in dry areas on gypsum wallboard (or gypsum plaster): Prime surface and all cut edges and penetrations of substrate in accordance with adhesive manufacturer's instructions.

Seal all openings at edges of substrate and holes around penetrating elements with non-hardening sealant in accordance with adhesive manufacturer's instructions.

Set tile on organic adhesive of a type recommended by the manufacturer for the type of tile and grout being used. Apply adhesive with a notched trowel as recommended by the manufacturer. Set tile in compliance with ANSI A108.4 and adhesive manufacturer's instructions.

Walls and bases on masonry (or cement plaster): Where wall substrate irregularities exceed 1/4 inch in 8 feet (6.4 mm in 2.6 m) or where walls need to be thickened to provide proper spacing for tile returns, etc., apply a leveling bed. Clean and roughen wall surface as required to thoroughly bond leveling bed.

For leveling beds less than 1/4 inch (6.4 mm) thick, provide dry-set mortar, latex underlayment or latex Portland cement mortar of the type intended for impervious tile.

For leveling beds from 1/4 to 1 inch (0.64 to 2.5 cm) thick provide mix composed of 1 part Portland cement, 1/2 to 1 part hydrated lime and 5 to 7 parts damp sand by volume.

Apply mortar to required thickness and carefully screed surface to true, accurate plane. Cure under vapor proof membrane or other approved method for not less than 3 days before installing tile.

Set tile in a bond coat of dry-set mortar or latex Portland cement mortar in compliance with ANSI A108.5 and mortar manufacturer's instructions.

3.3.07 Ceramic Tile Installation on Floors.

Floors in wet areas: Prepare base slab and install setting bed accurately to slopes indicated and in accordance with ANSI A108.1.

Maximum variation from required plane shall be 1/8 inch in 10 feet (3.2 mm in 3 m).

Reinforce setting bed with reinforcing mesh in center of setting bed thickness.

Install waterproof membrane over setting bed (wet cured 3 days minimum) in accordance with manufacturer's instructions.

Set tile on waterproof membrane in a bond coat of latex Portland cement mortar in compliance with ANSI A108.5 and mortar manufacturer's instructions.

Floors in dry areas: Slab preparation for thin-set installation.

Clean, etch, or scarify slab as required to secure proper bond for tile installation.

Fill depressions in slab with latex underlayment or latex Portland cement mortar.

Set tile on fresh mortar bed in a bond coat of neat Portland cement paste in compliance with ANSI A108.1.

Set tile on cured mortar bed (wet cured 3 days minimum) or on concrete base slab in a bond coat of latex Portland cement mortar in compliance with ANSI A108.5 and mortar manufacturer's instructions.

3.3.08 Accessory Installation. Install a duplex soap holder and rail for each shower head in shower rooms. Anchor securely to wall.

Set marble thresholds firmly into bond coat, level and true in both directions.

Provide metal divider strips at juncture of ceramic mosaic tile floors and other floors where thresholds are not indicated. Set divider strips level, straight and true, at proper heights, and bonded to substrate with adhesive recommended by manufacturer.

3.3.09 Carpeting. Install materials in strict accordance with the manufacturer's printed instructions, except where higher standards are required, direct to concrete floors, using application techniques recommended by the adhesive manufacturer.

Do not install carpet where or when there is excessive moisture present. Condition building area carpet and adhesives as recommended by the respective manufacturer.

Perform necessary cutting on the job site. Unroll carpet face up and cut the lengths required.

Install carpet flat and smooth, without bulges, ridges or wrinkles. Lay work true, even, with tight joints, surfaces flush and set firmly against thresholds and divider strips. Scribe carpeting to within 1/16 inch (1.6 mm) of obstructions.

Cut, fit and scribe carpet edges snugly and evenly along the entire length of abutting vertical surfaces. Stop carpeting at vertical surfaces without the use of trim pieces or moldings. Check starting wall for squareness and allow for off-square walls.

“Dry-cut” vertical obstructions such as columns and pipes with as much overlap as possible. After the carpet is cemented in place, “finish-cut” these areas, being careful to position the seams made by these cuts before working the balance of the carpet into place.

Lay carpet with the rows of yarn parallel and running in the same direction throughout, except as otherwise approved by the Engineer. Side to end of cross seaming will not be approved.

Install carpeting in dye lot and run sequence, matching color and pile height at the juncture of all roll breadths.

Keep carpet joints to a minimum using pieces as large as possible.

Locate seams occurring at doors and parallel to doors centered under the door.

Extend carpet into closets, alcoves and recesses.

Prepare seams by trimming off the factory edge on the carpet, far enough into the carpet so that a clean and even seaming edge is provided, using cutting tools having razor sharp blades.

Treat cut edges or seaming with a seam sealer using a product recommended by the carpet manufacturer. Apply sealer to the edge of the carpet, at the level of the backing material, to form a secure bond when the two pieces of the carpet are jointed together. Remove any excess sealer on the face of the carpet immediately with the proper solvent.

Securely bond seams and cut edges to the subfloor along their entire length. Carefully mark the first seam on the floor, straight and true. Cut and fit carpet before cement is applied, using the first seam mark as a guide. Overlap breadths 1/8 inch to 1/4 inch (3.2 to 6.4 mm) and check junctures for differences in shading and pile height.

Turn back breadths halfway and apply part two of the carpet adhesive with a trowel with notches sized as recommended by adhesive manufacturer. After the first breadth is unrolled and adjusted to the seam line, tuck the overlapped width into place to make a tight fit. Eliminate any puckering or peaking from excess width by distributing the excess toward the center of the breadth with the knee kicker. Close any opened areas by bringing sufficient width from the center with a series of knee kicks. Take care that the knee kicker does not tear the carpet backing.

Sweep trapped air toward the edges, using a stiff push broom and not a linoleum roller. Check seams for evenness of pile height and adjust unevenness by an underlayment of felt paper and double-sided pressure-sensitive carpet tape. Raise pile trapped in seams with a knife point or other suitable instrument.

3.3.10 Protection. Do not allow foot traffic on work on or at perimeter of new tile work until new adhesives and grout have set, dried and cured. For carpeting, do not allow traffic for at least 24 hours. For ceramic tile, do not allow traffic or work for 7 days.

Cover finished floors until all construction is complete.

For ceramic tile, protect waterproof membrane and lead flashings at floor drains.

3.3.11 Cleaning. After installation in an area is complete, remove waste and excess materials, tools and equipment, dirt and debris from the building.

For carpeting, carefully and thoroughly vacuum clean the entire floor surface with an upright, beater bar type vacuum cleaner and clean soiled areas of carpeting.

For tile work, once tile has been sufficiently seated, (7 days for ceramic tile), clean surfaces free of adhesive, dirt and other foreign materials in accordance with the instructions of the tile manufacturer.

Replace flooring that cannot be cleaned satisfactorily for acceptance by the Owner.

3.4 SPARE STOCK. For resilient tile, provide one carton of tile for each 1,000 square feet (93.0 sq m) of flooring installed. For ceramic tile, provide one square foot of tile for each 1,000 square feet (93.0 sq m) of installed flooring tiles.

End of Section

SECTION 09510

ACOUSTICAL CEILINGS

PART 1 - GENERAL

1.1 SCOPE. This section covers lay-in acoustical panel ceilings with exposed grid suspension systems to be furnished and installed at the locations indicated on the drawings.

1.2 GENERAL.

1.2.01 Governing Standards.

AM (Acoustical Materials) MA-1-II - Ceiling Sound Transmission Test by Two-Room Method.

ASTM (American Society for Testing and Materials) C423 – Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.

ASTM C635 - Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings.

ASTM C636 – Specification for Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.

ASTM C665 - Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.

ASTM E84 - Test Method for Surface Burning Characteristics of Building Materials.

ASTM E1264 – Specification for Classification for Acoustical Ceiling Products.

CISCA – Ceilings and Interior Systems Construction Association.

National Fire Protection Association (NFPA) 90A – Installation of Air Conditioning and Ventilating Systems.

1.3 QUALITY ASSURANCE.

1.3.1 Contractor's Qualifications. Contractor shall be authorized by manufacturer with a minimum of 5 years experience.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit Shop Drawings that show layout of ceiling suspension system(s) to be installed, pattern, mechanical fixtures, and other items that will penetrate the ceiling system. Submit large scale isometric detail showing method of suspension, support fastening devices, tying, carrying members, main runners cross runners, wall molding, accessibility, special framing and bracing methods for items supported by the system. Also show large scale cross section drawings detailing light fixtures, air diffusers, grilles, sprinkler heads and other items that penetrate the ceiling system.

1.4.02 Certifications. Submit in triplicate a certificate addressed to the Fire Marshall or other authority having jurisdiction over the Project in the following suggested format with bracketed questions completed:

> "This is to certify that, (name of product) which was or will be furnished to (company making application of product) for (job or Project name and address) is the same in all respects in content, and specifications for mixing and/or application as the specimen tested by (name of laboratory) on their project or test number (test number) dated (date of test).
>
> Flame spread is (flame spread test result number).
>
> Smoke developed is (smoke test result number developed)."

Also, submit a certificate addressed to the Fire Marshall or other authority having jurisdiction over the Project from the company that installed the product, stating that the product was installed as tested.

Submit a testing laboratory certificate from an independent and nationally recognized testing laboratory identifying tests for fire hazard classification dated within 2 years of date of submittal. Test report, in duplicate, for fire resistance rating, showing construction details of test panel. One copy will be returned for use by the Contractor.

Also submit certificate of compliance stating that materials and installation comply with the Contract Documents.

1.4.03 Samples. Submit full size samples for each type of acoustical units, as specified in finish schedule and grid system components. Full size sections shall be approximately 12 inches (30.48 cm) long.

1.4.04 Test Reports. Submit test data for suspension members as outlined in ASTM C635 and performed by an approved independent testing laboratory. Submit data in log form as outlined in C635, Article 10. Submit shear and pull-out test data for hanger devices to be used.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver materials in their original packages, containers or bundles with manufacturer's name, brand name, grade and other pertinent data clearly marked.

Store materials in original containers in dry area at not less than 65 degrees F (18.33 degrees C) for at least 24 hours before installation.

1.6 WARRANTY. Warrant the Work for 2 years against defective materials and workmanship, including shrinkage of acoustical units and discoloration, except where such failure is due to abuse or failure of related work installed by other parties.

During the warranty period, restore defective Work to the standard of the Contract Documents, including materials, labor, refinishing and other costs incidental to the Work. Inspect the Work within 24 hours after receipt of notice from the Engineer. Restore Work found to be defective as defined in the Contract Documents within 10 days after receipt of notice from the Engineer.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Prior to start of the Work, maintain the spaces to receive the work at minimum temperature of 65 degrees F (18.33 degrees C).

Install acoustical materials only when normal temperature and humidity conditions approximate the interior conditions that will exist when the building is occupied. Maintain these conditions during and after the installation.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Minimum performance requirements for completed acoustical ceiling installations as tested by an approved independent testing laboratory:

Noise reduction coefficient (NRC) range shall be as specified, when tested in accordance with ASTM C423, mounting no. 7 suspension system. Ceiling sound transmission class (STC) shall be as specified, when tested in accordance with AMA-1-II with interrupted ceiling detail at partitions.

Light reflectance coefficient shall be a minimum 0.90 per ASTM E1264.

Fire hazard classification shall be a maximum of 25 for flame spread and 50 for smoke developed, when tested in accordance with ASTM E84.

2.2.01 Plenum Chamber. When the space above the suspended ceiling system is used as an air plenum and the ceiling system is not a required part of a UL-fire-rated assembly, provide members of the ceiling system which meet the requirements of NFPA 90A.

2.2.02 Suspension System Members. Support all applied dead loads without exceeding a deflection of 1/360 of the unsupported span.

2.3 ACCEPTABLE MANUFACTURERS.

2.3.01 Suspension System. Chicago Metallic, Donn Corporation, or equal.

2.3.02 Acoustical Ceiling Units. Armstrong Cork Company, Celotex Corporation, Conwed Corporation, U.S. Gypsum Company, or equal.

2.4 MATERIALS.

2.4.01 Suspension System Members. Fabricate members and devices from materials and conform to design criteria for intermediate-duty systems, as specified in ASTM C635 and as modified in this Section.

For hanger attachment devices, provide anchors, fasteners, hooks, eyebolts and other devices designed for fastening to building construction, for support of ceiling suspension systems, and for maximum loads that may be transmitted by the completed ceiling system. Furnish devices that are to be set in concrete complete with approved placement and location drawings.

Hanger wire shall be galvanized carbon steel, soft temper, prestretched, with a yield stress load of at least 3 times design load, but not less than 12 gage (2.8 mm).

Carrying, hanging and bracing channels shall be 11/2 inch (3.81 cm) cold rolled steel, galvanized, having a minimum weight of 0.475 lbs per lineal foot (0.711 kg per m), unless otherwise indicated.

Tie wire shall be not less than 18 gage (1.3 mm) soft temper galvanized steel. Specially designed spring wire and sheet steel clips may be used providing they meet the standards specified.

2.4.02 Wall Molding. Shall be angle or channel shaped; unless indicated otherwise, exposed flange of same width as main runners; factory finished to match main runners.

Provide special shadow line wall molding as indicated.

2.4.03 Acoustical Tiles. Shall be mineral tile of homogeneous mineral fiber, blended and cast with cementitious binder and manufactured by Armstrong World Industries, Inc. “Cirrus”; USG Interiors, Inc. “Eclipse”; or approved equal.

Tile size shall be of 24” x 24” (61.0 cm x 61.0 cm) , thickness shall be 3/4 inch (1.9 cm), edge treatment shall be ‘shadowline’, NRC range shall be 0.65 - 0.75. Thermal resistance (R-value) shall meet or exceed 2.12, face pattern shall be monolithic texture and the finish shall be factory applied vinyl latex paint with white.

2.4.04 Sound Attenuation Blanket. Shall be 2 inch (5.1 cm) thick glass or mineral fiber complying with ASTM C665, Type I, 2.5 pcf (40.1 kg per cu m) density.

2.4.05 Acoustical Sealant. Shall comply with acoustical ceiling system manufacturer’s instructions.

2.4.06 Acoustical Ceiling Systems. Provide acoustical ceilings consisting of ceiling suspension systems and acoustical elements, as indicated and specified.

2.4.07 Exposed Grid Lay-In System. Factory-finished exposed main runners and cross runners directly suspended from overhead construction shall be mechanically interlocked. Acoustical lay-in panels (boards) shall be sized for laying in the grid openings and supported by the exposed flanges of the grid members. Exposed angle or channel molding shall be used to support panels at wall line.

In ceilings which form an air plenum and where indicated, hold panels in place with clips.

In systems using panels with regressed edges, provide shims for support of runners at wall molding where panel edges are cut square.

PART 3 - EXECUTION

3.1 PREPARATION. Protect this Work and adjacent construction against damage during progress of the Work until completion of the Project.
Coordinate with the other work supported by or penetrating through ceilings, including light fixtures, HVAC equipment and partition systems.

3.2 INSTALLATION. Install acoustical ceiling systems, in conformance with ASTM C636, modifications included in this Section, approved Shop Drawings, material samples and printed information from material manufacturer.

3.2.01 Suspension System. Hang suspension system independent of walls, columns, ducts, pipes and conduit. Where carrying members are spliced, avoid visible displacement of face plane adjacent members.

Do not attach to or suspend (support) from metal roof deck any part of ceiling suspension system.

Where overhead construction will not permit attachment to or the proper location of hanging devices, provide additional support steel in the form of specified carrying channels or other steel members of size required to safely support the completed ceiling system.

Install entire ceiling system so additional bracing is not required to support movable partitions at any point.

3.2.02 Acoustical Units. Install acoustical units in strict conformance with manufacturer's approved printed installation instructions and this Section.

Install sound attenuation blanket over ceilings indicated to be sound attenuated.

Seal joints between wall or partition and wall molding for ceilings indicated to be sound attenuated with acoustical sealant.

In all locations where edges of acoustical units are exposed and at intersection of acoustical units with all vertical surfaces, provide wall molding. Rest ends of runners on extended leg of wall molding and wire-tie or clip the runners to the wall molding.

Provide all framing in acoustical ceilings for support of lighting fixtures, grilles, and other penetrating features as indicated and as required to complete the installation. Coordinate the Work with that of mechanical and electrical work.

Locate acoustical units in a straight pattern with border units not less than 1/2 unit in width. Center joints or center line of units on lighting fixtures or other penetrations. Locate units accurately with joints parallel with room axis, and in line, in both directions.

3.2.03 Cutting and Fitting.

Do all cutting and fitting of acoustical materials as required to complete the Work and to accommodate the work of other trades.

Where cut edges of lay-in tile or boards with edge treatment other than square occur at wall molding, rout the edges to match the edge treatment.

3.2.04 Adjusting. Remove and replace acoustical units that are defective, or that have been damaged for any reason, with new matching acoustical units.

Repaint acoustical metal pan units that have been scratched, marred or have otherwise damaged surfaces to match adjacent units, or replace them with new matching units, as approved.

3.2.05 Cleaning. Following completion of Work, clean dirty or discolored acoustical units and leave surfaces free from any foreign matter.

End of Section

SECTION 09720

WALL COVERINGS

PART 1 – GENERAL

1.1 SCOPE. This section includes surface preparation, prime painting, and vinyl coated fabric wall covering.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) D4442 - Test Methods for Direct Moisture Content Measurement of Wood and Wood-Base Materials.

ASTM E84 – Test Method for Surface Burning Characteristics of Building Materials.

ASTM F793 – Specification for Classification of Wallcovering by Durability Characteristics.

FS L-P-1040 – Specification for Plastic Sheets and Strips (Polyvinyl Fluoride).

NFPA (National Fire Protection Association) 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. Company shall specialize in manufacturing products specified in this section with a minimum of 5 years documented experience.

1.3.02 Installer Qualifications. Company shall specialize in performing Work of this section with a minimum of 5 years documented experience.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Shop drawings shall indicate wall elevations with seaming layout. Submit product data on covering and adhesive.

Submit manufacturer's installation instructions, special procedures, and any perimeter conditions requiring special attention.
Submit data on cleaning, touch-up, and repair of covered surfaces.

1.4.02 Samples. Submit 3 samples of covering 12 x 12 inch (30.5 x 30.5 cm) in size illustrating color, finish, and texture.

1.4.03 Test Reports. Test reports shall indicate verification of flame and smoke ratings tested by UL or an agency approved by authority having jurisdiction.

1.4.04 Mock-Up. Provide panel, 8 feet (2.4 m) wide, and full height, that illustrates installed covering, and joint seaming technique. Locate where directed by Engineer. Mock-up may remain as part of the work.

1.4.05 Extra Materials. Supply 25 linear feet (7.62 linear m) of each color and pattern of covering; store where directed by Engineer.

Package and label each roll by manufacturer, color and pattern, and destination room number.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver wall paper rolls in their original packaging with manufacturer’s name, brand names, grade, lot, etc. clearly marked. Inspect roll materials on site to verify acceptance. Protect packaged adhesive from temperature cycling and cold temperatures. Do not store roll goods on end.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Do not apply materials when surface and ambient temperatures are outside the temperature ranges required by the adhesive or vinyl covering product manufacturer.

Maintain temperatures within manufacturer approved range 24 hours before, during, and after installation of adhesive and covering.

Provide lighting level of 80 ft candles measured mid-height at substrate surfaces.

2.2 PERFORMANCE REQUIREMENTS AND BASIS OF DESIGN. Wall coverings shall conform to flame and smoke ratings of 25/50 when tested to ASTM E84.

2.3 ACCEPTABLE MANUFACTURERS. Columbus Coated Fabrics, GenCorp Wall Coverings, Koroseal Wall Coverings, Vicrtex Wall Coverings or approved equal.

2.4 MATERIALS. Wall covering shall be vinyl coated fabric roll stock and shall comply with ASTM F793. Include clear top overcoat of polyvinyl fluoride in accordance with FS L-P-1040 Type 1, Grade B, Class 2, 0.0005 inch (0.01 mm) thick.

Adhesive shall be type recommended by covering manufacturer to suit application to substrate.

Termination trim shall be extruded plastic.

Substrate filler shall be as recommended by adhesive and covering manufacturers.

Substrate primer and sealer shall be alkyd enamel.

PART 3 – EXECUTION

3.1 INSPECTION. Verify that substrate surfaces are prime painted and ready to receive work, and conform to requirements of the covering manufacturer.

Measure moisture content of surfaces using an electronic moisture meter. Do not apply coverings unless moisture content of surfaces is below the following maximums:

> Plaster and Gypsum Wallboard: shall be less than 12 percent.
>
> Masonry, Concrete, and Concrete Unit Masonry: shall be less than12 percent.
>
> Wood Surfaces: shall be less than 15 percent, measured in accordance with ASTM D4442.

Verify flatness tolerance of surfaces does not vary more than 1/8 inch in 10 feet (3 mm in 3 m) nor vary at a rate greater than 1/16 inch per ft (1.5 mm per 300 mm).

3.2 PREPARATION.

Remove or mask electrical plates, hardware, light fixture trim, escutcheons, and fittings prior to preparing surfaces or finishing. Wash impervious surfaces with tetra-sodium tri-sodium phosphate, rinse, neutralize and wipe dry. Correct defects and clean surfaces, which affect work of this section. Remove existing coatings that exhibit loose surface defects. Fill cracks in substrate, smooth irregularities with fillers, and sand to a smooth finish. Seal marks with shellac, which may bleed through surface finishes. Apply one coat of primer sealer to substrate surfaces. Lightly sand smooth surface once allowed to dry. Vacuum clean surfaces free of loose particles.

3.3 INSTALLATION. Apply adhesive to wall covering surface immediately prior to application of covering. Let contact adhesive set tack free. Use each roll in appropriate number of sequences to match pattern. Razor trim edges on flat work table, changing blade often to prevent rough cut edges. Do not razor cut on gypsum board surfaces. Apply covering smooth, without wrinkles, gaps or overlaps. Eliminate air pockets and ensure full bond to substrate surface. Butt edges tight. Horizontal seams are not acceptable. Do not seam within 2 inches (5.1 cm) of internal corners or within 6 inches (15.2 cm) of external corners. Install covering before installation of bases, cabinets, hardware, or items attached to or spaced slightly from wall surface. Do not install covering more than 1/4 inch (6.4 mm) below top of resilient base. Cover spaces above and below windows, above doors, in pattern sequence from roll. Apply covering to electrical, telephone and wall plates prior to replacing.

Covering is required behind radiation and convector covers.

Where covering tucks into reveals, metal wallboard or plaster stops, apply covering with contact adhesive within 6 inches (15.2 cm) of covering termination. Ensure full contact bond. Install termination trim. Remove excess adhesive while wet from seam before proceeding to next covering sheet. Wipe clean with dry cloth.

3.4 CLEANING. Clean coverings of excess adhesive, dust, dirt, and other contaminants. Reinstall wall plates and accessories removed prior to work of this section.

End of Section

SECTION 09900

PAINTING

PART 1 - GENERAL

1.1 SCOPE. Painting of all equipment, pipe, ducts, conduits, accessories and appurtenances is included in this section. Furnish all materials, equipment and labor for painting to include surface preparation, prime coats and topcoats as specified.

Coatings for exterior work shall include exterior epoxy gloss enamel and exterior epoxy semi-gloss enamel.

Coatings for Interior work shall include overhead, self-priming, one-coat epoxy flat finish (spray-applied), alkyd eggshell enamel, alkyd semi-gloss enamel, epoxy semi-gloss enamel, epoxy gloss enamel, and epoxy eggshell enamel.

1.2 GENERAL. The term paint shall mean both paints and coatings including emulsions, enamels, stains, varnishes, sealers, and all other coatings whether organic or inorganic and whether used as prime, intermediate, or finish coats.

The Contractor shall purchase paint from an approved manufacturer. The manufacturer shall assign a representative to inspect the application of the product both in the shop and field. The manufacturer's representative shall submit a report to the Engineer at the completion of the work, identifying the products used and verifying that said products were properly applied and that the paint systems were proper for the exposure and service.

All new buildings, facilities, structures, and appurtenances, which are customarily painted, shall be painted with not less than 1 shop coat and 2 field coats, or 1 prime coat and 2 finish coats of the appropriate paint. Surfaces of exposed members that will be inaccessible after erection shall be cleaned and painted before erection.

Aluminum, stainless steel, fiberglass, and bronze work shall not be painted unless color coding and marking is required or otherwise specified.

Unless otherwise required or specified, do not paint factory-finished or installer-finished items such as metal toilet enclosures, prefinished partition systems, acoustic materials, architectural woodwork and casework, elevator entrance doors and frames, elevator equipment, and finished mechanical and electrical equipment, including control, light fixtures, switchgear and distribution cabinets.

Unless otherwise indicated or specified, do not paint surfaces in concealed areas and generally inaccessible areas, foundation spaces, furred areas, utility tunnels, pipe spaces, duct shafts and elevator shafts.

Unless otherwise indicated or specified, do not paint moving parts of operating units, mechanical and electrical parts, such as valve and damper operators, linkages, sinkages, sensing devices, motor and fan shafts.

Paints and the paint products mentioned in this specification are given as standards of quality. Products of other manufacturers, comparable in quality and type to those specified will be acceptable if the manufacturer provides, in writing, satisfactory proof and data on past performance of similar applications in water and wastewater treatment plants.

Contractor shall be responsible for abatement and disposal, by suitable means and methods, for all hazardous substances before applying any coatings.

1.2.01 Governing Standards.

American Society for Testing and Materials (ASTM) D16 – Standard Terminology for Paint, Related Coatings, Materials and Applications.

Society for Protective Coating SSPC-SP 1 - Solvent Cleaning.

SSPC-SP 3 - Power Tool Cleaning.

SSPC-SP 6 - Commercial Blast Cleaning.

SSPC-SP 7 - Brush-Off Blast Cleaning.

SSPC-SP 10 - Near-White Blast Cleaning.

1.3 QUALITY ASSURANCE. Provide primers and other undercoat paint produced by same manufacturer as finish coats. Use only thinners approved by paint manufacturer, and use only within recommended limits.

Review other Master Specification Sections in which prime paints are to be provided to ensure compatibility of total coatings system for various substrates. Upon request from other trades, furnish information or characteristics of finish materials provided for use, to ensure compatible prime coats are used.

All materials shall be brought to the jobsite in the original sealed and labeled containers and shall be subject to inspection by the Engineer.

Conform to applicable code for flame/fuel/smoke rating requirements for finishes.

1.3.01 Manufacturer's Qualifications. The product manufacturer shall be a company specializing in manufacturing quality paint and finish products with 5 years documented experience.

1.3.02 Contractor's Qualifications. The applicator shall be a company specializing in commercial painting and finishing with 5 years of documented experience.

1.3.03 Testing. Wet film thickness readings or spreading rate checks shall be made by the Contractor for each 500 square feet (46.5 sq m) of painted surface to make certain that proper film thickness is being achieved. More frequent checks may be required by the Contractor at his discretion.

Films exhibiting defects shall be entirely removed and the surface recoated at no additional cost to the Owner.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit product data, including paint label analysis and application instructions for each material proposed for use including all finishing products and special coatings. Submit Material Safety Data Sheets (MSDS). Manufacturers of equipment to receive finish coating in the shop shall submit color charts with the shop drawings for color selection by the Engineer.

1.4.02 Certification. The manufacturer shall provide certification that all paints, primers and thinners which may come into contact with potable water meet the National Sanitation Foundation Standard 61 and all MDCH and MDEQ regulations in force at the time of submittals.

1.4.03 Samples. Submit 3 each 8 x 10 inch (20.3 c 25.4 cm) samples indicating textures for each scheduled finish surface.

1.4.04 Extra Stock. Provide a 1 gallon container of each color and surface texture to Engineer and store as directed by Engineer. Label each container with color, texture, date, room locations, and surface preparation in addition to the manufacturer's label.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver products to site in original, new and unopened labeled packages and containers.

Container labeling shall include manufacturer's name, stock number, date of manufacture, type of paint, brand name, brand code, coverage, surface preparation, drying time, cleanup, color designation, contents by volume, for major pigments and vehicle constituents, thinning instructions, and instructions for mixing.

Store paint materials at minimum ambient temperature of 45 degrees F (7.2 degrees C) and a maximum of 90 degrees F (32 degrees C), in well ventilated area, unless required otherwise by manufacturer's instructions.

Take precautionary measures to prevent fire hazards and spontaneous combustion.

Oily or solvent-soaked rags and all waste shall be removed every night. All necessary precautions shall be taken to reduce fire hazard to a minimum.
No flammable or combustible compounds or material shall be stored within any building or structure. All painting materials used on the job shall be stored in a single place designated by the Contractor. Such storage shall comply with MIOSHA requirements and the recommendations of the National Fire Protection Association (NFPA).

Upon completion of the work, if the storage space was a fixed part of the project, it shall be left clean and in as good a condition as any other area on the job. Any damages to such storage space or its surroundings shall be restored at no cost to the Owner.

1.6 WARRANTY. All work under this Section of the Specifications shall be guaranteed against checking, cracking, peeling, discoloration or other defects due to improper materials. It shall also be guaranteed against, inadequate workmanship due to improper preparation of the surfaces which were not in proper condition to receive paint, varnish or other painter's materials. All unsatisfactory work shall be completely removed and refinished in accordance with the Guarantee requirements of the Contract Documents.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Provide continuous ventilation and heating facilities to maintain surface and ambient temperatures above 50 degrees F (10 degrees C) for Latex (water-base) paints and 45 degrees F (7.2 degrees C) for solvent-thinned paints for 24 hours before, during and 48 hours after application. Otherwise follow manufacturer's instructions.

Apply Latex (water-base) paints only when temperature of surfaces to be painted and surrounding air temperatures are between 50 and 90 degrees F (10 and 32 degrees C) and at least 5 degrees F (2.8 degrees C) above the dew point unless required otherwise by manufacturer's instructions.

Apply solvent-thinned paints only when temperature of surfaces to be painted and surrounding air temperatures are between 45 and 95 degrees F (7.2 and 35.0 degrees C) and at least 5 degrees F (2.8 degrees C) above the dew point unless required otherwise by manufacturer's instructions.

Do not apply paint in snow, rain, mist, or when relative humidity exceeds 85%, or to damp or wet surfaces, unless otherwise permitted by paint manufacturer's printed instructions, or when the wind direction and velocity is such that overspray will not

fall on objects not scheduled to be painted or which cannot be protected from overspray.

Painting may be continued during inclement weather if areas and surfaces to be painted are enclosed, heated and dehumidified within the temperature limits specified by paint manufacturer during application and drying periods.

Provide lighting level of 80 ft.-candles measured mid-height at substrate surface.

Material specified for all coats applied to fabrics and vapor barrier jackets over insulation shall contain a fungicide that will not adversely affect the color, texture, or durability of the coating. The paint shall contain a fungicide incorporated into the paint by the manufacturer.

Paints and painting practices shall comply with all applicable state and local laws enacted to insure compliance with Federal Clean Air Standards.

Paints containing lead or chromium in excess of 0.06 percent by weight of the total nonvolatile content (calculated as lead or chromium metal) shall not be used.

Mercurial fungicides shall not be used.

2.2 MATERIALS. The products of manufacturers not named may be submitted for use provided they are equal in quality and grade to the primers and finishes specified. If substitute paint products are desired, submit a statement to the Engineer giving the manufacturer's name, proposed primer and finish for each paint system, analysis of each type of paint, and the use or uses intended.

The painting systems required for the various surfaces shall be in accordance with the following paragraphs, unless specified otherwise in the finish schedule or other sections of the specifications. All coats shall be applied to the dry film thickness (DFT) specified. Products of other manufacturers meeting or exceeding these specifications will be acceptable.

2.2.01 Ferrous Metal Surfaces, Interior, Non-Submerged. Surface preparation shall be in accordance with SSPC-SP 6 - Commercial Blast Cleaning. Primer shall be one coat (2.5-3.5 mils DFT) Tnemec "37H Chem-Prime H.S." and finish shall be two coats (3-4 mils DFT)Tnemec "n69 Hi-Build Epoxoline II or n69F Hi-Build Epoxoline II when temperature is below 55ºF at coat application ". Or for primer use one coat (3-4 mils DFT) Carboline "888 Primer" and for the finish coat use two coats (3-4 mils DFT) Carboline "Carboguard 890".

2.2.02 Ferrous Metal Surfaces, Exterior, Non-Submerged.
Surface preparation shall be in accordance with SSPC-SP6-Commercial Blast Cleaning. Spot prime bare areas with one coat (3-5 mils DFT) Macropoxy 646 (or Duraplate 235 for cold weather application). The intermediate coat shall be one coat (4-5 mils DFT) Macropoxy 646 (or Duraplate 235 for cold weather application). The finish coat shall be one coat (1.5-2.5 mils DFT) Acrolon 218HS or High Solids Polyurethane.

As an alternative, the primer shall be one coat (3-5 mils) DFT Carboline “888 Primer”. The intermediate coat shall be one coat (4-5 mils DFT) Carboline “Carboguard 890”, and the finish coat shall be one coat (1.5-2.5 mils DFT) “Carbothane 134 HG”.

As second alternative, the primer shall be one coat (2.5-3.5 mils) DFT Tnemec “37H Chem-Prime H.S.” The intermediate coat shall be one coat (4-5 mils DFT) Tnemec“n69 Hi-Build Epoxoline II or n69F Hi-Build Epoxoline II when temperature is below 55ºF at coat application ", and the finish coat shall be one coat (2-5 mils DFT) Tnemec “1074 Endura-Shield".

As a third alternative, the primer shall be one coat (2-3 mils DFT) International Paint LLC “Devoe 201H”. The intermediate coat shall be one coat (4-6 mils DFT) International Paint LLC “Devoe 231 Series”. The finish coat shall be on coat (2-3 mils DFT) International Paint LLC “Devoe 379 Series

2.2.03 Ferrous Metal Surfaces, Submerged. Surface preparation shall be in accordance with SSPC-SP 10 – Near-White Blast Cleaning. The primer shall be one coat (4-6 mils) DFT Carboline “888 Primer” and the finish coat shall be two coats (4-6 mils DFT) Carboline “Carboguard 890". Or the primer shall be one coat (3-5 mils DFT) Tnemec “N27 S.T. Typoxy”, and the finish shall be Tnemec “69 High-Build Epoxoline II”, two coats, 4-6 mils DFT, each.

As a second alternative, the primer shall be one coat (4-6 mils DFT) International Paint LLC “Devoe 236” and the finish coat shall be two coats (4-6 mils DFT) International Paint LLC “Devoe 236”.

As a third alternative, the primer shall be one coat (4-8 mils DFT) Sherwin- Williams DuraPlate 235 and finish coat shall be one coat (4-8 mils DFT) Sherwin-Williams Dura-Plate 235.

2.2.04 Ferrous Metal Surfaces, Submerged (NSF Certified Systems). Surface preparation shall be in accordance with SSPC-SP 10 – Near-White Blast Cleaning. The primer shall be Carboline “Carboguard 891”, one coat, 4-6 mils DFT, and the finish coat shall be Carboline “Carboguard 891”, 2 coats, 5-7 mils DFT. As an alternative the primer shall be Tnemec “N140 Pota-Pox Plus”, one coat, 4-6 mils DFT and the finish coat shall be Tnemec “N140 Pota-Pox Plus”, two coats, 5-7 mils DFT. A second alternative would be to use no primer and use as the finish coat

Sherwin Williams “Hi-Solids Catalyzed Epoxy”, three coats (use different color for second coat), 5-7 mils DFT.

2.2.05 Hollow Metal Work, Exterior. Surface preparation shall be in accordance with SSPC-SP 3 - Power Tool Cleaning. The prime coat shall be Tnemec “37H Chem-Prime H.S.”, one coat, 2.5-3.5 mils DFT or Tnemec “N27 S.T. Typoxy”, one coat, 2.5-3.5 mils DFT, the intermediate coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 3-4 mils DFT, and the finish coat shall be Tnemec “74 Endura-Shield”, one coat, 1.5-2.5 mils DFT. As an alternative, the primer coat may be Carboline “888 Primer”, one coat, 2.5-3.5 mils DFT, the intermediate coat shall be Carboline “Carboguard 890”, 3-4 mils DFT and the finish coat shall be Carboline “Carbothane 134 HG”, one coat, 1.5-2.5 mils DFT.

2.2.06 Hollow Metal Work, Interior. Surface preparation shall be in accordance with SSPC-SP 2 - Hand Tool Cleaning. The shop primer shall be Tnemec “37H Chem-Prime H.S.”, one coat, 2.5-3.5 mils DFT, and the finish coat shall be Tnemec “69 High-Build Epoxoline II”, two coats, 2.5-3.5 mils DFT, each. As an alternative, the shop primer may be Carboline “888 Primer”, one coat 2.5-3.5 mils DFT, and the finish coat shall be Carboline “Carboguard 890”, two coats, 3-4 mils DFT, each.

2.2.07 Galvanized Surfaces, Exterior. Surface preparation shall be in accordance with SSPC-SP 1 - Solvent Cleaning. No primer is required and the finish coat shall be Tnemec “69 Hi-Build Epoxoline II”, two coats, 2.5-3.5 mils DFT, each as an alternative the finish coat shall be Carboline “Carboguard 890”, two coats, 3-4 mils DFT, each.

2.2.08 Galvanized Surfaces, Interior. Surface preparation shall be in accordance with SSPC-SP16 Brush-Off Blast Cleaning of Non-Ferrous Metals. Prime Coat shall be Tnemec Series 66 Hi-Build Epoxoline at 2.0-4.0 mils DFT. Finish Coat shall be Tnemec Series 290 CRU at 2.0-3.0 mils DFT.

2.2.09 Aluminum. Surface preparation shall be in accordance with SSPC-SP 1 - solvent cleaning. No primer is required. The finish coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 3-4 mils DFT. Or Carboline “Carboguard 890”, one coat, 3-4 mils DFT.

Aluminum in contact with concrete, masonry, or dissimilar metals shall be thoroughly protected cathodically by means of a heavy application thereon of an approved permanent bituminous material or approved insulating product.

2.2.10 Ferrous Metal Surfaces Exposed to Heat (From 200° to 600°F). Surface preparation shall be in accordance with SSPC-SP 10 - Near-White Blast Cleaning. The primer coat shall be Tnemec “43-38H Diffused Aluminum”, one coat, 1.2 mils DFT and the finish coat shall be same as primer, one coat, 1 mil DFT. Or the primer shall be Carboline “Thermaline 4900”, one coat, 2.5 mils DFT and the finish coat shall be same as primer, one coat, 2 mil DFT.

2.2.11 Concrete Ceilings. Surface preparation shall allow concrete to cure 28 days, if new. Remove all foreign matter; leave dust free and dry, moisture level below manufacturer's requirements. Primer coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 3-4 mils DFT and the finish coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 3-4 mils DFT. As an alternative, no primer is required and the finish coat shall be Carboline “Carboguard 890”, two coats, 3-4 mils DFT, each.

2.2.12 Concrete Building Walls, Interior. Surface preparation shall allow concrete to cure 28 days, if new. Remove all foreign matter, leave dust free and dry, moisture level below manufacturer's requirements. Primer coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 3-4 mils DFT and the finish coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 5-6 mils DFT. As an alternative, the primer coat shall be Carboline “Carboguard 890”, one coat, 3-4 mils DFT, and the finish coat shall be Carboline “Carboguard 890”, one coat, 5-6 mils DFT.

2.2.13 Concrete Block Masonry, Interior. Surface preparation shall be general cleaning. The primer coat shall be Tnemec “54-660 Masonry Filler” and the finish coat shall be Tnemec “69 Hi-Build Epoxoline II”, two coats, 3-4 mils DFT, each. As an alternative, the primer coat shall be Carboline “Carboguard 954 HB 9029” and the finish coat shall be Carboline “Carboguard 890”, two coats, 3-4 mils DFT, each.

2.2.14 Concrete Surfaces Inside Tanks (Subject To Immersion). Surface preparation shall be to abrade per ASTM D4259. The primer coat shall be Tnemec “69 Hi-Build Epoxoline II”, two coats, 10 mils DFT with no finish coat. As an alternative, the primer/finish coat shall be Carboline “Carboguard 890”, two coats, 10 mils DFT; Tnemec “N140 Pota-Pox Plus”, two coats, 10 mils DFT; or Carboline “Carboguard 891”, two coats, 10 mils DFT.

2.2.15 Concrete Floors. Surface preparation shall be to etch new floors with muriatic acid, flush thoroughly with clean water and dry for a minimum of 72 hours. The primer coat shall be Tnemec “69 Hi-Build Epoxoline II”, one coat, 3-4 mils DFT, and the finish coat shall be Tnemec “69 Hi-Build Epoxoline II”, non-skid, one coat, 3-4 mils DFT, each. As an alternative, the primer: Carboline “Carboguard 890”, one coat, 2-3 mils DFT, and the finish coat shall be Carboline “Carboguard 890”, non-skid one coat, 3-4 mils DFT.

2.2.16 Concrete or Concrete Block Masonry, Exterior. Surface preparation shall allow to cure 28 days, if new. Remove all foreign matter, leave dust free and dry, moisture level below manufacturer's requirements for concrete. Perform general cleaning for block walls. The primer coat shall be Tnemec “69 Hi-Build Epoxoline II”, two coats, 3-4 mils DFT, each, and the finish coat shall be Tnemec “75 Endura-Shield”, one coat, 1.5-2.5 mils DFT. As an alternative, the primer coat shall be Carboline “Carboguard 890”, two coats, 3-4 mils DFT, each, and the finish coat shall be Carboline “Carbothane 134 HG”, one coat, 1.5-2.5 mils DFT.

2.2.17 Woodwork, Interior. Surface preparation shall be to sand smooth and wipe clean of all dust, coat all knots, pitch and sapwood with an approved knot sealer. After priming, fill all holes, cracks, open joints and other holes with approved spackling putty. The primer coat shall be Tnemec “37 H Chem-Prime HS”, one coat, 2.0-3.0 mils DFT, and the finish coat shall be Tnemec “6 Tneme-Cryl SCI”, one coat, 2.0-3.0 mils DFT. As an alternative the primer coat may be Carboline “Carbocrylic 120”, one coat, 1-2 mils DFT and the finish coat may be Carboline “Carboline 3350”, one coat, 2.0-3.0 mils DFT.

2.2.18 Woodwork, Exterior. Surface preparation shall be sand smooth and wipe clean of all dust, coat all knots, pitch and sapwood with an approved knot sealer. After priming, fill all holes, cracks, open joints, and other holes with spackling putty. The primer coat shall be Tnemec “N27 ST Typoxy”, one coat, 2.0 mils DFT, the intermediate coat shall be Tnemec “23 Enduratone”, one coat, 3-4 mils DFT, and the finish coat shall be Tnemec “74 Endura-Shield”, one coat, 1.5-2.5 mils DFT. As an alternative the primer coat Carboline “888 Primer”, one coat, 2.0 mils DFT, the intermediate coat shall be Carboline “Carboguard 890”, one coat, 3-4 mils DFT, and the finish coat shall be Carboline “Carbothane 134 HG”, one coat, 1.5-2.5 mils DFT.

2.2.19 Insulation Materials. Insulation materials, including insulated pipe, ducts, equipment and appurtenances, shall be coated with glue sizing or a primer sealer before application of finish coat. Primer sealer shall be Tnemec 51-792 Vina-Cryl Primer or equal. Finish coats shall be the same as used for adjacent surfaces unless otherwise directed by the Contractor.

2.2.20 Shop Painting. All fabricated steel work and equipment shall receive at the factory at least one shop coat of prime paint compatible with the paint system required by these specifications. Equipment or steel work that is to be assembled on the site shall likewise receive a minimum of one shop coat of paint at the factory.

Finish coats may be applied in the shop if approved by the Engineer. All shop painted items shall be properly packaged and stored until they are incorporated in the work.

Any painted surfaces that are damaged during handling, transporting, storage, or installation shall be cleaned, scraped, and patched before field painting begins so that the work shall be equal to the original painting received at the shop.

The contractor shall specify the shop paints to be applied when ordering equipment in order to assure compatibility of shop paints with field paints.

2.3 COLOR SCHEDULE. Pipe and equipment colors shall be in accordance with DWSD Standards. Refer to finish schedule for all paint colors and locations.

Primer shall be applied as identified in each section.

On pipes, coloring shall be done in conjunction with number and color of stripes specified.

Color shall meet the tests specified in Section 3, Color Definitions, of ANSI Z53.1 “Safety Color Code for marking Physical Hazards.”

Field Painting shall be in accordance with the following color code charts, unless otherwise identified by Owner to be shop painted:

COLOR CODE

EQUIPMENT	COLOR
Bins	See Note 1
Compressors	See Note 1
Conveyors	See Note 1
Couplings	
Eddy Current	Yellow
Fluid	Yellow
Cranes (Hoists)	Yellow
Blocks	Yellow & Capacity in Black
Disintegrators	Yellow
Ejectors	See Note 1
Fans	Orange
Feeders	See Note 1
Filters	See Note 1
Flow Meters	See Note 1
Gear Reducers	Yellow

Note: Stainless steel, copper and plastic piping; 6-inch wide band with ¾-inch stripes with 1-inch wide spacing.

2.4 PAINTING AND TESTING EQUIPMENT. Provide 2 of each of the following paint inspection tools for use by the Engineer.

Surface Temperature Thermometer shall be Pacific Transducer Corp. Model No. PTC 312F.

Psychrometer shall be Belfort Instruments Phychron (Mercury) Model No. 566-2, including one pair of replacement bulbs and one box of replacement wicks.

Surface Profile shall be Testex Set with Replica Tape (X-Coarse)..

Pictorial Standards shall be SSPC-Vis 1 and SSPC-Vis 2.

Wet Film Thickness Gage shall be Nordson Model No. 790-010.

Dry Film Thickness Gage shall be PosiTector 2000 with NIST Calibration Standards (Range 1.5-8 mils).

Low Voltage Holiday Detector shall be Tinker and Rasor M-1 including one replacement sponge M1-S.

Adhesion Tester shall be Elcometer 106.

Tool Box for storage of the above inspection tools (2 sets). Tool Boxes shall be made from molded durable gray plastic with tray and approximately 19 inch (48.3 cm) wall x 12 inches (30.5 cm) deep x 12 inches (30.5 cm) high.

PART 3 – EXECUTION

3.1 INSPECTION. Verify that substrate conditions are ready to receive work as instructed by the product manufacturer. Examine surfaces scheduled to be finished prior to commencement of work. Report any condition that may potentially affect proper application.

Measure moisture content of surfaces using an electronic moisture meter. Do not apply finishes unless moisture content of surfaces of Masonry, Concrete and Concrete Unit Masonry are below 12 percent.

Beginning of installation means acceptance of substrates.

Test surfaces for chloride contamination (soluble salts) using Chlor*Test field kits by Chlor*Rid.

3.2 PREPARATION. Before commencing work, remove hardware, accessories, plates, lighting fixtures and similar items that are not to be painted, or in place, provide ample protection for such items. Replace such items after completion of each space. Do not remove UL labels on fire doors and frames.

The following items shall be masked or protected with suitable covering:

Sealing and glazing compounds (unless otherwise directed by the. A job site meeting shall be held before start of Work to review procedures.

Equipment identification, performance rating and other informational plates.

Moving parts of machinery and other mechanical equipment such as shafts, couplings, valve stems, fire protection system sprinkler heads and similar items.
Factory finished items.

All spaces shall be clean before painting commences, and all surfaces to be painted shall be dry. Remove all dust, dirt, grease, form oil and other foreign matter that would affect the finished work.

Inspect all surfaces to be coated and perform surface preparation in accordance with requirements of the manufacturer of the coating to be applied to each of the surfaces, or to the requirements specified herein if not provided by the manufacturer.

All surface preparation shall be as defined by the latest edition of the "Manual of Good Painting Practice" published by the Society for Protective Coating (SSPC), 4400 Fifth Avenue, Pittsburgh, Pennsylvania and hereinafter referred to as SSPC.

Should any surface be deemed unsatisfactory to produce a proper finish, the Engineer shall be notified in writing and no further material shall be applied until the problem has been resolved.

Abraded or otherwise damaged portions of shop applied paint shall be repaired using such materials and procedures as approved by the manufacturer of the damaged coating.

The Contractor shall be responsible for the compatibility of field applied coating over previously coated surfaces.

When more than one coat is to be applied, each coat should have a marked visual difference from the preceding and following coats. Undercoats shall be of approximate shade of final coat, but each coat shall be of slightly different tint to allow verification of coverage. Each coat shall be inspected before application of the succeeding coats, otherwise no credit for coat applied will be given and the work in question shall be recoated.

For ferrous metals, fill dents, hollows and other irregularities with approved metal filler suitable for the purpose. After setting, sand to a smooth, hard finish.

All ferrous metal to be primed in the shop shall have all visible rust, dust and scale as well as all other foreign substances removed by abrasive blasting to SSPC SP-10 "Near White" standard, except that structural steel and trusses shall be cleaned per SP-3 standard

All ferrous metals not primed in the shop shall be abrasive blasted in the field prior to application of the primer, pretreatment or paint

Cleaned metal shall be primed or pretreated within 6 hours after cleaning to prevent new rust formation

All nonferrous metals, whether shop or field primed, shall be cleaned with the correct solvent for the material prior to the application of the pretreatment (priming) and painting.

Galvanized metal surfaces, in accordance with SSPC-SP-1, shall be washed with a solution of Tri-sodium Phosphate (TSP), Detergent, and warm water. The solution shall consist of 2/3 cup TSP, 1/3 cup detergent in 3 quarts of warm, clean water to remove the solution. Improper washing will result in a coating failure.

Factory primed and/or finished surfaces shall be tested for coating integrity and cure by a MEK (Methyl Ethyl Ketone) Tub Test (ASTM D5402). If surface tested softens, detergent wash entire surface to remove grease and oil. Allow to thoroughly dry and paint as scheduled. If surface tested does not soften, hand abrade with emery cloth, solvent wipe with mineral spirits, and paint as scheduled.

For concrete and unit masonry surfaces scheduled to receive paint finish remove dirt, loose mortar, scale, salt or alkali powder, and other foreign matter. Remove oil and grease with a solution of tri-sodium phosphate; rinse well and also to dry. Remove stains caused by weathering of corroding metals with a solution of sodium metasilicate after thoroughly wetting with water. Allow to dry. Fill cracks and irregularities with Portland cement grout to provide uniform surface texture. Smooth rough spots on concrete block and joints with a stone sander. All masonry surfaces shall be scrubbed clean with soap and water before applying paint or coatings.

Before applying paint or coatings to concrete floors, or other surfaces, these surfaces shall be etched with a 15 percent solution of muriatic acid to remove efflorescence and laitance, clean the surface, remove glaze and roughen concrete surfaces for proper adhesion. If the concrete surface is exceedingly dense a greater strength acid or a second etching may be required. The acid shall be washed off with water 30 minutes after it is applied (ASTM D4260)

Before applying paint or coatings to submerged concrete, these surfaces shall be lightly sandblasted to remove all form oil, curing oil, laitance, soluble salts, loose concrete or any other foreign substance which may interfere with the bonding of the paint or coating to the concrete surface (ASTM D4259)

Wood Surfaces to be painted shall be cleaned of foreign matter. Wood surfaces adjacent to surfaces to receive water-thinned paints shall be primed or touched up, or both, before applying water-thinned paints to the adjacent surfaces. Small, dry, seasoned knots shall be scraped, cleaned, and given a thin coat of knot sealer, equal parts shellac and alcohol, before application of the priming coat. Pitch on large, open, unseasoned knots and all other beads or streaks of pitch shall be scraped off, or, if still soft, removed with mineral spirits or turpentine, and the resinous area thinly coated with knot sealer. Surfaces shall be checked to insure that finishing nails have been properly set, and all holes and surface imperfections shall be filled with putty or plastic wood filler, colored to match the finish coat if natural finish is required, allowed to dry, and sanded smooth with sandpaper. Putty or wood filler used shall be compatible with subsequent coatings. Painting shall proceed when the moisture content of the wood does not exceed 12 percent as measured by a moisture meter, unless otherwise authorized.

Before applying sealer to gypsum board surfaces, remove loose dirt and dust by brushing with a soft brush or by rubbing with a soft cloth. Joint treatment shall be thoroughly dry before application of sealer or paint, 12 to 18 hours under normal conditions.

All surfaces shall be thoroughly cleaned, smooth, dry and free from rust, dust, grit, efflorescence, oil and frost before painting. Dust shall be removed before succeeding coats are applied.

3.3 PERFORMANCE.

3.3.01 System Description. All unfinished surfaces, both interior and exterior, shall be painted to effect a complete project in every respect even though every item or surface may not be specifically mentioned. Paint surfaces of architectural work including structural steel, miscellaneous metals, concrete and masonry block walls, metal wall panels, doors of all types, dock levelers, gypsum wallboard, undersides of exposed roof and floor decks. Paint all unfinished surfaces of mechanical and electrical work including ductwork, piping, tanks, pumps, fans, valves, fittings, conduit, panels, boxes, hangers, anchors, supports, fittings and unfinished equipment, except as otherwise required.

Touch-up damaged or defective shop prime painted surfaces. Clean and repaint existing painted surfaces if required.

Provide all scaffolds, staging, ladders, drop cloths and other equipment required for the work.

Shop-primed ferrous metals such as structural and miscellaneous metals, metal doors and other items will require no additional coat of primer other than touch-up.

All painting shall be carefully done by skilled painters. The work areas shall be left clean and acceptable to the Engineer.

All coats of paint shall be compatible with previously applied coats. Colors and sheens shall in general match existing surfaces, DWSD Standards, or as selected by the Engineer.

Nothing in these specifications shall be deemed to cancel or supersede the directions of the manufacturers, except where specific film thickness of spreading rates are set forth, the most stringent shall take precedence.

A qualified representative of the manufacturer shall be available to instruct the painters on any special requirements or techniques for the application of the paints, coatings, etc. at no additional cost to the owner.

The Contractor shall be expected to provide tools and equipment in first class working order including moisture traps in air lines to pressure pot and spray gun when air atomization is used. Moisture shall be set for continuous bleed during spraying operation.

3.3.01 Application. No interior painting shall be started until the structure has been enclosed, ventilated, thoroughly dried out, and inspected by the Engineer.

Apply materials under adequate illumination and ventilation. Special fans shall be provided when natural ventilation is insufficient and if required, face masks shall be provided for the painters. Written consent of the Engineer will be required before building fans may be used.

Allow exterior paints and finishes to dry at least 48 hours between coats. Allow interior paints to dry at least 24 hours between coats.

Allow enamels, lacquers and varnishes to dry at least 48 hours between coats. Allow additional drying time if conditions warrant, assuring that all coats are perfectly dry before applying succeeding coats.

Remove or protect during painting all finish hardware, accessories, fixtures and similar items installed prior to painting and not required to be painted. If removed, carefully replace and adjust on completion of painting.

All work shall be performed by experienced and competent painters in conformance with the requirements of the specifications.

Paint all unfinished items which will be exposed to view after completion of the building to match adjacent surfaces, except for prefinished or plated surfaces.

Prime unprimed surfaces and apply finish coats, including adjacent closets and storage rooms, free standing columns and piers and free standing stub walls.

All piping shall be identified, including exposed piping and concealed piping, painted or not painted. Identification shall be a combination of painted pipes and fitting colors, or colored bands and lettering as required to match the existing DWSD piping identification system. Fire protection piping shall be continuously painted with safety red paint.
Electrical conduit shall be identified by marks not more than 50 feet (15.2 m) apart by stenciling or adhesive labels. Identification marking shall give voltage of conductors in conduit. Systems other than light and power shall also be identified by name.

Application may be by brush, roller or spray as required by the material used and surface to be covered. Rollers for applying enamel shall have a short nap. Spray equipment shall be as recommended by the manufacturer of the paint used. Areas inaccessible to spray painting shall be coated by brushing or other suitable method.

Provide barrier coats over incompatible primers or remove and reprime. Notify Engineer in writing of any anticipated problems in using the specified coating systems with substrates primed by others.

Piping shall not be painted until piping system has been tested and approved.

Finished surface shall be uniform in finish and color and free from brush marks, sagging, rippling and other imperfections.

Should any coat be judged unsatisfactory, the coat shall be sandpapered or otherwise cleaned off and another coat applied. If the undercoating is disturbed, complete refinishing will be required.

Finish all returns, edges and recesses which will be exposed in the finished work and which will be seen from any angle to match the adjacent work.

Finish with flat gray-black paint all surfaces situated behind grilles or seen from any other angle, except interior duct surfaces.

Paint edges of wood doors scheduled to be painted with the same material and number of coats scheduled for faces. This work shall be done in all cases after the doors have been fitted and are ready for final hanging.

Edges of paint or finish adjoining other materials or colors shall be sharp and clean without overlapping.

Should workmanship be found defective, proper preparatory work shall be done and additional coats applied as necessary to give a finish in accordance with specified requirements.

3.3.02 Protection. Furnish and lay drop cloths in all areas where painting work is being done, to protect floors and all other adjacent work and materials from defacement. Remove all temporary protections and properly replace and adjust all enclosures, coverings, fixtures, etc. removed from any part of the work or equipment immediately upon completion of painting in the area. Any damage resulting from neglect of this requirement shall be repaired at the Contractor's expense to the complete satisfaction of the Engineer.

Maintain the work in a neat and orderly condition, promptly removing empty containers, wrappings, waste, rubbish and like matter from site. Mix paints, varnishes and lacquers only in a designated area at the site. Provide galvanized steel pans in which all mixing pails or barrels shall be kept. No mixing will be permitted outside the pans.

Freshly painted surfaces shall be legibly posted "Wet Paint" signs as such immediately following their completion.

The contractor shall use whatever means deemed advisable to protect all surfaces from accidental over spraying, spattering, or spillage of paint.

The contractor shall be responsible for all corrections and/or repairs resulting from his painting operation or that of his personnel.

3.3.03 Mixing and Thinning. Packaged paint, other than cement-emulsion filler, may be thinned when necessary to suit conditions of surface, temperature, weather, and application methods. The use of thinner shall be in accordance with the coating manufacturer recommendation. Paints of different manufacturers shall not be mixed.

3.3.04 Cleaning. Upon completion of each day's work, the painter shall return all paints and materials to the area designated by the Engineer, dispose of all waste and oily rags and remove any paint spots or spatters that may have fallen on the floor or walls and, in general, leave the area in a neat, orderly condition.

Once painting is started, perform no further broom cleaning. Use only commercial vacuum cleaning equipment.

3.4 FIELD QUALITY.

3.4.01 Field Testing. The Engineer reserves the right to inspect all surfaces deemed ready to receive a coating before the application of the next succeeding coat. The Contractor will be notified if this right is invoked, and if he proceeds without approval, after being notified, he may, at the discretion of the Engineer, be required to remove and/or recoat all such work at no additional cost to the Owner.

General inspection may be done by the Engineer and/or Coating Supplier.

The Contractor shall schedule and coordinate this work with the Engineer to allow for expeditious inspection including the use of ladders, scaffolds, swings and stages to provide regular access for inspections.

End of Section

SECTION 09960

HIGH PERFORMANCE COATINGS

PART 1 – GENERAL

1.1 SCOPE. This section covers 2 types of specialized coating systems that focus on chemical resistance and wear resistance. The chemically resistant system is a catalyzed vinyl ester coating system designed to be applied as a liner to the floor and walls of chemical storage areas or as a topping to the floor to chemical filling stations. The wear resistant system is a multipart film forming urethane system designed to be applied in warehouses, parking garages, and vehicle maintenance bays. Both finishes are intended for application over concrete.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) C957 – Specification for High Solids Content, Cold Liquid Applied.

ASTM D4263 – Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method.

ASTM D4258 – Specification for Practice for Surface Cleaning Concrete for Coating.

ASTM D4259 – Specification for Practice for Abasing Concrete.

ASTM D4541 - Test Method for Pull-Off Strength of Coatings Using Portable Adhesives Testers.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor's Qualifications. The coating applicator shall have 5 years of documented experience as applicator of the system used and shall be licensed by the manufacturer. Contractor shall provide a list of completed projects of similar scope and complexity complete with references, addresses, and telephone numbers.

1.3.02 Manufacturer's Field Services. The material manufacturer shall provide engineering field services to review the project and the method of material application prior to application. Approval of the application shall include the material and the procedure to be used to provide the minimum pull-off adhesion strength, surface preparation, and observation of application. The field representative of the material manufacturer shall submit, in writing through the contractor, approvals of proposed materials, application procedures, and surface preparation. The field representative shall be an employee of the material manufacturer.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit 2 copies of manufacturer's literature for all products furnished, including appropriate Material Safety Data Sheets (MSDS) and other safety requirements.

1.4.02 Certifications. Submit copy of "Certificate of License" issued to applicator by manufacturer.

1.4.03 Samples. Submit 2 samples of each coating system, applied to 1/4 inch (6.4 mm) plywood or similar rigid base.

1.4.04 Mock-up. Provide samples of products to be applied at project site. Sample shall be representative of installed system. Samples shall be approved by the Engineer. Leave sample at job site for reference during project execution.

1.5 DELIVERY, STORAGE, AND HANDLING. Deliver materials to job site in sealed, undamaged containers with labels intact and legible, indicating material name, date of manufacture and lot number.

Store materials indoors or outdoors and covered at temperatures above 32 degrees F (0 degrees C) but not exceeding 90 degrees F (32 degrees C). Store drums on sides and pails inverted.

1.6 WARRANTY. Upon completion, on a single document, provide a copy of written guarantee, from manufacturer and applicator, against defects of materials and workmanship, for a period of 5 years, beginning with date of substantial completion of system.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Install materials in accordance with safety and weather conditions required in manufacturer's written application instructions, or as modified by applicable rules and regulations of local, state, and federal authorities having jurisdiction.

Seal doors, windows, air intake, elevators and other openings that will allow vapors to migrate into occupied spaces. Inspection of the job site by a qualified industrial hygienist before work begins and periodic air monitoring during and after application may be necessary to determine ventilation requirements according to U.S. Occupational Safety and Health Administration (OSHA).

Ventilate interior and exterior application areas and occupied spaces adjacent to application areas during application and for 8 hours minimum after application or until vapor concentrations are below Permissible Exposure Limits (PEL) listed in manufacturer's MSDS.

Remove open fires and spark producing equipment from application area until vapors have dissipated.

In order for coating systems to cure properly, do not apply coating if rain is anticipated within 8 hours of application, if air temperatures are lower than 40 degrees F (4 degrees C), if temperature is expected to drop below 40 degrees F (4 degrees C) within 24 hours of application, or if air temperature is higher than 110 degrees F (43 degrees C). Cure times specified are based on curing coating at 77 degrees F (25 degrees C) and 50 percent relative humidity. Lower temperatures and humidity require extended cure.

2.2 <u>ACCEPTABLE MANUFACTURERS</u>.

2.2.01 <u>Chemical Resistant System</u>. Shall be manufactured by Dudick, Inc. or an approved equal.

2.2.02 <u>Wear Resistant System</u>. Shall be manufactured by 3M Construction Markets Division or equal.

<u>2.2.03</u> Edge Retentive System<u>. FAST Clad Edge Retentive Epoxy: Shall be manufactured by Sherwin Williams Company.</u>

2.3 <u>MATERIALS</u>. Coating system used shall be supplied in total by a single manufacturer. Components of different manufacturer's system shall not be mixed.

2.3.01 <u>Chemical Resistant System</u>. The lining and topping coats shall be a 2 component vinyl ester coating that is 100 percent solids, solvent-free, catalyzed vinyl ester resin, graphite filled, high-build protective and waterproofing coating. Unless otherwise specified, Basecoat shall be Dudick "Protector-Coat 800"; Topcoat shall be Dudick "Protector-Coat 805". Where coating may come in contact with sulfuric acid, Basecoat shall be Dudick "Protector-Coat 900"; Topcoat shall be Dudick "Protector-Coat 905".

The concrete surface primer shall be a catalyzed vinyl ester resin containing conductive fillers, 100 percent solids content and shall be Dudick "Primer 27C"

2.3.02 Wear Resistant System. Shall be liquid applied, urethane 319 Scotch-Clad Deck Coating system or approved equal. Concrete primer shall be Scotch-Clad concrete primer. Base coating shall be Scot-Clad base coat 5893. Intermediate coat (if applicable) shall be Scotch-Clad Intermediate coat 5768 LC. Top coat shall be Scotch-Clad Top Coat 5891. Aggregate shall be silicon carbide, 24 mesh, or silica sand (12-20 mesh) as defined in Finishes schedule.

Thicknesses of intermediate coat and quantities of aggregate per square foot shall be defined in the Finishes schedule based on wearability desired.

2.3.03 Accessories for Wear Resistant System. Primers shall be Scotch-Clad Concrete Primer.

Backer Rod shall be closed cell urethane foam rod.

Sealant shall be low modulus, unmodified polyurethane or polysulfide based.

Sheet Flashing shall be 50 mils (1.3 mm) thick, procured, commercial grade neoprene.

Flashing Reinforcement shall be non-woven, uncoated fiberglass mesh.

Detail Coat shall be Scotch-Clad Non-Flow Base Coat by 3 M applied 25 dry mils (0.6 mm) thick, 11 to 12 dry mils (0.27 mm to 0.3 mm) topcoat on U.V. exposed vertical.

Aggregate shall be locally obtained silicon carbide 24 mesh or aluminum oxide.

Cleaning Agents shall be Toluene.

2.3.04 Edge Retentive System. Shall be an Edge Retentive (Not less than 70% retention required) providing rapid return to service 24-36 @ 40-70F at 50% relative humidity). Ultra high amine coating engineered for immersion service recommended for primary and secondary containment. Coating shall have a result of less than 30 mg loss when tested to ASTM D4060 test method.

Required surface preparation shall be SSPC-SP6/NACE2 near white abrasive blast B62W230/B62V230; 9-11 mils Dry Film Thickness (DFT).

Finish Coat: Fast Clad Edge retentive epoxy B62W230/B62V230 9-11 dft. Total System DFT 18-22 mills.

PART 3 – EXECUTION

3.1 INSPECTION. New concrete shall be at least 4 weeks old before lining or topping is applied, in accordance with the manufacturer's recommendations. Concrete surfaces shall be tested for capillary moisture in the concrete in accordance with ASTM D4263. Capillary moisture shall not exceed the manufacturer's recommendation.

Concrete must exhibit 3000 psi (20.7 MPa) minimum. Concrete surfaces to be coated must be trowel finished in compliance with ACI 301-84 paragraph 11.7.3 (except that hand troweling is not required), followed by a fine hair brooming, left free of loose particles, and shall be without ridges, projections, voids and concrete droppings that would be mechanically detrimental to coating application or function.

Before coating is applied, inspect slab to receive coating. Surface shall be free of voids, laitance, loose material on surface, grease, oil, rust and other contaminants, which will affect bond of coating. Inspect slab for variations in surface finish, joint offsets and other defects that may adversely affect coating application or performance.

Concrete surfaces must be visibly dry and pass a 4-hour rubber mat test (no condensation) prior to application of coating system.

Verify that curing methods used for concrete are compatible with requirements for coating system.

Commencement of coating installation implies acceptance of substrate as suitable to accept coating.

All surfaces to be lined or topped shall be cleaned in accordance with ASTM D4258 and abrasive blasting in accordance with ASTM D4259. Prior to application of the coating, the surfaces shall be thoroughly washed, or cleaned by air blast, to remove all dust and residue. Spalled areas, voids, and cracks shall be removed by Contractor from all concrete surfaces to provide a flush surface before application of lining or topping.

All surfaces shall be free of objectionable substances and shall meet the recommendations of the coating manufacturer for surface preparation.

The concrete surfaces including "bug" holes shall be prepared using materials recommended by material manufacturer. "Bug" holes may be prepared, when approved by the lining or topping material manufacturer, using the reinforced basecoat.

3.2 PREPARATION.

3.2.01 Chemical Resistant Coating Systems. Concrete must be abrasive blasted or etched with muriatic acid (Solution of 1 part 20 degree Be HCI and 1 part water) to remove surface laitance and other contaminants. Concrete must be free of curing compounds and form release agents. Surface texture should be similar to 40-60 grit sandpaper with exposed pea gravel. The prepared surface should have a minimum tensile strength of 250 psi (1,723.7 kPa) per ASTM D4541.

All concrete substrates must be cheeked for moisture prior to product application using the Plastic Sheet Test, ASTM D4263.

Additional surface preparation will be required if a 40-60 grit texture with exposed pea gravel is not achieved and the surface laitance not completely removed after a single application of acid or with the first mechanical preparation procedure. Abrasive blasting removes laitance, exposing honeycombs or voids beneath the surface which must be filled with Scratch Coat 800. (Refer to separate product bulletin)

3.2.02 Wear Resistant Coating System. Protect adjacent surfaces with drop cloths and tape to control dust and overspray and to make lines.

Clean surfaces to receive coating materials in accordance with manufacturer's instructions. Remove oil and grease with a commercial grade alkaline cleaner then thoroughly rinse and dry. Prepare concrete surface by sandblasting or shotblasting. Only new concrete (minimum 21 days) may be acid etched with 10 to 15 percent solution of muriatic acid. Flush acid with clean water and allow surface to dry one to three days. Sweep, blow or vacuum clean surfaces to be coated.

Rout or sawcut 1/4 inch by 1/4 inch (6.4 mm by 6.4 mm) minimum where system(s) is/are to be terminated in a horizontal plane, and cracks exceeding 1/16 inch (1.6 mm) wide.

Apply sealant, using backer rod as needed, to expansion, control and construction joints and routed cracks to be coated. Joints wider than 1 inch (2.5 cm) should not be coated. Install a 1/2 inch (12.7 mm) sealant cove at rigidly connected deck projections, such as many types of posts, vents, pipes, stanchions, railings, wall/slab intersections and connected items having very limited movement.

Prime concrete, masonry and metal following manufacturer's recommendations. Protect sealant from primer spray.

Install 8 inches (20.3 cm) minimum width of sheet flashing fully, bonded 3 inches (7.6 cm) minimum vertical and horizontal, and unbonded 1 inch (2.5 cm) minimum vertical and horizontal, to locations of potential high movement such as wall/slab intersections which are not structurally and rigidly connected. Do not use procured sheet flashing over expansion joints in horizontal surfaces.

Install 12 inches (30.5 cm) Flashing Reinforcement imbedded in detail coat 2 inches (5.1 cm) wider than flashing reinforcement vertical and horizontal at rigidly connected wall/slab intersections.

For vertical surfaces higher than 2 inches (5.1 cm) provide detail coating. Where water is expected to accumulate due to ponding, snow and ice build-up, excessive splashing, or other regional and project conditions, provide vertical detail coat 2 inches (5.1 cm) higher than anticipated high water exposure line.

Apply Detail Coat over preparatory work described above and cracks under 1/16 inch (1.6 mm). Extend detail coat 2 inches (5.1 cm) onto concrete surface on each side.

3.3 INSTALLATION.

3.3.01 Chemical Resistant Coating System. The following conditions must exist to begin application of the Protector-Coat 800/805 system.

Substrate temperature for both concrete and metal must be between 50 and 110 degrees F (10 and 43 degrees C).

Relative humidity must not exceed 90 percent.

Substrate temperature must be 5 degrees F (2.8 degrees C) above the Dew Point.

Hardener	**Substrate Temp.**	**Primer 27 27C**	**PC-800 B-Coat T-Coat**	**PC-805 B-Coat T-Coat**
PH-1	50 degrees F* (10 degrees C)	3-4 oz.	4-5 oz.	3-4 oz.
	70 degrees F* (21 degrees C)	4-5 oz.		
PH-1	70 degrees F* (21 degrees C)	2-3 oz.	3-4 oz.	2-3 oz.
	90 degrees F* (32 degrees C)	3-4 oz.		

Pot life of the mixed Protector-Coat 800/805 will depend on the temperature. To prevent material waste and avoid damage to equipment, do not mix more material than can be used according to the following table:

Temperature	Pot Life
50 degrees F (10 degrees C) 75 degrees F (24 degrees C) 90 degrees F (32 degrees C)	60 min. 40 min. 25 min.

Do not attempt to store mixed material. Residual material should be properly disposed of at the end of each work period.

Concrete surfaces must be thoroughly dry before the application of the primer. All concrete must be primed with either Primer 27 or 27C at 3-4 mils WFT. Do not allow the primer to puddle.

Primer 27C must be mechanically mixed for 1-2 minutes prior to adding the correct amount of PH-1 Hardener; apply using roller only. Use brush application for touch-up or repair.

To apply the basecoat and topcoat, mix the Protector-Coat 800/805 separately to redisperse pigments and fillers, which have settled. Then add the correct amount of PH-1 Hardener to the Protector-Coat 800/805 and mix thoroughly until a uniform color is achieved. Apply at 15-20 mils (0.4 – 0.5 mm) WFT using a brush, spray or roller to an even, smooth finish. Allow the basecoat to cure until “firm” or slightly “tacky” before applying the topcoat.

In order to prevent curing problems with styrenated products, air movement and/or ventilation must be maintained not only during application but also after application until the system has totally cured. This will prevent high concentration of styrene inhibiting/retarding the cure of the system.

For the Standard Formulation, use conventional air spray equipment with a pressure pot: Binks #18 spray gun with #68 fluid nozzle and #68 air nozzle, or Binks #62 spray gun with #68 fluid nozzle and #68 air nozzle are recommended.

For Plural Component use a Binks 8 to 1 pump, and Binks Model 18 NC spray gun 59BSSX9-47 with a 102-3430 ACI valve Catalyst should be supplied by a 101-5202 catalyst tank. 1/2 inch (1.3 cm) ID material supply hose is recommended.

Brush or roller application may require additional coats to meet the specified dry film thickness.

Plan ahead so that recoating can be accomplished to allow sufficient cure cycles for Protector-Coat 800/805:

Recoat Time

Temp.	Min.	Max.	Cure Time
50 degrees F (10 degrees C) 75 degrees F (24 degrees C) 90 degrees F (32 degrees C)	12 hours 4 hours 3 hours	120 hours 96 hours 72 hours	96 hours 24 hours 10 hours

If these recoat times are exceeded, consult a manufacturer. Sanding or abrasive blasting may be required before the next coat. Recoat times are dramatically reduced when the coating is exposed to direct sunlight.

Application of Protector-Coat 800/805 in direct sunlight may lead to blistering pinholes, or wrinkling due to outgassing of air in the concrete and high substrate temperatures. Double priming, shading, or evening application may be required. Consult a Dudick representative.

For cleaning use S-10 Cleaning Solvent to clean tools and equipment. DO NOT USE ACETONE.

3.3.02 Wear Resistant Coating System. Apply base coat at 25 dry mils (0.6 mm) using a notched squeegee. Extend base coat over detail coating. Back roll base coat to ensure uniform leveling.

Allow to cure for 16 hours minimum.

Apply top coat at 11 to 12 dry mils (0.27 mm to 0.3 mm) using a notched squeegee. Backroll to ensure uniform leveling before aggregate is broadcast.

While coating is still fluid, uniformly broadcast aggregate at 5 pounds per 100 square feet (2.4 kg per 10 square meters) into coating.

Immediately backroll to evenly distribute and completely coat aggregate.

For system V, allow to cure 48 hours minimum before permitting traffic on surface.

For system VHD, allow to cure overnight before applying second top coat. Apply second top coat by repeating steps for top coat above.

Allow system to cure 48 hours minimum before permitting traffic on surface.

Clean masking protection, equipment, material, and debris from surface and storage area.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. For the chemical resistant coating system where immersion service is required, spark test the coating with a 5000 volt AC spark tester. Mark and repair all pinholes using Protector-Coat 800. Retest only the repairs.

Protector-Coat 805 cannot be spark tested.

SECTION 09962

RESINOUS FLOORING

PART I – GENERAL

1.1 SECTION INCLUDES

A. Epoxy-based floor resurfacing system.

B. Compounds and accessories needed for a complete installation.

1.2 RELATED SECTIONS

A. Section 03300 - Cast-In-Place Concrete

B. Section 09900 - Paints and Coatings

C. Section 09960 - High Performance Coatings

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM):
1. ASTM C 501 - Standard Test Method for Relative Resistance to Wear of Unglazed Ceramic Tile by the Taber Abraser.
2. ASTM D 257 - Standard Test Methods for DC Resistance or Conductance of Insulating Materials.
3. ASTM D 570 - Standard Test Method for Water Absorption of Plastics.
4. ASTM D 635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
5. ASTM D 638 - Standard Test Method for Tensile Properties of Plastics.
6. ASTM D 695 - Standard Test Method for Compressive Properties of Rigid Plastics.
7. ASTM D 696 - Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between -30°C and 30°C With a Vitreous Silica Dilatometer.
8. ASTM D 790 - Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
9. ASTM D 2047 - Standard Test Method for Static Coefficient of Friction of Polish-Coated Floor Surfaces as Measured by the James Machine.
10. ASTM D 2240 - Standard Test Method for Rubber Property--Durometer Hardness.
11. ASTM D-2566 - Test Method for Linear Shrinkage of Cured Thermosetting Casting Resins During Cure.
12. ASTM D 2794 - Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
13. ASTM D 4060 - Standard Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser.
14. ASTM D-4541 - Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers.
15. ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials.

B. NFPA 101 - Code for Safety to Life from Fire in Buildings and Structures; National Fire Protection Association; 1997.

1.4 SUBMITTALS

A. Submit under provisions of Division 1.

B. Product Data: Manufacturer's data sheets on each product to be used, including:
1. Preparation instructions and recommendations.
2. Storage and handling requirements and recommendations.
3. Installation methods.

C. Selection Samples: For each product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.

D. Verification Samples: For each product specified, two samples, minimum size 6 inches (150 mm) square, representing actual flooring, color, and patterns.

1.5 QUALITY ASSURANCE

A. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
1. Finish areas designated by Architect.
2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.
3. Refinish mock-up area as required to produce acceptable work.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to project site in clean, unopened factory-labeled containers.

B. Store materials in manufacturer's unopened packaging until ready for installation. Store in a dry, protected area, and maintain temperature of storage area between 50 and 90 degrees F (10 to 32 degrees C).

C. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.7 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

1.8 WARRANTY

A. At Substantial Completion, submit a one year warranty against defects in materials and workmanship

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: Dur-A-Flex, Inc; 95 Goodwin Street, East Hartford, CT

06108. ASD. Tel: (860) 528-9838.

B. TNEMEC

C. Approved equal

D. Requests for substitutions will be considered in accordance with provisions of Section 01600.

2.2 MATERIALS

A. Epoxy Floor Resurfacing System with Colored Quartz Aggregate: Dur-A-Flex Dur-A-Quartz multiple component, seamless, decorative quartz, slip resistant flooring system with the following installed properties:
1. Shore D Hardness: 75 to 80, when tested in accordance with ASTM D 2240.
2. Compressive Strength: 17,500 psi, (120.6 MPa), when tested in accordance with ASTM D 695.
3. Tensile Strength: 4,000 psi (27.6 MPa), when tested in accordance with ÅSTM D 638.
4. Tensile Elongation: 7.5 percent, when tested in accordance with ÅSTM D 638.
5. Flexural Strength: 6,250 psi (43.0 MPa), when tested in accordance with ÅSTM D 790.
6. Water Absorption: 0.04 percent, when tested in accordance with ASTM D 570.
7. Flame Spread Index: 75 or less, when tested in accordance with ÅSTM E 84, IIA.
8. Topcoat: Dur-A-Glaze Novolac.
9. Surface Finish: Standard Slip Resistant, with 0.9 coefficient of friction per ÅSTM D 2047.
10. Color: As selected by Architect from manufacturer's standard color blends.

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. Verify that surface is dry and perfectly clean, free of all oil, grease, detergent, and other contaminants.

3.2 PREPARATION

A. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

B. Create a surface profile with a steel shot blast machine and dust-free diamond grinders for edges.

C. Clean surfaces thoroughly prior to installation.

D. Thoroughly rout and vacuum clean moving cracks and joints; fill with manufacturer's recommended flexible filler material.

E. Repair non-moving surface deviations with manufacturer's recommended patching compound.

3.3 INSTALLATION

A. Install flooring system in strict accordance with manufacturer's instructions.

B. Mix components on site with manufacturer-supplied mix and measure apparatus to ensure timely, accurate mix ratios and to minimize waste.

C. Prime substrate with manufacturer's recommended primer and allow to cure.

D. Apply flooring system in number of coats and to thickness recommended by manufacturer.
   1. Install a 4 inch (100 mm) integral cove base at perimeter walls and columns.
   2. Key in all drains, edges, and transition points according to manufacturer's instructions.

E. Broadcast aggregate to excess, and allow to cure and subsequently sweep up excess aggregate.

F. Apply topcoat in number of coats recommended by manufacturer and allow to cure.

3.4 PROTECTION

A. Protect installed flooring until completion of project.

B. Touch-up, repair or replace damaged flooring system after Substantial Completion.

End of Section

INDEX

DIVISION 10 – SPECIALTIES

SECTION 10100

MISCELLANEOUS SPECIALTIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the miscellaneous specialty items to include anchors, coat racks, janitor closets, vestibule items, and projection accessories.

1.2 GENERAL. Miscellaneous specialties shall be furnished and installed as specified herein and in accordance with the details, arrangements, and dimensions indicated on the drawings. Where not specifically indicated or specified, fasteners, gaskets, and other accessories shall be provided as required and as recommended by the manufacturer of the specific item.

1.3 QUALITY ASSURANCE.

1.3.01 Governing Standards. Comply with ASTM, ANSI and other applicable industry standards. Electrical equipment and materials shall be UL listed, except that FIA, FM or another testing agency will be acceptable where approved by local jurisdictional authorities.

1.4 SUBMITTALS. Submit complete specifications, detailed drawings, and setting or erection drawings covering miscellaneous specialties.

1.5 DELIVERY, STORAGE AND HANDLING. Deliver items to job site in original unopened containers bearing labels identifying manufacturer brand, model number and other pertinent information. Use methods to prevent damage and deterioration.

1.5.01 Storage and Protection. Contractor shall be responsible for locating areas subject, to approval of engineer, for use as required for storage and work areas.

1.5.02 Damaged Material. Damaged, defective materials shall be identified, conspicuously marked as rejected, permanently removed from premises and replaced with suitable undamaged material at no additional cost to Owner.

PART 2 – PRODUCTS

2.1 ANCHOR MATERIALS.

2.1.01 Anchorage Devices. Type, Class and Style shall be as recommended by approved unit manufacturer to suit conditions of installation.

2.1.02 Wood Screws. Shall be flat head carbon steel; FS FF-S-111; length as recommended by approved manufacturer.

2.2 FABRICATION.

2.2.01 General. Fabricate units using materials carefully selected to be free of defects, objectionable projections, and irregularities. Make smoothly rounded corners, edges and exposed fasteners to minimize snagging and pinching hazards.

Fabricate fixed units for attachments, using methods suitable for rigid anchorage support to substrate conditions involved.

Fabricate metal units of welded tubular steel or die-formed steel panels with integral or welded edge reinforcement and welded steel feet. Provide seat mounting and back connector plates securely attached in position to maintain property relationships and clearances.

2.3 FINISHES. Unless otherwise indicated, finish exposed iron and steel components with manufacturer's baked-on enamel in color as selected from manufacturer's standards.

2.4 COAT RACKS – WALL MOUNTED.

2.4.01 Manufacturers. Provide bracket type, size and number of shelves indicated, as manufactured by A. R. Nelson Co., Inc.; Vogel-Peterson Co.; Millberg Co.; or approved equal.

2.4.02 Fabrication. Shelves shall be fabricated of four, 3/4 inch (1.9 cm) minimum O.D., 0.065 inch (1.7 mm) thick extruded aluminum tubes with manufacturer's standard clear anodized and polished finish, with ends closed by brackets or caps.

Hanger rod shall be 1 inch (2.5 cm) minimum O.D. aluminum tube finished and closed same as shelf tubes.

Brackets shall be cast aluminum with baked enamel finish in manufacturer's standard color selected by the Owner. Prevent tubing from turning in brackets.

Wall mounts shall be extruded aluminum with clear anodized and polished finish, designed to provide for vertical adjustment of brackets.

2.5 COAT AND HAT RACKS – FREE STANDING.

2.5.01 Manufacturers. Provide equal to “Model SF-CK” for single face and “Model DF-CK” for double face units as manufactured by Vogel-Peterson, length as indicated.

2.5.02 Fabrication. Provide each rack with two metal shelves and chromium-plated angular hanger rail, supplied with nylon receptacles spaced 2 1/2 inches (6.35 cm) on center, complete with T-top 17 inch (43.2 cm) hardwood hangers.

Provide bottoms of bases with plastic glides.

Adequately brace each unit to prevent lateral racking and swaying.

For metal, not chromium-plated, provide a baked enamel finish, color as indicated on the Finish Schedule.

2.6 JANITOR CLOSET UTILITY SHELF.

2.6.01 Manufacturers. American Specialties, Inc. “No. 1308”; Bobrick Washroom Equipment, Inc. “B-239”; or approved equal, approximately 34 inches (86.4 cm) wide with 3 mop holders and 4 rag and towel hooks.

2.6.02 Fabrication. Shelf and vertical strip shall be type 302 stainless steel with No. 4 finish. Mop holders shall be cadmium-plated steel, with spring-loaded, serrated rubber cams, mounted to strip.

2.7 VESTIBULE MAT.

2.7.01 Manufacturers. Provide Pawling Rubber Co. “Parco Hi-Rib”; American Floor Products Co. “Afco Hi-Rib”; R.C. Musson Rubber Co. “Deep-Rib”; or approved equal.

2.7.02 Fabrication. Shall be 7/16 inch (1.1 cm) thick solid rubber in manufacturer’s standard color selected by the Owner. Edge shall be square.

2.8 VESTIBULE GRATING.

2.8.01 Manufacturers. Product shall be Construction Specialties, Inc. “Series 1200V Vinyl Pedigrid”; Reese Enterprises, Inc. “No. 471 Perfec Clean”; or approved equal; recessed with aluminum frame, designed to support a uniformly distributed load of 200 psf (976.4 kg/sq m) without exceeding a deflection of 1/16 inch (1.6 mm).

2.8.02 Fabrication. Grating surface shall be vinyl with serrated pattern in color selected by the Engineer from manufacturer's standard range, locked and mechanically secured to the tread rails.

Tread rails shall be extruded aluminum, alloy 6063-T52, structurally joined to aluminum key lock bars, alloy 6061-T6, spaced 10 inches (25.4 cm) O.C. maximum.

Framing members shall be extruded aluminum, alloy 6063-T52, neatly coped at corners and assembled with stainless steel screws, for 4 inch (10.2 cm) nominal recess.

Finish for aluminum shall be mill finish. Surfaces in contact with concrete shall be coated with zinc chromate paint.

2.9 INTERIOR DOME.

2.9.01 Manufacturers. Provide product from Edon Corp., 1160 Easton Road, Horsham, PA., or approved equal.

2.9.02 Fabrication. Provide Fiberglass Reinforced Polyester (FRP) components using class "A" material to meet local fire codes and have a gel-coat finish with a minimum thickness of not less than 1/8 inch (3.2 mm).

2.10 PROJECTION SCREEN.

2.10.01 Manufacturers. Provide product from Da-Lite Screen Company, Inc.; Draper Shade & Screen Co., Inc.; or approved equal.

2.10.02 Fabrication. Screen surface shall be matte white surface with 2 inch (5.1 cm) black masking borders, 60 x 60 inch (1.5 m x 1.5 m) size, unless otherwise indicated, mounted on 3 inch (7.6 cm) steel roller.

Case shall be 22 gage (0.85 mm) steel finished with flat black, baked enamel finish, fitted with end caps and wall mounting brackets.

PART 3 – EXECUTION

3.1 INSPECTION. Examine areas and conditions under which Work is to be installed including condition of substrate to which fixed units are to be attached and notify in writing of conditions detrimental to proper and timely completion of Work.

3.2 PREPARATION. Protect the Work and adjacent construction against damage. All parts and assemblies shall be protected during fabrication, shipment, storage, and erection to prevent damage. Damaged units will be rejected and shall be replaced at no additional cost to the Owner.

3.3 INSTALLATION. Install each item of miscellaneous specialties in accordance with manufacturer's instructions, approved Shop Drawings, and specified requirements. Furnish each item with required fasteners.

Install in locations as shown in drawings with each fixed unit attached to substrate by not less than 2 anchoring devices of recommended size. Install operable moving components operate properly. Install closure plates and strips where required with joints coordinated with units of equipment.

Install sealants and gaskets all around each unit to make joints air-tight, waterproof, vermin-proof and sanitary for cleaning purposes. In general, make sealed joints not less than 1/8 inch (3.2 mm) wide and stuff with backer rod to shape sealant bead properly at 1/4 inch (6.4 mm) depth. Shape exposed surfaces of sealant slightly concave with edges flush with faces of materials at joint. At internal-corner joints, apply sealant or gaskets to form a sanitary cover of not less than 3/8 inch (9.5 mm) radius. Provide sealant-filled or gasket joints up to 3/4 inch (1.9 cm) joint width; use metal closure strips for wider joints, with sealant application each side of strips. Anchor gaskets mechanically or with adhesives to prevent displacement.

3.3.01 Coat Racks. Anchor wall mounts to wall with toggle bolts at maximum spacing of 38 inches (96.5 cm).

3.3.02 Utility Shelf. Anchor utility shelving to the wall in each janitor's closet as directed in plans.

3.3.03 Vestibule Mat. Install mat in floor recess with corrugations parallel to thresholds, edges square, straight and parallel to boundary of recess. Where joints are required in large mats for ease of handling, fit the joints tight.

3.3.04 Vestibule Grating. Install frame surface mounted in recess in concrete floor in a level and accurate plane. Set grating in frame.

3.3.05 Projection Screen. Install projection screens in accordance with the manufacturer's instructions, approved shop drawings and specified requirements. Furnish required fasteners.

Anchor projection screens to the wall with 3/8 inch (9.5 mm) toggle bolts at an elevation of 8 foot, 6 inches (2.6 m) above finish floor, unless otherwise indicated.

3.4 CLEANING. Upon completion, clean the Work in accordance with manufacturer's instructions. Remove protective coverings if any, and clean equipment internally and externally. Restore exposed and semi-exposed finishes to remove abrasions and other damages; polish exposed-metal surfaces and touch-up painted surfaces. Replace work, which cannot be successfully restored.

End of Section

SECTION 10150

TOILET COMPARTMENTS AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers toilet components and miscellaneous toilet accessories.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standards specifications:

AA (Aluminum Association) DAF-45 – Designation System for Aluminum Finishes.

ANSI (American National Standards Institute) Z97.1 - Specification for Safety Performance Specifications and Methods of Test for Glazing Materials Used in Buildings.

ASTM (American Society for Testing and Materials) A424 – Specification for Steel Sheet for Porcelain Enameling.

ASTM A591 – Specification for Steel Sheet, Electrolytic Zinc-Coated, for Light Coating Mass Applications.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy – Coated (Galvannealed) by the Hot-Dip Process.

ASTM A666 – Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM - B456 – Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium.

ASTM C1036 – Specification for Flat Glass.

Fed. Spec. (Federal Specifications) FF-S-325 – Specification for Shield, Expansion; Nail, Expansion; and Nail, Drive Screw (Devices, Anchoring, Masonry).

FS RR-P-1352 – Specification for Partitions, Toilet, Complete.

SAA (Specification for Anodized Architectural Aluminum0 46.

1.3 QUALITY ASSURANCE. Take field measurements to verify or supplement dimensions indicated. Be responsible for accurate fit of the Work.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings indicating component layout, dimensions, location, hardware, finish, manufacturer's name and catalog number, and pertinent construction and erection details. Furnish maintenance instructions for finishes and operating equipment.

1.4.02 Samples. Submit full size samples of items, if requested by the Engineer. Samples will be returned to the Contractor upon completion of the Work.

1.4.03 Record Drawings. Furnish receipts for keys for dispenser cabinet doors and other such items.

1.5 DELIVERY, STORAGE AND HANDLING. Protect the Work from damage during transportation to the Project site, storage at the site, and during progress of Work until completion.

1.6 WARRANTY. Mirrors shall be warranted for 15 years against silver spoilage.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS.

2.1.01 Partitions. Accurate Partitions Corp; Metpar Corp; The Mills Co; Sanymetal; Weis/Robart Partitions, Inc; or as approved.

2.1.02 Toilet Accessories. Bobrick Washroom Equipment, Inc. (Bobrick), A & J Washroom Accessories, Inc., American Specialties, Inc., Bradley Corp., Washroom Accessories Div., McKinney/Essex or equivalent models unless otherwise specified.

2.2 MATERIALS.

2.2.01 Toilet Compartment Steel. Steel sheets and strips shall be cold-rolled galvanized, bonderized and stretcher-leveled steel, unless otherwise specified. Minimum thickness of zinc coating shall conform to ASTM A591, Class C. Provide steel and galvanizing which does not fracture, flake or peel from the necessary forming and die-drawing operations. Flash-coated steel is not acceptable.

Metal gages for steel sheets and strips, prior to zinc coating, shall be as follows unless otherwise specified:

Face plates of doors	22 gage	(0.85 mm)
Face plates of panels	20 gage	(1.0 mm)
Reinforcement for tapping	14 gage	(1.9 mm)
Concealed reinforcement for anchoring devices	12 gage	(2.7 mm)

2.2.02 Core Material. Shall be pads of honeycomb paper expanded to 1 inch (2.5 cm) maximum cell size, with cell walls of .009 caliper kraft paper, 26 lbs/1,000 square feet (11.8 kg/92.9 sq. m) minimum, processed with flanged edges and uniform expansion, or faced with kraft paper both sides for adhesion.

2.2.03 Reinforcement. Steel for concealed reinforcement shall be hot rolled.

2.2.04 Fittings and Hardware. Brackets shall be bright chromium-plated cast brass or zinc alloy, or extruded aluminum having edges and corners rounded and polished smooth.

Hinges, coat hooks, latch and keeper shall be bright chromium-plated cast brass or zinc alloy. Latch handle and keeper may be aluminum, provided edges and corners are round.

Aluminum finish shall be AA M21A41 polished clear anodic complying with AA DAF-45 and AA SAA-46.

2.2.05 Fastenings. Hex bolts and machine screws shall be chromium-plated and concealed where possible.

2.2.06 Stainless Steel. Shall be Type 302 or 304 with No. 4 finish.

2.2.07 Chromium-Plated Brass. Exposed surfaces of brass shall be chromium-plated in accordance with ASTM B456.

2.2.08 Mirror Glass. Shall be ASTM C1036, quality Q2, Type I, Class 1, 1/4 inch (6.4 mm) thick glass complete with silvering, copper coating, and protective organic coating; silvering of pure silver, free of pinholes or other defects visible to the naked eye; two-coat abrasion resistant baked on protective coating; as manufactured by Guardian Industries Corp., or approved equal.

2.2.09 Fasteners. Provide tamperproof fasteners. Expansion shields shall be machine bolt type, tubular type, or self-drilling tubular type complying with Fed. Spec. FF-S-325. Fasteners shall be toggle bolts for hollow masonry and stud walls, expansion shields for solid masonry or concrete.

2.3 CEILING MOUNTED TOILET COMPARTMENT.

2.3.01 Type. Shall be overhead braced type with 20 gage (1.0 mm) pilasters extending from floor to approximately 12 inches (30.5 cm) above top of compartments and with extruded aluminum or 20 gage (1.0 mm) tubular steel overhead bracing. Provide overhead bracing continuous through top of pilasters and anchored to walls with brackets. Cap exposed ends of bracing.

2.3.02 Pilasters. Provide top of pilasters with leveling device to carry weight of compartment and to provide secure mechanical anchorage to structure above with adjustable fittings.

2.3.03 Fittings. Anchoring device at top of pilasters shall be12 gage (2.7 mm) hot-rolled steel plate, concealed with a 3 inch (7.6 cm) high stainless steel shoe with polished finish.

2.4 GRAB BARS.

2.4.01 Grab bar material. Shall be stainless steel tubing, with 0.050 inch (1.3 mm) minimum wall thickness, welded to flanges.

2.4.02 Joints. Shall be mortised, brazed or soldered, and ground smooth to form invisible, flush connection.

2.4.03 Flanges. Shall be designed to be anchored to mounting plates with minimum of 3 stainless steel Allen head set screws.

2.4.04 Size. Shall be 1-1/2 inch (3.8 cm) outside diameter with 1-1/2 inch (3.8 cm) clearance between rail and wall.

2.4.05 Concealed Anchors for Masonry Walls. Shall be plates with stud anchors welded on.

2.4.06 Mounting Plates for Connecting Flange to Anchors. Shall be a minimum of 12 gage (2.7 mm) case-hardened and plated steel formed to bear against set screws.

2.5 MIRRORS.

2.5.01 General. Frame shall be not less than 3/8 by 5/8 inch (9.5 mm by 15.9 mm) by 20 gage (1.0 mm) stainless steel. Each side of metal frame: one continuous piece to form square corner with corners welded and welds ground smooth. Edge of mirror shall be protected by plastic filler strips with no exposed seams or screws on frame.

Backing shall be one piece sheet metal, not less than 22 gage (0.85 mm), with galvanized or other rust and corrosion resistant finish, fitting smoothly to frame. Concealed theftproof hangers shall be securely spot-welded to back with not less than 2 welds each.

2.5.02 Mirror and Frame Units. Shall be mirror glass in frame with backing, of size indicated, Bobrick B-290 Series or approved equal.

2.5.03 Mirror and Shelf Units. Shall be mirror glass in frame with backing, of size indicated, with shelf, Bobrick B-292 Series or approved equal. Shelf shall be not less than 22 gage (0.85 mm) stainless steel, 5 inches (12.7 cm) wide by width of frame, and attached to frame with concealed stainless steel brackets.

2.6 DISPENSERS AND RECEPTACLES.

2.6.01 General. Cabinets shall be stainless steel, all welded construction with one piece seamless flanges construction, 22 gage (0.85 mm) minimum thickness.

Flush doors shall be a minimum of 22 gage (0.85 mm) double pan construction or 18 gage (1.3 mm) single sheet with flange. Doors shall be mounted on continuous stainless steel hinges. Cabinet doors shall be equipped with tumbler locks keyed alike.

Towel openings shall be hemmed.

Removable containers for waste receptacles shall be stainless steel, 28 gage (0.47 mm) minimum thickness, bottom edges hemmed.

2.6.02 Surface-Mounted Towel Dispensers. Shall be stainless steel, equipped with a tumbler lock, designed to dispense 300 C-fold or 500 multi-fold towels, one at a time, Bobrick B-262 or approved equal.

2.6.03 Towel Dispenser and Receptacle Units. Recessed towel dispenser and receptacle units shall be designed for handicapped use to dispense all makes of C-fold and multi-fold paper towels, have removable waste container and two flush cabinet doors with two locks, Bobrick B-3900 or approved equal.

2.6.04 Sanitary Napkin Dispenser. Shall be designed to dispense standard packaged napkins or tampons, and have flush cabinet door, with two locks, coin box keyed separately, Bobrick B-3500 or approved equal. Dispenser shall be equipped with mechanism for gratis operation.

2.6.05 Sanitary Napkin Receptacles. Recessed sanitary napkin receptacles shall be self-closing, push-in door, and removable stainless steel container with recessed finger grip, Bobrick B-353 or approved equal.

Sanitary napkin receptacles for recessing in metal toilet compartments shall be two self-closing, push-in doors, and stainless steel container with recessed finger grip, removable from one side, and flange adjustable to fit compartment thickness, Bobrick B-354 or approved equal.

2.7 SOAP DISPENSERS.

2.7.01 Surface Mounted Soap Dispenser. Shall be stainless steel vessel with minimum capacity of 40 fluid ounces (1.2 L), unbreakable refill indicator, locked filler top and push-in valve to dispense liquid soap, Bobrick B-4112 or approved equal.

2.8 TOILET PAPER HOLDERS. Shall be chromium-plated brass, chromium-plated steel, or chromium-plated cast aluminum, with stainless steel springs. Double-roll type, Bobrick B-2740 or approved equal.

2.9 SHOWER ACCESSORIES.

2.9.01 Towel Bars. Shall be stainless steel, 7/8 inch (2.2 cm) round towel bar with square or rectangular or round end brackets, 24 inches (61 cm) long, Bobrick B-205 or approved equal.

2.9.02 Shower Curtain Rods. Shall be assemblies of 1-1/4 inch (3.2 cm) outside diameter, 0.050 inch (1.27 mm) thick, stainless steel tubing, complete with end brackets, and length as required to suit conditions, Bobrick B-6047 or approved equal.

2.9.03 Shower Seat. Folding shower seat shall be stainless steel, designed to support 500 pounds (226.8 kg) in fold down position and fold up into wall housing, Bobrick B-521 or approved equal.

2.10 CONSTRUCTION.

2.10.01 Toilet Compartment Sizes. Panels shall be 58 inches (1.5 m) high, set 12 inches (30.5 cm) above floor. Compartment width and doors shall be as indicated on plans.

2.10.02 Doors and Panels. Shall be 1 inch (2.5 cm) thick, constructed of 2 face plates with formed edges, cemented under pressure over the sound deadening core and sealed at all edges (except at anchoring device) with continuous rounded locking strip with corners mitered and welded, welds ground smooth, or with corners internally welded and finished with stainless steel preformed reinforcements. Provide doors and panels with concealed tapping reinforcement for attachment of hardware and accessories where machine screws are required for fastening. Provide smooth surfaces, free from wave, warp or buckle. Provide panels with cutouts for recessed sanitary napkin receptacles and concealed reinforcement for attachment of grab bars.

2.10.03 Pilasters. Shall be 1-1/4 inches (3.2 cm) thick and of same construction as panels.

2.10.04 Fittings. Attach panels and pilasters to one another or to walls, or both, with brackets of approved type.

2.10.05 Hardware. Provide gravity type hinges adjustable to hold door ajar 30 degrees when unlatched. Conceal all operating parts within door. Equip each compartment door with latch, combination stop and keeper fitted with rubber bumper, and combination coat and hat hook and rubber bumper. For attaching hardware, provide machine screws with theft-resistant heads.

2.11 URINAL SCREENS. Shall be wall-hung, bracket-supported type, one inch thick, of same construction as toilet compartment panels, except for both vertical edges of screens, provide additional reinforcement consisting of 4 inch (10.2 cm) wide wood core. Screen size shall be 24 by 42 inches (61 cm by 1.1 m), unless otherwise indicated. Brackets shall be extra heavy gage stirrup brackets with provisions for 2 bolts through screen and 4 holes for attachment of wall anchors.

2.12 FINISH.

2.12.01 Enamel Finish. Thoroughly clean metal surfaces, except chromium-plated, stainless steel or aluminum surfaces, and shop apply a prime coat and finish coat of high grade synthetic enamel, oven-baked to produce a highly mar resistant surface.

2.12.02 Finish Colors. Shall be selected by the Engineer from manufacturer’s full range.

PART 3 - EXECUTION

3.1 INSPECTION. Verify correct spacing of and between plumbing fixtures. Verify correct location of built-in framing, anchorage, and bracing.

3.2 PREPARATION. Protect adjacent construction against damage during progress of this Work.

3.3 INSTALLATION.

3.3.01 General. Erect Work in rigid, substantial manner, straight, plumb, and with horizontal lines level. Install panels with clearance between 1/2 inch (1.3 cm) and one inch (2.5 cm) at wall and fasten by means of at least 2 wall brackets, one located near top and the other near bottom of the panel. Through-bolt each wall bracket to panel and attach to wall with 1/4 inch (6.4 mm) bolts of suitable type. Locate wall brackets so that holes for wall bolts will occur in joints of concrete masonry units or ceramic tile units. Anchor panels to pilasters with stirrup bracket supports matching those at walls.

Conceal evidence of drilling, cutting and fitting of wall, floor and ceiling connections by finished Work. At vertical edges of doors provide uniform clearance from top to bottom, not exceeding 3/16 inch (4.8 mm). Carefully adjust door hardware.

3.3.02 Ceiling Mounted Toilet Compartments. Secure each pilaster to structure above with 1/4 inch (6.4 mm) cadmium-plated screws and lead expansion shields. Provide anchor device which is readily accessible for leveling, plumbing, and tightening the installation.

Fasten toilet and bath accessories securely to walls in accordance with manufacturer's instructions and as approved by the Engineer. Anchor surface-mounted accessories for stud partitions, except bars, to steel sheet reinforcing in the partitions.

Accessory locations and mounting heights above finish floor shall be as indicated or as specified. Coordinate the installation of all accessories, including location preparation of openings for recessed items, to avoid interference with other work.

3.3.03 Grab Bars. Attach concealed anchors for masonry walls with toggle bolts.

Bolt mounting plates to steel plate reinforcing in stud partitions, to expansion shields in concrete walls, to reinforcement in metal partitions, and to thru-bolts welded to back mounting plate, unless otherwise specified. Where back mounting plate on thru-bolts will be exposed to view, anchor the mounting plate to wall with toggle bolts or concealed anchors.

3.3.04 Mirrors. Anchor wall hangers to wall with approved fasteners. Anchor frame to wall hangers with concealed set screws.

3.3.05 Dispensers and Receptacles. Screw cabinets of recessed units to wall recesses.

3.3.06 Surface-Mounted Towel Dispensers. Mounting height shall be 40 inches (1.0 m) to bottom of cabinet.

3.3.07 Sanitary Napkin Dispensers. Unless otherwise indicated, install one sanitary napkin dispenser in each women's toilet room.

3.3.08 Sanitary Napkin Receptacles. Unless otherwise indicated, install one sanitary napkin receptacle in each water closet compartment in women's toilet rooms.

3.3.09 Toilet Paper Holders. Mounting height shall be 34 inches (86.4 cm) to center of holder. Unless otherwise indicated, install one toilet paper holder in each water closet compartment in all toilet rooms.

3.4 SHOWER ACCESSORIES.

3.4.01 Shower Accessory Mounting Heights. Towel bars shall be 49 inches (1.2 m) to center of bar. Curtain rods shall be 74 inches (1.9 m) to center of rod.

3.5 MAINTENANCE.

3.5.01 Cleaning. Clean finished surfaces in accordance with manufacturer's instructions. Leave the Work free of imperfections.

End of Section

SECTION 10200

LOUVERS AND GRILLES

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous louvers and grilles.

1.2 GENERAL.

1.2.01 Coordination. Coordinate the Work with installation of masonry flashings, mechanical ductwork, and electrical services to motorized devices.

1.2.02 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

AMCA (Air Movement and Control Association) 500 – Test Method for Louvers, Dampers, and Shutters.

ASTM (American Standard Testing Material) A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy Coated (Galvanealed) by the Hot-Dip Process.

ASTM A666 – Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

ASTM B209/B209M – Specification for Aluminum-Alloy Sheet and Plate.

ASTM B221/B221M – Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes.

SMACNA (Sheet Metal and Air Conditioning Contractor's National Association) "Architectural Sheet Metal Manual"

UL (Underwriters Laboratories, Inc.) – Electrical Construction Materials Directory.

1.3 QUALITY ASSURANCE. Comply with SMACNA (Sheet Metal and Air Conditioning Contractor's National Association) "Architectural Sheet Metal Manual" recommendations for fabrication, construction details, and installation procedures, except as otherwise indicated.

1.3.01 Manufacturer's Qualifications. Company shall have a minimum of five years documented experience manufacturing products specified in this section.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings for the fabrication and erection of louver assemblies. Include layout plan and elevations, details of sections and connections. Show anchorage items.

Submit manufacturer's technical data, including maximum recommended air velocity, design free area, anchor details and installation instructions including finishing products. Submit installation instructions and provide to the installer. Submit operation and maintenance data for the installed louvers and grilles.

1.4.02 Certifications. Certify that louvers and grilles furnished meet or exceed specified SMACNA requirements and other requirements specified in this section.

1.4.03 Samples. Submit 2 samples, 6 inch (15.2 cm) square, of each type of metal finish to be used in the Work. Prepare samples on metal of the same gage and alloy to be used in the work. Samples will be reviewed for color and texture only. Compliance with all other requirements is the exclusive responsibility of the Contractor.

1.5 WARRANTY. Provide ten year manufacturer warranty for louvers. Include coverage for degradation of flouropolymer finish.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide products of one of Airline Products Co., Greenheck Corp, Industrial Louvers, Inc., or an approved equal.

2.2 MATERIALS.

2.2.01 Aluminum Sheet. Shall be ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by the metal producer to provide the required finish.

2.2.02 Aluminum Extrusions. Shall be ASTM B 221, Alloy 60603 - T52.

2.2.03 Fastenings. Use same material as items fabricated, unless otherwise indicated. Fasteners for exterior applications may be hot-dip galvanized, stainless steel or aluminum. Provide types, gages and lengths to suit unit installation conditions. Use Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.

2.2.04 Finish. All exposed interior and exterior aluminum surfaces shall receive a fluoropolymer coating (70 percent Kynar) applied in a minimum of 3 coats. The coating shall comply with AAMA 605.2 requirements. A maximum of three colors will be selected from the manufacturer's full line of colors by the Engineer.

2.2.05 Anchors and Inserts. Use non-ferrous metal or hot-dip galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use steel or lead expansion bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.

2.2.06 Bituminous Paint. Shall be SSPC-Paint 12 (cold-applied asphalt mastic).

2.3 EXTRUDED ALUMINUM LOUVERS. Furnish extruded aluminum louvers, with extrusions not less than 0.081 inches (2.1 mm) thick, of size indicated. Fabricate frames to suit adjacent construction. Assemble louvers and provide all supports, anchorages and accessories for complete installation. Locate sills where shown, of the same material and thickness as louvers.

2.4 SCREENS. Provide removable screens for exterior louvers. Fabricate screen frame of the same metal and finish as the louver units to which secured.

Provide frames consisting of u-shaped metal for permanently securing screen mesh.

Use 1/2 inch square (12.7 mm sq) mesh, 0.064 inch (1.63 mm) anodized aluminum wire bird screen.

Locate screens on inside face of louvers. Secure screens at Louver frames with machine screws, spaced at each corner and at 12 inch (30.5 cm) o.c. between.

2.5 MANUFACTURE AND FABRICATION. Verify size, location and placement of louver units prior to fabrication wherever possible. Coordinate field measurements and shop drawings with fabrication and shop assembly to minimize field adjustment, splicing mechanical joints and field assembly of units. Preassemble units in as large of sections as practicable.

2.5.01 Louver Blade Design. Sloped at 45 degrees reinforced with intermediate stiffeners, with integral and lateral rain water stops positioned on blade unless indicated otherwise.

2.5.02 Intermediate Mullions. Concealed of extruded aluminum, profiled to suit louver frame.

2.5.03 Head and Sill Flashings. Install head and sill flashings extruded to required shape, single length in one piece per location.

2.5.04 Screens. Install screen mesh in shaped frame, reinforce corner construction.

PART 3 - EXECUTION

3.1 INSPECTION. Installer must examine the areas and conditions under which louvers and associated items are to be installed and notify the Contractor in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the Installer and Engineer

3.2 PREPARATION. Coordinate setting drawings, diagrams, templates, instructions and directions for the installation of anchorages which are to be embedded in concrete or masonry construction. Coordinate the delivery of such items to the project site.

3.3 INSTALLATION. Locate and place louver units plumb, level and in proper alignment with adjacent work. Use concealed anchorages wherever possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

Form tight joints with exposed connections accurately fitted together. Provide reveals and openings for sealants and joint filler, as indicated.

Repair finishes damaged by cutting, welding, or grinding operations required for fitting and joint. Restore finishes and prime coats of paint so that there is no evidence of corrective work. Return items which cannot be refinished in the field to the shop, make the required alterations, and refinish the entire unit, to provide new units, at Contractor's option.

Protect galvanized and non-ferrous metal surfaces from corrosion or galvanic action by application of a heavy coating of bituminous paint on surfaces which will be in contact with concrete, masonry or dissimilar metals. Provide concealed gaskets, flashing, joint fillers, caulking, insulation, and install as the work progresses to make the installations weathertight. Refer to Master Specification Section 07600, Caulking and Sealers for caulking of louvers.

3.3.01 Adjusting. Adjust operable louvers for freedom of movement of control mechanism. Lubricate operating joints.

3.2.02 Cleaning. Clean surfaces and components.

End of Section

SECTION 10300

VISUAL DISPLAY BOARDS

PART 1 - GENERAL

1.1 SCOPE. This section covers various types of display boards, including projection screens, marker boards and tack boards..

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

AHA (American Hardboard Association) A135.4 – Specification for Basic Hardboard.

ANSI (American National Standards Institute) A208.1 – Specification for Wood Particleboard.

ASTM (American Society for Testing and Materials) A424 – Specification for Steel Sheets for Porcelain Enameling.

ASTM A653/A653M – Specification for Steel Sheets, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvanealed) by the Hot-Dip Process.

ASTM B209 – Specification for Aluminum-Alloy Sheet and Plate.

ASTM B221 – Specification for Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes.

ASTM C36 – Specification for Gypsum Wallboard.

ASTM C208 – Specification for Cellulosic Fiber Insulation Board.

ASTM E84 – Test Method for Surface Burning Characteristics of Building Materials.

FS (Federation Specifications.) CCC-W-408 – Specification for Wall Covering, Vinyl-Coated.

FS L-P-1040 – Specification for Plastic Sheets and Strips (Polyvinyl

Fluoride).

1.3 QUALITY ASSURANCE. Conform to Fed. Spec. CCC-W-408A for flame/smoke rating for vinyl fabric covered tackboards in accordance with ASTM E84.

1.3.01 Manufacturer's Qualifications. Company shall have a minimum of five years documented experience specializing in manufacturing products specified in this section.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Indicate wall elevations, dimensions, joint locations, and special anchor details. Submit product data on chalkboards, markerboards, trackboards, trackboard surface covering, and trim and accessories. Submit Operation and Maintenance data.

1.4.02 Samples. Submit two samples each 4 x 4 inch (101.6 mm x 101.6 mm) in size illustrating materials and finish, color and texture of chalkboard, markerboard, chalkboard and trim, tackboard, and tackboard surfacing.

1.5 DELIVERY, STORAGE, AND HANDLING. All parts and assemblies shall be protected during fabrication, shipment, storage, and erection to prevent damage. Damaged units will be rejected and shall be replaced at no additional cost to the Owner.

1.6 WARRANTY. Provide two-year manufacturer warranty for visual display boards. Chalkboard and markerboard surface shall be warranted against discoloration due to cleaning, crazing or cracking, and staining.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide products of Alliance America, Best-Rite Chalkboard Co. Inc., Claridge Products and Equipment, and Marsh Industries Inc., or an approved equal.

2.2 MATERIALS.

2.2.01 Sheet Steel. Shall be ASTM A424, Type I, commercial quality.

2.2.02 Aluminum Sheet. Shall be ASTM B209 6063-T4 alloy.

2.2.03 Hardboard. Shall be AHA A135.4, Tempered type, with pretreated surface for chalkboard paint.

2.2.04 Cork. Shall be fine grain natural cork, homogeneous composition.

2.2.05 Composition Cork. Shall be formulation of cork granules, oils, pigments, and urea formaldehyde plastic, color as selected by Owner.

2.2.06 Tackboard Covering. Shall be vinyl coated fabric roll stock.

2.2.07 Hardboard. Shall be AHA A135.4, tempered, smooth face.

2.2.08 Particle Board. Shall be NPA A208.1, wood chips, or shavings set with waterproof resin binder, sanded faces.

2.2.09 Foil Backing. Shall be aluminum foil sheet.

2.2.10 Frame and Chalkrail. Shall be aluminum extrusions, ASTM B221, 6063-T5 alloy.

2.2.11 Marker Boards. Marker board panels shall have an LCS white liquid chalk porcelain-enameled writing surface. All panels shall be factory-mounted on tempered hardboard or other suitable backing as recommended by the manufacturer. Each unit shall have a clear, anodized aluminum surrounding frame with square corners, and each marker board shall have an attached marker tray.

2.3 ACCESSORIES.

2.3.01 Adhesives. Use a type approved by manufacturer.

2.3.02 Map Supports. Shall be formed aluminum sliding hooks or roller brackets to fit map rail.

2.3.03 Flag Holders. Shall be cast aluminum or formed steel bored to receive 1 inch (25.4 mm) diameter flag staff, bracketed to fit top rail of chalkboard, marketboard, or trackboard.

2.3.04 Cleaning Instruction Plate. Provide instructions for chalkboard cleaning on a plastic plate fastened to perimeter frame.

2.4 PROJECTION SCREEN.

2.4.01 Manufacturers. Provide product from Da-Lite Screen Company, Inc.; Draper shade & screen Co., Inc., or approved equal.

2.4.02 Fabrication. Screen surface shall be matte white surface with 2 inch (5.1 cm) black masking borders, 60 x 60 inch (1.5 m x 1.5 m) size, unless otherwise indicated, mounted on 3 inch (7.6 cm) steel roller. Case shall be 22 gage (0.85 mm) steel with flat back, finished with baked enamel finish, fitted with end caps and wall mounting brackets.

PART 3 - EXECUTION

3.1 INSPECTION. Verify internal wall blocking is ready to receive Work and positioning dimensions are as indicated on shop drawings or as instructed by the manufacturer. Verify flat wall surface for frameless adhesive applied type.

3.2 PREPARATION. Protect the Work and adjacent construction against damage during installation.

3.3 INSTALLATION. Install each visual display board or projection screen in accordance with manufacturer's instructions, approved shop drawings and specified requirements. Furnish each item with required fasteners.

Anchor projection screens to the wall with 3/8 inch (9.5 mm) toggle bolts at an elevation of 8 feet, 6 inches (2.6 m) above finish floor, unless otherwise indicated.

3.4 CLEANING. Upon completion, clean the Work in accordance with manufacturer's instructions.

End of Section

SECTION 10400

MARKER POSTS AND SIGNAGE

PART 1 - GENERAL

1.1 <u>SCOPE</u>. This section includes fabricated marker posts and interior and exterior signage.

1.2 <u>GENERAL</u>.

1.2.01 <u>Governing Standard</u>. Unless otherwise specified, the work of this section shall conform to the application portions of the following:

> ASTM (American Society for Testing and Materials) A120 – Specification for Black and Hot-Dipped Zinc-Coated (Galvanized) Welded and Seamless Steel Pipe For Ordinary Uses.
>
> Federal Highway Administration's <u>Manual on Uniform Traffic Control Device</u>.
>
> American Association of State Highway and Transportation Officials <u>Standard Specifications for Structural Supports for Highway Signs</u>.
>
> The Building Officials and Code Administrators (BOCA) <u>National Building Code</u>.

1.3 <u>QUALITY ASSURANCE</u>.

1.3.01 <u>Manufacturer's Qualifications</u>. Manufacturer shall have a minimum of five years of documented experience specializing in manufacturing sign products specified in this section.

1.3.02 <u>Field Measurements</u>. Take field measurements prior to preparation of shop drawings and fabrication where necessary to ensure proper fitting. Show recorded measurements on final shop drawings.

1.4 <u>SUBMITTALS</u>.

1.4.01 <u>Drawings and Data</u>. Show fabrication and erection of signs. Include plans, elevations, and large-scale sections of typical members and other components. Show anchors, grounds, layout, reinforcement, accessories, and installation details.

Submit data to Engineer for each type of sign specified, including details of construction relative to materials, dimensions of individual components, profiles, and finishes.

Provide message list for each sign required, including large-scale details of wording and lettering layout.

For signs supported by or anchored to permanent construction, provide setting drawings, templates, and directions for installation of anchor bolts and other anchors to be installed as a unit of work in other sections.

1.4.02 Samples. Submit to Engineer manufacturer's full range of samples for initial selection of signage color, pattern, and texture. Submit for approval, one sample of each type of sign or marker post. The Contractor shall clearly label each sample submittal including project title and number.

Furnish full-size spacing templates for individually mounted dimensional letters and numbers.

1.5 DELIVERY, STORAGE, AND HANDLING. Package signs, labeled in name groups. Package and handle all markers, signs, and accessories to prevent damage or marring during transportation, storage, and handling.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Marker Posts. Steel pipe for marker posts shall conform with ASTM A120, Schedule 40. Furnish each post with a 10 gauge (3.5 mm) steel cap, flush welded. Concrete for post encasement shall conform with Master Specification Section 03300, Cast-in-Place Concrete.

2.1.02 Aluminum Sheet. Alloy and temper shall be as recommended by the sign manufacturer for the type of use and finish indicated, and with not less than the strength and durability properties specified in ASTM B209 for 5005-H15.

2.1.03 Aluminum Castings. Alloy and temper shall be as recommended by the sign manufacturer for the casting process used and for the use and finish indicated.

2.1.04 Metal Fasteners. Use metals that are not corrosive to the sign material or mounting surface.

2.1.05 Anchors and Inserts. Use nonferrous metal or hot-dipped galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or lead expansion bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.

2.2 MANUFACTURE AND FABRICATION.

2.2.01 Graphic Content and Style. Provide sign that complies with the requirements indicated for size, style, spacing, content, position, material, finishes, and colors of letters, numbers, and other graphic devices.

Exterior building signage shall be cast aluminum letters as detailed on building elevations, with anodized finish as described below.

2.2.02 Finishes. Provide color match charts to Engineer for exposed sign material that requires selection of materials with integral or applied colors, surface textures or other characteristics related to appearance. Where not indicated, color will be as selected by the Engineer.

Metal Finishes shall comply with NAAMM Metal Finishes Manual for finish designations and applications recommendations. Aluminum finish designations shall be prefixed by "AA" and conform to the system established by the Aluminum Association for designating aluminum finishes. Color anodized finishes shall be medium satin AA-M31C22A32. Baked-enamel finishes shall be A-M4xC12C42R1x. Apply baked enamel in compliance with paint manufacturer's specifications for cleaning, conversion coating, and painting. Organic coating shall be thermosetting-modified acrylic enamel primer/topcoat system complying with AAMA 603.8 except with a minimum dry film thickness of 1.5 mils (0.04 mm), medium gloss.

2.2.03 Marker Post Painting. Prior to painting, all exposed galvanized surfaces shall be thoroughly cleaned of all dirt, oil, grease, and other foreign matter.

Only surfaces that are not to be encased in concrete shall be painted. Before any paint is applied, the galvanized areas to be painted shall be chemically treated thoroughly with “Lithoform,” “Galvaprep,” or approved equal in order to ensure that the paint will firmly bond with the surface it is applied to.

Prime coat shall be a zinc-dust primer such as “Speedhide Galvanized Steel Primer,” Number 6-215/216, color grey, as manufactured by Pittsburgh Plate Glass Company or approved equal.

After the prime coat is thoroughly dry, there shall be applied two finish coats of “Dulux” Matching Number 181-15666, color Surf Blue, as manufactured by DeNemours E.I. DuPont and Company or approved equal.

All paints shall be applied only as recommended by the manufacturer. Paints may be applied by brush or spray provided that each coat forms a uniform film without runs, snags, or brush marks.

After installation, the Contractor shall touch-up any marks or abrasions to the satisfaction of the Engineer.

General contractor shall provide temporary signs for exterior building sign Type “A” painted on ¾” thick exterior grade plywood surfaces for owner/architect approval

2.2.04 Interior Signage System. The interior signage system shall be ASI “SP” series as manufactured by ASI Sign Systems, Inc., with 0.080 inch (2.0 mm) laminated back plate style “SPF”. Mounting shall be on the door surface unless scheduled otherwise. Signs shall be square cornered and shall have a semi-matte low luster finish.

Colors of the field and lettering shall be selected from the manufacturer’s standard colors by the Owner. Size of the signs shall be a minimum 6 inch (15.2 cm) square and larger as required by the typography.

Lettering shall be Helvetica Medium Ultra Condensed of the sizes scheduled herein. Lettering shall be upper and lower case.

Furnish room identification signage in accordance with the signage schedule, and with designated room names and numbers as provided by the Owner. Signs for installation on glass shall be provided with matching backing plate for application to the reverse side of the glass.
Provide mechanical signs/labels as per DWSD standard master specification Division 15.

2.2.05 Exit Signage. “Exit” signs shall have red letter at least 6 inches (15.2 cm) high and the minimum width of each stroke shall be 3/4 inch (19 mm) on a white background or in other approved distinguishable colors. The word “Exit”, except the letter “i”, shall have letters having a width of not less than 2 inches (51 mm) and the minimum spacing between letters shall not be less than 3/8 inch (10 mm). Signs larger than the minimum size herein required shall have letter widths and spacing in the same proportions to the heights as indicated in this section. If an arrow is provided as part of an “Exit” sign, the construction shall be such that the arrow direction cannot be readily changed. The word “Exit” shall be clearly discernible when the sign illumination means is not energized.

Each sign shall be illuminated by a source providing not less than 5 footcandles (54 lux) at the illuminated surface and shall have a contrast ratio of not less than 0.5. As an exception, approved self-illuminated letters shall have a minimum luminance of

0.06 foot lamberts (0.21 cd per sq m) Primary power shall be provided to signs in accordance with Master Specification Division 16, Electrical.

All “Exit” signs shall be illuminated at all times that building is occupied. To assure continued illumination for a duration of not less than 1 hour in case of primary power loss, the “Exit” signs shall be connected to an emergency electrical system except where approved self-luminous signs are used and provide continuos illumination independent of external power sources.

2.2.06 Safety and Warning Signs. Safety and warning signs and labels shall be furnished and installed to indicate and define hazards, which may lead to accidental injury to personnel or to property damage. The signs and labels shall be constructed of laminated plastic. The sign size, shape, and color shall be in accordance with the Occupational Safety and Health Act (OSHA), Federal Register Part 2, Paragraph 1910.45.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 Sign Placement. Install room identification signage in accordance with the signage schedule, and with designated room names and numbers as provided by the Owner.

Mount sign units and accessories where indicated, using methods described and in compliance with the manufacturer's instructions. Install signs level, plumb, and at the height indicated, with sign surfaces free from distortion or other defects in appearance.

Dimensional letters and numbers shall be mounted using standard fastening methods recommended by the manufacturer for the sign or lettering type, wall construction, and condition of exposure indicated.

For individual lettering, provide heavy paper template to establish letter spacing and to locate holes for fasteners. For flush mounting, mount letters with backs in contact with the wall surface.

3.1.02 Marker Post Installation. Marker posts shall be placed on the same side of the right-of-way as the main is located, laterally opposite the appurtenance, and transversely 1 foot inside the right-of-way or property line unless otherwise directed by the Engineer.

Marker posts opposite structures located in gravel surface roads, where the frame cover is set 15 inches (38.1 cm) below grade, shall have a 3 inch by 4 inch (7.6 cm by 10.2 cm) stainless steel plate (ASTM 304) placed 3 inches (7.6 cm) from top of post and secured to the post with stainless steel machine screws. The plate shall indicate the structure type and distance(s), direction(s), and offset(s) to the structures. The lettering on the plate shall be block 1/4 inch (6.4 mm) engraved block lettering. Details of the plate shall be submitted for approval prior to fabrication.

In cultivated lands, the marker post shall be installed opposite the appurtenance and as close to a fence line as possible where directed by the Engineer.

In residential areas, where three or more appurtenances are located within a total length of 200 feet (61 m) or less, marker posts shall be placed opposite one appurtenance selected by the Engineer.

3.1.03 Interior Sign Mounting. Interior signs shall be mounted as specified and as recommended by the manufacturer at the locations indicated. Mounting methods shall be appropriate for the mounting surface available. Signs shall be installed square and level at the height designated. Signs shall be door-mounted unless noted otherwise.

3.1.04 Installation of Exit Signage. In all buildings, rooms, or spaces required to have more than one exit or exit access, all required means of egress shall be indicated with approved signs reading “Exit”. The “Exit” signs shall be visible from the exit access and, where necessary, supplemented by directional signs in the exit access corridors indicating the direction and way of egress. All “Exit” signs shall be located at exit doors or exit access areas, so as to be readily visible. Sign placement shall be such that any point in the exit access shall not be more than 100 feet (30.5 m) from the nearest visible sign.

As an exception, main exterior exit doors which are obviously and clearly identifiable as exists are not required to have “Exit” signs where approved.

3.1.05 Cleaning. After installation, clean soiled sign surfaces according to the manufacturer's instructions. Protect units from damage until acceptance by the Owner.

End of Section

SECTION 10522

FIRE EXTINGUISHERS, CABINETS, AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This Section includes furnishing portable fire extinguishers, fire extinguisher cabinets, and related accessories.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified the work of this section shall conform to the applicable portions of the following:

NFPA (National Fire Protection Association) 10 – Standard for Portable Fire Extinguishers.

UL (Underwriters Laboratories, Inc.) – Fire Protection Equipment Directory.

1.3 QUALITY ASSURANCE. Provide only fire extinguishers which comply with NFPA 10.

1.3.01 Labels. Provide only fire extinguishers, and fire extinguisher cabinets which are listed and labeled by Underwriters Laboratories Inc., or Factory Mutual System. Do not use permanent fire extinguishers for protection during construction period.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Provide drawings showing location of extinguishers, cabinets and applicable dimensions. Also submit manufacturer's data showing compliance with contract documents, color, finish and anchorage details. Submit manufacturer’s installation instructions. Provide maintenance data, including recommended cleaning, testing and recharging methods and materials.

1.4.02 Certifications. Installer shall submit written certification that the fire extinguishers installed comply with the contract documents and are fully and correctly charged.

1.4.03 Samples. Provide samples showing finishes of cabinets, on actual or similar material.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Products of the following manufacturers, or others that are equal, provided they comply with requirements of contract documents, will be among those considered acceptable:

2.1.01 Fire Extinguishers.

Ansul Incorporated
Grinnell Corp.
JL Industries
Larsen's Manufacturing Co.
Nystrom Products Co.
Cosmic
ABC Dry Chemical

2.1.02 Cabinets and Accessories.

Ansul Incorporated
Grinnell Corp.
JL Industries
Larsen's Manufacturing Co.
Nystrom Products Co.

2.2 FIRE EXTINGUISHERS. Provide fire extinguishers with cabinets or without in the quantities and sizes indicated on the drawings. Where indicated, provide such additional extinguishers in accordance with the instructions, requirements and recommendations of all applicable Governing Codes, Regulations and Standards.

2.2.01 Dry Chemical Type. Shall be stainless steel or cast steel tank, with pressure gage; size and classification as indicated on the drawings.

2.2.02 Foam Type. Shall be stainless steel or cast steel tank, with pressure gage, size and classification as indicated on the drawings.

2.2.03 Carbon Dioxide Type. Shall be stainless steel or cast steel tank, with pressure gage; size and classification as indicated on the drawings.

2.2.04 Extinguisher Finish. Shall be stainless steel, satin chrome or enamel finish.

2.3 CABINETS AND CABINET ACCESSORIES.

2.3.01 Metal. Shall be formed stainless steel or as indicated on the drawings.

2.3.02 Style. Shall be recessed mounted, with overlapping 2 1/2 inch (6.4 cm) return trim, single flat door flush with trim.

2.3.03 Door Material. Shall be stainless steel, satin finished, and with surface mounted door handle, finished to match door.

2.3.04 Trim (box flange or frame). Shall be same material and finish as door with no lettering on door or trim.

2.3.05 Box. Shall be manufacturer's standard material and construction.

2.3.06 Hinges. Provide hinges for each door, concealed or continuous type that allow full 180 degree opening of door. Finish exposed hinges to match door.

2.4 ACCESSORIES.

2.4.01 Fire Blanket. Shall be fire retardant treated material. The color and size to be chosen by Owner.

2.4.02 Extinguisher Brackets. Provide brackets suitable for extinguishers made of compatible materials.

2.4.03 Cabinet Signage. Provide signage as indicated on the Drawings.

PART 3 – EXECUTION

3.1 INSPECTION. Verify the intended mounting surfaces and openings are ready to receive the work. Verify field measurements are as on shop drawings.

3.2 PREPARATION. Clean substrate surfaces. Protect elements surrounding the work of this Section from damage or disfiguration. Prepare openings for recessed cabinets.

3.2.01 Keys for Cabinet Locks. Obtain the Owner's instructions as to the keying scheme required. Do not deliver or install extinguishers until just before substantial completion.

3.3 INSTALLATION. Perform installation in accordance with the manufacturer's instructions except where more stringent requirements are shown or specified, and except where project conditions require extra precautions or provisions to ensure satisfactory performance of the work. Install cabinets and extinguishers at locations and heights indicated, in accordance with NFPA. Deliver keys to owner at substantial completion.

3.3.01 Cleaning. Clean the work in accordance with Master Specification Section 01190, Contract Closeout and Cleaning and clean the exposed surfaces of all components.

End of Section

SECTION 10700

STORAGE SHELVING, PARTITIONS, AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section includes miscellaneous shelving, partitions, and all associated accessories.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Maintain spaces to receive the Work at a temperature of at least 65 degrees F (18 degrees C). Install materials only when normal temperature and humidity conditions approximate the interior conditions that will exist when the building is occupied.

1.2.02 Governing Standards. Unless otherwise specified, the work of this section will conform to the applicable portions of the following standard specifications:

AA (Aluminum Association) DAF-45 - Designation System for Aluminum Finishes.

AA SAA-46 - Specification for Anodized Architectural Aluminum.

ASTM (American Society for Testing and Materials) A36 – Specification for Carbon Structural Steel.

ASTM A53/A53M – Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

ASTM A123 – Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A167 – Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

ASTM A500 – Specification for Cold-formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A501 – Specification for Hot-formed Welded and Seamless Carbon Steel Structural Tubing.

ASTM A510 – Specification for General Requirement for Wire Rods and

Course Round Wire, Carbon Steel.

ASTM A580 – Specification for Stainless and Heat-Resisting Steel Wire.

ASTM A1008-01 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM B209 – Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

ASTM B211 – Specification for Aluminum-Alloy Bars, Rods, and Wire.

ASTM B221/B221M – Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes and Tubes.

ASTM C847 – Specification for Metal Lath.

ASTM E84 - Test Method for Surface Burning Characteristics of Building Materials.

ASTM E90 - Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions.

AWS D1.1 – Structural Welding Code.

FS QQ-W-461 – Wire, Steel, Carbon (Round, Bare, and Coated).

FS TT-P-31 – Paint, Oil, Iron Oxide, Ready Mix, Red and Brown.

FS TT-P-641 – Primer Coating, Zinc Oxide (for Galvanized Surfaces).

FS TT-P-645 – Primer, Paint, Zinc Chromate.

NEMA (National Electrical Manufacturers Association) LD 3 - High-Pressure Decorative Laminates.

1.3 QUALITY ASSURANCE.

1.3.01 Contractor's Qualifications. Employ manufacturer, or his authorized representative as approved by the Engineer, to install the Work with the use of workmen skilled in the trade.

1.3.02 Manufacturer's Qualifications. Company shall have five years documented experience in manufacturing the products specified in this section.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings depicting all the shelving and partition system layouts. Drawings shall include walls, ceilings, gates, accessories, interruptions, special sized panels, appurtenances, edge details, elevation differences, stairs, ramps, plan and vertical dimensions, elevations, component details, head, jamb and sill details, and the location of hardware. Drawings shall show all framed openings, bearing and anchorage points and loadings, welds, types and locations of fasteners and accessories, and all items required for related work.

Provide design analysis, fabrication and installation calculations for all shelving and partition system loadings, stresses, material size and shape selections, bearing and anchorage point loadings. Information shall be prepared, sealed and signed by a design professional having the appropriate discipline education, training, and experience, and currently registered in State of Michigan.

Provide product date for all shelving and partition system components, including screen materials. Furnish maintenance instructions for finishes and operating components.

1.4.02 Certifications. Submit a statement of compliance for performance requirements.

1.4.03 Samples. Submit samples for the purpose of selecting finishes of all the shelving and partition systems construction and components, including samples of posts, post heads, brackets, anchors, rails, frames, panels, gates, hinges, latches and locksets, clearly depicting the work that will be provided, including style, color, and finish.

1.5 DELIVERY, STORAGE, AND HANDLING. Protect the Work from damage during transportation to the Project site, storage at the site, and progress of the Work until completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Provide folding partitions having the following minimum performance requirements when tested in accordance with the applicable test method by a testing laboratory approved by the Engineer:

Sound transmission class for sound insulating partitions: 50 per ASTM E90, in large scale opening 14 feet (4.3 m) by 9 feet (2.7 m), incorporating standard irregularities.

Fire hazard classification of facing material: maximum 25 for flame spread and 50 for smoke developed per ASTM E84.

2.2 MATERIALS.

2.2.01 Fiberboard. Shall be 7/16 inch (11 mm) thick mineral backing as manufactured by Conwed Corp. or Simpson Timber Co., having maximum fire hazard classification of 25 for flame spread and 50 for smoke developed, when tested in accordance with ASTM E84.

2.2.02 Fabric. Shall be GF Business Equipment Co. panel fabric no. "G3A Roan".

2.2.03 Vinyl Fabric. Forbo Industries, Inc. "Vicrtique", "Loba" pattern in color selected by the Engineer from manufacturer's standard range, or as approved, complying with the following:

Backing weight: 4.2 oz. per sq. yd. (142 g per sq m) average.

Coating weight: 10.8 oz. per sq. yd. (366 g per sq m) average.

Total weight: 15.0 oz. per sq. yd. (508 g per sq m) average.

Backing type: non-woven polyester.

Tensile strength (W x F): 150 x 130 lbs. (667 x 578 N).

Tear strength (Elmendorf W x F): 100 x 100.

Color fastness (200 hours fadometer): no change.

Shrinkage (W x F): 1.7 x 0.5 percent average.

Noise reduction coefficient: 0.15.

Adhesive for laminating vinyl fabric to fiberboard shall be as recommended by manufacturer of vinyl fabric.

2.2.04 Plastic Laminate. Shall meet NEMA publication LD3 for general purpose type. Plastic laminate face sheet shall be 0.028 inch (0.71 mm) thick with low-gloss finish; Formica Corp. "Formica"; Nevamar Div. of International Paper Co. "Nevamar"; International Paper Co. "Micarta"; Wilsonart International "Wilsonart"; or as approved; in solid patterned color as selected by the Engineer from manufacturer's standard range.

2.2.05 Aluminum. Extruded aluminum shall comply with ASTM B221, 6063 alloy. Aluminum for hard anodic finish shall be the alloy required to produce the specified finish, temper as recommended by the manufacturer.

2.2.06 Framing Members. Shall be ASTM A36, formed steel sections.

2.2.07 Chain Link Fabric. Shall be 2 inch (5.1 cm) diamond mesh galvanized steel wire, interwoven, 6 gage thick, top salvage twisted tight, bottom salvage knuckle end closed; including tension bars, tension wire, and accessories.

2.2.08 Welding Materials. Shall be AWS D1.1; type required for materials being welded.

2.2.09 Bolt, Nuts and Washers. Shall be hot dip galvanized.

2.2.10 Anchorage Devices. Shall be drilled expansion bolts.

2.2.11 Exposed Mechanical Fastenings. Shall be flush countersunk screws or bolts, unobtrusively located, consistent with design of structure.

2.3 INDIVIDUAL FOLDING PANEL PARTITION.

2.3.01 Manufacturers. Product shall be Hufcor, Inc. "Series 6600"; Modernfold, Inc. "Acousti-Seal 931"; Panelfold, Inc. "Model 610"; or approved equal.

2.3.02 Operation. Partition shall be a series of individual panels, manually operated, top supported, with operable floor seals. Final closure shall be accomplished with a horizontally expanding panel.

2.4 PAIRED FOLDING PANEL PARTITION.

2.4.01 Manufacturers. Product shall be Hufcor, Inc. "Series 6500"; Modernfold, Inc. "Acousti-Seal 932"; Panelfold, Inc. "Model 620"; or approved equal.

2.4.02 Operation. Partitions shall be a series of panels hinged in groups of two, manually operated, top supported, with operable floor seals. Final closure accomplished with a horizontally expanding panel.

2.5 CONTINUOUSLY HINGED FOLDING PARTITION.

2.5.01 Manufacturers. Product shall be Hufcor, Inc. "Series 6900"; Modernfold, Inc. "Acousti-Seal 933"; Panelfold, Inc. "Model 630"; or approved equal.

2.5.02 Operation. Product shall be series of continuously hinged panels, manually operated, top supported, with operable floor seals that drop automatically with final closure. Final closure accomplished with a hinged closure panel.

2.6 MANUFACTURE AND FABRICATION.

2.6.01 Partition Panel Construction. Shall be sound insulation core construction 3 5/8 inches (92 mm) thick with facing of vinyl fabric laminated with adhesive to fiberboard and extruded aluminum frame, with provision for replacing panel facing in field. Equip lead panels and panels abutting pocket doors with a self-adjusting, telescoping vertical seal.

2.6.02 Partition Suspension System. Partition top shall be supported by an extruded aluminum overhead track with bolted connection to steel framing or insert embedded in concrete, with provision for leveling during installation and access for future adjustment.

Each panel shall be supported by a vertical duplex carrier system consisting of a pair of 4-wheel steel race, nylon tired, ball bearing carriers which travel within the panel race from center of panel when stacked to lead edge of panel when extended.

2.6.03 Pocket Doors. Shall be a minimum of 3 inch (76 mm) thick sound insulation core construction with hardwood stiles and rails, with facing of vinyl fabric.

Provide required hardware, including hinges, flush pulls and bolts, as approved. Provide sound seal at floor and head.

2.6.04 Trim. Soffit trim shall be extruded aluminum.

2.7 WIRE MESH PARTITIONS. Fabricate assemblies of framed sections; to sizes and profiles required; with framing members fitted, reinforced and braced to suit design requirements. Fit and assemble in largest practical sections for delivery to site, ready for installation. Fabricate items with joints tightly fitted and secured. Grind exposed welds flush and smooth with adjacent finish surface. Ease exposed edges to small uniform radius. Make exposed joints flush and hairline.

Provide components required for anchorage to metal fabrications. Fabricate anchorage and related components of same materials and finish as framing members.

2.8 FINISHES.

2.8.01 Hard Anodic Finish. Anodize aluminum exposed to view to produce an AA-M12C22A42 hard anodic finish, unless otherwise specified, in accordance with AA DAF-45 and AA SAA-46. Color selection shall be determined by Owner.

2.8.02 Clear Anodic Finish. Anodize aluminum exposed to view to produce an AA-M12C22A31 clear anodic finish in accordance with AA DAF-45 and AA SAA-46.

2.8.03 Finish for Hardware. B.H.M.A. Code 626 (US26D satin chromium-plated) or 630 (dull stainless steel).

2.9 ACCESSORIES.

2.9.01 Bracing. Shall be formed sheet steel, thickness determined for conditions encountered, manufacturer’s standard shapes, same finish as framing members.

2.9.02 Plates, Gussets, Clips. Shall be formed sheet steel, thickness determined for conditions encountered, manufacturer’s standard shapes, same finish as framing members.

2.9.03 Touch-up Primer for Galvanized Surfaces. Shall be FS TT-P-641.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that surfaces and openings are ready to receive work. Verify field measurements are as shown on shop drawings. Beginning of installation shall mean installer accepts existing conditions.

3.2 PREPARATION. Clean substrate surfaces. Protect adjacent construction against damage during progress of the Work.

3.3 INSTALLATION. Install shelving and partitions in accordance with manufacturer's instructions and approved Shop Drawings. Install items plumb and level, accurately fitted, free from distortion or defects. Perform field welding in accordance with AWS D1.1. After installation, touch-up scratched or damaged surfaces with primer.

3.3.01 Cleaning. Thoroughly clean partition and other surfaces in accordance with manufacturer's instructions. Remove temporary protection from pre-finished surfaces.

3.4 FIELD QUALITY CONTROL.

3.4.01 Acceptance Tests. Before Owner’s acceptance, demonstrate to the Engineer’s satisfaction that folding partitions are free moving and operate smoothly and evenly. Make all final adjustments as may be necessary to obtain proper operations of the Work.

End of Section

SECTION 10800

LOCKERS

PART 1 - GENERAL

1.1 SCOPE. This section covers metal lockers and benches including all accessories and appurtenances.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified, the work of this section shall conform to the applicable portions of the following standard specifications:

> ASTM (American Standard Testing Materials) A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvanealed) by the Hot-Dip Process.

1.3 QUALITY ASSURANCE. Employ the metal locker manufacturer or his authorized representative to install the work using workmen skilled in the trade.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings indicating layout, dimensions, and other pertinent construction and erection details.

Submit manufacturer's installation instructions with installation template and attachment devices.

1.4.02 Samples. Submit samples of manufacturer's full range of painted finishes.

1.4.03 Record Drawings. Furnish receipts for keys for keyed lockers.

1.5 DELIVERY, STORAGE AND HANDLING. Protect the Work from damage during transportation to the Project site, storage at the site, and during progress of the work until completion.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Take field measurements to verify and supplement dimensions indicated. Be responsible for accurate fit of the Work.

2.2 ACCEPTABLE MANUFACTURERS. Provide product of Interior/Medart; Lyon Metal Products, Inc.; Penco Products; Republic Storage Systems Co., Inc.; or an approved equal.

2.3 LOCKER TYPES.

2.3.01 Double Tier Lockers. Standard louvered doors with 2 point locking device, flat top, compartment divider, equipped with 3 single-prong coat hooks and one double-prong ceiling coat hook for each compartment. Unless otherwise indicated, width x depth x height per compartment shall be 12 x 12 x 30 inches (30.5 x 30.5 x 76.2 cm).

2.4 LOCKER BENCHES.

2.4.01 Tops. 1 1/4 inch (3.2 cm) laminated maple with rounded edges, 9 1/2 inches (24.1 cm) deep, with 3 coat transparent finish, overall height 18 inches (45.7 cm) nominal, length as indicated.

2.4.02 Pedestals. Steel tubing with flanged base zinc-coated and finished in same color as lockers and anchored to top and floor at 6 feet (1.8 m) maximum spacing in accordance with manufacturer's instructions.

2.5 LOCKER GROUPS AND TRIM. Unless otherwise indicated, arrange lockers in single row groups with continuous sloping top hood, and mounted on continuous metal base.

Provide sloping top hoods in addition to locker section flat top and fillers or closures at exposed ends of sloping top hoods formed of minimum 20 gage (1 mm) steel.

Form metal bases of minimum 12 gage (2.7 mm) steel sheet in Z shape, 4 inches (10.2 cm) high with 3 inch (7.6 cm) recess.

2.5.01 Fillers. Provide filler panels at ends of locker groups abutting walls. Form fillers of minimum 18 gage (1.3 mm) steel. Secure fillers to locker body and to building construction with continuous strips.

2.6 MATERIALS AND FABRICATION – GENERAL.

2.6.01 Materials. Fabricate lockers and trim from cold-rolled, oiled, commercial grade steel, free from buckle, scale, and imperfections which impair appearance and strength.

Bolts shall be cadmium plated or subject to other rust-proofing treatment.

2.6.02 Locker Construction. Form tops, backs, bottoms, sides and shelves of minimum 24 gage (.70 mm) steel sheets with flanges as required. Reinforce locker side panels at exposed ends of locker groups. For double-row locker grouping, provide single back common to both rows.

Fabricate door frames of either 1/8 by 7/8 by 1/4 inch (3.2 x 22.2 x 6.4 mm) steel angle uprights or channel uprights, formed of minimum 16 gage (1.6 mm) steel sheets, with formed channel cross members, corners welded, and side of frames forming a continuous door strike.

Provide a keeper projection welded to side of door frames to engage each point of locking device, formed of minimum 14 gage (1.9 mm) steel and designed to prevent freeing of locking device by prying. Provide each keeper with rubber silencers at latching lug, at top and bottom of latching bar or handle insert.

Form shelves with flanges on sides and back and with front edge rolled or flanged with channel formation.

Form doors in one piece of minimum 16 gage (1.6 mm) steel sheet with channel shaped flange on vertical edges and right angle flange on top and bottom edges, unless otherwise specified.

2.6.03 Finish. Metal parts and surfaces, except plated metal, shall be bonderized, factory applied and baked-on finish coat of enamel, which will stand a rigid hammer test without flaking.

2.7 HARDWARE.

2.7.01 Hinges. Minimum 2 inches (5.1 cm) high, full-loop, tight pin style, securely welded to frame and bolted to door. For single tier lockers, provide 3 hinges per door. For double tier lockers and smaller, provide 2 hinges per door.

2.7.02 Locking Devices. Unless otherwise specified, provide positive automatic and prelocking type locking device mechanism which can be locked while the door is open and automatically lock the door when closed with latching bar of channel formation and tamperproof.

Handles for lockers with 2 point or 3 point locking device shall be straight-lift type, of die cast zinc alloy having tensile strength not less than 40,000 psi (275,760 kPa), and with satin chromium-plated finish with latching lift operating in and protected by handle. Provide handles with padlock attachment so arranged that handle or locking device cannot be operated when padlock is in place.

For lockers with one-point locking device, provide built-in, grooved key, 5-pin tumbler spring bolt locker lock such as Master Lock Co. "No. 1714 MK". Provide 2 keys with each lock and 3 master keys.

For lockers with 2 point or 3 point locking device, provide built-in, grooved key, removable only in locked position, 5-pin tumbler dead-bolt locker lock, such as Master Lock Co. "No. 1710 MK". Provide 2 keys with each lock, and 3 master keys.

2.7.03 Coat Hooks. Ball points, free from sharp edges and corners, fabricated of wrought or malleable iron with chromium-plated or other approved finish or of cast aluminum, each bolted in place with 2 bolts.

2.7.04 Number Plates. Provide each locker door with aluminum number plate with black filled numbers not less than 7/16 inch (1.1 cm) high. Securely rivet number plates to door. Arrange numbers in sequence as determined by the Engineer.

PART 3 - EXECUTION

3.1 INSPECTION. Verify prepared bases are in correct position and configuration. Verify bases and embedded anchors are properly sized.

3.2 PREPARATION. Protect adjacent work and materials against damage during progress of the Work.

3.3 INSTALLATION. Install the work in strict accordance with the manufacturer's printed instructions and the approved Shop Drawings.

Anchor metal base to floor with machine bolts and expansion shields or power-driven studs installed through horizontal flange. Close exposed ends flush.
Align lockers horizontally, vertically, and rigidly secure them to the base and wall. Bolt adjacent locker sections together.

Install all end panels and filler panels required. At completion, adjust all doors to operate freely without sticking or binding and to close tightly.

3.3 CLEANING. Following completion, clean finished surfaces and leave work free of imperfections.

End of Section

INDEX

DIVISION 11 – EQUIPMENT

SECTION 11050

EQUIPMENT GENERAL PROVISIONS

PART 1 - GENERAL

1.1 SCOPE. This section includes the basic requirements for equipment furnished under Division 11. This section supplements Master Specification Division 01, General Requirements. Additional requirements for pumps are addressed in Master Specification Section 11100, Pump Applications General Requirements. Where provisions of other sections conflict with those in this section, the more stringent of the requirements shall apply.

Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with Contract drawings and specifications, and engineering data, instructions, and recommendations of the equipment manufacturer. The work shall be complete and ready for satisfactory operation whether or not each and every item is shown on the Drawings or specifically mentioned in these Specifications.

1.2 GENERAL.

1.2.01 Coordination. Construction and installation shall comply with all required regulatory agencies, including federal, state and local agencies related to the work. All equipment and miscellaneous accessories and appurtenances shall be new. No previously used material of any kind shall be incorporated into any of the building systems.

1.2.02 General Equipment Stipulations. Equipment and accessories not specifically described or identified by manufacturer's catalog numbers shall be designed in conformity with applicable technical standards and suitable for maximum working pressure, test pressure and temperatures required.

Packaged equipment, where specified, shall be completely factory-assembled equipment. Packaged equipment shall include all mechanical and electrical components mounted on a common base or in a common enclosure with all piping, controls and wiring factory installed ready to be incorporated into the system.

Motors shall be as specified in Master Specification Section 16220, General Purpose Induction Motors - Procurement, unless indicated otherwise. Electrical equipment provided will be completely wired except for external connections, and will be securely attached to equipment, unless indicated otherwise.

All electrical work, wire and conduit provided shall meet the requirements of Master

Specifications Division 16, Electrical. Control panels, motor starters, and other electrical devices furnished as part of the Equipment shall also comply.

Wire and terminal numbering and wire color requirements shall be as specified in Master Specification Division 16, Electrical. Wiring diagrams are required in the form called for in Master Specification Division 16, Electrical.

Motors and other equipment with moving parts shall be especially selected for quietness of operation. The full load operating noise levels for interior equipment shall not exceed 80 dBA at a distance of 3 feet (91.4 cm) from the surface of the equipment in accordance with ANSI S1.4-1971. The full load operating noise levels for exterior equipment shall not exceed 70 dBA as measured at any point 20 feet (6.1 m) from the surface of the equipment.

Wherever static and dynamic balancing of equipment is specified, vibration velocities measured at equipment shafts or other rotating shaft bearing caps, shall not exceed 0.1 inches (2.5 mm) per second peak in any plane. In case of conflicts between codes or references, the code or reference with more stringent requirements shall be used. To use a lesser code or reference, written permission by the Engineer shall be obtained.

Procure vibration isolation devices for isolating equipment from the building structure from a single vibration materials manufacturer through a local representative. Furnish the local representative with copies of Shop Drawings of all equipment requiring vibration isolation.

For equipment requiring factory installation of vibration isolators, furnish the equipment manufacturer with the identity of the supplier of the vibration isolation manufacturer selected for the Project. Submittals for equipment not equipped with the product of the vibration isolation manufacturer selected for the Project will be rejected.

1.2.03 Governing Standards. All equipment and systems shall comply with Federal, State, and local regulations. Construction and installation shall be in accordance with relevant technical and industrial associations such as NFPA, AWWA, ASTM, ASHRAE, ANSI, etc., insofar as they apply and in accordance with best industry practice. See Master Specification Section 01020, Documentation Standards for a more complete list of abbreviation definitions.

American Society of Mechanical Engineers (ASME) – Boiler and Pressure Vessel Code. Section IX - Welding Qualifications

ASNT SNT-TC-1A (American Society for Nondestructive Testing) - Recommended Practice for Personnel Qualification and Certification in Nondestructive Testing

American Society of Testing and Materials (ASTM) A48, Gray Iron Castings

ASTM A276, Stainless and Heat-Resisting Steel Bars and Shapes

ASTM A36, Structural Steel

ASTM A322, Steel Bars, Alloy, Standard Grades

American National Standards Institute (ANSI)/Institute of Electrical and Electronic Engineers (IEEE) 112-84 - Test Procedures for Polyphase Induction Motors and Generators

Anti-Friction Bearing Manufacturers' Association (AFBMA) Std 11-78 - Load and Fatigue Life for Roller Bearings

AWS D1.1 (American Welding Society) Structural Welding Code – Steel

Hydraulic Institute (HI) USA

National Electrical Manufacturers' Association (NEMA) MGI-78 – Motors and Generators

QC1 - Standard for Qualification and Certification of Welding Inspectors

Underwriters Laboratories (U.L.) 1004-84 - Motors, Electric

1.2.04 Reference To Design Drawing Schedules.

Refer to equipment schedules, where applicable for equipment identification numbers corresponding area locations, capacities, and design requirements.

Wherever schedules or notes appear in the Contract Documents indicating sizes and capacities of equipment, provide equipment under the Contract, which complies. Unless specified elsewhere, the following guidelines shall be followed in selecting equipment. Motor horsepower ratings specified or shown are the minimum acceptable. Indicated motor speeds are the maximum acceptable. The rpm, outlet velocities, tip speeds, and pressure ratings specified are the maximum that will be accepted.

If a motor is provided having a larger horsepower rating than specified, provide the associated increased wire, breaker, starter, fuses, overload protection, etc. Do not provide increased motor horsepower that together adds more than 5 percent to the load of an electrical distribution equipment item (e.g., Motor Control Center, Power Panel, etc.).

1.3 QUALITY ASSURANCE.

1.3.01 Contractors Qualifications. The contractor shall obtain manufacturer's printed equipment installation instructions to aid in properly executing work of installing equipment whenever such instructions are available.

Erect equipment in a neat and workmanlike manner. Align, level, and adjust for satisfactory operation. Install so that connecting and disconnecting of piping and accessories can be made readily, and so that parts are easily accessible for inspection, operation, maintenance and repair. Minor deviation from arrangements indicated may be made.

1.3.02 Manufacturer's Field Services. The Contractor shall furnish services of a factory-trained Service Engineer, specifically trained and having experience with installation procedures and operation and maintenance requirements for the type of equipment supplied under these specifications. Manufacturer(s) services shall be in conformance with Master Specification Section 01060, Quality Control. Where specified the Service Engineer shall make not less than two separate 8-hour visits to the Site. On the first visit he shall instruct the Owners and Contractors personnel in the proper means and methods for installation of the equipment, and shall check that equipment and accessories are present and in acceptable condition. On the second visit he shall check that the Contractor has properly installed the equipment, he shall supervise the required performance tests and instruct the Owner's personnel in the proper methods of operating and maintaining the equipment.

The period of Services shall be as specified in the contract and FormSpec. If more time is required because of Contractors activities or problems with equipment, additional time shall be at Contractor's expense.

1.3.03 Testing. Tests shall be performed in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts and Tools. Testing shall include but is not limited to Certified Shop Tests, Factory and Field Acceptance Tests. If specified, testing method, location and facility shall be approved and witnessed by the Engineer.

Vibration Testing of Rotating Equipment: Where specified, the contractor shall provide the services of a qualified vibration consultant to take vibration velocity measurements on all rotating equipment in accordance with HI 1.1-1.5.

Take measurements on the bearing caps of each piece of equipment in the vertical, horizontal, and axial directions or, if bearings are concealed, take the readings at the equipment mounting feet.

Maximum allowable self-excited, total unfiltered vibration velocity shall be 5.5 mils per second peak to peak. If the measured velocity exceeds this figure, determine the source of the vibration and make the necessary corrections to bring the velocity figure to within the specified maximum.

Submit on approved data sheets the vibration measurements for each piece of rotating equipment.

1.4 SUBMITTALS. In accordance with the procedures and requirements set forth in Master Specification Section 01080, Project Submittals, the Contractor shall obtain from the equipment manufacturer and submit the following:

Shop, assembly and erection drawings.

Equipment specifications and data sheets identifying all materials used and methods of fabrication.

Installation and start-up instructions.

Weights of all component parts, assembled weight of units and approximate total shipping weight.

Example equipment nameplate data sheets.

Interconnecting ladder-type wiring diagrams for power and control wiring required for final connections. Clearly differentiate between portions of wiring that are factory installed and portions to be field installed. Identify all wiring and terminals with a numbering system, which corresponds with the Owner's standards.

Narrative type description of control sequences corresponding to the ladder-type wiring diagrams. These shall be provided even for packaged systems.

List of recommended spare parts.

Products once reviewed shall be rechecked and/or retested by the Contractor, if warranted, at the time of actual installation.

The equipment performance and ratings shall be submitted.

Certified test results shall be submitted to the Contractor.

Tests shall be conducted in accordance with these specifications and industry standards.

Products that are modified, repaired or re-worked shall be tested again.

Submit list of manufacturers and model numbers.

Submit special tools list.

Submit samples.

Submit maintenance and operation manual for each manufactured product.

Each submittal shall also be identified by the applicable Equipment Identification Number and Specification Section as required by Master Specification Section 01080, Project Submittals.

The specific equipment proposed for use by each Contractor on the project may require changes in construction materials, structures, auxiliary equipment, piping, electrical, mechanical, controls, or other Work to provide complete and satisfactory operating installation. The Contractor, with proposed changes, shall submit to the Engineer, for approval, all necessary drawings and details showing such changes to verify conformance with the overall project and overall operating performance. The bid price shall include all cost associated with changes to construction work, drawings or specifications to accommodate the proposed equipment, including increases in the costs of other contracts.

See Master Specification Section 01080, Project Submittals for Schedule of Submittals and additional information pertaining to this section.

1.4.01 Coordination Drawings. Prepare coordination drawings to a minimum scale of 1/4 inch equals 1 foot (6.4 mm equals 30.5 cm) (1:48). Detail major elements, components, and systems of mechanical equipment and materials in relationship with other systems, installations, and building components. Show space requirements for installation and access. Show where sequence and coordination of installations are important to the efficient flow of the Work. Include the following:

Proposed location of equipment, and materials.

Clearances for installing and maintaining insulation.

Clearances for servicing and maintaining valves and equipment, including space for equipment disassembly required for periodic maintenance.

Equipment service connections and support details, including any conduit stub-up locations.

Exterior wall and foundation penetrations.

Fire-rated wall and floor penetrations.

Sizes and location of required concrete pads and bases.

Scheduling, sequencing, movement, and positioning of large equipment into the building during construction.

Floor plans, elevations, and details to indicate penetrations in floors, walls and ceilings and their relationship to other penetrations and installations.

Reflected ceiling plans to coordinate and integrate installations, air outlets and inlets, light fixtures, communication systems components, sprinklers, and other ceiling-mounted items

1.7 NAMEPLATE DATA. All equipment, piping, valves, ductwork, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate in an accessible location. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where necessary due to excessive length, lettering shall be placed on more than one row and centered.

Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/4 inch (19mm) high for section identity and 1/8 inch (3 mm) high for other information Nameplates and tags shall be at least 12 gage (2.66 mm) thickness. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be located in an accessible location with corrosion-resistant mechanical fasteners.

1.8 SUPPORTS AND HANGERS. The Contractor is fully responsible for the structural adequacy of all hangers and supports installed under this contract.

1.9 IDENTIFICATION. Each unit of equipment shall be identified with the equipment item number. A corrosion resistant tag or nameplate, securely affixed in a conspicuous place on each unit shall give the equipment item number, manufacturer's name or trademark and such other information as the manufacturer may consider necessary, or as specified, to complete identification. Equipment tag number shall be assigned by the Engineer.

1.10 DELIVERY, STORAGE AND HANDLING. The transportation, handling and storage of all equipment shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.10.01 Shipping. Equipment, material and spare parts shall be shipped complete except where partial disassembly is required by transportation regulations or for protection of components.

Spare parts shall be packed in containers bearing labels clearly designating contents and pieces of equipment for which intended. Containers shall be suitable for long term storage and shall protect their contents from moisture and physical damage.

Spare parts shall be delivered at same time as pertaining equipment. The contractor shall coordinate and make arrangements to deliver spare parts to the owner.

1.10.02 Receiving. Equipment, material and spare parts shall be stored and safeguarded in accordance with the Manufacturer's recommendations for protection from weather, temperature, and moisture contamination. The Contractor is liable for any and all damages to the products during his possession.

1.11 WARRANTIES. Refer to Master Specification Section 01170, Warranties and Bonds for provisions concerning Contract general warranty, correction of Work period and for form of special warranty. Submit special warranties for the products so specified elsewhere in Master Specification Division 11.

1.11.01 Service During Contract Correction Period. In the event of the failure of any system or its component equipment items or the improper functioning thereof, the Contractor shall have competent service personnel available, for the restoration and repair of systems and equipment.

Should the nature of the failure be such as to present an emergency, in the opinion of the Engineer and/or Owner, such personnel shall be promptly available, regardless of the hour of the day or the day of the week.

PART 2 - PRODUCTS

2.1 GENERAL. Reference shall be made to individual Master Specification Sections for detailed specifications of products.

2.2 GUARDS. All equipment shall be provided with removable guards around rotating, reciprocating or other moving parts conforming to MIOSHA requirements. Guards shall be constructed of 12 gauge (2.75 mm) sheet steel with expanded metal portions as required for ventilation and visual inspection.

2.3 EQUIPMENT BASES. All rotating equipment shall be provided with concrete bases, baseplate, vibration isolation, leveling grout and concrete adhesive anchors.

All belt driven equipment shall be provided with a sliding base for belt tension adjustment.

All aluminum surfaces in contact with concrete shall be coated with 12 to 20 dry mils (0.3 to 0.5 mm) of NSF approved paint.

The equipment manufacturer shall furnish adequate templates to accurately place anchor bolts.

2.4 PAINTING. Equipment and identification shall be painted except for stainless steel or machined surface in accordance with Master Specification Section 09900, Painting, unless indicated otherwise. Where practicable, the surface shall be prepared, primed and one finish coat shall be applied by the manufacturer at the factory, with balance of painting applied in the field.

All exterior cast iron and or steel surfaces shall be given two shop coats of Amerlock 400 or approved equal. The color of the finish coat shall be selected by the Engineer.

All cast iron and steel surfaces which will be exposed to water shall be given two coats of Amerlock 400, NSF List 61 approved coating to a thickness of 12 to 16 dry mills, or approved equal. The coating shall be applied in strict conformity with the manufacturer's application directions and shall have no deleterious effect upon the quality, color, taste, or odor of potable water.

2.5 BEARINGS. All bearings, including those provided in gear boxes, drivers, and reducers, except those furnished as an integral part of electric motors, shall conform to these requirements, unless indicated otherwise.

All bearings shall be low friction, heavy duty type constructed completely of stainless steel material specially selected for the service required. The bearings shall have a AFBMA B-10 service life, without adjustment factors, of 100,000 hours.

All bearings shall be equipped with double seals and cap to completely prevent the intrusion of dirt, dust, water, sludge, chemicals, etc., from entering the bearing. The seals shall be effective in preventing the entrance of water from a high pressure hose.

Bearing lubrication requirements shall be scheduled by type of lubricant and time period required for preventative maintenance. Oil shall be ISO-68AW.

All bearing calculations shall assume the most severe duty of the unit while operating continuously for 24 hours a day, 7 days per week.

Use Babbott Grade #2 sleeve bearings for larger motors and pumps.

PART 3 - EXECUTION

3.1 ERECTION, INSTALLATION AND APPLICATION. Apparatus and equipment, furnished and installed shall be of such dimensions and design as to be adapted to the arrangement of the installation and to fit within the limits of the space available. Insulated equipment shall be provided with stand-off brackets for attaching components to allow full insulation thickness.

Tools required to operate, adjust, or make minor repairs to the equipment shall be provided and installed in a wall mounted wood or metal case. The case shall be provided with a lock and two keys.

3.1.01 Building Openings for Admission of Equipment. The contractor shall ascertain from his examination of the Drawings whether any special temporary openings in the building will be required for the admission of apparatus to be furnished and shall provide such openings.

3.1.02 Standard Products. The products and equipment to be furnished shall be essentially the standard product of the manufacturer. Where two or more units of the same product or type of equipment are required, these units shall be the products of the same manufacturer.

Where the requirements of the Contract Documents exceed that of a manufacturer's standard product in terms of quality, performance or efficiency, the manufacturer shall make special provisions to ensure that the product proposed meets the requirements of the Contract Documents.

3.1.03 Substituted Items. Should a substitute item be offered and accepted and the substitute item requires services or utilities other than required by the item substituted for, provide those services or utilities at no additional cost to the Owner.

3.1.04 Coordination. The Contract Documents are not intended to serve as coordinated construction drawings showing all minor adjustments in locations that are required for a fully coordinated installation that respects the work of all trades.

Fully coordinate the work within itself and with the work of other trades to ensure the avoidance of all interferences.

3.1.05 Setting and Alignment of Equipment. Furnish anchor bolts together with templates or setting diagrams.

Equipment and motor pulleys shall be aligned and belt tension adjusted in accordance with manufacturer’s instructions.

Before piping or electrical connections are made, all equipment shall be leveled and aligned on bases and foundations per manufacturer’s instructions and recommended tolerances, using an indicating micrometer. Recheck before start-up. Assure that thrust is balanced, that shaft can be freely rotated by hand and that motor is quiet in operation. After all adjustments are completed, recheck alignment and adjust as necessary. Piping should not place stress on the equipment flanges. Support piping as necessary to meet this requirement, bolt tightly and grout. Final checking and adjustment shall be performed by the manufacturer’s representative, a qualified millwright, or machinist. Proof of such qualification shall be provided to the Engineer.

3.1.06 Lines and Grades. Construct Work in conformity with lines and grades as required.

Lay out the Work and be responsible for lines, elevations and measurements required for the installation of the Work.

Axis lines within building shall be so spaced on each floor level that work may be laid out with metal tape measure having length of 100 feet (30.5 m) maximum. The use of cloth tape for layout will not be permitted.

Benchmarks outside building shall be used from which lines and grades required for installation of work may be set.

3.1.07 Identification. Each component of equipment shall have the manufacturer's name, catalog number and date of manufacture on a plate securely attached to the item of equipment, or the name and catalog number and date of manufacture may be stamped or cast into the body of the item. Nameplates shall also give data pertinent to the operation and characteristics of the equipment.

Tags: Provide brass identification tags attached by tag chain on motorized dampers and on valves (except isolation and by-pass valves installed adjacent to the equipment they serve).

Tags shall be numbered by systems according to a definite code.

Cross-reference between valve tag numbers and diagrams and charts specified above shall give exact function and location of each valve.

3.1.08 Protection of Equipment. After installation, all equipment shall be adequately protected from further construction activities. Electrical equipment controls and insulation shall be protected from moisture, water, or dust damage. All space heaters provided in equipment shall be connected as soon as possible and shall be operated at all times until equipment is placed into operation.

Coated surfaces shall be protected from impact, abrasion, discoloration, and other damage. All coated surfaces damaged shall be recoated.

3.1.09 Access Panels and Doors. Access panels or doors are required through building construction assemblies such as walls, ceilings, partitions and floors to service and maintain control motors, regulators, pressure gauges, thermometers, expansion joints, trap primers, coils, pumps, fans, filters, flexible duct, and other items or devices.

See Master Specification Section 05630, Access Hatches and Master Specification Division 8, Doors and Windows for additional information. Where the building construction assemblies are fire resistant assemblies, the access panels or doors are so specified.

Coordinate the exact location with the work of other trades in order to provide a neat appearance. Install access doors true and plumb with building construction.

The size of access panels and doors shall be of the size required to allow easy human entry through the ceiling or building assembly. In general, the minimum size shall be 24 inches x 18 inches (60.1 cm x 45.7 cm) with minor dimensional changes allowed to fit ceiling or structure requirements.

Verify the exact quantity, size and location of the required access panels and doors after the systems and equipment requiring access have been installed and prior to the closure of the affected ceilings and building assemblies.

3.1.10 Painting. Paint equipment according to DWSD color code in Master Specification Section 09900, Painting. Color of equipment not listed will be as selected by the Engineer or as noted in the specifications.

3.2 GUARDS FOR DRIVES AND ROTATING PARTS.

3.2.01 Belt Guards. Provide guards for belted motor drives unless furnished as an integral part of the equipment.

Rigidly brace guards every 3 feet (0.9 m) height to some fixed rigid part of the equipment or building structure and have at least four upright frame members each of which shall be extended to the floor or base and securely fastened.

Design guards to enclose the drive assembly on all sides and have a minimum clearance of two inches from moving parts, to be removable, and allow for one size increase in motor sheave without reconstruction.

Provide tachometer openings at shafts and an opening for checking belt tension, each with bolted covers.

3.2.02 Direct Drive Guards. Install a solid guard of No. 20 gage (1.00 mm) galvanized steel over the coupling of each item of direct driven equipment.

3.2.03 Fan Inlet and Outlet Guards. Provide screen guards with rigid angle frames on fan inlet and outlet openings that are accessible to personnel.
Extend all guards over exposed rotating shafts.

3.3 FIELD QUALITY CONTROL.

3.3.01 Lubrication. Rotating equipment shall be lubricated in accordance with the manufacturer's directions before it is operated. Rotating equipment shall be re-lubricated as required during construction and upon turning over to Owner.

The housing of bearings requiring grease lubrication shall be equipped with 5/8 inch (16 mm) stainless steel button type head fittings.

Mount grease and oil fittings directly on bearings. Where grease lubrication points are not accessible during operation, the grease lubrication points will be brought to a single convenient lubrication panel (one per side of machine, if required) using stainless steel tubing.

3.3.02 Tests. Equipment Field Tests & System Tests shall be conducted by the Contractor in the presence of the Engineer. Contractor shall furnish gauges, instruments, test equipment, and personnel required for testing. Adjust equipment to perform with the least possible noise and vibration consistent with its duty. Noise level of equipment shall be below the standards allowed by OSHA regulation 29 CFR-1910.95 for eight hours of continuous exposure. Allowable vibration amplitude shall be 2.0 mils (0.05 mm) maximum for blowers or any 3600 rpm machinery, and

4.0 mils (0.10 mm) for other machinery or as defined in appropriate standards. Test gauges shall be certified within last 6 months.

All pumps 4 inches (10.2 cm) and above shall be field tested.

Operate all piping systems, make all adjustments in controls and equipment, and complete necessary balancing to deliver fluid quantities specified for each equipment item. Operate all pumping equipment during the system test. Measure and record suction and discharge pressure of each pump operating alone, at the following five points on the pump curve, at maximum rpm, 125%, 100%, 70%, 30% and 0% of maximum flow.

Measure and record volumetrically, the flow rate of each pump operating alone at eight points on the pump curve to include shut-off. Measure and record shut-off head pressure of each pump. Verify pump performance by comparison with Hydraulic Institute Standards and horsepower or operating current for each test condition outlined above. Repair or replace pumping equipment if tests show pumping equipment does not perform within 3 percent of certified manufacturer's curves for flow and horsepower.

The Contractor will supply a certificate of installation stating that the equipment is properly installed and adjusted to operate as designed. This certificate will be required before the equipment can be placed into service. The Engineer will define what equipment requires installation certification.

3.3.02 Welder Qualifications and Procedures. Before any welding is performed, submit a copy of the standard welding procedure specification together with the procedure qualification record as required by Section IX of the ASME Boiler and Pressure Vessel Code.

Before any welder shall perform any welding, submit a copy of the Contractor's record of welder or welding operator qualification tests as required by Section IX of the ASME Boiler and Pressure Vessel Code. Welders who have been inactive with the welding process for a period of more than three months, or six months if allowed by the particular code for which their qualifications are being reviewed, shall be requalified.

The types and extent of non-destructive examinations required for pipe welds are as shown in table 136.4 of ANSI B31.1. If requirements for non-destructive examinations are to be other than that stated above, the degree of examination and basis of rejection shall be a matter of prior written agreement between the fabricator, or Contractor and the purchaser. Qualifications for non-destructive testing personnel shall be as established by the American Society for Nondestructive Testing in their recommended practice No. SNT-TC-1A.

Welding inspectors shall meet requirements of AWS QC-1.

The manufacturer or Contractor shall be responsible for the quality of welding done by his organization and shall repair or replace any work not in accordance with these Specifications.

ASME Section VIII

Division 1 Pressure Vessel & Addenda

Division 2 Pressure Vessels Alternative Rule

Welding done to fabricate structures other than piping and vessels shall conform to the requirements of AWS D1.1.

3.4 SPARE PARTS, SPECIAL TOOLS AND MANUALS.

3.4.01 Operation and Maintenance Manuals. Submit operation and maintenance manuals for each system, except as otherwise specified herein, and for each piece of equipment. This section supplements Master Specification Section 01160, Training and Operation and Maintenance Manuals.

Furnish copies of the manual bound in hardback binders or an approved equivalent. One complete manual shall be furnished prior to system or equipment performance testing and the remaining manuals shall be furnished before the Contract is completed.

The following identification shall be inscribed on the cover: the words "Operating and Maintenance Manual", the name and location of the building, the project name, and the name of the Contractor.

The manual shall include the names, addresses, and telephone numbers of each subcontractor installing equipment and systems and of the local representatives for each item of equipment and each system. The manual shall have a table of contents and be assembled to conform to the table of contents with the tab sheets placed before instructions covering the subject. The instruction sheets shall be legible and easy to read, with large sheets of drawings folded in.

The manual shall include, but not be limited to, the following:

Installation instructions.

Detailed starting, operating, and shut down procedures.

A control sequence describing start-up, operation and shutdown.

Maintenance and overhaul instructions.

Safety precautions, diagrams, and illustrations.

Test procedures.

A detailed description of the function of each principal component of the system.

Performance data.

Wiring and control diagrams with data to explain detailed operation and control of each component.

Lubrication schedule including type, grade, temperature range, and frequency.

List of size, location and number of filters.

List of size and location of V-belts.

Parts lists with sources of supply, recommended spare parts, and local qualified service organization to service and maintain equipment systems.

The manual shall be complete in all respects for all equipment, controls, accessories, and associated appurtenances provided.

3.4.02 <u>Operating Instructions</u>. As part of O & M Manuals, Contractor shall furnish laminated operating instructions for each system and each principal piece of equipment that can be posted adjacent to each principal piece of equipment for the use of operation and maintenance personnel. Where special tools are the too large to fit in a metal box, consult with the Owner for the appropriate turnover requirements. Where special tools are too large to fit in a metal box, consult with the Owner for the appropriate turnover requirements.

The operating instructions shall include start-up, proper adjustment, operating, lubrication, safety precautions, emergency shutdown procedures in the event of equipment failure, and any other necessary items of instruction as recommended by the manufacturer of the unit.

The operating instructions shall include wiring and control diagrams showing the complete layout of the entire system including equipment, piping, valves, and control sequence and shall be framed under glass or in approved laminated plastic and posted where directed.

Operating instructions shall be laminated with durable materials to prevent damage from moisture, sunlight, extreme temperatures, and delimitation.

3.4.02 Special Tools. The contractor shall furnish, in a suitable metal box, a complete set of all special tools necessary to disassemble, service, repair, operate, and adjust each piece of equipment. All wrenches and spanners shall be case hardened steel and shall have a bright finish with working faces dressed to fit nuts and bolt heads. Where special tools are too large to fit into a metal box, consult with the Owner for direction.

Special tools shall include any type of tool that has been specifically made for use on an item of equipment for assembly, disassembly, repair, or maintenance. All special tools required to assemble, disassemble, repair, or maintain any item of equipment shall be furnished with the equipment. A separate set of special tools shall be furnished with each separate item of equipment.

Furnish all special tools necessary to disassemble, service, repair and adjust the equipment.

3.4.03 Spare Parts. The Contractor shall furnish a complete inventory of spare parts for equipment as stated in these specifications.

Shop drawings submitted for all items of equipment shall include complete current published parts information, which shall clearly identify the manufacturer's recommended spare parts. Spare parts lists, included with the submittal shall indicate specific sizes, quantities, and part numbers of the items to be furnished.

Parts shall be completely identified with a numerical system to facilitate parts inventory control and stocking. Each part shall be properly identified by a separate number.

All spare parts shall be properly packed in storage containers suitable for long term storage providing protection from moisture and mechanical drainage. All spare parts, supplies, and special tools shall be supplied as directed by the Engineer. Deliver all spare parts, supplies and special tools to project site as directed by the Engineer.

End of Section

SECTION 11100

PUMP APPLICATIONS GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 SCOPE. This section includes the general requirements for pump applications, including pump motors, electrical characteristics, assembly, testing and other items that are common to most pumps and accessories furnished under Master Specification Division 11, Equipment. This section supplements Master Specification Section 11050, Equipment General Provisions. Items special to different types of pumps will be addressed in each individual pump specification. Where provisions of other sections conflict with those in this section, the more stringent of the requirements shall apply.

1.2 GENERAL.

1.2.02 Governing Standards.

H.I.S. – Hydraulic Institute Standards

ANSI – American National Standards Institute

OSHA – Occupational Safety and Health Administration

ASTM – American Society for Testing and Materials

NEMA – National Electrical Manufacturing Association

1.2.02 Electrical Requirements. Electrical equipment provided will be completely wired except for external connections, and will be securely attached to equipment, unless indicated otherwise. Electrical equipment, wiring, conduit, wire terminal numbering, wiring diagrams, wire color, control panels, motor starters, and other electrical devices furnished shall meet the requirements of Master Specification Division 16, Electrical.

1.2.03 Motors and Other Equipment. Motors and other equipment with moving parts shall be especially selected for quietness of operation. The full load operating noise levels for interior equipment shall not exceed 80 dB at a distance of 3 feet (91.4 cm) from the surface of the equipment, in accordance with ANSI S1.4. The full load operating noise levels for exterior equipment shall not exceed 70 dB as measured at any point 20 feet (6.1 m) from the surface of the equipment. Motors shall be as specified in Master Specification Division 16, Section 16220, General Purpose Induction Motors, unless indicated otherwise.

1.2.04 Balancing and Vibrations. Wherever static and dynamic balancing of equipment is specified, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed the limits of USN MIL-STD-167. Residual imbalance shall not exceed:

4 W/N (oz*in).

Vibration isolation devices for isolating equipment from the building structure shall be provided. Procure these devices from a single vibration materials manufacturer through a local representative. Furnish the local representative with copies of Shop Drawings of all equipment requiring vibration isolation.

For equipment requiring factory installation of vibration isolators, furnish the equipment manufacturer with the identity of the supplier of the vibration isolation manufacturer selected for the Project. Submittals for equipment not equipped with the product of the vibration isolation manufacturer selected for the Project will be rejected.

In case of conflicts between codes or references, the code or reference with more stringent requirements shall be used. To use a lesser code or reference, written permission by the Engineer shall be obtained.

1.3 QUALITY ASSURANCE. Pumps are to be engineered and manufactured under a written Quality Assurance program. The Quality Assurance program is to be in effect for at least 5 years, to include a written record of periodic internal and external audits to confirm compliance with such program.

1.3.01 Manufacturer's Qualifications. The pump manufacturer shall have a minimum of 5 years experience with the successful manufacture and installation of the type of pumps specified and shall provide references on a minimum of 10 pumps of that type that have been in service a minimum of 5 years. Pump manufacturer shall be prepared to supply references upon request. Pump manufacturer shall have a history of maintaining an extensive parts inventory for its pumps.

1.3.02 Manufacturer's Field Services. The Contractor shall furnish services of a factory-trained Service Engineer, specifically trained on installation procedures and operation and maintenance requirements for the type of pump supplied under this specification. The Service Engineer shall make not less than two separate 8-hour visits to the Site. On the first visit he shall instruct the Owners and Contractors personnel in the proper means and methods for installation of the pumps, and shall check that all pumps and accessories are present and in acceptable condition. On the second visit he shall check that the Contractor has properly installed the pumps, he shall supervise the required performance tests and instruct the Owner's personnel in the proper methods of operating and maintaining the Pumps.

If more time is required because of the Contractor's activities or problems with equipment, the additional time shall be provided at the Contractor's expense.

1.3.03 Testing. All tests shall be performed in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools and industry standards. Testing shall include but is not limited to Certified Shop Tests, Factory Acceptance Tests, and Field Acceptance Tests. The Standards of the Hydraulic Institute shall govern the procedures and calculations for these tests. The limits of vibration as set forth in the Standards of the Hydraulic Institute shall govern. All testing shall be witnessed by the Engineer.

Large pumps (as determined by the Engineer) shall be individually factory tested in accordance with Hydraulic Institute Standards and a Certified Test Curve shall be provided as requested by the Engineer.

At no cost to the Owner, the manufacturer shall have each pump tested for the operating ranges defined on the pump schedule. Each test shall be conducted a minimum of 3 times to obtain representative results. Products that are modified, repaired or re-worked shall be tested again.

The Contractor shall, before contracting with the Manufacturer for the pumps, submit the guaranteed performance curve showing the efficiency of the pump at the design conditions specified and its performance over the full range of operation.

Field Acceptance Testing shall be performed in the presence of the Owner, facility superintendent, and the design engineer at the cost of the pump manufacturer.

Vibration Testing: The contractor shall provide for the services of a qualified vibration consultant to take vibration velocity measurements on all large, special order rotating equipment in accordance with ANSI HI 1.1-1.5. He shall take measurements on the bearing caps of each piece of equipment in the vertical, horizontal, and axial directions or, if bearings are concealed, take the readings at the equipment mounting feet.

Maximum allowable self-excited, total unfiltered vibration velocity shall be 5.5 mils per second peak to peak. If the measured velocity exceeds this figure, determine the source of the vibration and make the necessary corrections to bring the velocity figure to within the specified maximum.

Submit on approved data sheets the vibration measurements for each piece of rotating equipment.

1.4 SUBMITTALS. Before the pumps are assembled by the Manufacturer, the Contractor shall submit shop drawings to the Engineer for approval.

1.4.01 Drawings and Data. Submit the following product data:

Submit list of manufacturers, types, and model numbers.

Equipment specifications and data sheets identifying all materials used and methods of fabrication.

For pumps, include rotative speed, type of bearings and method of lubrication, suction and discharge nozzle sizes, net weight of pump only, and performance curves showing capacity versus head, pump efficiency, and horsepower.

For motors, include type of bearings and method of lubrication, rated size of motor in horsepower, temperature rating, full load rotative speed, net weight, service factor, locked rotor and full load current, and starting, full load, and breakdown torque.

Installation and start-up instructions.

Weights of all component parts, assembled weight of units and approximate total shipping weight.

Nameplate Data

Example equipment nameplate data sheet.

Interconnecting ladder-type wiring diagrams for power and control wiring required for final connections. Clearly differentiate between portions of wiring that are factory installed and portions to be field installed.

Verbal description of control sequences corresponding to the ladder-type wiring diagrams. These shall be provided even for packaged systems.

Equipment performance and ratings.

Recommended spare parts list.

Special tools list.

Operation and maintenance manuals for each manufactured product.

Manufacturer's installation and start up instructions.

Data on shop painting.

Job site storage requirements

Submit complete fabrication, assembly, foundation, and installation shop drawings to a minimum scale of 1/4 inch (6.4 mm) equals 1 foot (30.5 cm). Detail major elements, components, and systems of mechanical equipment and materials in relationship with other systems, installations, and building components. Show space requirements for installation and access. Show where sequence and coordination of installations are important to efficient flow of the Work. Include the following:

Proposed location of equipment, and materials.

Exterior wall and foundation penetrations.

Equipment service connections and support details.

Clearances for installing and maintaining insulation.

Clearances for servicing and maintaining valves and equipment, including space for equipment disassembly required for periodic maintenance.

Fire-rated wall and floor penetrations.

Sizes and location of required concrete pads and bases.

Scheduling, sequencing, movement, and positioning of large equipment into the building during construction.

Floor plans, elevations, and details to indicate penetrations in floors, walls and ceilings and their relationship to other penetrations and installations.

Reflected ceiling plans to coordinate and integrate installations, air outlets and inlets, light fixtures, communication systems components, sprinklers, and other ceiling-mounted items.

Motor Certified Dimension Print and Frame Size

1.5 <u>DELIVERY, STORAGE, AND HANDLING</u>.

1.5.01 <u>Shipping</u>. Equipment, material and spare parts shall be shipped complete except where partial disassembly is required by transportation regulations or for protection of components.

Spare parts shall be packed in containers bearing labels clearly designating contents and pieces of equipment for which intended. Containers shall be suitable for long term storage and shall protect their contents from moisture and physical damage.

Spare parts shall be delivered at same time as pertaining equipment. The contractor shall coordinate and make arrangements to deliver spare parts to the owner.

1.5.02 <u>Receiving</u>. Equipment, material and spare parts shall be stored and safeguarded in accordance with the Manufacturer's recommendations for protection from weather, temperature, and moisture contamination.

1.6 <u>WARRANTY</u>. The pump manufacturer shall warrant the units being supplied to the Owner against defects in workmanship and material for a period of 1 1/2 years, unless otherwise specified, from the date of acceptance by Owner. If Manufacturer cannot provide a warranty of this duration, then the Contractor shall provide the warranty coverage specified.

PART 2 - PRODUCTS

2.1 <u>GENERAL</u>. Pump specific information will be provided in each specific pump specification as well as on the drawings and diagrams.

2.2 <u>NAMEPLATE DATA</u>. Provide permanent operational data nameplate on each item of power operated mechanical equipment, indicating manufacturer, product name, model number, serial number, date of manufacture, capacity, operating and power characteristics, labels of tested compliance, and similar essential data. Locate nameplates in an accessible location.

2.3 <u>BEARINGS</u>. All bearings, including those provided in gear boxes, drivers, and reducers, except those furnished as an integral part of electric motors, shall conform to these requirements, unless indicated otherwise.

All bearings shall be anti-friction type constructed completely of stainless steel material specially selected for the service required. The bearings shall have a B-10 life, without adjustment factors, of 100,000 hours.

All bearings shall be equipped with double seals and cap to completely prevent the intrusion of dirt, dust, water, sludge, chemicals, etc., from entering the bearing. The seals shall be effective in preventing the entrance of water from a high pressure hose.

Bearing lubrication requirements shall be scheduled by type of lubricant and time period required for preventative maintenance.

Calculations of bearing life shall be submitted with the shop drawings for approval by the Engineer.

All bearing calculations shall assume the most severe duty of the unit while operating continuously for 24 hours a day, 7 days per week.

2.4 PUMP CONNECTIONS. All pumps shall be flanged, unless otherwise specified, and the flanges shall be drilled to suit 125 lbs. ANSI piping system. The pumps shall conform to all applicable AVS or ANSI standards.

Use Babbott Grade #2 sleeve bearings for larger motors and pumps.

2.5 NOISE LEVEL. Sound pressure levels shall be measured according to IEEE 85 and shall not exceed 80 decibels as measured on the A-Weighted Scale at a distance of five (5) feet from any motor surface under no load, free field conditions.

PART 3 - EXECUTION

3.1 INSTALLATION. Install pumps, motors, and accessories in accordance with the manufacturer's printed installation instructions.

Erect equipment in a neat and workmanlike manner. Align, level and adjust for satisfactory operation. Install so that connecting and disconnecting of piping and accessories can be made readily, and so that parts are easily accessible for inspection, operation, maintenance and repair. Minor deviation from arrangements indicated may be made.

Apparatus and equipment, furnished and installed shall be of such dimensions and design as to be adapted to the arrangement of the installation and to fit within the limits of the space available.

Insulated equipment shall be provided with stand-off brackets for attaching components to allow full insulation thickness.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. Upon completion of the installation, the Contractor shall be required to make performance tests of all pumps in the field, under the direction of the Engineer. Startup and Testing shall be performed in accordance with Master Specification Section 11050, Equipment General Provisions. The Pump Manufacturer will be entitled to have representatives present during these field tests. During the tests, the operation of the unit may be under the direction of the Pump Manufacturer's representative if he so desires. The Contractor shall provide competent personnel to make any necessary alterations to achieve proper operation of the pumping equipment without voiding the manufacturer's warranty.

Measure and record volumetrically, the flow rate of each pump operating alone at eight points on the pump curve to include shut off. Measure and record shut-off head pressure of each pump. Verify pump performance by comparison with Hydraulic Institute Standards and horsepower or operating current for each test condition outlined above. Repair or replace pumping equipment if tests show pumping equipment does not perform within three percent of certified manufacturer’s curves for flow and horsepower.

3.3 SPARE PARTS & SPECIAL TOOLS.

3.3.01 Special Tools. The contractor shall furnish, in a suitable metal box, a complete set of all special tools necessary to disassemble, service, repair, operate, and adjust each pump. All wrenches and spanners shall be case hardened steel forgings and shall have a bright finish with working faces dressed to fit nuts and bolt heads. Where special tools are too large to fit in a metal box, consult with the Owner for the appropriate turnover requirements.

3.3.02 Spare Parts. The contractor shall furnish spare parts as defined in each specific pump specification as well as all others recommended by the supplier and those identified during the submittal process.

Parts shall be completely identified with a numerical system to facilitate parts inventory control and stocking. Each part shall be properly identified by a separate number. All spare parts shall be properly packed in storage containers suitable for long term storage providing protection from moisture and mechanical drainage. All spare parts, supplies, and special tools shall be supplied to project site as directed by the Engineer.

End of Section

Table 1 - Specific Pump Applications

Spec No	Pump Type	Primary or Best Applications	Head Ranges/Flow Ranges	Preferred Manufacturers	Testing & Manufacturer Support	Spare Parts (Quantities for 1 - 4 pumps, Double for 5 - 10 pumps)
11200	Vertical Turbine Pump	Medium sized pump used to pump clean water or storm water (low lift single stage) typically at pump and lift stations.	Variable/Variable	Fairbanks-Morse Johnston Pump ITT-AC	Often a shelf item. Need factory certified curve. Witness required for factory testing unless otherwise identified by Owner. Manufacturer's representative to inspect installation and provide training to owner's maintenance staff along with training videos. Need witness testing.	1 Impeller 1 Set of Pump Bearings 1 Intermediate Shaft Bearings 1 Set of Motor Bearings 1 Set of Shaft Couplings 1 Set of Casing Wear Rings 1 Set of Impeller Wear Rings
11210	Submersible Pump	Used to pump clean water, sewage, and storm water, these pumps do not require a drywell thereby reducing initial costs. Typical applications are lift and pumps stations.	< 100 ft/<1000 gpm	ITT Flygt Corp., EMU-Davis, KSB, Inc.	Often a shelf item. Need factory certified curve. Witness required for factory testing unless otherwise identified by Owner. Manufacturer's representative to inspect installation and provide training to owner's maintenance staff along with training videos. Need witness testing.	1 Impeller 1 Set of Bearings 1 Set of Casing Wear Rings 1 Set of Mechanical Seals 1 Set of seals, O-rings & gaskets Need complete list of special tools
11220	Axial Horizontal Split Pump	An extremely efficient pump normally used to move high volumes of clean water at larger pump stations	N/A/<75 mgd	Ebara, Japan ITT-A C Patterson	Sizes 48" and up are not a shelf item. Manufacturer should provide individual pump curve for each pump. Engineer must witness factory testing.	1 Impeller, 1 Impeller Hub or Shaft Sleeve, 1 Set of Pump Bearings 1 Set of Wear Rings 1 Set of O-Rings & Gaskets 1 Set of Couplings (Koppers)
11300	Dry Pit Solids Handling Pump	The recognized work horse in DWSD for moving large quantities of sewage	< 100 ft/500-20K gpm	ITT-AC Fairbanks Morse Morris	Typically a shelf item. Need factory certified curve. No witness required for factory testing. Manufacturer's representative to inspect installation and provide training to owner's maintenance staff along with training videos. Need witness testing.	1 Pump Shaft Sleeve 1 Sets of Pump Bearings 1 Intermediate Shaft Bearings 1 Set of Shaft Couplings (Koppers) 1 Set Casing & Impeller Wear Rings 1 Limited End Float
11310	Self Priming Pump	Sewage	< 100 ft/< 2000 gpm	Gorman-Rupp ITT-AC	Often a shelf item. Need factory certified curve. Witness required for factory testing unless otherwise identified by Owner. Manufacturer's representative to inspect installation and provide training to owner's maintenance staff along with training videos. Need witness testing.	1 Impeller 1 Set of Bearings 1 Wearplate 1 Set of Mechanical Seals

SECTION 11200

VERTICAL TURBINE PUMPS

PART 1 - GENERAL

1.1 SCOPE. Contractor shall furnish all labor, materials, tools, equipment, and supervision required to install vertical, constant speed turbine pumps with vertical hollow-shaft type motors direct-connected to the pumps with bolted motor couplings. Each pumping unit shall be provided with an electric motor. The pumps shall be utilized for pumping clean or storm water containing some quantities of grit and sand.

These specifications must be used together with Master Specification Sections 11100, Pump Application General Requirements and 11050, Equipment General Provisions. Errors due to failure to reference these sections will be borne by Contractor.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Head and flow rate requirements should be defined in either pump schedule or on the drawings.

2.1.01 Pump Design. The pumps shall be of the vertical type with submerged impellers. They shall be either an axial flow or a mixed flow type, and shall have no more than two stages. The maximum head of pump operations must be at least 2 feet (0.6 m) below the low points of the unstable portion of the curve.

The pumps will be used to pump storm or clean water and shall be designed for frequent starting and stopping and shall be capable of starting against maximum head. The pumps shall be capable of pumping storm water that has passed through a screen with no larger than 1 3/4 inch (4.4 cm) clear openings and which carries suspended sand originating from winter road sanding operations.

Within the required pumping range, the minimum efficiency of the pumps, exclusive of the motor, shall be at least 70 percent. The pumps, at maximum total head, shall not load the motors in excess of their rated horsepower under conditions of normal voltage, frequency, temperature, and clean water. Pumps shall be so constructed that explosive gases from the sump cannot enter the motor room through the pumps.

Based upon the specific pump selected, the pumps shall be capable of passing 2 inch (5 cm) solids and will be tested in the field for this feature prior to installation by the insertion of a 2 inch (5 cm) diameter sphere.

2.1.02 Motor Design Requirements. Each pump shall be provided with a vertical, 460 volt, 3 phase, 60 Hertz, squirrel cage induction motor with normal starting torque, low starting current and shall be of the weather protected, Type 1 type.

2.2 ACCEPTABLE MANUFACTURERS. The pumps shall be Fairbanks, Morse, Johnston Pump, ITT-AC mixed flow pump, or equal.

2.3 PUMP CONSTRUCTION. All materials used in the construction of the equipment specified herein shall be new, high grade, of a quality best suited to the requirements of the work, and shall conform to the latest standard specifications of the American Society for Testing and Materials for all cases covered by such specifications. Castings with holes, cracks, or other defects shall not be accepted.

The pump assembly shall be supported from a base plate of such design that the unit can be easily removed through the openings of the floor and the roof. The column pipe and pump bowl shall be made in sections to permit ready assembly, dismantling, and removal of the impeller. The minimum wall thickness of column pipe shall be in no case less than 3/8 inch (1.0 cm). Joints shall be of the flange type with a gasket or other suitable means to make them watertight. Vanes shall not be used in the construction of the discharge elbow.

2.3.01 Bowl Assembly. The pump bowl and suction bell shall be of ductile iron, semi-steel or a combination of these with a minimum strength of 30,000 psi (206,842 kPa). The pump column, discharge elbow, and pipe shall be composed of flanged sections of mild steel pipe with a minimum thickness of 3/8 inch (1.0 cm). All parts shall be sufficiently strong and reinforced as necessary to stand all loads, including vibrations, and shall also be designed for proper rigidity. The complete unit, when assembled and operating, shall be free from undue vibration, cavitation, noise, or leaks.

2.3.02 Mounting. The motor mounting shall be for a direct-connected motor.

2.3.03 Shaft. The line shaft shall be cold-rolled steel and the impeller shaft shall be stainless steel, both of sufficient diameter to transmit the torque and thrust with a safety factor of not less that 8. The shaft dimensions and bearings spacing shall be so proportioned that no injurious deflection or whip will occur, and bearing spacing of more than 5 feet (1.5 m) will not be approved. The thrust shall be carried by a thrust bearing in the motor. The intermediate and bowl bearings shall be of the bronze sleeve type. Provision shall be made for making any necessary vertical adjustment to the shaft after it has been assembled in the pump unit, and without interfering with its alignment. The shaft shall be enclosed in a shaft-enclosing tube of stainless steel tubing attached to the bearings with tight fittings in such a way as to prevent leakage of liquid into the tubing and bearings, and adequate seals shall be provided at the bearings adjacent to the impellers. The column pipe, shaft tube, and shaft shall be fitted with necessary joints and couplings to permit dismantling the unit into sections of not more than 10 feet (3 m) in length. A shaft joint shall be provided between the motor and the shaft enclosing tube. Provision shall be made for vertical adjustment of the pump shaft and impeller, the point of adjustment being easily accessible to someone in the motor room.

All intermediate shaft couplings shall be made of high grade steel.

2.3.04 Impeller. The pumps shall be provided with dynamically balanced SAE 63 abrasion resistant bronze impellers. Impellers shall be locked to the pump in such a manner as to permit ready inspection and removal, and also to prevent any damage should the direction of rotation become reversed.

The impellers shall have a minimum blade thickness at the outer circumference of not less than 2.2 percent of the maximum diameters of the propellers.

2.3.05 Seals and Greasing. Top and bottom seals shall be so constructed as to permit pressure greasing without blowing the seals. All column bearings and the top bowl bearings shall be lubricated by means of a single fitting for forcing grease into the top of the shaft enclosing tub. A bypass port shall be provided in the lower part of the top bowl bearing for use in determining when grease has reached this bearing. The port shall be through one of the guide vanes and shall be furnished with an elbow and riser extending up above motor base plate (but no less that 18 inches (45.7 cm) above the minimum pumping elevation) and plugged or capped with a standard pipe fitting. Slots shall be provided in all intermediate shaft suction manifold bearings to facilitate the passage of grease to the lower bearings. Intermediate bowl bearings, if used, and suction manifold bearings shall be grease-lubricated through one of the guide vanes and shall be provided with separate grease lines. Grease lines shall be stainless steel and shall have a minimum diameter of 3/8 inch (1.0 cm). They shall extend above the floor plate in the motor room, and terminate in an approved fitting. Exposed grease lines shall be supported from the outer pump column and shall be as close thereto as practicable to avoid mechanical injury to the lines.

2.3.06 Data Plates. All data plates shall be of stainless steel suitably attached to the pumps. Data plates shall contain:

Manufacturer's name.

Pump size and type.

Serial number.

Maximum speed.

Impeller diameter.

Capacity.

Head rating.

Other pertinent data identified by manufacturer.

2.3.07 Hardware. All machine bolts, nuts and capscrews shall be minimum 316 stainless steel of the hex head type. Hardware (or parts) requiring special tools or wrenches shall not be used.

2.4 MOTOR CONSTRUCTION. Pumps shall have maximum horsepower and speed ratings noted hereinafter and shall not overload the motor at any point on the operating curve. Motors shall be as specified in Master Specification Section 16220, General Purpose Induction Motors.

2.5 SHOP TESTING. Each pump shall be assembled at the factory to insure fit of adjoining parts. One pump selected at random by a representative of the Engineer shall be tested at the factory for operating efficiency. A minimum of 8 shall be taken to include 1 each at maximum static head, average static head, 115% of maximum static head, and 85% of minimum static head.

The tests shall be such as to satisfy the Engineer that the equipment complies with the specification requirements. The manufacturer shall furnish 6 certified copies of test curves to the Engineer. The Standard of the Hydraulic Institute shall govern the procedures and calculations for these tests. The limits of vibration as set forth in the Standards of the Hydraulics Institute shall govern.

For vertical turbine pumps large enough to be manufactured with sleeve bearings, factory testing of each unit shall be conducted with a representative of the Engineer present.

PART 3 – EXECUTION

3.1 INSTALLATION. Each pumping unit shall be leveled, plumbed, aligned, and bolted into position to fit connecting piping. Installation procedures shall be as recommended by the pump manufacturer and the Hydraulic Institute Standards. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to fit properly.

3.1.01 Seals and Greasing. In the field and prior to installing the riser tube on the top bowl bearing, the Contractor shall be required to force grease into the shaft enclosing tube through the grease fitting at the top until grease is forced out of the enclosing tube at the top bearing. The riser tube shall be prefilled with grease prior to installation. After the riser tube has been installed, the Contractor shall again force grease into the shaft enclosing tube until grease is forced from the top of the riser tube. All of this work shall be done in the presence of a representative of the Engineer.

Motor room (or dry well) shall be completely sealed from wet well to prevent sewer gases from accessing the motors and electrical equipment.

3.1.02 Surface Preparation and Shop Painting. The following areas of the pump shall be painted with NSF approved epoxy paint.

Inside of the outer pump column

Outside of the shaft enclosing tube

Inside of the discharge pipe

Both sides of the pump bowl

Outside the outer pump column for entire length below the floor plate

The remainder of the pump exterior, the motor, motor base, and base ring surfaces shall be cleaned and primed with one coat of polyamide epoxy primer followed by 2 coats of green polyamide epoxy finish. Manufacturer shall be Tnemec Epoxoline Series 66 or approved equal.

3.1.03 Cleaning. Prior to acceptance of the work of this section, thoroughly clean all installed materials, equipment and related areas.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. Upon completion of the installation, the Contractor shall be required to make performance tests of all pumps in the field, under the direction of the Engineer. Startup and Testing shall be performed in accordance with Master Specification Section 11050, Equipment General Provisions. The Pump Manufacturer will be entitled to have representatives present during these field tests. During the tests, the operation of the unit may be under the direction of the Pump Manufacturer's representative if he so desires. The Contractor shall provide competent personnel to make any necessary alterations in accordance with the operation guarantee.

3.3 SPARE PARTS.

3.3.01 Spare Parts. The contractor shall also furnish the following spare parts as well as any others agreed to during submittal process:

1 Pump Bowl Assembly

1 Set of Pump Bearings

1 Set of Shaft Couplings

1 Intermediate Shaft Bearings

1 Set of Motor Bearings

1 Set of Casing and Impeller Wear Rings

End of Section

SECTION 11210

SUBMERSIBLE PUMPS

PART 1 - GENERAL

1.1 SCOPE. This section covers submersible heavy-duty centrifugal pumping units up to the 50 horsepower (37.3 kW) range intended for continuous duty in sewerage and storm water environments. Each pumping unit shall be complete with a close-coupled, submersible electric motor; base connection and all other appurtenances specified or otherwise required for proper operation. Furnish explosion proof motors in hazardous locations where indicated on the drawings.

1.2 QUALITY ASSURANCE.

1.2.01 Source Quality Control. Each pump casing shall be hydrostatically tested to 1.5 times maximum shut off pressure. Each assembled pump shall be fully tested on water and have curves plotted to determine the rated capacity of each pump in accordance with the standards of HI USA.

Drilling templates, space requirements and mounting instructions shall be obtained from pump supplier.

Pumps and motors shall be manufactured and furnished by same manufacturer as a package to insure proper coordination and compatibility of equipment. Pumps of same type shall only be obtained from one manufacturer.

These specifications shall be used together with Master Specification Section 11100, Pump Application Requirements and Master Specification Section 11050, Equipment General Provisions. Any costs resulting from errors due to failure to reference these sections will be borne by Contractor.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. In addition to the submittals required under Master Specification Sections 11050, Equipment General Provision and 11100, Pump Application General Requirements, submit the following data and drawings for motors:

Details of Cable Entry

Type and Size of Cable or cables.

Locked rotor torque in lb-ft.

Number of permissible starts under specified conditions per hour.

Enclosure type.

1.3.02 Certifications. A certified performance test, as specified in Master Specification Section 11100, Pump Application Requirements shall be performed on each pump to prove that it conforms in all respects to its submitted performance criteria.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Pump performance shall be stable and free from cavitation and noise throughout the specified operating head range.

2.3 ACCEPTABLE MANUFACTURERS. Submersible pumps shall be manufactured by ITT Flygt Corp., KSB Inc., EMU-Davis, or equal.

2.4 MATERIALS.

Motor Housing, Oil Chamber Housing, Impeller and Volute	Cast iron, ASTM A48 Class 35B
Impeller Wearing Ring	Type 316 Stainless Steel
Volute Wearing Ring	Type – 17 – 4 pH Stainless Steel or nitrile coated steel.
Shaft	C 1035 Carbon Steel
All Wetted Assembly Fasteners	Type 316 Stainless steel
Mechanical Seals	Tandem System consisting of two totally independent seal assemblies. Lower seal shall have one stationary and one rotating tungsten carbide ring. Upper seal shall have one stationary tungsten carbide ring and one rotating carbon ring.
Discharge Base	Cast iron ASTM A48 Class 35B

2.4.01 Anchor Bolts. All anchor bolts, nuts, and washers shall be 300 Series stainless steel.

2.5 PUMP CONSTRUCTION. Pumping units shall be mounted on a pedestal base extending from the volute casing to below the bottom of the suction elbow inlet flange. All seams and contact surfaces between steel shapes and plates of fabricated steel pedestals shall be continuously welded and ground smooth. Each pedestal shall be suitable for grouting and bolting to lifting platform.

All mating surfaces of major components shall be machined and fitted with O-rings where watertight sealing is required. Sealing shall be accomplished by O-ring contact on four surfaces and O-ring compression in two planes, without reliance on a specific fastener torque or tension to obtain a watertight joint. The use of elliptical O-rings, gaskets, or seals requiring a specific fastener torque value to obtain and maintain compression and water tightness will not be acceptable. The use of secondary sealing compounds, gasket cement, grease, or other devices to obtain watertight joints will not be acceptable.

2.5.01 Volute. Pump volute shall be single-piece grey cast iron, ASTM A48 Class 35B. It shall be of non-concentric design with smooth passages large enough to pass any solids that may enter the impeller. The volute casing shall have well-rounded water passages and smooth interior surfaces free from cracks, porosity, blowholes, or other irregularities. The discharge nozzle shall be flanged, with dimensions and drilling conforming to ANSI B16.1, Class 125. Minimum inlet and discharge size shall be as specified and/or as shown on the Drawings. Pump volutes shall be provided with renewable wear rings.

2.5.02 Pump Seals. Each pump shall be provided with a tandem mechanical shaft sealing system consisting of two independent seal assemblies. The seals shall operate in an oil chamber that hydrodynamically lubricates the lapped seal faces at a constant rate. The lower seal unit between the pump and the oil chamber shall contain one stationary and one positively driven rotating tungsten carbide ring. The upper seal unit between the oil chamber and the motor housing shall contain one stationary tungsten carbide ring and one positively driven rotating ceramic ring. Each seal interface shall be held in contact by its independent spring system designed to withstand maximum suction submergence. The seals shall require neither maintenance nor adjustment and shall be readily accessible for inspection and replacement. Oil shall be an NSF 61 approved lubricant.

Shaft seals lacking positively driven rotating members or conventional double mechanical seals which utilize a common single or double spring acting between the upper and lower units and requiring a pressure differential to offset external pressure and effect sealing, will not be acceptable. The seals shall not rely upon the pumped media for lubrication and shall not be damaged if the pumps are run unsubmerged for extended periods while pumping under load.

2.5.03 Pump Shaft. Pump and motor shaft shall be the same unit. The pump shaft shall be an extension of the motor shaft. Couplings shall not be acceptable. The pump shaft shall be as specified above and shall be completely isolated from the pumped liquid.

2.5.04 Impeller. The impeller shall be a double shrouded non-clogging design one-piece casting. The interior water passages shall have uniform sections and smooth surfaces and shall be free from cracks and porosity. The impeller shall be dynamically balanced and securely locked to the shaft by means of a key and retained with an expansion ring. It shall be capable of handling solids, fibrous materials, grit and other matter found in wastewater.

2.5.05 Bearings. The pump shaft shall rotate on two bearings. Motor bearings shall be permanently grease lubricated. The upper bearing shall be a single row roller bearing. The lower bearing shall be a double row angular contact bearing to resist axial thrust and radial forces.

2.6 DRIVE UNITS.

2.6.01 Electric Motors. Each submersible pump shall be driven by a completely sealed and jacketed, heavy duty, electric submersible, squirrel cage induction motor of specified horsepower, minimum 1.15 service factor, specified RPM, 460 volts, 3 phase, 60 Hertz power, housed in an air filled, watertight chamber, NEMA B type. Motor shall be compatible with variable frequency drives for variable speed pumps.. The stator windings and stator leads shall be insulated with moisture resistant Class F insulation rated for 155 °C. The stator shall be dipped and baked three times in Class F varnish and shall be heat-shrink fitted into the stator housing. The rotor bars and short circuit bars shall be made of cast aluminum.

2.6.02 Cooling system and motor protection. Each dry-pit submersible pump shall be provided with a cooling system for continuous pump operation in liquid temperature of up to 104 degrees F (40 degrees C). The cooling systems for the pumps shall consist of a water jacket encircling the stator housing. Impeller back vanes shall provide the necessary circulation of the cooling liquid through the water jacket. The cooling media channels and ports shall be non-clogging by virtue of their dimensions. Provisions for external cooling in lieu of a water jacket will not be permitted. The motor insulation and cooling systems shall be designed for at least 10 starts per hour under load.

The motor protection systems shall consist of thermal and leakage sensors. The stators in each motor shall be equipped with two thermal switches per each of the 3 phases or a total of 6 to monitor stator temperature and protect from overheating. The thermal switches per each of the 3 phases or a total of 6 shall be embedded in the stator lead coils to monitor the temperature of each phase winding, and shall be used in conjunction with external motor overload protection and wired to the control panel. Should high temperature occur, the thermal switches shall open, shut down the pump, and activate an alarm.

A leakage sensor shall be provided to detect water in the stator chamber. The monitoring system shall consist of a float switch which when activated, shall activate an alarm.

The thermal sensors and float switch shall be connected to a control and status (CAS) monitoring system provided by the manufacturer. The unit shall be designed to be mounted in any control panel.

The flexible power cables for the pumps shall include an equipment grounding conductor to the pump frames. The cable entry water seal design shall preclude specific torque requirements to insure a watertight and submersible seal. The cable entry shall be comprised of a single cylindrical elastomer grommet, flanked by washers, having a close tolerance fit against the cable outside diameter and the entry inside diameter and compressed by the entry body. The assembly shall provide ease of changing the cable when necessary using the same entry seal. The cable entry junction chamber and motor shall be separated by a stator lead terminal board, which shall isolate the motor interior from foreign material or moisture gaining access through the pump top.

Each pump shall be equipped with one or more multi-conductor cable assemblies for power and control. Each cable assembly shall bear a permanently embossed code or legend indicating the cable is suitable for submerged use. The power cable shall be sized according to the current NEC and ICEA standards and also meet with P-MSHA approval. The outer jacket of the cable shall be oil resistant chloroprene rubber. The motor and cable shall be capable of continuous submergence underwater without loss of watertight integrity to a depth of 65 feet. All cables shall be of sufficient length to terminate in a junction box as indicated on the drawings, with 10 feet (3 m) of slack. Each cable shall be provided with, and supported by an AISI Series 300 corrosion-resistant stainless steel Kellems or woven grips to prevent damage to the cable insulation.

The cable entry water seal shall include a strain relief and a grommet type seal designed so that a specific fastener torque is not required to ensure a watertight, submersible seal. The cable entry junction box and motor shall be separated by a stator lead terminal board. The cable entry junction box shall isolate the motor interior from foreign material or moisture gaining access through the top of the stator housing.

The power cable shall be sized according to the current NEC and ICEA standards and also meet with P-MSHA approval. The outer jacket of the cable shall be oil resistant chloroprene rubber. The motor and cable shall be capable of continuous submergence underwater without loss of watertight integrity to a depth of 65 feet

2.7 PULL UP DESIGN. The submersible pump shall be of the pull up design with stainless steel guide rails and a chain or cable. Lifting shall be done by portable hoist. The pumps shall discharge to a special self-locking suction elbow permanently mounted to the wet well floor.

The pull up design shall allow maintenance and repair of the pump and motor without personnel having to enter the wet well.

All field testing of the pump shall be conducted with the special elbow in place.

2.8 MANUFACTURE AND FABRICATION. All iron and steel parts which will be in contact with pumped liquid or which are submerged after installation, including the inside of the casing, the impeller, and the discharge nozzle, shall be shop cleaned in accordance with the coating manufacturer's recommendations and painted with a factory applied spray coating of acrylic dispersion zinc phosphate primer with a polyester resin paint finish on the exterior of the pump. At least 1 quart (0.9 L) of the finish coat material shall be furnished with each pump for field touchup.

2.9 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed 5.0 mils (0.125 mm).

2.10 SHOP TESTING. Each pumping unit shall be tested at the factory for capacity, power requirements, and efficiency at specified rated head, shutoff head, operating head extremes, and at as many other points as necessary for accurate performance curve plotting. All tests and test reports shall conform to the requirements and recommendations of the Hydraulic Institute Standards. Acceptance testing shall be Level A, with no minus tolerance or margin allowed.

The Engineer, where specified, will witness shop tests of large pumps, inspect and check the testing equipment used, and observe the calibration of pressure gauges and transducers. The Contractor shall furnish the Engineer a plan and elevation sketch of the test setup showing the piping and instrumentation and shall notify the Engineer at least 14 days in advance of the time of each shop test. In the event the tests are conducted more than 75 miles (121 km) from Detroit, Michigan, the Contractor shall pay the expenses incurred by two of the Engineer's representatives in witnessing the test at no additional cost to the city. All the cost of witnessing tests by Engineer's representatives shall be paid by the Contractor in advance. The cost shall include travel, room, car rental, meals, and other incidental expenses.

If the pump fails to operate properly or fails to meet the specified conditions or requirements during testing, the pump manufacturer shall modify the pump and perform additional tests at no additional cost to the Engineer.

Five certified copies of a report covering each test shall be prepared by the pump manufacturer and delivered to the Engineer not less than 10 days prior to the shipment of the equipment from the factory. The report shall include data and test information as stipulated in the Hydraulic Institute Standards, copies of the test log originals, test reading to curve conversion equations, and certified performance curves. The curves shall include head, bhp, pump efficiency, and shop test NPSH available, plotted against capacity. The curves shall be easily read and plotted to scales consistent with performance requirements. All test points shall be clearly shown.

PART 3 - EXECUTION

3.1 INSPECTION. Examine bases and verify size of base and anchor bolt positioning. Rectify conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable for proper positioning, alignment, and anchorage.

3.2 INSTALLATION. Install all items in accordance with printed instructions of manufacturers, as indicated and specified. Make adjustments necessary to place equipment in satisfactory working order, at time of tests.

Include disassembly means to permit flow tests as specified below.

Each discharge base shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. Installation procedures shall be as recommended by the pump manufacturer and the Hydraulic Institute Standards.

3.3 FIELD QUALITY CONTROL. The general requirements for system testing, check out, initial start-up, certification, and instruction of plant personnel are contained in Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Additional requirements follow.

3.3.01 Acceptance Tests. Complete installations. Furnish labor, equipment and materials to conduct the tests. Give each pump a running test in the presence of Engineer to demonstrate satisfactory operation without vibration or overheating

Check centrifugal pump for head, capacity, RPM, and motor input (including supply power characteristics and line amps).

Correct all defects or replace defective equipment revealed and noted during test. Make necessary adjustments at the time of tests, at no additional compensation.

Repeat tests if necessary to obtain results acceptable to Engineer.

3.4 SPARE PARTS. A complete set of seals, O-rings, and gaskets, and one spare set of mechanical seals consisting of an upper and a lower seal, one spare set of each sized impeller and casing wear rings, one spare set of each size and type of bearings furnished and one of each sized impeller furnished shall be furnished.

End of Section

SECTION 11220

AXIAL HORIZONTAL SPLIT PUMPS

PART 1 - GENERAL

1.1 SCOPE. Contractor shall furnish all labor, materials, tools, equipment, and supervision required to install single stage, axially split case centrifugal pumps with shaft couplings and constant speed horizontal electric motors. Each pumping unit shall be provided with an electric motor. The pumps shall be used to pump potable water. The Contractor shall require the pumping units specified in this section be supplied by a single manufacturer.

These specifications shall be used together with Master Specification Section 11100, Pump Application General Requirements and 11050, Equipment General Provisions. Costs resulting from errors due to failure to reference these sections will be borne by Contractor.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. In addition to the submittals required under Equipment General Provisions and Pump Applications General Requirements, submit the following data and drawings.

Efficiency at full, 3/4, and 1/2 load.

Guaranteed minimum efficiencies at 100 percent, 75 percent, 50 percent and 25 percent of full load.

Guaranteed minimum power factor at 100 percent, 75 percent and 50 percent of full load.

1.3 WARRANTY. The Contractor shall warrant against any defect in material, construction, or performance the Pumping Equipment and Appurtenances furnished under this specification including motors, drives, controls, etc. for a period of three (3) calendar years from the date of final acceptance.

Any defects occurring during this three (3) year period shall be reported by the Owner or his Representative to the Contractor, who shall make all necessary repairs at no cost to the Owner.

The Contractor shall warrant against any defect in material, construction or performance of the repair work for a period of two (2) calendar years from the date of acceptance of the repair work or for the balance of the three (3) year period specified above whichever is longer.

Defects in repair work that occur within this two (2) year period shall be reported by the Owner or his Representative to the Contractor who shall make necessary repairs at no cost to the Owner.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Refer to pump schedule for head and flow rate requirements.

2.1.01 Motor Design Requirements. Electric motors shall be squirrel cage induction type, shielded drip-proof, horizontal motors unless indicate otherwise. Motors shall be complete with motor base, and shall be suitable for operation on 230/460 volts, 3 phase, 60 hertz, electrical power. Unless indicated otherwise. Refer to Master Specification Sections 16220, General Purpose Induction Motors and 16150, Variable Frequency Drives for additional information.

Each pump shall be provided with a horizontal motor that is designed to drive the pump. Motors for variable speed pumps shall be rated for use on variable frequency drives (Nema MG-1, Part 31) with nameplate listed 10:1 speed range (6 – 60 Hz) Variable torque and include Inverter Grade Class F Insulation.

2.2 ACCEPTABLE MANUFACTURERS. The pumps shall be as manufactured by Ebara Pumps, ITT-AC, Ingersoil-Dresser Pump, Patterson Division of Banner Industries, Worthington Pump Division of Dresser Industries, or equal.

2.3 PUMP CONSTRUCTION.

2.3.01 Casing. The pump casing shall be manufactured from materials specified in Paragraph 2.3.10 or 2.3.11 herein as applicable and shall be tested at a hydrostatic pressure of 200 psi (1,380 kPa). The casing shall be provided with ribs and supporting sections. The material of construction and the structural design of the casings shall be subject to the approval of the Engineer. The bearing bracket shall be cast integrally or separate with the lower half casing. The upper half casing shall be fitted with lifting lugs or eye bolts. The casing shall be provided with all necessary taps for vents, drain plugs, lubrication seal water and suction and discharge gauge connections. The suction and discharge connections shall be ASA standard flanges of size and rating shown on drawings.

The flanged joint between the upper and lower halves of the casing shall be provided with dowels, located at diametrically opposite points of the flange to ensure proper alignment. The dowels shall be tapered and provided with a threaded part and hexagon nut at the large end to facilitate their withdrawal.

2.3.02 Impeller. The impeller shall be manufactured from materials specified in Paragraph 2.3.10 or 2.3.11 herein as applicable and of the double suction type. The impeller shall be dynamically balanced and mounted on the shaft with a single key which extends beyond the impeller hub locking the impeller and shaft sleeves against rotation on the shaft.

2.3.03 Wearing Rings. The casing shall be fitted with renewable wearing rings manufactured from materials specified in Paragraph 2.3.10 or 2.3.11 herein as applicable and designed to provide a smooth flow of water into the impeller eye. The casing ring shall be provided with a positive means of preventing rotation. The impeller shall also be fitted with removable wearing rings held in place by set screws or anti rotation lugs. The rings shall be machined for a running fit to minimize the leakage of water from the discharge to the suction side of impeller, and to maintain high sustained efficiency.

2.3.04 Shaft and Sleeves. The pump shaft and sleeves shall be manufactured from materials specified in Paragraph 2.3.10 or 2.3.11 herein as applicable. The shaft shall be accurately machined and ground over its entire length. The shaft shall be protected from wear and erosion in the pump by removable sleeves. The sleeves shall be keyed to the shaft with the same key extended from the impeller and held in place by an approved method water-tight with the impeller hub. Splash collars or deflectors shall be provided to prevent water from the stuffing boxes from running into the bearings.

2.3.05 Bearings. The pump bearings shall be manufactured from materials specified in Paragraph 2.3.10 or 2.3.11 herein as applicable.

The inboard pump bearing shall be of the radial sleeve, ring oiling type. The bearings shall consist of shell lined with grade two (2), tin base babbitt. Babbitt adhesion shall not be less than 95%. The bearing shall be accurately fitted to the shaft and grooved for thorough and uniform lubrication. They shall be split to permit their removal without disturbing the shaft. The bearing housings shall be designed to prevent leakage of oil and entrance of dust, and shall contain a large oil well with an adequate settling chamber.

Each oil well shall be equipped with an approved gurarded glass sight gauge and a plugged drain cock. Each pump shall be equipped with combination of radial and thrust bearing at the outboard which shall be designed to withstand all unbalanced axial thrust that may be imposed on the pump. The thrust bearing shall be as manufactured by Kingsbury and shall be furnished with Kingsbury Housing Model-CH.

The pump shall be equipped with an independent, two (2) oil ring lubrication system, which shall provide continuous, automatic flood lubrication of this thrust bearing.

The bearing temperatures shall not exceed 60°F above an ambient temperature outside the housing of 100°F.

Both inboard and outboard bearings shall be provided with Water Cooling System suitably designed to meet this requirement. The inboard and outboard sleeve bearings shall be provided each with one (1) RTD and the outboard thrust bearing shall be provided with two (2) RTDs to monitor the temperatures.

The RTDs shall be inserted in the bearings in such a manner to permit their removal and replacement easily, without disassembling the bearings as detailed on the drawings and as per bearing manufacturers recommendations.

2.3.06 Stuffing Box. Stuffing boxes shall be water sealed, and shall be designed to insure tight packing without excessive wear or friction on the shaft and to prevent air leakage into the pump under all conditions of operation. Refer to Paragraph 2.3.10 or 2.3.11 as applicable.

The stuffing box shall be complete with 316 stainless steel sleeve, 316 stainless steel pit lantern rings, split type adjustable 316 stainless steel glands with all necessary lattice braid packing. The stuffing box shall be provided with an inside liner of 316 stainless steel. Each split lantern ring shall have two ¼-20 threaded holes for ease of removal. Drip pockets shall be provided under glands and shall have tapped drains for piping away leakage. Suitable connections shall be provided for gland seal cooling from the casing as well from the external high pressure water source.

2.3.07 Baseplate. The pump and driver should be mounted on a one piece fabricated steel baseplate with provision to collect leakage or the pump casing shall be provided with machined supporting feet designed and located as approved by the Engineer. The supporting feet shall have adequate strength to resist all loads that may be imposed on the pump.

Each pump shall be equipped with approved sole plates made of ductile iron or fabricated from steel plates from single stock of not less than 1 ½ inches in thickness, and shall be provided with approved shear ribs, a finished surface on which the pump shall be mounted, and 1/8 inch shims between this surface and the pump supporting feet. The sole plates shall be designed to be bolted and grouted to concrete base.

The sole plates shall be machined on both sides to a smoothness not greater that 63 RMS micro inches. The bottom of the sole plates shall be painted with epoxy primer.

Each pump shall be doweled to support with tapered dowel pins in approved locations. Dowel pins shall be made of steel at least ¾ inch in diameter and provided with a threaded part and hexagon nut at the large end to facilitate removal.

The Pump Manufacturer shall furnish, a full scale template which indicates anchor bolts locations. The template shall be constructed from ASTM A36 Steel Plate and shall be shipped to the jobsite with the anchor bolts, minimum sixteen (16) weeks prior to the shipment of the pump.

2.3.08 Flexible Coupling. Each pump shall be coupled to its drive motor by means of an all steel type flexible coupling. The coupling shall be of the self-aligning, double engagement, lubricated, limited end float type designed to be moisture and dust proof similar to limited end float coupling size #5.0 fast type “HBPL” with phenolic spacers as manufactured by Kopflex, Inc.

2.3.09 Data Plates. All data plates shall be of stainless steel suitably attached to the pumps. Data plates shall contain:

Manufacturer’s name.

Pump size, type, and model.

Serial number.

Maximum speed.

Impeller diameter.

Capacity.

Head rating.

Other pertinent data identified by manufacturer.

A special data plate shall be attached to the pump frame that shall contain identification of frame and bearing numbers.

2.3.10 Pump Materials. The materials of construction for different parts of large pumps (40 MGD, or more) shall conform to the following reference standards. Any alternative standards require approval of the Engineer.

PART	MATERIAL
Casing – Lower Half or Upper Half	Cast Steel ASTM A216/A216, Latest Revision, Grade WCB
Impeller	Stainless Steel ASTM A743-CF3M
Shaft	Alloy Steel ASTM 434 Class BC
Wear Ring – Casing	Stainless Steel ASTM A747-CB7CU-1
Wear Ring – Impeller	Stainless Steel ASTM A743 –CF3M
Packing	Graphite Impregnated
Shaft Sleeve	Stainless Steel ASTM A747-CB7CU-1
Bearing – Inboard	Sleeve (MFG, STD)
Gland	Stainless Steel ASTM A743-CF3M
Bearing – Outboard	Kingsbury with Sleeve (MFG, STD)
Nut – Shaft Sleeve	Stainless Steel
Locknut	Steel (MFG, STD)
Lantern Ring	Stainless Steel ASTM A240-316
Bearing Housing – Inboard	Cast Iron – ASTM A48 CLASS 30
Impeller Key	AISI 420 Stainless Steel
Bearing Housing – Outboard	Cast Iron – ASTM A48 CLASS 30
Bearing Cover – Inboard	Cast Iron – ASTM A48 CLASS 30
Deflector	Aluminum (MFG, STD)
Bearing Cap – Inboard	Cast Iron – ASTM A48 CLASS 30
Stuffing Box Bushing	Stainless Steel ASTM A240-316
Shaft Collar	Steel (MFG, STD)
Bearing Cover – End	Steel (MFG, STD)
Seal Piping	Steel (MFG, STD)

For above items, provide Ductile Iron instead of Cast Iron if available or if owner requests.

2.3.11 Pump Materials. The materials of construction for different parts of small pumps (less than 40 MGD) shall conform to the following reference standards. Any alternative standards require prior approval of Engineer.

STANDARD MATERIAL HORIZONTAL SPLIT CASE PUMP	
PART	**MATERIAL**
CASING – LOWER HALF	DUCTILE IRON ASTM A536-CLASS 60-40-18
CASING – UPPER HALF	
IMPELLER	STAINLESS STEEL ASTM A743-CF8M
SHAFT	STAINLESS STEEL ASTM A276-316
WEAR RING – CASING	STAINLESS STEEL ASTM A743-CA40
WEAR RING – IMPELLER	STAINLESS STEEL ASTM A743-CA15
PACKING	GRAPITE IMPREGNATED
SHAFT SLEEVE	STAINLESS STEEL ASTM A743-CA15
BEARING – INBOARD	SLEEVE (MFG. STD)
GLAND	STAINLESS STEEL ASTM A743-CD8M
BEARING – OUTBOARD	SLEEVE – KINGSBURY (MFG. STD)
NUT – SHAFT SLEEVE	STAINLESS STEEL
LOCKOUT	STEEL (MFG. STD)
LANTERN RING	STAINLESS STEEL ASTM A240-316
BEARING HOUSING – INBOARD	CAST IRON – ASTM A48 CLASS 30
BEARING HOUSING – OUTBOARD	CAST IRON – ASTM A48 CLASS 30
DEFLECTOR	ALUMINUM (MFG. STD)
BEARING CAP – INBOARD	CAST IRON – ASTM A48 CLASS 30
STUFFING BOX BUSHING	STAINLESS STEEL ASTM A240-316
SHAFT COLLAR	STEEL (MFG. STD)
BEARING COVER – END	STEEL (MFG. STD)
SEAL PIPING	COPPER TUBING

For above items, provide Ductile Iron instead of Cast Iron if available or if owner requests.

2.3.12 Hardware. All machine bolts, nuts and capscrews shall be of the hex head type. Hardware (or parts) requiring special tools or wrenches shall not be used.

2.4 MOTOR CONSTRUCTION. Pump maximum horsepower and speed ratings shall not overload the motor at any point on the operating curve. Motors shall be as specified in Master Specification Section 16220, General Purpose Induction Motors.

2.5 SHOP TESTING. Each pump shall be fully tested on water at the manufacturer's plant before shipment. Tests shall consist of checking the unit at its rated speed, head, capacity, efficiency and brake horsepower, and at such other conditions of head and capacity to properly establish the performance curve. Certified copies of test curves shall be submitted to contractor. The Standard of the Hydraulic Institute shall govern the procedures and calculations for these tests. The limits of vibration as set forth in the Standards of the Hydraulics Institute shall govern or at a minimum of 0.0196 in/sec velocity.

PART 3 – EXECUTION

3.1 INSTALLATION. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints greater that .002 is observed, piping shall be adjusted to fit properly.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. Startup and Testing shall be performed in accordance with Master Specification Section 11050, Equipment General Provisions. Pumping operation shall be adjusted as required to provide the appropriate flow conditions.

3.3 SPARE PARTS.

3.3.01 Spare Parts. The contractor shall furnish the following spare parts.

1 Impeller of each size provided.

2 Sets of Gaskets, O-Rings, etc. for each pump.

2 Sets, Each Type of Bearings.

1 Impeller Hub or Shaft Sleeve for each size provided.

1 Each, Each Type and size of Coupling.

2 Sets, Complete replacement all packing

1 Each, Each Type and size of Wear Rings

1 Each, Stuffing Box Gland split with Bronze Bolts and Nuts

1 Set of each size of Motor Bearings

End of Section

SECTION 11300

DRY PIT SOLIDS HANDLING PUMPS

PART 1 - GENERAL

1.1 SCOPE. Contractor shall furnish all labor, materials, tools, equipment, and supervision required to install vertical, dry-pit type solids handling wastewater pumps with extended shafting, shaft couplings, intermediate steady bearings, and vertical electric motors located on the grade floor. Each pumping unit shall be provided with an electric motor.

These specifications shall be used together with Master Specification Section 11100, Pump Application General Requirements and 11050, Equipment General Provisions. Costs resulting from errors due to failure to reference these sections will be borne by Contractor.

1.2 QUALITY CONTROL.

1.2.01 Testing. In addition to the submittals required under Equipment General Provisions and Pump Applications General Requirements, the manufacturer shall, at no cost to the Owner, have each pump individually tested for the operating ranges defined on the pump schedule. Pumps shall be factory tested in accordance with Hydraulic Institute Standard and a Certified Test Curve shall be provided to the Engineer. Where specified, pumps shall be tested in the presence of the Owner, facility superintendent, and the design engineer at the cost of the pump manufacturer. Testing shall include but is not limited to Certified Shop Test and Field Acceptance Test.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. In addition to the submittals required under Equipment General Provisions and Pump Applications General Requirements, submit the following data and drawings.

Guaranteed minimum motor efficiencies at 100 percent, 75 percent and 50 percent of full load.

Guaranteed minimum motor power factor at 100 percent, 75 percent and 50 percent of full load.

Pump and motor cross sections, identifying all parts and materials.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Refer to pump schedule for horse power, head and flow rate requirements.

2.1.01 Shafting Design Calculations. Calculations shall be submitted to determine both a lateral and torsional critical speed analysis of the entire shafting assembly including the motor, the shafting, and the pump to identify that the first lateral critical speed shall be at least 25% above the maximum pump speed. Other exciting frequencies such as universal joint and vane-passing excitation shall also be avoided by placing these at least 20% above or below running RPM. No torsional natural frequency shall occur within a range extending from 20% below to 20% above any existing resonant frequency.

The drive shaft assembly shall be capable of withstanding the applied torque produced by the motor with a safety margin of no less than 2 times over the expected motor peak torque covering the entire range and speed specified. The driveshaft assembly shall be designed to operate below its critical speed. The 1/2 critical speed and potential excitation by impeller vanes shall also be avoided.

2.1.02 Motor Design Requirements. Each pump shall be provided with a shielded drip proof, solid shaft, vertical high-thrust motor that is designed to drive the pump and to support the weight of the suspended shafting. Motors for variable speed pumps shall be rated for use on variable frequency drives (Nema MG-1, Part 31) with nameplate listed 10:1 speed range (6 – 60 Hz) Variable torque and include Inverter Grade Class B Insulation.

2.2 ACCEPTABLE MANUFACTURERS. The pumps shall be ITT A-C pump type NSWV, Fairbanks Morse, Morris Pumps, Vaughn, or approved equal.

2.3 PUMP CONSTRUCTION.

2.3.01 Casing. The pump casing shall be ductile iron of sufficient strength, weight and metal thickness to insure long life, accurate alignment, and reliable operation. The volute shall have smooth fluid passages large enough at all points to pass any size solid which can pass through the impeller and provide smooth unobstructed flow. A large clean-out opening with removable cover, having its interior surface matching the volute contour, shall be located on the casing at the impeller centerline, to allow access to interior of the impeller. The casing shall be split perpendicular to the shaft, with removable suction piping and stuffing box cover and bearing frame. Machined fits for these parts shall be accurately aligned and identical so that casing may be installed for either clockwise or counterclockwise direction of rotation. The casing shall be so arranged that the impeller may be removed without disturbing either suction or discharge piping.

2.3.02 Casing Connections. The discharge flange shall be ANSI 125-psi () flat face. One of the taps in the discharge nozzle shall serve as a vent. A 1 inch (2.5 cm) diameter tap shall be provided on the discharge vent as a pressure gauge connection.

The pump discharge nozzle shall be capable of rotating to any one of eight discharge positions for each direction of rotation.

2.3.03 Suction Cover. The suction cover shall be removable to allow for access to the impeller. It shall be made of ductile iron. A 1/4 inch (6 mm) IPS tap shall be provided next to the suction flange. The suction flange shall be ANSI 125 pound flat faced.

A replaceable 11.5%-14% chrome steel wear casing plate shall be furnished. It shall provide 1/4 inch (6 mm) minimum wear and shall be installed with its wear surface parallel to the end of the impeller inlet.

2.3.04 Impeller. Impeller shall be single-suction enclosed type with 2 vanes, made of ductile iron. Impeller shall be particularly designed with smooth water passages to prevent clogging by stringy or fibrous materials, and shall be capable of passing solids having a maximum sphere size of not less than 4 inch (10.2 cm). Impeller shall be dynamically balanced. Impeller shall have a tapered bore and shall be keyed and secured to the shaft by a 18-8 stainless steel nut locked in placed and shall be readily removable without the use of special tools.

Pump shall have provisions for adjustment of axial clearance of impeller. This adjustment shall be made through the use of shims placed between the frame and outboard bearing housing.

A replaceable 11.5%-14% chrome steel "L" shaped impeller wear ring shall be provided. Ring shall be mounted on impeller to provide a renewable surface opposite the suction cover wear plate.

2.3.05 Stuffing Box Cover and Stuffing Box. The stuffing box cover shall be made of ductile iron with integral stuffing box. Stuffing box shall consist of 5 rings of graphited yarn/non-asbestos packing, teflon seal cage and a split-type gland to permit easy removal and access to packing. Sealing liquid connection to stuffing box shall be tapped in a convenient location. Ample space shall be provided for repacking the stuffing box. The stuffing box shall have a ¾ inch (2 cm) connection to drain leakage from gland. Mechanical seals may be requested by the Engineer.

2.3.06 Shaft. Pump shaft shall be high-strength carbon steel, AISI #1045 minimum, accurately machined, tapered at the impeller end, and of sufficient size to transmit full driver output. It shall be protected from the pumped liquid by a shaft sleeve in the Mechanical Seal area. A seal shall be provided by a synthetic rubber "O" ring, between the shaft and shaft sleeve to prevent leakage of pumped liquid out and/or air into the pump. (For packed pump only)

2.3.07 Shaft Sleeves. Renewable shaft sleeves shall be of a corrosive-resistant 400 Series stainless steel with a 500 Brinnell hardness. The sleeve provided shall extend through the stuffing box and under the gland.

2.3.08 Bearing Frame and Bearings. Pump bearing frame shall be one-piece ductile iron construction, Frame shall be provided with a ductile iron bearing housing at the outboard end, and a ductile iron end cover at the inboard end. Both ends of the frame shall be provided with lip type grease seals and labyrinth type deflectors to prevent the entrance of contaminants. Bearing frame shall be designed so that complete rotating element can be removed from the casing without disconnecting piping.

Bearings shall be designed for (100,000 hours for 24 hour per day pumps) minimum life at 50% of B.E.P. Radial inboard bearing shall be roller type, suitable for all loads encountered in the service conditions. Axial thrust outboard bearings shall have an outboard bearing arrangement consisting of one deep groove ball bearing to take the radial loads and one angular contact bearing to take axial loads.

Bearings shall be grease-lubricated with provisions for the addition and relief of grease. Bearings shall be provided with extended lubrication lines, attached to the bearing frame, to permit lubrication of all bearings by an operator standing on the pump floor.

2.3.09 Pump Drive Support Pedestal Base and Elbows. Each pump shall be provided with a ductile iron base to contain the suction reducing elbow and to provide a rigid base for anchoring the pump. Elbow may be dependent on pump layout.

Each pump shall be provided with a ductile iron reducing suction elbow which is bolted directly to the pump suction flange. A clean-out hand hole shall be provided with a removable cover of the largest possible size in the suction cover. A 1/4 inch (6 mm) tapped hole for gauge connection shall be provided in the suction cover. The pump suction connection shall be a 24 inch (61 cm) diameter.

2.3.10 Rotation. Each pump shall be arranged to rotate clockwise or counterclockwise as shown on the Drawings. Rotation direction is based on direction viewed from driver end.

2.3.11 Data Plates. All data plates shall be of stainless steel suitably attached to the pumps. Data plates shall contain:

Manufacturer's name.

Pump size and type.

Serial number.

Maximum speed.

Impeller diameter.

Capacity.

Head rating.

Other pertinent data identified by manufacturer.

A special data plate shall be attached to the pump frame that shall contain identification of frame and bearing numbers.

2.3.12 Hardware. All machine bolts, nuts and capscrews shall be of the stainless steel hex head type. Hardware (or parts) requiring special tools or wrenches shall not be used.

2.4 SHAFT CONSTRUCTION. Universal joint type intermediate shafting shall be provided to transmit power between the motor and the pump.

Each section of shafting shall consist of one "A" section just above the pump and one or more "B" sections as shown on the Drawings. The "A" Section shall have a telescoping splined slip member which will permit removal of the pump shaft and impeller without removing any section of intermediate shafting. The "B" section can be provided in multiple numbers to allow for the pump to be placed at a non-angling elevation.

Universal joint bearings shall provide a minimum AFBMA L-10 bearing life of 100,000 hours sized at maximum horsepower and maximum RPM.

Intermediate shafting shall be manufactured utilizing metallic DOM tubing only.

Shafting shall be precision dynamically balanced to 1/2 ounce inch per 10 pounds (36 gram cm per 4.53 kg) of shaft weight per end. Units shall be balanced at the maximum running RPM. The shafts shall be balanced as a unit and match marked to ensure proper in-field installation.

Shafting manufacture shall have complete vibration diagnostic equipment and trained personnel to test shafting and system components should they be required to eliminate any vibration which might occur at start-up.

Safety guards shall be provided as detailed on the Drawings. Safety guards shall be manufactured in two semi-circular halves rigidly formed over metal rods. Mounting fixtures shall be provided at the pump, each floor and ceiling as applicable. Safety guards shall be galvanized after fabrication.

Bearing pedestal stands or supports shall be provided as detailed on the Drawings. They shall be rigidly mounted so that their natural frequency is 4 times greater than the running speed (RPM) forcing frequency.

Intermediate steady bearings where required shall be manufactured with an AFBMA L-10 life not less than 100,000 hours and shall be grease lubricated and self-aligning with seals to prevent contamination by dust or moisture. Bearings shall be Dodge, Link, Belt, Torrington or equal. Where grease points are inaccessible, lube lines shall be extended to bearings.

2.5 MOTOR CONSTRUCTION. Pumps shall have maximum horsepower and speed ratings noted hereinafter and shall not overload the motor at any point on the operating curve. Motors shall be as specified in Master Specification Section 16220, General Purpose Induction Motors.

2.6 SHOP TESTING. Each pump shall be fully tested on water at the manufacturer's plant before shipment. Tests shall consist of checking the unit at its rated speed, head, capacity, efficiency and brake horsepower, and at such other conditions of head and capacity to property establish the performance curve. Certified copies of test curves shall be submitted to contractor. The Standard of the Hydraulic Institute shall govern the procedures and calculations for these tests. The limits of vibration as set forth in the Standards of the Hydraulics Institute shall govern. Tests shall be conducted with Owner present if so directed.

PART 3 – EXECUTION

3.1 INSTALLATION. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to fit properly.

3.2 SPARE PARTS. The contractor shall furnish the following spare parts:

2 Pump Shaft Sleeves of each size provided.

2 Sets Casing and Impeller Wear Rings of each size provided.

6 Sets Spare Packing

2 Sets of Pump Bearings of each size provided.

2 Sets of Shaft Couplings of each size provided.

2 Intermediate Shaft Bearings of each size provided.

2 Sets of Motor Bearings of each size provided.

1 Impeller of each size provided.

End of Section

SECTION 11310

SELF PRIMING PUMPS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous, self-priming, constant or variable speed centrifugal pumping units designed to handle raw, unscreened, domestic sanitary sewage.

These specifications shall be used together with Master Specifications Sections 11100, Pump Application General Requirements and 11050, Equipment General Provisions. Any costs resulting from errors due to failure to reference these sections will be borne by Contractor.

1.2 QUALITY ASSURANCE. Each pump casing shall be hydrostically tested to 1.5 times maximum shut-off pressure by manufacturer. Each assembled pump shall be fully tested on water and have curves plotted to determine the rated capacity of each pump in accordance with the Hydraulic Institute standards

1.3 SUBMITTALS.

1.3.01 Drawings and Data. In addition to the submittals required under Equipment General Provisions and Pump Applications General Requirements, submit the following data and drawings.

Cross Section Showing Parts numbers and all materials of construction

Type of coupling

Motor efficiency at full load and rated pump condition

Number of permissible motor starts per hour under specified conditions

Motor insulation class/temp rise

Motor enclosure and type

Motor Voltage

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Pumps shall be horizontal, self priming, centrifugal pumping units used to convey water, wastewater and other water based liquids to the points of discharge indicated on the Drawings.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each pumping unit shall be designed for the operating conditions indicated on the Drawings and below. Each pumping unit shall be designed so that reverse rotation due to reverse flow will not cause damage to any component. Pump performance shall be stable and free from cavitation and noise throughout the specified operating head range at design suction submergences.

2.2.01 Solids Handling Capability. All internal passages, impeller vanes, and recirculation ports shall pass a minimum 3 inches (7.6 cm) spherical solid or as shown in Drawings. Smaller internal passages that create a maintenance nuisance or interfere with priming and pump performance shall not be permitted.

2.2.02 Reprime Performance. During unattended operation, the pump shall retain adequate liquid in the casting to insure automatic repriming while operating at its rated speed in a completely open system. The need for a suction check valve or external priming device shall not be required. Pump shall reprime 15 vertical feet at the specified speed and impeller diameter. Reprime lift is defined as the static height of the pump suction above the liquid, while operating with only one-half of the liquid remaining in the pump casing. The pump shall reprime and deliver full capacity within five minutes after the pump is energized in the reprime condition.

2.3 ACCEPTABLE MANUFACTURERS. Provide products of Gorman-Rupp Company or equal.

2.4 PUMP MATERIALS. Provide pumping units as specified below unless indicated otherwise on the Drawings.

Casing, frame, seal plate, bearing housing and cover plates	Ductile Iron, ASTM A48 Class 30
Removable Impeller	65-45-12 Ductile Iron
Replaceable Wear Plate	Type 1018 Carbon Steel
Shaft	Type AISI 41L40 steel
Shaft Sleeve	Type 4130 steel
Mechanical Seal	Oil lubricated double floating, self aligning seal with tugsten carbide rotating and stationary seal faces and 316 stainless steel spring.
Bearings	Antifriction open single ball bearings

Base	Fabricated steel
Check Valve	Molded Neoprene with integral steel and nylon reinforcing

2.5 PUMP CONSTRUCTION.

2.5.01 Casing. The casing fill port and pump interior shall have quick opening inspection covers retained by hand nuts. The priming recirculation port in the volute shall pass a 3 inch (7.6 cm) diameter sphere or other size as specified. The pump rotating assembly including the impeller, shaft, mechanical shaft seal, lip seals, bearings, seal plate and bearing housing shall be removable as a single unit without disturbing the pump casing or piping.

The nozzle flanges shall have ANSI Class 125 drilling. Pipe-tapped openings shall be provided for draining, priming, and venting the casing.

2.5.02 Impeller. The impeller shall be a one piece, two vane, semi open, non clog casting with integral pump vanes on the back shroud completely machined on all exterior surfaces and dynamically balanced. The impeller shall thread onto the shaft and be secured with a lockscrew and conical washer.

The interior impeller water passages shall have uniform sections, smooth surfaces and be free from cracks and porosity and shall pass a sphere not less than 4 inches (10.1 cm) in diameter.

2.5.03 Shaft and Shaft Sleeves. The shaft shall be completely machined. The shaft shall be provided with a replaceable sleeve extending from the impeller through the seal area. The sleeve shall be positively locked against rotation and axial movement and shall be sealed to prevent leakage between the shaft and the sleeve. After assembly of the shaft, total runout shall not exceed 0.002 inch (0.005 mm).

2.5.04 Check Valve. A check valve shall be located in the suction side of the pump as an integral part of the housing. The check valve shall be removable without disconnecting the suction piping.

2.5.05 Bearings. Bearings shall be anti-friction ball or tapered roller type of proper size and design to withstand all radial and thrust loads expected during pump operation. Bearings shall be oil lubricated from a dedicated oil reservoir. Bearings shall have an AFBMA L_{10} rating of not less than 50,000 hours at the most severe loads imposed by the specified continuous duty conditions. The pump shaft speed shall not exceed the bearing manufacturer's limitations.

2.5.06 Accessories. The pump shall be provided with lifting eye bolts or lugs;

plugged gage cock connections at the suction and discharge nozzles; tapped and plugged openings for casing and bearing housing vents and drains; and fittings for properly adding the lubricant. Constant level oilers shall be provided.

2.5.07 Frame Assembly. The frame assembly shall rigidly support the rotating element with two bearings. The outboard bearing shall carry both axial and radial loads. The assembly design shall permit axial adjustment of the rotor without dismantling the pump. Bearing enclosures shall keep out contaminants and retain the lubricant and shall have adequate provisions for adding and flushing lubricant.

2.5.08 Flexible Coupling. The pump coupling shall have a horsepower rating 1.5 times the motor nameplate horsepower when the misalignment is within the manufacturer's tolerance limit. Coupling design shall permit removal of the pump rotating element without disconnecting the piping, moving the drive unit, or axial movement of the coupling halves on the shaft.

2.5.09 Base plates. Base plates shall be provided with adequate openings for grouting and venting. Base plates shall provide for tapered dowels to maintain alignment of pump and motor.

2.6 DRIVE UNITS.

2.6.01 Electric Motors. Each pump shall be supplied with an electric motor. Each motor shall be squirrel-cage induction type, horizontal, shielded drip proof, and rated 230/460 volts, 3 phase, 60 Hz. Motors powered from variable frequency drives shall be rated for inverter duty in conformance with NEMA MG1 Part 31. The maximum brake horsepower of the pumps shall not exceed 90% of motor nameplate horsepower exclusive of service factor. Electric motors shall conform with Master Specification Division 16.

2.6.02 Variable Speed Drives. Variable frequency drives, where specified, are furnished under Master Specification Section 16150, Variable Frequency Drives.

2.7 CONTROLS. The pump controls shall be as shown on the Drawings and electrical schematics and shall be installed under Master Specifications Division 16 in accordance with Master Specifications Division 17, unless indicated otherwise.

2.8 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the vibration displacement (peak-to-peak) as measured at any point on the machine shall not exceed 4.5 mils (0.11 mm) and that of the shaft measured at the face of the stuffing box shall not exceed 2.0 mils (0.05 mm).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be less than 0.8 or more than 1.3.

PART 3 – EXECUTION

3.1 INSTALLATION. Each pumping unit shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. The sub base shall then be grouted in place using non-shrinking grout. Installation procedures shall be as recommended by the pump manufacturer, the Hydraulic Institute Standards, and as required herein. A concrete base shall be provided as required. Flanged connections to pumps are specified Master Specification Division 15, Mechanical.

The pump base shall be grouted after initial fitting and alignment but before final bolting of connecting piping. Special care shall be taken to maintain alignment of pumping unit components. Piping stresses shall not be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joint is observed, piping shall be adjusted to proper fit.

Shimming between machined surfaces will not be permitted.

3.2 FIELD QUALITY CONTROL. After initial startup under the supervision of a qualified representative of the pump manufacturer, a preliminary running-in period will be provided for the Contractor to make field tests and necessary adjustments.

The Owner will then operate the pumps for a period of 30 consecutive calendar days. At the end of the specified period of operation, the pumping unit will be accepted if, in the opinion of the Engineer, it has operated satisfactorily without excessive power use, wear, or need for lubrication, or requiring undue attention; and if all its rotating parts operate without excessive vibration or noise at any operating head, including shutoff.

3.3 SPARE PARTS. The contractor shall also furnish the following spare parts as well as any others agreed to during submittal process:

1 Impeller of each size provided.

1 Wearplate, each pump

1 Set of Mechanical Seals for each Pump.

1 Set, Each Type and size of Bearings.

End of Section

SECTION 11320

RECESSED IMPELLER PUMPS

PART 1 – GENERAL

1.1 SCOPE. This section covers recessed impeller pumps for transporting sewage or slurries with or without grit and/or sludge generated from water, storm water and wastewater treatment processes. Pumps shall be of a severe duty, recessed cupped impeller design suitable for use in sludge and grit applications with a 20 year performance life.

These specifications shall be used together with Master Specification Sections 11100, Pump Application General Requirements and 11050, Equipment General Provisions. Costs resulting from errors due to failure to reference these sections will be borne by Contractor.

1.2 QUALITY ASSURANCE. The manufacturer shall test each pump casing hydrostatically to 1.5 times maximum shut-off pressure. Each assembled pump shall be fully tested on water and have curves plotted to determine the rated capacity of each pump in accordance with Hydraulic Institute Standards.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. In addition to the submittals required under Equipment General Provisions and Pump Applications General Requirements, submit the following data and drawings.

Type of coupling or belt drive

Motor efficiency at full, 3/4, and 1/2 load

Number of permissible starts per hour under specified conditions

Motor insulation class/temp. rise

Motor enclosure type

1.4 WARRANTY. The Contractor shall provide a guarantee from the manufacturer against mechanical failure due to materials and workmanship or abrasive wear under the original specified operating conditions for the pump liquid end (suction cover, casing, impeller, and rear liner). The guarantee shall include the replacement of the part for 5 years from the date of shipment. The liquid end guarantee shall be provided in certificate form, signed by an officer of the manufacturing corporation and listed in the submittal.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each pumping unit shall be designed for the operating conditions indicated on the drawings and below. Since these pumps will be used to pump abrasive grit and other solids, the pumps shall be specifically designed to both optimize wear resistance and then maintain hydraulic performance as wear occurs.

The pump(s) shall be of a fully recessed, cup type design, with the impeller mounted completely out of the flow path between the pump inlet and discharge connection, so that solids are not required to flow through the impeller. All flow path clearances within the pump(s) shall be equal to or greater than the discharge diameter, so that all solids which will pass through the discharge will pass through the pump.

Minimum hydrostatic test pressure shall be 1.5 times shutoff head plus max suction pressure.

The pump shall be designed to operate continuously for an extended period of time at any point in the specified operating range of the curve without cavitation, overheating, or excessive vibration. The motor nameplate horsepower rating shall not be exceeded by the pump brake horsepower requirements at any point of the specified operating range.

Each pumping unit shall be designed so that reverse rotation due to reverse flow will not cause damage to any component. The pump casing shall be reversible for right hand or left hand rotation without the need for changing the impeller or casing and shall be of sufficient strength and metal thickness to insure long life, accurate alignment, and reliable operation. The volute of the pump casing shall have smooth fluid passages large enough at all points to pass any size solid which can pass through the discharge and provide smooth, unobstructed flow. The casing shall have a separate and removable suction cover, rear liner and stuffing box cover.

The pump shall have a continuously rising head capacity from runout to shutoff. The pump’s head vs. capacity curve shall slope upward toward shutoff in one continuous curve with no points of inflection capable of causing hunting at any pump operational speed.

Pumps shall be equipped with slotted raised-face flanges to receive 125 lb (56.7 kg) standard bolting. Special case slots shall be cast in to retain bolts and to fasten the case to the bearing housing and to the intake for easy case removal.

2.3 ACCEPTABLE MANUFACTURERS. Pumps shall be Wemco Pump Co. Model C, Morris Pump Co. Model 6100 or approved equal.

2.4 MATERIALS.

2.4.01 Parts Exposed to Abrasive Wear. The pump case, removable suction piece, impeller, and wear plate, shall be of all Ni-Hard material conforming to ASTM Designation A532 Class I, Type A, and be a minimum of 650 Brinell hardness for maximum wear resistance. Brinell values below this are not acceptable and will be rejected.

A removable wear plate of Ni-Hard shall be provided in back of the impeller designed to direct flow from behind the impeller to the center of the volute for maximum protection to the casing. The packing housing shall be a separate piece bolted to the bearing housing for ease of removal. Wear plates that incorporate a stuffing box are not acceptable.

2.4.02 Parts Not Exposed to Abrasive Wear. The bearing housing shall be cast iron ASTM A48, Class 35B.

Shaft shall be steel and comply with AISI 1045 H.R.

Shaft sleeve shall be hardened type 420 stainless steel conforming to ASTM A473, Grade CA-40 with a minimum hardness of 450 BNN.

Bearings shall be antifriction.

Base plate shall be fabricated steel

Anchor Bolts, Nuts, and Washers shall be stainless steel.

2.5 PUMP CONSTRUCTION.

2.5.01 Casing Assembly. The pump casing shall be of the two-piece radially split-type, with a separate and removable suction piece designed so that the impeller can be withdrawn without the need to remove the discharge casing or disturb the discharge piping. The casing shall be constructed so that it can be reversed for opposite rotation, and shall be of Ni-Hard. To insure a liberal wear allowance, the casing and suction piece shall be constructed, and the entire wet end weights shall be, as indicated on the Drawings or as specified.

Test bars shall be cast integrally with the case and suction piece and shall remain attached to the casting upon final delivery to the Owner. Test bars shall be of sufficient thickness to represent the average thickness of the cast part. After receipt of final delivery, the Engineer may at any time prior to final acceptance, remove the test bar and independently verify compliance to the material and hardness specification. Failure of the tested bars to meet the specified requirements shall be cause for rejection.

2.5.02 Impeller. The impeller shall meet ASTM A532, Class 3, Type A, be constructed of 650 Brinell Ni-Hard, and be specifically designed to maintain hydraulic pumping performance as wear occurs.

The impeller shall be of the single suction vortex design recessed into the rear wear liner and out of the flow path. The impeller shall be of a cupped shape with the impeller shroud fully encasing the tips of the impeller vanes preventing direct impingement of the pumpage on the wear liner or casing resulting in localized wear. Radical discharging impellers will not be accepted.

The shroud of the impeller shall incorporate pump out vanes for the purpose of maintaining a solids free area behind the impeller to decrease wear and extend the life of the stuffing box seal.

The impeller shall be straight bored and keyed to the pump shaft. The impeller shall be held in place by a recessed 18-8 SS impeller bolt and will be sealed front back with Buna-N O-rings to provide a dry shaft design. The impeller bore shall be directly through the homogeneous impeller material. The use of soft metal casting inserts which could break loose due to torque and fatigue associated with starting and stopping will not be accepted.

The cupped impeller shall be capable of being easily removed and remounted on the pump shaft without the use of special procedures to confirm impeller bore engagement. Designs which do not utilize a machined keyway for torque transfer shall not be acceptable.

Due to the size, shape and weight of the cupped impeller design, special tool shall be provided to assist with handling the impeller during maintenance.

The impeller shall provide the same hydraulic performance regardless of rotation.

2.5.03 Shaft and Shaft Sleeves. The shaft sleeve shall be of a hook style design and will extend from the impeller past the face of the stuffing box. The sleeve shall be sealed against the impeller with an o-ring to provide a dry shaft design. Sleeve designs that do not fully protect the shaft against the corrosive and abrasive effects of the pumpage will not be accepted.

The sleeve shall be keyed to the shaft to prevent rotation relative to the shaft.

The shaft shall be high strength, accurately machined and of sufficient size, with liberal safety factor, to transmit the maximum horsepower and loading from the impeller to the bearings when the pump is operating at the maximum allowable speed. The pump shaft shall be designed such that the maximum shaft deflection shall not exceed .002 inch (0.05 mm) at the stuffing box.

2.5.04 Stuffing Box Cover. The stuffing box cover shall be clamped between the rear liner and the bearing frame and will be provided with machined registered fits to assure true alignment with the pump shaft.

The stuffing box shall be suitable for either packing or mechanical seals. The stuffing box will be provided with two 3/8 inch (1.0 cm) NPT flush taps for piping arrangement flexibility and shall have a 4 bolt gland pattern.

The packed stuffing box shall be provided with 5 rows of packing, a Teflon lantern ring, a 316SS split gland and 316SS gland hardware.

A taperbore stuffing box shall be available as an option for use with single mechanical seals on abrasive services.

Ample room shall be provided for maintenance of the stuffing box. As a minimum the distance from the face of the stuffing box. As a minimum the distance from the face of the stuffing box to the first obstruction shall be 3 inch (7.6 cm).

2.5.05 Frame Assembly. The frame assembly shall rigidly support the rotating element with 2 bearings. The outboard bearing shall carry both axial and radial pump loads. The assembly design shall permit axial adjustment of the rotor without dismantling the pump. Bearing enclosures shall keep out contaminants and retain the lubricant and shall have adequate provisions for adding and draining lubricant. The bearing frame shall be designed so that the complete rotating assembly can be removed without disturbing the suction and discharge piping.

2.5.06 Bearings. Bearings shall be oil bath lubricated. The oil reservoir shall be sealed at both ends to prevent entrance of foreign matter. The thrust bearings shall consist of three angular contact ball bearings for maximum protection from all thrust loads. The bearing housing will be equipped with a pressure venting device and oil fill and drain taps. A built-in sight glass shall be furnished to check proper oil level. The bearings shall be rated for a minimum AFBMA L-10 life of 100,000 hours, without credit for any rear pump-out vanes to balance hydraulic thrust.

2.5.07 Mounting. Mounting shall be horizontal with V-belt drives between motor and pump. The pump supplier shall furnish and install belts and sheaves to drive the pump at the speed necessary to meet the rated conditions. The drive shall be of the “stationary control” variable speed type that allows a speed change by means of an adjustment to the motor sheave when the drive is not in operation.

An approved fiberglass belt guard shall be provided to safely enclose the V-belt. If metal guards are furnished, they shall be of all 316 stainless steel construction with suitable lifting eyes and handles to aid in removal.

2.5.08 Base plates. The pump manufacturer shall provide a common pump and motor base constructed of a minimum 3/8 inch (1.0 cm) thick fabricated steel, suitably reinforced to support the full weight of pump and motor. Base plates shall provide for tapered dowels to maintain alignment of pump and motor.

The pump supplier shall furnish and mount a separate, adjustable motor base so that the motor can be easily moved for V-belt tensioning and adjustment.

2.6 MOTORS. Electric motors shall be shielded drip proof type with sheave. Motor shall comply with Master Specification Section 16220, General Purpose Induction Motors-Procurement.

2.7 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed 4 mils (0.1 mm).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or its components shall be not less than 0.8 nor more than 1.3.

2.8 SHOP TESTING.

2.8.01 Hardness Testing. Before final shipment, a Brinell hardness test shall be conducted showing compliance to ASTM A532 and shall be submitted for approval. Each individual casting shall be Brinell tested at the manufacturer’s plant to ASTM Method E-10. Each casting shall be checked in a minimum of 2 places, in an area that is representative of casting thickness.

2.8.02 Performance Testing. All hydro and performance testing shall be completed prior to the application of any final paint and/or coating. All factory tested shall be in accordance with the standards of the Hydraulic Institute (latest edition). All testing is to be performed at the manufacturer’s facility using lab personnel, instrumentation and drives.

Hydrostatic testing shall be performed on the assembled pump with the liquid end components being held at a pressure of 150 psi, but not greater than the allowable mechanical seal pressure, for a period of not less than 30 minutes.

Performance testing shall include head, capacity and power readings at 8 points including the rated point, to determine the actual pump performance and efficiency. Performance testing shall establish that the pump is free of overheating, cavitation and excessive vibration over the specified conditions. A certified performance curve shall be completed after the test and included in the final data package.

A 30 day notice shall be given to the Engineer prior to the start of any witness testing.

2.9 ACCESSORIES. Each pump shall be provided with plugged gauge cock connections at the suction and discharge nozzles; tapped and plugged openings for casing drain; and appropriate fittings for adding bearing lubricant and seal water.

PART 3 – EXECUTION

3.1 INSPECTION. Examine bases and verify size of base and anchor bolt positioning. Rectify conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable for proper positioning, alignment and anchorage.

3.2 INSTALLATION. Each pumping unit shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. Installation procedures shall be as recommended by the pump manufacturer and the Hydraulic Institute Standards, and as required herein.

The pump base shall be grouted after initial fitting and alignment, but before final bolting of connecting piping. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to proper fit.

3.3 FIELD QUALITY CONTROL. The general requirements for system testing, check out, initial start-up, certification and instruction of plant personnel are contained in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.4 FIELD TESTING. Field functional testing will be performed to insure proper mechanical operation at the job site. All testing to be used for performance evaluation shall be performed at the pump manufacturer’s facility.

3.5 SPARE PARTS. The contractor shall also furnish the following spare parts as well as any others agreed to during submittal process:

1 Impeller of each size furnished.

1 Set of Mechanical Seals for each Pump.

2 Sets of Gaskets, O-Rings, etc. for each pump.

1 Set, Each Size and Type of Bearings.

1 Each, Each Size and Type of Wear Ring

End of Section

SECTION 11330

PLUNGER PUMPS (SLUDGE)

PART 1 – GENERAL

1.1 SCOPE. This section covers plunger pumps for transporting sludge generated from wastewater treatment processes.

1.2 QUALITY ASSURANCE. Each pump shall be hydrostatically tested to 200 psig test pressure by manufacturer. Each assembled pump shall be fully tested on water and have data plotted to determine the rated capacity of each pump.

1.3 WARRANTY. The motor and reducer as a direct coupled unit shall be warranted for 2 years against defects in material and workmanship.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Plunger pumps shall be used to remove and transport sludge to the points of discharge as indicated on the drawings.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each pumping unit shall be designed for the operating conditions indicated on the drawings and below. Minimum hydrostatic test pressure shall be 200 psig (1,379 kPa). Pump performance shall be stable throughout the specified operating head range.

2.3 ACCEPTABLE MANUFACTURERS. Plunger pumps shall be ITT-Marlow, Komline-Sanderson Engineering Corp., or equal.

2.4 MATERIALS.

2.4.01 Plunger Pumps. Pump body, housing and valve chamber shall be Grey Iron No. 30 unless indicated otherwise. The connecting rods, eccentrics and drive/driven flanges shall also be cast iron.

2.5 PUMP CONSTRUCTION.

2.5.01 Pump Body Assembly. The pump body, housing, and valve chambers shall be of 30,000 psi (207 MPa) minimum cast iron, capable of 100 psi (689 kPa) working pressure and 200 psig (1,379 kPa) test pressure. The construction of the pump shall be such as to permit easy removal of the plunger and connecting rod without disturbing the piping or the main eccentric shaft. The plunger shall be Class 40 cast iron and shall be ceramic coated with a minimum coating thickness of .012 (0.3 mm) and minimum hardness of 65 Rockwell. The plunger surface shall also have a polished finish. Standard equipment shall include a 0.25 inch (6.4 mm) “snifter” valve on the suction side of the pump, and a 1-inch (2.5 cm) sampling valve on the discharge side.

2.5.02 Connecting Rods. The connecting rods, eccentrics and drive/driven flanges shall also be cast iron. The eccentric shall be provided with shear pin protection. The stroke length shall be adjustable with 11 stroke positions. Each eccentric shall be supported on each face with a flange and the plunger thrust shall be distributed over the main shaft. A hardened steel bushing shall be pressed into each adjusting position on the drive flange and a hardened steel bushing shall also be fitted on the eccentric to ensure a clean cut of the shear pin without damaging the cast iron.

The connecting rod shall be cast iron with the eccentric bearing liner as a separate removable insert, such that the connecting rod need not be removed to replace the liner. Bearing liner will be lubricated by a 5 ounce (141.7 g) manual sight feed oiler or automatic ball-type drop feed oiler.

2.5.03 Pump Shaft. The main pump shaft shall be of ground and polished high strength alloy steel and shall be supported by self-aligning bearings. The main shaft shall have a minimum tensile strength of 160,000 psi (1,1030,000 kPa) and a minimum weld strength of 130,000 psi (896,000 kPa). The pump drive shall transmit torque to only the pump shaft, eliminating all side loading stresses except for those that are transmitted by the plunger eccentric. A 1.5 safety factor of actual stress to shaft yield stress shall be maintained. A six figure mechanical revolution counter shall be provided and driven from the pump shaft

2.5.04 Stuffing Box. The stuffing box shall be equipped with a ½ inch (1.3 cm) “Leak Free” packing arrangement that includes a pilot ring, sealing ring and braided packing, lubricant, and hardware to ensure that very little or no stuffing box leakage will be present during the pump’s operation. Each stuffing box shall be equipped with an adjustable packing gland and 1inch (2.5 cm) drain connection. Also acceptable as an alternate to the leak free packing arrangement would be a plunger pac that includes a 1/2 inch (12.7 mm) urethane u-cup, Chevron packing rings and teflon rope.

2.6 DRIVE UNITS. Motor shall comply with Master Specification Section 16220, General Purpose Inductor Motors - Procurement.

2.6.01 Motor. The pumps shall be driven by a constant speed 1750 rpm motor of indicated Horse Power, direct connected to a single reduction, fully enclosed gear reducer drive. The motor shall be furnished for 3 phase, 60 hertz, 230-460 volt operation with TEFC construction. The gear drive shall be oil lubricated, and designed to distribute the stresses over a minimum of 60% of the gear faces. It shall have a minimum 1.5 service factor and be capable of handling 500% shock loads. For simplex and duplex pumps that incorporate a coupling between the reducer and the main shaft, the coupling shall be designed to handle high shock loading and torque reversal and prevent backlash and noise. Couplings shall be Rexnord Thomas AMR coupling, Falk Steelflex or equal.

2.6.02 Variable Speed Drivers. The pumps shall be driven by motor of indicated Horse Power, and mechanical variable speed drive, direct connected single reduction, fully enclosed gear reducer. The variable speed unit shall have a 10:1 speed ratio with an electric, remote speed control and tachometer generator with 2 speed indicators. Variable speed drive shall be US Varidrive or equal.

2.7 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed 4 mils (0.1 mm).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or its components shall be not less than 0.8 nor more than 1.3.

2.8 ACCESSORIES.

2.8.01 Valves. Each pump, as specified, shall be furnished with single or dual ball valves in series for each plunger on the suction and discharge side. The valve chambers shall have ball guide ribs beveled at the top and bottom to prevent clogging. The valve balls shall be urethane rubber ball valves with centralized metal cores at least 5-1/8 inch (13.0 cm) diameter. The valve seats shall be one piece, independent, fully machined 316 stainless steel plates that can be replaced without disturbing valve chambers or piping. Valve seat removal shall not require any special tools. Quick opening clamp type covers with “O” ring gaskets shall be provided for each valve chamber.

2.8.02 Air Chambers. Suction and discharge air chambers shall be of galvanized steel or 304 stainless steel with an air release valve included with each pump. Air chambers shall be a minimum of 30 inches (76.2 cm) high by 9 inches (22.9 cm) in diameter included on both the suction and discharge side of the pump to reduce pulsations. To reduce clogging, the air chambers shall have an area at the entrance of 12-1/2 square inches (80.6 square cm) that shall be maintained through to the manifold or adapter.

2.8.03 Gauges. A 4-1/2 inch (11.4 cm) compound suction gauge, reading 30 inches (76.2 cm) Hg to 15 psi (103.4 kPa), and a 4-1/2 inch (11.4 cm) discharge gauge, reading 0 to 40 psi (275.8 psi), shall be mounted on the air chambers. Gauges shall be provided with protective diaphragm seals with vent petcocks. Protective diaphragms shall be as manufactured by Red Valve or equal. Refer to Master Specification Section 15130, Indicating Devices.

PART 3 – EXECUTION

3.1 INSPECTION. Contractor shall examine bases and verify size of base and anchor bolt positioning. Rectify conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable for proper positioning, alignment and anchorage.

3.2 INSTALLATION. Contractor shall grout after initial fitting and alignment, but before final bolting of connecting piping the pump base. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to proper fit.

3.3 FIELD QUALITY CONTROL. The general requirements for system testing, check out, initial start-up, certification and instruction of plant personnel are contained in Master Specification Section 01018, Equipment, Materials, Parts and Tools.

3.4 SPARE PARTS. The Contractor shall also furnish the following spare parts:

5 sets of packing

2 sets, each type and size of bearings.

1 eccentric shear pin.

1 eccentric bearing liver.

1 valve ball and seat, each type.

End of Section

SECTION 11340

DRY PIT HORIZONTAL CHOPPER PUMPS

PART 1 - GENERAL

1.1 SCOPE. Contractor shall furnish all labor, materials, tools, equipment, and supervision required to install dry-pit horizontal chopper pumps with shaft couplings and horizontal electric motors located in the dry pit.

The pump shall be specifically designed to pump wastewater with heavy concentrations of solids. Materials shall be macerated and conditioned by the pump as an integral part of the pumping action. The pump shall have demonstrated the ability to chop through and pump high concentrations of solids such as plastics, heavy rags, grease, hair balls, wood, paper products, and stringy materials without plugging, both in tests and field applications.

These specifications shall be used together with Master Specification Sections 11100, Pump Application General Requirements and 11050, Equipment General Provisions. Costs resulting from errors due to failure to reference these sections will be borne by Contractor.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. In addition to the submittals required under Master Specification Sections 11050, Equipment General Provisions and 11100, Pump Applications General Requirements, submit the following data and drawings.

Motor Efficiency at full, 3/4, and 1/2 load.

Guaranteed minimum power factor at 100 percent, 75 percent and 50 percent of full load.

Pump and motor cross sections, identifying all parts and materials.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Refer to pump schedule for head and flow rate requirements.

2.1.01 Motor Design Requirements. Electric motors shall be totally enclosed fan cooled (TEFC) solid shaft, horizontal motors suitable for operation with a variable frequency drive where specified. Motors shall be complete with motor base, and shall be provided for operation on 230/460 volts, 3 phase, 60 hertz electrical power. Motors shall be rated for use on constant torque variable frequency drives, where specified. The motors shall be supplied with necessary power and control wiring for integration into variable frequency drives.

2.2 ACCEPTABLE MANUFACTURERS. The pumps shall be Vaughn horizontal dry pit chopper pump type or equal.

2.3 PUMP CONSTRUCTION.

2.3.01 Casing. The pump casing shall be semi-concentric back pull-out design, with the first half of the circumference being cylindrical beginning after the pump outlet, and the remaining circumference spiraling outward to the 150 lb (68 kg) flanged centerline discharge. Casing shall be ASTM A536 ductile cast iron with all water passages to be smooth, and free of blowholes and imperfections for good flow characteristics. A 1/4 inch (6.4 mm) NPT pressure tap shall be included in the discharge flange.

2.3.02 Impeller. The impeller shall be semi-open type with pump out vanes to reduce seal area pressure. Chopping/maceration of materials shall be accomplished by the action of the cupped and sharpened leading edges of the impeller blades moving across the cutter bar at the intake openings, with a maximum set clearance between the impeller and cutter bar of 0.020" - 0.030" (0.51 - 0.76 mm) cold. Impeller shall be cast from ASTM A148 alloy steel, case hardened to minimum Rockwell C 60 and dynamically balanced. The impeller shall be threaded to the shaft and shall have no axial adjustments and no set screws.

2.3.03 Cutter Bar. The cutter bar shall be recessed into the pump bowl, with a funnel shaped inlet opening, and shall extend diametrically across entire pump suction opening. Cutter bar shall be cast from ASTM A536 ductile iron, hardened to minimum Rockwell 50. Replaceable shear bars shall be AISI 8620, case hardened to minimum Rockwell C 60.

2.3.04 Pump Shafting. The pump shaft and impeller shall be supported by ball bearings. All shafting shall be AISI 4140 heat treated.

2.3.05 Bearings. Shaft thrust in both directions shall be taken up by two back-to-back mounted single-row angular contact ball bearings. AFBMA L-10 bearings life shall be minimum 100,000 hours.

2.3.06 Bearing Housing. Shall be A536 ductile cast iron, and machined with piloted bearing fits for concentricity of all components. Bearing housing shall be oil bath lubricated with ISO Gr. 46 turbine oil and a side-mounted site glass to provide a permanently lubricated assembly. Viton double lip seals riding on stainless steel shaft sleeves shall be provided to seal each end of the bearing housing.

2.3.07 Stuffing Box. The stuffing box shall be a packing design with 5-ring packing, split Teflon lantern ring and water fitting. The system shall be provided with a 6-10 gallon/hour (22.7-37.9 L/hour) flush with clean filtered water. Seal water system shall be provided by the contractor and shall include a Rotometer and throttle valve.

2.3.08 Shaft Sleeve. Shaft sleeve shall be 316 SS (mechanical seal) with Nickel-Chrome-Boron coating (packing).

2.3.09 Inlet Seal. The pump assembly shall be mounted horizontally with a 150 lb (68.0 kg) standard inlet flange, cleanout, 1/4 inch (6.4 mm) NPT suction pressure tap, drain connection, and mounting feet.

2.3.10 Shaft Coupling. Bearing housing and motor stool design shall provide accurate, self aligning mounting for a C-flanged electric motor. Pump and motor coupling shall be T.B. Woods Sureflex or equal elastomeric type.

2.3.11 Rotation. Pumps shall be arranged to rotate clockwise. Rotation direction is based on direction viewed from driver end.

2.3.12 Data Plates. All data plates shall be of stainless steel suitably attached to the pumps. Data plates shall contain:

Manufacturer's name.

Pump size and type.

Serial number.

Maximum speed.

Impeller diameter.

Capacity.

Head rating.

Other pertinent data identified by manufacturer.

A special data plate shall be attached to the pump frame that shall contain identification of frame and bearing numbers.

2.3.13 Hardware. All machine bolts, nuts and capscrews shall be of the hex head type. Hardware (or parts) requiring special tools or wrenches shall not be used. (Note stainless steel hardware specified later)

2.4 MOTOR CONSTRUCTION. Pumps shall not overload the motor at any point on the operating curve. The motor nameplate horsepower rated shall exceed the brake horsepower requirements of the specified head and capacity conditions. Electric motors shall be as specified in Master Specification Section 16220, General Purpose Induction Motors - Procurement.

2.5 SHOP TESTING. Each pump shall be fully tested on water at the manufacturer's plant before shipment. Tests shall consist of checking the unit at its rated speed, head, capacity, efficiency and brake horsepower, and at such other conditions of head and capacity to properly establish the performance curve. Certified copies of test curves shall be submitted to contractor. The Standard of the Hydraulic Institute shall govern the procedures and calculations for these tests. The limits of vibration as set forth in the Standards of the Hydraulics Institute shall govern.

PART 3 – EXECUTION

3.1 INSTALLATION. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to fit properly.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. Startup and Testing shall be performed in accordance with Master Specifications Section 11050, Equipment General Provisions. Pumping operation shall be adjusted as required to provide the appropriate flow conditions.

3.3 SPARE PARTS. The contractor shall also furnish the following spare parts as well as any others agreed to during submittal process:

1 Impeller.

1 Cutter Bar Plate.

1 Shear Bar Insert.

1 External Cutter.

1 Set of Shims.

5 Sets of packing for each Pump.

2 Sets of Gaskets, O-Rings, etc. for each pump.

1 Set of Pump Radial and Thrust Bearings.

1 Shaft Sleeve.

End of Section

SECTION 11650

SUMP PUMPS

PART 1 – GENERAL

1.1 SCOPE. This section covers heavy duty submersible sump pumps used to pump water out of meter pit and building sumps.

1.2 GENERAL.

1.2.01 Governing Standards. Unless otherwise specified, the work of this Section shall conform to the applicable portions of the following Standard Specifications:

AFBMA - Anti-Friction Bearings Manufacturers Association

ANSI – American National Standards Institute

ASTM – American Society for Testing and Materials

HI USA – Hydraulics Institute USA

NEMA – National Electrical Manufacturers' Association

1.3 QUALITY ASSURANCE. Each pump casing shall be hydrostatically tested to 1.5 times maximum shut-off pressure by manufacturer. Each assembled pump shall be fully tested on water and have curves plotted to determine the rated capacity of each pump in accordance with the standard of HI USA.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit manufacturer's product data. This data should be included, unless otherwise directed, in a schedule shown elsewhere. The data and specifications for each unit shall include, but not be limited to, the following:

Name of manufacturer

Type and model

Rotative speed

Size of suction nozzle

Size of discharge nozzle

Net weight of pump

Complete performance curves showing capacity versus head, NPSH required, pump efficiency, and bhp

Submit shop drawings detailing installation, wiring, and controls. Drawings shall also show details of anchoring and identify type, length and diameter of anchors to be used. Submit Control Panel layout drawings showing details of all panel components, including ladder schematics, wiring diagrams and manufacturer's details and catalog cut sheets.

Submit Operation and Maintenance Manual, including parts list, control diagrams in ladder format, spare parts listing, and recommended schedule of inspection, cleaning and lubrication. Include manufacturer's recommended lubricants.

1.5 DELIVERY, STORAGE AND HANDLING. The Contractor shall transport and store all material and equipment in a manner to eliminate the possibility of damage, breakage or chipping.

1.6 WARRANTY. The pump manufacturer shall warrant the units being supplied to the Owner against defects in workmanship and material for a period of 1-1/2 years from the date of acceptance by Owner.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS. Sump pumps shall be used to remove potable and storm water and other water based liquids as indicated on the drawings.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each pumping unit shall be designed for the operating conditions indicated on the drawings and below. Minimum hydrostatic test pressure shall be 1.5 times shutoff head plus max suction pressure.

Pump performance shall be stable and free from cavitation and noise throughout the specified operating head range at design suction submergences. Each pumping unit shall be designed so that reverse rotation due to reverse flow will not cause damage to any component.

2.3 ACCEPTABLE MANUFACTURERS. Submersible sump pumps from Peabody and Barnes, Hydromatic, Flyght, or equal are acceptable.

2.4 PUMP CONSTRUCTION. Casing assembly shall be stainless steel or cast iron. The impeller shall be cast iron, ductile iron, or 316 stainless steel as indicated. Contractor shall provide ductile iron for all cast iron upon Owner's request. The interior water passages shall have uniform sections and smooth surfaces and shall be free from cracks and porosity. Shaft shall be stainless steel. Suction and discharge ports shall be flanged connections. Pump shall have upper and lower heavy duty ball bearings and carbon/ceramic mechanical seals both permanently lubricated in an oil bath.

2.5 MOTORS. Motor shall be Class F with a maximum temperature of 310 degrees F (155 degrees C) and with dry running capability. Motor shall be permanently lubricated for extended service life. Also see Master Specification Section 16220, General Purpose Induction Motors - Procurement.

2.6 CONTROLS. Where applicable, the duplex type sump pumps shall be furnished with a NEMA 4X local control panel incorporating a magnetic-only adjustable circuit breaker type disconnect with overload and phase failure protection, and NEMA rated motor starters with thermal overload protection. An alternating relay shall be provided for pump lead-lag status alternation. All pilot devices shall be transformer type, 1-1/6 Inch (30 mm), oil-tight type. Relays should be 3 PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings. A 120 volt control power transformer with one secondary lead fused and the other grounded shall also be provided.

The duplex units shall have a control system consisting of four mechanical float switches located inside sealed, double walled NEMA type 6 floats of rigid plastic with a cable molded onto the end and a NEMA 4X local control panel. The pump control and alarm mechanical float switch assemblies shall be furnished with 20 foot (6 m) cables to be hardwired to the local control panel, a support pipe of compatible material, support brackets, and gas-tight cable clamps.

The duplex local control panel shall include, but shall not be limited to, the following:

Power ON/OFF selector switch

H/O/A selector switch for each pump

Start and Stop pushbuttons for each pump

Alarm Reset pushbuttons for each pump

“Running” pilot light (red – per pump), “Off” pilot light (green – per pump), “Power On” pilot light (white), “High Sump Level Alarm” pilot light (amber), “High-High Sump Level Alarm” pilot light (amber).

Elapsed Time Meter

Duplex receptacle

Terminal Strip

Normally closed contacts pre-wired to terminals for external connections to others corresponding to the following:

"Pump No.1 General Failure"

"Pump No.2 General Failure"

"Pump No.1 Running Status" (On; Off)

"Pump No.2 Running Status" (On; Off)

"Low Sump Level"

"High Sump Level"

"High-High Sump Level"

The first high level switch will alarm and start the lead sump pump. The lead and lag pump order shall be determined through an electric alternating relay. The second high level switch will alarm and start the lag sump pump if the liquid level continues to rise. The high-high level switch will alarm if the liquid level continues to rise with both sump pumps running. The low level switch will shut down both sump pumps.

2.7 ACCESSORIES. Each pump shall be provided with a seal water valve station as required for proper pump operation. The valve station shall include, but not be limited to, isolation valves, strainers, foot valves, pressure regulating device (optional), flow regulating device, flow indicator, pressure switch, pressure gauge or gauges, and flexible connector. Piping shall conform to the piping section. Pressure and flow setpoints shall be as recommended by the pump supplier. Water supply pressure to the seal water system may vary but shall be not less than 5 psi above pump sheet off pressure.

PART 3 – EXECUTION

3.1 INSPECTION. Examine bases and verify size of base and anchor bolt positioning. Rectify conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable for proper positioning, alignment and anchorage.

3.2 INSTALLATION. Each pumping unit shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. Installation procedures shall be as recommended by the pump manufacturer and the Hydraulic Institute Standards, and as required herein.

3.3 FIELD QUALITY CONTROL. The general requirements for system testing, check out, initial start-up, certification and instruction of plant personnel are contained in the section on Master Specification Section 01180, Equipment, Materials, Parts and Tools.

End of Section

SECTION 11700

SAMPLING PUMPS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous pumping units for pumping samples.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Each pumping unit shall be complete with a pump, constant speed electric motor, flexible coupling, coupling guard and all other appurtenances specified or otherwise required for proper operation. Each pumping unit shall be mounted on a common base.

Pumps of the close coupling type, having impellers attached directly to the motor shafts with no pump bearings or flexible couplings are not acceptable.

Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Contractor. Hydraulic considerations and definitions of terms shall be as set forth in the latest revision of the Hydraulic Institute Standards.

1.2.02 Governing Standards.

H.I.S. - Hydraulic Institute Standards

ANSI - American National Standards Institute

OSHA - Occupational Safety and Health Administration

ANSI - American National Standards Institute

ASTM - American Society for Testing and Materials

NEMA - National Electrical Manufacturing Association

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer's Field Services. Pump manufacturer shall provide services of factory-trained Service Engineer, specifically trained on type of equipment. Services include:

Align pump and motor couplings after pump bases have been grouted.

Shop and field test pumping units specified herein.

Provide a minimum of 2 man-days of on-site factory representative personnel to assist in the start-up and testing of pumping units. Man-day requirements do not include travel time and do not relieve the Contractor of his obligation to provide the required service to place all pump units in acceptable operation.

1.4 SUBMITTALS. Complete fabrication, assembly, foundation, and installation drawings, together with detailed specifications and data covering materials used, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted. The data and specifications for each unit shall include, but shall not be limited to, the following:

Pumps
Name of manufacturer

Type and model

Rotative speed at rated condition

Materials of construction

Size of suction nozzle

Size of discharge nozzle

Net weight of pump only

Net weight with baseplate and coupling

Performance curves showing capacity versus head

Type of coupling

Submit product data on motors per Master Specification Section 16220, General Purpose Induction Motors-Procurement.

The Contractor shall submit operation and maintenance manuals in accordance with the procedures and requirements set forth in Master Specification Section 01160, Training and Operations & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Shipping. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.

1.5.02 Receiving. Store and safeguard equipment, material and spare parts, in accordance with manufacturer's recommendations.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Pumps shall be as manufactured by Vaughn or approved equal.

2.2 SERVICE CONDITIONS. Each pump shall be furnished and installed in the area indicated. Each pump shall take suction from the sampling point indicated in the schedule and on the drawings and shall discharge continuous or intermittent samples to the sampling sink, sampler or other location as indicated on the drawings. Hose connections and valves will be provided in the suction and discharge piping from each pump as indicated on the drawings.

2.3 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each pumping unit shall be designed for the following operating conditions at maximum speed:

All pumps shall have 1-1/4 inch (3.2 cm) minimum size suction and discharge nozzles.

Pump performance shall be stable and free from cavitation and noise throughout the specified operating head range.

2.4 PUMP CONSTRUCTION. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the amplitude of vibration as measured at any point on the machine shall not exceed 2 mils (0.05 mm).

At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be less than 0.8 or more than 1.3.

2.5 MOTORS. Motors shall be TEFC, solid shaft type per Master Specification Section 16220, General Purpose Induction Motors.

2.6 CONTROLS. Sample pump controls and motor starters shall be as shown on the Drawings and electrical schematics and shall be installed under requirements of Division 16 specifications.

PART 3 - EXECUTION

3.1 INSTALLATION. Each pumping unit shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. Installation procedures shall be as recommended by the pump manufacturer and the Hydraulic Institute Standards, and as required herein. Grouting shall be as specified in the grout section.

Each pump base shall be grouted after initial fitting and alignment but before final bolting of connecting piping. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to proper fit.

3.2 SPARE PARTS. One mechanical seal for each pump shall be furnished. The spare parts shipment shall be properly identified on the outside of shipping boxes with purchase order number, name, and part number of parts enclosed specifically spelled out. Parts enclosed in boxes, crates, or packages shall be individually identified by name and manufacturer's part name.

End of Section

SECTION 11730

MIXERS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous mixing equipment and mixers for water and wastewater treatment processes.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Contractor.

Each unit shall be furnished and installed complete with all anchors and supports. Provide all mechanical equipment required for proper operation, including a complete drive unit and provide all additional materials or construction required by the manufacturer's design.

Power supply to the equipment will be 480 volts, 60 Hz, 3 phase, unless indicated otherwise on the drawings.

1.2.02 Governing Standards. Unless otherwise specified, the work of this Section shall conform to the applicable portions of the following Standard Specifications:

AFBMA – Anti-Friction Bearings Manufacturers Association

ANSI – American National Standards Institute

ASTM – American Society for Testing and Materials

NEMA – National Electrical Manufacturers' Association

1.3 QUALITY ASSURANCE. Mixing equipment shall be manufactured and assembled as specified herein and as indicated on the drawings. Mixing equipment shall be of same type from one manufacturer. Obtain drilling templates, space requirements and mounting instructions from mixer supplier.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly, foundation, and installation drawings, together with detailed specifications and data covering materials, power drive assemblies, and accessories forming a part of the equipment furnished, shall be submitted. Data and specifications for each unit shall include, but shall not be limited to, the following:

Number, size, and type of impellers.

Impeller shaft size, material, and number of sections.

Size, make, and type of electric motor.

Electrical control equipment.

Type, specifications, details, input and output speeds, exact gear ratios, and service factor (24 hour continuous service) of gear reducers.

Maximum horsepower requirements.

Ratio of rotative speed to critical speed of shaft.

Details of supporting base.

Submit product data on motors per Master Specification Section 16220, General Purpose Induction Motors-Procurement.

The Contractor shall submit operation and maintenance manuals in accordance with the procedures and requirements set forth in Master Specification Section 01160, Training and Operations & Maintenance Manuals.

1.4.02 Certifications. Prior to start up the manufacturer shall provide written certification that the completed installation is in accordance with standards.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Shipping. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

Deliver spare parts at same time as pertaining equipment. Deliver to OWNER after completion of work.

1.5.02 Receiving. Store and safeguard equipment, material and spare parts in accordance with the manufacturer’s recommendation for protection from weather, temperature, and moisture contamination.

1.6 WARRANTY. The mixing equipment shall be warranted against defects in workmanship and materials for a period of 1-1/2 years from the date of final acceptance.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Drive units will be mounted outdoors and shall be suitable for outdoor operation with exposure to rain, snow, and dust. Submersible mixers shall be capable of continuous submergence under water without loss of watertight integrity to a depth of 65 feet (20 m).

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. The impeller water-horsepower requirements, gear losses, and an ample allowance for buildup on the impeller for each mixer shall be included in determination of the brake horsepower requirements.

2.2.01 Dimensions. The mixers shall be designed for the requirements indicated on the drawings and for operation in tanks having dimensions indicated on the drawings.

2.3 ACCEPTABLE MANUFACTURERS. Mixing equipment shall be as manufactured by Chemineer, Mixing Equipment Company, Flygt Corporation, or Philadelphia Mixer Corporation.

2.4 MATERIALS. Fabricate mixing utilizing the following typical materials unless indicated otherwise:

Steel Plates and Shapes shall comply with ASTM A36.

Shafts shall comply with AISI Type 316 stainless steel.

Impeller Assemblies and Couplings shall comply with AISI Type 316 stainless steel.

All bolts, nuts, washers, and other fasteners that are submerged or subject to contact with the liquid shall be stainless steel. Bolting and fasteners not in contact with liquid shall be galvanized.

2.4.01 Elastomers. All mating surfaces where watertight sealing is required shall be machined and fitted with a double set of Nitrile rubber or Viton O-rings. Fitting shall be such that sealing is accomplished by metal-to-metal contact between machined surfaces. This will result in controlled compression of the O'rings without requiring a specific torque limit. No secondary sealing compounds, rectangular gaskets, elliptical O-rings, grease or other devices shall be used.

2.4.02 Bearings. All bearings shall have a minimum AFBMA L-10 rated life of 100,000 hours.

2.5 CONSTRUCTION.

2.5.01 General. All welded joints which will be fully or partially submerged shall be sealed watertight by continuous welds.

Sharp projections of cut or sheared edges of ferrous metals, other than stainless steel, which will be submerged in operation shall be ground to a radius as required to ensure satisfactory coating adherence.

All welds shall be thoroughly cleaned and ground smooth in preparation for coating. All ferrous metal surfaces, except stainless steel, shall be solvent cleaned in accordance with SSPC-SP1 before shop primer is applied.

2.5.02 Mixer Supports. Each mixer shall be designed and mounted so that it can be removed from its box as a complete unit after the impeller is removed from the shaft. Each mixer shall be assembled on a rigid and substantial base, and the base secured to the supporting structure. The opening in the mixer platform shall be large enough to permit removal of the shaft, including couplings, after removal of the impeller.

2.5.03 Impellers and Shafts. Each mixer shall be provided with a double turbine impeller of the open type without balancing rings or discs. Impellers shall be of a design, arrangement, and diameter and shall operate at a speed that will provide efficient and proper mixing as specified herein. The rotative speed shall be not more than 40 percent of the critical speed of the shaft (including impellers and appurtenances). Bottom steady bearings will not be acceptable.

The location of the impellers above the bottom of the tank shall be as recommended by the manufacturer and shall be acceptable to the Contracting Officer. Impellers shall be provided with split hubs or removable arms to permit the impellers to be removed in sections through the access hatches in the cover slab.

Vertical shafting for the impeller assembly shall be of ample size and design for the service intended and shall be supported and steadied so that the unit will operate without shaft whip or vibration.

Shafts shall be of the solid type, except that stainless steel sheathed shafts will be acceptable. Rigid type couplings shall also be fabricated from stainless steel. The gear reducer output shaft and the top half of the coupling need not be of stainless steel if a seal is provided around the shaft to prevent carbon slurry from reaching the coupling.

Shafts may be of the solid type or the torque tube type, as recommended by the manufacturer and accepted by the Engineer.

Each impeller shaft (exclusive of shafting in the gear reducer) shall be constructed preferably in one section, but in no case more than two sections, as determined by the manufacturer. If furnished in two sections, the shaft shall be connected with a suitable rigid coupling.

2.5.04 Shop Painting. All ferrous metal surfaces except stainless steel shall be given a shop coat of universal rust-inhibitive primer. The requirements for additional field coating are covered in the painting section.

2.6 MOTORS. Motors for the mixers shall be two speed, two-winding, variable torque type rated 460 volts, 60 Hz, 3 phase. Each motor shall be totally enclosed fan-cooled type. Refer to Master Specification Section 16220, General Purpose Induction Motors-Procurement.

2.7 DRIVE UNITS. Drive units shall be designed for the specific requirements of mixer service and shall be suitable for 24 hour a day operation under moderate shock conditions. Each drive unit shall consist of a foot-mounted electric motor and a gear reducer, with a flexible coupling provided between the motor and gear reducer. Drive units having a pinion mounted directly on the motor shaft will not be acceptable. Lifting lugs shall be provided on each motor and gear reducer. One set of lifting lugs shall be designed and located to permit lifting the complete mixer and drive unit. Motors shall be readily separated from gear reducers.

2.7.01 Gear Reducers. Supplementing the requirements of section on Equipment Materials, Parts and Tools, gear reducers shall be double or triple reduction type with helical or spiral bevel gearing. Worm gearing will not be acceptable. Output shaft shall be enclosed in a drywell which provides positive leakproof sealing. The mixer shaft shall be rigidly coupled to the output shaft.

All gear reducer and motor bearings shall be oil or grease lubricated, rolling element, antifriction type. Thrust bearings shall be provided to carry all shafting and impeller loads, plus an allowance of at least 25 percent of the weight of the shaft and impeller. No bearings shall be located below the bottom of the supporting platform.

Gear reducers shall be specifically designed for mixer service. The gear reducers shall be selected, designed, and rated in accordance with the appropriate AGMA standards. The gearing shall be designed with a life factor at least equivalent to 10 million cycles, and an overall service factor of 2.0, based on the sum of the continuous loads plus any transient loads other than starting loads. Bearings shall have an AFBMA L-10 Life Rating of at least 100,000 hours, except output shaft bearings, which shall have an AFBMA L-10 rating of at least 200,000 hours. The mixer manufacturer shall submit evidence of having furnished equipment similar in size, torque, and shaft overhang, which has performed successfully for a substantial period of time.

2.8 CONTROLS. Furnish controls as indicated on the drawings.

2.9 ACCESSORIES.

2.9.01 Baffles. Baffles, if required to prevent formation of vortices in the tanks, shall be furnished and installed with the mixers. Baffles shall be substantial, shall be of materials suitable for immersion and shall be acceptable to the Engineer.

PART 3 - EXECUTION

3.1 INSPECTION. Examine bases and verify size of base and anchor bolt positioning. Rectify conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable for proper positioning, alignment, and anchorage.

3.2 INSTALLATION.

3.2.01 General. Anchor bolts shall be supplied by the Equipment Manufacturer. Install equipment at locations and position as indicated on the plans with installation in strict conformance to manufacturer’s recommendations.

3.2.02 Hazardous Location Equipment. In addition to requirements listed above, for installations which are considered to be in hazardous locations as defined by the National Electrical Code (NEC), only mixers certified by Factory Mutual for use in such locations shall be used. Specifically, mixers used shall be certified for use in all Class I, Division 1 and 2, Groups C and D, and Class II, Division 1 and 2, Groups E, F, and G locations as outlined in Articles 500-502 inclusive of the NEC code.

In addition, the above mentioned certified mixers shall be installed in conjunction with mixer mounting hardware made of nonsparking materials.

3.2.03 In Basin Mixer Support. All mixers shall be supported in the basin as indicated on the Plans. The mixer mount assembly shall be provided by the mixer manufacturer for a complete system. The support structure shall be designed to withstand the thrust forces of the mixer when operating in water or out of water.

3.3 MIXER TEST. The mixer manufacturer shall perform the following inspections and tests on each mixer before shipment from the factory:

Propeller, motor rating, and electrical connections were checked for compliance to the purchase order.

All mixers are vacuum tested to establish sealing integrity. All mixers are momentarily energized to determine correct rotation and current draw.

All mixers are run to determine correct shaft rotation, thrust direction, and power consumption.

After immersion test(s), all mixers are inspected for oil seepage and/or water infiltration, insulation defect(s), and motor resistance (ohms).

Inspection and tests performed shall confirm the mixer(s) listed have met all established quality assurance standards set for similar materials. All mixers shall be warranted against defects in design, workmanship, and material (with validation being the warranty card(s) shipped with the product(s).

A written report stating the foregoing steps have been completed shall be furnished to the Engineer.

End of Section

SECTION 11740

CHEMICAL PUMPS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous chemical pumps for use in water and wastewater treatment applications.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Contractor. Hydraulic considerations and definition of terms shall be as set forth in the Hydraulic Institute Standards.

Each pumping unit shall be complete with a pump, electric motor, coupling guard, anchor bolts, and other appurtenances specified or otherwise required for proper operation, all mounted on a common baseplate. Pumps of the close-coupled type, with the impeller attached directly to the motor shaft without pump bearings or flexible couplings, will not be acceptable.

Master Specification Section 01180, Equipment, Materials, Parts and Tools shall apply to all equipment furnished under this section.

Power supply to equipment will be 480 volts, 60 Hz, 3 phase, unless indicated otherwise.

1.2.02 Governing Standards.

AFMB – Anti-Friction Bearings Manufacturers Association.

ANSI - American National Standards Institute.

ASTM - American Society for Testing and Materials.

H.I.S. - Hydraulic Institute Standards.

NEMA - National Electrical Manufacturing Association.

OSHA – Occupational Safety and Health Administration.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer's Field Services. Pump manufacturer shall provide services of factory-trained Service Engineer, specifically trained on type of equipment. Services include:

Furnish the pumps and motors, regardless of manufacturer, as a package to insure proper coordination and compatibility of equipment.

Assist during Installation in location of anchor bolts, setting, leveling, field erection, coordination of piping, electrical, and miscellaneous utility connections.

Align pump and motor coupling after pump base is grouted.

Start-up, testing, and calibration. Shop and field test pump units as specified herein.

Start-up and demonstrate each pump operation in cooperation with the variable frequency control supplier for pumping units with VFD units.

Provide operation and maintenance instruction.

Perform service inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls.

Provide 2 man-days minimum of service from factory representatives for each type of pump unit. Man-day requirements do not include travel time and do not relieve the Contractor of his obligation to provide the required service to place all pump units in acceptable operation.

1.3.02 Testing. Each pump casing shall be hydrostatically tested to 1.5 times maximum shut-off pressure by manufacturer. Each assembled pump shall be fully tested on water and have curves plotted to determine the rated capacity of each pump in accordance with the standard of HI USA.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete fabrication, assembly, foundation, and installation drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished. The data for each unit shall include, but not be limited to, the following:

Pumps

Name of manufacturer

Type and model

Rotative speed

Size of suction nozzle

Size of discharge nozzle

Net weight of pump only

Net weight with baseplate and coupling

Complete performance curves showing capacity versus head, NPSH required, pump efficiency, and bhp

Type of coupling

Data on shop painting

Submit drawings and data for motors per Master Specification Section 16220, General Purpose Induction Motors-Procurement.

Submit operation and maintenance manuals in accordance with the procedures and requirements set forth in Master Specification Section 01160, Training and Operations & Maintenance Manuals.

1.4.02 Certifications. Submit certificate from manufacturer indicating that pumps have been properly installed, tested and are ready for operation.

1.4.03 Test Reports. Submit certified test of mechanically duplicate units.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Shipping. Ship equipment, materials and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

1.5.02 Handling Materials and Equipment. All material shall be handled in a manner as to eliminate the possibility of damage, breakage, or chipping in transit or otherwise.

1.5.03 Storage of Materials and Equipment. The Contractor shall store material and equipment in accordance with the manufacturer's recommendation for protection from weather, temperature, and moisture contamination.

1.6 WARRANTY. The pump manufacturer shall warrant the units being supplied to the Owner against defects in workmanship and material for a period of 1-1/2 years from the date of acceptance by Owner.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Pumping units shall convey measured quantities of chemical solutions to water or wastewater streams as indicated on the Drawings to enable chemical treatment processes to occur.

Chemical sump pumps shall be used to pump cleanup water and chemical solutions, including ferric chloride, liquid polymer, spilled carbon slurry and other chemicals used in water and wastewater treatment processes. Applicable pumps shall be capable of pumping the stored chemicals as follows.

Chemical	Max Concentration (% by Wt)	Max Specific Gravity	Max Temperature (Degrees F(C))	Max Viscosity (Centipoise)
Carbon Slurry	-	1.12	85 (29)	-
Ferric Chloride	47	1.53	85 (29)	-
Polymer	Varies	Varies	85 (29)	4000
Sodium Bisulfite	38	1.26	85 (29)	-
Alum	48.5	1.33	85 (29)	-
Sodium Hypochlorite	20	1.10	85 (29)	-
Sulfuric Acid	93	1.84	85 (29)	-
Hydrofluosilicic Acid	24	-	85 (29)	-
Chlorine	Varies	-	85 (29)	-
Sodium Hydroxide	50	1.54	85 (29)	-

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each pumping unit shall be designed for the general operating conditions shown on drawings and below:

Minimum hydrostatic test pressure shall be 1.5 times shutoff head plus max suction pressure.

Pump performance shall be stable and free from cavitation and noise throughout the specified operating head range at design suction submergence. The design performance shall be based on a wearing ring diametrical or axial clearance of not less than 1 mil per inch (2.54 cm) of wearing ring diameter, or 12 mils total, whichever is greater.

Pumping units shall be designed so that reverse rotation due to reverse flow will not cause damage to any component.

2.3 ACCEPTABLE MANUFACTURERS. Pumping units from the following manufacturers or on approved equal will be acceptable for use:

Eco Gearchem Pump, Rochester, N.Y.

Prominent Fluid Controls, Inc., Pittsburgh, PA.

2.4 MATERIALS. Provide chemical feed pumping units manufactured with materials indicated on the Drawings or as specified herein.

2.4.01 Chemical Sump Pumps. Pump Body and all wetted parts shall be molded of chemically inert Polypropylene (CPVC) (PVC).

Shaft shall be stainless steel sheathed with Kynar on wet end.

2.4.02 Transfer Pumping Units. Transfer pumps shall be seal-less magnetic drive centrifugal type. Pumps shall have one piece solid ductile iron casing. Impellers shall be one piece closed type. Shaft shall be one-piece, replaceable, non-rotating, and constructed of silicon carbide. The shaft shall be fully supported at both ends utilizing front shaft support and rear casing support, with an axial groove for improved lubrication and particulate bypass. The rear casing shall have a minimum 800 psi burst pressure. The magnetic coupling shall be designed for zero slippage and zero losses. All wetted parts shall be constructed of materials resistant to the pumped chemicals.

Pumps shall be Ansimag “Model KF”, or “K”, or “KM” or Iwaki Walchem “Model MDF” or equal.

2.5 PUMP CONSTRUCTION.

2.5.01 Casing Assembly. The casing assembly and drive connection shall permit the removal of the rotating element without disconnecting the piping. The discharge nozzle shall have a flanged cleanout handhole. Cleanout handholes shall have interior surfaces flush with the casing water passages. Casing parts shall have registered fit to maintain alignment. The nozzle flanges shall be flat faced, with ANSI/ASME B16.1, Class 125 diameter and drilling. A pipe-tapped opening shall be provided for draining stuffing box leakage.

Pipe-tapped openings shall be provided for draining, priming, and venting the casing.

2.5.02 Impeller. Shall be molded plastic with an investment casting insert, statically balanced, and keyed on the shaft. The interior water passages shall have uniform sections and smooth surfaces and shall be free from cracks and porosity. The impeller shall be securely locked to the shaft so that it will not be loosened by reverse rotation, but shall be easily removable.

The impeller shall be semi-open nonclog type, with at least 3 ports, and shall be locked to the shaft with a self-locking or pinned nonclog type fastener.

2.5.03 Shaft and Shaft Sleeves. The shaft shall be completely machined. Deflection at the stuffing box shall not exceed 0.002 inch (.05 mm) at any head in the operating range. A suitable splash deflector shall be mounted on the shaft adjacent to the frame bearing housing.

The shaft shall be provided with a replaceable sleeve extending from the impeller through the stuffing box. The sleeve shall be positively secured to the shaft and shall be sealed to prevent leakage between the shaft and the sleeve. After assembly on the shaft, total runout shall not exceed 0.002 inch (.05 mm).

The stuffing box for each pumping unit shall contain a double mechanical seal. Each mechanical seal shall be provided with a flushing water connection.

2.5.04 Frame Assembly. The frame assembly shall rigidly support the rotating element with two bearings. The outboard bearing shall carry both axial and radial pump loads. The assembly design shall permit axial adjustment of the rotor without dismantling the pump. Bearing enclosures shall keep out contaminants and retain the lubricant and shall have adequate provisions for adding and draining lubricant.

The frame shall provide ample clearance for stuffing box maintenance.

Bearings shall be either oil or grease lubricated, antifriction type. Bearings shall have an AFBMA L-10 Life Rating of 100,000 hours at specified operating conditions. The pump shaft speed shall not exceed the limits specified by the bearing manufacturer.

2.5.05 Flexible Coupling. The pump coupling shall have a horsepower rating 1.25 times the motor nameplate horsepower when the misalignment is within the manufacturer's tolerance limit. Coupling design shall permit removal of the pump rotating element without disconnecting the piping, moving the drive unit, or axial movement of the coupling halves on the shaft.

2.5.06 Anchor Bolts. Shall be accurately located and centered in pipe sleeves having an inside diameter approximately 2-1/2 times the bolt diameter and a length approximately 8 times the bolt diameter. A square anchor plate with thickness of approximately 1/2 the bolt diameter and side dimensions 4 times the bolt diameter shall be welded to the bottom of each sleeve, with the anchor bolt extended through the plate and welded thereto.

2.5.07 Baseplates. Shall be provided with adequate openings for grouting and venting. Baseplates shall provide for tapered dowels to maintain alignment of pump and motor.

2.6 MOTORS. Each pump shall be supplied with an electric motor. Each motor shall be squirrel-cage induction type, horizontal, open-drip proof, premium efficient, and rated 460 volts, 3 phase, 60 Hz, and shall conform to Master Specification Section 16220, General Purpose Induction Motors-Procurement.

If the motor is not shop tested with the pump, certified motor efficiency data shall be furnished to the pump supplier based on tests conducted on the motor or on an identical motor.

Provide a fused power factor correction capacitor for each motor, sized to improve motor power factor to 0.95 (lagging) when operated at full load.

2.7 CONTROLS. Chemical feed and transfer pumps' controls shall be as shown on the P&IDs and electrical schematics and shall be installed under Master Specifications Division 17.

2.8 BALANCE. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational dynamic balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the unfiltered vibration displacement (peak-to-peak), as measured at any point on the machine, shall not exceed 4 mils.

At any operating speed, the ratio of rotative speed to the critical speed of a unit or its components shall be less than 0.8 or more than 1.3.

2.9 SHOP TESTING. Factory test operation of each type of pumping unit. Provide certified test reports in accordance with the latest edition of the Hydraulic Institute Standards.

2.10 ACCESSORIES. Each pump shall be provided with lifting eyebolts or lugs; plugged gauge cock connections at the suction and discharge nozzles; tapped and plugged openings for casing assembly and bearing housing vents and drains; and appropriate fittings for adding bearing lubricant and seal water. Grease lubricated pumping units shall be provided with a means of venting the casing. Oil lubricated units shall be provided with constant level oilers or with sight glasses arranged to indicate operating and static oil levels.

PART 3 - EXECUTION

3.1 INSTALLATION. Each pumping unit shall be leveled, plumbed, aligned, and wedged into position to fit connecting piping. Installation procedures shall be as recommended by the pump manufacturer and the Hydraulic Institute Standards, and as required herein. Grouting shall be as specified in the grout section.

The pump base shall be grouted after initial fitting and alignment, but before final bolting of connecting piping. Special care shall be taken to maintain alignment of pumping unit components. No stresses shall be transmitted to the pump flanges. After final alignment and bolting, pump connections shall be tested for applied piping stresses by loosening the flange bolts. If any movement or opening of the joints is observed, piping shall be adjusted to proper fit.

Shimming between machined surfaces will not be permitted.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. The general requirements for system testing, check out, initial start-up, certification and instruction of plant personnel are contained in the section on Equipment, Materials, Parts and Tools. After initial start-up, a preliminary running-in period will be provided for the Contractor to make field tests and necessary adjustments. Under the supervision of a qualified representative of the pump manufacturer. The Contractor will then operate the pumps for a period of 30 consecutive calendar days.

At the end of the specified period of operation, the pumping unit will be accepted if, in the opinion of the Engineer, it has operated satisfactorily, without excessive power use, wear, or need for lubrication, or requiring undue attention; and if all its rotating parts operate without excessive vibration or noise at any operating head, including shutoff.

3.3 SPARE PARTS. The following spare parts shall be furnished:

1 set of pump bearings.

1 set of wearing rings or wear plate.

1 set of 0-rings.

1 set of seals.

1 Impeller per pump.

Spare parts shall be suitably packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools with labels indicating the contents of each package. Spare parts shall be delivered to the Owner as directed.

End of Section

SECTION 11745

CHEMICAL FEED SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers liquid chemical feed systems, equipment, and accessories for water and wastewater treatment processes. Principal items to be furnished and installed include the following:

1.1.01 Coagulant (Alum) Feed System.

Day tanks
Metering pumps
Calibration columns

1.1.02 Fluoride (Hydrofluosilicic Acid) Feed System.

Transfer pumps
Day tanks
Metering pumps
Diffusers
Calibration columns

1.1.03 Activated Carbon Feed System.

Dust removal unit
Day Tanks
Metering pumps
Diffusers
Calibration column

1.1.04 Coagulant Aid (Polymer) Feed System.

Recirculation/mixing pumps
Polymer blenders (including transfer pumps)
Aging tanks
Polymer system control panel
Metering pumps
Calibration columns
Secondary dilution water panel
Static mixers
Diffusers

1.1.05 Sulfuric Acid Feed System.

Transfer pumps
Day Tanks
Metering pumps
Calibration columns

1.1.06 Caustic Soda Feed System.

Day tanks
Metering pumps
Calibration column

1.1.07 Sodium Bisulfite Feed System.

Day Tanks
Metering pumps
Calibration column
Diffusers
Rotameters

1.1.08 Filter Aid (Polymer) Feed System.

Polymer makedown units
Transfer/recycle pumps
Day tanks
Booster pumps
Calibration column
Diffusers

1.1.09 Phosphoric Acid (Corrosion Inhibitor) Feed System.

Day tanks
Metering pumps
Calibration column
Diffusers

1.1.10 Chlorine Feed System.

Container scales for chlorine ton containers.

Ton container hook-up assemblies.
Automatic switchover systems.
Evaporators.
Vacuum regulators.

Chlorine feeders.
Chlorine solution injectors
Diffusers.

1.1.11 Sodium Hypochlorite Feed System.

Metering Pumps.

The following items of work and equipment are covered under other sections:

Bulk chemical storage tanks.
Carbon Slurry mixers and transfer pumps.
Hoist and monorail for chlorine ton containers.
Piping and valves between items of equipment.
Instrumentation.
Water supply and electric power supply to the equipment.
Drain and vent piping

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer.

1.2.01 General Equipment Stipulations. Each item shall be furnished and installed complete with all mechanical and electrical equipment required for proper operation. Furnish all components indicated on the drawings or specified, and all additional materials or construction required by the design of the system.

Master Specification Section 1018, Equipment, Materials, Parts and Tools shall apply to all equipment furnished under this section.

All electrical equipment shall conform to applicable standards of Master Specifications Division 16, Electrical.

Unless otherwise specified, the power supply will be 120 volts, 60 Hz, single phase. Where control voltage lower than the power supply voltage is required, a suitable control power transformer shall be furnished.

Metal thickness and gages specified herein are the minimum required. Gages refer to US Standard gage.

A nameplate shall be provided and mounted on or adjacent to each chemical feeder to identify its function. Nameplates shall be approximately 1 by 3 inches (2.54 and 6.62 cm), made from stainless steel material. Letters shall be engraved. Feeder designations on the nameplates shall correspond to those indicated on the drawings.

Similar components of different chemical feed systems shall be from the same manufacturer to facilitate maintenance and stocking of repair parts. Whenever possible, identical units shall be furnished.

1.2.02 Governing Standards.

H.I.S. – Hydraulic Institute Standards

ANSI – American National Standards Institute

OSHA – Occupational Safety and Health Administration

ASTM – American Society for Testing and Materials

NEMA – National Electrical Manufacturing Association

1.3 QUALITY ASSURANCE. Provide 2 man-days minimum of service from factory representatives for each type of Chemical Feed System, on two separate visits Man-day requirements do not include travel time and do not relieve the Contractor of his obligation to provide the required service to place all units in acceptable operation.

Provide services of factory-trained Service Engineer, specifically trained on type of equipment. Services to include:

Assist during installation with location of anchor bolts, setting, leveling, field erection, coordination of piping, electrical, and miscellaneous utility connections.

Perform start-up, testing, and calibration.

Conduct service inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete fabrication, assembly, and installation drawings, isometric piping schematics, and wiring diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be.

1.4.02 Certifications. The Supplier shall submit proof of the following qualifications:

The supplier has the required financial capability.

The names of manufacturers whose products will be supplied.

The supplier maintains a qualified technical staff and design office.

The supplier has the physical plant and fabricating personnel to complete the work specified.

The suppliers have and will maintain competent service personnel to service the equipment furnished.

The supplier has successfully provided similar work for at least 5 years.

The names of at least three references that are users of similar systems designed, assembled, and furnished by the supplier.

1.4.03 Test Reports. The supplier shall prepare a calibration graph from field tests for each chemical feed unit which does not have a rate set device reading in pounds per hour for dry feeders or in gallons per hour for liquid feeders. The graph shall show the rate setter graduation conversion to pounds per hour or gallons per hour throughout the range of the feed unit. Each graph shall be furnished on hard paper and sealed in clear plastic.

The Supplier shall submit operation and maintenance manuals in accordance with the procedures and requirements set forth in Master Specification Section 01160, Training and Operations & Maintenance Manuals.

Refer to Master Specifications Section 01080, Project Submittals for additional requirements.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Shipping. Ship equipment, materials, and spare parts complete, except where partial disassembly is required by transportation regulations or for protection of components.

Pumps and accessories shall be prepared for shipment after testing. Preservative shall be applied to machined surfaces and journals to prevent corrosion during transit.

Pack spare parts in containers for long-term storage bearing labels clearly designating contents and pieces of equipment for which intended.

Deliver spare parts at same time as pertaining materials in the containers for long-term storage. The Contractor shall furnish and deliver to the Engineer 1 complete set of special tools and wrenches required.

1.5.02 Receiving and Storage. Inspect and inventory items upon delivery to site. Store all equipment as directed by the Engineer.

1.6 SYSTEM SUPPLIER. Each chemical feed system shall be designed, coordinated, and supplied by a qualified system supplier who is regularly engaged in the business of designing and assembling liquid chemical feed systems for water and wastewater projects.

The suppliers shall prepare system installation drawings, isometric piping schematics, interconnecting diagrams, panel layouts, and other data required for complete system description. The supplier shall verify that each system component is compatible with all other components of the system, that all pipe materials and sizes are appropriate, and that all devices necessary for a properly functioning system have been provided.

Review of drawings submitted prior to the final determination and coordination of related equipment to be provided will not relieve the Supplier from responsibility for supplying systems in full compliance with the specific requirements of the related equipment.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Chemical feed equipment shall be of substantial construction with all parts designed for long life under working conditions including corrosive atmospheres and intermittent or continuous operation. All wearing parts and items requiring adjustment shall be readily accessible. Each unit shall be completely enclosed and dust tight when in operation. All parts which are exposed to corrosive conditions shall be made from corrosion-resistant materials or covered with suitable protective coatings. All electrical enclosures shall be NEMA 4X fiberglass reinforced plastic.

Chemical piping connections with valves, pumps, and other equipment shall be flanged. No threaded connections are allowed.

Each chemical feed system, except for the day tanks, shall be completely assembled, mounted and delivered to the site on a single skid. Components to be mounted on each skid shall include, but not be limited to the metering pumps, instrumentation, calibration column, all piping, valves, and piping accessories from the isolation valve immediately upstream of the calibration column up to and including the back pressure valve. The chemical feed system supplier shall be responsible for providing all equipment, valves and piping within the skid.

2.2 ELECTRICAL. All Electrical requirements shall conform to Master Specification Section 16220, General Purpose Induction Motors-Procurement which includes but is not limited to equipment, controls and motors. All motors shall be suitable for corrosive duty service.

Each metering pump shall be equipped with a dc motor for operation from a rectified 60 Hz, single phase power supply.

2.3 COAGULANT (ALUM) FEED SYSTEM. One assembly of feeding equipment shall be furnished and installed, as indicated on the drawings, to dispense one of four coagulant chemicalsMaterials of construction of all components in contact with the coagulant shall be suitable for all four potential coagulants. The chemical shall be one of the following:

48.5 percent alum with a specific gravity of 1.33

47 percent ferric chloride with a specific gravity of 1.53

43 percent ferric sulfate with a specific gravity of 1.56

51 percent polyaluminum chloride with a specific gravity of 1.34

2.3.01 Day Tanks. Each day tank shall have a useful capacity needed for operation not to be less than 24 hours of operation. All parts of the tank shall be fabricated of translucent fiberglass reinforced vinyl ester plastic material of sufficient weight for adequate support and protection. The tank shall be flat bottom, flanged top type, conforming to dimensions indicated on the drawings, as manufactured by Raven Industries, Inc. The tank shall include bonded flanged fittings for inlet, overflow, and gauge glass. Hold down lugs shall be provided to anchor the tank to the base.

A gasketed cover shall be provided with a Type 316 stainless steel or chemical-resistant plastic piano type hinged access door for inspection and cleaning of the tank and with flanged connections described above.

A chemical-resistant valve and gauge glass assembly shall be mounted on the side of the tank. Steel protection rods shall be provided the full length of the gauge. Valve assemblies shall be Type 316 stainless steel with integral ball checks to prevent flow in the event of gauge glass failure.

The supplier shall coordinate with the Contractor to incorporate instrument flanged connections on the day tanks for level measuring instruments. Level measuring instruments will be supplied by others.

2.3.02 Metering Pumps. Metering pumps shall be furnished and installed as indicated on the drawings to dispense any of the four coagulants to the point of application.

Each pump shall include continuous local manual/remote manual and remote auto controlled metering of solution under the following conditions and requirements. Refer to Master Specification Division 17, Instrumentation and Controls for additional information.

Motor horsepower for each pump shall be based on the above requirements and on the discharge back pressure required by the pump furnished. Motor shall be not less than the indicated horsepower.

Each pump shall be of the positive displacement type, using a hydraulic plunger actuated diaphragm. The diaphragm shall have an integrally molded O-ring for installation in the pump housing. Diaphragms relying solely on friction and compression of the diaphragm material for installation and leak prevention will not be acceptable.

Metering pumps shall have an internal drive shaft connected to a motor with support bearings on both ends within the gear case. Each pump shall have one adjustable head.

Inlet and outlet check valves shall be of the single valve type, with valve housing which is removable without disassembly of threaded pipe fittings.

Materials of construction shall be selected for resistance to the pumped solutions.

Each pump shall be mounted on a structural steel or cast iron base to be set on the equipment skid as indicated on the drawings and shall include a self-lubricating speed reducer and liquid end splash guards.

Each pump shall be furnished with the following accessories:

One back pressure valve, factory adjusted for the back pressure recommended for the pump.

One internal pressure relief valve sized to pass the maximum displacement of the pump. The pressure setting shall be as recommended by the pump manufacture.

One vent valve.

One properly sized diaphragm type surge chamber in each pump discharge piping arrangement. Each chamber shall be fabricated of materials resistant to the pumped solutions, and shall include an air charging valve and air gauge. The chamber shall be sized to limit pressure surges to between 5 and 10 percent of mean pressure.

One strainer installed in the inlet piping. The strainer shall be PVC bodied Y-pattern, with 8 mesh screen and O-ring seals.

All wiring shall be furnished complete and ready for connection to an external power circuit.

The metering pumps shall be Wallace and Tiernan “Chemtube 2000”, Milton Roy "Milroyal B" or Pulsafeeder "Series 7440".

2.3.03 Calibration Columns. Transparent plastic calibrating columns shall be furnished and installed on the pump suction piping as indicated on the drawings.

The columns shall be 6 inch (15.24 cm) ID clear PVC or other resistant, rigid, transparent plastic tubing complete with vented top cap and 1 inch (2.54 cm) screwed flow fitting. The column shall be graduated in 0.1 gallon (.378 L) increments over a range of 0 to 1.8 gallons (0 to 6.813 L), complete with a numeral at each graduation. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs.

2.4 FLUORIDE (HYDROFLUOSILICIC ACID) FEED SYSTEM. One assembly of feeding equipment shall be furnished and installed, as indicated on the drawings, to dispense 24 percent hydrofluosilicic acid solution to the points of application.

2.4.01 Transfer Pumps. Transfer pumps shall be furnished and installed as indicated on the drawings. Each pump shall be designed for pumping hydrofluosilicic acid from storage tanks to day tanks.

Each pumping unit shall be of the positive displacement peristaltic type utilizing a flexible hose and shoe. Pumps shall be Alfa Laval “Model IP800” or Watson Marlow/Bredel “Model SP/65”, and shall be designed for the following conditions.

Each pump shall consist of a sealed lubricant filled housing, pump hose, rotor assembly, and one-piece connectors. The process fluid shall only be in contact with the inside of the pump hose.

The pump hose shall be a three-layer reinforced hose consisting of a natural rubber outer layer, nylon braided reinforcing layer and an inner wetted layer of natural rubber. The hose shall be of 53-68 durometer with a static burst pressure of 600 psi (4,136 kPa). The hose shall be in contact with the inside diameter of the track through an angle of 180 degrees and be held in place on the suction and discharge sides by a one piece cast neoprene seal gland. Hose type clamp fittings are not acceptable. The hose shall be replaceable without removing the pump or opening the pumphead door. Inlet/outlet connectors shall be one solid piece and shall be located by and secured to the pump housing by permanent 316 stainless steel studs and hex nuts.

The rotor assembly shall be equipped with two polished aluminum sliding shoes. Shoes shall be located 180 degrees apart for compression of the hose against the track twice per rotor revolution. Each rotor assembly shall be keyed to the output shaft of the gear reducer/gearmotor and be axially secured to that shaft by a heavy-duty washer and socket head cap screw. Each rotor assembly shall have ribbed spokes, which will create constant circulation of lubricant upon rotation to enhance lubrication and cooling within the pump housing.

Each pump shall be supplied with an integral squirrel cage induction type gear motor rated 460 volts ac, 3 phase, 60 Hz. The motor shall have a fan sized for adequate cooling of the drive at the lowest operating speed. Gearing shall be of the helical gear arrangement, classified for continuous heavy shock, AGMA Class II, 24-hour duty. Minimum gear reducer efficiency shall be 95 percent. The motor shall be contained in a cast iron housing suitable for corrosive duty. Refer to Master Specification Section 16220, General Purpose Induction Motors for complete details.

Each pump shall be completely self-priming with a suction lift capability of up to 20 feet (6 m). The pump shall be capable of running dry without damaging effects to the pump or hose. The pump shall be valveless and without diaphragms and not utilize any dynamic seals.

The pump housing shall contain a threaded drain plug and vent port. The drain shall be located at the lowest point in the housing and allow for complete removal of all liquid from within the housing.

Three complete sets of spare parts, as recommended by pump manufacturer, shall be provided.

Each pair of transfer pumps shall be furnished with a control panel incorporating magnetic-only adjustable circuit breaker type disconnects and NEMA rated motor starters (per Master Specification Section 16480, 600 Volt Class Motor Control Centers and Division 16, Electrical) with thermal overload protection. The local control panel shall be wired to shut down the pump and alarm on pump high discharge pressure and can be restarted only if the alarm is reset at the local control panel. The pump will also be wired to stop and alarm on high “Day Tank Level” and Low “Bulk Tank Level”. These alarms will reset when the condition does not exist.

The local control panel shall include as a minimum the following:

Power ON/OFF selector switch.

L/O/R selector switch.

Start and Stop push buttons.

“Running”, “Off”, “ Day tank high level Alarm”, “ Bulk tank low level Alarm”, “ High discharge pressure Alarm”, and “Power on” lights.

RESET push button.

Normally closed contacts pre-wired to terminals for external connection by others corresponding to:

“Pump Failure”

“Pump Running”

“L/O/R” switch position

Discharge pressure high shall be able to accept:

Digital inputs to Start and Stop the Pump

Digital inputs from Day Tank high level switch, Pump discharge pressure switch, and Bulk Tank low level switch.

All pilot devices shall be transformer type, 30 mm, oil tight type. Relays shall be 3PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings.

2.4.02 Day Tanks. Each day tank shall have a useful capacity for not less than 24 hours for the process intended and shall be provided with a scale graduated in gallons. All parts of the tank shall be fabricated of translucent polyethylene plastic material of sufficient weight for adequate support and protection. Each tank shall be flat bottom, dome top type, as manufactured by Raven Industries, Inc. or equal. Each tank shall include flanged fittings for inlet, overflow, pump suction, and gauge glass. Hold-down lugs shall be provided to anchor the tank to the base.
A gasketed cover shall be provided with an 18 inch (45.7 cm) diameter bolted and gasketed access hatch for inspection and cleaning of the tank

The supplier shall coordinate with the Contractor to incorporate instrument flanged connections on the day tanks for level measuring instruments. Level measuring instruments will be supplied by others.

2.4.03 Metering Pumps. Metering pumps shall be furnished and installed as indicated on the drawings to dispense hydrofluosilicic acid or other solution to the points of application. The materials used shall be able to handle the various solutions to be used in the processes.

Each pump shall include continuous remote electric and local manual mechanically controlled metering of solution under the following conditions and requirements.

Motor horsepower for each pump shall be based on the above requirements and on the discharge back pressure required by the pump furnished.

Each pump shall be of the positive displacement type, using a hydraulic plunger actuated diaphragm. The diaphragm shall have an integrally molded O-ring for installation in the pump housing. Diaphragms relying solely on friction and compression of the diaphragm material for installation and leak prevention will not be acceptable.

Metering pumps shall have an internal drive shaft connected to a motor with support bearings on both ends within the gear case. Each pump shall have one adjustable heads.

Inlet and outlet check valves shall be of the single valve type, with valve housing which are removable without disassembly of threaded pipe fittings.

Materials of construction shall be selected for resistance to the pumped solution.

Refer to the sections on Pump Controls and Instrumentation for more details.

Each pump shall be mounted on a structural steel or cast iron base to be set on the equipment skid as shown on the Drawings and shall include a self-lubricating speed reducer and liquid end splash guards.

Each pump shall be furnished with the following accessories:

One back pressure valve, factory adjusted for the back pressure recommended for the pump.

One internal pressure relief valve sized to pass the maximum displacement of the pump. The pressure setting shall be as recommended by the pump manufacture.

One vent valve.

One properly sized diaphragm type surge chamber in each pump discharge piping arrangement. Each chamber shall be fabricated of materials resistant to the pumped solution, and shall include an air charging valve and air gauge. The chamber shall be sized to limit pressure surges to between 5 and 10 percent of mean pressure.

One strainer installed in the inlet piping. The strainer shall be PVC bodied Y-pattern, with #8 mesh screen and O-ring seals.

All wiring shall be furnished complete and ready for connection of an external power circuit per Master Specification Division 16, Electrical.

The metering pumps shall be Wallace and Tiernan “Chemtube 200” or “2000”, Milton Roy "Milroyal B", or Pulsafeeder "Series Pulsar 25HJ and 7440" or equal.

2.4.04 Diffusers. Two channel type diffusers, one corporation cock type diffuser and one special type as detailed on the drawings, shall be provided. The diffuser tube shall be fabricated of PVC.

2.4.05 Calibration Columns. Transparent plastic calibrating columns shall be furnished and installed on the pump suction piping. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs.

2.5 ACTIVATED CARBON FEED SYSTEM. One assembly of preparation and feeding equipment shall be furnished and installed to prepare and dispense carbon slurry.

2.5.01 Dust Removal Unit. Ejector-venturi gas scrubbers and dust removal units with separator, shall be furnished and installed on the carbon slurry storage tanks. The scrubber shall be used to remove powdered activated carbon dust from the air exhausted from the tanks during the pneumatic unloading of carbon into the tanks. The scrubber shall be designed for intermittent operation. The scrubber and separator shall be constructed from fiberglass-reinforced plastic. Water from the separator shall drain into the carbon storage tank. The clean air outlet from the separator shall be covered with a stainless steel insect screen and shall discharge to the atmosphere. The scrubber/separator shall be provided by Ametek “Type 7014 Scrubber-Separator System or equal.

2.5.02 Metering Pumps. Metering pumps furnished shall be sizedto pump water slurry solution to points of application as required. Each pumping unit shall be of the positive displacement peristaltic type utilizing a flexible hose and shoe. Pumps shall be Alfa Laval “Model IP600” or Watson Marlow/Bredel “Model SP/50”, or equal.

Each pump shall be supplied with an integral squirrel cage induction type gear motor rated 460 volts ac, 3 phase, 60 HZ per Section 16220 of Electrical Division 16. The motor shall have a fan sized for adequate cooling of the drive at the lowest operating speed. Gearing shall be of the helical gear arrangement, classified for continuous heavy shock duty, AGMA Class II, 24-hour duty. Minimum gear reducer efficiency shall be 95 percent. The motor shall be contained in a cast iron housing suitable for corrosive duty.

Each motor shall be specifically selected for service with an adjustable frequency type speed controller and shall compensate for harmonic heating effects and reduced self-cooling capability at low speed operation. This is to ensure the motor does not exceed Class B temperature rise when operating in the installed condition at load. All motors shall be supplied with full phase insulation on the end turns and shall meet the requirements of NEMA MG1, Part 31.

Each motor shall be furnished with an adjustable frequency drive conforming to the requirements of Master Specification Section 16150, Variable Frequency Drives . Each adjustable frequency drive shall be capable of varying the speed of the pump to deliver the metering range as specified. The drive shall be powered from a 480 volt, 3 phase, 60 Hz power supply. The drive shall be provided in the local panel supplied by the vendor. The drives shall be provided by the pump manufacturer to ensure a coordinated system.

Two complete sets of spare parts as recommended by pump manufacturer shall be provided.

Each pump shall be provided with a local panel with the following minimum components/output and control:

Shall be able to accept a remote 4- 20mA signal to control the rate of feed by varying the speed of the pump.

Shall be able to provide a 4-20mA signal for remote indication.

Shall be able to accept 2 remote digital inputs to start and stop the pump.

Shall provide contact for remote signaling of “Remote” status.

“Running” and “Fail” status.

Shall provide volt free contacts for pump discharge pressure high and discharge low flow.

Shall have “Local/Off/Remote” selector switch.

Shall have power “On/Off” selector switch.

Shall have local indicating lights for “Running”, “Off” and “Power on” status.

Shall have local speed adjustment.

Shall have Alarm lights for High Discharge Pressure and Low Discharge Flow.

Shall have push buttons for Start, Stop and Reset.

All pilot devices shall be transformer type, 1- 1/6 inch (30 mm), and oil tight type. Relays shall be 3PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings.

Each pump shall be Hardwire interlocked, such that the pump will stop:

On High Discharge Pressure

Low Discharge Flow

Low Bulk Tank Level

In local mode the pump shall be started and stopped from the LCP and speed can be adjusted locally, with no control possible from a remote control system. In remote mode, all control is transferred to a remote control system.

2.5.03 <u>Diffusers</u>. Two channel type diffusers shall be provided. The diffuser tubes shall be fabricated from stainless steel.

2.5.04 <u>Calibration Columns</u>. One transparent plastic calibrating column shall be furnished and installed on the pump suction piping.

The column shall be 12 inch (30.5 cm) ID clear PVC or other resistant, rigid, transparent plastic tubing complete with vented top cap and 1 inch (2.54 cm) screwed flow fitting. The column shall be graduated in 0.25 gallon (1 L) increments over a range of 0 to 18 gallons (0 to 68 L), complete with a numeral at each graduation. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs. The column shall have a water connection.

2.6 COAGULANT AID (POLYMER) FEED SYSTEM. One complete polymer feed system consisting of solution preparation equipment and feed equipment shall be furnished and installed as indicated on the drawings. The entire polymer feed system shall be furnished and integrated by Stranco, Inc. or Fluid Dynamics or equal. The system shall prepare polymer solution from liquid emulsion polymer delivered in bulk. The system shall transfer, wet, mix, and age the polymer for feeding to the polymer diffuser. The system shall automatically prepare aged polymer solution of a selected strength in aging tanks to provide a continuous supply of polymer solution to the polymer metering pumps. The system shall also be capable of complete manual batching operation. The polymer feed batching operation shall be operated and controlled as desired from a polymer feed system control panel.

2.6.01 Recirculation/Mixing Pumps. Recirculation/mixing pumps shall be furnished to recirculate neat polymer.

The pumps shall operate under the following conditions and requirements:
The pump shall be of the progressing cavity type, constructed of materials selected for resistance to the pumped solution, at least Type 316 stainless steel and EPDM synthetic rubber. The pump shall be heavy-duty, universal pin joint type. The pump and drive shall be mounted on a structural steel baseplate complete with a drip rim, a drainage connection, and suitable guards.

The pump shall have a stable head-capacity curve and be free from cavitation and objectionable noise. Pumping heads and other terms shall be as defined in the Hydraulic Institute Standards.

The pump shall be provided with a high discharge pressure switch and a pressure switch isolator, to stop the pump on excessive discharge pressure.

Suction and discharge nozzles shall have ANSI Class 125 pound flanges and shall be tapped and plugged for a pressure gauge connection. The pump stuffing box shall be tapped at the lantern ring position for an outside water seal connection. The pump shall be furnished with Durametallic “Type RO” mechanical seals, and shall be arranged for side suction and end discharge.

The pump shall be Netzsch, Nemo Pump Division, Robbins & Myers, Moyno, Seepex “Group N”, or equal.

The local control panel shall include as a minimum the following:

Power ON/OFF selector switch

L/O/R selector switch

Start and Stop push buttons

“Running”, “Off”, “Discharge Pressure High Alarm”, “Seal Water Pressure Low”, Low Discharge Flow, and “Power On” lights

RESET push button

Normally closed contacts pre-wired to terminals for external connection by others corresponding to:

“Pump Failure”

“Pump Running”

“L/O/R” switch position

Discharge Pressure High

Seal Water Pressure Low

Low Discharge Flow

Shall be able to accept:

Digital inputs to Start and Stop the Pump

Digital inputs from, Pump discharge pressure switch, Seal water pressure switch, Low discharge flow switch and Bulk Tank low level switch.

2.6.02 Polymer Blenders. Polymer blending units shall be provided for wetting and blending liquid polymers with the tempered service water supply. The blenders shall receive and blend liquid polymers with water and completely wet the liquid polymer particles. The polymer mixing device shall impart the necessary initial mixing energy for efficient polymer activation to prevent the formation of fisheyes, stringers, and excessive mixing times and excessive polymer use.

Water control components and piping shall include pressure switches, automatic valves, flowmeters, and flow control valves to provide control of water flowrates as required through the blender for wetting of the polymer and transfer of solution to the aging tanks. The pressure switches and controls shall not allow the system to operate with inadequate water supply pressure.

A strainer, pressure gauges, pressure regulating valve, isolation valves, and temperature gauge shall be provided on the primary dilution water supply to the blender in addition to those furnished with the blender package.

Water in excess of that required by the blender may bypass the blender for filling the aging tanks. Appropriate piping, valves, and controls shall be furnished as required for a complete system.

Each unit shall have a neat polymer transfer pump. The pumps shall be positive displacement, progressing cavity type, having materials of construction selected for resistance to the pumped solution, at least Type 316 stainless steel and synthetic rubber. Each pump shall be a heavy-duty universal pin joint type.

A totally enclosed motor directly connected to a gear reducer shall drive each pump per Master Specification Section 16220, General Purpose Induction Motors-Procurement. Maximum motor speed shall not exceed 1,800 rpm.

Each transfer pump shall be furnished with a control panel incorporating magnetic only adjustable circuit breaker type disconnect and NEMA rated motor starters with thermal overload protection. All pilot devices shall be transformer type, 1-1/6 inch (30 mm), and oil tight type. Relays shall be 3PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings. The local control panel shall be pre-wired that the pump will shut down and alarm on pump high discharge pressure, low discharge flow, low seal water pressure and can be re-started only if the alarm is reset at the local panel. The pump will also be wired to stop and alarm on high “Aging Tank Level” and Low “Bulk Tank Level”. These alarms will reset when the condition does not exist. All electrical shall be in compliance with Master Specification Division 16, Electrical.

The local control panel shall include as a minimum the same features as that for the recirculation/mixing pumps and shall be able to accept:

> Digital inputs to Start and Stop the Pump.
>
> Digital inputs from Pump discharge pressure switch, Seal water pressure switch, Low discharge flow switch, Aging Tank low level, Aging Tank high level, and Bulk Tank low level switch.

2.6.03 Aging Tanks. Each aging tank shall have a useful capacity as required for the process. All parts of each tank shall be fabricated from translucent fiberglass reinforced vinyl ester plastic or Type 304 stainless steel material of sufficient weight for adequate support and protection. Each tank shall be of the flat bottom, open flanged top type of cylindrical or square configuration. Each tank shall include flanged fittings for inlet, side bottom outlet, gauge glass, and overflow. Bonded flanged fittings shall be provided with FRP tanks. Hold-down lugs and anchor bolts shall be provided to anchor each tank to the base.

The supplier shall coordinate with the Contractor to incorporate instrument flanged connections on the aging tanks for level measuring instruments. Level instrument will be supplied by others. Operation and control of the system is covered in the Polymer System Controls paragraph. Each tank shall have a cover equipped with a split access door with piano-type hinges for inspection and cleaning of the tank, and openings for electrodes and connection of piping. The hinge shall be fabricated of Type 316 stainless steel or chemical-resistant plastic. The door shall be so oriented that the opening is accessible from the platform.

A chemical-resistant valve and gauge glass assembly shall be mounted on each tank. The gauge glass shall be fabricated of 1 inch (2.54 cm) thick clear Schedule 40 PVC, and shall be graduated over a 0 to 3,000 gallon range in 50 gallon increments, with a numeral at each 100 gallon graduation. Valve assemblies shall be Type 316 stainless steel with integral ball checks to prevent flow in the event of gauge glass failure.

2.6.04 Polymer System Control Panel. The electric primary dilution water supply valve, polymer blender drive, polymer transfer pump, electric transfer valves, and accessories previously specified shall be controlled from the system control panel and shall operate as an automatic polymer solution preparation system. Controls shall also be furnished for complete manual preparation of polymer solution. The system shall be installed and wired complete, ready for connection of a 480 volt, 3 phase power supply and plant control system outputs. System wiring shall be in conduit. Cable and conduit shall meet the requirements specified in the electrical section. The polymer system controls and control panel shall be furnished by the polymer system manufacturer.

The control panel shall be the polymer system manufacturer's standard oil and dust tight enclosure for polymer control service. Terminal blocks shall be provided for connection of all external wiring to the panels. This shall include power supply complete with circuit breaker type disconnect and remote equipment controls as required by the equipment furnished.

All instrument and component device wiring shall be furnished as described below. All wiring shall be grouped or cabled and firmly attached to the panel. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings.

All instruments and devices shall be separately fused as required to protect the equipment. All devices within the panels shall be permanently identified. The device and terminal designations shall agree with those indicated on the equipment drawings.

Push-button control and selector switches to be mounted on the front of the control panel shall be full size 30 mm, oil tight, heavy-duty type with the control function engraved on the lens cap.

Each switch shall have a nameplate indicating the controlled unit. Indicating lights shall be full size 30 mm heavy duty, push-to-test transformer type. Lenses shall be amber for alarm indication, red for run indication, and green for off indication.

Auxiliary relays and timers shall have 120 volt, 60 Hz continuous duty coils and 10 ampere, 3PDT, 120 volt ac contacts.

The polymer control panel shall transmit the following alarm signals to a control and status system in addition to the signals stated for the transfer pumps. Digital interface signals shall be 120 volt ac dry contacts rated for at least 5 amperes.

Polymer System Master Alarm.

Water Supply Low Pressure Alarm.

Low Level Cutoff on the selected aging tank for metering pump cutoff.

Major components to be installed on the front of the control panel shall include, but not be limited to, the following items:

System " Local, Off, Remote" selector switch.

Polymer System Master Alarm Light (motor, equipment, and valve failures not alarmed separately).

Blender Mixer rpm (if applicable).

System timers

System Elapsed Time Meter.

Elapsed Time Meter for each tank that displays the amount of time a new batch of polymer has aged. The timer shall reset when the high switch in the tank being filled is energized.

Run, Off, and Alarm Lights for transfer pump, blender drive, (if applicable) and water control valves and transfer valves.

High/Alternate/Low Aging Tank level Alarm Lights (3 lights).

Low Water Supply Pressure Alarm Light.

Major components to be installed inside the control panels shall include the following items:

Control relays.

Magnetic starters.

Circuit breakers.

Auxiliary power transformers to transform 480 volt, 3 phase to 240 volt, single-phase, three-wire, with the midpoint grounded to serve all pump controller circuits and 120 volt control circuits.

Main 480 volt, 3 phase power service circuit breaker disconnect.

2.6.05 Metering Pumps. Metering pumps shall be furnished and installed as indicated on the drawings to dispense prepared polymer solution.

Each pump shall include local and remote electrically controlled metering of solution under the following conditions and requirements:

Each pump shall be of the progressing cavity type, having materials of construction selected for resistance to the pumped solution, at least Type 316 stainless steel and EPDM synthetic rubber. Each pump shall be a heavy-duty universal pin joint type. The pump and drive shall be mounted on a structural steel baseplate complete with a drip rim, drainage connection, and suitable guards.

Each pump shall have a stable head-capacity curve and be free from cavitation and objectionable noise. Pumping heads and other terms shall be as defined in the standards of the Hydraulic Institute.

Suction and discharge nozzles shall have ANSI 125 pound flanges and shall be tapped and plugged for a pressure gauge connection. Each pump stuffing box shall be tapped at the lantern ring position for an outside water seal connection. The pumps shall be furnished with Durametallic "Type RO" mechanical seals. Each pump shall be arranged for side suction and end discharge. Each pump shall be provided with a high discharge pressure switch.

Each metering pump shall be equipped with a dc motor of minimum rating 180 volt dc, suitable for operation from a rectified 208 volt, 60 Hz, single phase power supply.

Each pump shall be equipped with a control enclosure housing an electronic SCR drive and the auxiliary control devices specified herein. The control enclosure shall be NEMA Type 4X. Refer the sections on Pump Controls and Instrumentation.

The control enclosure shall be mounted adjacent to the pump. The supplier shall furnish power and control cable between the control enclosure and the pump motor for installation by the Contractor.

The metering pumps shall be Netzsch, Nemo Pump Division; Robbins & Myers, Moyno, Seepex “Group N” or equal.

2.6.06 Calibrating Columns. Transparent plastic calibrating columns shall be furnished and installed on the pump suction pipes. Each column shall be constructed of clear PVC or other chemical resistant, rigid, transparent plastic tubing, complete with vented top cap. Each column shall be graduated, with numerals at each graduation. Each column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on stainless steel legs.

2.6.07 Secondary Dilution Water Panel. One secondary dilution water panel shall be provided in accordance with the P&ID and as specified. The panel shall be rigidly supported or may be skid-mounted with the polymer metering pumps. The panel shall be fiberglass reinforced plastic, suitably reinforced.

All facilities shall be rigidly mounted on the panel, including piping and valves necessary for control of water, water flow meters, and other necessary appurtenances, all as indicated and required. Piping and valves shall conform to the applicable specification sections. Flow meters shall be medium vane style with digital rate indication and output of remote indicator. Each flow meter shall be provided with a nameplate indicating the point of application.

2.6.08 Static Mixers. Three in-line type static mixers shall be furnished and installed to provide intimate mixing of prepared polymer solution and secondary dilution water. The mixers shall be single element "Series 50 Mixers" as manufactured by TAH Industries, Inc., complete with removable plastic elements.

2.6.09 Diffusers. Channel type diffusers shall be provided as indicated on the drawings. The diffuser tubes shall be fabricated from stainless steel.

2.7 SULFURIC ACID FEED SYSTEM. One assembly of feeding equipment shall be furnished and installed as indicated on the drawings, to dispense sulfuric acid. The chemical consists of 93 percent sulfuric acid with a specific gravity of 1.84.

2.7.01 Transfer Pumps. Transfer pumps shall be furnished and installed as indicated on the Drawings. Each pump shall be designed for pumping sulfuric acid from the storage tanks to the day tank.

Each pumping unit shall be of the positive displacement peristaltic type utilizing a flexible hose and shoe. Pumps shall be Alfa Laval “Model IP800” or Watson Marlow/Bredel “Model SP/65”, or equal.

Each pump shall be supplied with an integral squirrel cage induction type gear motor rated 460 volts ac, 3 phase, 60 HZ per Master Specification Section 16220, General Purpose Induction Motors-Procurement. The motor shall have a fan sized for adequate cooling of the drive at the lowest operating speed. Gearing shall be of the helical gear arrangement, classified for continuous heavy shock duty, AGMA Class II, 24-hour duty. Minimum gear reducer efficiency shall be 95 percent. The motor shall be contained in a cast iron housing suitable for corrosive duty.

The pump housing shall contain a threaded drain plug and vent port. The drain shall be located at the lowest point in the housing and allow for complete removal of all liquid from within the housing.

Discharge pulsation dampeners shall be provided with each pump. Dampeners shall be the appendage type, and consist of a two part housing, bell shaped bladder, one-way air inlet valve to prevent backflow and shall have a pressure gauge.

Two complete sets of spare parts, as recommended by pumps manufacturer, shall be provided.

Each transfer pump shall be furnished with a control panel incorporating magnetic-only adjustable circuit breaker type disconnect and motor starters with thermal overload protection. All pilot devices shall be transformer types, 1-1/6 inch (30 mm, oil tight type. Relays shall be 3PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number and coded to the approved panel drawings. The local control panel shall be pre-wired that the pump will shut down and the alarm on pump high discharge pressure can be re-started only if the alarm is reset at the local panel.

The local control panel shall include as a minimum the following:

Power ON/OFF selector switch

L/O/R selector switch

Start and Stop push buttons

“Running”, “Off”, “Discharge Pressure High Alarm”, “Bulk Tank Low Level”, “Day Tank High Level”, and “Power On” lights

RESET push button

Normally closed contacts pre-wired to terminals for external connection by others corresponding to:

“Pump Failure”

“Pump Running”

“L/O/R” switch position

Discharge Pressure High

Shall be able to accept:

Digital inputs to Start and Stop the Pump

Digital inputs from, Pump discharge pressure switch, Bulk Tank low level, and Day Tank high level.

2.7.02 <u>Metering Pumps</u>. Metering pumps shall be furnished and installed to dispense sulfuric acid to the point of application.

Each pump shall include continuous local and remote electric and local manual mechanically controlled metering of solution under the following conditions and requirements.

Motor horsepower for each pump shall be based on the above requirements and on the discharge back pressure required by the pump furnished. Motor shall not be less than the indicated horsepower.

Refer to Master Specification Division 17, Instrumentation and Controls for information on pump controls.

Each pump shall be of the positive displacement type, using a hydraulic plunger actuated diaphragm. The diaphragm shall have an integrally molded O-ring for installation in the pump housing. Diaphragms relying solely on friction and compression of the diaphragm material for installation and leak prevention will not be acceptable.

Metering pumps shall have an internal drive shaft connected to a motor with support bearings on both ends within the gear case. Each pump shall have one adjustable head.

Inlet and outlet check valves shall be of the single valve type, with valve housings, which are removable without disassembly of threaded pipe fittings.

Materials of construction shall be selected for resistance to the pumped solution.

Each pump shall be mounted on a structural steel or cast iron base to be set as indicated on the drawings and shall include a self-lubricating speed reducer and liquid end splash guards.

Each pump shall be furnished with the following accessories:

> One back pressure valve, factory adjusted for the back pressure recommended for the pump.
>
> One internal pressure relief valve sized to pass the maximum displacement of the pump. The pressure setting shall be as recommended by the pump manufacturer.
>
> One vent valve.
>
> One properly sized diaphragm type surge chamber in each pump discharge piping arrangement. Each chamber shall be fabricated of materials resistant to the pumped solution, and shall include an air charging valve and air gauge. The chamber shall be sized to limit pressure surges to between 5 and 10 percent of mean pressure.
>
> One strainer installed in the inlet piping. The strainer shall be PVDF bodied Y-pattern, with #8 mesh screen and O-ring seals.
>
> Wiring shall be furnished complete and ready for connection to external power circuit.
>
> The metering pumps shall be Wallace and Tiernan “series 43” or “Chemtube 2000”, Milton Roy "Milroyal B", or Pulsafeeder “Pulse Series 7120" or equal.

2.7.04 <u>Calibration Columns</u>. Transparent plastic calibrating columns shall be furnished and installed on the pump suction piping. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs.

2.8 CAUSTIC SODA FEED SYSTEM. One assembly of feeding equipment shall be furnished and installed, to dispense 50% caustic soda solution, with a specific gravity of 1.54, to the points of application.

2.8.01 Day Tanks. Each day tank shall have a useful capacity as necessary for not les than 24 hours operation and shall be provided with a scale graduated in gallons. All parts of the tank shall be fabricated of translucent fiberglass reinforced vinyl ester of sufficient weight for adequate support and corrosion protection. The tank shall be flat bottom, flanged top. The tank shall include bonded flanged fittings for inlet, overflows, vent, outlet, drain, level sensors, level switches, and gauge glass. Hold down lugs shall be provided to anchor the tank to the base. All inlet and outlet connections shall be made with flexible connections.

A gasketed flanged door shall be provided on top of the tank for inspection and cleaning of the tank. The access manhole shall be 24 inches (60.96 cm) diameter minimum.

A chemical-resistant valve and gauge glass assembly shall be mounted on the side of the tank. The gauge glass shall be fabricated of clear corrosion resistant material. Steel protection rods shall be provided the full length of the gauge. Valves assemblies shall be PVC with integral ball checks to prevent flow in the event of gauge glass failure.

2.8.02 Metering Pumps. Metering pumps shall be furnished and installed as indicated on the drawings to dispense caustic soda to the points of application. Each pump shall include continuous local and remote electric and local manual mechanically controlled metering of solution under the following conditions and requirements.

Motor horsepower for each pump shall be based on the above requirements and on the discharge back pressure required by the pump furnished. Motor shall be not less than the indicated horsepower

Refer to Master Specification Division 17, Instrumentation and Controls for information on pump controls.

Each pump shall be of the positive displacement type, using a hydraulic plunger actuated diaphragm. The diaphragm shall have an integrally molded O-ring for installation in the pump housing. Diaphragms relying solely on friction and compression of the diaphragm material for installation and leak prevention will not be acceptable.

Metering pumps shall have an internal drive shaft connected to a motor with support bearings on both ends within the gear case. Each pump shall have one adjustable head.

Inlet and outlet check valves shall be of the single valve type, with valve housings which are removable without disassembly of pipe connections.

Materials of construction shall be selected for resistance to the pumped solution.

The rate of metering shall be changed by concurrently varying the pump speed and stroke length.

Each pump shall be mounted on a structural steel or cast iron base to be set as indicated on the drawings and shall include a self-lubricating speed reducer and liquid end splash guards.

Each pump shall be furnished with the following accessories:

> One back pressure valve, factory adjusted for the back pressure recommended for the pump.
>
> One internal pressure relief valve sized to pass the maximum displacement of the pump. The pressure setting shall be as recommended by the pump manufacture.
>
> One vent valve.
>
> One properly sized diaphragm type surge chamber in each pump suction piping arrangement. Each chamber shall be fabricated of materials resistant to the pumped solution, and shall include an air charging valve and air gauge. The chamber shall be sized to limit pressure surges to between 5 and 10 percent of mean pressure.
>
> One strainer installed in the inlet piping. The strainer shall be PVC bodied Y-pattern, with #8 mesh screen and O-ring seals.
>
> All wiring shall be furnished complete and ready for connection of an external power circuit.

The metering pumps shall be ProMinent “Makro”, Wallace and Tiernan “Series 43", Milton Roy "Milroyal B", or Pulsafeeder “Pulsa Series” or equal.

2.8.03 Calibration Columns. One transparent plastic calibrating column shall be furnished and installed on the pump suction piping as indicated on the drawings. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs.

2.9 SODIUM BISULFITE FEED SYSTEM. One assembly of feeding equipment shall be furnished and installed as indicated on the drawings, to dispense 38 percent liquid sodium bisulfite solution, with a specific gravity of 1.26.

2.9.01 Day Tanks. Each day tank shall have a useful capacity as necessary for 24 hours operation and shall be provided with a scale graduated in gallons. All parts of the tank shall be fabricated of translucent fiberglass reinforced vinyl ester of sufficient weight for adequate support and corrosion protection. The tank shall be flat bottom, flanged top type. The tank shall include bonded flanged fittings for inlet, overflows, vent, outlet, drain, level sensors, level switches, and gauge glass. Hold down lugs shall be provided to anchor the tank to the base. All inlet and outlet connections shall be made with flexible connections.

A gasketed cover shall be provided with a 24 inch (60.96 cm) inner diameter flanged bolted access opening that is used for inspection and cleaning of the tank.

A chemical resistant valve and gauge glass assembly shall be mounted on the side of the tank. The gauge glass shall be fabricated of clear, corrosion resistant material. Steel protection rods shall be provided the full length of the gauge. Valve assemblies shall be PVC with integral ball checks to prevent flow in the event of a gauge glass failure.

2.9.02 Metering Pumps. Metering pumps shall be furnished and installed to dispense sodium bisulfite solution to the points of application.

Each pump shall include continuous local manual/remote manual and remote auto controlled metering of solution under the following conditions and requirements.

Motor horsepower for each pump shall be based on the above requirements and on the discharge back pressure required by the pump furnished. Motor shall be not less than the indicated horsepower.

Refer to Master Specification Division 17, Instrumentation and Controls for information on pump controls.

Each pump shall be of the positive displacement type, using a hydraulic plunger actuated diaphragm. The diaphragm shall have an integrally molded O-ring for installation in the pump housing. Diaphragms relying solely on friction and compression of the diaphragm material for installation and leak prevention will not be acceptable.

Metering pumps shall have an internal drive shaft connected to a motor with support bearings on both ends within the gear case. Each pump shall have one adjustable head.

Inlet and outlet check valves shall be of the single valve type, with valve housings, which are removable without disassembly of pipe connections.

Materials of construction shall be selected for resistance to the pumped solution.

Each pump shall be mounted on a structural steel or cast iron base to be set on a concrete support as indicated on the drawings and shall include a self-lubricating speed reducer and liquid end splash guards.

Each pump shall be furnished with the following accessories:

One back pressure valve, factory adjusted for the back pressure recommended for the pump.

One internal pressure relief valve sized to pass the maximum displacement of the pump. The pressure setting shall be as recommended by the pump manufacturer.

One vent valve.

One properly sized diaphragm type surge chamber in each pump discharge piping arrangement. Each chamber shall be fabricated of materials resistant to the pumped solution, and shall include an air charging valve and air gauge. The chamber shall be sized to limit pressure surges to between 5 and 10 percent of mean pressure.

One strainer installed in the inlet piping. The strainer shall be PVC bodied Y-pattern, with #8 mesh screen and O-ring seals.

Wiring shall be furnished complete and ready for connection to external power circuit.

The metering pumps shall be ProMinent “Meta”, Wallace and Tiernan "Series 43 ", Milton Roy "mRoy ", or Pulsafeeder "Pulse Series" or equal.

2.9.03 Calibration Column. One transparent plastic calibrating column shall be furnished and installed on the pump suction piping. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs.

2.9.04 Diffusers. Channel type diffusers shall be provided as indicated on the drawings. The diffuser tubes shall be fabricated of Type 316, Schedule 40 stainless steel.

2.9.05 Rotameters. Rotameters shall be provided for chemical lines and shall have vertical bottom inlets and top outlets with ANSI 150 lb. (68 kg) flanged ends for vertical mounting. Rotameters shall be rated for a minimum working pressure of 150 psi (1034 kPa), shall be calibrated in gallons per minute, shall have Hastelloy C floats with an accuracy of +/- 2 percent. The Rotameter also shall have integral flow control valves for adjusting the flowrates. The body materials shall be Type 316 stainless steel ends with heavy borosilicate glass tubes and packing glands, or other materials best suited for the fluid being measured. The rotameters on the discharge side of the chemical systems shall be provided with all valve and piping mounted on a single panel. Rotameters shall be as manufactured by Brooks, Pennwalt or equal.

2.10 FILTER AID (POLYMER) FEED SYSTEM. The filter aid feed system shall be integrated equipment packages to automatically meter, dilute, mix, completely activate, and feed liquid/emulsion polymer and water.

2.10.01 Polymer Makedown Units. Each automatic polymer dilution/feed system shall consist of an integrated equipment package capable of automatically metering, diluting, activating and feeding liquid polymer and water. The system shall activate concentrated emulsion and solution polymer in a mixing vessel or multi-staged hydrodynamic blending device without moving parts. A diaphragm pump will deliver neat polymer as needed.. The system shall be an integrated package pre-piped and pre-wired.

The makedown system shall be constructed of a 304 stainless steel chassis. All hardware used for the component attachment shall be 304 stainless. Any components in contact with polymer or water shall be constructed of electroless nickel plated brass, stainless steel, or an inert plastic.

Mixing energy shall be provided by a motor-driven stainless steel multi-bladed turbine. Turbine shall rotate on a stainless steel shaft supported by stainless steel sealed, lubricated ball bearings and mechanical seals. Mixing chamber shall be transparent. All metallic materials of construction shall be 304 stainless steel or electroless nickel-plated brass.

Metering pumps shall be controlled by a device capable of both manual and remote control and of automatic remote in response to a 4-20 mA input signal - one for remote control of speed and one for control of stroke with a device able to be unistrut or wall-mounted. The control device shall include an on/off switch, an LCD display showing pump operating parameters in strokes per minute, strokes per hour or RPM, and a dial to adjust polymer input rate to the system by varying stroke frequency or RPM of the pump.

The system shall include loss of flow sensor which, sensing that water flow has been interrupted for any reason, will place the polymer pump on standby and will restart it automatically when flow is restored. A pressure regulator shall be provided. Differential pressure switches shall be provided to monitor the differential pressure in the mixing chamber**,** placing the polymer pump on standby when the differential pressure drops below minimal values. Indicator light shall come on.

Refer to Master Specification Division 17, Instrumentation and Controls for information on pump controls.

Unless otherwise shown, all polymer mix/feed pumps shall be mounted on concrete pedestals and they shall be equipped with the following accessories:

Solenoid valve for on/off control of dilution water supply.

Rotameter flow indicator

Rate adjusting valve.

All polymer mix/feed pumps shall be furnished with a complete set of the manufacturer's suggested spare parts, such as seals, packing, gaskets, O-rings, and any other parts subject to wear. Where applicable, one set of spare bearings shall be furnished with each piece of equipment.

The system shall have a 304 stainless steel or brass solenoid valve for on/off of dilution water supply, and a rotameter-type flow indicator equipped with integral rate-adjusting valve. The flow indicator shall be machined acrylic with a valve stop and guided float. Water flow rate shall be adjustable.

Acceptable manufacturers include the following or equal:

Stranco (Bradley, Illinois), "Polyblend"

Fluid Dynamics, "Dynablend"

2.10.02 Transfer**/**Recycle Pumps. Polymer transfer/recycle pumps shall be furnished. The pumps will also be capable of recycling the storage tanks contents to keep the polymer emulsified. Each pump shall operate under the following conditions and requirements:

Each pump shall be of the progressing cavity type, constructed of materials selected for resistance to the pumped solution, at least Type 316 stainless steel and EPDM synthetic rubber. The pump shall be heavy-duty, universal pin joint type. The pump and drive shall be mounted on a structural steel baseplate complete with a drip rim, a drainage connection, and suitable guards.

Each pump shall have a stable head-capacity curve and be free from cavitation and objectionable noise. Pumping heads and other terms shall be as defined in the Hydraulic Institute Standards. Each pump shall be provided with a high discharge pressure switch and a pressure switch isolator, to stop the pump on excessive discharge pressure.

Suction and discharge nozzles shall have ANSI Class 125 pound flanges and shall be tapped and plugged for a pressure gauge connection. The pump stuffing box shall be tapped at the lantern ring position for an outside water seal connection. Each pump shall be furnished with Durametallic "Type RO" mechanical seals or equal.

Each pump shall be supplied with an electric motor. Each motor shall be squirrel cage induction type, horizontal, totally enclosed fan cooled, premium efficient, rated 460 volts, 3 phase, 60 Hz, and shall conform with the requirements of Master Specification Section 16220, General Purpose Induction Motors-Procurement.

If the motor is not shop tested with the pump, certified motor efficiency data shall be furnished to the pump supplier based on tests conducted on the motor or an identical motor.

Each pump shall be furnished with a control panel incorporating magnetic-only adjustable circuit breaker type disconnect and motor starters with thermal overload protection. All pilot devices shall be transformer type, 30 mm, oil tight type. Relays shall be 3PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings.

The local control panel shall be wired that the pump will shut down and alarm on pump high discharge pressure, low discharge flow and low seal water pressure and can be re-started only if the alarm is reset at the local panel.

The local control panel shall include as a minimum the following:

Power ON/OFF selector switch

L/O/R selector switch

Start and Stop push buttons

“Running”, “Off”, “ Day Tank High Level Alarm”, “ Bulk Tank Low Level Alarm”, “ High Discharge Pressure Alarm”, “Low Seal Water Pressure”, Low Discharge Flow and “Power On” lights

RESET push button

Normally closed contacts pre-wired to terminals for external connection by others corresponding to:

”Pump Failure”

“Pump Running”

“L/O/R” switch position

Discharge Pressure High

Low Seal Water Pressure

Low Discharge Flow

Shall be able to accept:

Digital inputs to Start and Stop the Pump

Digital inputs from Day Tank high level switch, Pump discharge pressure switch, Low Seal Water Pressure, Low discharge flow switch and Bulk Tank low level switch.

The transfer pumps shall be Allweiler Pump Inc.; Netzsch, Nemo Pump Division; or Robbins & Myers, Moyno or equal.

2.10.03 Day Tanks. Each day tank shall have a useful capacity as necessary for 24 hours operation and shall be provided with a scale graduated in gallons. All parts of each tank shall be fabricated from translucent fiberglass reinforced vinyl ester plastic material of sufficient weight for adequate support and protection. The tank shall be flat bottom, flanged top type. The tank shall include bonded flanged fittings for inlet, overflows, vent, outlet, drain, level sensors, level switches, and gauge glass. Hold down lugs shall be provided to anchor the tank to the base.

All inlet, overflow and outlet connections to the tank shall be made with flexible connections. A gasketed cover shall be provided with a 24 inch (60.96 cm) minimum diameter flanged bolted access opening that is used for inspection and cleaning of the tank.

A chemical resistant valve and gauge glass assembly shall be mounted on the side of the tank. The gauge glass shall be fabricated of clear and corrosion resistant material. Steel protection rods shall be provided the full length of the gauge. Valve assemblies shall be PVC with integral ball checks to prevent flow in the event of a gauge glass failure.

2.10.04 Polymer Booster Pumps. Polymer booster pumps shall be furnished to transfer neat polymer. Each pump shall operate under the following conditions and requirements:

Each pump shall be of the progressing cavity type, constructed of materials selected for resistance to the pumped solution, at least Type 316 stainless steel and EPDM synthetic rubber. The pumps shall be heavy-duty, universal pin joint type. The pump and drive shall be mounted on a structural steel baseplate complete with a drip rim, a drainage connection, and suitable guards.

Each pump shall have a stable head-capacity curve and be free from cavitation and objectionable noise. Pumping heads and other terms shall be as defined in the Hydraulic Institute Standards.

Each pump shall be provided with a high discharge pressure switch and a pressure switch isolator, to stop the pump on excessive discharge pressure.

Suction and discharge nozzles shall have ANSI Class 125 pound (56.6 kg) flanges and shall be tapped and plugged for a pressure gauge connection. The pump stuffing box shall be tapped at the lantern ring position for an outside water seal connection. Each pump shall be furnished with Durametallic "Type RO" mechanical seals or equal and shall be arranged for side suction and end discharge.

Each pump shall be supplied with an electric motor. Each motor shall be squirrel cage induction type, horizontal, totally enclosed fan cooled, premium efficient, rated 460 volts, 3 phase, 60 Hz, and shall conform to the requirements of the Master Specification Section 16220, General Purpose Induction Motors-Procurement.

If the motor is not shop tested with the pump, certified motor efficiency data shall be furnished to the pump supplier based on tests conducted on the motor or an identical motor.

The booster pumps shall be manufactured by Allweiler Pump Inc.; Netzsch, Nemo Pump Division; or Robbins & Myers, Moyno or equal.

2.10.05 Calibration Column. One transparent plastic calibrating column shall be furnished and installed on the blender suction pipe as indicated on the drawings. Each column shall be mounted on a steel stand. The column shall be as manufactured by Valcom or equal.

2.10.06 Diffusers. Channel type diffusers shall be provided as indicated on the drawings. The diffuser tubes shall be fabricated of PVC.

2.11 PHOSPHORIC ACID (CORROSION INHIBITOR) FEED SYSTEM. One assembly of feeding equipment shall be furnished and installed.

2.11.01 <u>Day Tanks</u>. Each day tank shall have a useful capacity as necessary for 24 hours operation and shall be provided with a scale graduated in gallons. All parts of each tank shall be fabricated from translucent fiberglass reinforced vinyl ester plastic of sufficient weight for adequate support and protection. The tank shall be flat bottom, flanged top type. The tank shall include bonded flanged fittings for inlet, overflows, vent, outlet, drain, cross connection, level sensors, level switches, and gauge glass. Hold down lugs shall be provided to anchor the tank to the base.

All inlet and outlet connections shall be made with flexible connections.

A gasketed cover shall be provided with a 24 inch (60.96) minimum diameter flanged bolted access opening that is used for inspection and cleaning of the tank.

A chemical resistant valve and gauge glass assembly shall be mounted on the side of the tank. The gauge glass shall be fabricated of clear and corrosion resistant material. Steel protection rods shall be provided the full length of the gauge. Valve assemblies shall be PVC with integral ball checks to prevent flow in the event of a gauge glass failure.

2.11.02 <u>Metering Pumps</u>. Metering pumps shall be furnished and to dispense the phosphoric acid to the points of application.

Each pump shall include continuous local and remote electric and local manual mechanically controlled metering of solution under the following conditions and requirements.

Motor horsepower for each pump shall be based on the above requirements and on the discharge back pressure required by the pump furnished. Motor shall be not less than the indicated horsepower.

Refer to Master Specification Division 17, Instrumentation and Controls for information on pump controls.

Each pump shall be of the positive displacement type, using a hydraulic plunger actuated diaphragm. The diaphragm shall have an integrally molded O-ring for installation in the pump housing. Diaphragms relying solely on friction and compression of the diaphragm material for installation and leak prevention will not be acceptable.

Metering pumps shall have an internal drive shaft connected to a motor with support bearings on both ends within the gear case. Each pump shall have one adjustable head.

Inlet and outlet check valves shall be of the single valve type, with valve housings, which are removable without disassembly of pipe connections.

Materials of construction shall be selected for resistance to the pumped solution.

The rate of metering shall be changed by concurrently varying the pump speed and stroke length.

Each pump shall be mounted on a structural steel or cast iron base to be set as indicated on the drawings and shall include a self-lubricating speed reducer and liquid end splash guards.

Each pump shall be furnished with the following accessories:

> One back pressure valve, factory adjusted for the back pressure recommended for the pump.
>
> One internal pressure relief valve sized to pass the maximum displacement of the pump. The pressure setting shall be as recommended by the pump manufacturer.
>
> One vent valve.
>
> One properly sized diaphragm type surge chamber in each pump discharge piping arrangement. Each chamber shall be fabricated of materials resistant to the pumped solution, and shall include an air charging valve and air gauge. The chamber shall be sized to limit pressure surges to between 5-10% of mean pressure.
>
> One strainer installed in the inlet piping. The strainer shall be PVC bodied Y-pattern, with #8 mesh screen and O-ring seals.

All wiring shall be furnished complete and ready for connection of an external power circuit.

The metering pumps shall be Prominent “Meta”, Wallace and Tiernan "Series 43", Milton Roy “mRoy", or Pulsafeeder "Pulsa Series" or equal.

2.11.03 <u>Calibration Column</u>. One transparent plastic calibrating column shall be furnished and installed on the pump suction piping as indicated on the drawings. The column shall be Valcom, Inc., "Model 8500", or equal, and shall be mounted on steel legs.

2.11.04 <u>Diffusers</u>. Channel type diffusers shall be provided. The diffuser tube shall be fabricated of PVC.

2.12 CHLORINE FEED SYSTEM. Feeding equipment shall be furnished to dispense chlorine solution to the points of application.

2.12.01 Container Scales. Electronic load cell scales of the digital indicating type shall be provided. Each scale shall be designed for floor surface mounting. Each scale shall include a digital electronic indicator with capacity of transmitting a loop powered 4-20 mA dc signal to a remote control system. The indicator shall have the capacity of displaying net, gross, and tare weights. The indicator shall include a digital keyboard for indicating programming and tare weight entry.

Each scale shall withstand eccentric loading and container impact. Each weigh frame shall be equipped with the required number of frame-mounted, grease lubricated, carbon steel roller trunnions to facilitate rotation of the containers.

Each scale shall be Eagle Microsystems "Weigh Trunnion WT3600" with "UW12000 Weight Indicator" or Force Flow Equipment "Model DR160 and DR240" with "Wizard 4000 Indicator" or equal.

2.12.02 Evaporators. Electrically heated, thermostatically controlled evaporators for converting liquid to gas shall be provided. The evaporators shall be vented to the outside of the building through vent piping terminating with a turned-down elbow.

The evaporators shall be Capital Controls "Model VAX 4690C" or Wallace & Tiernan "Series 50-200", and shall have an evaporating capacity of 10,000 pounds of chlorine per 24 hours. Each evaporator shall be housed in an FRP enclosure. All electrical equipment shall be wired complete and ready for connection of power supply and remote circuits.

The following items shall be included with each evaporator:

Insulation on water bath tank.

Automatic water level control and low level alarm switch with alarm relay for closure of the gas pressure reducing and shutoff valve and for remote annunciation.

Water level gauge.

High and low temperature alarm switches with alarm relays for remote annunciation. The low temperature alarm relay shall operate to close the gas pressure reducing and shutoff valve.

Gas pressure gauge.

Gas temperature gauge.

Water temperature gauge.

Adjustable water temperature control thermostat.

"On-Off", single-pole, double-throw selector switch in 120 volt control circuit.

Cathodic protection with meter.

Lifting eyes and spare gaskets.

Pressure relief system, including rupture disc, alarm pressure switch with pilot light, and relief valve.

A unit-mounted disconnect switch.

Magnetic contactor for evaporator electric heaters.

A NEMA rated size 2, 120 volt coil combination magnetic motor starter for 480 volts, 3 phase, with thermal magnetic circuit breaker, but without overloads, in an FRP NEMA Type 4X enclosure. Provide a control power transformer with two primary fuses and capacity for all control items at 120 volts secondary, with one lead fused and one lead grounded. All items shall be mounted in same enclosure. Provisions shall be included for locking the cover closed and the circuit breaker "Off".

Isolated contact outputs for "Evaporator On" to the SCADA System of Division 17 and a common alarm.

Controls and power to automatically open the gas pressure reducing and shutoff valve when the evaporator is running and to close it on the abnormal conditions specified under the valve portion of this specification.

All remote signal wiring and power wiring shall terminate on numbered, pressure type copper terminal blocks. The terminal blocks shall be grouped together in a common location such as the equipment controller or a separately mounted, completely prewired, NEMA Type 4X FRP terminal box.

The local panel provided for each evaporator shall be pre-wired to provide the following signals to the PCS:

Evaporator running Status

Evaporator Power Failure

Evaporator bath Low Level

Evaporator bath High Level

Evaporator bath Low Temperature

Evaporator bath High Temperature

Chlorine gas low temperature

2.12.03 Low Temperature Switch. A low temperature switch shall be provided in the outlet piping of each evaporator to sense the entry of liquid into the gas piping. The switch will be normally closed on normal chlorine gas temperature, allowing operation of the electrically operated gas pressure reducing and shutoff valve, and will open on low chlorine gas temperature to close the gas pressure reducing and shutoff valve.

2.12.04 Gas Filters. Gas filters shall be provided on the outlet piping from each evaporator as indicated on the drawings. Each unit shall have two chambers to act as both a gas filter and a condensate trap. The filters shall be Chlorine Specialties "Model C-282 Chlorine Gas Filter".

2.12.05 Chlorine Feeders. Solution feed, vacuum operated, variable orifice type chlorine feeders, Capital Controls "Series 4000" or Wallace & Tiernan "Series V2000" or equal. The orifice and rotameter size and orifice positioner to be provided with each feeder.

In addition to the orifices and rotameters furnished with the chlorine feeders, spare orifice and rotameter assemblies shall be furnished. The assemblies shall include all necessary seals, o-rings and hardware required to install the rotameters and orifices.

Each feeder shall be equipped with a linear-scale, variable-area flowmeter which will indicate the quantity of gas being fed with an accuracy of plus or minus 4 percent of indicated flow rate over a 20 to 1 range. The meter shall be readily removable for cleaning or change of flow range and shall be direct reading in pounds per 24 hours.

2.12.06 Chlorine Solution Injectors. Operating vacuum for each feeder shall be created by a properly sized, water-operated injector mounted. The injector shall be manufactured from the same manufacturer as the chlorine feeder.

2.13 SODIUM HYPOCHLORITE FEED SYSTEM. Furnish, install and test variable speed sodium hypochlorite feed pumps and appurtenances. Interface with variable frequency controller to vary gpm output of the pump in proportion to process flow.

The pump shall be the positive displacement gear type with hastelloy C shaft housing, hastelloy C drive gear, teflon idle gear and carbon/graphite wearplates, and internal mechanical seal. The mechanical seal shall not require seal water.
The pumps shall be self-priming. The pump shall be designed to be disassembled without breaking pipe connections.

Mount each metering pump and motor on a fabricated steel base epoxy coated to resist sodium hypochlorite. Pump and motor shall be coupled with an approved type flexible coupling with OSHA guard.

2.13.01 Manufacturers. Provide products of Eco Gearchem Pump, Rochester, N,Y.orequal.

2.13.02 Motors. Provide each pump with a 460 volt, 60 Hz, 3 Phase, TEFC motor with antifriction bearings lubricated for life per Section 16220 of Electrical Division 16. The motor shall operate smoothly with a variable frequency controller in response to flow volume.

Pump motors shall be non-overloading over entire operating range of the pump.

2.14 LOCAL PUMP CONTROL PANELS. Each pump shall be provided with a local control panel (LCP) with the following minimum components/output and control.

An electronic SCR drive.

Shall be able to accept a remote 4- 20mA signal to control the rate of feed by varying the speed of the pump.

Shall be able to accept a remote 4- 20mA signal to control the rate of feed by varying the stroke length of the pump (Wherever applicable).

Shall be able to provide a 4-20mA signal for indication at a remote control system.

Shall be able to accept 2 remote digital inputs to start and stop the pump.

Shall provide contact for remote signaling to a remote control system of “Remote” status

“Running” and “Fail” status.

Shall provide volt free contacts for pump discharge pressure high and discharge low flow.

Shall have “Local/Off/Remote” selector switch.

Shall have power “On/Off” selector switch.

Shall have local indicating lights for “Running”, “Off” and “Power on” status.

Shall have local speed adjustment.

Shall have local stroke adjustment(except for progressive cavity type pumps).

Shall have Alarm lights for High discharge pressure, Low discharge flow and Low seal water pressure (if applicable).

Shall have push buttons for Start, Stop and Reset.

All pilot devices shall be transformer type, 30 mm, oil tight type. Relays shall be 3PDT, 10 ampere, 120 VAC rated. All wiring shall be terminated in pressure type terminal strips. All internal panel wiring shall be tagged with a unique wire number, coded to the approved panel drawings.

The rate of metering shall be changed by varying the pump speed or by concurrently varying the pump speed and stroke length (wherever applicable), as required to meet the specified metering range of the pump, unless specified otherwise.

The rate controllers shall be mounted adjacent to the pumps and shall be furnished with an engraved nameplate indicating the controlled unit. Each controller shall operate from a 120 volt, single phase, 60 Hz power supply, and shall be mounted in a NEMA Type 4 enclosure.

Each pump shall be Hardwire interlocked, such that the pump will stop:

On High Discharge Pressure

Low Discharge Flow

Low Seal Water Pressure (if applicable)

In local mode the chemical feed system shall be started and stopped from the local control panel and speed and stroke can be adjusted locally, with no control possible from a remote control system. In remote mode all control is transferred to a remote control system.

2.15 SHOP TESTING. Factory test operation of each piece of motor driven equipment. All tests to be in accordance with the latest edition of the Hydraulic Institute Standards. Provided certified test report for each pump.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with drawings, specifications, and recommendations of the manufacturer, unless exceptions are noted by the Contractor. All items necessary for a complete operating system shall be installed.

3.2 FIELD QUALITY CONTROL.

3.2.01 Acceptance Tests. After installation of equipment, give each pump a running test in presence of Engineer to demonstrate its ability to operate without vibration or overheating, and to pump solution satisfactorily in proportion to (simulated) water or wastewater flow. Correct or replace promptly defects or defective equipment revealed by or noted during tests at no expense to Owner, and if necessary, repeat tests until results acceptable to Engineer are obtained. Furnish all labor, piping, equipment, and materials necessary for conducting tests. Provide signed test documentation at test conclusion.

Start-up and demonstrate each pump operation in cooperation with the variable frequency control supplier for feed systems utilizing VFD units.

Make all adjustments necessary to place equipment in satisfactory working order at time of above tests.

In event that Contractor is unable to demonstrate to satisfaction of Engineer that units will satisfactorily perform the service required and that they will operate free from vibration and heating, the pumping units may be rejected. Contractor shall then remove and replace the equipment at his own expense.

3.3 SPARE PARTS. The Contractor shall supply the following spare parts in labeled boxes. Quantities are per pump type. Special tools necessary for maintenance shall be furnished by the Contractor.

2 Sets of Gears

2 Sets of Bearings

1 Set of Wear Plates

2 Sets of O-Rings

4 Shaft Seals

1 Pulsation Dampener

1 Variable Speed Drive Controller

1 Diaphragm Back Pressure Control Valves

End of Section

SECTION 11800

CENTRIFUGES

PART 1 – GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of centrifuges.

1.2 GENERAL.

1.2.01 Governing Standards.

American Society for Testing and Materials (ASTM) Publications:

A36- Specification for Structural Steel
A48 – Specification for Gray Iron Castings
A480 – Specification for Flat-Rolled Stainless and Heat Resisting steel Plate, Sheet and trip
A500 – Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes
ASTM G65 – Practice for Conducting Dry Sand / Rubber Wheel Abrasion Test

American National Standards Institute (ANSI)

B15 – Ball Bearings, Local Bearings and Fatigue Life
B16.1 – AN Standard for Cast Iron Pipe Flanges and Flanged Fittings Class 25, 125, 250 and 800

Steel Structures Painting Council (SSPC): SP10 – Near Whit Blast Cleaning

Hydraulic Institute: Current Standards

Anti-Friction Bearing Manufacturers Association (AFBMA)

National Electrical Manufacturers Association (NEMA)

Underwriters Laboratories Inc. (UL)

National Electrical Code (NEC)

Institute of Electrical and Electronic Engineers (IEEE): IEEE Std-85: Test Procedures for Airborne Sound Measurements on Rotating Electric Machinery

American Gear Manufacturers Association (AGMA)

Instrument Society of America (ISA)

1.3 QUALITY ASSURANCE. Provide centrifuges, main drives, back drives, lube oil system, controls and all other specified herein as a complete integrated package for proper coordination and compatibility of equipment. Centrifuge manufacturers shall have a material quality assurance system to ensure that material specifications are met, and shall permit inspection of this system at the request of the owner. Shop tests as specified. The centrifuge manufacturer shall have manufactured ten centrifuges of the type (high solids >25% cake) and size (29 or 36-inch diameter bowl) specified herein (within the last three years), the centrifuge manufacturer shall have a minimum of ten operating centrifuges of the type (high solids >25% cake) and size (29 or 36-inch diameter bowl) being specified, for dewatering municipal sludge. The centrifuge manufacturer shall have manufactured the proposed type (high solids >25% cake) and size (29 or 36-inch diameter bowl) of centrifuge for at least 10 years. All anchor bolts, nuts, and washers shall be AISI Type 316 stainless steel. The size and spacing are to be determined by the centrifuge manufacturer.

1.4 SUBMITTALS. The Vendor shall submit to the Engineer for review and acceptance the following items in accordance with the requirements of Master Specification Section 01080, Project Submittals.

Written guarantee that the proposed centrifuges (6 or 8) are capable of meeting the performance requirements specified in paragraph 2.3.

Building layout showing the size of centrifuges in the Building Plan including control panels, bowl drive, back drive system, lubrication system and screw conveyors.

Overall plan and elevations showing dimensions, weights and handling instructions for delivery and installation.

Shop Assembly, Erection and Schematic Drawings, showing layout and clearances necessary around and above the units, details of construction, dimensions and anchor bolt locations.

Product Data including full details of controls.

Size, dimension and detail of bowl, scroll, piping, feed nozzles, discharge port, wash water, drainage connections, centrate and cake discharge chutes, adjustment devices, alignment devices and complete control description including schematics and wiring diagrams.

Materials of Construction shall include Centrifuge Bowl, Bowl Heads, Scroll Conveyor, Wear Tiles, Bowl Wear Strips, Feed Chamber, Feed Parts, O-

Rings, Cake Discharge Parts, Cake Discharge Area Housing, Feed Pipe, Upper Housing, Lower Housing, Removal Cover, Base Frame, Discharge Chutes.

Rotative speeds of bowl and conveyor, and operating G-force.

Differential speed range.

Vibration isolator details.

Gear unit details.

Oil lubrication system details.

Performance curve showing feed rates verses brake horsepower.

Estimated bearing life.

Standard Warranty.

Verification of previous experience with this size and type of equipment, including location, number of units, percent solids of feed and cake and number of years in service.

Manufacturer Information shall include Assembly Factory Location, Centrifuge Service Centers, US Headquarters, and Sales Offices.

Unit Weights and loads shall include a) Dead load due to unit weight empty b) Dead load due to unit weight full of sludge c) Dynamic loads d)Combination of b and c above.

Shipping Weight (lbs, Kg) shall include Drive, Bowl, Conveyor and Complete Assembly.

Complete list of recommended spare parts and special tools.

Estimated life of conveyor surfacing material.

O& M Manuals per Master Specification Section 01160, Training and Operations & Maintenance Manuals.

Estimated maximum noise levels in decibels at 3 feet from centrifuge. a) At factory operating with water b) Installed at DWSD operating with sludge feed under design condition.

Recommend cleaning instruction, procedures and safety precautions for equipment. Provide detailed cleaning instructions for particular cleaning system as specified.

Control Panel shop drawings shall include Outline, Ladder Logic diagrams, Equipment interconnect drawings, Bill of materials and catalog cuts of components, Nameplate schedule, Clarifications and exceptions, Written description of all instrumentation and control system, List of functions monitored, controlled and alarmed, Centrifuge serial communication I/O listings, Sequence of operation, Catalog cut sheets, and Harmonic filter details.

Motor starter panel shop drawings shall include Outline, Electrical Schematic Drawings, Wiring Diagrams, Bill of Materials and Catalog Cuts Sheets for All Devices, VFD Data Sheets, and Motor Starter Data Streets.

Setting plans with tolerances for anchor bolts.

Typical field inspection and test report.

Test reports that certify that all abrasion resistant materials supplied are in accordance with ASTM G65, Procedure A.

Recommendations for both short and long term storage of each major component.
Weights and lifting points of all equipment and sub-assemblies. Identify any special handling requirements.
Typical centrifuge sound pressure level ratings outlined in AMCA (Standard 301), including back drive at manufacturing location and at speed specified.
Electrical power demand at specified rate.

Bearing Life: Certified by a professional engineer. List life and calculation each centrifuge bearing.

Main bearing temperature operating range for the service conditions specified.
Motor nameplate data and typical motor test results.

Shop and field-testing procedures with equipment to be used.

Training lesson plan.

1.5 DELIVERY, STORAGE, AND HANDLING. Delivery and storage requirements are described in Master Specifications Section 11050, Equipment General Provisions.

1.5.01 Handling. Prior to shipment, the centrifuge units shall be disassembled as required into components weighing less than 30,000 pounds each (capacity of the centrifuge room bridge crane). Accessory equipment shall be boxed separately from the centrifuge unit. The centrifuge units shall not be lifted by eyebolts on the bearing housings or on the case. The bolt holes provided at these parts are to be used to lift these individual parts only. Machines equipped with fume seals shall be lifted by slings fastened around the base in order to avoid damage to seal assemblies.

1.6 WARRANTY. Centrifuges and all associated products and parts should be covered under warranty per Master Specifications Section 01170, Warranties and Bonds.

PART 2 – PRODUCTS

2.1 GENERAL. The centrifuges shall be of the solid bowl, horizontal, continuous feed scroll type with the cake and centrate being continuously discharged.

2.2 SERVICE CONDITIONS. General Requirements shall include that centrifuges shall be suitable for dewatering wastewater treatment residuals consisting of a blended gravity thickened primary and oxygen waste activated sludge with the aid of a polymer conditioner. Each centrifuge shall be designed for continuous or intermittent operation. The Process Description shall include that the thickened residuals will be pumped through a central header to the centrifuges with adjustable speed sludge feed pump. The dewatered sludge will be discharged to a solids-receiving screw conveyor. The solids receiving conveyor will convey dewatered residuals to belt conveyor, which will discharge to either incinerators or a lime mixing facility. Centrifuge centrate will be drained to the plant sewer.

2.3 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each centrifuge shall be a completely integrated unit designed for continuous operation and designed to meet the following requirements:

General Mechanical requirements shall include model, number of units required, minimum bowl diameter (inches), minimum bowl length(inches), design bowl speed (rpm), Maximum main drive motor speed(rpm), maximum back drive motor speed (rpm), connected horsepower of main drive and back drive, maximum footprint without oil lubrication pump unit* length and width.

*Note: the location of the oil lubrication pump unit is to be proposed by the manufacturer.

Performance requirements shall include the following:

Normal Operation

Hour/day	24
Days/week	7
Number of units operating	6 or 8

Design polymer feed concentration 0.30 % (*)

Performances at 2.0 – 6.0 percent dry solids influent residuals concentration from a blend of primary (50% by weight-minimum) and oxygen waste activated sludge.

Total (all new machines together) minimum design feed rate (lbs DSS/hour)	32,000
Minimum cake concentration (percent dry solids)	34
Minimum cake solids capture (percent)	92

Solids Capture:

$$\%Capture = \frac{FC[Corr] - CentC}{FC[Corr]} x \frac{CakeC}{CakeC - CentC} x100\%$$

Where FC[Corr] is calculated as follows

$$FC[Corr] = \frac{SF(gpm)}{SF(gpm) + PF(gpm)} xFC$$

Where FC[Corr] = Corrected Feed Total Solids Concentration (%TS)
CentC = Centrate Concentration (%TSS)
CakeC = Cake Total Solids Concentration (%TS)
SF = Sludge Feed (gpm)
PF = Polymer Feed (gpm)
FC = Feed Total Solids Concentration (%TS)

Maximum polymer dosage, 18 active lbs/dry ton feed solids*
*Based on use of GLWA WRRF house polymer; Note: polymer can be diluted at each machine after polymer flow meter.

Maximum power usage(kwh/gpm) 0.80

Contractor to verify that the selected machine fits in the layout arrangement shown while meeting all OSHA and operation and maintenance requirements. Space needs to be allowed for feed tube and scroll and bowl removal.

2.4 ACCEPTABLE MANUFACTURERS. The acceptable centrifuge manufacturers and models, which are acceptable to submit bids, are as follows: Baker Hughes (CP-3094), Alfa Laval (DS-706, Baker Hughes (CP-3084) and Westfalia (CA755)

2.5 MATERIALS.

Base Frame Assembly	Cast iron ASTM A48; fabricated steel, ASTM A36 or a combination of both.
Case	Stainless steel, AISI Type 304 or 316
Bowl	Stainless steel, AISI Type 316 or 329 or 2205
Scroll Conveyor	Stainless steel, AISI Type 316 or 329 of 2205
Abrasion-Resistant Material 1. Most Sever Service	Sintered tungsten carbide with volume loss of 3 cubic millimeters or less when subjected to an abrasion test in accordance with ASTM G65, Procedure A; minimum 15,000 hours of operation
2. Moderately Severe Service	Aluminum ceramic, sintered tungsten carbide, or flame sprayed tungsten carbide with volume loss of 12 cubic millimeters or less when subjected to an abrasion test in accordance with ASTM G65, Procedure A; minimum 15,000 hours of operation.
3. Least Severe Service	Satellite 40, Coast 53, aluminum ceramic, or sintered tungsten carbide with volume loss of 40 cubic millimeters or less when subjected to an abrasion test in accordance with ASTM G65, Procedure A; minimum 15,000 hours of operation.
Flexible chute connectors & discharge skirts	Fiber reinforced Neoprene, 1/8-inch minimum thickness.
Centrate and Solids discharge Chutes	Stainless steel, AISI Type 304

Guards	Carbon steel, 11-gauge minimum thickness, conforming to OSHA standards.
Drive Pulleys	High strength zinc-plated carbon steel or ductile iron.
Fasteners	
Bowl Assembly	Stainless steel, AISI Type 316.
Other internal locations subject to contact with residual centrate, or vapors or wash water.	Stainless steel, AISI Type 316.
3. External case, flexible connections, centrate and residual chutes	Stainless steel, AISI Type 316

2.6 CONSTRUCTION.

2.6.01 Orientation. The orientation of the centrifuges shall be as shown on the drawings for the six and eight unit layouts.

2.6.02 Base-Frame Assembly. The base-frame assembly shall rigidly support the centrifuge and drive assemblies and shall be furnished with lifting eyes or facilities that will permit the lifting of the entire assembled centrifuge unit. Machined surfaces shall be provided at all points where support loads are transferred to the base.

2.6.03 Case. The rotating bowl assembly shall be completely enclosed in a fabricated case in order to contain and direct the solids and liquid discharge from the unit. The case shall act as a protective guard and minimize noise levels. The upper portion of the case shall be provided with lifting eyes or lugs and shall be provided with inspection ports at each end. The inspection ports shall be of such size to allow internal adjustments to be made without removing the upper case. The bottom portion of the case shall be provided with flanged outlets for the attachment of the solids and centrate chutes or hoppers. A flanged and gasketed seal shall be provided between the upper and lower case components. Flange bolts shall be stainless steel.

2.6.04 Bowl. Each centrifuge shall consist of a centrifugally cast cylindrical-conical solid bowl in which a scroll conveyor mounted on inner bearings fits concentrically. The bowl wall shall include longitudinal strips or grooves, evenly spaced and extending over the full length of the bowl, designed to trap a protective layer of feed solids between the bowl wall and scroll conveyor. Leak tight connections shall be provided between the bowl and bowl ends. The pool depth in the bowl shall be adjustable through the use of plate dams at the large diameter end of the bowl where the centrate is discharged. Solids shall be discharged from the opposite end. The solids discharge ports shall have field-replaceable liners that surround the entire discharge port area, made of abrasion-resistant material for “most severe” service. Field balancing shall be accomplished by adjustments that do not involve grinding or welding.

2.6.05 <u>Bearings</u>. Two main bearings shall support the entire rotating assembly. Each main bearing shall be cylindrical or spherical roller bearing-type. The bearings shall be oil-lubricated with an external circulating lube oil system. Main bearings shall have an AFBMA L_{10} rating without adjustment factors of 100,000 hours at the specified operating conditions. The main bearings shall be housed in horizontal pillow blocks having lifting eyes or lugs. Thrust imposed upon the scroll conveyor shall be taken by separate thrust bearings. Thrust bearings shall be grease-lubricated, ball or roller bearing-type installed in the driven sheave that forms the bearing housing. Thrust bearings shall have an AFBMA L_{10} rating without adjustment factors of 100,000 hours at the specified operating conditions. Scroll conveyor bearings shall be bail or roller bearings, grease lubricated, protected by seals, and with external grease lines, or shall be self-lubricated bushings of bronze construction with graphite inserts <u>(or approved alternate)</u> and protected from product contamination. Bearings shall have an AFBMA L_{10} rating without adjustment factors of 100,000 hours at the specified operating conditions.

2.6.06 <u>Scroll Conveyor</u>. Each centrifuge shall include a stainless steel horizontal scroll conveyor. The scroll conveyor shall be equipped with helical flights designed to fit within the bowl. Feed ports shall have field-replaceable liners that surround the entire feed port area, made of abrasion-resistant material for “most sever” service. Wearing edges of the conveyor shall be constructed of field-replaceable tiles of abrasion-resistant material for “most severe” service and shall be furnished between the solids discharge and two flight lengths past the feed port as a minimum. The remainder of the scroll conveyor shall be furnished with abrasive-resistant material for “least severe” service. Solid flights welded to the scroll body are required. Ribbon designed flights will not be allowed unless they can be shown to significantly improve centrifuge performance.

2.6.07 <u>Vibration Isolators</u>. Each centrifuge unit and motor shall be mounted on spring or rubber-type isolators. The number, capacity, design, and vibrator constant of the isolators shall be as recommended by the isolator manufacturer for the load and impact resulting from operation of the centrifuge. Each isolator shall be provided with built-in leveling bolts and resilient shocks to control oscillation and withstand lateral forces in all directions. Housings shall be cast semi-steel or welded steel and springs shall be oil tempered high carbon chrome-vanadium steel. The centrifuge shall be mounted on anti vibration isolators guaranteed by the centrifuge manufacturer to control the vibration within the required limits. The isolator shall be designed such that the dynamic load does not exceed 1.05 times the static load. A maximum of 2.0 mils of displacement peak to peak measured on centrifuge pillow blocks at maximum operating speed will be acceptable under dry shop test conditions. Sensors shall be provided to monitor the vibration on the frame and/or gear housing.

2.6.08 Oil Lubricating System. An external pressure lubricating system shall be mounted on or adjacent to each centrifuge. It shall provide a controlled flow of filtered and cooled oil to each main bearing and shall consist of a reservoir, oil pump of adequate capacity with fractional horsepower motor, oil filter, water-cooled temperature controlled oil cooler, oil flow indicators, thermal switches, pressure gauge, relief valve, thermometers, and flexible hose lines. The oil cooler shall be a heat exchanger designed to maintain the temperature of the lube oil leaving the exchanger within the maximum limits for satisfactory operation of the centrifuge provided, giving due consideration to the quantity of heat to be removed, the type and quantity of the lube oil, and the temperature of the lube oil coming to the exchanger. The exchanger shall fulfill these requirements using not more than the amount of water indicated in the Service Water Connections paragraph of this section for cooling at a maximum ambient air temperature of 101 degrees F. The heat exchanger shall be of the oil-to-water type. The fouling factor, as defined by the Tubular Exchanger Manufacturers' Association Standards, shall be not more than 0.002. The pressure drop through the heat exchanger shall not exceed 5 psi for the cooling water. The oil pump controls will be interlocked with the centrifuge motor starter so that the oil pump has to be running before the centrifuge can be started. Oil temperature switches shall be furnished in the oil return lines or the pillow block bearings to stop the centrifuge on high bearing oil temperature. A flow or pressure switch shall be furnished in the oil line and a level control shall be furnished in the oil reservoir to stop the centrifuge or prevent it from starting on low oil level, flow, or pressure. The main bearing shall not be grease lubricated.

2.6.09 Influent Connections. Each centrifuge shall be furnished with flanged residuals inlet, polymer and flushing water connections. Flanges shall be flat-faced and shall conform to ANSI B16.1, Class 125 Dimension and Drilling. Flexible connections are required at each influent connection as specified herein. Machines using a nozzle or port smaller than 1-3/16 inches in any dimension to either introduce residuals into the centrifuge or to discharge dewatered residuals from the centrifuge bowls will not be acceptable.

2.6.10 Flexible Connections. All piping connections and the centrate and solids chutes shall be equipped with flexible connections. The flexible connections shall be flanged, ribbed, fabricated from neoprene and shall have 12 inches minimum laying length at the piping connections and a minimum laying length of 12 inches at the centrate and solids chutes. The flexible connections shall be bolted directed to the flanged outlets of the centrifuges, unless indicated otherwise. Stainless steel bolts with stainless steel retainer plates shall be provided at each end of flexible connections. No exterior loads are to be transferred to the centrifuge units. Flexible connections shall be designed to accommodate lateral and vertical movements of not less than 3/8 inch. Electrical conduits connected to the centrifuge equipment shall be installed with flexible connections. The arrangement of flexible connections shall be as recommended by the equipment manufacturer for the anticipated vibration and movement between centrifuge and rigid conduit termination.

2.6.11 Centrate Chute. A 3/16-inch stainless steel chute shall be provided for the centrate connection to each centrifuge. Each chute shall be welded construction, free from offsets and projections that might impede the flow of centrate. All joints shall be continuously welded and watertight. The inlet connection shall be coordinated with the flexible connection attached to the centrifuge. The outlet connections shall be compatible with the piping connections as indicated on the drawings. A vent connection, a sample pipe, and centrate spray nozzle connections shall be provided on each chute. The chute shall be provided with anchor bolts and anchor bolt templates. A centrate sampling port shall be provided in the centrate discharge, above the operating floor elevation. The centrifuge Manufacturer shall coordinate the design, installation, and operation of the chute with the piping provided by others.

2.6.12 Solid Discharge Chute. The solids discharge chute will be provided by the receiving screw conveyor supplier. The centrifuge supplier shall coordinate the design of the solids discharge chute with the receiving screw conveyor supplier.

2.6.13 Centrate Spray Nozzle. Two centrate spray nozzles for foam control shall be furnished for each centrate chute in locations recommended by the Manufacturer. Nozzles shall be cast bronze or Type 304 stainless steel, providing a solid cone-shaped spray pattern with a round impact area and spray cone angle between 120 and 130 degrees. Nozzles shall be Spraying Systems Co., Wheaton, IL, “13 (1/2-inch) Full Jet H-W small capacity (6 gpm)” or equal.

2.6.14 Shop Painting. Centrifuge is to be brown, gearbox yellow and motor orange. All other painting requirements are as described in Master Specification Section 09900, Painting.

2.7 DRIVE UNITS.

2.7.01 General. The centrifuge bowl shall be driven by variable frequency drive (VFD) controlled alternating current electric motor. The scroll conveyor back drive can be either powered by a VFD controlled alternating current electric motor and a cyclo or planetary gearbox or powered by a hydraulic drive unit with a constant speed electric motor. The centrifuge Manufacturer shall be responsible for coordinating the load and drive components to ensure that a complete and properly operating system is furnished. All equipment shall be derated as recommended by the drive Manufacturer for reduced-speed operation with an adjustable frequency drive.

2.7.02 Scroll Conveyor Back Drives. The back drive system shall provide automatic, torque-controlled regulation of relative scroll speed, corresponding to changes in feed concentration or quality. The back drive shall automatically maintain a preset torque input to the scroll by allowing the differential speed to vary. The back drive shall operate in such a manner that as the reactive torque of the scroll increases due to an increased solids inventory in the bowl caused by fluctuating feed concentration, the scroll speed shall gradually increase and conversely, as the inventory and resultant reactive torque decreases, the scroll differential speed shall decrease within an adjustable range. Torque-based adjustment shall be a function of input to the driven unit. The back drive shall offer a minimum differential speed range adjustment of 0 to 20 rpm. Each centrifuge unit shall be protected from damage as a result of high torque overload. A thermal overload protection system on the drive motor shall not be considered sufficient protection for the gear unit, but shall also be provided.

2.7.03 Alternating Current Back Drives. VFD driven ac back drives shall be equipped with a Cycle speed inducers, or planetary gear box, unit which shall control the differential speed between the centrifuge bowl and conveyor. The gear unit shall generate a torque capacity to meet the expected service conditions, but not less than 220,000 inch-pounds. The centrifuge manufacturer shall select the reduction gear ratio required to handle the solids obtained and to be consistent with satisfactory results. The gear units shall be lubricated by a built-in circulating oil lubrication system.

2.7.04 Hydraulic Back drives. Hydraulic back drives hall be supplied with a hydraulic reservoir complete with water-cooled temperature controlled heat exchanger and necessary filters. The necessary controls, tachometers, hoses, pressure gauges, and appurtenances to monitor the operating condition of the back drive and provide alarm and overload interlocks shall be provided. If hydraulic overload interlocks are electric, these controls shall be clearly indicated on control wiring diagrams prepared by the Manufacturer in accordance with the submittals section. Hydraulic back drives shall be water-cooled, shall have a minimum torque capacity of at least 292,000 inch-pounds and shall be of a design such that no gear reducer is required in the scroll conveyor drive train. The electric motor supplied with the hydraulic scroll drive shall be TEFC 460 volt, 3 phases 60 Hz with 1.15 service factor NEMA design B.

2.7.05 Direct Current Back Drives. Direct current (dc) back drives will not be acceptable.

2.7.06 Electric Motors. All motors provided shall conform to Master Specifications Section 16220, General Purpose Induction Motors except as modified herein. Motors shall be horizontal, squirrel-cage induction type rated 460 volts, three phase, and 60 Hz motor torques shall be adequate for the operating conditions. Motors shall have a 1.15 service factor. All motors shall be provided with a totally enclosed fan cooled (TEFC) enclosure with lifting lugs. Thrust and guide bearings shall be self-cooled, grease lubricated and shall be provided to withstand any momentary thrust and normal loads imposed on the motor. Antifriction bearings shall have an AFBMA L10 rating without adjustment factors of 40,000 hours at the specified operating conditions. Each motor shall be provided with an engraved nameplate stating the bearing identification and the type and weight of lubricant required. The continuous operation of the centrifuge equipment over the extreme operating feed rate ranges as specified shall not exceed the motor nameplate horsepower rating. Each motor shall be provided with a space heater element sized to prevent condensation on the core and windings. The space heater shall be isolated or so located as to prevent heat damage to adjacent painted surfaces and shall be suitable for 120 volt, 60 Hz, single phase power supply. Space heaters shall be wired to a separate terminal box from the motor terminal box. Space heaters shall be powered from the centrifuge motor control circuits at 120 volts ac and shall be energized only when the motor is off. With the motor at ambient temperature, it shall be capable of making two complete starts in succession with coasting to stop between starts. Each motor shall be capable of at least one restart within one hour after any shutdown. Each main drive motor shall have a minimum guaranteed efficiency of at least 94 percent. Each main drive motor shall be furnished with an oversized motor terminal box suitable for termination of up to two 4-inch conduits. Main drive and back drive motors shall be furnished with at least one automatically reset motor winding temperature switch per phase to trip off the motor on high temperature an alarm at the centrifuge control panel. Temperature switch contacts shall be wired in series, with the end leads brought out to a separate terminal box from the motor terminal box. Switches shall be as recommended by the motor manufacturer. Each motor used in conjunction with an variable frequency drive shall be specifically selected for service with an variable frequency type speed controller an shall be derated as required to compensate for harmonic heating effects and reduced self-cooling capability at low speed operation so that the motor does not exceed Class B temperature rise when operating in the installed condition at load with power received from the adjustable frequency drive. The motor shall be supplied with full phase insulation on the end turns and shall meet the requirements of NEMA MG1, part 31. Each motor used in conjunction with a variable frequency drive shall be provided with a warning nameplate on the motor to remind the operator to trip the main breaker prior to performing maintenance.

2.7.07 Base. Each drive unit shall be mounted on a rigid cast iron or fabricated steel base. The drive units shall be furnished with an adjustable, sliding base to adjust tension in the V-belt drive. Jacking screws shall be used to permit movement of the motor without the need to realign the motor after its sheaves and belts have been changed.

2.7.08 Sheaves and Belts. A matched set of V-belts shall be provided at each centrifuge. Motor sheave sizes shall be as selected by the centrifuge manufacturer for the specified application. Sheaves other than those furnished with equipment shall not be used without acceptance by the Engineer. V-belt and sheave groove dimensional tolerances shall be in accordance with the Engineering Standards for Multiple V-Belt Drives as published by the Multiple V-Belt and Mechanical Power Transmission Association.

2.8 CONTROLS. Each centrifuge unit shall be provided with a complete configured control system as required for safe and satisfactory operation of the unit. Each centrifuge shall be provided with a freestanding centrifuge control panel to be installed in the Control Room and a separate AFD panel to be installed adjacent to the centrifuge.

2.8.01 Centrifuge Control Panel Construction. The centrifuge control panel shall be a NEMA type 12 enclosures constructed of a least 12-gage stainless steel, with doors on the front. Access to the rear of the panel shall not be required. Enclosure doors shall be essentially full height, gasketed, continuously hinged type. In addition to the door retaining clips, each door shall be provided with a chrome-plated three-point latch and a single oil-tight operating handle for maintenance. The panel shall house all electronic instruments, controls, indicators, and the programmable logic controller.

2.8.02 Centrifuge Control Panel Operator Interface and Alarms. The operator interface unit shall be able to auto or manual start/stop as well as provide displays of the following: centrifuge drive motor amps, sludge desired and actual flow rates, polymer desired and actual flow rates, pre-set and actual operation time, grinder operation, cake discharge screw conveyor. The elapsed time meter shall be a six (6) digit, non-reset register type, with the last digit reading tenths of an hour. Fault Alarm and Shut down Conditions.

Faults that shall provide “alarms” include sludge feed header low pressure faults, grinder faults, polymer system low header pressure, and cake conveyor fault.

Faults that shall provide “alarm and shutdown” include main motor overheated, main drive malfunction, excessive vibration, back drive motor overheated, back drive malfunction, torque alarm, torque alert, lube pump overload, low lube oil flow-front pillow block bearing, low lube oil flow-rear pillow block bearing, excessive return oil temperature-front pillow block bearing, excessive return oil temperature-rear pillow block bearing, low differential speed, and centrifuge bowl over speed.

2.8.03 VFD Panel Construction. The VFD panel shall be a NEMA Type 4x enclosure constructed of at least 12-gage stainless steel with doors on the front. Access to the rear of the panel shall not be required. In addition to the door retaining clips, each door shall be provided with a chrome-plated three-point latch and a single oil-tight operating handle for maintenance. Provide closed loop top mounted air conditioners (120 volt) for all NEMA 4X stainless steel panels that have VFD’s. An adjustable thermostat shall be provided for panel enclosure temperature regulation. The operating temperature inside the panels shall be maintained to be

15% below the rating of VFD solid state devices. The panel shall house motor starters, variable frequency drives, control power transformers, power monitors, ac line reactors, and harmonic filters.

2.8.04 Panel Size and Arrangement. The centrifuge control panel and VFD panel shall be freestanding. Both panels shall be of the same height (72 to 90 inches) and the same nominal depth (24 to 36 inches) to assure flush alignment. Devices on the face of the panels shall be located not more than 60 inches above the panel base.

2.8.05 480 Volt Components. The VFD panel shall include provisions for terminating the 480-volt, 3 phase service for the centrifuge equipment on terminal blocks. Control voltage for motor starters, lights, relays, timers, auxiliaries, and for the centrifuge control panel shall be 120 volts, single phase from a control power transformer in the AFD panel. All controls shall be suitable for a supply voltage variation of ±10 percent. A voltage regulation transformer shall be provided if required.

The AFD panel shall be equipped with a main circuit breaker disconnect with an external operating handle. The circuit breaker shall be thermal magnetic type, and shall have an interrupting rating of at least 65,000 amperes at 480 volts.
Control power transformers shall be sized to handle all simultaneous loads. Control power transformers shall have primary leads fused, one secondary lead fused, and one secondary lead grounded. Motor starters for each ac motor not driven by a VFD shall be furnished in the VFD panel. Three phase starters shall be circuit breakers combination type, consisting of 3 phase, 60 Hz contactors with thermal overloads, a 120-volt ac coil, and a circuit breaker disconnect. Starters shall be NEMA rated for the motors furnished, and shall be at least NEMA Size 1. Circuit breakers shall be 600-volt magnetic motor circuit protectors. Each breaker shall be manually operated with a quick-make, quick-break, trip-free toggle mechanism. Each complete 3-phase starter shall have an interrupting rating of at least 65,000 amperes at 480 volts. The starters for the grinder and screw conveyor shall be included in the centrifuge starter panel.

Each VFD furnished in the VFD panel shall include an input circuit breaker, line reactor, and harmonic filter. Harmonic filters are not necessary if deemed so by the manufacturer. AFDs shall be UL listed and labeled and shall comply with the latest applicable standards of ANSI, NEMA, IEEE, and NEC. The variable frequency controller drive shall convert input power of 480 volt ac (±10 percent), 3 phase, 60 HZ (±2 percent), into an adjustable frequency output in an ambient temperature of 0°C to 40°C at the installed conditions on the jobsite. Each drive shall be of sufficient capacity and shall produce a quality output waveform for step-less speed control throughout the operating range. The controller shall be suitable for, and coordinated with, the thermal, electrical, and mechanical characteristics of the motor furnished. The variable frequency drives shall be of the 18 pulse width modulated, adjustable frequency inverter type, with a full-wave diode bridge rectifier to convert incoming ac voltage to a controlled dc voltage. The dc voltage shall be inverted to an adjustable frequency output. The inverter output shall be generated by insulated gate bi-polar transistors that shall be controlled by six identical base-driver circuits. The adjustable frequency output shall be capable of providing variable or constant volts/Hz excitation to the motor terminals up to the nominal 60 Hz rating. The inverter output carrier frequency shall be adjustable up to 6,000 Hz. The drive shall maintain a displacement power factor of 0.95 or better over the entire speed range. The drive shall have self-diagnostics for detection of failed electronic circuitry. The drive shall include fault detection and trip circuits to protect itself and the connected motor against line voltage transients, over temperature, power line under voltage and over voltage and output over current. The drive shall be protected by fast acting, current limiting input fuses. The drive shall be capable of sustaining 110 percent of motor rated full load current. The drive shall have a current limiting feature to prevent output currents greater than 100 percent of rating.

Each drive shall have a membrane keypad with integral 2-line, 24-character minimum LCD display mounted through the AFD panel door. The keypad shall be capable of setting all drive parameters and controlling drive operation, including manual/automatic operation modes, start/stop control, speed control, and alarm/trip reset functions. The drive shall have microprocessor-based digital logic control fully programmable from the front panel display with nonvolatile memory for the programmed functions. Maximum speed shall be field adjustable. The speed shall increase or decrease at a linear time ramp, independently adjustable for acceleration and deceleration control. The minimum speed (zero point), and the maximum speed (span) shall be independently fielded adjustable. Local set points shall be entered to the controller via the front panel controls. The input circuit breaker shall be thermal magnetic or instantaneous-trip type, and shall have an interrupting rating of at least 65,000 amperes at 480 volts. Variable frequency drives shall be protected from incoming voltage transients with an input ac line reactor. AC line reactors shall be designed to address performance issues of NEMA MG1-20.55 and to provide proper transient protection of the drive input power devices. AC line reactors shall be K-rated per IEEE C57-110 and shall be TCI “Model KLR’, or equal.

Harmonic filters shall utilize an interlocking contactor that shall be automatically operated by the drive run circuit. The filter shall be sized as recommended by the filter manufacturer for the motors and drives furnished. Harmonic filters shall be TCI “Harmonic Guard Series”, or equal.

The power monitor shall measure the total power in kilowatts supplied to the centrifuges. All required current transformers (CTs) and potential transformers (PTs) should be provided installed, and interfaced with the power monitoring system. The power use shall be displayed on the face of the panel and shall be connected as an input to the PLC to allow remote monitoring.

2.8.06 Programmable Logic Controller (PLC). The centrifuge monitoring, control and interlock logic shall be performed by a redundant programmable logic controller (PLC) located in the centrifuge control panel. The PLC shall be Allen-Bradley SLC 5/03 or equal. The PLC shall be capable of seamlessly integrating into the OWS system. The centrifuge operation will be remotely monitored. All safety interlocks and permissive from external equipment shall be hardwired to/from the centrifuge control panel. One spare processor and one spare of each type of PLC card, including power supply, shall be provided. Analog inputs and outputs shall be 4-20 mA dc. Discrete inputs and outputs shall be 120 volts ac. A minimum of 25 percent spare input/output (I/O) and 40 percent spare memory shall be provided. Spare processor shall be connected in a hot standby mode.

PLC software shall be completely configured and programmed by the Centrifuge Supplier. The Supplier shall furnish a laptop computer for maintaining the software. Supplier shall furnish a computer file copy of the PLC program and a printout of the PLC ladder logic. The printout shall be documented to clearly indicate the function of each rung in the logic. In addition, the printout shall include memory usage documentation to indicate all memory locations used. A dedicated port for connection of a cable to a programming device shall be provided on the PLC.

Local Operator Interface (LOI) Device shall be of a graphic display type and operator interface device to monitor and control the centrifuge and its entire ancillary systems shall be provided on the face of the centrifuge control panel. The unit shall be similar to an Allen Bradley Panel View. In addition to the LOI mounted on the centrifuge panel, Supplier shall provide local controls for maintenance testing mounted in each starter panel to be installed in close proximity of each centrifuge for local operation. These controls shall have pushbuttons for starting and stopping individual centrifuge components. Also provided will be monitoring run and stop lights.

A" software programmer" representative of the centrifuge supplier shall attend a software coordination meeting to coordinate issues such as the PLC address usage and interface requirements for communicating data to the OWS system. The meeting will be held at the project site after the centrifuge installation contract commences. A representative of the OWS system supplier/integrator will attend the meeting.

2.8.07 Machine Monitoring System. A vibration and temperature monitoring system shall be provided for the centrifuge main bearings. Vibration monitoring shall use a vibration transmitter and a snap action switch, or a solid state dual set point vibration switch for sensing vibration. Set-points shall be for alarm and shutdown. Vibration in excess of predetermined displacement shall automatically shutdown the machine. Vibration amplitude shall be indicated in the Centrifuge Control panel. The temperature monitoring system shall be a Basler "Model BE4-49R" or equal.

2.8.08 Centrifuge Control Operation. Each centrifuge shall be furnished with controls to operate as specified below. Controls shall include interlocks to associated equipment furnished by others such as the sludge grinders, sludge pinch valves, polymer pinch valves, cake solids screw conveyors, and SFE wash water supply valve. The sludge grinders and cake solids screw conveyors motor starter and controls shall be provide in the Centrifuge starter panel. See specification Section 17105 for the controls description and the Instrumentation and Control Centrifuge P & ID drawings for the control logic.

PART 3 – EXECUTION

3.1 INSPECTION.

3.1.01 Shop Testing. Each centrifuge unit shall be tested in the manufacturer's shop for mechanical performance, including vibration and noise, before shipment. Test shall be conducted using water as attesting medium. The Owner Engineer and Contractor shall be allowed to observe the testing with 2 weeks' written notice before testing begins. The testing procedure shall be submitted to the Engineer for record purposes.

Scroll Conveyor Abrasion Test for testing the abrasion-resistant material to be used shall be tested for abrasion in accordance with ASTM G65, Procedure A. The test shall be performed at a laboratory certified to conduct the test. The type of material proposed and the service conditions shall meet the requirements for abrasion resistance. Copies of the certified laboratory test report shall be submitted in accordance with the submittals section.

The Motor Shop Test shall be done by manufacturer and furnish complete certified performance test data on one main drive motor. The test shall conform to IEEE Report 112A, Forms A-1 and A-2. Tests may be performed on motors from this purchase or on previously tested electrically identical motors. If such data is to be furnished from tests on electrically identical motors, the Contractor shall so state. If the complete test is to be run on one motor to be furnished, the manufacturer shall notify the Engineer as stipulated in the quality control section. The motor manufacturer shall furnish the Engineer, through the centrifuge manufacturer, a sketch of the test setup showing the equipment and instrumentation to be used. Test points shall include ¼ load, ½ load, ¾ load, full load, and service factor load. Motors and certified test data shall be delivered to the centrifuge manufacturer before final assembly of the units is stated. If the motors fails to operate properly, or fails to meet the testing requirements during testing, the manufacturer shall modify or repair all motors for this contract and perform additional tests. Provisions for witnessing additional tests are covered in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

3.1.02 Field Quality Testing. Manufacturers Field Installation and Checkout Services: The centrifuge Manufacturer shall provide the services of a qualified field representative to assist during installation, mechanical/electrical checkout and startup of the equipment by the Contractor. As a minimum, the centrifuge Manufacturer's field representative shall be made available as follows, travel time excluded.

Initial installation assistance (2 trips)	8 days (total)
Checkout assistance (3 trips)	12 days (total)
Startup assistance (4 trips)	20 days (total)

The centrifuge Manufacturer shall also supply and install all oil, grease. And hydraulic fluids required for initial operation.

3.1.03 Field Mechanical Electrical Test. In conjunction with startup, after installation and mechanical and electrical checkout of the units and after all accessories are in operable condition, a Field Mechanical Electrical Test shall be performed by the Contractor under the supervision of the centrifuge Manufacturer in the presence of the Engineer. Each unit shall be subjected to a complete normal start, normal stop, and emergency stop cycles. Each unit shall then be subjected to a 4-hour running test. At the beginning and end of the test and at periodic intervals between, all thermometers, pressure gauges, and flow indicators shall be observed and recorded. All safety devices shall be checked for satisfactory operation. The no-load amperage of the motor shall be checked and recorded. The start timer and acceleration time to running speed shall be checked and adjusted, if necessary. The belt tension shall be adjusted at the end of the test, checked and readjusted, if necessary, at the end of the test, and complete instructions given to the operator for further check and adjustment at the end of an additional 72 hours of operation. Any malfunctions appearing during the tests shall be corrected and additional testing performed, as directed by the Engineer to assure that the defective or maladjusted equipment will perform satisfactorily after adjustment.

3.1.04 Field Performance Tests. A performance test shall be run on each centrifuge unit after the installation is complete and the units are operating properly as determined by the representative of the centrifuge Manufacturer. The performance test shall be conducted by a capable representative of the centrifuge manufacturer and accepted by Engineer. The Owner's operating personnel shall assist the centrifuge Manufacturer's representative in the performance test. A designated representative of the Contractor and the Engineer shall observe the performance test. As a minimum the Manufacturer's field representative shall be made available as follows for the performance tests, travel time excluded: Performance testing (trips as required - 30 day total). At least 2 weeks prior to the proposed testing date, the Contractor shall notify the Engineers of the testing date and shall submit a report from the centrifuge Manufacturer detailing the proposed performance testing procedure and analyses. Proposed data collection sheets shall be submitted for review.

Preliminary field tests shall be conducted using the centrifuge unit under the design conditions specified. Preliminary field tests shall consist of a series of runs to determine the appropriate pool depth, operating torque, and polymer dosage to meet the design conditions.

Extended Duration Field Tests shall be conducted to demonstrate the equipment's ability to consistently perform at the design conditions specified after the appropriate operation parameters are established. Each centrifuge unit shall be operated for a minimum of 48 consecutive hours under design operating conditions. The centrifuge manufacturer's representative shall adjust machine operation at the start of each 8 hour shift and shall make no further adjustments during each 8 hour shift unless specifically authorized by the Engineer. Each centrifuge shall be tested on successive days for the service conditions specified. The test results will be used to prove compliance with the performance requirements specified in paragraph 2.3 prior to acceptance of the equipment. Consistent compliance with design conditions shall be defined as the average of all sample values meeting or exceeding the specified performance requirements. A protocol shall be developed for the 48 hour test. This will include but not be limited to the following: No more than 2 centrifuges may be tested at one time. The average operating data for each 24 hour period of the 48 hour test shall have to meet the performance criteria. Each machine being tested shall be equipped with a temporary watt meter. Essentially steady state operation shall be maintained throughout the test. The centrifuges will be required to maintain acceptable performance while dewatering residuals with characteristics within the specified ranges. WWTP house (See Appendix A) liquid emulsion polymer shall be the only polymer used as a basis of centrifuge performance.

Samples shall be taken at approximately one-hour intervals during the test. The following test determinations shall be made on the appropriate sample. For Influent Flow, determine the flow rate of the gravity thickened residuals entering the centrifuges. For Influent Solids, determine the solids concentration of the gravity thickened residuals entering the centrifuges. For Dewatered Residual Solids, determine the percent solids concentration of the dewatered residuals discharged from the centrifuges. For Centrate Solids, determine the suspended solids concentration of the centrate discharged from the centrifuges.

Samples will be collected as directed by the Engineer, and analyses performed by an independent testing laboratory. Parallel samples may be collected for analyses by others. The Engineer shall initial all data sheets. The polymer usage (pounds per dry ton of solids in centrifuge influent residuals) shall be measured and recorded during the dewatering performance test. The polymer consumption rate shall be calculated and recorded using the polymer flow rate liquid polymer concentration, and subsequent polymer dilution as required. The consumption rate shall be measured and recorded hourly during the steady state performance tests, and the polymer consumption rate shall be the average rate over the testing period. Should the equipment not achieve consistent compliance during the extended tests or require a higher polymer dosage than that specified to achieve compliance then the centrifuge manufacturer should modify the equipment and repeat the field evaluation tests. Costs of modifying equipment or subsequent retesting shall be borne by the centrifuge manufacturer. Additional equipment shall include all items specified or indicated to be part of the dewatering system.

3.1.05 Field Evaluation Report. The Contractor shall prepare a written report within 10 days after completion of the tests presenting the results of the field evaluation tests. The report shall include all laboratory analysis reports and recorded data and observations as specified. Six copies of the report shall be submitted to the manufacturer and the Engineer within 30 days after completion of the specified tests. The report shall include all data collected during field testing, including, but not limited to, the following:

Results of preliminary test runs to select pool depth, operating torque, and polymer dosage. Data from extended duration testing to demonstrate consistent achievement of design conditions for the centrifuge, including at least hourly data for residuals feed rate, feed solids concentration, polymer consumption rate, centrate suspended solids concentration, cake solids concentration. Conclusions from extended duration field testing utilizing the average of the data collected, including hydraulic throughput (gpm), solids throughput dry (tons/hr), cake consistency (percent dry solids), solids capture efficiency (percent), polymer type, and polymer use (lbs/dry ton solids.

A complete solids balance shall be developed form flow metering together with the solids concentration tests. Solids balance calculations shall be used to verify the accuracy of measured quantities.

3.1.06 Balance. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Excessive vibration shall be sufficient cause for rejection of the equipment. The mass of the unit and its distribution shall be such that resonance at normal operating speeds is avoided. In any case, the vibration displacement (peak-to-peak) as measured at any point on the centrifuge pillow block bearing housing shall not exceed 2.0 mils without residuals feed. At any operating speed, the ratio of rotative speed to the critical speed of a unit or components thereof shall be less than 0.8 or more than 1.3. A vibration monitoring and shutdown system shall be provided to shut down the centrifuge upon excessive vibration.

3.1.07 Noise Levels. Sound generated by all centrifuges (one at a time running by itself) shall not exceed 92 dBA at a free field distance of 3 feet in any direction under load as installed, in accordance with ANSI S1.4-1971 specifications. If the sound exceeds 92 dBA, the equipment shall be modified or a sound attenuation package shall be provided at no additional cost.

3.2 INSTALLATION. Install all items in accordance with the manufacturer's printed instructions as indicated and as specified.

Make necessary adjustments to place equipment in satisfactory working order and ready for acceptance testing.

3.3 SERVICE AND MAINTENANCE. Centrifuge manufacturer shall service and maintain all centrifuge equipment according to the general conditions and the following requirements. After installation by the Contractor, the centrifuge manufacturer shall service and maintain all centrifuge equipment until all centrifuge equipment has successfully completed all performance testing. All service and maintenance during this period shall be furnished by the centrifuge manufacturer at no additional cost.

3.4 EQUIPMENT IDENTIFICATION AND MANUFACTURERS NAMEPLATES.

3.4.01 Equipment Identification. Each centrifuge denoted by a symbol and an identifying number in the Specifications or on the Drawings shall be provided with permanent plastic or metal identification nameplates. An identification nameplate shall be placed on each starter panel, back drive panel, control panel, and centrifuge. Identification used shall be the same as the symbol indicated in the Specifications or on the Drawings and shall be located in a conspicuous place as acceptable to the Contracting Officer. Plastic nameplates shall be made of laminated material and shall have engraved letters extending through the black face into the white layer. Letters shall be approximately 1 inch tall. Nameplates shall be mechanically fastened to the equipment surface.

3.4.02 Manufacturer’s Nameplate. Each major component of equipment shall have the manufacturer’s name and address, and equipment model number and size on a nameplate securely affixed to the equipment. The nameplate of the distributing agent only will not be acceptable.

End of Section

SECTION 11820

COMMINUTORS

PART 1 – GENERAL

1.1 SCOPE. This section covers the furnishing and installation of comminutors (including sludge grinders, scum grinders, etc.).

Each comminutor unit should include at minimum a grinder, reducer, motor and control panel.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Equipment furnished and installed under this section shall be fabricated, assembled, erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer.

All electrical equipment shall conform to applicable standards of Division 16, Electrical.

1.2.02 Governing Standards

American Society of Testing and Materials (ASTM).

Anti-Friction Bearing Manufacturers Association.

National Electric Code.

American Iron And Steel Institute

Underwriters' Laboratory (UL).

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. Manufacturer shall have a minimum of 5 years of experience of producing substantially similar equipment, and shall be able to show evidence of at least 5 installations in satisfactory operation for at least 5 years in the continental United States.

1.3.02 Field Quality Control. Supplier shall provide the services of a factory-trained representative to check installation and to start-up each comminutor. Factory representative shall have complete knowledge of proper installation, operation and maintenance of equipment supplied. Representative shall inspect the final installation and supervise a start-up test of the equipment.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Drawings and Data should be submitted as specified in Section 01080, Project Submittals.

1.4.02 Operations and Maintenance Manuals. CONTRACTOR shall provide Operation and Maintenance manuals in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING.

Delivery, storage, and handling of comminutors, and all associated parts are to take place as specified in Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.6 WARRANTY

The products shall be warranted against any defects in material or workmanship per Master Specification Section 01170, Warranties and Bonds.

PART 2 – PRODUCTS

2.1 SERVICE CONDITIONS.

2.1.01 General. Furnish equipment suitable for the process and service conditions as described. All grinders will normally receive intermittent discharges of scum and/or sludge from facilities associated with the Work. Grinder shall be capable of operating without a hot water system.

2.2 ACCEPTABLE MANUFACTURERS
Products shall be supplied by any of the following manufacturers: Monofolo, Inc of Houston, TX, or JWC Environmental, Inc. of Costa Mesa, CA

2.3 CONSTRUCTION.

2.3.01 Cutting Elements. The inside configuration of both the individual cutters and the individual spacers shall be hexagonal so as to fit the shafts with a total clearance not to exceed 0.009 inch across the flats. Individual cutters and spacers shall be AISI 4140 Heat Treated Alloy Steel, surface ground for uniformity and through-hardened to a minimum 45-50 Rockwell C. Cutter configuration shall consist of one shaft with individual 5-tooth double-edged cutters and one shaft with individual 11-tooth cam cutters. To maintain particle size, the height of the tooth shall not exceed 5/16-inch (8 mm) above the root diameter. Cutter to cutter root diameter overlap shall be not less than 1/16-inch (1.6 mm) or greater than ¼-inch.

2.3.02 End Housing and Covers. Grinder end housings shall be cast of ASTM A 48-83 Class 40 grey iron with a cast-in-place flow deflector, designed to protect the bushings while guiding particles directly into the cutting chamber. Provide gasketed housing having standard bolted inlet for securing the grinder to the conveyor housing. Provide support frame on the outlet connection as shown on the drawings and as described herein.

2.3.03 Shafts. Grinder shall be made of AISI 4140 heat treated hexagon steel with a tensile-strength rating of not less than 149,000 psi. Each shaft hex shall be a maximum thickness of 2 inches.

2.3.04 Seals. The radial and axial loads of the shafts shall be borne by four sealed oversize Conrad-type ball bearings. The bearings shall be protected by a combination of a tortuous path device and end face mechanical seals. Face materials must be a minimum of tungsten carbide to tungsten carbide, not requiring an external flush or any type of lubrication. The mechanical seal shall be rated at 90-psi continuous duty by the seal supplier. The bearings and seals shall be housed in a replaceable cartridge that supports and aligns the bearings and seals, as well as protects the shafts and end housings. O-rings and seal wedges shall be made of Buna-N elastomers.

2.3.05 Drive Unit Assembly. Drive unit assembly shall have a speed reducer and electric motor connected by a flexible direct shaft coupling. Speed reducer shall be a grease filled cycloidal type of reducer with "Heavy Shock" load classification and enclosed in a cast iron or welded steel weatherproof casing. Speed reducer moving parts shall be immersed in oil, and bearings shall be anti-friction throughout. Casing shall be provided with inspection covers, oil fill, and drain connections and means for inspection of oil flow. Inspection, oil fill and drain covers shall be chained to the casing.

2.3.06 Side Rails. The inside profile of the side rail shall be concave to follow the radial arc of the cutters. The side rails shall be affixed to the grinder and maintain a clearance not to exceed 5/16-inch between major diameter of the cutter and the concave arc of the side rail. Each side rail shall incorporate a pocket area which provides positive location and attachment of the cleanout comb cartridges. Side rails shall be cast of ASTM A 536-84 ductile iron.

2.3.07 Cleanout Combs. Each side rail shall have a cartridge style comb which is positioned between the cutters at the outer side of each cutter stack. The cleanout combs act to strip grease and other scum materials from the backside of the grinder to prevent in-process buildup or blinding of the flow passages through the grinders. The cleanout combs shall prevent any blinding or buildup of scum material on the upstream side of the grinder.

2.4 MOTOR. Unless otherwise noted, motors shall follow requirements as described in Master Specification Section 16220, General Purpose Induction Motors.

2.5 CONTROL PANEL. Each unit shall be supplied with a programmable control unit, mounted in a NEMA enclosure as specified by Engineer. The panel shall include forward and reverse contactors, fuses, thermal overloads. Control panels, programmable control units and other modules to be contained within the panel should comply with the requirements of Master Specification Division 17, Instrumentation and Controls.

2.5.01 Operation and Alarm Sequence. The programmable control unit shall measure motor power. In the event of an overload, the controller shall cause the grinder to reverse momentarily to clear the condition. The grinder shall then return to normal operation. If the unit reverses 3 times within a 30 second period, the unit shall reverse, shut-down, and activate an alarm

2.6 PAINTING. Clean and prime ferrous metal surfaces of equipment in the shop in accordance with the requirements of Master Specification Section 09900.

PART 3 – EXECUTION

3.1 INSPECTION. Inspect and verify that structures or surfaces on which the equipment will be installed have not defects which will adversely affect installation. Inspect all equipment prior to installation. Promptly report defects which may affect the Work to the Engineer.

3.2 INSTALLATION. Install in a manner and to the tolerances recommended by the equipment manufacturer.

3.3 FIELD QUALITY CONTROL. A manufacturer’s factory-trained representative shall check and approve the installation before operation. The representative shall operate and test system in the presence of Engineer and verify that the equipment conforms to requirements, and instruct relevant personnel on care and maintenance. The representative shall revisit the Site as often as necessary until all deficiencies are corrected. Perform testing, checkout and start-up of the equipment under the technical direction of the manufacturer’s factory-trained representative. Do not energize drive system without authorization from manufacturer’s representative.

End of Section

SECTION 11975

BLOWERS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous blower units and accessories.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Contractor.

Each unit shall be furnished and installed complete with all anchors and supports; all mechanical equipment required for proper operation, including a complete drive unit; and all additional materials or construction required by the manufacturer's design.

Master Specification Section 01180, Equipment, Materials, Parts and Tools shall apply to all equipment furnished under this section.

Power supply to the equipment will be 480 volts, 60 Hz, 3 phase, unless indicated otherwise on the drawings.

1.2.02 Governing Standards. Unless otherwise specified, the work of this Section shall conform to the applicable portions of the following Standard Specifications:

AFBMA - Anti-Friction Bearings Manufacturers Association

ANSI – American National Standards Institute

ASTM – American Society for Testing and Materials

NEMA – National Electrical Manufacturers' Association

1.3 QUALITY ASSURANCE. All blower units shall be one manufacturer. The manufacturer shall be Hartzell Fan, Inc. or approved equal.

1.3.01 Manufacturers Field Services. Provide services of manufacturer's representative for start-up and acceptance testing of blower units as follows:

Align blower and motor couplings after bases have been grouted.

Shop and field test blower units specified herein.

To assist in the start-up and testing of pumping units, provide 2 man-days minimum of on site factory representative personnel. Man-day requirements do not include travel time and do not relieve the Contractor of his obligation to provide the required service to place all pump units in acceptable operation.

1.4 SUBMITTALS. Submit complete shop drawings in accordance with section on Project Submittals.

As a minimum, shop drawings shall include a bill of materials, front views, assembly drawings, discharge transition duct piece, schematics and wiring drawings.

Submit for review the name of the manufacturer, trade name and/or model designation and catalog cuts.

Submit operation and maintenance manuals in accordance Master Specification Section 01160, Training and Operations & Maintenance Manuals.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. The blower units shall meet the following design criteria:

The Blowers shall be Direct Driven with Down Blast Discharge.

All internal hardware shall be 300 series stainless steel encapsulated with fiberglass.

Blower units shall be furnished completely assembled.

Motor shall be readily accessible.

Wheel shall be flat blade radial design of one-piece construction, die formed of individual laminations of fiberglass.

The bearings shall have a minimum L_{10} life of 20,000 Hrs.

Motors shall be open end drip proof.

PART 3 - EXECUTION

3.1 INSTALLATION. Install all items in accordance with the manufacturer's printed instructions as indicated and as specified.

Make necessary adjustments to place equipment in satisfactory working order and ready for acceptance testing.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. Give each blower unit a running test in the presence of the Engineer to demonstrate satisfactory operation.

Make whatever adjustments are required to achieve a satisfactory test.

End of Section

INDEX

DIVISION 12 – FURNISHINGS **PAGE NO.**

SECTION 12100

OFFICE FURNISHINGS AND FIXTURES

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous office furnishings and equipment including all accessories and window treatments.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing Materials) D635 – Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position

FS (Federal Specification) CCC-T0191b – Specification for Flame Retardancy of Textiles.

NFPA (National Fire Protection Association) 70 – Specification for National Electrical Code

NFPA 701 – Specification for Fire Tests for Flame-Resistant Textiles and Films.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturers Qualifications. Manufacturers shall have not less than 5 years documented experience in manufacture of furnishings and equipment specified in this section. Provide window shades and blinds as complete units produced by one manufacturer, including hardware, accessories items, mounting brackets and fastenings.

1.3.02 Flame Retardant Materials. Shall be approved by Michigan State Fire Marshall Office. Shade fabrics shall comply with and have passed either NFPA 701 or FS CC-T-191 test.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit layout drawings for equipment and furnishings showing proposed locations and where applicable, details of fabrication and installation. Submit data showing details of construction, dimensions of individual components, profiles and finishes. Also, include attachments, accessories, utility and service requirements and locations. Submit operation and maintenance data for products furnished under this section.

1.4.02 Samples. Submit samples of proposed finishes for color selection.

1.5 RECEIVING, HANDLING AND STORAGE. Handle and store materials carefully. Protect products from weather and other damage.

1.6 WARRANTY. Provide installation warranty for a period of 2 years against defective materials and workmanship.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Furnishings and equipment shall be provided by the following full service contracters EMCO Industries, Raymond Engineering, Steel Case or equal.

2.2 WINDOW TREATMENTS.

2.2.01 Shades. Fabrics shall be washable, flame resistant cotton duck; color as selected.

Slats shall be selected white pine or plastic; tapered at ends.

Pull shall be braided cord with rayon ring pull attached to lower hem by metal eyelet.

Roller shall be minimum 1-1/8 inch (2.9 cm) seasoned straight grained white pine with tempered steel spring, nylon bearings, and zinc coated metal parts.

2.2.02 Blinds. Slat supports shall be braided of polyester yarn and dimensionally stabilized.

Slats shall be virgin aluminum alloy 1.0 inch (2.54 cm) wide and shall have plastic type coating.

Head channel shall be 0.025 inch (0.635 mm) thick steel U-shaped with plastic type coating.

Tilt control shall consist of an enclosed worm and gear tilting mechanism.

Bottom rail shall be of 0.031 inch (0.787 mm) formed steel.

Cord shall be of adequate diameter of high strength synthetic fibers.

2.2.03 Curtain Rods. C-shaped track, minimum 0.03 inch (0.762 mm) thick roll-formed steel; manufacturer's standard white finish; by Kirsch or Graber.

2.2.04 Accessories, Brackets, Fittings and Fastenings. Suitable for proper and satisfactory installation and operation of shades, blinds, and curtain rods.

Unless otherwise specified or indicated, provide materials, construction and finishes in accordance with the manufacturer's latest catalog published at time of bidding, and with approved Samples.

2.3 COMMAND AND CONTROL CONSOLES.

2.3.01 Components. Electronic equipment enclosures also referred to as consoles, are modular and flexible components for computer workstation environments. Typical components include the following:

Equipment Positioning Kits:

CRT's.

PC Processors.

Rackmounts.

Operator Convenience Components:

Pencil Drawers.

Binder Storage Compartments.

Mobile Storage Pedestals.

Form Storage/Paper Organizer.

Keyboard Accommodation:

Under counter retractable ergonomic tray.

First level retractable tray with wrist rest as indicated on the drawings.

Console Accessory Items:

Ventilation Fans (shall be 4 inch (10.2 cm) diameter muffin fans, sized as required to extract heat to exterior of unit, with grilles).

Cable Management Trays.

Peripheral Accessory Items:

Printer Enclosures

Storage Cabinets

LAN Cabinets, Credenzas, Conference Tables, Podiums, Media Cabinets, and Chairs

2.3.02 Hardware. Utilize manufacturer's standards for hardware applications.

2.3.03 Specialty Components.

Pistons: Gas operated for maximum actuation.

Worksurface Adjustable Hardware.

CRT Adjustable Shelf.

Anti-Glare Filters.

Electric Plug Strip.

Task Lighting.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Consoles Fabrication.

Shop assembles consoles.
Fabricate each unit rigid, not dependent on building structure or adjacent units for rigidity.

Fit shelves, doors, and exposed edges with plastic edging. Use one piece for full length only.

Cap exposed plastic laminate finish edges with plastic laminate finish edges with plastic trim.

Door and Drawer Fronts shall be 3/4 inch (1.9 cm) thick overlay style.

2.4.02 Shades. Number the shades and curtain rods as to the specific locations in the Work. Provide single widths of fabric with no center seams for each shade. The shade mounting system shall allow for shade removal and replacement without dissembling hardware assembly.

PART 3 - EXECUTION

3.1 INSPECTION. Verify existing conditions before starting work, including adequacy of backing and support framing and location and sizes of utility rough-in associated with work of this section.

3.2 PREPARATION. Protect the Work and adjacent construction against damage.

3.3 INSTALLATION. Install the Work in accordance with manufacturer's instructions and approved Shop Drawings. Install wall blocking as required for wall mounted furnishings.

3.3.01 Fasteners. Use fastening devices to secure hooks to wall construction which are appropriate for type of construction being mounted to.

3.3.02 Location. As noted on drawings. Verify mounting height with Engineer prior to installation.

3.3.03 Console Installation. Consoles shall be installed by the manufacturer's factory trained installers and shall be completed as indicated in the project schedule.

Adjust doors, drawers, hardware, fixtures, and other moving or operating parts to function smoothly.

Touch up damaged finishes equal to original condition as approved.

End of Section

SECTION 12200

LABORATORY FURNISHINGS AND FIXTURES

PART 1 - GENERAL

1.1 SCOPE. This section covers laboratory furnishings, fume hoods and other laboratory equipment and fixtures including control systems materials and equipment, complete with components and accessories.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) A167 – Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip.

ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

ASTM B221 – Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes and Tubes.

ASTM B584 – Specification for Copper Alloy Sand Castings for General Applications.

ASTM C1036 – Specification for Flat Glass.

ASTM D570 – Test Method for Water Absorption of Plastics.

ASTM D635 - Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position

ASTM D638 – Test Method for Tensile Properties of Plastics.

ASTM D695 – Test Method for Compressive Properties of Rigid Plastics.

ASTM D785 – Test Method for Rockwell Hardness of Plastics and Electrical Insulating Materials.

ASTM D790 – Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

NFPA 30 (National Fire Protection Association) – Specification for Flammable and Combustible Liquid Code.

NFPA 70 – Specification for National Electrical Code.

Underwriters Laboratories (UL) 913 – Specification for Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II and III, Division 1, Hazardous Locations.

1.2.02 Definitions. Conventional Hood - A fume hood with a sliding sash and fixed solid upper panel. The net opening area into the hood varies with sash position.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Indicate equipment and fixture locations. Include details of connections between units and to adjacent work, the location and size of holes and cutouts, and dimensional locations for rough-in of mechanical and electrical services.

Include system piping and electrical connections, a written description of operation, and data on equipment used including flow measuring devices and dampers.

Submit engineering data for automatic control dampers and volume control devices stating the amount of leakage, flow characteristics and construction of the device.

Furnish graphic flow diagram drawings for each system.

Label items and devices shown and indicate coordination with: submitted catalog information, proper settings and adjustments of instruments, normal condition of devices (such as normally closed dampers, normally open valves and contacts), and sizes of devices and accessories included with devices.

Submit a control diagram for each system with a complete written sequence of operation pertaining to the diagram and shown on the same drawing. Submit control sequences incorporating symbol elements from diagrams, such as D-1 Exhaust Damper.

Submit catalog sheets for every item used in the system showing two or more devices or models of a device, marked to show the specific model and/or accessories being used in the control diagram.

1.3.02 Certifications. Submit a statement of compliance for performance requirements.

Submit certification that the laboratory hood control system manufacturer has supervised the installation of the control systems in the fume hoods, including a listings of personnel, dates, and times of supervision. Manufacturer shall attest that the level of supervision provided is sufficient to accomplish a quality and well integrated installation.

Submit a statement attesting that the laboratory hood control system manufacturer understands and accepts the responsibility for the integration of these control systems into the fume hood construction, and that the control systems are functioning properly and as designed.

Submit certification that the laboratory hood control system manufacturer has supervised the installation of the interconnection of the laboratory hood control system with all other building and system controls or construction, and attests that such construction is in full compliance with the laboratory hood control system performance requirements as specified herein.

1.3.03 Samples. Submit the following samples:

Interior lining material, 12 x 12-inch (30.48 cm x 30.48 cm) size.

Working surface, with depression, 12 x 12-inch (30.48 cm x 30.48 cm) size.

Finish for sheet steel.

One full size combination drawer and cupboard base cabinet.

Submit complete operation and maintenance manuals as specified in Master Specification Section 01160, Training, Operation and Maintenance Manual.

1.3.04 Documentation and Training.

Provide thorough documentation and training to permit the Owner to perform the necessary operation and maintenance functions required by the system.

Provide 3 days of onsite training for Owner’s Personnel. Training to include, but not limited to, system operation, troubleshooting, instrument calibration, alarm handling and system reconfiguration.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

2.1.01 Operation of Metal Fume Hoods. Design conventional general purpose fume hoods to operate at the total cfm (cubic meter) and a maximum static pressure as indicated on the Drawings.

2.1.02 Hood Design. Design the fume hood so that when properly installed in a laboratory and connected to an exhaust system of the proper capacity, it will contain and remove fumes generated within the hood and will exhaust light or heavy gases efficiently.

"Properly installed" means installed in an area where there is at least 5 feet (1.5 m) of clear space in front and sufficient space on each side for observation of the airflow pattern entering the hood and where there are no cross drafts or other air currents exceeding 10 fpm (3.05 m per min.) that would affect the hood performance in the area in front and around the hood.

Design hood to maximize user safety and energy conservation. Hood shall operate on room air only with no auxiliary air supply and provide a constant sweep of air through the hood, obtained over an airfoil sill, when the sash is closed, and to maintain a constant face velocity when the sash is open at any position.

2.1.03 Verification of Fume Hood Face Velocities. With exhaust system in operation, determine the quantity of air being exhausted by measuring the velocity of the air entering the hood face, and multiplying this velocity by the square feet of hood opening. Determine the air velocity by averaging at least six velocity readings taken in the center of a grid made up of 3 sections across the top half of the hood face and 3 sections across the bottom half of the hood face. Maximum variation of readings from the average face velocity: plus-or-minus 10 fpm (3.05 m per min.).

2.1.04 Air Flow – General. When the selected face velocity has been established and verified, perform the following tests:

Make a complete traverse of the hood face with a cotton swab dipped in titanium tetrachloride to demonstrate that a positive flow of air is maintained into the hood over the entire hood face. No reverse air flow or dead air space will be permitted.

Paint a strip of titanium tetrachloride along each end and across the working surface of the hood, in a line parallel with the hood face and 6 inches (15.24 cm) back into the hood to demonstrate that no back flow of air exists at these points and that flow of smoke is directly to the rear of the hood, without swirling turbulence or reverse flow.

Discharge a smoke bomb (one half-minute size, as available from E. Vernon Hill Company) within the hood area to show the exhaust capability of the hood and its design efficiency. No reverse air flow will be permitted. Place lighted bomb in the hood area and move it to various places, checking end panels and working surface to verify that no reverse air flow exists at any point. Lower the sash to closed position to verify that a sufficient air volume is flowing through the hood work area to carry away fumes from a massive fume source. Verify that, within one minute after the smoke bomb stops discharging smoke, the hood area is purged of smoke.

Repeat the above test for every face velocity setting selected to be tested in the 70-125 fpm range (21.3 - 38.1 m per min.).

2.1.05 Sash. Provide sash which will glide smoothly and freely and hold at any height without creeping, assuring proper counter-balance.

2.2 ACCEPTABLE MANUFACTURERS. Fume hoods may be provided by Kewaunee Scientific Equipment Corp., Fisher Hamilton Scientific Inc., Labconco, Inc, or as approved.

2.3 MATERIALS. Unless otherwise specified or indicated, provide materials, construction and finishes in accordance with the manufacturers latest catalog published at time of bidding, and with approved Samples.

2.3.01 Molded Resin for Casework. Modified epoxy resin as manufactured by Epoxyn Products, Kewaunee Scientific Equipment Corp., or as approved, uniform in mixture throughout thickness, non-glaring, black color, having the following minimum properties as tested in accordance with referenced ASTM designations:

Flexural strength	15,000 psi (103,410 KPa); D790
Compressive strength	35,000 psi (241,290 KPa); D695
Tensile strength	8,500 psi (58,599 KPa); D638
Hardness, Rockewell M	100; D785
Flammability	Self extinguishing; D635
Water absorption, percent by weight, maximum in 24 hours	0.02; D570

2.3.02 Stainless Steel. Shall be per ASTM A167, Type 304, No. 4 finish, unless otherwise specified.

2.3.03 Sheet Steel. Shall be per ASTM A366 and free from scale, pits, buckles and other imperfections. Sheet steel for surfaces exposed to view: stretcher leveled.

2.3.04 Aluminum. Shall be per Extruded aluminum, ASTM B221, alloy 6063-T42 or 6063-T5.

2.3.05 Glass. Shall be per ASTM C1036, glass for framed doors.

Safety glass for metal fume hoods: sheets of float glass separated by clear plastic interlayer.

2.3.06 Sealant. Shall be two-component epoxy compound.

2.3.07 Table Leg Shoes. 2 1/2 inch (6.35 cm) high vinyl with bottom coved, color to match base selected by the Engineer for the room finish.

2.3.08 Fixture Materials. Chromium-plating: an electro-deposited copper-nickel-chromium coating. Minimum thickness of chromium: 0.000015 inch (.0000381 cm).

Leaded red brass castings Shall be per ASTM B584.

2.3.09 White Polyresin. White polyresin shall be per as manufactured by Fisher Hamilton Scientific Inc, or as approved with uniform color throughout.

Material consists of a press-molded, that converted catalyzed glass polyester sheet which is flame retardant, self extinguishing.

2.4 CONSTRUCTION. Provide fume hood superstructure of double wall construction with a flush interior lining and a removable interior baffle with adjustable openings at top and bottom, or at top, bottom and middle. Fabricate screws and other metal exposed on interior, except service fixtures, of stainless steel. Fabricate exterior of sheet steel.

Provide interior light fixture, UL-listed, two-lamp fluorescent, 120-volt, unless otherwise specified, shielded from hood interior by safety glass or tempered glass sealed to hood and provided with access panel.

Fabricate sliding sash of 18 gage (1.3 mm) steel or stainless steel sheet frame with corners overlapped and welded or mitered and welded and ground smooth, glazed with safety glass set with rubber channel and stainless steel inside stop screwed on. Provide vertical sliding sash suspended on stainless steel cables over ball bearing sheaves, counterbalanced to insure non-binding sash performance and fitted with chromium-plated pull handles or integral, full-width, flush pull. Provide single-hung sashes, except at 8 foot (2.4 m) hoods, which shall have two equally dependent interlocking operation vertical full view sashes so that each can be opened only when the other sash is fully closed. Sashes to ride in PVC or stainless steel guides. Provide access to counterweight system for maintenance.

Provide sash stops at 18 inches (45.72 cm) above the working surface.

Fabricate duct collar at top of hood of terne plate with plastic metallic aluminum finish or stainless steel.

Mount an air foil at bottom of hood opening, with approximately a one-inch open space between the foil and top front edge of working surface, extending back under sash so that sash closes on top of the foil.

Provide all operable components, work surfaces, fixture locations and clearances at Fume Hoods indicated as ADA compliant to comply with ANSI CABO A117.1.

2.4.01 Casework Materials. Provide casework, including cabinets and countertops, which is the product of one of the manufacturers specified for each type of casework.

Provide materials, construction and finishes in accordance with the manufacturer's latest catalog published at time of bidding and with approved Samples.

Include sinks, fixtures, and fittings. All fixtures shall be by one manufacturer.

Construct metal cabinets of sheet steel with minimum thickness (U.S. standard gage) as follows:

Corner gussets for leveling blots and apron corner braces	12 gage (.2754 cm)
Drawer support channels	14 gage (.1994 cm)
Hinge reinforcement	14 gage (.1994 cm)
Horizontal rails, and reinforcing gussets	16 gage (.1613 cm)
Aprons	16 gage (.1613 cm)
Support struts	16 gage (.1613 cm)
Cabinet tops, ends, bottom, backs, vertical posts, shelves, glazed doors	18 gage (.1311 cm)
Door panels, scribing strips, filler	20 gage (.1006 cm)

panels, enclosures, drawer fronts
and bodies

2.4.02 Cabinet Construction. Provide cabinets of modular construction so that the various units can be combined in assemblies to fit the floor plan and functional requirements of the facility.

Cabinets construction shall be durable, sturdy, dust-tight and designed to provide easy access for installation and maintenance of plumbing and electrical work.

Shut-off valves and plumbing traps in service chase assemblies shall be accessible with cabinets in place. Coordinate access panel requirements with plumbing work.

Drawers operation shall be smooth and quiet for a minimum of 10,000 in-out cycles with a 150 lb. (67.95 Kg) Load evenly distributed in drawer.

Self-centering full width drawers in 3 foot (.91 m) and 4 foot (1.21 m) wide cabinets shall be operable from corner without racking or binding when loaded or empty.

Maximum force required to open a drawer shall be 3 percent of unloaded or loaded drawer weight.

Drawer shall be full drawer extension type.

Doors shall support, without sagging, a 200 lb. (90.60 Kg) load applied at top edge while door is being swung up to 180 degrees.

Provide closure panels to enclose space between ceiling and fume hoods. Provide fillers between wall and cabinets and between cabinets and fume hoods.
Filler panels between metal cabinets and wall or between metal cabinets and fume hoods shall be metal and finished to match metal cabinets. Closure panels shall be fabricated of sheet steel and channel-shaped.

2.5 CONTROLS.

2.5.01 Control System Components. Install the operator control panel and the volume flow control device, specified herein, for each variable air volume hood, under the supervision of the laboratory hood control systems manufacturers' field engineer.

2.6 MANUFACTURE AND FABRICATION.

2.6.01 General Purpose Interior Construction. Lining and baffle shall be white polyresin material, with joints in lining backed up and sealed.

Working surface shall be 1-1/4 inch (3.17 cm) thick molded resin with 1/2 inch (1.27 cm) depression.

Provide molded resin cup sink fitted with sink plug for general purpose superstructures to be mounted on base cabinets. Sink plug shall be molded resin, 1-1/2 inch (3.81 cm), with integral cross bars, removable strainer, inlet machined for overflow, threaded tailpiece, complete with washer and lock nut.

2.6.02 Finish for Sheet Steel. After fabrication and before finishing, thoroughly clean and treat all sheet steel to prevent corrosion and to provide proper adhesion of the finish.

Apply a prime coat baked on, sand smooth, and apply a synthetic enamel or resin base finish system baked on.

For surfaces exposed to view on exterior of hood, comply with performance requirements for moisture and chemical resistance.

Finished surfaces with smooth, semi-matte finish, evenly covered without short or thin coating on corners, runs, sags, or roughness.

Color shall be as selected by the Engineer from manufacturer's standard range.

2.7 GENERAL PURPOSE HOOD. Use conventional type hood with variable air volume

2.7.01 Construction. Metal fume hood shall be used with general purpose interior construction. Sidewalls of superstructure for general purpose hood with approximately 3-1/2 inches (8.89 cm) thick and contain the mechanical and electrical service fixtures.

2.8 SERVICE FIXTURES.

2.8.01 General Mechanical Fixtures. Include piping from valves to outlets, mounted in fume hoods. All renewable valve components to be serviceable from outside of hood.

Remote-controlled with four-arm control handles. Fixture surfaces exposed on interior of hood coated with an acid-and-solvent-resistant finish baked on to minimum dry film thickness of 2 mils.

2.8.02 Water. Fixed gooseneck type with renewable units containing all working parts including a model or stainless steel replaceable seat. Provide an integral volume control contained in the renewable unit or in the inlet or outlet of the fixture.

2.8.03 Air, gas and vacuum. Provide a stainless steel floating needle and removable stainless steel seat for air valves. Action of valve shall be slow compression for fine control under pressures up to 100 psi (689.4 KPA).

2.8.04 Acetylene Fixtures. Provide units with a self-centering stainless steel floating cone and replaceable stainless steel seat.

Provide turret base for deck mounting. At island assemblies, provide set of two cocks at 180 degrees. For all other deck mounted fixtures, provide one cock.

2.8.05 Electrical Fixtures. Pre-wire electrical equipment in fume hood to a junction box mounted on top of hood.

In addition to specified light fixtures, provide the following for each fume hood, unless otherwise indicated: 2 duplex receptacles, 1 light switch and wiring devices as specified in Master Specification Section 16050, Electrical.

2.9 FUME HOOD CONTROLS.

2.9.01 Manufactured Units. Provide the laboratory airflow control systems to control the airflow into and out of the laboratory rooms and laboratory auxiliary support rooms where indicated on the drawings. The exhaust volume of a laboratory fume hood is to be controlled by a fume hood control system to maintain a constant average face velocity into the fume hood. A make-up/supply air control system varies the volume of supply and make-up air into room to maintain both temperature control and airflow balance (e.g. room pressurization).

This system includes fume hood control systems, make-up/supply air controllers, supply, exhaust, constant volume and general purpose airflow terminal units, plus all interconnecting wiring and pneumatic tubing to result in a complete and operational system.

Provide all control components except for pneumatic actuators to be DDC analog electronic in nature.

Provide controls manufactured by Phoenix Controls; ACCU-Aire Controls, Inc.; Tek-Air Systems, Inc.; Siemens Building Technologies, Landis Division; TSI, Inc., or approved equal.

Designed and installed in strict compliance with the NFPA 70 requirements. All electric and electronic devices installed within hoods, exhaust ductwork, or exposed to the fume hood environment, listed under UL 913.

2.9.02 Fume Hood Monitor and Controller. Fume hood monitor and controller directly measures the area of the fume hood sash opening. The fume hood monitor and controller use the measured sash opening to proportionally control the hood's exhaust airflow. Hood airflow is varied to maintain an "average" constant face velocity to +/- 5% tolerance over no less than a 5 to 1 change in the sash open area.

The fume hood control system responds to a step change in sash position by reaching 90 degrees of the final position CFM value within one (1) second with no more than a 5 degrees overshoot or undershoot and with no noticeable oscillation.

A vertical sash sensor measures the height of each vertically moving fume hood sash. Install the sash sensor in an easily accessible location on the fume hood for service.

Provide a horizontal sash sensor for each pair of horizontal or overlapping sashes that are located on horizontal, combination or walk-in sash fume hoods. The horizontal sash sensors determine the total amount of horizontal sash opening. The sash sensors must not obstruct hood usage.

Provide the required combinations of vertical and/or horizontal sash sensors as required by the types of fume hoods to be controlled.

The fume hood monitor receives the sash opening signals from the vertical and/or horizontal sash sensors. The monitor computes the total open sash area and then outputs an exhaust airflow control command signal to the appropriate exhaust airflow control device.

An emergency exhaust capability to override the sash sensor and command maximum exhaust airflow. A push button switch shall initiate this mode.

The fume hood monitor is to include visual indication for normal operation, visual and audible alarm for an unsafe flow condition and visual and audible alarm to indicate emergency exhaust condition. Alarms automatically reset when the alarm condition ceases.

Provide a push button switch to mute the audible alarm. The mute mode automatically resets when the alarm condition ceases.

The fume hood monitor alarms an unsafe flow condition if any of the following conditions occur: The airflow through the hood reduces to approximately 25 percent below its setpoint, or the hood exhaust airflow terminal unit does not move to its commanded position.

2.9.03 Laboratory Air Terminal Units. Laboratory air terminal unit controls the exhaust flow out of a fume hood, the general exhaust or return airflow out of a room, or make-up/supply airflow into a room.

All terminal units are to have an equal percentage flow characteristic to provide stable control at low flow values.

Terminal unit is to be pressure independent throughout a pressure drop range of 0.6” WG to 3.0” WG (static pressure drop across the terminal unit). The terminal unit is to respond and maintain specific airflow within one (1) second of a change in duct static pressure, irrespective of the magnitude of the pressure change (within the above stated pressure drop range) and irrespective of the quantity of terminal units on a manifold system.

Terminal unit airflow control accuracy is to be +/- 5% of reading regardless of duct inlet or exit configurations over turndown range of no less than 16 to 1.

Laboratory airflow control system is to maintain intersystem stability within one (1) second of a change in duct static pressure and/or flow to eliminate hunting, system oscillations and crosstalk between airflow controllers.

Fume hood exhaust terminal units shall be of a corrosion resistant design. All components and/or surfaces exposed to the airstream shall be 316 stainless steel, or shall have at least two baked-on coats of Heresite P403 coating material.

Electronically Modulated Laboratory Airflow Terminal Units shall be able to vary the terminal unit’s airflow to within 90% of its commanded setpoint value is to be no more than one (1) second less than a 5% undershoot or overshoot.

A pneumatic actuator to the terminal unit body to vary the terminal unit from its minimum to maximum flows. Loss of pneumatic supply air causes the terminal units to fail to the position indicated on the drawings. Fail-in-last-position actuators, electric actuators or actuators which fail to uncontrolled flows are not acceptable.

2.9.04 Control Unit. Provide a Control Unit (CU) to control the supply and/or general exhaust airflow control devices to maintain proper room pressurized polarity (positive or negative). Each individual laboratory with fume hoods shall have a dedicated CU. Provide a microprocessor-based digital controller.

The CU maintains a constant design offset between the sum of the room’s total exhaust and make-up/supply airflows. This offset is to be field adjustable and represents the volume of air which will enter (or exit) the room from the corridor or adjacent spaces.

All points shall be available through an interface to the building management system (BMS) for trending, archiving, graphics alarm notification and status reports. Laboratory airflow control system performance (speed, stability and accuracy) must be unaffected by the quantity of points being monitored, processed, or controlled.

Refer to the BMS specification to the required input/output summary for the necessary points to be monitored and/or controlled.

Provide the CU with the capability for full stand alone operation as well as capable of communicating digitally with other CUs.

Provide the CU with a port connecting a notebook computer, desktop computer, modem, or alarm printer. This port provides access to all points in the CU.

The CU is to meet FCC Part Subpart L Class A, and be UL 916 listed.

2.10 CABINET HARDWARE.

2.10.01 General. Catches, shelf adjustment clips and drawer stops shall be cadmium-or nickel-plated steel and sliding doors with nylon rollers.

2.10.02 Pulls. Drawer pulls and pulls for swing doors shall be brass or cast zinc alloy with dull chromium-plated finish, or extruded aluminum with clear polished anodic finish. Provide two pulls on drawers wider than 28 inches (71.12 cm). Pulls for sliding doors shall be recessed flush with door.

2.10.03 Hinges. Chromium-plated brass or steel, 2 1/2 inch (6.35 cm) heavy duty institutional type, attached with flathead screws. For doors over 36 inches (91.44) high, provide 1 1/2 pair of hinges.

2.10.04 Keying. Unless otherwise directed, key locks alike within a room, differently between rooms and masterkey all locks.

2.11 COUNTERTOPS.

2.11.01 General. Provide countertops and backsplashes of the same material up to and including 8 feet (2.43 m) in length in one length. Where countertops exceed 8 feet (2.43) in length, provide concealed field joints of flush-bolt construction or other approved construction. Provide cutouts for required service fixtures and sinks.

2.11.02 Molded Resin Tops. One inch thick top with 4 inch (10.16 cm) high and 3/4 inch (1.91 cm) thick integral curb. Provide drip groove at underside of exposed edges and round exposed corners. Cove junction between top and curb to a 3/4 inch (1.91 cm) radius.

Curbs at sides of tops shall be 3/4 inch (1.91cm) thick, bonded to the surface of top to form a square joint.

2.11.03 Stainless Steel Tops. Fabricated tops of 16 gage (.1613 cm) stainless steel. Exposed edges shall be formed into channel shape. Edge of top shall be 1 inch (2.54 cm) plus raised rim for tops with sinks. Underside reinforced shall be constructed to prevent twisting, oil canning or buckling and coated with sound deadner.

Backsplashes, curbs and integral sinks shall be in one piece with top or continuously welded to top, welds ground smooth and welding flash removed. Provide drainboard adjacent to sinks. No field joints, or no organic materials will be accepted.

Strippable plastic coating shall be provided on finished surfaces for protection.

2.12 SERVICE CHASE ASSEMBLIES.

2.12.01 General. Provide horizontal service chase assemblies, and vertical pipe enclosures as directed.

2.12.02 Service Chase Assembly. Horizontal pipe support strut assembly shall be fabricated from steel components and secured to floor. Removable closure panels of same material and finish as cabinets shall also be provided.

2.12.03 Vertical Pipe Enclosures. A vertical pipe support strut assembly shall be fabricated from steel components and secured to counter top, masonry wall or floor with removable metal closure panels.

2.13 SINKS.

2.13.01 Manufacturers. Molded resin sinks shall be Epoxyn Products, or as approved.

2.13.02 Molded Resin Sink. Use one-piece construction with all inside corners coved and bottom pitched to drain outlet. Fit sink with molded resin sink plug 1 1/2 inches (3,81 cm) with integral cross bars, removable strainer, inlet machined for overflow, and threaded tailpiece, complete with washer and locknut. Provide proper hanger support for sink.

2.13.03 Stainless Steel Sinks. Use 18 gauge (.1311 cm), unless otherwise specified, integral top, welded joints, ground smooth, polished, inside corners coved and bottom pitched shall drain to outlet. Provide sound-deadner spray applied to underside of sinks.

Sinks more than 10 inches (25.4 cm) deep or more than 96 inches (243.84 cm) in perimeter shall be 16 gage (.1613 cm).

Fit each stainless steel sink with a stainless steel sink plug, integral cross bars, removable strainer, inlet tapered for overflow, and 16 gage (.1613 cm) threaded tailpiece, complete with washer and locknut.

2.14 GLASSWARE WASHERS. Furnish a Reliance Glassware Washer, Model 370 or equal. Voltage shall be 208 V, 3-PH, 60 Hz, 4-Wire. Options include cold water pre-wash, pure water rinse, second pure water rinse, and electric water temperature booster. Under-counter installation to include closure and filler panels to surrounding work to completely enclose space below counter. Closure and filler panels to be the same material and finish as glassware washer and glassware dryer enclosures.

2.15 GLASSWARE DRYER. Furnish a Reliance Glassware Dryer, Model 375 or equal. Voltage shall be 208 V, 3-Phase, 60 Hz, 4-Wire. Options include adjustable digital cycle timer and adjustable temperature controller. Under-counter installation to include closure and filler panels to surrounding work to completely enclose space below counter. Closure and filler panels to be the same material and finish as glassware dryer and glassware washer enclosures.

2.16 STERILIZER. Furnish an Amsco Century Small Sterilizer or equal. Size/Type shall be 16 x 16 x 26 vacuum. Steam source shall be electric steam, 480 Volts. Doors shall be single mounted so cabinet will be enclosed/freestanding. Options include electric stainless steel steam generator, eighteen cycle capacity (six per screen). Accessories include single door, one intermediate shelf, and single door.

PART 3 - EXECUTION

3.1 PREPARATION. Protect the Work and adjacent construction from damage during installation and subsequent operations under the Contract.

3.2 INSTALLATION.

3.2.01 General. Install casework and fume hoods in accordance with manufacturer's instructions and approved Shop Drawings, and under the supervision of the manufacturer's trained personnel.

3.2.02 Casework. Completely install casework less installation of mechanical and electrical service fixtures and final connection to services.

Installation of service fixtures and final connection to services are specified in Master Specification Divisions 15 and 16, Mechanical and Electrical.

3.2.03 Casework Assemblies. Assemble cabinets in the field with provision for future relocation, connected together with concealed bolts and set level and in alignment.

Install leg shoe on each table leg. Provide all fastening devices, supports, adhesive and fillers required for a complete installation. Provide metal grounds bolted to stud partitions for support of wall cabinets. Provide hanger supports for sinks with bolts and expansion shields for items connected to masonry walls.

Provide strut assemblies for support of fume hood superstructures or other heavy equipment and for drain troughs and piping. Closure panels to ceiling shall have exposed ends closed. Fillers are required to enclose space between walls and cabinets.

Provide holes and cutout required for installation of equipment indicated to be mounted to casework, including items furnished under other Sections and items indicated to be not included in the Contract. Coordinate location of utilities.

3.2.04 Countertops and Sinks. Anchor tops to base cabinet (or support structure) and knee space assemblies with concealed fastenings. Install drain troughs and sinks and sealant required to seal against tops.

Installation of sink fittings is specified in Master Specification Division 15, Mechanical. Install sink plugs and fill annular space around top of sink plugs with sealant. Set backsplashes and curbs in a full bed of sealant. Seal joints in tops, backsplashes and cubs with sealant.

3.2.05 Fume Hoods. Install the Work completely less final connection to mechanical and electrical services, and in accordance with manufacturer's instructions and approved Shop Drawings and under the supervision of the manufacturer's representative.

Touch up damaged finishes equal to original condition as approved. Make final adjustments required for proper operation as determined by the Contractor.

Require the laboratory hood control system manufacturer to be responsible for ensuring that the hood control system is installed and operates properly, and to provide a field engineer to supervise the installation of all components. Deliver the laboratory hood control system devices connected to, or installed within laboratory hoods, to the laboratory hood manufacturer for installation.

Exhaust Control Devices shall provide detailed installation instructions for such devices prior to installation. Check all dampers for proper positioning and assure that linkages are properly set and operating.

3.3 ADJUSTING. Make final adjustment required for proper operation as determined by the Engineer

3.4 CLEANING. Following completion, clean finished surfaces and leave work free of imperfections. Touch up damaged finish equal to original condition as approved.

End of Section

SECTION 12800

UTILITY ROOM FURNISHINGS

PART 1 - GENERAL

1.1 SCOPE. This section covers miscellaneous utility room furnishings and accessories.

1.2 GENERAL.

1.2.01 Governing Standards.

ASTM (American Society for Testing and Materials) D635 – Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position

National Fire Protection Association (NFPA) 70 – Specification for National Electrical Code

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturers Qualifications. Manufacturers shall have not less than 5 years documented experience in manufacture of a furnishings specified.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit layout drawings showing proposed locations of items specified and applicable details of fabrication and installation. Submit data showing dimensions of individual components, profiles and finishes, utility and service requirements and locations.

1.4.02 Samples. Submit samples of finishes for color selection.

Submit operation and maintenance data for cleaning of finishes.

1.5 RECEIVING, HANDLING AND STORAGE. Handle and store materials carefully. Protect products from weather and other damage.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Furnish products from American Specialties, Inc., Kohler, Bradley Corp. or an approved equal. Unless otherwise specified or indicated, provide materials, construction and finishes in accordance with the manufacturer's latest catalog published at time of bidding, and with approved Samples.

2.2 MEDICINE CABINET. One-piece construction of heavy-gage steel with factory-applied, gloss white, baked enamel finish, surface-mounted. Furnish with bright polished finish stainless steel mirror frame, type as indicated on the drawings.

Shelves: Adjustable, aluminum or glass; provide not less than 2 shelves.

Door: Fitted with continuous piano-type hinge, magnetized catch, left-hand swing.

2.3 SERVICE SINK. Provide a raised floor utility service sink where indicated on the drawings. Manufactured sinks may be provided to the sizes indicated from the manufacturers listed above or an approved equal. Materials shall be as indicated on the drawings. Where permitted, a precast concrete or terrazzo service sink may be provided.

2.3.01 Faucet. Provide brass service sink faucet by Kohler Model K-8905 or an approved equal.

2.4 UTILITY ROOM ACCESSORIES.

2.4.01 Mop and Broom Holder. Provide holders as indicated on the drawings of 0.05 inch (1.3 mm) thick stainless steel, Type 304 with hat-shaped channel.

Holders: 3 spring-loaded rubber cam holders.

Length: 36 inches (914 mm).

Length: Manufacturer’s standard length for number of holders.

2.4.02 Combination Utility Shelf/Mop and Broom Holder. Provided combination holders as indicated on the drawings of 0.05 inch (1.3 mm) thick stainless steel, Type 304, with ½ inch (12 mm) returned edges, 0.06 inch (1.6 mm) steel wall brackets.

Drying rod: Stainless steel, ¼ inch (6 mm) diameter.

Hooks: 3, 0.06 inch (1.6 mm) stainless steel rag hooks at shelf front.

Mop/broom holders: 3 spring-loaded rubber cam holders at shelf front.

Length: 36 inches (914 mm).

Length: Manufacturer’s standard length for number of holders/hooks.

PART 3 - EXECUTION

3.1 INSPECTION. Verify that walls and floor finishes are prepared and ready for installation of fixtures.

Confirm that millwork is constructed with minimum sizes indicated for particular fixtures.

3.2 PREPARATION. Protect the Work and adjacent construction against damage. Rough-in fixture piping connection shall be in accordance with minimum sizes indicated for particular fixtures.

3.3 INSTALLATION. Install the Work in accordance with manufacturer's instructions and approved Shop Drawings.

Touch up damaged finishes equal to original condition as approved.

End of Section

INDEX

DIVISION 13 – SPECIAL CONSTRUCTION

SECTION 13110

CATHODIC PROTECTION SYSTEM (SACRIFICIAL ANODE)

PART 1 – GENERAL

1.1 SCOPE. This specification covers system for cathodically protecting metal buried surfaces against corrosion by producing a continuous flow of direct current from sacrificial anodes to the metal to be protected. The anodes shall be of sufficient size and quantity to protect the buried metal items for a specified number of years before replacement.

1.2 GENERAL.

1.2.01 Governing Standards. The current editions of publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only

ASTM (American Society For Testing and Materials) B 418 - Cast and Wrought Galvanic Zinc Anodes.

ASTM B 843 – Magnesium Alloy Anodes for Cathodic Protection.

ASTM D 1248 – Polyethylene Plastics Molding and Extrusion Materials.

CFR (Code of Federal Regulations) 40 280, Technical Standards and Corrective Action Requirements for Owners and Operators of Underground Storage Tanks (UST).

49 CFR 192 Transportation of Natural and other Gas by Pipeline: Minimum Federal Safety Standards.

49 CFR 195 Transportation of Hazardous Liquids by Pipeline.

NACE (National Association of Corrosion Engineers) RP0169 - Control of External Corrosion on Underground or Submerged Metallic Piping Systems.

NACE RP0177 – Mitigation of Alternating Current and Lightning Effects on Metallic Structures and Corrosion Control Systems.

NACE RP0188 – Discontinuity (Holiday) Testing of Protective Coatings.

NACE RP0190 - External Protective Coatings for Joints, Fittings, and Valves on Metallic Underground or Submerged Pipelines and Piping Systems.

NACE RP0193 - External Cathodic Protection of On-Grade Metallic Storage Tank Bottoms.

NACE RP0285 - Corrosion Control of Underground Storage Tank Systems by Cathodic Protection.

NEMA (National Electrical Manufacturers Association) TC 2 - Electrical Polyvinyl Chloride (PVC) Tubing (EPT) and Conduit (EPC-40 and EPC-80).

NEMA WC 5 -Thermoplastic-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.

NFPA (National Fire Protection Association) 70 - National Electrical Code.

UL (Underwriters Laboratories) 6 - Rigid Metal Conduit.

UL 510 - Polyvinyl Chloride, Polyethylene, and Rubber Insulating Tape.

UL 514A - Metallic Outlet Boxes.

1.3 QUALITY ASSURANCE.

1.3.01 Services of “Corrosion Expert”. The Contractor shall obtain the services of a “Corrosion Expert” to supervise, inspect, and test the installation and performance of the cathodic protection system. “Corrosion Expert” refers to a person, who by thorough knowledge of the physical sciences and the principles of engineering and mathematics, acquired by professional education and related practical experience, is qualified to engage in the practice of corrosion control of buried or submerged metallic surfaces. Such a person shall be accredited or certified by the National Association of Corrosion Engineers (NACE) as a NACE Accredited Corrosion Specialist or a NACE certified Cathodic Protection (CP) Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control of buried or submerged metallic piping and tank systems, if such certification or licensing includes 5 years experience in corrosion control on underground metallic surfaces of the type under this contract.

The “Corrosion Expert” shall make at least 3 visits to the project site. The first of these visits shall include obtaining soil resistivity data, acknowledging the type of pipeline coatings to be used and reporting to the Contractor the type of cathodic protection required. Once the submittals are approved and the materials delivered, the “Corrosion Expert” shall revisit the site to ensure that the Contractor understands installation practices and laying out the components. The third visit shall involve testing the installed cathodic protection systems and training applicable personnel on proper maintenance techniques. The “Corrosion Expert” shall supervise installation and testing of all cathodic protection.

The scope of services provided by the “Corrosion Expert” shall include, but shall not be limited to, the following:

Close-interval potential surveys

Design of Cathodic Protection Systems

System testing

Casing corrosion control

Interference testing

Training

Operating and maintenance manual

Insulator testing and bonding testing

Coating and holiday testing procedures shall be submitted within 45 days of notice to proceed

1.3.02 Electrical Potential Measurements. Electrical potential tests shall be made at a minimum of 10 foot (3 m) intervals witnessed by the Engineer. Submittals shall identify test locations on separate drawing, showing all metal to be protected and all cathodic protection equipment. Test points equipment and protected metal shall be easily distinguished and identified, and shall be properly witnessed.

1.3.03 Tests of Components. A minimum of 4 tests shall be made at each metallic component. Two measurements shall be made directly over the anodes and the other 2 tests shall be over the outer edge of the component, but at the farthest point from the anodes. Structure and pipes shall be shown with the cathodic protection equipment. All components of the cathodic protection system shall be shown on drawings, showing their relationship to the protected structure or component. A narrative shall describe how the cathodic protection system will work and provide testing at each component. Components requiring cathodic protection shall include but not be limited to the following:

Pipes under floor slabs or foundations.

Shutoff valves.

Metallic pipe extended from aboveground locations.

Each connector or change-of-direction device.

Any metallic pipe component or section.

Backflow preventor.

Culvert.

Underground metallic storage tanks.

1.3.04 Achievement of Criteria for Protection. All conductors, unless otherwise shown, shall be routed to or through the test stations. Each system provided shall achieve a minimum pipe-to-soil "instant off" potential of minus 850 millivolt potential with reference to a saturated copper-copper-sulfate reference cell on all underground components of the piping system. Based upon the measurements taken, the current and voltage of the anodes shall be adjusted as required to produce a minimum of minus 850 millivolts "instant off" potential between the structure being tested and the reference cell. This potential shall be obtained over 95 percent of the metallic area. This must be achieved without the "instant off" potential exceeding 1150 millivolts. Testing will be witnessed by the Engineer. Additional anodes shall be provided by the Contractor if required to achieve the minus 850 millivolts "instant off". Although acceptance criteria of the cathodic protection systems are defined in NACE RP0169 , for this project the "instant off" potential of minus 850 millivolts is the only acceptable criteria.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit detailed drawings. Provide a complete list of equipment and material including manufacturer's descriptive and technical literature, catalog cuts, and system design calculations. Provide soil-resistivity and certified test data stating the maximum recommended anode current output density and the rate of gaseous production if any at that current density. Detail drawings shall contain complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will function properly as a unit. The drawings shall show anode arrangement, anode size and number, anode materials and layout details, conduit size, wire size, mounting details, wiring diagram, method for electrically-isolating each pipe, and any other pertinent information required for proper installation and performance of the system.

Within 30 days after receipt of notice to proceed, submit an itemized list of equipment and materials to be furnished including item number, quantity, and manufacturer of each item. The list shall be accompanied by a description of procedures for each type of testing and adjustments, including testing of coating for thickness and holidays. Installation of materials and equipment shall not commence until this submittal is approved.

Submit recommended spare parts data for each different item of material and equipment specified. The data shall include a complete list of parts, special tools, and supplies, with current unit prices and source of supply. One spare anode of each type shall be furnished.

The Contractor shall prepare a report that includes pipe-to-soil measurements throughout the affected area, indicating that the modifications improved the overall conditions, and current measurements for anodes. The following special materials and information are required: taping materials and conductors; zinc grounding cell, installation and testing procedures, and equipment; coating material; system design calculations for anode number, life, and parameters to achieve protective potential; backfill shield material and installation details showing waterproofing; bonding and waterproofing details; insulated resistance wire; exothermic weld equipment and material.

1.4.02 Certification. Submit proof that the materials and equipment furnished under this section conform to the specified requirements contained in the referenced standards or publications. The label or listing by the specified agency will be acceptable evidence of such compliance.

The "Corrosion Expert's" name and qualifications shall be certified in writing to the Engineer prior to the start of construction. Certification shall be submitted giving the name of the firm, the number of years of experience, and a list of not less than 5 of the firm's installations 3 or more years old that have been tested and found satisfactory.

1.4.03 Test Reports. Submit test reports in booklet form tabulating all field tests and measurements performed, upon completion and testing of the installed system and including close interval potential survey, casing and interference tests, final system test verifying protection, insulated joint and bond tests, and holiday coating test. A certified test report showing that the connecting method has passed a 120-day laboratory test without failure at the place of connection, wherein the anode is subjected to maximum recommended current output while immersed in a three percent sodium chloride solution.

1.4.04 Record Drawings. Detailed “as-built” record drawings shall be provided showing location of anodes, insulated fittings, test stations, permanent reference cells, and bonding. Each location shall be referenced to 2 permanent facilities or mark points.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Anode Storage. The Engineer will designate storage area for magnesium anodes. If anodes are not stored in a building, tarps or similar protection shall be used to protect anodes from inclement weather. Packaged anodes, damaged as a result of improper handling or being exposed to rain, shall be re-sacked by the Contractor and the required backfill added to the package.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. The Contractor shall furnish and install a complete, operating, sacrificial anode cathodic protection system in complete compliance with NFPA 70, with all applicable Federal, State, and local regulations and with minimum requirements of this contract. The services required include planning, installation, adjusting and testing of a cathodic protection system, using sacrificial anodes for cathodic protection of the designated buried metallic tanks and pipelines. The cathodic protection system shall include anodes, cables, connectors, corrosion protection test stations, and any other equipment required for a complete operating system providing the NACE criteria of protection as specified. Insulators are required whenever needed to insulate the pipes from any other structure. Any pipe crossing a designated buried pipe shall have a test station.

The specified system shall be based on a complete system with magnesium sacrificial anodes. The Contractor shall modify the cathodic protection system after review of the project, site verification, and analysis, if the proposed modifications include the anodes specified and will provide better overall system performance. The modifications shall be fully described, shall be approved by the Engineer's representative, and shall meet the following criteria.

The proposed system shall achieve a minimum pipe-to-soil "instant off" potential of minus 850 millivolts with reference to a saturated copper-copper sulfate reference cell on the underground components of the piping or other metallic surface. The Contractor shall take resistivity measurements of the soil in the vicinity of the pipes and ground bed sites. Based upon the measurements taken, the current and voltage shall be required to produce a minimum of minus 850 millivolts "instant off" potential between the structure being tested and the reference cell. This potential shall be obtained over 95 percent of the metallic area.

The anode system shall be designed for a life of 25 years of continuous operation.

2.1.01 Isolators. Isolators are required to insulate the indicated pipes from any other structure. Isolators shall be provided with lightning protection and a test station as shown.

2.1.02 Anode and Bond Wires. Magnesium anodes shall be provided at uniform distances along the metallic pipelines. These anodes shall be in addition to anodes for the pipe under concrete slab and casing requirements. For each cathodic system, the metallic components and structures to be protected shall be made electrically continuous. This shall be accomplished by installing bond wires between the various structures. Bonding of existing buried structures may also be required to preclude detrimental stray current effects and safety hazards. Provisions shall be included to return stray current to its source without damaging structures intercepting the stray current. The electrical isolation of underground facilities in accordance with acceptable industry practice shall be included under this section. The Engineer shall witness all tests.

2.1.03 Surge Protection. Approved zinc grounding cells or sealed weatherproof lightning arrestor devices shall be installed across insulated flanges or fittings installed in underground piping as indicated on the drawings. The arrestor shall be gapless, self-healing, solid state type. Zinc anode composition shall conform to ASTM B 418, Type II. Lead wires shall be number 6 AWG copper with high molecular weight polyethylene (HMWPE) insulation. The zinc grounding cells shall not be prepackaged in backfill but shall be installed as detailed on the drawings. Lightning arrestors or zinc grounding cells are not required for insulated flanges on metallic components used on nonmetallic piping systems.

2.1.04 Nonmetallic Pipe System. In the event pipe other than metallic pipe is approved and used in lieu of metallic pipe, all metallic components of this pipe system shall be protected with cathodic protection. Detailed drawings of cathodic protection for each component shall be submitted to the Engineer for approval within 45 days after date of receipt of notice to proceed, and before commencement of any work.

2.1.05 Tracer Wire. When a nonmetallic pipe line is used to extend or add to an existing metallic line, an insulated No. 8 AWG copper wire shall be thermit-welded to the existing metallic line and run the length of the new nonmetallic line. This wire shall be used as a locator tracer wire and to maintain continuity to any future extensions of the pipeline.

2.1.06 Coatings. Coatings for metallic components shall be as required for metallic fittings. Protective covering (coating and taping) shall be completed and tested on each metallic component (such as valves, hydrants and fittings). This includes fire hydrants, T's, elbows, valves, etc. This covering shall be as required for underground metallic pipe. The Engineer shall witness each test. Coatings shall be selected, applied, and inspected in accordance with NACE RP0190 and as specified in these specifications. The use of nonmetallic pipe does not change other requirements of the specifications. Any deviations due to the use of nonmetallic pipe shall be submitted for approval.

2.1.07 Metallic Components. As a minimum, each metallic component shall be protected with 2 magnesium anodes. This number of anodes is required to achieve minus 850 millivolts "instant off" potential on the metallic area and at the same time not provide overvoltage above 1150 millivolts "instant off. The magnesium anodes shall be located on each side of the metallic component and routed through a test station.

2.1.08 Fire Hydrants. Fire hydrant pipe components shall have a minimum of two (2) anodes. These magnesium anodes shall have an unpackaged weight of 17 lbs. (7.7 kg).

2.1.09 Pipe Under Concrete Slab. Pipe under concrete slabs shall have a minimum of 2 magnesium anodes. Pipe under concrete slabs shall have a minimum of 2 permanent reference electrodes located under the slab. One permanent reference electrode shall be located where the pipe enters the concrete slab. All conductors shall be routed to a test station.

2.1.10 Valves. Each valve shall be protected with a minimum of 1 magnesium anode.

2.1.11 Metallic Pipe Component or Section. Each section of metallic pipe shall be protected with a minimum of 2 magnesium anodes.

2.1.12 Connectors or Change-of-Direction Devices: Each change-of-direction device shall be protected with a minimum of 2 magnesium anodes.

2.2 MATERIALS.

2.2.01 Magnesium Anodes. Anodes shall be of high-potential magnesium alloy, made of primary magnesium obtained from seawater or brine, and not made from scrap metal. Magnesium anodes shall conform to ASTM B 843 and to the following analysis (in percents) unless otherwise indicated: Aluminum max. 0.010; Manganese max. 0.50 to 1.30; Zinc 0.05; Silicon max. 0.05; Copper max. 0.02; Nickel max. 0.001; Iron Max. 0.03; Other impurities max. 0.05 each or 0.3 max. The Contractor shall furnish spectrographic analysis on samples from each heat or batch of anodes used on this project.

Refer to the Cathodic Protection Schedule for actual quantities and weights of anodes. A minimum of 2 anodes shall be installed on the pipe system. The tables below show typical dimensions for given weights of anodes.

TYPICAL MAGNESIUM ANODE SIZE (English Units)
(Cross sections may be round, square, or D shaped)

NOMINAL WT. (lbs)	APPROX SIZE (in)	NOMINAL GROSS WT (lb) PACKAGED IN BACKFILL	NOMINAL PACKAGE DIMENSIONS (in)
3	3 X 3 X 5	8	5-1/4 X 5-1/4 X 8
5	3 X 3 X 8	13	5-1/4 X 5-1/4 X 11-1/4
9	3 X 3 X 14	27	5-1/4 X 20
12	4 X 4 X 12	32	7-1/2 X 18
17	4 X 4 X 17	45	7-1/2 X 24
32	5 X 5 X 20-1/2	68	8-1/2 X 28
50	7 X 7 X 16	100	10 X 24

(Note: Multiply lbs. by 2.2 for Kg and Multiply in. by 2.54 for cm)
TYPICAL MAGNESIUM ANODE SIZE (Metric Units)
(Cross sections may be round, square, or D shaped)

NOMINAL WT (kg)	APPROX SIZE (mm)	NOMINAL GROSS WT (kg) PACKAGED IN BACKFILL	NOMINAL PACKAGE DIMENSIONS (mm)
1.4	76 X 76 X 127	3.6	133 X 133 X 203
2.3	76 X 76 X 203	5.9	133 X 133 X 286
4.1	76 X 76 X 356	12.3	133 X 508
5.5	102 X 102 X 305	14.5	191 X 457
7.7	102 X 102 X 432	20.5	191 X 610
14.5	127 X 127 X 521	30.9	216 X 711
22.7	178 X 178 X 406	45.5	254 X 610

(Note: Multiply lbs. by 2.2 for Kg and Multiply in. by 2.54 for cm)

Anodes shall be provided in packaged form with the anode surrounded by specially-prepared quick-wetting backfill and contained in a water permeable cloth or paper sack. Anodes shall be centered by means of spacers in the backfill material. The backfill material shall be composed of 75 percent Gypsum, 20 percent Bentonite, and 5 percent Sodium Sulphate by weight unless otherwise approved by the Engineer.

2.2.02 Zinc Anodes. Zinc anodes shall conform to ASTM B 418 , Type II.

2.2.03 Connecting Wire. Any pinhole, cut, scratch or other damage to the anode cable exposing bare copper to the electrolyte will result in early failure of the cathodic protection system. For this reason, special, extra heavy insulation shall be used on anode cable.

Wire shall be AWG solid copper wire, not less than 10 feet (3 m) long, un-spliced, complying with NFPA 70 insulation. Type RHH insulation shall be used under hot asphalt. Connecting wires for magnesium anodes shall be factory installed with the place or emergence from the anode in a cavity sealed flush with a dielectric sealing compound. Connecting wires for zinc anodes shall be factory installed with the place of connection to the protruding steel core completely sealed with a dielectric material.

Cables for anode header and distribution shall be AWG stranded copper wire with type CP high molecular weight polyethylene, 7/64 inch (2.8 mm) thick insulation, 600-volt rating, in accordance with NEMA WC 5.

2.2.04 Electrical Wire. Wire shall be AWG stranded copper wire with NFPA 70 , insulation. Polyethylene insulation, if used, shall comply with the requirements of ASTM D 1248 and shall be of the following types, classes, and grades: High-molecular weight polyethylene shall be Type I, Class C, Grade E5 and High-density polyethylene shall be Type III, Class C, Grade E3.

Test wires shall be AWG No. 12 stranded copper wire with NFPA 70, Type TW or RHW or polyethylene insulation.

Resistance wire shall be AWG No. 16 or No. 22 nickel-chromium wire with TW insulation.

2.2.05 Wire Splicing. Connecting wire splicing shall be made with copper compression connectors or exothermic welds, following instructions of the manufacturer. Single split-bolt connections shall not be used. Sheaths for encapsulating electrical wire splices to be buried underground shall fit the insulated wires entering the spliced joints and epoxy potting compound shall be as specified below.

In buried metallic tanks, split bolts may be used. A minimum of two split bolts shall be used. At ground level or in trenches, the swaged sleeve connection shall be used.

2.2.06 Conduit. Rigid galvanized steel conduit and accessories shall conform to UL 6. Non metallic conduit shall conform to NEMA TC 2.

2.2.07 Test Boxes and Junctions Boxes. Boxes shall be outdoor type conforming to UL 514A.

2.2.08 Joint, Patch, Seal, and Repair Coating. Sealing and dielectric compound shall be a black, rubber based compound that is soft, permanently pliable, tacky, moldable, and unbacked. Compound shall be applied as recommended by the manufacturer, but not less than 1/2 inch (13 mm) thick. Coating compound shall be cold-applied coal-tar base mastic. Pressure-sensitive vinyl plastic electrical tape shall conform to UL 510.

2.2.09 Backfill Shields. Shields shall consist of approved pipeline wrapping or fiberglass-reinforced, coal-tar impregnated tape, or plastic weld caps, specifically made for the purpose and installed in accordance with the manufacturer's recommendations. When joint bonds are required, due to the use of mechanical joints, the entire joint shall be protected by the use of a kraft paper joint cover. The joint cover shall be filled with poured-in, hot coat-tar enamel.

2.2.10 Epoxy Potting Compound. Compound for encapsulating electrical wire splices to be buried underground shall be a two package system made for the purpose.

2.2.11 Test Stations. Stations shall be of the flush-curb-box type and shall be the standard product of a recognized manufacturer. Test stations shall be complete with an insulated terminal block having the required number of terminals. Each test station shall be provided with a lockable over and shall have an embossed legend, "C.P. Test." A minimum of 1 test station shall be provided for each component of the pipe. A minimum of 6 terminals shall be provided in each test station. A minimum of 2 leads is required to the metallic pipe from each test station. Other conductors shall be provided for each anode, other foreign pipe, and reference cells as required. Test stations may be constructed of nonmetallic materials. However, if nonmetallic materials are utilized, as a minimum, the materials shall be resistant to damage from ultraviolet radiation, contain good color retention qualities, contain high strength qualities, and be resistant to accidental or vandalistic impacts. The test stations shall be listed for the particular application for which they are to be utilized.

2.2.12 Electrical Connections. Electrical connections shall be made using Exothermic welds such as "Cadweld", " Bundy", "Thermoweld" or approved equal. Use of this material shall be in strict accordance with the manufacturer's recommendations.

Electrical-shielded arc welds shall be approved for use on steel pipe by shop drawing submittal action.

2.2.13 Electrical Tape. Pressure-sensitive vinyl plastic electrical tape shall conform to UL 510.

2.2.14 Permanent Reference Electrodes. Permanent reference electrodes shall be Cu-CuS04 electrodes suitable for direct burial. The supplier shall guarantee electrodes for 25 years of service in the environment in which they shall be placed. Electrodes shall be installed directly beneath pipe, or metallic component.

2.2.15 Casing. Where a pipeline is installed in a casing under a structure, roadway or railway, the pipeline shall be electrically insulated from the casing, and the annular space sealed and filled with an approved corrosion inhibiting product against incursion of water.

2.3 ELECTRICAL ISOLATION OF STRUCTURES. Isolation fittings, including isolating flanges and couplings, shall be installed aboveground or in a concrete pit. As a minimum, isolating flanges or unions shall be provided at the following locations:

Connection of new metallic piping or components to existing piping.

Pressure piping under floor slab of a building.

Metallic connection of all lines to existing system and where connecting to a building.

Between water and/or force main and foreign pipes that cross within 10 feet (3.1 m) of the new line.

If the new piping is a short extension to an existing old piping system not under cathodic protection, an isolating fitting shall be installed at the point of connection. If the older system is under cathodic protection, no isolating fitting need be used.

2.3.01 Electrically Isolating Pipe Joints. Electrically isolated pipe joints shall be of a type that is in regular factory production.

2.3.02 Electrically Conductive Couplings. Electrically conductive couplings shall be of a type that has a published maximum electrical resistance rating given in the manufacturer's literature. Cradles and seals shall be of a type that is in regular factory production made for the purpose of electrically insulating the carrier pipe from the casing and preventing the incursion of water into the annular space.

2.3.03 Insulating Joint Testing. A Model 601 Insulation Checker, as manufactured by "Gas Electronics", or approved equal, shall be used for insulating joint (flange) electrical testing.

2.4 UNDERGROUND STRUCTURE COATING. This coating specification shall take precedence over any other project specification and drawing notes, whether stated or implied, and shall also apply to the pipeline or tank supplier. No variance in coating quality shall be allowed by the Contractor or Base Construction Representative without the written consent of the designer. All underground metallic pipelines and tanks to be cathodically protected shall be afforded a good quality factory-applied coating. This includes all carbon steel, cast-iron and ductile-iron pipelines or vessels. Coatings shall be selected, applied, and inspected in accordance with NACE RP0190 and as specified. If non-metallic pipelines are installed, all metallic fittings on pipe sections shall be coated in accordance with this specification section.

The nominal dry thickness of the metallic pipe joint or other component coating shall be 8 mils (0.2 mm), plus or minus 5 percent.

Pipe and joint coating for factory applied or field repair material shall be applied as recommended by the manufacturer and shall be one of the following:

Continuously extruded polyethylene and adhesive coating system.

Polyvinyl chloride pressure-sensitive adhesive tape.

High density polyethylene/bituminous rubber compound tape.

Butyl rubber tape.

Coal tar epoxy.

2.4.01 Field Joints. All field joints shall be coated with materials compatible with the pipeline coating compound. The joint coating material shall be applied to an equal thickness as the pipeline coating. Unbonded coatings shall not be used on these buried metallic components. This includes the elimination of all unbonded polymer wraps or tubes. Once the pipeline or vessel is set in the trench, an inspection of the coating shall be conducted. This inspection shall include electrical holiday detection. Any damaged areas of the coating shall be properly repaired. The Engineer shall be asked to witness inspection of the coating and testing using a holiday detector.

2.4.02 Protective covering for aboveground piping systems. Finish painting shall conform to the applicable paragraph in Master Specification Section 09900, Painting, and as follows: shop-primed ferrous surfaces shall be touched-up with ferrous metal primer. Surfaces that have not been shop-primed shall be solvent-cleaned. Surfaces that contain loose rust, loose mil scale, and other foreign substances shall be mechanically-cleaned by power wire-brushing and primed with ferrous metal primer. Primed surface shall be finished with 2 coats of exterior paint. Coating for each entire piping service shall be an approved pipe line wrapping having a minimum coating resistance of 50,000 Ohms per square foot (0.0929 Ohms sq m).

PART 3 - EXECUTION

3.1 INSPECTION.

3.1.01 Inspection of Pipe Coatings. Any damage to the protective covering during transit and handling shall be repaired before installation. After field coating and wrapping has been applied, an electric holiday detector shall inspect the entire pipe with impressed current in accordance with NACE RP0188 using a full-ring, spring-type coil electrode. The holiday detector shall be equipped with a bell, buzzer, or other type of audible signal that sounds when a holiday is detected. All holidays in the protective covering shall be repaired immediately upon detection. Occasional checks of holiday detector potential will be made by the Engineer's representative to determine suitability of the detector. The Contractor shall furnish all labor, materials, and equipment necessary for conducting the inspection.

3.2 INSTALLATION.

3.2.01 Excavation. In the event rock or other underground obstruction is encountered in providing the required depth for anodes, the Contractor shall determine an alternate approved location and, if the depth is still not provided, an alternate plan shall be submitted to the Engineer. Alternate techniques and depths shall be approved prior to implementation.

Trenching and backfilling shall be in accordance with Master Specification Section 02221, Trenching, Backfilling, and Compacting.

3.2.02 Anode Installation. Unless otherwise authorized, installation shall not proceed without the presence of the Engineer. Anodes of the size specified shall be installed to the depth indicated and at the locations shown. Locations may be changed to clear obstructions with the approval of the Engineer. Anodes shall be installed in sufficient number and of the required type, size, and spacing to obtain a uniform current distribution over the surface of the structure. The anode system shall be designed for a life of 25 years of continuous operation. Anodes shall be installed as indicated in a dry condition after any plastic or waterproof protective covering has been completely removed from the water permeable, permanent container housing the anode metal. The anode connecting wire shall not be used for lowering the anode into the hole. The annular space around the anode shall be backfilled with fine sand or gravel in 6 inch (150 mm) layers and each layer shall be hand tamped. Care shall be exercised not to strike the anode or connecting wire with the tamper. Approximately 5 gallons (20 L) of water shall be applied to each filled hole after anode backfilling and tamping has been completed to a point about 6 inches (150 mm) above the anode. After the earth has absorbed the water, backfilling shall be completed to the ground surface level.

Single anodes, spaced as shown, shall be connected through a test station to the pipeline, allowing adequate slack in the connecting wire to compensate for movement during backfill operation.

Groups of anodes, in quantity and location shown, shall be connected to an anode header cable. The anode header cable shall make contact with the structure to be protected only through a test station. Anode lead connection to the anode header cable shall be made by an approved crimp connector or exothermic weld and splice mold kit with appropriate potting compound.

Connections to ferrous pipe shall be made by exothermic weld methods manufactured for the type of pipe supplied. Electric arc welded connections and other types of welded connections to ferrous pipe and structures shall be approved before use.

3.2.03 Underground Pipeline. Anodes shall be installed at a minimum of 8 feet (2.5 m) and a maximum of 10 feet (3 m) from the line to be protected.

3.2.04 Lead Wire Connections. For underground metallic pipelines, all anode lead wires shall be connected to a test station and buried a minimum of 24 inches (610 mm) in depth to facilitate periodic electrical measurements during the life of the sacrificial anode system and to reduce the output current of the anodes. The cable shall be No. 10 AWG, stranded copper, polyethylene or RHW-USE insulated cable. The cable shall make contact with the structure only through a test station. Resistance wire shall be installed between the cable and the pipe cable, in the test station, to reduce the current output, if required. Anode connections, except in the test station, shall be made with exothermic welding process, and shall be insulated by means of at least 3 layers of electrical tape; and all lead wire connections shall be installed in a moistureproof splice mold kit and filled with epoxy resin. An exothermic welding process shall accomplish lead wire-to-structure connections. All welds shall be in accordance with the manufacturer's recommendations. A backfill shield filled with a pipeline mastic sealant or material compatible with the coating shall be placed over the weld connection and shall be of such diameter as to cover the exposed metal adequately.

Resistance wire connections shall be accomplished with silver solder and the solder joints wrapped with a minimum of 3 layers of pressure-sensitive tape. Lead wire connections shall be installed in a moistureproof splice mold kit and filled with epoxy resin.

3.2.05 Location of Test Stations. Test stations shall be of the type and location shown and shall be curb box mounted. Buried insulating joints shall be provided with test wire connections brought to a test station. Unless otherwise shown, other test stations shall be located as follows:

At 1,000 foot (300 m) intervals or less.

Where the pipe or conduit crosses any other metal pipe.

At both ends of casings under roadways and railways.

Where both sides of an insulating joint are not accessible above ground for testing purposes.

3.2.06 Joint and Continuity Bonds. Bonds shall be provided across all joints in the metallic buried lines, across any electrically discontinuous connections and all other pipes and structures with other than welded or threaded joints that are included in this cathodic protection system. Unless otherwise specified in the specifications, bonds between structures and across joints in pipe with other than welded or threaded joints shall be No. 8 AWG stranded copper cable with polyethylene insulation. Bonds between structures shall contain sufficient slack for any anticipated movement between structures. Bonds across pipe joints shall contain a minimum of 4 inches (102 mm) of slack to allow for pipe movement and soil stress. Bonds shall be attached by exothermic welding. Exothermic weld areas shall be insulated with coating compound and approved, and witnessed by the Engineer. Continuity bonds shall be installed as necessary to reduce stray current interference. Additional joint bonding shall be accomplished by the Contractor where the necessity is discovered during construction or testing or where the Engineer's representative directs such bonding to be done. Joint bonding shall include all associated excavation and backfilling. There shall be a minimum of 2 continuity bonds between each structure and other than welded or threaded joints. The Contractor shall test for electrical continuity across all joints with other than welded or threaded joints and across all metallic portions or components. The Contractor shall provide bonding as required and as specified above until electrical continuity is achieved. Bonding test data shall be submitted for approval.

3.2.07 Resistance Bonds. Resistance bonds should be adjusted as outlined in this specification. Alternate methods may be used if the Engineer approves them.

3.2.08 Isolation Joints and Fittings. Isolating fittings, including main line isolating flanges and couplings, shall be installed aboveground, or within manholes, wherever possible. Where isolating joints must be covered with soil, they shall be fitted with a paper joint cover specifically manufactured for covering the particular joint, and the space within the cover filled with hot coal-tar enamel. Isolating fittings in lines entering buildings shall be located at least 12 inches (305 mm) above grade or floor level, when possible. Isolating joints shall be provided with grounding cells to protect against over-voltage surges or approved surge protection devices. The cells shall provide a low resistance across isolating joint without excessive loss of cathodic current.

3.2.09 Gas Distribution Piping. Electrical isolation shall be provided at each building riser pipe to the pressure regulator, at all points where a short to another structure or to a foreign structure may occur, and at other locations as indicated on the drawings.

3.2.10 Coatings. All aboveground pipeline shall be coated as indicated or as approved. The coating shall have a minimum thickness of 7 mil (0.18 mm). The pipeline coating shall be in accordance with all applicable Federal, State, and local regulations.

3.2.11 Clearing of Trees and Underbrush. In the areas of the anode beds, all trees and underbrush shall be cleared and grubbed to the limits shown or indicated.

3.2.12 Seeding. The Contractor, as directed, in all un-surfaced locations disturbed by this construction shall do seeding as specified in Division 2. In areas where grass cover exists, it is possible that sod can be carefully removed, watered, and stored during construction operations, and replaced after the operations are completed since it is estimated that no section of pipeline should remain uncovered for more than 2 days. The use of sod in lieu of seeding shall require approval by the Engineer.

3.2.13 Cleanup. The Contractor shall be responsible for cleanup of the construction site. All paper bags, wire clippings, etc., shall be disposed of as directed.

3.3 FIELD QUALITY CONTROL. Acceptance criteria for determining the adequacy of protection on a buried underground pipe shall be in accordance with NACE RP0169 and as specified below.

3.3.01 Iron and Steel. The following method shall be used for testing cathodic protection voltages.

A negative voltage of at least minus 850 millivolts as measured between the underground component and a saturated copper-copper sulphate reference electrode connecting the earth (electrolyte) directly over the underground component. Determination of this voltage shall be made with the cathodic protection system in operation. Voltage drops shall be considered for valid interpretation of this voltage measurement. A minimum of minus 850 millivolts "instant off" potential between the underground component being tested and the reference cell shall be achieved over 95 percent of the area of the structure. Adequate number of measurements shall be obtained over the entire structure, pipe, tank, or other metallic component to verify and record achievement of minus 850 millivolts "instant off." This potential shall be obtained over 95 percent of the total metallic area without the "instant off" potential exceeding 1150 millivolts.

If more than one method is required, this method shall also be used. A minimum polarization voltage shift of 100 millivolts as measured between the underground component and a saturated copper-copper sulphate reference electrode contacting the earth directly over the underground component. This polarization voltage shift shall be determined by interrupting the protective current and measuring the polarization decay. When the protective current is interrupted, an immediate voltage shift will occur. The voltage reading, after the immediate shift, shall be used as the base reading from which to measure polarization decay. Measurements achieving 100 millivolts decay shall be made over 95 percent of the metallic surface being protected.

For any metallic component, a minimum of 4 measurements shall be made using the methods outlined in the above subparagraph, and achieving the "instant off" potential of minus 850 millivolts. Two measurements shall be made over the anodes and 2 measurements shall be made at different locations near the component and farthest away from the anode.

3.3.02 Aluminum. Aluminum underground component shall not be protected to a potential more negative than minus 1200 millivolts, measured between the underground component and a saturated copper-copper sulphate reference electrode contacting the earth, directly over the metallic component. Resistance, if required, shall be inserted in the anode circuit within the test station to reduce the potential of the aluminum to a value which will not exceed a potential more negative than minus 1200 millivolts. Voltage shift criterion shall be a minimum negative polarization shift of 100 millivolts measured between the metallic component and a saturated copper-copper sulphate reference electrode contacting the earth, directly over the metallic component. The polarization voltage shift shall be determined as outlined for iron and steel.

3.3.03 Copper Piping. Copper piping shall have a minimum of 100 millivolts of cathodic polarization between the structure surface and a stable reference electrode contacting the electrolyte. The polarization voltage shift shall be determined as outlined for iron and steel.

3.4 TESTS AND MEASUREMENTS.

3.4.01 Baseline Potentials. Each test and measurement will be witnessed by the Engineer. The Contractor shall notify the Engineer a minimum of 5 working days prior to each test. After backfill of the pipe, the static potential-to-soil of the pipe shall be measured. The locations of these measurements shall be identical to the locations specified for pipe-to-reference electrode potential measurements. The initial measurements shall be recorded.

3.4.02 Isolation Testing. Before the anode system is connected to the pipe, an isolation test shall be made at each isolating joint or fitting. This test shall demonstrate that no metallic contact, or short circuit exists between the two isolated sections of the pipe. Any isolating fittings installed and found to be defective shall be reported to the Engineer.

A Model 601 insulation checker, as manufactured by "Gas Electronics", or an approved equal, using the continuity check circuit, shall be used for isolating joint (flange) electrical testing. Testing shall conform to the manufacturer's operating instructions. Test shall be witnessed by the Engineer. An isolating joint that is good will read full scale on the meter. If an isolating joint is shorted, the meter pointer will be deflected or near zero on the meter scale. Location of the fault shall be determined from the instructions, and the joint shall be repaired. If an isolating joint is located inside a vault, the pipe shall be sleeved with insulator when entering and leaving the vault.

Meter A Model B3A2 cathodic protection meter, as manufactured by "M.C. Miller", or an approved equal, using the continuity check circuit, shall be used for isolating joint (flange) electrical testing. This test shall be performed in addition to the Model 601 insulation checker. Continuity is checked across the isolation joint after the test lead wire is shorted together and the meter adjusted to scale. A full-scale deflection indicates the system is shorted at some location. The Model 601 verifies that the particular insulation under test is good and the Model B3A2 verifies that the system is isolated. If the system is shorted, further testing shall be performed to isolate the location of the short.

3.4.03 Anode Output. As the anodes or groups of anodes are connected to the pipe, current output shall be measured with an approved clamp-on milliammeter. The values obtained and the date, time, and location shall be recorded.

3.4.04 Reference Electrode Potential Measurements. Upon completion of the installation and with the entire cathodic protection system in operation, electrode potential measurements shall be made using a copper-copper sulphate reference electrode and a potentiometer-voltmeter, or a direct-current voltmeter having an internal resistance (sensitivity) of not less than 10 megohms per volt and a full scale of 10 volts. The locations of these measurements shall be identical to the locations used for baseline potentials. The values obtained and the date, time, and locations of measurements shall be recorded. No less than 8 measurements shall be made over any length of line or component. Additional measurements shall be made at each distribution service riser, with the reference electrode placed directly over the service line.

3.4.05 Location of Measurements. For coated piping or conduit, measurements shall be taken from the reference electrode located in contact with the earth, directly over the pipe. Connection to the pipe shall be made at service risers, valves, test leads, or by other means suitable for test purposes. Pipe-to-soil potential measurements shall be made at intervals not exceeding 10 feet 3 (m). The Contractor may use a continuous pipe-to-soil potential profile in lieu of 10 foot (3 m) interval pipe-to-soil potential measurements. Additional measurements shall be made at each distribution service riser, with the reference electrode placed directly over the service line adjacent to the riser. Potentials shall be plotted versus distance to an approved scale. Locations where potentials do not meet or exceed the criteria shall be identified and reported to the Engineer's representative.

3.4.06 Casing Tests. Before final acceptance of the installation, the electrical separation of carrier pipe from casings shall be tested and any short circuits corrected.

3.4.07 Interference Testing. Before final acceptance of the installation, interference tests shall be made with respect to any foreign pipes in cooperation with the owner of the foreign pipes. A full report of the tests giving all details shall be made. Stray current measurements shall be performed at all isolating locations and at locations where the new pipeline crosses foreign metallic pipes. The method of measurements and locations of measurements shall be submitted for approval. As a minimum, stray current measurements shall be performed at the following locations:

Connection points of new pipeline to existing pipeline.

Crossing points of new pipeline with existing lines. Results of stray current measurements shall also be submitted for approval.

3.4.08 Holiday Tests. Any damage to the protective covering during transit and handling shall be repaired before installation. After field-coating and wrapping has been applied, the entire pipe shall be inspected by an electric holiday detector with impressed current in accordance with NACE RP0188 using a full-ring, spring-type coil electrode. The holiday detector shall be equipped with a bell, buzzer, or other type of audible signal which sounds when a holiday is detected. Holidays in the protective covering shall be repaired upon detection. Occasional checks of holiday detector potential will be made by the Engineer to determine suitability of the detector. Labor, materials, and equipment necessary for conducting the inspection shall be furnished by the Contractor. The coating system shall be inspected for holes, voids, cracks, and other damage during installation.

All pipe to-soil potential measurements, including initial potentials where required, shall be recorded. The Contractor shall locate, correct and report to the Engineer any short circuits to foreign pipes encountered during checkout of the installed cathodic protection system. Pipe to-soil potential measurements shall be taken on as many pipes as necessary to determine the extent of protection or to locate short-circuits.

3.4.09 Stray Current Measurements. Stray current measurements shall be performed at each test station. Stray currents resulting from lightning or overhead alternating current (AC) power transmission systems shall be mitigated in accordance with NACE RP0177.

3.4.10 Test Report. The Contractor shall submit a report including potential measurements taken at adequately-close intervals to establish that minus 850 millivolts potential, "instant-off" potential, is provided, and that the cathodic protection is not providing interference to other foreign pipes causing damage to paint or pipes. The report shall provide a narrative describing how the criteria of protection is achieved without damaging other pipe or structures in the area.

3.5 MAINTENANCE.

3.5.01 Operations and Maintenance Data. Before final acceptance of the cathodic protection system, submit operating manuals outlining the step-by-step procedures required for system startup, operation, adjustment of current flow, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Provide maintenance manual, listing routine maintenance procedures, recommendation for maintenance testing, possible breakdowns and repairs, and troubleshooting guides. The manuals shall include single-line diagrams for the system as installed; instructions in making pipe-to-reference cell and tank-to-reference cell potential measurements and frequency of monitoring; instructions for dielectric connections, interference and sacrificial anode bonds; instructions shall include precautions to ensure safe conditions during repair of pipe or other metallic systems. The instructions shall be neatly bound between permanent covers and titled "Operating and Maintenance Instructions." These instructions shall be submitted for the Engineer's approval. The instructions shall include the following:

> As-built drawings, to scale of the entire system, showing the locations of the piping, location of all anodes and test stations, locations of all insulating joints, and structure-to-reference cell potentials as measured during the tests required in paragraph above on Tests and Measurements.

Recommendations for maintenance testing, including instructions in making pipe-to-reference cell potential measurements and frequency of testing.

All maintenance and operating instructions and nameplate data shall be in English.

Instructions shall include precautions to insure safe conditions during repair of pipe system.

3.5.02 Training Course. The Contractor shall conduct a training course for the operating staff as designated by the Engineer. The training period shall consist of a total of 8 hours of normal working time and shall start after the system is functionally completed but prior to final acceptance tests. The field instructions shall cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance instructions. At least 14 days prior to date of proposed conduction of the training course, the training course curriculum shall be submitted for approval, along with the proposed training date. Training shall consist of demonstration of test equipment, providing forms for test data and the tolerances that indicate that the system works.

The Contractor shall furnish a reference cell on a reel with 350 feet (120 m) of conductor, along with other accessories, and a digital voltmeter that can be used in the maintenance of this cathodic protection system. Use of this equipment shall be demonstrated in actual tests during the training course, which shall include a description of the equipment and measurement of the pipe-to-soil potential.

The proposed Training Course Curriculum (including topics and dates of discussion) indicating that all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance instructions, are to be covered.

End of Section

SECTION 13200

PRE-ENGINEERED METAL UNITS

PART 1 – GENERAL

1.1 SCOPE. This section addresses the construction and installation of pre-fabricated, pre-engineered, metal buildings, vaults and structure units. Pre-engineered units shall be fabricated at the plant and erected onsite. Pre-fabricated units, shall be pre-assembled at the factory and set into place and anchored to foundations or slabs.

1.2 GENERAL.

1.2.01 Governing Standards.

AISC (American Institute of Steel Construction) – Specification for the Design, Fabrication and Erection of Structural Steel for Buildings.

ASTM (American Society of Testing Materials) A36/A36M - Specification for Carbon Structural Steel.

ASTM A123/A123M – Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A283/A283M - Specification for low and Intermediate Tensile Strength Carbon Steel Plates.

ASTM A307 – Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.

ASTM A325 – Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.

ASTM A490 – Specification for Heat-Treated Steel Structural Bolts, 150 ksi Minimum Tensile Strength.

ASTM A500 – Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A501 – Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.

ASTM A529/A529M – Specification for High-Strength Carbon-Manganese Steel of Structural Quality.

ASTM A653/A653M – Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

AWS (American Welding Society) D1.1 – Structural Welding Code.

FS (Federal Specification) HH-I-521 – Insulation Blankets, Thermal, Mineral fiber.

FS TT-P-31 – Paint, Oil: Iron-Oxide, Ready Mixed, Red and Brown.

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Provide certification that welders to be employed in the Work are certified by AWS and applicable local building officials, and have been re-certified in the last 12 months.

1.3.02 Installer's Qualifications. Installer shall have a record of at least 5 years of successful installation of units similar to those required for this Project.

1.3.03 Fabricator's Qualifications. Firm shall have a minimum of 5 years experience in producing units similar to those required for this Project, with sufficient production capacity to produce and deliver required units without causing delay in the Work. Fabricating plant shall be certified by one of the following:

Architectural Precast Association (APA)

Precast/Prestressed Concrete Institute (PCI), Group A1

Applicable municipal building department

Firms not certified by APA or PCI shall submit a written Quality Assurance/Quality Control program for approval

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit all shop drawings and product data, indicating the profiles, sizes, spacing, and locations of structural members. Also identify attachments, openings, fasteners, cambers, loads, welded connections using standard AWS welding symbols, net weld lengths, framing anchor bolt settings, sizes, anode alarm system and other components, and locations from datum.

The manufacturer shall sign and submit design analysis, fabrication and installation calculations for all pre-engineered units. The analysis shall be prepared by an Engineer registered in the State of Michigan and shall include loadings, stresses, size selections, shape selections, bearing and anchorage point loadings.

Indicate wall and roof system dimensions, panel layout, general construction details, anchorages, method of anchorage from uplifting forces, and method of installation. Submit manufacturer's installation instructions.

The Metal Vault Unit (MVU) shall be designed, signed and sealed by a Professional Engineer.

1.5 DELIVERY, STORAGE, AND HANDLING. Units shall be adequately protected during all transportation, loading and unloading, storage, installation, and subsequent construction activities. Repairs of minor damage, including scratches and abrasions, may be made where permitted by the Engineer in the manner recommended by the manufacturer. If a unit is damaged beyond reasonable repair, in the opinion of the Engineer, it will be rejected and shall be replaced by the Supplier with an undamaged unit.

All lifting of factory assembled units shall be done using properly designed crane eyes installed at roof on all four sides.

1.6 WARRANTY. The manufacturer of the pre-engineered units shall provide a ten-year warranty for exterior pre-finished surfaces. Manufacturer's warranty shall cover pre-finished color coat against chipping, cracking or crazing, blistering, peeling, chalking, or fading. All other warranties shall be in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 BUILDING PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Metal buildings shall have clear span rigid frame or modular rigid frame supported with intermediate columns or truss system as required and approved by Engineer.

Primary Framing shall consist of rigid frame or rafter beams and columns, canopy beams, intermediate columns, braced end frames, end wall columns, and wind bracing. Secondary Framing shall consist of purling, girts, eave struts, flange bracing, sill supports, clips, and other items as required. Wall and Roof System shall consist of pre-formed metal panels of vertical profile, with appropriate framing/anchorage assembly, insulation, liner sheets, and accessory components as required.

Members shall withstand dead load, applicable snow load, and design loads due to piping, equipment, pressure and suction of wind calculated in accordance with applicable local and state codes. Exterior wall and roof systems shall withstand imposed loads with maximum allowable span deflection of 1/90. The Vault shall withstand uplifting forces.

Provide drainage to exterior for water entering or condensation occurring within cladding system. Thermal Resistance of Wall System shall be 'R' value of not less than 11. Thermal Resistance of Roof System shall be 'R' value of not less than 19.

Assembly shall permit movement of components without buckling, failure of joint seals, undue stress on fasteners or other detrimental effects, when subject to temperature range of –20 degrees F to 120 degrees F (-28.8 degrees C to 48.9 degrees C).

Size and fabricate wall and roof systems to be free of distortion or defects detrimental to appearance or performance.

All openings required for equipment or shown on the Drawings shall be properly framed with structural members.

Foundations: Provide reactions from all columns and walls to the foundations. Provide anchor bolt layout and templates as required to allow the installer to provide a suitable foundation for the proposed building.

Applicable design and layout of foundations, equipment bases, toilets and utilities shall be provided on drawings by design Engineer or Owner. Contractor shall meet these requirements by selecting units that can handle design elements identified by Engineer or Owner.

2.2 BUILDING MATERIALS.

2.2.01 Building Framing Materials. Structural Steel Members shall meet ASTM A36. Structural Tubing shall meet ASTM A500, Grade B. Plate or Bar Stock shall meet ASTM A529.

Anchor Bolts shall meet ASTM A325. Bolts, Nuts, and Washers shall meet ASTM A325, A490, A307. Welding Materials shall meet AWS D1.1 for the materials being welded. Primer shall be FS TT-P-31, red.

Non-shrink Grout shall be premixed compound consisting of non-metallic aggregate, cement, water, reducing and plasticizing agents, developing minimum compressive strength of 2400 psi (16,548 kPa) in two days and 7000 psi (48,264 kPa) in 28 days.

2.2.02 Building Wall and Roof System. Sheet Steel Stock shall be ASTM A653, Grade A; zinc-coated (galvanized).

Insulation shall be FS HH-I-521 Semi-rigid glass fiber type, faced with white vinyl; UL flame-spread classification of 25 or less where exposed; and friction fit.

Fasteners shall be Manufacturer's standard galvanized types. Finish to match adjacent surfaces when exterior exposed.

Joint Seal Gaskets shall be Manufacturer's standard. Sealant shall be manufacturer's standard. Bituminous Paint shall be asphaltic type.

2.2.03 Building Doors, Frames, and Windows. Shall be provided in accordance with Master Specification Division 8, Doors and Windows or as approved by Engineer.

2.3 BUILDING MANUFACTURE AND FABRICATION.

2.3.01 Building Framing. Fabricate frame members in accordance with AISC Specification for plate, bar, tube, or rolled structural shapes. Roof Slope shall be 2 inch in 12 inches (1 cm in 6 cm) or manufacturers standard.

Anchor Bolts shall be formed with bent straight shank, unprimed, zinc coated and assembled with template for casting into concrete.

Building overhead Door Frame shall be formed steel sections braced to building frame.

2.3.02 Building Gutter and Downspouts. Fabricate of same material and finish as roofing metal. Form gutters and downspouts and scuppers to match building and size to collect and remove water.

Form sections in maximum possible lengths. Hem exposed edges. Allow for expansion at joints. Fabricate support straps of same material and finish as roofing metal, color as selected.

2.3.03 Building Framing Finish. Clean, prepare, and shop prime framing members. Galvanize framing members. Do not prime surfaces to be field welded.

2.3.04 Acceptable Manufacturers. Acceptable fabricators include Nucor Building Systems, Butler Manufacturing, American Buildings, or approved equal.

PART 3 - EXECUTION

3.1 BUILDING INSTALLATION.

3.1.01 Framing Erection. Erect framing in accordance with AISC Specification. Provide for erection and wind loads. Provide temporary bracing to maintain structure plumb and in alignment until completion of erection and installation of permanent bracing. Set column base plates with non-shrink grout to full plate bearing. Do not field cut or alter structural members without approval of Engineer.

After erection, prime welds, abrasions, and surfaces not shop primed. Use a primer consistent with shop coat. Use primer recommended for galvanized surfaces.

3.1.02 Wall and Roofing Systems. Install in accordance with manufacturer's instructions and Master Specification Division 7, Thermal & Moisture Protection. Exercise care when cutting pre-finished material to ensure cuttings do not remain on finished surface. Fasten cladding system to structural supports, aligned level and plumb.

Locate end laps over supports. Overlap panel ends a minimum of 2 inches (5.1 cm). Place sidelaps over bearing. Provide expansion joints. Use concealed fasteners. Install sealant and gaskets to prevent weather penetration. System shall be free of rattles, noise due to thermal movement, and wind whistles.

3.1.03 Installation of Accessories. Install doorframe, door, overhead door, window and glass, in accordance with manufacturer's instructions and Master Specification Division 8, Doors and Windows. Seal wall and roof accessories watertight and weather-tight with sealant. Provide all applicable grounding and wiring in accordance with Master Specification Section 16050, Electrical.

3.1.04 Gutter and Downspout Erection. Rigidly support and secure components. Joint lengths with formed seams sealed watertight. Flash and seal gutters to downspouts. Apply bituminous paint on surfaces in contact with cementious materials. Slope gutters minimum 1/16 inch per foot (5.2 mm per m). Install plash pads.

3.2 METAL VAULT UNITS. Furnish and install factory-built metal meter vault units at each location shown on the Drawings. The meter vault shall be assembled at the factory and consist of a prefabricated steel vault with entrance tube, ventilation fan system, ladder, electrical controls, sump pump and piping, cathodic protection with anode alarm system, wiring and lighting. Valves, meters, fittings and other equipment shall be placed in units as directed by Engineer. Appropriate clearances around all equipment shall be maintained. Pipes installed through units shall be performed as directed by manufacturer. Provide all applicable grounding and wiring in accordance with Master Specification Section 16050, Electrical. Gate boxes shall be installed per the manufacturer's instructions and in accordance with Master Specification Section 02620, Water Main Services.

The manufacturer shall assume full responsibility for the structural adequacy of the vault structure. The manufacturer shall determine the size, placements, and connections of all structural members. The manufacturer shall determine the plate thickness and reinforcement required. The steel vault, including roof and access hatch, shall be designed for a superimposed load of 300 psf (14.4 kPa), in addition to piping, backfill and other dead loads. The backfill shall be assumed to weigh 120lbs. per cu ft (1,922.2 kg per cu m). The walls shall be designed assuming and external pressure equivalent to a fluid weighing 60 pcf (961.1 kg per cu m). The entire vault shall also be designed for the specified internal test pressure assuming no backfill is in place. Openings shall be tightly sealed with Linkseal, by Thunderline Corporation, or equal to assure compliance with the quality control air tests as stated herein.

All mechanical thrusts, restraints, tie rods and supports shall be correctly designed, sized, and installed to prevent movement of Dresser Type Coupling, Gate Valves, pipes, equipment and other Vault components.

After installation of all components and completion of all penetrations, the steel vault shall be subject to an air test to assure the watertight integrity of the weld system. A test pressure of 3 psi (20.7 kPa) shall be maintained while a soap solution is applied to all welded joints on the exterior of the steel vault. The test pressure shall be measured by means of a tested and properly calibrated pressure gage. Openings in the vault shall be sealed against leakage.

All welds found to be defective shall be repaired and the vault shall be retested. Six certified copies of a report covering each test shall be prepared by the Contractor and delivered to the Engineer not less than 10 days prior to shipment of the vault.

The manufacturer shall provide at least four 3/8 inch (9.5 mm) thick lifting plates about the perimeter of the vault to ensure proper balance of the vault during the setting operation.

The steel vault shall be complete with a sump to accommodate the automatic sump pump specified elsewhere. The sump shall be a minimum of 18 inches (45.7 cm) in diameter and 8 inches (20.3 cm) deep; and shall be fabricated of plate 1/4 inch (6.4 mm) minimum thickness. The sump shall be located so as to ensure proper and complete drainage of the steel vault floor. The steel vault shall be capable of installing two sumps pumps.

The prefabricated master meter vaults shall be as manufactured by Engineered Fluid Inc. (EFI) or equal.

3.2.01 Access Hatch. The access hatch shall consist of a Bilco Type J or S steel access hatch, or equal as specified in Master Specification Section 05630, Access Hatches. Neither factory nor field welding of the access hatch to the entrance tube will be permitted. Size shall be as shown on the Drawings. All access hatches for vaults shall be designed to support an H-20 wheel load.

A flashing system clip shall be provided on the outside of the vault that shall lip the top of the riser with insulation. The flashing clip shall be fastened watertight to the riser flange so the insulation remains dry under all conditions.

The access hatch attachment system shall include but not be limited to 10 - 1/4 inch (6.4 mm) diameter stainless steel flange bolts with nuts and 2 flat washers each, bedding compound sealant, 4504 Scotch polyfoam and single side adhesive coated 1/4 inch (6.5 mm) by 3 inch (7.6 cm) gasket materials.

3.2.02 Prefabricated Steel. The plate forming the top and bottom of the capsule shall be cold formed prior to assembly so as to form a lap joint with the sidewall. The lap joint shall be continuously welded on the interior by hand and continuously welded on the exterior by machine to form an airtight seal. The lower side wall continuous weld shall be an average 1 1/2 inches (3.8 cm) above the capsule floor, which removes the lower weld from incidental water impingement. Sidewall to shell butt welds made at floor level will not be accepted. The lap joint shall be in full conformance with Steel Tank Institute (STI) P-3 specifications Section 4.2.6 and Underwriters Laboratories (UL) 58 specifications for steel vessels in buried service, and the American Welding Society (AWS) Structural Welding Code, Section 9.10,

The steel plate used in constructing the vault shall be at least 1/4 inch (6.4 mm) thick and meet or exceed the requirements of ASTM A283, Grade D. Steel for structural members shall meet or exceed the requirements of ASTM A36.

> The bottom of the vault shall be reinforced by structural steel channels and rectangular structural tube in parallel. There shall also be channels in parallel, placed perpendicularly to the channels and tubes.
>
> The top of the vault shall be a reinforced structure. The capsule shall be designed and fabricated for below ground installation and to meet or exceed an HS–20 wheel load.
>
> The plates forming the top and bottom of the vault shall be continuously welded on the interior by hand and continuously welded on the exterior by machine to form an air-tight seal.

The prefabricated steel vault shall be one complete unit when delivered to the installation location. Field welding of the entrance tube or any other parts will not be allowed. The manufacturer shall provide at least four 3/8 inch (9.5 mm) minimum thick lifting plates about the perimeter of the vault to ensure proper balance of the vault during the setting operation and to facilitate the lifting and handling of the station. Interior lifting eyes shall be placed over each piece of equipment in excess of 60 pounds (27.2 kg) in weight. Lifting eyes and connection shall be designed with a 25 percent safety factor. Any ferrous metal device passing through the walls shall be welded fully along its circumference or length on both sides of the vault wall. Non-ferrous, PVC, or ductile iron piping passing through the vault wall will be housed in a suitable ferrous metal wall sleeve. The sleeve shall be fully welded as described herein. The piping passing through the wall sleeve shall be sealed.

The attachment system shall, whenever possible, be factory installed. If because of shipping restrictions, the access hatch cannot be factory installed, field attachment is permitted only. The hatch drain shall be piped to the vault sump.

The access hatch shall be provided with keyed entry and hasp. The entry lock shall be flush mounted, protected from the elements by a cover skirt. The entry lock shall be of pin tumbler type, dead bolt, with an inside safety release. The Contractor shall coordinate with DWSD security to provide a standard #2246 DWSD master pad lock with two keys.

Data sheets detailing the access hatch and the attachment system shall be included in the manufacturer’s shop drawing submittal. If required to assure electrical continuity between the hatch and the remainder of the structure, the vault supplier shall provide a sufficient number of copper straps bonded to the structure and connected in accordance with the requirements of the selected cathodic protection system for the vault.

3.2.03 Access Ladder. An all fiberglass access ladder shall be provided in accordance with Master Specification Section 06550, FRP Ladders, Handrails, and Grating. The complete access ladder shall be bolted into place, at a minimum of 2 points both top and bottom, so as to be easily removable to facilitate equipment maintenance.

A ladder-up safety post shall be installed on the vertical centerline of the entrance ladder. The ladder-up safety post shall be spring balanced to move easily up and down and shall lock in the up position. The ladder-up safety post shall be made of steel of telescoping tubular section design. The up and down movement spring balance assembly shall be stainless steel.

3.2.04 Vault Insulation. Insulation shall comply with requirements of the Master Specification Section 07210, Thermal Protection and Building Insulation and the enclosed specification. The steel vault side wall, top and access hatch extension shall be insulated with a flame-retardant polyurethane foam insulating material. The insulation application around the hatch extension shall continue to the top of the attachment point of the hatch. The insulation shall be applied in a uniform thickness to the exterior of the vault by spray, or other approved methods. The insulation shall have a nominal minimum density of 2.0 PCF (32.0 kg per cu m) and shall be applied to the thickness required to achieve a minimum R value of 19. The insulation surface shall be fully protected and encapsulated by a water-resistant elastomeric membrane or other approved, water-resistant coating material, fully compatible with the foam insulation and suitable for below grade use. Foamed-in-place rigid insulation shall be as manufactured by North Carolina Foam Industries (NCFI), Energy Shield Incorporated or other approved. Nominal 1/8 inch (3.2 mm) protection board material, if required by system manufacturer, shall be provided to protect insulation and water-resistant coating prior to backfilling. Insulation coating shall be inspected prior to backfilling and be repaired, as necessary, to restore the water-resistant and thermal continuity of the system. All repairs shall be per insulation system manufacturer’s recommendations. Backfill shall be placed carefully to avoid damaging the insulation.

3.2.05 Corrosion Protection. The protective coating shall take place immediately after surface preparation. The protective coating shall be a 2 component, high solids, amide-cured epoxy system formulated for high build application having excellent chemical and corrosion-resistant properties. The epoxy system shall be self-priming and require no intermediate coatings. The protective coating shall provide, in not less than 2 applications, a high film build over welds, joints, bolts and sharp angles. The protective coating shall be applied as required to assure a dry film yield of no less than 4.0 mils (0.1 mm per application, with a total dry mil thickness of 8.0 mils (0.2 mm). If the specified dry mil thickness is not obtained with 2 coats, additional coats shall be applied.

All Metal Vaults should have a cathodic protection with anode alarm station and remote monitoring through computer control system in accordance with Master Specification Section 17100, Computer Control System.

Provide cathodic protection in accordance with Master Specification Section 13110, Cathodic Protection

3.2.06 Ventilation Equipment. The ventilation equipment shall draw air from outside the meter pit through a piping system and exhaust the air into the meter pit to provide ventilation. The fan shall be wired into the light switch so that when the lights are turned on, the fan will also turn on. The fan shall ventilate the pit to make it safe for personnel access. Installation shall include the ventilation system, including all equipment, piping, fittings, electrical, controls, devices, accessories, and appurtenances necessary for proper operation of the system. The ventilation system shall be approved by the engineer for the application.

Equipment furnished and installed shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer and the Engineer. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer. All major items of mechanical equipment shall be of the best quality normally used for the purpose in good commercial practice and shall be the products of reputable manufacturers. Each major component of equipment shall have the manufacturer's name, address, and catalog number on a nameplate securely affixed in a conspicuous place. The nameplate of a distributing agent only will not be acceptable.

The ventilation fan shall be furnished and installed where indicated on the drawings. The ventilation fan shall be a factory-assembled and tested, centrifugal fan unit consisting of a housing, wheel, fan shaft, corrosion-resistant wall support structure, motor, and an inlet transition connection. An inlet pipe anti-vibration fitting shall be provided. The fan shall be direct drive. Fan parts in contact with airstream shall be fiberglass. The fan construction and materials shall be suitable for sewer gases and sub-zero Fahrenheit temperatures. The shaft and coupling shall have a guard that meets applicable safety regulations. A drain plug shall be provided on the bottom of the circular casing. All belts, pulleys, chains, gears, couplings, projecting setscrews, keys and other rotating parts located so that any person may come in close proximity thereto shall be fully enclosed and properly guarded. The fan unit shall be provided with a fabricated wall support that resists and withstands corrosion.

The fan wheel shall be radial type, with a fastener to the shaft that can be disassembled, and reassembled. Each fan shall be factory test run and balanced. Vibration isolators, rubber-in-shear type, will be provided. The fan shall be tested and rated in accordance with AMCA Standard 210. The fan manufacturer shall provide the fan performance curve. The fan shall meet or exceed fire-rating standards per ASTM E84 test. The fan shall be wired in conjunction with the light switch so the light and ventilation fan operates simultaneously. After completion of the ventilation system, tests shall be conducted to demonstrate that each system is functioning in accordance with the specifications and to the satisfaction of the Engineer. If, upon testing, the fan does not meet all requirements of this specification, it shall be the obligation of the Contractor to make necessary modifications to bring the fan into compliance within ten days. No caulking of threaded joints or holes will be acceptable. The fan shall be Model 42-10-FE3 as manufactured by Hartzell Fan, Inc., Model FR-006 as manufactured by Duall Industries, Inc., or equal as approved by the engineer for the application. See drawings for complete details.

3.2.07 Lighting System. Lighting fixtures shall be furnished and installed as indicated on the drawings. Lamps shall be high efficiency, energy saving, of the same type as indicated in the fixture. The unit shall be an incandescent light fixture. The fixture accessories shall be high impact strength fiberglass reinforced polyester material with stainless steel hardware. The unit shall be fully enclosed, gasketed, vapor-tight and UL approved. It shall be complete with a glass heat resistant globe, die cast guard, and a 150-watt incandescent bulb. Manufacturers include Appleton, Crouse-Hinds, Hubbell or equal.

Fixtures shall be arranged in rows both vertically and horizontally to be clear of any obstructions. Fixtures shall be securely attached to mounting rails or plates, which are permanently attached to the vault ceiling or wall. Contractor shall furnish and install all bulbs for the entire lighting fixture installation and shall replace all burned out bulbs up to the time of final acceptance of the work.

Provide ten percent spare parts for light fixtures and lamps. Lighting shall also comply with Master Specification Section 16500, Lighting.

3.3 EXAMINATION. Verify that excavations are to required grade, dry, and not over excavated. Verify that concrete pad is of the required size and mass, and to the required elevation for proper vault installation.

3.3.01 Preparation. Remove scale and dirt, on inside and outside, before assembly. Prepare piping connections to equipment with flanges or unions.

3.3.02 Prefabrication. Fan, electrical controls, and accessories shall be factory installed as indicated on the Contract Drawings and shop drawings approved by the Engineer. Elements shall be supported with temporary supports until installed at site. All equipment, materials, and supplies shall be provided and installed in strict adherence with these specifications and Drawings, applicable codes, rules and regulations, and best current industry practice. After the steel has been completely installed underground including the electrical service and has been put in service by the installer, a factory service representative shall be scheduled to visit the job site and put the station into operation. The service representative shall be a regular employee of the vault manufacturer.

3.3.03 Installation. Install in accordance with manufacturer’s instructions and Master Specification Section 02211, Excavation, Filling and Grading. Provide non-conducting dielectric connections wherever jointing dissimilar metals. Route piping in orderly manner and maintain gradient. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment. Install bell and spigot pipe with bell end upstream. Install valves with stems upright or horizontal, not inverted. Provide magnetic locator markers 6 inches (15.2 cm) above (and directly over) each buried, cathodic protection anode.

3.3.04 Application. Use grooved mechanical couplings and fasteners only in accessible locations. Install all mechanical items in accordance with Master Specification Division 15000, Mechanical. Slope water piping and arrange to drain at low points.

End of Section

SECTION 13300

PRE-ENGINEERED PRECAST CONCRETE BUILDINGS

PART 1 - GENERAL

1.1 SCOPE. This section includes the manufacture and installation of pre-engineered prefabricated concrete buildings. They may arrive at the site pre-assembled or require erection. Pre-engineered pre-cast buildings shall be complete requiring only a foundation, electrical work and mechanical work to be a functional facility.

NOTE: BUILDINGS SPECIFIED ARE UNINSULATED

1.2 GENERAL.

1.2.01 Governing Standards.

AASHTO (American Association of State Highway and Transportation Officials)

ACI (American Concrete Institute) 318 - Building Code Requirements for Reinforced Concrete.

ACI 533 - Guide for Precast Concrete Wall Panels.

APA (Architectural Precast Association) and PCI (Precast/Prestressed Concrete Institute) Architectural Precast Concrete Color and Texture Selection Guide.

ASTM (American Society for Testing and Materials) A36 - Specification for Carbon Structural Steel.

ASTM A47 - Specification for Ferritic Malleable Iron Castings.

ASTM A123 - Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

ASTM A153 - Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A185 - Specification for Steel Welded Wire Fabric, Plain, for Concrete Reinforcement.

ASTM A283 - Specification for Low and Intermediate Tensile Strength

Carbon Steel Plates.

ASTM A307 - Specification for Carbon Steel Bolts and Studs 60,000 PSI Tensile Strength.

ASTM A325 - Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.

ASTM A416 - Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.

ASTM A496 - Specification for Steel Wire, Deformed, for Concrete.

ASTM A500 - Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

ASTM A5 ASTM 63 - Specification for Carbon and alloy Steel Nuts.

ASTM A572 - Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.

ASTM A615 - Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

ASTM A666 - Specification for Austenitic Stainless Steel, Sheet, Strip, Plate, and Flat Bar.

ASTM A767 - Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement.

ASTM A934 - Specification for Epoxy-Coated Prefabricated Steel Reinforcing Bars.

ASTM C33 - Specification for Concrete Aggregates.

ASTM C150 - Specification for Portland Cement.

ASTM C260 - Specification for Air-Entraining Admixtures for Concrete.

ASTM C330 - Specification for Lightweight Aggregates for Structural Concrete.

ASTM C404 - Specification for Aggregates for Masonry Grout.

ASTM C494 - Specification for Chemical Admixtures for Concrete.

ASTM C979 - Specification for Pigments for Integrally Colored Concrete.

ASTM C1107 - Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink).

ASTM C1240 - Specification for Silica Fume for Use in Hydraulic-Cement Concrete and Mortar.

ASTM D412 - Test Methods for Vulcanized Rubber and Thermoplastic Rubbers and Thermoplastic Elastomers - Tension.

ASTM F593 - Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.

AWS (American Welding Society) D1.1 - Structural Welding Code.

CCRL (Cement and Concrete Reference Laboratory)

CRSI (Concrete Reinforcing Steel Institute) Manual of Standard Practice.

Precast/Prestressed Concrete Institute (PCI) MNL 117 - Manual for Quality Control.

PCI MNL 120 - Design Handbook.

SSPC (Steel Structures Painting Council) Painting Manual.

AISC (American Institute of Steel Construction) Manual of Steel Construction

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Provide certification that welders to be employed in the Work are certified by AWS and applicable local building officials, and have been re-certified in the last 12 months.

1.3.02 Installer's Qualifications. Installer shall have a record of at least 5 years of successful installation of units similar to those required for this Project.

1.3.03 Fabricator's Qualifications. Firm shall have a minimum of 5 years experience in producing units similar to those required for this Project, with sufficient production capacity to produce and deliver required units without causing delay in the Work. Fabricating plant shall be certified by one of the following:

Architectural Precast Association (APA)

Precast/Prestressed Concrete Institute (PCI), Group A1

Applicable municipal building department

Firms not certified by APA or PCI shall submit a written Quality Assurance/Quality Control program for approval

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit shop drawings that show in-place location, fabrication details, plans, elevations, anchorages, reinforcement, connection details connection methods, dimensions, finishes, relationships to adjacent materials, erection and placement.

Include setting diagrams, templates, instructions and directions as required for installation. Also submit engineering calculations sealed by an engineer licensed to practice in Michigan. Provide reactions and all foundation loads required for the design of the building foundations.

Show identification marks, coordinated to Shop Drawings, and date of manufacture on all units to facilitate hauling and erection.

Submit proposed concrete mix design for each type and color of concrete mix required including backup mix.

Include color pigments, admixtures, steel primer and galvanized touch-up material.

1.4.02 Certifications. Submit Fabricator's certification from APA and PCI, or applicable municipal certification. Also submit Welders' AWS certification.

1.4.03 Samples. Submit 6 inch by 6 inch (15.3 cm by 15.3 cm) samples by appropriate thickness, for each type of unit and finished facing specified for approval of quality, color, and texture of surface finish. Submit prior to fabrication and show full range of color and texture.

1.4.04 Test Reports. Provide test reports on materials, compressive strength, and water absorption.

1.5 DELIVERY, STORAGE, AND HANDLING. Materials and equipment shall be adequately protected during all transportation, loading and unloading, storage, installation, and subsequent construction activities in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, parts, and Tools. Deliver building(s) to the Project site in such quantities and at such times to ensure continuity of installation but minimize job site storage. When job site storage is required, store in a manner to prevent physical damage and so that markings are visible.

Lift and support only at designated lifting or supporting points as shown on reviewed Shop Drawings.

1.6 WARRANTY. Provide a ten-year warranty to pre-engineered buildings in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The General Contractor shall furnish field measurements, if required, to precast fabricator.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Shall comply with Building Officials and Code Administrator Code (BOCA) National Building Code and the local municipal building codes, and regulations of other governing agencies having jurisdiction.

The facility shall be designed to withstand a roof load of 40 pounds per square foot in addition to piping, equipment or snow loads required by the building code.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable fabricators include Advanced Concrete Products Co.; Oldcastle Precast; ROMTEC Utilities; APS Concrete Products, Inc. or approved equal.

2.2 MATERIALS.

2.2.01 Concrete Materials.

Portland Cement	ASTM C 150, Type I or III, white or gray colors to achieve desired finish colors. Use only one brand, type, and color from the same mill. Gray cement may be used for non-exposed backup mixes.
Aggregates	ASTM C 33, gradation may differ to achieve desired finish characteristics. Select coarse and fine aggregate colors and screen sizes to match approved sample(s). Verify that adequate supply, from one pit or quarry, for each type of aggregate is available for the entire Project. If possible obtain entire aggregate supply prior to starting Work, or have aggregate supply held in reserve by aggregate supplier.
Lightweight aggregate	ASTM C 330

Water	Potable. Clean, clear, and free from deleterious amounts of salts, acids, alkalies, organic materials, oils, detergents, or other matter that may interfere with color, curing, or strength of concrete.
Admixtures	Select to be compatible in specified mix.
Air Entraining Admixture	ASTM C 260
Water Reducing Admixture	ASTM C 494, Type A, B, C, F, or G
Silica Fume	ASTM C 1240, for cement replacement for high performance concrete.
Coloring Agent	ASTM C 979, compatible with other concrete materials

2.2.02 Formwork. Provide forms with acceptable form facing materials that are non-reactive with concrete or form release agents and will produce required finish surfaces.

Construct and maintain forms to produce precast concrete units of shapes, lines, and dimensions indicated, within specified tolerances.

2.2.03 Reinforcing Materials.

Reinforcing Bars	ASTM A 615, Grade 40 or 60, unless otherwise required to meet structural requirements. (Use galvanized reinforcing bars; ASTM A 767, hot-dip galvanized where concrete cover is less than 1 1/2 inches (3.8 cm)). (Epoxy coated reinforcing bars, ASTM A 934, may be used in special applications.
Steel Welded Wire Fabric	ASTM A 185, plain, cold drawn
Pre-stressing Tendons	ASTM A 416, Grade 250 or 270, un-coated, 7 wire, low relaxation strand

2.2.04 Connection Materials.

Steel Shapes and Plates	ASTM A 36

Malleable Iron Castings	ASTM A 47
Carbon Steel Plates	ASTM A 283
High Strength, Low Alloy Structural Steel	ASTM A 572
Carbon Steel Structural Tubing	ASTM A 500, Grade B
Anchor Bolts	ASTM A 307, carbon steel or ASTM A 325, high strength; bolts, nuts, and washers
Welded Headed Studs	AWS D1.1, Type B
Deformed Steel Wire Bar Anchors	ASTM A 496
Stainless Steel Plate	ASTM F 593, Type 304 or Type 316; bolts and studs, nuts and washers)

2.2.05 Finish for Steel Connection Materials. Hot-dip galvanize (ASTM A 123 or A 153) steel exposed to weather in final assembly.

Shop Prime Remaining Steel Shapes	SSPC-Paint 25
Anchor Bolts, Nuts, Washers, Cadmium Plated	ASTM A 563, Grade C

Hot-dip galvanize (ASTM A 153) setting bolts or projecting steel in masonry applications.

Galvanizing Repair Paint	DOD-P-21035A or SSPC-Paint 20
Welding Electrodes	Comply with AWS Standards

2.2.06 Grout Materials.

Cement Grout	Cement ASTM C 150; sand ASTM C 404; proportions 1:2.5 by volume, minimum water for placement and hydration.

Non-Shrink Grout	ASTM C 1107
Epoxy Grout	Consult suppliers

2.3 MIXES. Design mixes for each type of concrete specified shall be prepared by an independent testing agency or by architectural precast manufacturing plant personnel at precast fabricator's option.

Proportion mixes by either testing agency trial batch or field test data methods in accordance with ACI 211.1, using materials to be used on the Project, to provide normal weight concrete. Compressive Strength shall be 5,000 psi (or other strength requirement) when tested in accordance with ASTM C 39. Cement content shall be not less than 5 1/2 sacks per cubic yard.

Maximum water cement ratio shall be 0.40 at point of placement.

Add air-entrainment admixture to result in air content at point of placement complying with ACI 533 requirements, but in any case not less than 4.5 percent.

Water absorption shall be a maximum 6% (by weight) when tested in accordance with ASTM C 642.

2.4 MANUFACTURE AND FABRICATION. Fabricate precast concrete units with manufacturing, curing, testing procedures, quality control recommendations, and dimensional tolerances as specified in ACI 533, unless more stringent requirements are shown or specified.

Fabricate units straight, smooth and true to size and shape, with exposed edges and corners precise and square, unless otherwise indicated.

2.4.01 Openings. Cast openings larger than 10 inches (25.4 cm) in any dimension according to locations shown on Shop Drawings. Smaller holes may be field cut when approved by Engineer.

2.4.02 Reinforcement. Comply with CRSI "Manual of Standard Practice" and ACI 318 recommendations. Reinforce architectural precast concrete units to resist handling, transportation, and erection stresses, and to comply with specified performance criteria.

2.4.03 Cast-In Items. Provide embedded anchors, inserts, steel shapes, and lifting devices as shown on reviewed

Comply with ACI-533 requirements for measuring, mixing, transporting, and placing concrete. Place facing mix to a thickness of the greater of 1 inch (2.5 cm) or 1.5

times the maximum aggregate size. Place back-up concrete to ensure bond with face concrete.

Consolidate concrete using equipment and procedures complying with ACI 533.

Permanently mark units with pick-up points as shown on reviewed Shop Drawings. Imprint casting date and piece mark on a surface to be concealed from view in the finished structure.

Cure concrete in accordance with ACI 533 requirements.

Discard units that are warped, cracked, broken, spalled, stained, or otherwise defective unless repairs are approved by the Engineer and meet specified requirements. Refer to ACI 533 for product finish requirements unless otherwise shown or specified.

2.4.04 Fabrication Tolerances. Fabricate to tolerances listed in ACI 533.

2.5 FINISHES. Finish shall be selected by the Engineer based on submittal prepared using APA and PCI “Architectural Precast Concrete Color and Texture Selection Guide”. Visible bugholes shall not be acceptable. Finish exposed back surface of units by smooth steel trowel finish.

2.6 SOURCE QUALITY CONTROL. Inspect and test architectural precast concrete in accordance with ACI 533. Producers certified by APA or PCI may conduct their own Quality Control operations with reports to designated authorities.

Non-certified producers shall furnish and pay for reports by an independent Testing Laboratory, approved by the Owner.

The Owner may retain an independent Testing Laboratory to evaluate fabricator’s quality control and testing methods. Testing Laboratory shall be certified by CCRL or similar national authority. Fabricator shall allow Testing Laboratory access to all operations pertinent to the Project.

2.6.01 Defective Work. Buildings that are damaged shall be repaired to the satisfaction of the Engineer or replaced.

PART 3 - EXECUTION

3.1 INSPECTION. Examine substrates and conditions for compliance with requirements for installation, tolerances, true and level bearing surfaces, and other conditions affecting performance of architectural precast concrete units.

Do not proceed with installation until unsatisfactory conditions have been corrected. Do not install units until supporting structure has been completed (has attained minimum allowable design compressive strength).

If pre-cast building is pre-fabricated and pre-assembled, inspect the building for quality of assembly and measure that all the walls and roof are true and fit together well. Check for change.

3.2 INSTALLATION.

3.2.01 Erection. Erection shall be by contractor experienced and trained in placement and securing of architectural precast concrete units. Lift and handle precast using lift points and embeds as shown on precast shop drawings.

Erect level, plumb, and true to line within tolerances listed in ACI-533. Do not allow cumulative dimensional errors to develop. Adjustments such as shimming which would place additional stress on units will not be permitted. Adhere to dimensional tolerances in accordance with PCI recommendations. Erect and secure in a manner to prevent damage to units or units in place. Replace any damaged units.

Use joint sealants as specified in Master Specification Section 07600, Caulking and Sealers. Where two stage joint seal is required, sequence with sealant applicator to ensure that sealant, gaskets, and similar items required for interior side seal are installed concurrently with installation of precast units.

3.2.02 Repair. When approved by Engineer, repair exposed surfaces of units to match color, texture, and uniformity of surrounding units. Remove and replace damaged units when repairs do not meet requirements.

3.2.03 Protection. Protect finished surfaces from soiling or damage.

3.2.04 Cleaning. Clean exposed surfaces of units after erection if soiled or stained. Wash and rinse according to precast concrete fabricator's recommendations. Protect other Work from damage while cleaning.

Do not use cleaning materials or methods that change the appearance of architectural precast concrete finishes. Test clean a small area to verify adequacy and safety of materials and methods.

Leave in condition for application of items in Master Specification Division 7, Thermal and Moisture Protection.

End of Section

SECTION 13400

PRECAST CONCRETE VAULTS, METER PITS, AND OTHER UNITS

PART 1 - GENERAL

1.1 SCOPE. This specification covers the materials for and manufacture of precast, reinforced concrete vaults, meter pits, and other units produced in accordance with the plans and these specifications.

1.2 GENERAL.

1.2.01 Standards. Where applicable, the latest editions of the following standards shall be considered a part of these specifications. In case of conflict, these specifications shall take precedence over the listed standard.

AASHTO (American Association of State Highway and Transportation Officials) "Standard Specification for Highway Bridges".

AASHTO "Guide Specifications for Structural Design of Sound Barriers".

ACI (American Concrete Institute) 318 "Building Code Requirements for Reinforced Concrete".

ASTM (American Society for Testing and Materials) C478 "Specification for Precast Reinforced Concrete Manhole Sections".

ASTM C1433 - "Standard Specification for Precast Reinforced Concrete Box Sections for Culverts, Storm Drains, and Sewers".

ASTM C825 "Specification for Precast Concrete Barrier".

ASTM C850 "Specification for Precast Reinforced Concrete Box Sections for Culverts, Storm Drains, and Sewers with Less Than 2 ft Cover Subjected to Highway Loadings".

ASTM C858 "Specification for Underground Precast Concrete Utility Structures".

ASTM C890 "Practice for Minimum Structural Design Loading for Monolithic or Sectional Precast Concrete Water and Wastewater Structures".

ASTM C913 "Specification for Precast Concrete Water and Wastewater Structures".

ASTM C915 "Specification for Precast Reinforced Concrete Crib Wall Members".

ASTM C923 "Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes and Laterals".

ASTM C936 "Specification for Solid Concrete Interlocking Paving Units".

ASTM C990 "Specification for Joints for Concrete Pipe, Manholes and Precast Box Sections Using Preformed Flexible Joint Sealants".

ASTM C1227 "Specification for Precast Concrete Septic Tanks".

AWS (American Welding Society) Structural Welding Code - Structural Steel AWS D1.1.

AWS Structural Welding Code – Reinforcing Steel AWS D1.4.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer’s Qualifications. The Precaster shall have been in the business of producing precast concrete products similar to those specified for a minimum of 5 years. Precaster shall demonstrate adherence to the standards set forth in the National Precast Concrete Association Quality Control Manual and shall maintain a permanent quality control department or retain an independent testing agency on a continuing basis. The agency shall issue a report, certified by a licensed engineer, detailing the ability of the Precaster to produce quality products consistent with industry standards.

1.3.02 Testing. The Precaster shall show that the following tests are performed in accordance with the ASTM standards indicated. Tests shall be performed for each 150 cu. yd. (115 cu. m) of concrete placed, but not less frequently than once per structure and per week.

Slump	C143
Compressive Strength	C31, C192, C39
Air Content (when air-entrained concrete is being used)	C231 or C 1 73
Unit Weight	C138

The Precaster shall provide documentation demonstrating compliance with this section.

The Owner may place an inspector in the plant when the products covered by this specification are being manufactured.

1.3.03 Clearances. All clearances as identified on standard meter pit drawings around equipment, valves, fittings and materials unless otherwise directed by Engineer.

1.4 SUBMITTALS

1.4.01 Drawings and Data. For standard units, the Precaster will supply cut sheets showing conformance to project drawings and requirements and applicable ASTM specifications listed in this specification. The Precaster shall certify that such products will meet the ASTM specifications.

For custom-made units, the plans for precast concrete units shall be shop drawings furnished by the Precaster for approval by the Engineer. These drawings shall show complete design, installation, and construction information in such detail as to enable the Engineer to determine the adequacy of the proposed units for the intended purpose. Details of steel reinforcement size and placement and supporting design calculations shall be included. The drawings shall include a schedule that will list the size and type of precast concrete unit at each location where the units are to be used. The precast concrete units shall be produced in accordance with drawings. All design calculations shall be performed by, and certified by, an engineer registered in the State of Michigan.

The size of the Vaults, Meter Pits shall be in accordance with site conditions and per requirements of Great Lakes Water Authority (GLWA) Meter Operations.

1.4.02 Certifications. The Precaster shall provide proof of certification by the National Precast Concrete Association's Plant Certification Program prior to and during production of the products for this project.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Handling. Products shall be stored, handled and shipped in a manner to minimize damage. Lifting holes or inserts shall be consistent with industry standards. Lifting shall be accomplished with methods or devices intended for the purpose of handling.

1.5.02 Minimum Strength. Products shall not be shipped until they are at least 5 days old, unless it can be shown that the concrete strength has reached at least 75% of the specified 28-day strength, or that damage will not be caused which will impair the performance of the product.

1.5.03 Acceptance. Final inspection and acceptance of the precast concrete products shall be made by the Engineer upon arrival at the job site.

1.6 WARRANTY. Provide all warranties in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 – PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS.

Precast reinforced concrete vaults, meter pits, and other underground enclosures shall be designed and fabricated to withstand the following conditions as appropriate.

Design Criteria	Live Load	30% Impact Factor	AASHTO & ASTM C857 Design Load	Load Area
Pedestrian (Areas such as sidewalks, terraces, & other areas which do not receive vehicular traffic)	350 psf (1709 kg/sq m)	N.A.	N.A.	
Incidental Traffic (AASHTO H-10, Wheel load to be used in driveways, parking lots, right of ways, & other areas of incidental vehicular traffic)	8,000 lbs (3,629 kg)	10,400 lbs (4,717 kg)	22,568 lbs (10,237 kg)	10” x 10” (25.4 cm x 25.4 cm) Placed at any location on the roof
Roadway Traffic (AASHTO H-20 or HS-20, Wheel load to be used in traffic way)	16,000 lbs (7,258 kg)	20,800 lbs (9,435 kg)	45,135 lbs (20,473 kg)	8” x 20” (20.3 cm x 50.8 cm)

Horizontal loading shall be based on available soil data, but in any case shall be no less than an equivalent fluid weighing 60 pounds per cubic foot in addition to live loads from the above table. Vaults, Meter Pits, and other underground enclosures shall be designed to withstand a minimum H 20 Class Loading.

2.2 MATERIALS.

2.2.01 Concrete. Raw materials for concrete shall meet the following standards.

Portland Cement	ASTMC150, Type I, II, III or V

Aggregates	ASTM C33 or C330
Water	Potable or free of deleterious substances in amounts harmful to concrete or embedded metals
Air-entraining Admixtures	ASTM C260
Water reducing, retarding, accelerating, high range water reducing Admixtures	ASTM C494
Pozzolans, fly ash and other mineral admixtures	ASTM C618
Ground granulated blast furnace slag Admixtures	ASTM C989

2.2.02 Reinforcing Steel. Concrete reinforcement shall be steel bars or welded wire fabric, or a combination. Reinforcement shall meet the following standards:

Deformed Billet-steel Bars	ASTM A615
Deformed Rail-steel Bars	ASTM A616
Deformed Axle-steel Bars	ASTM A617
Deformed Low-alloy steel Bars	ASTM A706
Plain Wire	ASTM A82
Deformed Wire	ASTM A496
Plain Wire	ASTM Al 85
Deformed Wire Welded Wire Fabric	ASTM A497
Epoxy Coated Reinforcing Bars	ASTM A775
Epoxy Coated Wire and Fabric	ASTM A884
Galvanized Reinforcing Bars	ASTM A7673.3

2.2.03 Inserts and Embedded Metal. All items embedded in concrete shall be of the type required for the intended task, and meet the following standards:

Structural steel plates, angles, etc	ASTM A36

Welded studs	AWS DI. 1

2.2.04 Finishes (as required).

Shop primer	Manufacturers' standards
Hot-dipped galvanized	ASTM A152
Zinc-rich coating	MIL-P-2135 self-curing, one component, sacrificial

2.2.05 Joint Sealant and Joint Gaskets.

Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets	ASTM C443
External Sealing Bands for Noncircular Sewer, Storm Drain, and Culvert Pipe	ASTM C877
Joints for Concrete Pipe, Manholes, and Manufactured Box Sections Using Preformed Flexible Joint Sealants	ASTM C990
Specification for Elastomeric Joint Sealant	ASTM C920

2.2.06 Pipe Entry Connectors.

Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes and Laterals	ASTM C923

2.2.07 Grout.

Cement grout	Portland cement with enough water for the required strength and sand for proper consistency. May contain mineral or chemical admixtures, if approved by Owner's representative
Non-shrink grout	Premixed, packaged expansive and non-expansive shrink resistant grout.

2.3 CONCRETE MIXES.

2.3.01 Mix Proportions. Mix proportions shall be determined by following the standards in ACI 318 Chapter 5.

Recommendations for selecting proportions for concrete are given in detail in "Standard Practice, for Selecting Proportions for Normal, Heavyweight, and Mass Concrete" (ACI 21 1.1). Recommendations for lightweight concrete are given in "Standard Practice for Selecting Proportions for Structural Lightweight Concrete" (ACI 211.2).

2.3.02 Water-Cement Ratio and Air Content. Concrete that will be exposed to freezing and thawing shall contain entrained air and shall have water-cement ratios of 0.45 or less. Concrete which will not be exposed to freezing, but which is required to be watertight, shall have a water-cement ratio of 0.50 or less if the concrete is exposed to fresh water, or 0.45 or less if exposed to brackish water or sea water. For corrosion protection, reinforced concrete exposed to deicer salts, brackish water or sea water shall have a water-cement ratio of 0.40 or less. Cement content shall be no less than 6 sacks per cubic yard.

The air content of concrete that will be exposed to freezing shall be within the limits shown below.

Content For Frost-Resistant Concrete		
	Air Content, %*	
Aggregate Size	Severe Exposure	Moderate Exposure
3/8 in (9.5 mm)	6.0 to 9.0	4.5 to 7.5
1/2 in (12.7 mm)	5.5 to 8.5	4.0 to 7.0
3/4 in (19.1 mm)	4.5 to 7.5	3.5 to 6.5
1 in (2.5 cm)	4.5 to 7.5	3.0 to 6.0
1 1/2 in (3.8 cm)	4.0 to 7.0	3.0 to 6.0

*For specified compressive strengths greater than 5000 psi (34.5 MPa), air content may be reduced 1 percent.

2.3.03 Compressive Strength. All concrete shall develop a minimum compressive strength of 4000 psi (27.6 MPa) in 28 days unless other strengths are designated on the drawings.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Forms. Forms for manufacturing precast concrete products shall be of the type and design consistent with industry standards. They should be capable of consistently providing uniform products and dimensions. Forms shall be constructed so that no product damage shall be caused by the forces and vibrations to which the forms will be subjected. Forms shall be cleaned of concrete buildup after each use. Coating of form release agents shall not be allowed to build up.

2.4.02 Reinforcement. Cages of reinforcement shall be fabricated either by tying the bars, wires or welded wire fabric into rigid assemblies or by welding where permissible in accordance with AWS D 1.4.

Reinforcing shall be positioned as specified by the design and so that the concrete cover conforms to requirements. The tolerance on concrete cover shall be one-third of that specified but not more than 1/2 inch (12.7 mm). Concrete cover shall not be less than 1 1/2 inch (12.7 mm). Positive means shall be taken to assure that the reinforcement does not move significantly during the casting operations.

2.4.03 Embedded Items. Embedded items shall be positioned at locations specified in the design documents. Inserts, plates, weldments, lifting devices and other items to be imbedded in precast concrete products shall be held rigidly in place so that they do not move significantly during casting operations.

2.4.04 Placing Concrete. Concrete shall be deposited into forms as near to its final location as practical. The free fall of the concrete shall be kept to a minimum and in any case shall not exceed 5 feet (1.5 m).

Concrete shall be consolidated in such a manner that segregation of the concrete is minimized and honeycombed areas are kept to a minimum. Vibrators used to consolidate concrete shall have frequencies and amplitudes sufficient to produce well-consolidated concrete.

2.4.05 Cold Weather Requirements. Recommendations for cold weather concreting are given in detail in "Cold Weather Concreting" reported by ACI Committee 306.

Adequate equipment shall be provided for heating concrete materials and protecting concrete during freezing or near-freezing weather.

All concrete materials and all reinforcement, forms, fillers, and ground with which concrete is to come in contact shall be free from frost.

Frozen materials or materials containing ice shall not be used.

Freshly constructed units shall be protected from freezing until the concrete has attained its design 28 day strength.

2.4.06 Hot Weather Requirements. Recommendations for hot weather concreting are given in detail in "Hot Weather Concreting" reported by ACI Committee 305.

During hot weather, proper attention shall be given to ingredients, production methods, handling, placing, protection, and curing to prevent excessive concrete temperatures or water evaporation that could impair required strength or serviceability of the member or structure.

2.4.07 Curing by Moisture Retention. Moisture shall be prevented from evaporating from exposed surfaces until adequate strength for stripping is reached by one of the following methods:

> Cover with polyethylene sheets a minimum of 6 mils (6 x (.001 x 25.4 mm) thick.
>
> Cover with burlap or other absorptive material and keep continually moist.
>
> Curing compounds applied at a rate not to exceed 200 sq. ft. per gallon (52.3 sq. m per liter) or per manufacturer's recommendations.

Surfaces that will be exposed to weather during service shall be cured as above a minimum of 3 days. Forms shall be considered effective in preventing evaporation from the contact surfaces. If air temperature is below 50 degrees F (10 degrees C) the curing period shall be extended.

2.4.08 Curing with Heat and Moisture. Concrete shall not be subjected to steam or hot air until after the concrete has attained its initial set. Steam, if used, shall be applied within a suitable enclosure, which permits free circulation of the steam. If hot air is used for curing, precautions shall be taken to prevent moisture loss from the concrete. The temperature of the concrete shall not be permitted to exceed 160 degrees F (71.1 degrees C). These requirements do not apply to products cured with steam under pressure in an autoclave.

2.4.09 Finishes for Standard Formed Surfaces. Surfaces cast against approved forms using industry practice in cleaning forms, designing concrete mixes, placing and curing concrete. Normal color variations, form joint marks, small surface holes caused by air bubbles, and minor chips and spills will be tolerated but no major imperfections, honeycombs or other defects will be permitted.

2.4.10 Finishes for Standard Unformed Surfaces. Surfaces finished with a vibrating screen, or by hand with a float. Normal color variations, minor indentations, minor chips and spills will be tolerated but no major imperfections, honeycombs, or other defects shall be permitted.

2.4.11 Special Finishes. Troweled, broomed or other finishes shall be according to the requirements of project documents and performed per industry standards or supplier specifications.

Precasters shall submit sample finishes for approval when required by the project documents. The sample finishes shall be approved prior to the start of production.

2.4.12 Stripping Products from Forms. Products shall not be removed from the forms until the concrete reaches the compressive strength for stripping required by the design. If no such requirement exists, products may be removed from the forms after the final set of concrete provided that stripping damage is avoided.

2.4.13 Patching and Repairs. No repair is required to formed surfaces which are relatively free of air voids and honeycombed areas, unless the surfaces are required by the design to be finished.

2.4.14 Repairing Minor Defects. Defects that will not impair the functional use or expected life of a manufactured precast concrete product may be repaired by any method, which does not impair the product.

2.4.15 Repairing Honeycombed Areas. When honeycombed areas are to be repaired, all loose material shall be removed and the areas cut back into essentially horizontal or vertical planes to a depth at which coarse aggregate particles break under chipping rather than being dislodged. Proprietary repair materials shall be used in accordance with the manufacturer's instructions. If a proprietary repair material is not used, the area shall be saturated with water and, immediately prior to repair, the area should be damp, but there should not be excess water. A cement-sand grout or an approved bonding agent shall be applied to the chipped surfaces, followed immediately by consolidating an appropriate repair material into the cavity.

2.4.16 Repairing Major Defects. Defects in precast concrete products which impair the functional use or the expected life of products shall be evaluated by qualified personnel to determine if repairs are feasible and, if so, to establish the repair procedure.

2.5 ACCESSORIES.

2.5.01 Access Hatch. The access hatch shall consist of a Bilco Type J or S steel access hatch, or equal as specified in Master Specification Section 05630, Access Hatches. Size shall be as shown on the Drawings. All access hatches for vaults shall be designed to support an H-20 wheel load. A flashing system clip shall be provided on the outside of the vault that shall lip the top of the riser with insulation. The flashing clip shall be fastened watertight to the riser flange so the insulation remains dry under all conditions.

The access hatch attachment system shall include but not be limited to 10 - 1/4 inch (6.4 mm) diameter stainless steel flange bolts with nuts and 2 flat washers each, bedding compound sealant, 4504 Scotch polyfoam and single side adhesive coated 1/4 inch (6.5 mm) by 3 inch (7.6 cm) gasket materials.

The access hatch shall be provided with keyed entry and hasp. The entry lock shall be flush mounted, protected from the elements by a cover skirt. The entry lock shall be of pin tumbler type, dead bolt, with an inside safety release. The Contractor shall coordinate with DWSD security to provide a standard #2246 DWSD master pad lock with two keys.

2.5.02 Access Ladder. An all fiberglass access ladder shall be provided in accordance with Master Specification Section 06550, FRP Ladders, Handrails, and Grating. The complete access ladder shall be bolted into place, at a minimum of 2 points both top and bottom, so as to be easily removable to facilitate equipment maintenance.

A ladder-up safety post shall be installed on the vertical centerline of the entrance ladder. The ladder-up safety post shall be spring balanced to move easily up and down and shall lock in the up position. The ladder-up safety post shall be made of steel of telescoping tubular section design. The up and down movement spring balance assembly shall be stainless steel.

2.5.03 Ventilation Equipment. The ventilation equipment shall draw air from outside the meter pit through a piping system and exhaust the air into the meter pit to provide ventilation. The fan shall be wired into the light switch so that when the lights are turned on, the fan will also turn on. The fan shall ventilate the pit to make it safe for personnel access. Installation shall include the ventilation system, including all equipment, piping, fittings, electrical, controls, devices, accessories, and appurtenances necessary for proper operation of the system. The ventilation system shall be approved by the engineer for the application.

Equipment furnished and installed shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer and the Engineer. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer. All major items of mechanical equipment shall be of the best quality normally used for the purpose in good commercial practice and shall be the products of reputable manufacturers. Each major component of equipment shall have the manufacturer's name, address, and catalog number on a nameplate securely affixed in a conspicuous place. The nameplate of a distributing agent only will not be acceptable.

The ventilation fan shall be furnished and installed where indicated on the drawings. The ventilation fan shall be a factory-assembled and tested, centrifugal fan unit consisting of housing, wheel, fan shaft, corrosion-resistant wall support structure, motor, and an inlet transition connection. An inlet pipe anti-vibration fitting shall be provided. The fan shall be direct drive. Fan parts in contact with airstream shall be fiberglass. The fan construction and materials shall be suitable for sewer gases and sub-zero Fahrenheit temperatures. The shaft and coupling shall have a guard that meets applicable safety regulations. A drain plug shall be provided on the bottom of the circular casing. All belts, pulleys, chains, gears, couplings, projecting setscrews, keys and other rotating parts located so that any person may come in close proximity thereto shall be fully enclosed and properly guarded. The fan unit shall be provided with a fabricated wall support that resists and withstands corrosion.

The fan wheel shall be radial type, with a fastener to the shaft that can be disassembled, and reassembled. Each fan shall be factory test run and balanced. Vibration isolators, rubber-in-shear type, will be provided. The fan shall be tested and rated in accordance with AMCA Standard 210. The fan manufacturer shall provide the fan performance curve. The fan shall meet or exceed fire-rating standards per ASTM E84 test. The fan shall be wired in conjunction with the light switch so the light and ventilation fan operates simultaneously. After completion of the ventilation system, tests shall be conducted to demonstrate that each system is functioning in accordance with the specifications and to the satisfaction of the Engineer. If, upon testing, the fan does not meet all requirements of this specification, it shall be the obligation of the Contractor to make necessary modifications to bring the fan into compliance within ten days. No caulking of threaded joints or holes will be acceptable. The fan shall be Model 42-10-FE3 as manufactured by Hartzell Fan, Inc., Model FR-006 as manufactured by Duall Industries, Inc., or equal as approved by the engineer for the application. See drawings for complete details.

2.5.04 Lighting System. Lighting fixtures shall be furnished and installed as indicated on the drawings. Lamps shall be high efficiency, energy saving, of the same type as indicated in the fixture. The unit shall be an incandescent light fixture. The fixture accessories shall be high impact strength fiberglass reinforced polyester material with stainless steel hardware. The unit shall be fully enclosed, gasketed, vapor-tight and UL approved. It shall be complete with a glass heat resistant globe, die cast guard, and a 150-watt incandescent bulb. Manufacturers include Appleton, Crouse-Hinds, Hubbell or equal.

Fixtures shall be arranged in rows both vertically and horizontally to be clear of any obstructions. Fixtures shall be securely attached to mounting rails or plates, which are permanently attached to the vault ceiling or wall. Contractor shall furnish and install all bulbs for the entire lighting fixture installation and shall replace all burned out bulbs up to the time of final acceptance of the work.

Provide ten percent spare parts for light fixtures and lamps. Lighting shall also comply with Master Specification Section 16500, Lighting.

2.5.05 Application. Install all mechanical items in accordance with Master Specification Division 15000, Mechanical. Slope water piping and arrange to drain at low points.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Site Access. Engineer shall be responsible for providing adequate access to the site to facilitate hauling, storage and proper handling of the precast concrete products.

3.1.02 Placement. Precast concrete products shall be installed to the lines and grades shown in the contract documents or otherwise specified. Products shall be lifted by suitable lifting devices at points provided by the Precaster. Products shall be installed per the Precaster's recommendation.

3.1.03 Installation of Small Boxes Subject to Incidental Traffic. Prepare the excavation approximately 6 inches (15.2 cm) deeper than the overall height of the overall height of the enclosure. The length and width of the excavation should be determined by adding 4 to 6 inches (10.2 to 15.2 cm) to the overall length and width of the box.

Place approximately 3 to 6 inches (7.6 to 15.2 cm) of compacted material such as sand or gravel. Gravel is the recommended material because of its drainage characteristics. The compacted material shall be leveled so the top of the box is flush to grade.

Place select backfill into the excavation at 12 inch (30.5 cm) lifts and compact either by mechanical compaction or flooding. The backfill shall be discontinued approximately 8 inches (20.3 cm) below finished grade. The final 8 inches (20.3 cm) of the excavation shall be finished with concrete.

3.1.04 Watertightness. Where watertightness is a necessary performance characteristic of the precast concrete product's end use, watertight joints, connectors and inserts shall be used to ensure the integrity of the whole system.

3.1.05 Testing. When testing is required for an underground product, one of the following methods shall be followed:

Vacuum testing prior to backfill according to ASTM C 1 244.

Water testing according to contract documents and Precaster's recommendations.

3.1.06 Equipment Placement. Contractor shall place all equipment, valves, fittings and materials in accordance with clearances identified on standard meter pit drawings unless otherwise directed by Engineer.

End of Section

SECTION 13500

INFORMATION DATA CENTERS

PART 1 - GENERAL

1.1 SCOPE. This section identifies the standards for installation of raised floor systems and accessories for Information Data Centers. It includes floor support framing systems, removable floor panels, fascia panels, plenum dividers, grilles, ramps, stairs, railings, and system electrostatic grounding.

1.2 GENERAL.

Governing Standards. (Unless otherwise noted the current edition of the following standards shall be referenced).

American National Standards Institute (ANSI) A208.1Particleboard Mat formatted Woods.

American Society for Testing and Materials (ASTM) ASTM E 84Surface Burning Characteristics of Building Materials.

ASTM E 648Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source.

Ceiling and Interior Systems Contractors Association (CISCA) CISCA Access FloorsRecommended Test Procedures for Access Floors.

Department of Commerce (DOC) DOC PS 1Voluntary Product Standard - Construction and Industrial Plywood.

Federal Specifications (FS) FS SS-T-312(Rev B; Int Am 1; Notice 2; Canc. Notice 1) Tile, Floor: Asphalt, Rubber, Vinyl, and Vinyl Composition.

International Conference of Building Officials (ICBO) ICBO Bldg CodeUniform Building Code (3 Vol.).

National Electric Manufactures Association (NEMA) NEMA LD 3(High-Pressure Decorative Laminates.

National Fire Protection Association (NFPA) 75Protection of Electronic Computer/Data Processing Equipment.

NFPA 99Health Care Facilities.

Underwriters Laboratories (UL) 779Electrically Conductive Floorings.

1.3 QUALITY ASSURANCE.

1.3.01 Manufacturer Qualifications. The manufacturer shall be a company specializing in manufacturing products specified in this section with minimum five years experience.

1.3.02 Installer Qualifications. The installer shall be a company specializing in performing work of this section with minimum five years experience and certified by manufacturer.

1.3.03 Testing. Raised flooring shall be factory tested by an independent laboratory at the same position and maximum design elevation and in the same arrangement as shown on the drawings for installation so as to duplicate service conditions as much as possible.

Floor panel, stringer, and pedestal load testing shall be conducted in accordance with CISA Access Flooring Standards.

Test factory installed floor covering for bond strength. The test panel shall be supported on pedestals and stringers as specified for the installed floor. The supports shall be braced as necessary to prevent sideways movement during the test. A test load of 1000 pounds (4.45 kN) shall be imposed on the test assembly through a hard plastic caster 3 inches (75 mm) in diameter and 1 inch (25 mm) wide. The caster shall be rolled completely across the center of the panel. The panel shall withstand 20 passes of the caster with no delamination or separation of the covering.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit drawings showing layout of the work, sizes and details of components, details at floor perimeter, bracing to resist seismic or other lateral loads, typical cutout details including size and shape limitation, method of grounding, description of shop coating, and installation height above structural floor.

Submit manufacturer's descriptive data, catalog cuts, and installation instructions. The data shall include information about any design and production techniques, procedures and policies used to conserve energy, reduce material, improve waste management or incorporate green building/recycled products into the manufacturer of their components or products. Cleaning and maintenance instructions shall be included.

Submit design calculations which demonstrate that the proposed floor system meets Building Code requirements for seismic and floor loading. Certified copies of test reports may be submitted in lieu of calculations.

1.4.02 Certificates. Submit certificate of compliance attesting that the raised floor system meets specification requirements.

1.4.03 Samples. Submit one sample of each panel type and suspension system proposed for use.

1.4.04 Test Reports. Submit certified copies of test reports from an approved testing laboratory, attesting that the proposed floor system components meet the performance requirements specified. Submit test results for testing of electrical resistance.

1.5 DELIVERY, STORAGE, AND HANDLING. Materials shall be stored in original protective packaging in a safe, dry, and clean location and shall be handled in a manner to prevent damage. Panels shall be stored at temperatures between 40 and 90 degrees F (4 and 32 degrees C), and between 20 percent and 70 percent humidity.

1.6 WARRANTY. Submit a written 1-year warranty from date of occupancy, executed by Contractor and Manufacturer, agreeing to repair or replace units that fail in materials or workmanship within the specified warranty period. Failures include, but are not necessarily limited to, structural failures including excessive deflection, excessive marring, scratching, chipping or other damage to flooring surface. This warranty shall be in addition to and not a limitation of other rights the Owner may have against the Contractor under the Contract Documents.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Raised floor systems must be designed to accommodate static, rolling and impact loading. There are three types of flooring installations:

> Type I Raised floors completely surrounded by building walls. These are the most resistant to seismic loadings.
>
> Type II Raised floors with part of the edge exposed and not restrained by other structural elements. Type II floors are less resistive to seismic loadings along the axis of the unconstrained side. Seismic loadings can be resisted by securing the perimeter panels of all floors to the supporting structural framing and fitting the panels tightly together, or by cross bracing

the structural frame to resist overturning.

Type III Raised floors are free standing without lateral contact with other structural elements. Type III floors are primarily strengthened with cross bracing to resist loads defined by the UBC Buildings not excluded by TI 800-01 Design Criteria will be accessible in accordance with 36 CFR, Part 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities.

Raised flooring support systems are available as either a stringer or stringerless system. A stringer is a horizontal framing member that connects the pedestal head, supports the panel edges and adds lateral stability to the floor system. Stringers shall be used on all systems with a height that exceeds 12 inches (300 mm) or if the total area is over 4000 square feet (371 square meters) unless the system provides bolted connection between the panel and pedestal.

The metropolitan Detroit Area is in Seismic Design Category A as defined by the International Building Code 2000. Refer to Section 1614 of the IBC for additional information.

2.1.01 Floor Panels. Floor panel testing shall be conducted in accordance with CISCA Access Floors Standard. When tested as specified, all deflection and deformation measurements shall be made at the point of load application on the top surface of the panel. Floor panels shall be capable of supporting 1000 pounds (4450 N) concentrated load without deflecting more than 0.080 inch (2.03 mm) and without permanent deformation in excess of 0.010 inch (0.25 mm) in any of the specified tests. Floor panels shall be capable of supporting 250 pounds per square foot (11.97 KPa per square meter uniform) live load without deflection more than 0.040 inch (1.02 mm). Floor panels shall be capable of supporting 600 pounds (2670 N) rolling load without deflecting more than 0.040 inch (1.02 mm) and without permanent deformation in excess of 0.020 inch (0.51 mm). In accordance with CISCA Access Floors Standard, the permanent deformation limit under rolling load shall be satisfied in all of the specified tests.

2.1.02 Stringers. Stringers shall be capable of supporting a 250 pound (1110 N) concentrated load at mid span without permanent deformation in excess of 0.010 inch (0.25 mm).

2.1.03 Pedestals. Pedestals consist of a base plate, post and an adjustable head, and are available in heights from 6 inches (150 mm) to 96 inches (2400 mm). Pedestals 24 inches (600 mm) high or higher shall be securely anchored to the structural floor in addition to being held in place by adhesive. Pedestals are normally held in place with an adhesive and shall be in full contact with the sub floor surface.

Pedestals shall be capable of supporting a 5000-pound (22.24 kN) axial load without permanent deformation.

2.1.04 Pedestal Adhesive. Adhesive shall be capable of securing a pedestal in place with sufficient bonding strength to resist an overturning force of 1000 inch-pounds (113 Nm).

2.1.05 Bond Strength of Factory Installed Floor Covering. Bond strength of floor covering shall be sufficient to permit handling of the panels by use of the panel lifting device, and to withstand moving caster loads up to 1000 pounds (4.45 kN), without separation of the covering from the panel.

2.1.06 Leakage. If the space below the finished floor is to be an air plenum, air leakage through the joints between panels and around the perimeter of the floor system shall be measured. The air leakage shall not exceed 0.1 cubic foot/minute/linear foot (0.15 L/s/linear meter) of joint when subjected to 0.1 inch (2.5 mm) water gauge positive pressure in the plenum.

2.1.07 Grounding. The raised floor system shall be grounded for safety hazard and static suppression.

2.2 FLOOR PANELS. There are five basic floor panel types: aluminum, hollow formed steel, metal-clad cementitious fill, metal-clad wood core, and concrete. Nonferrous materials shall be used in areas where there is potential for damage by rust oxides or paint flakes. In accordance with CISCA Test Method, hollow panels shall have a safety factor of 2 and filled panels a safety factor of 3 in terms of ultimate load.

Except for edge panels, panel size shall be 24 by 24 inches (600 by 600 mm). Finished panels shall be within a 0.010 inch (0.25 mm) tolerance of the nominal size, and shall be square within a tolerance of 0.015 inch (0.38 mm) measured corner-to-corner. The top surface of panels shall be flat within a 0.020 inch (0.51 mm) tolerance measured corner-to-corner. Panels shall be permanently marked to indicate load rating and model number.

2.2.01 Aluminum Panels Aluminum panels shall be of die-cast or extruded construction.

2.2.02 Hollow Formed Steel Panels. Steel panels shall be of die-formed construction, consisting of a flat steel top sheet welded to one or more formed steel stiffener sheets. Panels shall be chemically cleaned, bonderized, and painted with the manufacturer's standard finish.

2.2.03 Metal-Clad Cementitious Fill Panel (Composite Panels). Composite panels shall be of die-formed steel construction totally enclosing the panel, including the top surface. The void spaces between the top sheet and the formed steel bottom sheet shall be completely filled with an incombustible cementitious or concrete material.

2.2.04 Metal-Clad Wood Core Panels. Wood core panels shall have cores of wood particleboard conforming to ANSI A208.1, Grade 1-M-3, or of plywood conforming to DOC PS 1, EXT-DFPA-C-C. The core shall be not less than 1 inch (25 mm) thick, and shall be faced on both sides with structurally bonded zinc-coated steel sheets not lighter than 24 gauge (0.70 mm). All edges and corners shall be sealed with zinc-coated steel or extruded aluminum. The completed panels shall have a flame spread rating of 25 or less when tested in accordance with ASTM E 84.

2.2.05 Concrete Panels. Concrete panels shall be of lightweight structural concrete with either structural reinforcing or a die-formed, electro-galvanized steel bottom pan. All concrete surfaces including those resulting from field cuts shall be sealed with the manufacturer's standard sealer before covering the surfaces with other materials.

2.3 FLOOR COVERING. Floor panels shall be surfaced with materials firmly bonded in place with waterproof adhesive. The electrical resistance shall remain stable over the life expectancy of the floor covering. Any anti-static agent used in the manufacturing process shall be an integral part of the material, and shall not be surface applied. Bolt heads or similar attachments shall not rise above the traffic surface.

2.3.01 High Pressure Laminate. High pressure laminate surfacing shall conform to NEMA LD 3, Grade HW 62. Total system electrical resistivity from the wearing surface of the floor to the ground connection shall be between 150,000 ohms and 20,000,000,000 ohms.

Conductive high pressure laminate floor surfacing shall conform to FS SS-T-312, Type III, Vinyl Tile and UL 779. The total system electrical resistivity from the wearing surface of the floor to the ground connection shall be between 25,000 ohms and 1,000,000 ohms.

2.3.02 Vinyl Composition Tile. Vinyl composition tile surfacing shall be 1/8 inch (3 mm) thick conforming to FS SS-T-312, Type IV, Composition 1. Tiles may be approximately 12 inches (300 mm) square or may be the full size of the panel.

2.4 ACCESSORIES. Perforated panels shall be provided for use in areas with hard surfaces such as high pressure laminates, and grilles or registers shall be provided in areas with carpet.

Registers, grilles, perforated panels, and plenum dividers shall be provided where indicated, and shall be the manufacturer's standard type. Registers, grilles, and perforated panels shall be designed to support the same static loads as floor panels without structural failure, and shall be capable of delivering the air volumes indicated. Registers and perforated panels shall be 25 percent open area and shall be equipped with adjustable dampers.

2.4.01 Edge Strip. Panels shall be edged with extruded vinyl edge strips secured in place with mechanical interlock or adhesive bond, or shall be of a replaceable type. Top of strip shall be approximately 1/8 inch (3 mm) wide, and shall be flush with the floor surfacing.

2.4.02 Resilient Base. Base shall be manufacturers standard rubber coved style. Base shall be 4 inches (100 mm) high and a minimum 1/8 inch (3 mm) thick. Pre-formed outside corners shall be furnished.

2.4.03 Lifting Device. Each individual room shall be provided with one floor panel lifting device standard with the floor manufacturer. A minimum of two devices shall be furnished.

2.4.04 Fascia. Aluminum or steel fascia plates shall be provided at open ends of floor, at sides of ramps and steps, and elsewhere as required to enclose the free area under the raised floor. Steel plates shall have a factory applied baked enamel finish. Finish on aluminum plates shall be as standard with the floor system manufacturer. Fascia plates shall be reinforced on the back, and shall be supported using the manufacturer's standard lateral bracing at maximum 4 feet (1200 mm) on center. Trim, angles, and fasteners shall be provided as required.

2.4.05 Steps and Ramps. Steps and ramps shall be securely fastened to the raised floor system and to the structural floor. Construction shall include standard floor system components and custom components as required, and shall include all supports, fasteners, and trim necessary for a finished installation. Step nosings, threshold strips, and floor bevel strips shall be cast or extruded aluminum with non-slip traffic surfaces.

Height of step risers shall not exceed 7 inches (180 mm). Steps shall be designed to support a uniform load of 150 pounds per square foot (7.18 k Pa). Treads shall be surfaced with the manufacturer's standard non-slip floor finish.

Slope of ramps shall not exceed 1-inch (25 mm) rise to 12 inches (300 mm) of run. Ramps shall be designed to support the same loads as specified for floor panels. Ramps shall be surfaced with the manufacturer's standard non-slip floor finish.

2.4.06 Railings. Railings shall be the double rail and post type, fabricated of at least 1 inch (25 mm) round or square seamless aluminum tubing with a satin natural anodized finish. At steps and ramps, the top rail shall be approximately 36 inches (900 mm) high and parallel to the incline. The top rail shall be 42 inches (1050 mm) high at open ends of the floor.

2.5 PANEL SUPPORT SYSTEM.

2.5.01 Pedestals. Pedestals shall be of steel or aluminum or a combination thereof. Ferrous materials shall have a factory-applied corrosion-resistant finish. Pedestal base plates shall provide a minimum of 16 square inches (10,300 square millimeter) of bearing surface and shall be a minimum of 1/8 inch (3 mm) thick. Pedestal shafts shall be threaded to permit height adjustment within a range of approximately 2 inches (50 mm) to permit overall floor adjustment within plus or minus 0.10 inch (2.5 mm) of the required elevation, and to permit leveling of the finished floor surface within 0.062 inch (1.56 mm) in 10 feet (3000 mm) in all directions. Locking devices shall be provided to positively lock the final pedestal vertical adjustments in place. Pedestal caps shall interlock with panels to preclude tilting or rocking of the panels.

2.5.02 Stringers. Stringers shall be of rolled steel or extruded aluminum, and shall interlock with the pedestal heads to prevent lateral movement.

2.6 COLOR. Color shall be as provided in Color Schedule or as selected by Engineer from submittals.

PART 3 - EXECUTION

3.1 INSTALLATION. Raised flooring shall be installed at the location and elevation and in the arrangement shown on the drawings. The floor system shall be of the stringer type, complete with all supplemental items, and shall be the standard product of a manufacturer specializing in the manufacture of raised floor systems.

The floor system shall be installed in accordance with the manufacturer's instructions and with the approved detail drawings. Open ends of the floor, where the floor system does not abut wall or other construction, shall have positive anchorage and rigid support. Areas to receive raised flooring shall be maintained between 60 and 90 degrees F (16 and 32 degrees C) and between 20 percent and 70 percent humidity for 24 hours prior to and during installation.

3.1.01 Preparation for Installation. The area in which the floor system is to be installed shall be cleared of all debris. Structural floor surfaces shall be thoroughly cleaned and all dust shall be removed. Floor coatings required for dust or vapor control shall be installed prior to installation of pedestals only if the pedestal adhesive will not damage the coating. If the coating and adhesive are not compatible, the coating shall be applied after the pedestals have been installed and the adhesive has cured.

3.1.02 Pedestals. Pedestals shall be accurately spaced, and shall be set plumb and in true alignment. Base plates shall be in full and firm contact with the structural floor, and shall be secured to the structural floor with adhesive or steel expansion anchors.

3.1.03 Stringers. Stringers shall be interlocked with the pedestal caps to preclude lateral movement, and shall be spaced uniformly in parallel lines at the indicated elevation.

3.1.04 Auxiliary Framing. Auxiliary framing or pedestals shall be provided around columns and other permanent construction, at sides of ramps, at open ends of the floor, and beneath panels that are substantially cut to accommodate utility systems. Special framing for additional lateral support shall be as shown on the approved detail drawings.

3.1.05 Panels. The panels shall be interlocked with supports in a manner that will preclude lateral movement. Perimeter panels, cutout panels, and panels adjoining columns, stairs, and ramps shall be fastened to the supporting components to form a rigid boundary for the interior panels. Floors shall be level within 1/16 inch measured with a 10 foot (2 mm measured with a 250 mm) straightedge in all directions. Cut edges of steel and wood-core panels shall be painted as recommended by the panel manufacturer. Cut edges of composite panels shall be coated with a silicone rubber sealant or with an adhesive recommended by the panel manufacturer. Extruded vinyl edging shall be secured in place at all cut edges of all panel cutouts to prevent abrasion of cables. Where the space below the floor is a plenum, cutouts for conduit and similar penetrations shall be closed using self-extinguishing sponge rubber.

3.1.06 Resilient Base. Base shall be provided at vertical wall intersections. Cracks and voids in walls and other vertical surfaces to receive base shall be filled with an approved filler. The base shall be applied after the floor system has been completely installed. Base shall be applied with adhesive in accordance with the manufacturer's recommendations.

3.1.07 Repair of Zinc Coating. Zinc coating that has been damaged, and cut edges of zinc-coated components and accessories, shall be repaired by the application of a galvanizing repair paint. Areas to be repaired shall be thoroughly cleaned prior to application of the paint.

3.1.08 Cleaning. The space below the completed floor shall be free of all debris. Before any traffic or other work on the completed raised floor is started, the completed floor shall be cleaned in accordance with the floor covering manufacturer's instructions.

3.1.09 Protection. Traffic areas of raised floor systems shall be protected with a covering of building paper, fiberboard, or other suitable material to prevent damage to the surface. Cutouts shall be covered with material of sufficient strength to support the loads to be encountered. Plywood or similar material shall be placed on the floor to serve as runways for installation of heavy equipment. Protection shall be maintained until the raised floor system is accepted.

3.2 FIRE SAFETY. An automatic detection system shall be installed below the raised floor meeting the requirements of NFPA 75 paragraph 5-2.1 and shall sound an audible and visual alarm. Air space below the raised floor shall be subdivided into areas not exceeding 10,000 square feet (929 squared meters) by tight, noncombustible bulkheads. All penetrations for piping and cables shall be sealed to maintain bulkhead properties.

3.3 FIELD QUALITY CONTROL.

3.3.01 Field Testing. Testing of electrical resistance in the completed installation shall be conducted in the presence of the Contracting Officer. Testing shall be in accordance with NFPA 99 modified by placing one electrode on the center of the panel surface and connecting the other electrode to the metal flooring support. Measurements shall be made at five or more locations. Each measurement shall be the average of five readings of 15 seconds duration at each location. During the tests, relative humidity shall be 45 to 55 percent and temperature shall be 69 to 75 degrees F (21 to 24 degrees C). The panels used in the testing will be selected at random and shall include two panels most distant from the ground connection. Electrical resistance shall be measured with instruments that are accurate within 2 percent and that have been calibrated within 60 days prior to the performance of the resistance tests. The metal-to-metal resistance from panel to supporting pedestal shall not exceed 10 ohms. The resistance between the wearing surface of the floor covering and the ground connection, as measured on the completed installation, shall be in accordance with paragraph FLOOR COVERING.

3.4 SPARE PARTS. Spare floor panels, spare complete pedestal assemblies, and spare stringers shall be furnished at the rate of one space for each 100 or fraction thereof required.

3.5 MAINTENANCE.

3.5.01 Operations and Maintenance Manuals. Provide maintenance instructions for proper care of the floor panel surface. When conductive flooring is specified, require submittal of maintenance instructions to identify special cleaning and maintenance requirements to maintain "conductivity" properties of the panel finish.

End of Section

SECTION 13700

POLYETHYLENE CHEMICAL STORAGE TANKS

PART 1 – GENERAL

1.1 SCOPE. This specification covers upright, cylindrical, flat and/or cone bottom polyethylene upright storage tanks molded in one-piece seamless construction by rotational molding. The tanks shall be designed for above-ground, vertical installation and shall be capable of containing chemicals at atmospheric pressure.

1.2 GENERAL.

1.2.01 General Equipment Stipulations. Provide tanks classified as Type I or Type II as indicated. Type I tanks are molded from cross-linkable polyethylene resin. Type II tanks are molded from linear polyethylene resin (not cross-linkable resin).

1.2.02 Governing Standards.

ASTM (American Society for Testing and Materials) D618 – Specification for Conditioning Plastics and Electrical Insulating Materials for Testing.

ASTM D638 – Specification for Tensile Properties of Plastics.

ASTM D790 – Specification for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulation Materials.

ASTM D883 – Specification for Definitions of Terms Relating to Plastics.

ASTM D1505 – Specification for Density of Plastics by the Density-Gradient Technique.

ASTM D1525 - Test Method for Vicat Softening Temperature of Plastics.

ASTM D1693 - Test Method for Environmental Stress-Cracking of Ethylene Plastics.

ASTM D1998 – Specification for Polyethylene Upright Storage Tanks.

ASTM D2765 – Test Methods for Determination of Gel Content and Swell Ratio of Crosslinked Ethylene Plastics.

ASTM D2837 – Specification for Method for obtaining Hydrostatic Design Basis for Thermoplastic Pipe Materials.

ASTM D3892 – Specification for Practice for Packaging/Packing of Plastics.

ASTM F412 – Specification for Definitions of Terms Relating to Plastic Piping Systems.

ARM (Association of Rotational Molders) Low Temperature Impact Resistance (Falling Dart Test Procedure).

ANSI (American National Standards Institute) B-16.5 - Pipe Flanges and Flanged Fittings.

29 CFR 1910.106 Occupational Safety and Health Administration Flammable and Combustible Liquids.

BOCA (Building Officials and Code Administrators) National Building Code (Latest Edition).

Chemical Resistance Guide for Elastomers, Compass Publications, Kenneth M Pruett.

Compass Corrosion Guide II, Compass Publications, Kenneth M Pruett.

1.3 QUALITY ASSURANCE.

These references shall be considered as general guidelines only.

1.3.01 Manufacturer's Qualifications. Tank manufacturer shall have a minimum of 5 years experience manufacturing storage tanks of the type specified.

1.3.02 Contractor's Qualifications. Contractor shall have a minimum of 5 years experience installing tanks of the type specified and be certified by the manufacturer.

1.3.03 Chemical Compatibility. Chemical compatibility shall be according to the following chemical resistance guides:

Pruett, Kenneth M., "Chemical Resistance Guide for Elastomers", Compass Publications.

Pruett, Kenneth M., "Compass Corrosion Guide II", Compass Publications

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit detailed shop drawings showing details of construction and erection and product data for tanks, fittings, and accessories.

1.4.02 Certifications. Submit certification from manufacturer for tanks being provided that they are chemically compatible with materials to be stored for the design of the tank.

1.4.03 Samples. Submit a representative sample of the proposed tank wall.

1.5 DELIVERY, STORAGE, AND HANDLING.

1.5.01 Markings. The tanks shall be marked to identify the product, date of manufacture (month and year), capacity, and serial number. The tanks shall be shipped with a 3 of 9, HRI bar code label containing tank description, manufacturing order number, part number, serial number, manufacturer, and date.

Provide the proper caution or warning signs as prescribed by OSHA standard 29 CFR 1910.106.

1.5.02 Packing. All packing, packaging, and marking provisions of ASTM Practice D3892 shall apply to this standard.

Tank shall be shrink wrapped and bagged for shipping. All fittings shall be shipped separately.

1.5.03 Shipping. The manufacturer's instructions shall be followed in cases for shipping and unloading of tanks. Tanks with capacities of 2000 gallons (7,570 L) or more shall have molded-in lifting lugs provided to assist with tank handling.

Upon arrival at the site, the Engineer shall be responsible for inspection for damage in transit. If damage has occurred, the contractor shall repair or replace the tank as determined by the Engineer.

1.6 WARRANTY. Manufacturer shall fully warrant tank, fittings, and accessories for a minimum of 3 years from date of acceptance.

PART 2- PRODUCTS

2.1 SERVICE CONDITIONS. Tanks classified as Type I are not intended for materials above 140 degrees F (60 degrees C). Type II tanks are not intended for materials above 130 degrees F (54.4 degrees C).

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. The minimum required wall thickness for the cylinder straight shell shall be sufficient to support its own weight in an upright position without any external support. Flat areas shall be provided to allow locating large fittings on the cylinder straight shell.

The top head shall be integrally molded with the cylinder shell. The minimum thickness of the top head shall be equal to the top of the straight wall. The top head of tanks with 2000 or more gallons (7,570 L) of capacity shall be designed to provide a minimum of 1300 square inches (.83 sq m) of flat area for fitting locations.

Where indicated on the Drawings, the tank head shall be designed to support a mixer. Inspection manholes shall be provided on tank heads as indicated on the Drawings.

Tanks with 2000 or more gallons (7,570 L) of capacity shall have a minimum of 3 lifting lugs integrally molded into the top head. The lifting lugs shall be designed to allow erection of an empty tank.

The tank shall be designed to provide a minimum of 4 tie-down lugs integrally molded into the top head. The tie-down lugs shall be designed to allow tank retention in wind and seismic loading situations for Southeast Michigan without tank damage. Contractor shall coordinate with Engineer so all tanks have a high level alarm to prevent overflowing.

2.3 MATERIALS. The material used shall be virgin polyethylene resin as compounded and certified by the manufacturer. All polyethylene resin material shall contain a minimum of a U.V. 8 stabilizer as compounded by the resin manufacturer. Pigments shall not exceed 0.25 percent (dry blended) of the total weight.

2.3.01 Type 1 Tanks. Type I tanks shall be made from crosslinkable polyethylene resin as manufactured by Phillips 66, or resin of equal physical and chemical properties. Mechanical Properties of Type I Tank Material shall be as follows:

PROPERTY	ASTM	VALUE
Density (Resin)	D1505	0.938-0.944 g per cc (35 lb per in cu)
Tensile (yield Stress 2 in per min)	D638	2600 PSI (17,924 kPa)
Elongation at Break (2 in per min)	D638	400 percent
ESCR (100 percent lgepal, Cond. A, F50)	D1693	>1000 hours
ESCR (10 percent lgepal, Cond. A, F50)	D1525	>1000 hours
Vicat Softening Degrees F. Temperature	D1525	248 (120 degrees C)
Flexural Modulus	D790	100,000 PSI (689,400 kPa)

2.3.02 Type II Tanks. Type II tanks shall be made from linear polyethylene resin as manufactured by Exxon Chemical, or resin of equal physical and chemical properties. Mechanical Properties of Type II Tank Material shall be as follows:

PROPERTY	ASTM	VALUE
Density (Resin)	D1505	0.940-0.947 g per cc (35 lb per in cu)
Tensile (Yield Stress 2 inch per min)	D638	2700 PSI (18,614 kPa)
Elongation at Break (2 inch per min)	D638	350 percent
ESCR (100 percent lgepal, Cond A, F50)	D1693	400-1000 hours
ESCR (10 percent lgepal, Cond. A, F50)	D1693	200-500 hours
Vicat Softening Degrees F. Temperature	D1525	235 (113 degrees C)
Flexural Modulus	D790	97,000 - 103,000 PSI (668,718 – 710,082 kPa)

2.3.03 Fittings - General. All tank fitting attachments shall be equipped with flexible couplers or other movement provision. The tank will deflect based upon tank loading, chemical temperature, and storage time duration. Tank piping flexible couplers shall be designed to allow 4 percent design movement. Movement shall be considered to occur both outward in tank radius and downward fitting elevation from the neutral tank fitting placement.

2.3.04 Threaded Bulkhead Fittings (Nozzles). Provide threaded bulkhead fittings for below liquid installation for fittings up to 2 inches (5.1 cm) in diameter. Fittings shall be placed away from tank knuckle radius and flange lines.

The fittings shall be sized in accordance with the following table.

Fitting Size	Maximum Wall Thickness
<3/4 inch (< 1.9 cm)	0.750 inch (1.9 cm)
3/4 inch (1.9 cm)	0.875 inch (2.2 cm)
1 inch (2.5 cm)	0.875 inch (2.2 cm)
1 1/4 inch (3.2 cm)	0.875 inch (2.2 cm)
1 1/2 inch (3.8 cm)	0.875 inch (2.2 cm)
2 inch (5.1 cm)	1 inch (2.5 cm)
3 inch (7.6 cm)	1.125 inch (Flat Surface Only) (2.9 cm)

Bulkhead fittings shall be constructed of PVC, PP, or other specified material.

Gaskets shall be a minimum of 1/4 inch (6.4 mm) thickness and constructed of 40-50 durometer EPDM, 60-70 durometer Viton®, Baggby type gaskets, or other specified material.

2.3.05 Bolted Double 150 lb. Flange Fittings. Provide bolted double flange fittings for below liquid level installation for sizes above 2 inches (5.1 cm). Fittings shall be placed away from tank knuckle radius and flange lines. Size the fittings in accordance with the table shown below.

Tank Diameter	Maximum Bolted Fitting Size Allowable
48 inch - 86 inch (122 – 218 cm)	3 inch (6.8 cm)
90 inch - 102 inch (202 – 230 cm)	6 inch (13.5 cm)
120 inch - 142 inch (270 – 320 cm)	8 inch (18.0 cm)

Bolted double flange fittings shall allow tank wall thickness up to 2 1/2 inch (6.4 cm).

Bolted double flange fitting shall be constructed with 2 -150 lb. (68 kg) flanges, 2-150 lb. (68 kg) flange gaskets, and the correct number and size of all-thread bolts for the flange specified by the flange manufacturer. The flanges shall be constructed of PVC Type I, Grade I or other specified material. Gaskets shall be a minimum of 1/4 inch (6.4 mm) thickness and constructed of 40-50 durometer EPDM, 60-70 durometer Viton® or other specified material. There shall be a minimum of 4 full thread bolts. The bolts may have gasketed flanged metal heads or bolt heads encapsulated in Type II polyethylene material. The encapsulated bolt shall be designed to prevent metal exposure to the liquid in the tank and prevent bolt rotation during installation. The polyethylene encapsulation shall fully cover the bolt head and a minimum of 1/4 inch (6.4 mm) of the threads closest to the bolt head. The polyethylene shall be color coded to distinguish bolt material (white - 316 S.S., yellow - Hastelloy C276, red - Monel, green - Titanium). Each encapsulated bolt shall have a gasket to provide a sealing surface against the inner flange.

Standard orientation of bolted double flange fittings shall have bolt holes straddling the principal centerline of the tank in accordance with ANSI/ASME B-16.5 unless otherwise specified.

2.3.06 Bolted Stainless Steel Fittings. Provide bolted stainless steel fittings where indicated on the Drawings. Fittings shall be placed away from tank knuckle radius and flange lines. Size the fittings in accordance with the table shown below.

Tank Diameter	Maximum Bolted Fitting Size Allowable
48 inch (108 cm)	3 inch (6.8 cm)
64 inch - 142 inch (144 – 320 cm)	4 inch (9.0 cm)

Bolted stainless steel fittings shall allow tank wall thickness up to 2 1/2 inch (6.4 cm)

Bolted stainless steel fittings shall be constructed with a minimum of 4 fully threaded 3/8 inch (9.5 mm) studs. Each fitting shall have two gaskets and two flanges. One gasket shall be compressed between the inside of the tank wall surface and the inside flange of the fitting. The other gasket shall be compressed between the outside tank wall surface and the outside flange of the fitting. Provide stainless steel fittings with male or female pipe threads as indicated the Drawings or as specified. The fittings shall be constructed of Type 316 stainless steel. Gaskets shall be a minimum of 1/4 inch (6.4 mm) thickness and constructed of 40-50 durometer EPDM, 60-70 durometer Viton® or other specified material.

2.3.07 Siphon Tube Fittings. Provide Siphon tubes with the above specified fittings Siphon tubes allow fittings, when used as drainage fittings to provide better tank drainage.

2.3.08 Self-Aligning Threaded Bulkhead Fittings. Furnish self-aligning fittings where indicted on the Drawings or as specified for installation in vapor phase applications on curved surfaces. Fittings shall be placed away from tank radius. The maximum allowable size for self-aligning fittings placed on a spherical section of the tank is shown below.

Tank Diameter	Maximum Fitting Size Allowable
45 inch - 48 inch (114 – 121 cm)	2 inch (5.1 cm)
64 inch - 142 inch (162 – 361 cm)	3 inch (7.6 cm)

The maximum thickness and installation angle for fitting sizes are shown below.

Fitting Size	Maximum Angle	Maximum Thickness
1 inch (2.5 cm)	27 degrees	1.000 inch
2 inch (5.1 cm)	25 degrees	0.750 inch

3 inch (7.6 cm)	20 degrees	1.000 inch

Self-aligning fittings shall be constructed of PVC or other specified material. Gaskets shall be a minimum of 1/4 inch (6.4 mm) thickness and constructed of 40-50 durometer EPDM, 60-70 durometer Viton®, or other specified material.

2.3.09 Snyder Unitized Molded Outlet (SUMO) Fittings. Provide SUMO fittings as an integral part of specified tanks. SUMO fittings will facilitate complete drainage of the stored liquid through the sidewall of a flat bottom container without the use of a special support structure or concrete pad.

The tank attachment shall be constructed from a PVC schedule 80 male adapter or other material in the size indicated. The fitting orifice shall not be less than schedule 80 interior pipe size per ANSI B36.10. O-rings shall be constructed of 70 +/- 5 durometer Viton® or other specified material.

2.3.10 Sight Level Gage. The sight level gage shall be constructed of flexible PE tubing to allow for tank contraction and expansion due to loading and temperature changes. The level gage shall be connected to the tank with 2 appropriate 3/4 inch (1.9 cm) fittings as described in the proceeding paragraphs. Provide valves installed for isolation or drainage purposes where indicated or specified.

2.3.11 Float Level Gage. The float level gage shall be constructed of a guided float on the inside of the tank connected to a weight indicator on the exterior of the tank with a 1/4 inch (6.4 cm) rope. The weighted indicator shall move along inside a clear guide pipe and shall be equipped with a volumetric indicator board. The indicator board shall be PVC material and may be attached to the clear guide pipe. The board shall be stenciled with one hundred gallon (liters) marks and labeled every five hundred gallons (liters). The level gage shall be connected to the tank at an appropriate tank flat on the tank dome with a 3 inch (7.6 cm) threaded bulkhead fitting and held along the tank sidewall with appropriate 1 inch (2.6 cm) fittings and stand-off connections.

The float level gage rigid components shall be constructed of PVC or other specified material. The rope shall be constructed of polypropylene or other specified material. Gaskets shall be constructed of EPDM, Viton® or other specified material.

2.3.12 Ultrasonic Level Indicator. The ultrasonic level indicator when specified, shall consist of a 2 or 3 inch (5.1 – 7.6 cm), 4 - 20 mA output PVC sensor and a 3 1/2 inch (8.9 cm) digital display unit. The sensor may be equipped with male pipe threads and be connected to the tank head with a PE bulkhead fitting, or the sensor may be Teflon® faced and flanged bolted to the tank head with encapsulated 316 S.S. bolts. The sensor shall be connected to a display unit mounted on the containment tank. The display unit box shall be Nema 4X rated and factory prewired for 110 VAC power. All connections shall be labeled to prevent errors in field installation. The display unit shall be preprogrammed for the particular tank. The display shall show hundreds of gallons (liters) (display x 100 = gallons (liters)).

2.3.13 Manway and Fill Cap (Non-sealed). Tank shall have fill caps, 10 inch (25.4 cm) vented-threaded style with a minimum opening diameter of 7.125 inch (18.1 cm). Cap attachment shall be provided with all standard 10 inch (25.4 cm) cap placements with a polyurethane cap tie.

Include Manway 18 inch (45.7 cm) vented-threaded style (minimum opening diameter of 16 inch (40.6 cm)), or 24 inch (21.5 cm) vented threaded style (minimum opening diameter of 22 inch (55.9 cm)) or 24 inch (21.5 cm) slip fit style (minimum opening diameter of 19.25 inch 48.9 cm)).

All caps and manways shall be constructed of polyethylene material.

2.3.14 Bolted Sealed Top Manway. Provide sealed manways, in 18, 20 or 24 inch (45.7, 50.8 or 61.0 cm) sizes in selected positions as indicated on the Drawings or as specified.

The sealed manway shall be constructed of polyethylene material. The bolts shall be Isoplast® or other specified material. The gaskets shall be closed cell crosslinked polyethylene foam and Viton® materials.

2.3.15 Down Pipes and Fill Pipes. Down pipes and fill pipes shall be prepared per the approved drawings and specifications. All down pipes and fill pipes shall be supported at 5 ft. (1.5 m) maximum intervals with support structures.

All down pipes and fill pipes shall be constructed of PVC or other specified materials.

2.3.16 U-Vents. Each tank shall be properly vented for the type of material and flow rates expected. Vents shall comply with OSHA 1910.106 (F) (iii) (2) (IV) (9) normal venting for atmospheric tanks or other accepted standard, or shall be as large as the filling or withdrawal connections, whichever is larger but in no case less than 1 inch (2.5 cm) nominal inside diameter.

All U-vents shall be constructed of PVC or other specified materials.

2.3.17 Flange Adapters. Where required, provide flange adapters to adapt threaded or socket fitting outlets to 150 lb. (68 kg) flange connections for connection to piping system components. Flange adapters shall be PVC, CPVC or other specified materials. Flange adapter construction shall utilize schedule 80 components in sizes required for particular tank configuration.

2.3.18 Tank Ladders. Ladders shall be constructed of painted mild steel, stainless steel, FRP or other specified material.

Safety cages shall be provided with ladders where indicated on the Drawing. All ladders shall be designed to meet applicable OSHA 2206, 1910.27, Fixed Ladders.

Ladders shall be mounted to the tank to allow for tank expansion and contraction due to temperature and loading changes. All top ladder mounts shall be connected to integrally molded in attachment lugs that allow for tank movement.

2.3.19 Tie Down Systems. Tie down system shall be designed to withstand 110 MPH (176 Km PH) wind loads. Anchor bolts shall be provided by the Contractor per the manufacturer's instructions and the base plates for the system.

The tie down system shall be painted mild steel, 304 stainless steel or other materials as indicated on the Drawings or as specified.

2.3.20 Tank Heating Systems. Furnish heating systems for use with polyethylene tanks designed to meet specific requirements, including tank material type, tank size, low ambient temperature, and recommended maintenance temperature.

All control components of the heating system shall be mounted in water tight, high impact plastic box(es) with a gasketed cover.

All heating system components shall be Nema 4X rated and factory pre-wired for 110 or 220 VAC. All connections shall be labeled to prevent errors in field installation.

Each control box shall carry a decal attached to the inside surface of the cover, on which an electrical wiring diagram is printed.

Each control box shall contain two temperature controls. One control shall regulate the maintenance temperature setting and the other control shall regulate the high temperature setting. The maintenance temperature setting shall be set at the desired maintenance temperature. The high temperature setting shall be adjusted to 10 degrees above the desired maintenance temperature to a maximum of 130 degrees F (54 degrees C). All control systems shall be designed with a power off failure mode.

The heating panels shall be designed to wrap around and lie flat against the surface of the tanks. The heating panels shall have a maximum heating density of .09 watts per square inch (0.222 watts per sq cm). All heating panels and sensor bulbs shall be attached to the tank with 2 inch (5.1 cm) wide duct tape. Under no circumstances shall cable type heaters be used with polyethylene tanks.

Insulation used shall be polyurethane foam with a density of 2.0 - 3.0 lb per cubic foot (30 – 45 kg per cu m) with an "R" value of 8.33 per inch (2.5 cm). The foam shall be applied with a nominal thickness of 2 inch (5.1 cm) to all external tank surfaces except the tank bottom shell.

Upon completion of application and curing of the insulation, two full coverage coats of latex mastic coating shall be applied to the surface of the insulation in such manner as to seal the insulation from the outside environment. The latex mastic may be gray (standard) or white in color.

2.3.21 Equipment Platforms. Equipment platforms shall be mounted on tie down lugs integrally molded into the top head of the tank secured for its intended use. If the equipment platform is being used on a tank with saddle type tie down lugs and supporting a mixer, it is recommended the platform and tank be tied down with a tie down system as described in Paragraph 2.3.19.

Equipment platforms shall be offered in painted mild steel or as indicated on the Drawings or as specified.

Equipment platforms shall be designed to support a load of 150 PSF (1,034 kPa) in addition to equipment and piping loads.

2.3.22 Cone Bottom Tank Stands. Where indicated, provide Cone Bottom Tank Stands in 30 or 45 degree cone styles with rated gross weight capacities for all manufacturer cone bottom tanks. The stands shall be designed for a minimum of 2.4 safety factor accounting for wind and seismic loads. Ratings are based on stands anchored to an appropriate concrete support structure and the tank adequately secured. Cone bottom tank stands shall be offered in painted mild steel or as indicated on the Drawings or as specified.

2.4 MANUFACTURE AND FABRICATION. The finished tank wall shall be free, as commercially practicable, of visual defects such as foreign inclusions, air bubbles, pinholes, pimples, crazing, cracking and delaminations that will impair the serviceability of the vessel. Fine bubbles are acceptable with Type II tanks to the degree in which they do not interfere with proper fusion of the resin melt.

All cut edges where openings are cut into the tanks shall be trimmed smooth.

2.4.01 Tolerances. Dimensions will be taken with the tank in the vertical position, unfilled. Tank dimensions will represent the exterior measurements.

The tolerance for the outside diameter, including out of roundness, shall be per ASTM D1998.

The tolerance for fitting placements shall be +/- 0.5 inch (1.3 cm) in elevation and 2 degrees radial at ambient temperature.

2.5 SHOP TESTING. Test specimens shall be taken from fitting location areas or piggy-back test methods.

2.5.01 Low Temperature Impact Test. The test specimens shall be impacted in accordance with the standard testing methods as found in ASTM D1998.

2.5.02 Degree of Crosslinking Test (Percent Gel - Type I Only). The test method used shall be the ortho-xlene insoluble fraction (gel test) per ASTM D2765 Method C. This test method is for determination of the ortho-xlene insoluble fraction (gel) of crosslinked polyethylene.

The percent gel level for Type I tanks on the inside 1/8 inch (0.3 cm) of the wall shall be a minimum of 65 percent.

2.5.03 Ultrasonic Tank Thickness Test. All tanks 2000 gallons (7,400 L) or larger shall be measured for tank wall thickness at 6 inch (15.2 cm), 1 foot (30.5 cm), 2 feet (61.0 cm), etc. on the tank sidewall height at 0 degrees, 90 degrees, 180 degrees, and 270 degrees around the tank circumference with 0 degrees being the tank manway and going counter-clockwise per ANSI standard drafting specifications. A copy of this test report can be ordered when placing the original tank order. All tanks shall meet design thickness requirements and tolerances.

Furnish a copy of the test report for tanks smaller than 2000 gallons (7,400 L) when requested by the Engineer.

2.5.04 Hydrostatic Water Test. The hydrostatic water test shall consist of filling the tank to brim full capacity for a minimum of four hours and conducting a visual inspection for leaks. Perform a hydrostatic water test when requested by the Engineer.

PART 3 – EXECUTION

3.1 INSPECTION. The contractor shall inspect the site to receive the tank and ensure that the foundation is correctly installed and ready to receive the tank. The elevation of the tank base shall be checked to ensure it is as specified.

3.2 INSTALLATION. The contractor shall install the tank, fittings and accessories according to the Drawings and manufacturer's instructions.

All fitting connections shall be installed with flexible type connections as per the Manufacturers recommendations.

Make all pipe connections to tanks as shown on the Drawings.

Following the field test, tanks and support members shall be anchored in their final position according to the manufacturer's recommendations.

3.3 FIELD QUALITY CONTROL. After installation, each tank connecting pipe, and associated valving shall be field tested by filling with water. The tank and fittings shall hold water without loss, evidence of weeping or capillary action for a period of 24 hours prior to acceptance. The Engineer may also inspect each tank for defects, damage, and conformance with the Specifications.

After testing, the tanks shall be thoroughly cleaned and dried.

Should any defects become evident during inspection, testing, or within the guarantee period, the Contractor shall repair or replace the defective tank or fitting as approved by the Engineer.

End of Section

SECTION 13750

STEEL CHEMICAL STORAGE TANKS

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installation of lined or unlined steel single or dual wall tanks for the storage of chemicals. Connecting piping, valves, and accessories not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 Coordination. All equipment for this section shall be furnished by a single supplier who shall be responsible for the design, coordination, and function of the assembly. The coordinating supplier shall verify that each component is compatible with all other components of the assembly; that all pipe sizes and materials are appropriate; and that all devices necessary for a properly functioning assembly have been provided.

1.2.02 General Equipment Stipulations. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions and recommendations of the equipment manufacturer unless exceptions are noted by the Contractor.

The equipment shall be furnished and installed complete with all components indicated on the drawings or specified, and any additional materials or construction required by the manufacturer's design.

1.2.03 Governing Standards. Unless otherwise specified, the work for this section shall conform to the applicable portions of the following:

> ASME (American Society of Mechanical Engineers).
>
> ASTM (American Society of Testing and Materials) A283 - Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes, and Bars.
>
> ASTM A1011 - Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
>
> AWS D1.1 (American Welding Society) – Structural Welding Code – Steel.

AWS D1.3 – Structural Welding Code – Sheet Steel.

National Fire Protection Association.

UL (Underwriters Laboratories) Standard 142 – Steel Aboveground Tanks for Flammable and Cumbustible Liquids.

UL Standard 2085 - Insulated Aboveground Tanks for Flammable and Combustible Liquids.

Steel Tank Institute F-921 (STI) - Standard for Aboveground Tanks with Integral Secondary Containment.

Chemical Resistance Guide for Elastomers, Compass Publications, Kenneth M Pruett.

Compass Corrosion Guide II, Compass Publications, Kenneth M Pruett.

1.3 QUALITY ASSURANCE.

1.3.01 Welding Qualifications. Welding procedures, welders, and welding operators shall also be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code, and/or in accordance with AWS D1.1 and AWS D1.3.

1.3.02 Manufacturer's Qualifications. Manufacturer shall have a minimum of 5 years experience successfully manufacturing steel chemical storage tanks of type specified here.

1.3.03 Testing. Each tank shall be tested in conformance with ASME Section VIII requirements and Manufacturer Data Report (Form U-1) shall be completed prior to shipment.

1.3.04 Chemical Compatibility. Chemical compatibility shall be evaluated according to the following chemical resistance guides:

Pruett, Kenneth M., "Chemical Resistance Guide for Elastomers", Compass Publications.

Pruett, Kenneth M., "Compass Corrosion Guide II", Compass Publications

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Submit complete fabrication, assembly, and installation drawings, together with detailed specifications and product data covering materials used, parts, devices, and other accessories forming a part of the equipment furnished.

1.4.02 Certifications. The manufacturer shall certify they have evaluated the product(s) to be stored and that the tank materials and structure to be provided will be compatible with the product(s) to be stored over the design life of the tank.

Submit operation and maintenance manuals for the tanks, equipment, and accessories furnished.

1.5 DELIVERY, STORAGE, AND HANDLING. The tank and component parts shall be adequately protected during all transportation, loading and unloading, storage, installation, and subsequent construction activities. All nozzles shall be properly protected at all times and shall be plugged to prevent contamination of the tank interior. Repairs of minor damage, including scratches and abrasions, may be made where permitted by the Engineer in the manner recommended by the manufacturer. If a tank is damaged beyond reasonable repair, in the opinion of the Engineer, it will be rejected and shall be replaced by the Supplier with an undamaged unit.

At no time shall a tank be dropped or rolled. All lifting shall be done using the lifting lugs or suitable slings.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The storage tank shall be double wall type with insulation between the two steel walls. The tank shall be aboveground, atmospheric type with suitable supports and accessories as indicated on the Drawings and specified herein. The tank shall be secured to a concrete base by anchor bolts (cast in reinforced concrete) through the tank support. The entire tank system shall be electrically grounded.

Tank installation shall be coordinated with other construction under this contract.

2.2 PERFORMANCE AND BASIS OF DESIGN REQUIREMENTS. Each tank shall be designed in accordance with the latest edition of Section VIII, Division 1, PART UW of the ASME Boiler and Pressure Vessel Code. An ASME Code Stamp is not required.

Tanks and supports shall be designed to meet the seismic loading of the City of Detroit.

Each tank shall have a bottom capable of being supported on a concrete base. Each tank shall be provided with a suitable overflow alarm and fitting.

Each tank shall be vented and will normally be used to store the specified chemical at atmospheric pressure. Although the tank shall be designed to withstand the hydrostatic head which would result with the tank and fill pipe surcharged with the stored chemical to 6 inches (15.2 cm) above the top of the tank.

Each tank shall be suitable to withstand internal corrosion from the material stored at a maximum temperature of 150 degree F (65.6 degrees C).

Thermal insulation shall be placed between the two steel walls of dual wall tanks at the factory and shall provide a minimum 2 hour fire rating.

The secondary outer steel tank of dual wall tanks shall be suitable to withstand external corrosion due to atmospheric conditions.

Tank heads shall be self-supporting structurally reinforced to withstand a super-imposed load of 250 pounds (550 Kg) at any point and shall be additionally reinforced as necessary for the required accessories. Any necessary supporting members shall be located on top of the head plate.

Tank nozzles and personnel manholes shall be provided as indicated and as specified herein. Each tank and associated appurtenances shall be fabricated from a minimum number of pieces, and vertical shell seams shall be staggered. Welding seams shall be located to clear all nozzle openings. All flange faces shall be true to the center line of the nozzles, and bolt holes shall straddle center lines unless noted elsewhere.

All welding shall be done by the electric arc process. All welding shall be full and continuous, of uniform size and free from slag, porosity, undercuts, and other defects. All welds shall be fully penetrated. The manhole flange shall be machined smooth for a gasket surface after welding.

Provisions shall be made for anchoring each completed tank to the concrete base. Tanks shall be provided with anchor bolts and hold down lugs.

2.3 ACCEPTABLE MANUFACTURERS. Storage tanks shall be manufactured by a member in good standing of the Steel Tank Institute. Insulated tank manufacturers shall be licensed to build Fireguard type tanks.

2.4 MATERIALS.

Unless otherwise specified herein, material shall be suitable for continuous heavy duty industrial use and to withstand the service and environmental conditions specified. Materials shall be as follows:

Shell and plate (internal and outer)	ASTM A285, Grade C or ASTM A516, Grade 70: flange quality steel
Insulation	Lightweight thermal insulation suitable for preventing the internal tank temperature from rising 260 degrees F (126 degrees C) during a 2,000 degrees F (1093 degrees C) fire test for 2 hours
Nozzle and piping	ASTM A53, Grade B, Seamless
Flanges	ASTM A285, Grade C, flange quality
Structural shapes	ASTM A36
Bolts and nuts	Commercial quality carbon steel square head bolts and heavy cold press hex nuts
Gaskets	1/16 inch (1.6 mm) thick "Halon" TFE
Anchor Bolts	ASME approved, of same composition as base metal
Epoxy enamel	Ameron "Amercoat 385 Epoxy", Carboline "890" or Tnemec "Series 69 Hi-Build Epoxoline II"
Rubber Lining	0.2 inches (5 mm) vulcanized rubber or polyisoprene extending through and on the flanged faces of all tank connections, and continuous over all permanently attached brackets and supports

2.5 CONSTRUCTION. Dual wall internal and outer tanks shall both be of welded construction throughout and each shall be UL 142 listed and labeled. Other tanks shall be all welded construction with a minimum shell thickness of 3/8 inch (9.5 mm). All tanks shall include a 1/4 inch (6.4 mm) corrosion allowance in the wall thickness design.

Upon completion of dual wall construction, the exterior of the outer tank and inner tank interior seams shall be ground free of rough areas such that finished welds are full and rounded.

2.5.01 Surface Preparation. After fabrication, all metal surfaces and connections shall be blasted clean in conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.5.02 Painting. All exterior surfaces of each internal tank and the secondary outer tank shall be shop primed and painted in accordance with the tank manufacturer's requirements.

2.5.03 Connections. Connections on each tank shall be as indicated on the Drawings and as specified herein. All connections on the tank that are not used shall be capped.

All connections of dual wall tanks shall be sealed to prevent moisture from penetrating the outside of the secondary outer steel tank and shall maintain the specified fire rating.

2.5.04 Manway. The manway for each tank shall be an all welded extension cylinder in the location indicated on the drawings. The cover plate shall be the standard carbon steel manway cover furnished with the tank.

2.6 PROTECTIVE COATINGS. The exterior surfaces of each tank shall be thoroughly shop cleaned of all foreign materials as recommended by the paint manufacturer and shop painted with 7 mil (1.8 mm) thickness of epoxy enamel paint.

2.7 ACCESSORIES. Accessories shall be provided on each tank as indicated on the Drawings and as specified herein.

Each fill connection shall be suitably identified to indicate the type of product to be put into the tank.

A suitable means of sealing around the sensor wire entering the leak detection riser pipe shall be provided to prevent the annular space of dual wall tanks from being contaminated. Suitable fittings shall also be provided for a level transmitter to connect to the tank connection.

2.7.01 Vents. Each tank shall be provided with a flanged vent nozzle.

A check and vent valve assembly shall be mounted on the tank vent flange of tanks that draw air into the tank of tanks that to prevent corrosive fumes from entering the tank vent dryer. The valve shall be in accordance with Lectrodryer Drawing P-1050, as manufactured by Lectrodryer Division of Ajax Magnethormic Corp. with 2 1/2 inch (6.4) inlet and tank flange fittings. The vent valve exhaust port shall include a weather cover.

One tank vent breather shall be furnished and installed adjacent to the tank to remove moisture from the air drawn into the tank. The breather shall be Lectrodryer Division of Ajax Magnethormic Corp., "Model BR-50 Lectrobreather". A reactivator assembly shall be furnished and installed with the tank vent breather for periodic drying of the breather desiccant. The assembly shall be housed in a NEMA-4 enclosure, and shall include a 1/3 horse power motor and 2 kW heater for operation from a 120 volt, single phase, 60 Hz power supply.

2.7.02 Vent Covers. A 2 inch (5.1 cm) vent cover shall be provided on each tank vent in the location indicated on the Drawings. The cover shall have an aluminum body, 40 mesh screen over the outlet, and shall prevent rain from entering the vent line.

2.7.03 Dual Wall Internal Tank Emergency Vents. An emergency vent shall be provided on the top of each tank as indicated on the Drawings. The emergency vent shall relieve internal pressure in excess of 16 oz per square inch (73.37 ml per cm sq.)

2.7.04 Dual Wall Outer Tank Emergency Vents. A suitable secondary outer tank emergency vent shall be provided on top of the tank for the space between the two steel walls as indicated on the Drawings. The emergency vent shall relieve internal pressure in excess of 16 oz per square inch (73.37 ml per cm sq.) and shall be sized as required for proper operation.

2.7.05 Tank Supports. Tank support saddles or rails shall be provided with the tank at the spacing recommended by the manufacturer. Supports shall be fabricated of carbon steel as a part of the tank structure. Supports shall be of the size and design required to adequately support the tank and its contents, and shall be able to withstand the buoyancy forces when the tank is empty and covered with water.

2.7.06 Leak Detection Systems. Where indicated, tanks shall be provided with a leak detection system to continuously monitor the tank. The system shall consist of porous insulation, a riser pipe open on the bottom end and placed vertically next to and below the inner primary tank. Any leakage shall flow through the insulation to the riser pipe.

The system shall use a single sensor element to continuously monitor the presence of liquid in the riser pipe.

2.7.07 Access Manhole. The access manhole shall have an inside diameter of at least 24 inches (61.0 cm). One manhole shall be provided on the top of each storage tank and one shall be provided near the bottom on each tank. The tank manhole shall be flanged, fully gasketed, and furnished with a 5/8 inch (1.6 cm) minimum thick blind flange. Flange drilling and diameter shall conform to ANSI B16.5, 150 pound (330 Kg).

2.7.08 Flanged Nozzles. Nozzles for connecting piping shall be provided on each tank at the locations and of the sizes indicated on the Drawing or as specified herein. Each nozzle shall be flanged, with flange diameter and drilling conforming to ANSI B16.5, 150 pound (330 Kg). Flanged nozzles shall be fabricated of the same material as the tank.

Tank nozzles shall extend at least 4 inches (10.2 cm) from outside of face of tank to the face of the flange. Inlet or fill nozzles shall extend at least 4 inches (10.2 cm) into the tanks.

Two ultrasonic level sensor mounting nozzles are required. Level sensor nozzles shall be smooth bore, free and clear of frayed edges with 6 inch (15.2 cm) diameter raised outlet. Flanges shall be not be less than 18 inches (38.1 cm) above the maximum liquid level. Nozzle locations shall be on the top of the tank offset on either side of the tank center, equidistant from the centerline and wall. The centerline of the nozzles shall be at least 24 inches (61.0 cm) from the tank sidewall, fill nozzle, and other obstructions. Nozzles shall be located away from the fill stream or any other internal tank obstructions.

2.7.09 Tank Outlet. Each tank outlet assembly shall be as indicated on the Drawings. Outlets from sulfuric acid tanks shall be provided with a crank operated plug valve specifically designed for sulfuric acid service. The valve plug and seat shall be porcelain material. The valve seat shall be located in a welded tee fabrication at the tank outlet complete with a blind flange for washout. The valve crank operating mechanism shall be furnished through an 8 inch (20.3 cm) nozzle located on the top of the tank. General Chemical valve assembly "No. 50.78-6-A" is available from Kingsport Foundry and Manufacturing Corp., Kingsport, Tennessee or other as approved.

2.7.10 Gauge Glass. A chemical-resistant valve and gauge glass assembly shall be mounted on each storage tank. The gauge glass shall be fabricated of 1 inch (2.5 cm) clear schedule 40 PVC, and shall be graduated in 500 gallon graduations. Valve assemblies shall be PVC with integral ball checks to prevent flow in the event of gauge glass failure. The gauge shall be oriented so that the scale is visible from the normal personnel working area.

2.7.11 Certification Plates. A stainless steel certification plate shall be mounted on each storage tank. The following data shall be included on the certification plate:

Name of tank fabricator
Date of manufacture

Maximum allowable concentration and temperature of the specified chemical solution that can be stored safely
Mechanical properties of the tank

2.7.12 Ladder and Safety Cage. Each tank shall be provided with an exterior ladder and safety cage. A grating catwalk shall be provided at the top of the tank to the access manhole. The catwalk shall include safety rails attached to the ladder siderails, and anchored to the tank head as required. The ladder shall be supported on and anchored to the concrete base and bracketed to the tank shell as required. The ladder shall be fabricated of fiberglass reinforced plastic shapes, stainless steel, or carbon steel completely coated with at least 1/8 inch (.318 cm) of reinforced resin after fabrication. Uncoated or exposed carbon steel parts or fasteners will not be acceptable. The ladder shall have a clear width of at least 16 inches (40.6 cm), with rungs at least 3/4 inch (1.9 cm) in diameter and spaced not more than 12 inches (30.5 cm) apart. The clearance shall be at least 7 inches (17.8 cm) between the back of the ladder and the tank wall.

Safety handrails and kick plates meeting current OSHA requirements shall be provided around the top of each tank. Handrails shall be provided as required to surround the top manhole with adequate access space. The handrails and kick plates shall be designed and fabricated with the tank as a complete system.

PART 3 - EXECUTION

3.1 INSTALLATION. Each tank and components shall be adequately protected during transportation, in storage at the job site, and during subsequent installation and construction activities. Damaged units will be rejected and shall be replaced with undamaged units. The concrete bases shall be constructed in accordance with Master Specification Section 03300, Cast-in-Place Concrete and shall be level and smooth to the tolerances permitted by the tank manufacturer. The tank shall be installed in accordance with the manufacturer's recommendations, the supplier's written installation instructions, the applicable governing standard, to the satisfaction of the Engineer. The tank shall be made ready for the installation of piping and other appurtenances as indicated on the drawings and specified under the other sections. Grouting under the tank, if recommended by the tank fabricator, shall be done with non-shrink grout.

3.1.01 Field Painting. Field touch-up painting shall be performed as needed, using paint applied by the tank manufacturer and in accordance with manufacturer's instructions. Lettering as indicated on the Drawings shall be painted on the sides of the tank. Letters shall be of the block type, at least 5 inches (12.7 cm) high, spaced and proportioned to provide a well-balanced appearance. Two coats of paint shall be applied. Paint shall be supplied by tank manufacturer and compatible with shop-applied coating.

3.2 FIELD QUALITY CONTROL.

3.2.01 Field Testing. After shipment to the job site, but prior to installation, each inner primary tank and the secondary containment tank of dual wall tanks shall each be pressure tested separately at 5 psi (34.47 kPa) for 1 hour. The inner primary compartment tank and the secondary containment tank shall be checked for leaks, using an air gauge. During testing, connections may be plugged but shall not be blocked or plugged on the inside. If there are leaks or indications of leaks during either test, the tank shall be replaced with a new tank and tested after shipment to the job site.

End of Section

INDEX

DIVISION 14 – CONVEYING SYSTEMS

SECTION 14240

HYDRAULIC FREIGHT ELEVATOR

PART 1 - GENERAL

1.1 SCOPE. This section covers the design, fabrication, and installation of oil-hydraulic freight elevators as indicated in the Contract Documents.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with detail drawings, specifications, engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

The elevator shall be furnished complete, including elevator car, car gate, hoistway doors, power unit, hydraulic jack and jack hole casing, microprocessor based electric controller, buffers, guides, guide attachments and anchors, oil and oil piping, electric wiring, required accessories, and all other accessories and appurtenances required for an operating installation.

The elevator shall be of the electric push-button microprocessor controlled, motor driven oil pump operated, hydraulic type using oil as the power transmitting medium, and shall be the latest standard product of a manufacturer regularly engaged in the production of hydraulic elevators. The elevator manufacturer shall be experienced in the design and construction of hydraulic elevators.

The elevator shall be provided complete with all equipment enclosures, pit ladders, and other items and accessories necessary to meet the requirements of the governing standards.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Contractor shall submit for review detailed drawings, catalog data, descriptive matter, and manufacturer's specifications, including complete motor data, for the proposed equipment. The drawings shall include the jack hole requirements, the locations of each guide bracket insert and the horizontal load at that point, and details of the required equipment base or bases. Such data shall be sufficiently detailed to enable Engineer to judge whether or not the proposed equipment conforms to each feature of the contract requirements, and shall be submitted as set forth in Master Specification Section 01080, Project Submittals.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Materials shall be handled, transported, and delivered in a manner which will prevent bends, dents, scratches, or damages of any kind. Damaged materials shall be promptly replaced. All materials shall be stored off the ground and protected from weather.

1.5 SPARE PARTS. Spare parts shall be provided as indicated in the Contract Documents. Spare parts shall be suitably packaged in accordance with the handling and storage requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools, with labels indicating the contents of each package. Spare parts shall be delivered to Owner as directed.

1.5 WARRANTY. After the elevator installation and operation is acceptable to Engineer, the Elevator Manufacturer shall warrant all equipment for a period of four

(4) years. All other details of the warranty shall be in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 HYDRAULIC FREIGHT ELEVATOR. The freight elevator shall be of the model and performance as specified herein and shall be Thyssen Krupp, Montgomery Kone or Otis. Alternate suppliers may be proposed as required and as acceptable to Engineer.

2.2 PERFORMANCE AND DESIGN CRITERIA.

2.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and accessories furnished under this section.

2.2.02 Governing Standards. The elevator shall be designed, fabricated, and erected in accordance with ASME A17.1, the National Electrical Code, and all other applicable building and fire codes, laws, and regulations. In case of conflict, the applicable code, ordinance, law, or regulation shall govern.

2.2.03 Power Supply. Unless otherwise indicated, the power supply to the elevator power unit will be 480 volts, 3 phase, 60 Hz ac. The power supply for elevator ventilation, lighting, and miscellaneous circuits will be 120 volts, 60 Hz, single phase. A 3 pole, 600 volt, nonautomatic, externally operable, lockable, NEMA Type 1 surface-mounted circuit breaker shall be provided with the elevator for main disconnect and installed adjacent to the elevator controller. A 1 pole, 120 volt externally operable and lockable NEMA Type 1 surface mounted circuit breaker shall be provided with the elevator for 120 volt disconnect and installed adjacent to the elevator controller. The circuit breakers shall be sized per equipment supplied and in accordance with the NEC.

2.2.04 Metal Thicknesses. Metal thicknesses and gages specified herein are the minimum required. Gages refer to US Standard gage.

2.2.05 Protective Devices. All protective devices required by the governing standards, including stop switches, limiting and stopping devices, contacts, interlocks, and other safety devices, shall be provided whether or not specifically mentioned herein.

2.2.06 Modifications. Any additions or modifications to the structure as detailed or specified which may be required for proper installation or operation of the elevator furnished, or to meet the requirements of the governing standards, shall be done by and at the expense of Contractor.

2.2.07 Lifting Facilities. If lifting facilities are indicated, they may be used to facilitate lifting and handling equipment. The load imposed shall not exceed the specified load.

2.2.08 Maintenance. Contractor shall furnish maintenance and call-back service for the elevator equipment for a period of 1 year after the Work is accepted. The elevator shall be inspected and maintained in accordance with the current requirements of ASME A17-2.2, Inspector's Manual for Hydraulic Elevators. Maintenance service shall include monthly examinations by a competent representative of the manufacturer, all necessary adjustments, greasing, oiling, cleaning, supplies, and parts to keep the elevator equipment in operation, except those made necessary by misuse, accidents, or negligence by parties other than Contractor. Two spare fuses of each size and type used shall be provided for the power unit at the end of the maintenance period.

2.3 MATERIALS. Materials shall conform to the following:

Equipment Grout	Non-shrinking grout as specified in Master Specification Section 03600, Grout.
Jack Hole Casing Grout	Cementitious grout as specified in Master Specification Section 03600, Grout.
Touch-up Paint	As recommended or provided by the elevator supplier.
Finish Painting	As specified in Master Specification Section 09900, Painting.
Wiring, conduit, and other appurtenant material required for a complete electrical installation.	As specified in Master Specification Section 16050, Electrical General Requirements.

2.4 OPERATION. Operation shall be "Full-automatic push button", with the elevator controlled automatically by push buttons in the car marked to correspond with the respective levels and openings served, and by a single call button at each hoistway opening. The momentary pressure of any button shall operate the car. If the car gates and all hoistway doors are closed, the car shall travel to its destination in the direction chosen without interference. After the car has been placed in motion, all other push buttons shall become inoperative until the car has reached its designated landing.

Where power doors are specified, when the car has reached a landing in response to a landing call or a car signal, the car door and the hoistway door shall automatically open and shall remain open a set amount of time or until closed by the operation of a "Door Close" button as specified herein. A time delay adjustable for 0 to 60 seconds with manual override shall be provided to automatically close the car gate and hoistway doors after a set amount of time has elapsed after the doors are opened.

Where manually operated doors and gates are specified, a time delay noninterference feature shall be incorporated in each control circuit to allow ample time for manual opening of the car gate and hoistway door, once the car has reached a landing, before the car can be dispatched to another landing.

A two-way automatic maintaining leveling device shall cause reduced speed from either direction when approaching landing stops and automatically position at landings with an accuracy of 1/4 inch (6 mm), plus or minus, under all loading conditions. Landing level shall be maintained as long as the car is within the leveling zone.

Normal terminal stopping devices and emergency terminal speed limiting devices shall be provided in accordance with the governing standards.

2.5 HOISTWAY AND PIT. The hoistway construction is indicated on the drawings.

The elevator equipment shall be designed to accommodate the floor slope and the maximum depth at the walls of the elevator pit indicated on the drawings. The design of the pit walls and floor may be modified as needed to support the jack cylinder. The pit ladder may be relocated if necessary.

2.6 CAR PLATFORM AND ENCLOSURE. The car and platform frame shall be of welded steel construction, substantially braced and reinforced. The car enclosure shall not be subjected to excessive stresses caused by the elevator operation. The frame shall be provided with top and bottom guide shoes, and plates for connection of the jack.

2.6.01 Platform. The car platform shall be provided with double wood flooring. Bottom flooring shall be 1 inch (25 mm) thick, and top flooring shall be first-grade tongued and grooved hardwood, 1 inch (25 mm) nominal thickness. The underside of the platform shall be protected with a metal fire shield or fire-retardant paint in accordance with the governing standards.

2.6.02 Enclosure. The clear height of the car entrance and interior shall be at least equal to the hoistway entrance. The car shall be enclosed full height with 14 gage (1.90 mm) steel sheets suitably reinforced and securely fastened to the car frame and platform. Reinforced openings shall be provided where necessary for the operating panel and other accessories.

An engraved capacity and data plate, a loading designation sign, and a certificate frame, all fabricated of stainless steel, shall be mounted in the car near the operating panel in accordance with the governing standards.

2.6.03 Canopy. The canopy shall be 14 gage (1.90 mm) perforated or solid sheet steel or 10 gage (3.42 mm) expanded metal, suitably reinforced to conform to the governing standards. The canopy shall be rigidly fastened to the elevator car frame. Provisions shall be made for the vertically rising car gate.

2.6.04 Emergency Exit. An emergency exit shall be provided to conform with the governing standards.

2.6.05 Lighting. Lighting in the car shall be indirect or shielded fluorescent type, and shall be controlled by a switch on the car operating panel. Lighting shall be provided on the top of the car as specified by the governing standards.

2.7 CAR OPERATING PANEL. An operating panel fabricated of satin finish stainless steel shall be located at or near the front or rear of the car as specified, flush-mounted in the car wall. The operating panel shall include the following features:

A bank of buttons numbered to correspond to the landings and openings served. Buttons shall illuminate when pushed to register a call.

A switch for the car lights.

A switch for the car ventilating fan, when specified.

An emergency "Stop" button which will enable the operator to stop the car at any point in its travel.

An emergency "Alarm" button. The alarm button shall be of the continuous pressure type with two isolated contacts, one to operate a remote annunciator point at 120 volts ac and the other to operate an alarm bell. The bell shall be furnished and installed as part of the elevator equipment as specified herein. The remote annunciator will be furnished by others if it is required. Power to the bell will be from the 120 volt elevator service. Power for the annunciator point will be provided at the annunciator.

A key-operated switch to stop or start the unit.

If power doors are specified, a "Door Open" button to control the power operated car gate and hoistway doors. Momentary pressure on the button shall reverse the motion of closing doors, reopen the doors, and reset the interval.

If power doors are specified, a "Door Close" button to control the closing of the hoistway doors. This button shall be operable in conjunction with the delay interval sequence as specified.

The elevator shall be provided with a telephone and all necessary hardware. Telephone cable shall be provided by the elevator manufacturer from the telephone in the elevator to the telephone junction box located in the Elevator Equipment Room. All necessary hardware shall be provided and installed in the junction box to enable an external telephone circuit to be connected to the hardware provided by the elevator manufacturer to complete the telephone circuit.

2.8 CALL AND ALARM BELLS. An alarm bell shall be provided in the hoistway at the specified floor level, connected to the alarm button in the car operating panel.

A call bell shall be provided on the elevator car which shall ring when a landing button is pushed and the car gate or a hoistway door is open.

2. 9 TOP-OF-CAR OPERATING DEVICES. Provisions shall be made to operate the elevator from on top of the car during adjustment, inspection, maintenance, and repair, in accordance with the governing standards.

2.10 CAR GATE AND HOISTWAY DOORS. The following paragraphs apply to power and manual car gates and hoistway doors as specified.

2.10.01 Manual Operation. Where manual operated doors and gates are specified, the car gate and hoistway doors shall be manually operated, and shall be equipped with all necessary interlocks and safety devices. Manually operated doors and gate may only be opened when the elevator is at a landing.

2.10.02 Power Operation. Where power doors and gates are specified, the car gate and hoistway doors shall be electric motor operated, and shall be equipped with all necessary interlocks, controls and safety devices.

Gate and door movements shall be cushioned or checked at both limits of travel. The operating mechanism shall be arranged for manual operation in the event of a power failure. The electric operator shall be quiet and smooth in operation and designed for elevator service.

Doors shall preopen automatically as the car levels at the landing, and shall automatically close after a predetermined time or when the car is dispatched to another landing. The doors shall remain in the closed position with the elevator car at rest.

The bottom edge of the car gate shall be provided with safety edge designed to automatically return car gates and hoistway doors to the open position in the event doors are obstructed during closing cycle. If the obstruction continues, the alarm will sound.

2.10.03 Car Gate. A vertically rising, manually or power operated, counterbalanced steel mesh or expanded metal gate shall be furnished at the entrance to the car. The gate shall be equipped with electrical contacts to prevent operation of the elevator unless the gate is in the closed position. The gate may be either single or multiple section type, as needed by available overhead clearance when the car is at the uppermost landing.

A power operated gate shall be provided with a safety edge.

2.10.04 Hoistway Entrances and Doors. Hoistway entrances of the size and type indicated on the drawings shall be provided. All entrances shall be furnished complete with all doors, jambs, jamb extensions, heads, sills, hardware, and other accessories and appurtenances as required.

Hoistway entrances shall be equipped with manually or power operated, bi-parting, vertical sliding hoistway doors. Hoistway doors shall be fabricated from structural shapes, with 12 gage (2.66 mm) or thicker steel facing sheets on the lobby side. The doors shall be flush type without projecting bolts or rivets on the lobby side, and shall be of construction equivalent to UL Class B, 1-1/2 hour rating.

The doors shall operate inside the hoistway on continuous steel angle guide rails. Guide rails shall be rigidly anchored to the hoistway walls or structure and shall be carefully aligned to ensure proper operation of the doors. The leaves of each door shall be connected by noncorroding cables or chains running on sheaves with ball bearings, arranged so the upper leaf balances the lower leaf. The doors shall be designed to operate in the hoistway provided.

The upper edge of the lower leaf of each door shall be equipped with a truckable sill which will support loads equal to the capacity of the elevator. Each door shall be equipped with a device for holding the sill level independent of the suspension cables or chains when the door is fully open.

The lower edge of the upper leaf of each door shall be equipped with a flexible, non-crushing, non-shearing, fire-resistant safety meeting rail to provide a spacing of not less than 3/4 inch (19 mm) between the rigid members of the door sections when closed.

A 4 by 9 inch (100 by 225 mm) vision panel opening shall be provided in the upper leaf of each door. Vision panels shall be glazed with 1/4 inch (6 mm) diamond mesh wire glass.

The upper leaf of each door shall be equipped with a handle for emergency opening and a webbed strap or similar means for closing the door. A mechanical latch shall hold each door securely closed.

Each door shall be equipped with suitable electrical and mechanical interlocks which will prevent the operation of the elevator unless all doors are closed, and will prevent the opening of any door unless the car is at the corresponding landing.

The door at each landing shall be provided with a hoistway unlocking device in accordance with the governing standards. Two operating Master # 2246 keys shall be furnished.

If required by the drawings, the hoistway door at exterior openings shall be fully weatherstripped as recommended by the manufacturer and accepted by Engineer. Manually operated doors shall be fitted with the manufacturer's standard keyed locking device. The locking device shall have a manual release inside and shall be suitable for installation of the outside cylinder furnished under Master Specification Section 08710, Finish Hardware, master keyed to the building lock system. For power doors, the exterior push button station shall be provided with a keyed lockout device to disable exterior controls when locked.

2.11 <u>LANDING PUSH-BUTTON STATIONS</u>. A push-button station shall be provided at each hoistway opening. Each landing push-button station shall contain an "In-Use" light, a "Call" button, and door control buttons where power doors are specified. The "In-Use" light shall be illuminated while the car is in use, until the registered call has been completed. The "Call" button shall not function while the "In-Use" light is on. Push buttons shall be of the momentary pressure type and shall illuminate when pushed to register a call. Each landing push button shall be provided with a satin finish stainless steel cover plate. If required, the push-button station at each exterior door shall be waterproof.

2.12 CAR GUIDES. The car guides shall be heavy, planed steel guiderails erected plumb and secured to the building structure with heavy steel brackets attached to wall inserts or attached to the building structure as needed or detailed. All required inserts shall be furnished by the elevator supplier to be built into walls as indicated on the drawings. Guides shall be located at the sides of the hoistway. Ends of all guiderails shall be tongued and grooved, forming matched joints, and connected with steel splice plates.

Nylon or teflon inserts which require no lubrication shall be provided in car guides.

2.13 BUFFERS. Two heavy spring buffers shall be mounted in the pit. Buffers shall protect the jack packing gland should the car descend past the bottom limit switch. Buffer plates shall be provided on the underside of the car frame.

2.14 HYDRAULIC JACK. The hydraulic jack assembly shall comply with governing standards, and shall be rated for the specified service.

The cylinder shall be seamless steel tubing and shall have an end plug, cylinder head, hydraulic connection, and suitable mounting brackets. The cylinder head assembly shall have an adjustable packing gland and suitable packing, oil wiper, a bronze or babbitt guide bearing, air bleed, oil collector, and a shoulder to stop upward travel of the plunger. The plunger shall be heavy seamless steel tubing, machined and polished, shall have a stop ring or plate to limit upward travel, and shall have a heavy mounting plate for attachment to the car.

The jack assembly shall be shop tested at twice the operating pressure, without leakage or failure. Brittle material, such as gray cast iron or semisteel, shall not be used in jack construction.

2.14.01 Corrosion Protection. The jack cylinder shall be protected from corrosion by factory installation in a PVC casing with waterproof high pressure seal at the bottom. The PVC cylinder shall be sealed against any infiltration from flooding in the pit and shall be provided with a means of containing any leakage from the jack cylinder and shall provide means of detecting and removing any oil leakage or other contaminant from the interior of the PVC casing.

2.15 POWER UNIT. The power unit shall be compact, with all components listed below combined in a self-contained unit. The unit shall have a steel outer base with tank supports; an oiltight drip pan; an inner base for mounting the motor-pump assembly; an overhead oil reservoir with tight-fitting tank cover, oil fill strainer and oil level gauge assembly, and a self-cleaning strainer in the suction line; expanded metal sheave guard; an oil-hydraulic pump with electric motor and V-belt drive assembly; an oil control unit; and an electric controller. The oil reservoir capacity shall be at least 5 gallons (19 L) more than required to raise the elevator to full height.

The power unit assembly shall be mounted on vibration absorbing materials to isolate the unit from the building structure and shall be set on a concrete base at the location indicated on the drawings.

If the power unit is not specified to be located in a separate enclosed room, the power unit assembly shall be surrounded by an expanded metal or wire mesh enclosure which meets state and local codes and regulations. The enclosure shall be provided with a hinged door and suitable lock acceptable to Engineer.

2.15.01 Pump and Motor. The pump shall be especially designed and manufactured for oil-hydraulic elevator service and shall be rotary positive displacement type; gear or vane type pumps will not be acceptable. The output of the pump shall not vary more than 10 percent between no load and full load on the elevator car.

The motor shall be especially designed for oil-hydraulic elevator service, and shall be NEMA Type B with a 30 minute rating for elevator service. Motor rating shall equal or exceed the maximum load developed during operation of the elevator. The drive shall be multiple V-belts and sheaves of the number and size for the duty involved.

The pump shall be driven with multiple V-belts. Belts and sheaves shall be conservatively designed for the required service.

2.15.02 Oil Control Unit. The oil control unit shall consist of a high-pressure relief valve, a safety check valve, an automatic unloading up-start valve, an automatic unloading up-stop valve, a lowering valve, a leveling valve, a manual lowering valve, and a tank shutoff valve. All adjustments shall be accessible and shall be made without removing any item from the oil piping. Self-cleaning strainers shall be provided to prevent foreign materials from lodging in the control system.
The relief valve shall be externally adjustable, and shall be capable of bypassing the total oil flow without increasing back pressure more than 10 percent above that required to barely open the valve. The safety check valve shall be designed to close quietly without permitting any perceptible reverse flow and shall be designed to support the elevator on a positive locked column of oil when the car is at rest. The up-start valve shall be externally adjustable, and shall be designed to bypass oil flow during initial start of the motor-pump assembly and shall close slowly, gradually diverting oil to the jack unit, ensuring smooth up-starts, and to relieve load on the motor during starting. The up-stop valve shall be externally adjustable, and shall be designed to bypass the oil flow to ensure smooth up-stops and to compensate for inertia. The lowering valve and leveling valve shall be externally adjustable for drop-

away speed, lowering speed, leveling speed, and stopping speed to ensure smooth down-starts and stops. The manual lowering valve shall be designed for manual lowering of the elevator car in event of power failure and for use in servicing and adjusting the elevator mechanism. The tank shutoff valve shall be designed for isolating oil in the power unit tank to ensure ease of servicing and adjusting the elevator mechanism without removing the oil from the tank.

2.15.03. Electric Controller. The electric controller shall be microprocessor based with a magnetic type motor starter with silver-to-silver contacts on the contactors. Thermal overload relays shall be provided to protect each motor phase against overloading. A 120 volt control transformer with one secondary lead fused and the other grounded shall be provided in the controller for control circuit power and power for operation of interlocks. All switching shall be on the "hot" side of the 120 volt leads.

All components required for proper performance of the elevator shall be neatly mounted and wired on the front of a steel control panel, and completely enclosed in a cabinet with hinged doors, mechanically locked. The control cabinet shall be wall-mounted where indicated on the drawings. The electric control apparatus shall be completely isolated from the oil reservoir.

2.15.04 Piping. The power unit shall be complete with all piping necessary for the power unit and for connection to the jack unit. Piping shall comply with applicable piping sections. No rubber hose or mechanical flexible tubing shall be installed in the hydraulic piping system between the oil pump and the jack unit.

A blowout-proof hydraulic muffler device, designed to reduce hydraulic pulsations, shall be installed in the oil line near the power unit.

A mainline strainer and shutoff cock assembly, self-cleaning type with a 60 mesh element, and a magnetic drain plug shall be provided in the oil line. The unit shall be compact in design with easy access for cleaning.

All piping shall be tested at 1-1/2 times the maximum working pressure before being placed in service. All joints shall be made tight and all leaks shall be repaired and retested.

A sufficient quantity of oil shall be supplied in its original sealed container to fill the oil reservoir and piping as needed for proper operation.

2.16 LUBRICATION. Suitable provisions shall be made for lubrication of all equipment. The manufacturer shall furnish a chart with complete recommendations for equipment lubrication. An estimated 6 months' supply of each type and weight of lubricant required shall be provided in original sealed and labeled containers.

2.17 SMOKE DETECTORS. Smoke detectors shall be provided by the elevator manufacturer and mounted outside the elevator door at each landing and in the Elevator Room if one is provided. If power doors are provided, smoke detectors shall be wired into the elevator controls, and if smoke is detected, cause the elevator to go to ground level, open the door and remain in this condition until manually reset. Smoke detectors shall be powered from the electric controller and be provided with the necessary contacts to accomplish the specified sequence of operation.

2.18 PAINTING. All scale, rust, dirt and oil shall be removed from surfaces to be shop painted, by blast cleaning, pickling, or other acceptable methods.

All exposed surfaces of machinery, including motor, oil pump, tanks, and accessories therefore (except machined and noncorroding surfaces), shall be finished smooth, thoroughly cleaned, and shop primed. All exposed surfaces shall then be painted with two coats of first-quality machinery enamel.

Interior surfaces of the elevator car, all surfaces of the car gate, and all surfaces of the hoistway doors and frames shall be painted with one shop coat of universal primer. Exterior surfaces of the car frame and car enclosure, guiderails (except for rubbing contact surfaces), and other structural metal work within the hoistway shall be painted with two shop coats of universal primer.

Surfaces of the jack plunger shall not be painted, but shall be adequately protected from corrosion or other damage during shipment, storage, handling, and installation.

PART 3 - EXECUTION

3.1 ERECTION. Each hydraulic freight elevator and accessories shall be installed by an elevator erector and elevator mechanics who are acceptable to, and authorized for the work by, the manufacturer of the elevator furnished. Equipment will be erected in accordance with the manufacturer's instructions.

3.2 FINAL INSPECTION AND TESTING. At the conclusion of the elevator installation the Elevator Manufacturer's representative shall inspect and test the operation of all mechanisms, appliances, and operating devices. Tests shall comply with the governing standards. At the conclusion of the tests, the installation and operation shall be acceptable to Engineer.

End of Section

SECTION 14552

SCREW CONVEYORS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of shafted screw conveyors and shaftless screw conveyors for the locations as indicated in the Contract Documents.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated and assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

All structural and miscellaneous metal required shall conform to the requirements of Master Specification Section 05120, Structural Steel and Master Specification Section 05500, Metal Fabrications.

The supplier shall review the contract drawings and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow convenient collection of waste oil in containers from the operating area or platform without removing the unit from its normal installed position.
Grease fill openings shall be zerk fittings, buttonhead type, size as determined by Owner.

1.2.03 Abbreviations. Reference to standards and organization in this section shall be by the following designations:

AFBMA	Antifriction Bearing Manufacturers Association
AGMA	American Gear Manufacturers Association
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
AWS	American Welding Society
CEMA	Conveyor Equipment Manufacturers Association
MIOSHA	Michigan Occupational Safety and Health Administration

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, schematic and wiring diagrams, together with detailed specifications and data covering material used, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications for each conveyor shall include, but shall not be limited to, the following:

Screw Conveyors and Accessories

Specifications for materials of construction.

Complete conveyor dimensions and weight.

Support details.

Support dead loads.

Rotating speed.

Detailed shop drawings of screw conveyors and trough body.

Maximum transport weight capacity.

Details of end and intermediate bearings.

Details of shaft seal system.

Slide Gates

Name of manufacturer and catalog data.

Detailed drawings and dimensions.

Specifications for materials of construction.

Actuator drawings and details.

Drive

Name of manufacturer.

Type and model.

Type of bearings and lubrication.

Input/output speed.

Net weight.

Service factor at installed horsepower.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as indicated in the Contract Documents. Spare parts shall be suitably packaged in accordance with the handling and storage requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools, with labels indicating the contents of each package. Spare parts shall be delivered to Owner as directed.

1.6 WARRANTY. After the screw conveyor installation and operation is acceptable to Engineer, the Screw Conveyor Manufacturer shall warrant all equipment for a period of four (4) years. All other details of the warranty shall be in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Equipment provided under this section shall be suitable for the service conditions as indicated in the Contract Documents. Equipment shall conform to the applicable sections of the MIOSHA standards.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and products shall be as specified herein, or shall be equivalent products of manufacturers regularly producing screw conveyors, subject to acceptance by Engineer. All modifications necessary to accommodate the screw conveyors shall be subject to acceptance by Engineer and shall be made at no additional cost to Owner.

2.2.01 Screw Conveyors. The screw conveyors shall be as manufactured by American Bulk Conveyor, Continental Screw Conveyor, Thomas Screw Conveyor, U.S. Filter/Asdor, or approved equal.

2.2.02 Shaftless Screw Conveyors. The shaftless screw conveyors shall be manufacturered by American Bulk Conveyor, JDV Equipment Co., U.S. Filter/Asdor, or approved equal.

2.3 CONSTRUCTION. Shafted screw conveyors shall consist of flighting attached to a pipe shaft. Shaftless screw conveyors shall consist of spiral flighting only. Each screw conveyor shall consist of troughs, covers, bearings, shaft seals, slide gates and operator, drive units, and support structure.

2.3.01 Shafted Screws. Shafted screws shall consist of flights welded to a shaft. Flighting thickness shall be designed for the maximum torque requirements of the equipment. Minimum flight thickness shall be 5/16 inch (8 mm) thick. The pitch of the flights shall meet the performance as specified. The flights shall be mounted to a steel pipe of sufficient diameter so as to maintain a maximum deflection of 1/8 inch (3 mm) between trough ends and any intermediate hanger bearing assemblies.

2.3.02 Shaftless Screws. Spiral flighting for the shaftless screw conveyors shall be designed to convey material without a center shaft. Each screw conveyor shall be provided with an inner spiral to increase axial strength and capacity. Outer flights less than 3/4 inch (19 mm) thickness will require minimum 1/2 inch (12.5 mm) inner flight thickness. Outer flights thickness greater than 3/4 inch (19 mm) will require minimum 5/16 inch (8 mm) inner flight thickness. Minimum flight thickness shall be 5/16 inch (8 mm) thick. The spiral flights shall be designed for the maximum torque requirements of the equipment specified. The "spring effect" of the spiral shall not exceed 30 mils per foot (750 mm/300 mm) of length at maximum load conditions. Flights shall be formed from cold spring steel having a 72,000 psi (496 MPa) tensile strength and a minimum 250 Brinell hardness.

Spiral flighting shall have full penetration welds at all splice connections. The flights shall be aligned to assure true alignment when assembled and shall be made according to the manufacturer's recommendations. The connection of the spiral to the drive system shall be through a flanged connection plate that is welded to the spiral forming a smooth and continuous transformation from the flange plate to the spiral. The drive shaft shall have a mating matching flange and shall be bolted to the spiral connection plate.

2.3.03 Troughs. Troughs shall be U-shaped, minimum 3/16 inch (4.7 mm) thick and shall conform to CEMA 300. Troughs shall be equipped with inlet and discharge flanged connections having a minimum thickness of 5/16 inch (8 mm). The outlet openings in the trough bottom shall be sized to prevent screw conveyor plugging. The portion of each trough that is not covered by the inlet opening shall be covered. Covers shall conform to CEMA 300. The covers shall be manufactured in less than 4 foot (1.1 m) lengths to allow for access. Stiffeners shall be placed across the top of the trough and fastened to both sides of the trough to maintain trough shape and act as a seal face for the covers. A continuous 1 inch (25 mm) thick neoprene gasket shall be applied to entire top face of trough top flange and stiffeners. Wear liners shall cover the bottom 180 degrees of the trough. Wear liners shall be ultra high molecular weight (UHMW) polyethylene. The wear liners shall be manufactured in sections four feet or less to allow for replacement. Holddown bars shall be provided to minimize vertical movement of the flights.

Flushing and drain connections shall be provided. The flushing connection shall be a 1 inch (25 mm) NPT, welded to the side of the trough. The drain connection shall be 4 inch (100 mm) flanged, welded to the end of the trough.

2.3.04 <u>Shaft Seals</u>. Shaft seals shall be waste packing seal with lip type seal or packed gland.

2.3.05 <u>Bearings</u>. The screws shall be supported by antifriction roller bearings that are mounted outboard of the screw conveyor. The bearings shall have a minimum AFBMA B10 life of 50,000 hours. Thrust bearings shall be provided on the drive end of the shafted screw conveyors. Internal hanger bearings shall consist of CEMA 300, Type 226 hangers with greaseable hard iron bearing inserts. The grease lubrication line shall extend through the cover. The bearings shall be furnished with externally accessible grease fittings.

2.3.06 <u>Conveyor Supports</u>. Each conveyor shall be furnished complete with supports suitable for mounting as shown on the drawings and as required by the supplier's design. At a minimum, each screw conveyor trough shall have supports at the drive end and the tail end of the trough plus intermediate supports at a maximum of 12 foot (4 m) intervals. All shop welding shall conform to the latest standards of AWS. The supports shall be designed to avoid interference with other equipment or equipment supports. The supports shall be designed to prevent excessive vibration of any portion of the conveyor unit under all loading conditions.

All structural supporting members shall be designed such that the ratio of the unbraced length to least radius of gyration (slenderness ratio) shall not exceed 120 for any compression member and shall not exceed 240 for any tension member (of angles about Z-Z axis). In addition, all structural members and connections shall be designed so that the unit stresses will not exceed the AISC allowable stresses by more than 1/3 when subject to loading of twice the maximum design operating torque of the screw conveyor drive motors.

2.3.07 <u>Slide Gates</u>. Slide gates shall be installed on the discharge opening of the screw conveyors. Slide gates shall be constructed of a minimum 1/4 inch (6 mm) thick material. Slide gates shall be capable of being operated from the fully closed position to fully opened position along suitable guide channels. The guide channels and operators shall be suitably supported from the screw conveyor trough. Slide gates shall be actuated as indicated in the Contract Documents.

2.3.08 <u>Fasteners</u>. All bolts, nuts, washers, and other fasteners shall be constructed of stainless steel.

2.4 <u>Drive Units</u>. Each conveyor shall be driven by an electric motor through a chain or belt drive and gear reducer, or be driven directly by a gear reducer. The nominal input power rating of each gear or speed reducer shall be at least equal to the nameplate power rating of the drive motor. Drive units shall be designed for 24 hour continuous service. Gearmotors shall not be used.

2.4.01 Belt Drive. Belt drives shall be either V-belt or cogged timing belt. V-belt and sheave groove dimensional tolerances shall be in accordance with the "Engineering Standards - Multiple V-Belt Drives" published by the Multiple V-Belt Drive and Mechanical Power Transmission Association. Belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate power rating of the drive motor. The speed reduction ratio of belt drives shall not exceed 4 to 1. Each belt drive shall include a sliding base or other suitable means of tension adjustment.

2.4.02 Gear Reducers. Each gear reducer shall be a totally enclosed unit with oil or grease lubricated, rolling element, antifriction bearings throughout. Gear reducers shall be AGMA Class II, single or double reduction, helical gear units with high capacity roller bearings. Bearings shall be designed for the thrust loads from the spiral flights and shall have an AFBMA B_{10} life of 100,000 hours. The reducers shall be standard air-cooled units with no auxiliary cooling allowed. The gear housing shall be of 30,000 psi (207 MPa) cast iron, with removable inspection cover(s), oil breather(s), oil level indication, fill and drain holes with plugs; gearing shall be lubricated through an oil bath for the mounting position and inclination. The gear reducer shall be sized with a torque service factor of 1.5 based on motor nameplate, at the driven (output) shaft speed, whichever is greater.

2.4.03 Safety Guards. All belt or chain drives, couplings, and other moving or rotating parts of the conveyors shall be covered on all sides by a safety guard, fabricated from 16 USS gage (1.52 mm thick) or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal and shall be furnished complete with all necessary supports and accessories. Supports and accessories, including bolts, shall be galvanized. Safety guards in outdoor locations shall be designed to keep out rain and dripping water.

2.4.04 Electric Motors. The design of the electric motors shall be in accordance with the requirements of Master Specification Section 16220, General Purpose Induction Motors. Gearmotor type speed reducers are not acceptable.

2.5 CONTROLS. Motor starters and all other controls not specified herein shall be furnished under Master Specification Section 16050, Electrical General Requirements.

2.5.01 Accessories. The conveyor shall be provided with the following switches. Switches shall be furnished with standard watertight covered terminal strip junction box and 1/2 inch (12.7mm) threaded conduit connection unless otherwise indicated in the Contract Documents. Each switch shall be furnished and mounted as an integral part of the conveyor equipment and framework. All switches shall have 10 ampere, 115/120 volt ac, 60 Hz, rating.

2.5.02 Zero Speed Switch. A zero speed switch shall be provided on the conveyor to detect loss of speed. The zero speed switch shall be of the noncontacting type. The zero speed switch shall provide a contact output which opens to indicate zero speed and automatically resets or closes when the machine is operating. The zero speed switch shall be coordinated to properly operate over the full speed range of the driven equipment.

2.5.03 Emergency Stop Switches. Screw conveyors shall be equipped with two emergency stop safety switches, each with two normally closed double break contacts. Contacts shall be manually reset. Switches shall be equipped with a latching mechanism and a weight and cable along the length of the conveyor for operation of the switch. Switches shall be opened by cable linkage mounted on all sides of the conveyor. Cables shall be plastic covered metal cable (blaze orange color) and shall be located along the conveyor within easy reach of operating personnel who may be maintaining or observing the operating conveyor. Cable shall be accessible from all conveyor pinch points.

2.6 SHOP PAINTING. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Sharp corners of all cut or sheared edges shall be smoothed by a power grinder.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 ERECTION. Each screw conveyor shall be erected by workers who are regularly engaged in screw conveyor erection and who are acceptable to the equipment manufacturer.

3.2 WIRING. All wiring shall be installed in intermediate metal conduit in accordance with the National Electric Code.

3.3 FIELD QUALITY CONTROL.

3.3.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. In each case, the manufacturer's representative shall be present when the equipment is placed in operation and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish to Owner, through Engineer, a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3.02 Installation Supervision. When indicated in the Contract Documents, the equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the Contract Price.

The manufacturers' installation supervisor shall observe, instruct, guide, and direct the contractor's erection or installation procedures. The equipment manufacturer will be notified in writing 10 working days before for such services are needed.

3.4 TRAINING. When indicated in the Contract Documents, the manufacturer's representative shall provide training for Owner in proper operation and maintenance of the equipment. Such services shall be included in the contract price.

End of Section

SECTION 14553

BELT CONVEYORS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of belt conveyors for the locations as indicated in the Contract Documents.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated and assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

All structural and miscellaneous metal required shall conform to the requirements of Master Specification Section 05120, Structural Steel and Master Specification Section 05500, Metal Fabrications.

The supplier shall review the contract drawings and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow convenient collection of waste oil in containers from the operating area or platform without removing the unit from its normal installed position.

Grease fill openings shall be zerk fittings, buttonhead type, size as determined by Owner.

1.2.03 Abbreviations. Reference to standards and organization in this section shall be by the following designations:

AFBMA	Antifriction Bearing Manufacturers Association
AGMA	American Gear Manufacturers Association
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
AWS	American Welding Society
CEMA	Conveyor Equipment Manufacturers Association
MIOSHA	Michigan Occupational Safety and Health Administration

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, schematic and wiring diagrams, together with detailed specifications and data covering material used, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications for each conveyor shall include, but shall not be limited to, the following:

Belt Conveyors and Accessories

Idlers.

End pulleys.

Takeups.

Belt construction and materials.

Belt speed.

Specifications for materials of construction.

Complete conveyor dimensions and weight.

Support details.

Support dead loads.

Deflector plows. (if required)

Drive

Name of manufacturer.

Type and model.

Type of bearings and lubrication.

Input/output speed.

Net weight.

Service factor at installed horsepower.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 SPARE PARTS. Spare parts shall be provided as indicated in the Contract Documents. Spare parts shall be suitably packaged in accordance with the handling and storage requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools, with labels indicating the contents of each package. Spare parts shall be delivered to Owner as directed.

1.6 WARRANTY. After the belt conveyor installation and operation is acceptable to Engineer, the Belt Conveyor Manufacturer shall warrant all equipment for a period of four (4) years. All other details of the warranty shall be in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Equipment provided under this section shall be suitable for the service conditions as indicated in the Contract Documents. Equipment shall conform to the applicable sections of the MIOSHA standards.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and products shall be as specified herein, or shall be equivalent products of manufacturers regularly producing belt conveyors, subject to acceptance by Engineer. All modifications necessary to accommodate the track, hoist, or trolley shall be subject to acceptance by Engineer and shall be made at no additional cost to Owner.

The belt conveyors shall be as manufactured by American Bulk Conveyor, Custom Conveyor, Keystone or approved equal.

2.3 CONSTRUCTION. Each belt conveyor shall track within CEMA standards. The use of training idlers will not be permitted. The conveyor shall be designed so the belt will not lift off the idlers at any time. Maximum belt incline shall be as indicated in the Contract Documents.

2.3.01 Supporting Members. The belt conveyors shall have a rigid supporting framework and shall be supported from the floor.

The belt conveyor frame and support legs shall be fabricated from structural steel members which shall rigidly support all dead loads and live loads. Dead loads to be supported shall include conveyor, belt skirts, deck plates, drip pans, belt cleaner, motor drive, access provisions, and any other accessories required. Live loads shall consist of assumed unit loadings sufficient to provide for movable or transitory loads such as people and portable equipment. The design live load shall be as indicated in the Contract Documents.

The ratio of unbraced length to least radius of gyration (slenderness ratio) shall not exceed 120 for any compression member and shall not exceed 240 for any tension member (for angles about the Z-Z axis). In addition, all structural members and connections shall be designed so that the unit stresses will not exceed AISC allowable stresses by more than one-third when subjected to loading of twice the running torque of the drive motor.

All conveyor supporting members shall be constructed of ASTM A36 steel and shall be hot-dip galvanized steel.

2.3.02 Belts. Conveyor belts shall consist of a carcass, with top and bottom covers. The carcass shall be constructed of nylon or polyester fibers. The number of carcass plies shall be as indicated in the Contract Documents. Covers shall be constructed of nitrile and shall be oil resistant and suitable for temperatures up to 180°F (82°C). The type of conveyor belt splices shall be vulcanized or mechanical splices.

2.3.03 End Pulleys. Pulleys shall be provided on the head and tail ends of the conveyor. End pulleys shall be of welded construction of stainless steel or carbon steel and shall be the crown face type with tapered steel bushings bolted to the hub for securing the pulley on the shaft. Shaft shall be fabricated of stainless steel or high carbon steel. All drive pulleys shall be keyed to the shaft. Bearings shall be the self-aligning, double row roller type mounted in pillow blocks and shall be provided with spring loaded contact seals and grease fittings. End pulleys shall be provided with ceramic lagging. Bearings shall have a minimum life AFBA L_{10} Life Rating of 40,000 hours at specified operating conditions.

2.3.04 Idlers. Idlers shall be constructed in accordance with CEMA "Series C". Idler type and size shall be stainless steel or hot-dip galvanized steel. Bearings shall be the tapered roller type with labyrinth type seals and grease fittings. Bearings shall have a minimum life AFBA L_{10} Life Rating of 40,000 hours at specified operating conditions.

Return idlers shall be the rubber disc type.

2.3.05 Takeups. The conveyor shall be provided with manual or automatic takeups.

Manual takeups shall provide adjustment of at least 2 percent of the distance from center of tail pulley to center of head pulley or a minimum of 12 inches (300 mm). Manual takeups shall be constructed with hot-dip galvanized steel frame, stainless steel screw and brass nut.

Automatic takeups shall be the gravity type consisting of a counter weight attached to the take-up pulley. The take-up pulleys shall be constructed as specified for the end pulleys.

2.3.06 Drip Pans. A drip pan shall be provided beneath the return belt on all sections of each conveyor. The edges of the drip pan shall extend beyond the belt edges at least 2 inches (50 mm) and shall turn up at least 2 inches (50 mm). The drip pan shall be sloped to drains. The drip pans drains shall have a 1-1/2 inch (38 mm) threaded connection to accept hose. Drip pans shall be constructed of hot-dip galvanized steel, AISI Type 304 stainless steel, or AISI Type 316 stainless steel and shall be a minimum 10 gage (3.42 mm) thickness.

2.3.07 Deck Plates. A deck plate shall be provided as part of the conveyor framework and shall be located just below the idlers to prevent spillage onto the underside of the belt below. Deck plates shall be constructed of hot-dip galvanized steel, AISI Type 304 stainless steel, or AISI Type 316 stainless steel and shall be a minimum 10 gage (3.42 mm) thickness.

2.3.08 Fasteners. All bolts, nuts, washers, and other fasteners shall be constructed of stainless steel.

2.4 DRIVE UNITS. Each conveyor shall be driven by an electric motor through a chain or belt drive and gear reducer, or be driven directly by a gear reducer. The nominal input power rating of each gear or speed reducer shall be at least equal to the nameplate power rating of the drive motor. Drive units shall be designed for 24 hour continuous service. Gearmotors shall not be used.

2.4.01 Belt Drive. Belt drives shall be either V-belt or cogged timing belt. V-belt and sheave groove dimensional tolerances shall be in accordance with the "Engineering Standards - Multiple V-Belt Drives" published by the Multiple V-Belt Drive and Mechanical Power Transmission Association. Belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate power rating of the drive motor. The speed reduction ratio of belt drives shall not exceed 4 to 1. Each belt drive shall include a sliding base or other suitable means of tension adjustment.

2.4.02 Gear Reducers. Each gear reducer shall be a totally enclosed unit with oil or grease lubricated, rolling element, antifriction bearings throughout.

Helical, spiral bevel, combination bevel-helical, and worm gear reducers shall have a service factor of at least 1.50 based on the nameplate power rating of the drive motor. Cycloidal gear reducers shall have a service factor of at least 2.0 based on the nameplate power rating of the drive motor. Shaft-mounted and flange-mounted gear reducers shall be rated AGMA Class II. Helical gear reducers shall have a gear strength rating to catalog rating of 1.5. Each gear reducer shall be designed and manufactured in compliance with applicable AGMA standards.

The thermal power rating of each unit shall equal or exceed the nameplate power rating of the drive motor. During continuous operation, the maximum sump oil temperature shall not rise more than 100°F (55°C) above the ambient air temperature in the vicinity of the unit and shall not exceed 200°F (93°C).

Each grease lubricated bearing shall be installed in a bearing housing designed to facilitate periodic regreasing of the bearing using a manually operated grease gun. Each bearing housing shall be designed to evenly distribute new grease, to properly dispose of old grease, and to prevent overgreasing of the bearing. Permanently sealed, grease lubricated bearings will not be acceptable. An internal or external oil pump and appurtenances shall be provided, if required, to lubricate oil lubricated bearings. A dipstick or a sight glass shall be provided on each unit for checking lubricant level. Bearings shall have a minimum life L_{10} Life Rating of 100,000 hours.

Gear reducers which require removal of parts or disassembly of the unit for cleaning and manual regreasing of bearings will not be acceptable.

The gear reducer manufacturer shall certify that they have reviewed the intended application of each unit in detail and that the unit provided is fully compatible with the conditions of installation and service.

2.4.03 Safety Guards. All belt or chain drives, couplings, and other moving or rotating parts of the conveyors shall be covered on all sides by a safety guard, fabricated from 16 USS gage (1.52 mm thick) or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal and shall be furnished complete with all necessary supports and accessories. Supports and accessories, including bolts, shall be galvanized. Safety guards in outdoor locations shall be designed to keep out rain and dripping water.

2.4.04 Electric Motors. The design of the electric motors shall be as specified in Master Specification Section 16220, General Purpose Induction Motors. Gearmotor type speed reducers are not acceptable.

2.5 ACCESSORIES.

2.5.01 Grease Pipes. Stainless steel grease tubing and grease fittings shall be extended to accessible locations to facilitate greasing of all bearings while the conveyor is in operation. Tubing shall be ASTM A269, seamless, Grade TP316 with compression type fittings.

2.5.02 Side Skirts. Conveyor side skirts shall be provided as necessary and shall extend above the belt high point as required. Skirts shall have wiping edges constructed of a minimum 60 durometer solid rubber, shall be adjustable to maintain proper clearance with the belt, and shall be supported by brackets from the conveyor frame. Brackets shall be constructed of hot-dip galvanized steel, AISI Type 304 stainless steel, or AISI Type 316 stainless steel.

2.5.03 Belt Cleaner. A belt cleaner shall be provided at the discharge end of the conveyor. Belt cleaners shall consist of a primary cleaner and, when indicated in the Contract Documents, a secondary cleaner. The belt cleaner shall be of the spring tension type. The belt cleaner shall be positioned and adjusted so that material removed from the belt will drop directly into the loading opening. Belt cleaners operating against rollers will not be permitted. Belt cleaner brackets shall be constructed of hot-dip galvanized steel, AISI Type 304 stainless steel, or AISI Type 316 stainless steel. Blades shall be constructed of tungsten carbide, urethane or 80 Durometer rubber and shall be replaceable.

2.5.04 Discharge Chutes. Discharge chutes shall be provided when indicated in the Contract Documents. The chutes shall be of sufficient size whereby material can be transferred without spillage or clogging. Suitable deflector plates shall be attached to the inside of the chutes to limit falling velocities. In addition, shields shall be provided around the discharge end of the chutes to prevent splashing and spillage. Discharge chutes shall be provided with bracing and supports as necessary. Chutes shall be constructed as indicated in the Contract Documents and shall be a minimum 10 gage (3.42 mm) thickness. The interior of the chute shall be lined with 1/4 inch (6 mm) thick UHMW polyethylene and shall be bolted to the chute.

2.5.05 Deflector Plows. Deflector plows shall be provided when indicated in the Contract Documents to remove all material over one side of the conveyor belt. Plows shall be supported from the conveyor frame. Deflector plows shall be of sufficient height to keep the material from going over the top and shall be of heavy rigid construction capable of withstanding the maximum loads anticipated without excess deflection or vibration. A solid slider plate shall be provided on the underside of the belt below each plow.

Liners shall be provided for each plow face plate and slider plate. The liners shall be fastened to the surfaces so the material can be easily removed, material will not be restricted, and conveyor belts will not be damaged. Liners shall be 1/4 inch (6 mm) thick UHMW polyethylene.

In addition to the liner, the plow face plate shall be provided with an adjustable wiping blade. The blade shall maintain a minimum clearance between the plow and the belt and remove material off the belt. Blades shall be constructed of urethane or 80 Durometer rubber and shall be adjustable.

Actuators shall be manual, electric, or pneumatic type and shall be provided with each deflector plow to raise or lower the plows. When the plow is not in use the actuator shall raise the plow high enough to keep from interfering with the material on the conveyor.

2.5.06 Spray Water Header. When indicated in the Contract Documents, a spray water header with nozzles shall be provided to supply process water for washing the return belt. The spray nozzles shall supply process water in the pattern and quantity necessary for the most efficient washing of the belt.

2.5.07 Hoods. When indicated in the Contract Documents, hoods shall be provided to cover the conveyors. Hoods shall be suitable for outdoor installation, shall completely cover the top belt, and shall attach to the conveyor supporting members.

2.6 CONTROLS. Motor starters and all other controls not specified herein shall be furnished under Master Specification Section 16050, Electrical General Requirements.

2.6.01 Switches. The conveyor shall be provided with the following switches as indicated in the Contract Documents. Switches shall be furnished with standard watertight covered terminal strip junction box and 1/2 inch (12.7 mm) threaded conduit connection. Each switch shall be furnished and mounted as an integral part of the conveyor equipment and framework. All switches shall have 10 ampere, 115/120 volt ac, 60 Hz, rating.

2.6.02 Zero Speed Switch. When indicated in the Contract Documents, a zero speed switch shall be provided on the conveyor to detect belt or chain drive breakage. The zero speed switch shall be of the noncontacting type. The zero speed switch shall provide a contact output which opens to indicate zero speed and automatically resets or closes when the machine is operating. The zero speed switch shall be coordinated to properly operate over the full speed range of the driven equipment.

2.6.03 Emergency Stop Switches. Conveyors shall be equipped with two emergency stop safety switches, each with two normally closed double break contacts. Contacts shall be manually reset. Switches shall be equipped with a latching mechanism and a weight and cable along the length of the conveyor for operation of the switch. Switches shall be opened by cable linkage mounted on all sides of the conveyor. Cables shall be plastic covered metal cable (blaze orange color) and shall be located along the conveyor within easy reach of operating personnel who may be maintaining or observing the operating conveyor. Cable shall be accessible from all conveyor pinch points.

2.7 SHOP PAINTING. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Sharp corners of all cut or sheared edges shall be smoothed by a power grinder.

Surfaces to be coated after installation shall be prepared for coating as recommended by the coating manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 ERECTION. Each belt conveyor shall be erected by workers who are regularly engaged in belt conveyor erection and who are acceptable to the equipment manufacturer.

3.2 WIRING. All wiring shall be installed in intermediate metal conduit in accordance with the National Electric Code.

3.3 FIELD QUALITY CONTROL.

3.3.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. In each case, the manufacturer's representative shall be present when the equipment is placed in operation and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish to Owner, through Engineer, a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.3.02 Installation Supervision. When required in the Contract Documents, the equipment manufacturer shall furnish a qualified field installation supervisor during the equipment installation. Such services shall be included in the Contract Price.

The manufacturers' installation supervisor shall observe, instruct, guide, and direct the contractor's erection or installation procedures. The equipment manufacturer will be notified in writing 10 working days before for such services are needed.

3.4 TRAINING. When required, the manufacturer's representative shall provide training for the Owner in proper operation and maintenance of the equipment. Such services shall be included in the contract price for the number of days and round trips to the site as required.

End of Section

SECTION 14621

CHAIN HOISTS

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installation of hand-operated chain hoists, trolleys, proprietary monorail track systems, and accessories as indicated in the Contract Documents.

Hoist runway beams are covered in Master Specification Section 05120, Structural Steel.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Governing Standards. Equipment furnished under this section shall comply with the applicable requirements of the following:

Occupational Safety and Health Standards of the U.S. Department of Labor; Subpart N, Materials Handling and Storage.

ANSI/ASME HST-2M, Performance Standard for Hand Chain Manually Operated Chain Hoists.

ANSI/ASME B30.10, Hooks.

ANSI/ASME B30.11, Monorails and Underhung Cranes.

ANSI/ASME B30.16, Overhead Hoists (Underhung).

ANSI MH27.1, Specifications for Underhung Cranes and Monorail Systems.

MIOSHA Standards

1.2.03 Labels. Each hoist shall have a conspicuous, easy-to-read label showing manufacturer's name and rated capacity of equipment. The rated capacity of the hoist shall also be shown on the load block. Equipment shall be identified by an equipment tag number. Tag number shall be assigned by Owner.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit complete outline and installation drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, in accordance with Master Specification Section 01080, Project Submittals.

1.3..02 Manufacturer's Certification. The hoist manufacturer shall certify that each hoist provided has been load tested in accordance with ANSI/ASME B30.16 with a load of at least 125 percent of the rated load. A certificate shall be submitted for each hoist supplied and shall include the name of the project, the serial number on the hoist, and a description of the test performed. Testing of each hoist shall be the responsibility of the manufacturer and the certification shall be submitted before the hoist will be accepted for the project.

1.3.03 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operation instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data.

Test data and performance curves, where applicable.

A listing of all hoist locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.5 WARRANTY. The manufacturer shall provide a one (1) year warranty for the hoist and appurtenant equipment in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Service conditions shall be as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Each monorail, hoist, and trolley shall conform to the performance and design requirements as indicated in the Contract Documents.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and products shall be as specified herein, or shall be equivalent products of manufacturers regularly producing track, hoist, and trolley systems, subject to acceptance by Engineer. All modifications necessary to accommodate the track, hoist, or trolley shall be subject to acceptance by Engineer and shall be made at no additional cost to Owner.

2.3.01 Hoists and Trolleys. The hoists and trolleys shall be as manufactured by Lift-Tech International, P&H, Robbins & Myers, Yale or approved equal.

2.3.02 Monorail Track System. The monorail track system shall be as manufactured by American Monorail, Spanmaster, Twin City Monorail or approved equal.

2.4 HOIST CONSTRUCTION. The hoist and trolley arrangement shall be spur geared type, Army type, or low headroom type.

2.4.01 Spur-Geared Hoisting Assembly. A spur-geared hosting assembly shall consist of an upper block housing the spur gearing, load chain guide, and upper sheaves, and shall be equipped with a top hook for a attachment directly to the trolley; a load chain equipped with a load hook; and hand chains. The top hook shall be arranged to swivel and shall be of forged steel. Anti-friction bearings shall be used throughout, and the assembly shall have suitable fittings for proper lubrication.

2.4.02 Low Headroom Hoisting Assembly. An Army-type, or low headroom hoisting assembly shall consist of the necessary gearing, guides, and sheaves, all built integrally with the trolley; a load chain equipped with a load hook; and hand chains. Anti-friction bearings shall be used throughout, and the assembly shall have suitable fittings for proper lubrication.

2.4.03 Hooks. All hooks shall be slow opening, non-fracturing, forged steel, and shall be provided with a safety latch. The hooks shall be mounted on anti-friction bearings to permit easy turning.

2.4.04 Load Brake. Each hoist shall be equipped with self activating mechanical load brake which will prevent acceleration of the load when lowering and which will sustain the maximum load at any point. Load brakes shall operate in sealed enclosures.

2.4.05 Hoist Chains. Operating chains shall be welded link type, heavily zinc plated. Load chains shall be heat-treated alloy steel. Hand chains shall be steel and shall extend to approximately 3 feet (1 m) above the floor. Chain containers shall be provided to receive idle load chain.

2.5 TROLLEY CONSTRUCTION. Each hoist shall be provided with a trolley of the push type or hand-geared type. Each trolley shall have a rated capacity equal to or greater than the capacity of the corresponding hoist.

Each trolley frame shall be underhung type designed for operation on the specified running track, and shall either contain or support the hoist depending on the hoist/trolley arrangement. Each trolley frame shall be provided with lugs or wrap around side plates on both sides of the track.

Trolley wheels shall be of the single flange type, of rolled, forged, or cast steel, with machined universal crowned or tapered treads. When a hand-geared trolley is specified, the drive wheels shall have integrally cut spur gear teeth or machine-cut gears pressed on hubs.

Wheel axles shall be of the fixed type, made from high carbon steel, machined and ground to size to receive the wheel bearings. Wheel bearings shall be permanently shielded, lifetime-lubricated, anti-friction type, suitable for radial and end thrust loading.

When hook-attached hoists are required, the trolley shall be provided with a lug or crosshead with machined seat to receive the mounting hook of the hoist.

The drive wheels of manually operated, hand-geared trolleys shall be provided with a swinging chain guide which will permit rapid handling of the chain without fouling or gagging and will also permit reasonable side pull on the chain. Operating chains shall be all steel, welded link type, heavily zinc plated.

Operating chains shall extend to approximately 3 feet (1 m) above the floor.

2.6 MONORAIL TRACK SYSTEM. Each proprietary monorail track system shall be furnished complete with monorail track, a track suspension system, and appurtenances indicated on the drawings, specified, or required for a complete, properly operating installation acceptable to Engineer.

2.6.01 Track. The monorail track shall be runway beam track or a proprietary track system. The track shall be capable of supporting the weight of the hoist and trolley and the specified load, plus an impact factor of 25 percent of the specified load, with a limiting deflection of 1/450 of the span between supports.

Joints shall be close-fitting and free from unevenness. The track sections shall be rigidly supported in exact alignment. Where indicated on the drawings, curved sections shall be carefully formed to radius and shall be free of warp and distortion.

Removable stops shall be provided on each end of each monorail track to limit the hoist travel. Stops shall conform to the governing standards, and shall be so located that the hoist does not come into contact with any part of the structure or piping, or encroach on the any clearances indicated on the drawings.

2.6.02 Track Suspension System. The monorail track manufacturer shall furnish the suspension system, which shall consist of all track hangers, hanger rods, clamps, brackets, braces, supports, fasteners, and appurtenances required to support the track system from the structure, as indicated on the drawings. Unless otherwise permitted, track loads shall be applied at the load points indicated and shall not exceed the values indicated on the drawings.

2.6.03 Track Opener. A manually operated track opener shall be provided in the monorail at the location indicated on the drawings. The opener shall include provisions to prevent the hoist trolley from running off the open end of the track when the opener is not in the closed position. Operating chains shall be zinc plated and shall extend to within 3 feet (1 m) of the floor. Suitable hooks shall be provided on the adjacent wall to hold the chains out of the way when the opener is not being operated. In the closed position, the opener shall be suitable for operation of the trolley.

2.6.04 Track Switches. Manually operated track switches for push type trolleys and for hand-geared trolleys (whichever trolley type is specified) shall be provided at the locations indicated on the drawings. Each switch shall include provisions to prevent the hoist trolley from running off the open end of the track when the switch is not in the closed position. Operating chains or ropes shall extend to within 3 feet (1 m) of the floor. In the closed position, the switches shall be suitable for operation of the hoist trolley.

2.7 SHOP PAINTING. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Self-contained or enclosed components shall be shop primed or finished with an oil resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

All other surfaces to be coated after installation shall be prepared for painting as recommended by the coating manufacturer for the intended service, and then shop painted with one or more coats of the specified shop primer.

PART 3 - EXECUTION

3.1 ERECTION. Each hoist and trolley and monorail track system shall be erected by workers who are regularly engaged in hoist and track erection and who are acceptable to the equipment manufacturer. Hoist and monorail installation shall be the responsibility of a single manufacturer.

3.2 FIELD QUALITY CONTROL. When indicated in the Contract Documents, manufacturer's field services shall be provided, which shall consist of an installation check.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Material, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting appurtenances; and has been operated under full load conditions and that it operated satisfactorily.

End of Section

SECTION 14622

ELECTRIC WIRE ROPE HOISTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of electric wire rope hoists, trolleys, proprietary monorail track systems, and accessories as indicated in the Contract Documents.

Hoist runway beams are covered in Master Specification Section 05120, Structural Steel.

Each hoist and monorail track system shall be furnished and installed in the location and arrangement indicated on the drawings, complete with all hoisting equipment, monorail track (when required), electric wiring (including collectors, conductors, and conductor supports), controllers, pendant control station, and all other accessories necessary for a complete and properly operating installation.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are to be provided, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with Underwriters' Laboratories (UL) safety requirements.

Equipment furnished under this section shall comply with the applicable requirements of the following:

Occupational Safety and Health Standards of the U.S. Department of Labor; Subpart N, Materials Handling and Storage.

ANSI/ASME HST-4M, Performance Standard for Overhead Electric Wire Rope Hoists.

ANSI/ASME B30.10, Hooks.

ANSI/ASME B30.11, Monorails and Underhung Cranes.

ANSI/ASME B30.16, Overhead Hoists (Underhung).

ANSI MH27.1, Specifications for Underhung Cranes and Monorail Systems.

MIOSHA Standards

1.2.04 Power Supply. Power supply to equipment with motors shall be three phase neutral (TPN), three phase (TPI), or single phase and neutral (SPN). Power supply for controls shall be as required, unless otherwise required for a properly operating system.

1.2.05 Labels. Each hoist shall have a conspicuous, easy-to-read label showing the manufacturer's name and the rated capacity. The rated capacity of the hoist shall also be shown on the load block. Equipment shall be identified by an equipment tag number. Tag number shall be assigned by Owner.

1.2.06 Metal Thickness. Gages specified herein refer to US Standard gage.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, together with detailed specifications, schematic and wiring diagrams, and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project

Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable.

Drawings shall include electrical connection diagrams and schematics identifying all items requiring electrical control or power in the operation of each electrically operated hoist and motor driven trolley, and complete details and information on the power feed system.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160,Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all hoist locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.4.02 Contractor's Qualification. Contractor shall submit qualifications to do the work as indicated in the Contract Documents.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.6 WARRANTY. The manufacturer shall provide a one (1) year warranty for the hoist and appurtenant equipment in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the service conditions as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Each monorail, hoist, and trolley shall be designed for the performance and design requirements as indicated in the Contract Documents.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and products shall be as specified herein, or shall be equivalent products of manufacturers regularly producing track, hoist, and trolley systems, subject to acceptance by Engineer. All modifications necessary to accommodate the track, hoist, or trolley shall be subject to acceptance by Engineer and shall be made at no additional cost to Owner.

2.3.01 Hoists and Trolleys. The hoists and trolleys shall be as manufactured by Lift-Tech International, P&H, Robbins & Myers, Yale or approved equal.

2.3.02 Monorail Track System. The monorail track system shall be as manufactured by American Monorail, Spanmaster, Twin City Monorail or approved equal.

2.4 HOIST CONSTRUCTION. Each hoist shall be of the type as indicated in the Contract Documents. Each hoist shall consist of an electric motor, a grooved winding drum, and gearing, arranged with the trolley as required. Antifriction bearings shall be used throughout. The winding drum shall have machined grooves designed to receive the full run of hoisting cable without overwrapping. The winding drum shall have right-hand and left-hand grooves to provide True Vertical Lift. The ratio between the diameter of the drum and the diameter of the hoisting cable shall be at least 20 to 1. At least two laps of cable shall remain on the drum when the lifting hook is in the lowest position.

Each hoist shall be protected against the weather and shall be suitable for outdoor operation.

2.4.01 Gears and Bearings. Hoist gearing shall be spur or helical type and shall be fully enclosed in an oiltight housing. All bearings shall be antifriction type, with oil lubrication or lifetime grease packing.

2.4.02 Load Brakes. Each hoist shall be provided with mechanical and electrical load brakes arranged so that the load may be raised or lowered by electric power and automatically sustained at any position of the hook when the power is cut off. The mechanical load brake shall prevent acceleration of the load when lowering and shall completely sustain the load when brought to rest, independent of the electric brake. The electric brake shall be released whenever current is flowing to the hoist motor and shall be automatically activated when the current is shut off or interrupted. The mechanical load brake shall operate in oil in a sealed enclosure.

2.4.03 Limit Switches. Each hoist shall be provided with adjustable limit switches to stop the hoisting mechanism at the upper and lower limits of hook travel.

2.4.04 Lifting Tackle. The lifting tackle shall consist of a lower block and hook, necessary sheaves, and wire rope made especially for hoisting service. Wire rope shall be as recommended by the rope manufacturer for use on the specified drum. The lower block and hook shall be of the safety type, with guarded sheaves and a slow opening, nonfracturing, forged steel hook. The hook shall be supported on a ball or roller thrust bearing for easy turning, and shall include a safety latch. The sheaves shall have antifriction or sleeve type bearings.

2.5 TROLLEY CONSTRUCTION. Each hoist shall be provided with a trolley of the type as indicated in the Contract Documents. Each trolley shall have a rated capacity equal to or greater than the capacity of the corresponding hoist.

The trolley frame shall be rigid, shall support the hoist, and shall be underhung type designed for operation on the specified running track. The trolley frame shall be provided with lugs or wrap around side plates on both sides of the track.

Wheels shall be single flange type, made from rolled, forged, or cast steel, with hardened treads. If a hand-geared or motor-driven trolley is specified, trolley drive wheels shall have integrally cut spur gear teeth or machine-cut gears pressed on the hubs. Wheel bearings shall be permanently shielded, lifetime-lubricated, antifriction type, adequate for radial and end thrust loading.

The trolley drive of motor driven trolleys shall be a sealed worm or spur gear unit, permanently lubricated in an oil bath.

The trolley drive wheel of hand-geared trolleys shall be equipped with a swinging chain guide which will permit rapid handling of the chain without fouling or gagging of the wheel and will also permit reasonable side pull on the chain. The operating chain shall be heavily zinc plated and shall extend to approximately 3 feet (1 m) above the operating floor.

Each trolley shall be protected against the weather and shall be suitable for outdoor operation.

Each trolley shall be constructed to provide necessary clearances at all track joints, splices, and hangers, including all projections on any track opener sections and switches.

If curved tracks are indicated, each trolley shall be designed to operate on curved sections having the radii indicated on the drawings.

When a festooned power cord type power system is required, the hoist trolley shall have a suitable member to contact and push the bumper of the adjacent conductor cord trolley.

2.6 MONORAIL TRACK SYSTEM. Each proprietary monorail track system shall be furnished complete with monorail track, a track suspension system, and appurtenances indicated on the drawings, specified, or required for a complete, properly operating installation acceptable to Engineer.

2.6.01 Track. The monorail track shall be capable of supporting the weight of the hoist and trolley and the specified load, plus an impact factor of 25 percent of the specified load, with a limiting deflection of 1/450 of the span between supports.

Joints shall be close-fitting and free from unevenness. Track sections shall be rigidly supported in exact alignment. Where indicated on the drawings, curved sections shall be carefully formed to radius and shall be free of warp and distortion.

Removable stops shall be provided on each end of each monorail track to limit hoist travel. Stops shall conform to the governing standards and shall be so located that the hoist does not come into contact with any part of the structure or piping or encroach on any clearances indicated on the drawings.

When a festooned power cord type power system is specified, the power feed end of the monorail shall have stops designed so that the power cord trolleys will pass beneath the stops. The stops shall be located so that there is sufficient room on the monorail for storage of the cord trolleys beyond the stops. Secondary stops shall be provided for the cord trolleys.

2.6.02 Track Suspension System. The monorail track manufacturer shall furnish the track suspension system, which shall consist of all track hangers, hanger rods, clamps, brackets, braces, supports, fasteners, and appurtenances required to support the track system from the structure, as indicated on the drawings. Unless otherwise permitted, track loads shall be applied at the load points indicated and shall not exceed the values indicated on the drawings.

2.6.03 Track Opener. A manually operated track opener shall be provided in the monorail at each location indicated on the drawings. If electrical systems are in place for the hoist and trolley, the opener shall be equipped with electric conductors compatible with the conductor system specified for the hoist. The opener shall include provisions to prevent the hoist trolley from running off the open end of the track when the opener is not in the closed position. Operating chains shall be zinc plated and shall extend to within 3 feet (1 m) of the floor. Suitable hooks shall be provided on the adjacent wall to hold the chains out of the way when the opener is not being operated. In the closed position, the opener shall be suitable for operation of the trolley.

2.6.04 Track Switches. Manually operated track switches shall be provided at the locations indicated on the drawings. When electrical systems are in place for the hoist and trolley, the switches shall be equipped with electric conductors as specified herein. Each switch shall include provisions to prevent the hoist trolley from running off the open end of the track when the switch is not in the closed position. Operating chains or ropes shall extend to within 3 feet (1 m) of the floor. In the closed position, the switches shall be suitable for operation of the hoist trolley.

2.7 ELECTRICAL.

2.7.01 Motors. Motors shall be totally enclosed, high-starting torque, squirrel-cage type, designed especially for hoist service and suitable for operation on the power supply specified. Motor size and speed shall be adequate to start the fully rated load capacity.

2.7.02 Controllers. Control of hoist and trolley motions shall be from a single pendant push-button station, suspended a distance as required from the bottom of the running track. Controllers shall be of the reversing, magnetic contactor type, with thermal overload protection, and shall be installed at the motor and operated from the pendant station. Trolley controllers shall be provided with ballast resistance for cushioned starting.

The pendant station shall be suspended from the hoist and shall contain individual push buttons for motions of the hoist and trolley.

Push buttons shall be of the mechanical or electrical interlocking type to prevent the possibility of damage to equipment should two or more buttons be depressed simultaneously. Push buttons shall be provided with a spring return to neutral and shall automatically return to the "Off" position when pressure on the button is released.

A control power transformer, with one secondary lead fused and the other grounded, shall be provided to reduce voltage at the push-button station to an amount as required. The pendant control cable shall be heavy-duty type, with extra-flexible stranding and a neoprene jacket. Support for the pendant station shall be provided by a stainless steel wire rope or chain equipped with a suitable strain-relief clamp for the conductor cable. The support shall offset the pendant station at least 2 feet (600 mm) measured horizontally from the centerline of the running track.

The pendant and controls for each hoist shall be protected against the weather and shall be suitable for outdoor operation.

2.7.03 Power Feed System. A complete electric power feed system shall be provided for each hoist, and for the trolleys. The type of system shall be as indicated in the Contract Documents.

2.7.03.01 Cable Reel Power Feed System. When a cable reel power feed system is required, the system shall consist of a spring-loaded cable reel and a suitable power cord. The cable reel shall be installed at the location indicated on the drawings, and shall be of the type and size recommended by the hoist manufacturer. Reel tension shall be sufficient to take up the slack in the power cord when the hoist is moved toward the reel. Each hoist shall be equipped with a strain-relief device for the power cord.

The power cord shall be 600 volt, neoprene jacketed, heavy-duty portable cable, with the number of conductors as required, suitable for wet locations if specified. The power cord shall be rated for hoist and trolley full load amperes at 167°F (75°C) copper temperature.

The feeder circuit for each hoist will be furnished and installed under Master Specification Section 16050, Electrical General Requirements, to the location indicated on the drawings. A suitable junction box with all hanger brackets and other accessories required for a complete installation shall be furnished and installed under this section at the location indicated, and the feeder circuit wired in.

2.7.03.02 Festooned Cable Power Feed System. When a festooned power feed system is required, the power feed system shall consist of a portable power cord festooned in loops from power cord trolleys installed on the bottom flange of the running track. Power cord trolleys shall have ball bearing wheels, a swivelling cord clamp suitable for the size of cord provided, and integral bumpers to prevent contact between the wheels and the hoist or the hoist trolley. A sufficient number of cord trolleys shall be provided to ensure a minimum headroom between the bottom of cord loops and adjacent equipment or the floor, and to permit proper movement of trolleys around curved portions of the running track.

The power cord shall be 600 volt, neoprene jacketed, heavy-duty portable cable with the number of conductors as required, suitable for wet locations if specified. The power cord shall be rated for hoist and trolley full load amperes at 167°F (75°C) copper temperature. A watertight seal connector, of sufficient size to pass full cord diameter, and a woven stainless steel strain-relief grip shall be provided at each end of the cord. Grips shall be aligned parallel to the runway beam and shall not interfere with extension or retraction of the cord. A junction box with cover hub sized for the power cord connection shall be provided at the location indicated on the drawings. The box, mounting, and cover attachment shall be suitable for the maximum applied cord tension.

The feeder circuit for each hoist will be furnished and installed under Master Specification Section 16050, Electrical General Requirements, to the location indicated on the drawings. A suitable junction box with all hanger brackets and other accessories required for a complete installation shall be furnished and installed under this section at the location indicated, and the feeder circuit wired in.

2.7.03.03 Track-Mounted Power Bar Feed System. When a track-mounted power bar feed system is required, each system shall consist of insulated conductors and insulated collector assemblies with copper-graphite collector shoes. The current and voltage rating of the conductors and collectors shall be adequate for the maximum electrical load.

Stationary conductors shall be installed adjacent to the running track switches, and track opener section (if specified), with supports and brackets as needed. Insulated travelling collector assemblies shall be installed on the hoist trolley and wired to the hoist. Conductors and collectors shall be installed in compliance with the recommendations and instructions of the system manufacturer.

If the track extends, via a track opener, to the exterior of the structure, the interior and exterior monorail track sections shall be separately and independently powered, so that the hoist and trolley can be operated on either the interior or exterior monorail with the track opener section either open or closed. The conductor system on the exterior monorail section shall be weatherproof. Curved conductor sections shall be provided where required for a curved monorail track.

The feeder circuit for each hoist will be furnished and installed under Master Specification Section 16050, Electrical General Requirements, to the location indicated on the drawings. A suitable junction box with all hanger brackets and other accessories required for a complete installation shall be furnished and installed under this section at the location indicated, and the feeder circuit wired in.

2.7.04 Wiring. All insulated wire shall be heat-resistant and shall be insulated for 600 volts.

2.8 SHOP PAINTING. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.9 LUBRICATION. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment by Owner. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

2.10 SAFETY GUARDS. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.11 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 ERECTION. Each hoist and trolley and monorail track system shall be erected by workers who are regularly engaged in hoist and track erection and who are acceptable to the equipment manufacturer. Hoist and monorail installation shall be the responsibility of a single manufacturer.

3.2 WIRING. All wiring shall be installed in intermediate metal conduit in accordance with the National Electrical Code.

3.3 FIELD QUALITY CONTROL. When indicated in the Contract Documents, manufacturer's field services shall be provided, which shall consist of an installation check.

3.3.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Material, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting appurtenances; and has been operated under full load conditions and that it operated satisfactorily.

End of Section

SECTION 14630

TRAVELING BRIDGE CRANES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of traveling bridge cranes, complete with trolleys and hoists, as indicated in the Contract Documents. This section is applicable for capacities up to 10 tons and spans up to 60 feet.

Runway beams/crane rails are covered in Master Specification Section 05120, Structural Steel.

Each bridge crane assembly shall consist of structural members fabricated by the crane supplier and components (end trucks, wheels, bridge drive mechanism, trolley, and hoist) manufactured by the acceptable manufacturers. Equivalent products of other manufacturers regularly engaged in the production of equipment of this type may be furnished subject to acceptance by Engineer. All modifications necessary to accommodate the equipment shall be subject to review and acceptance by Engineer and shall be made at no additional cost to Owner.

1.2 GENERAL. Equipment and accessories furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system and that all devices necessary for a properly functioning system have been provided.

Where two or more traveling bridge cranes are to be provided, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer. Similar component parts of bridge cranes shall be from the same manufacturer to facilitate maintenance and stocking of repair parts. Whenever possible, identical units shall be furnished.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Each bridge crane assembly shall be preassembled and run in the shop, then matchmarked and disassembled for shipment.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with Underwriters' Laboratories (UL) safety requirements.

Equipment furnished under this section shall comply with the applicable requirements of the following:

Occupational Safety and Health Standards of the U.S. Department of Labor; Subpart N, Materials Handling and Storage.

MIOSHA Standards

For top running multiple girder electric overhead cranes:

Crane Manufacturers Association of America (CMAA) Specification No. 70, Specifications for Electric Overhead Traveling Cranes.

For top running and under-running single girder overhead cranes:

Crane Manufacturers Association of America (CMAA) Specification No. 74, Specification for Top Running & Under Running Single Girder Electric Overhead Traveling Cranes.

For underhung electric or manual cranes:

ANSI MH27.1, Specifications for Underhung Cranes and Monorail Systems.

ANSI/ASME HST-2M, Performance Standard for Hand Chain Manually Operated Chain Hoists.

ANSI/ASME HST-4M, Performance Standard for Overhead Electric Wire Rope Hoists.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in the Contract Documents. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise indicated or required for a properly operating system.

1.2.05 Labels. Each bridge, trolley, and hoist shall have a conspicuous, easy-to-read label showing manufacturer's name, crane serial number, and rated capacity. The rated capacity of the hoist shall also be shown on the load block. Equipment shall be identified by an equipment tag number. Tag number shall be assigned by Owner.

1.2.06 Metal Thickness. Gages specified herein refer to US Standard gage.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable.

Drawings shall include electrical connection diagrams and schematics identifying all items requiring electrical control or power in the operation of the traveling carne assembly, and complete details and information of the power feed system.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all crane locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.4.02 Contractor's Qualification. Contractor shall submit qualifications to do the work as indicated in the Contract Documents.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.6 WARRANTY. The manufacturer shall provide a one (1) year warranty for the bridge crane and appurtenant equipment in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the service conditions as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Each traveling bridge crane shall be designed for the performance and design requirements as indicated in the Contract Documents.

2.3 ACCEPTABLE MANUFACTURERS. The bridge crane shall be as specified herein and shall be as manufactured by Lift-Tech International, P&H, Robbins & Meyers, Wright, or approved equal.

2.4 HOISTS AND TROLLEYS. Hoist and trolley manufacturers and model numbers shall be as indicated in the Contract Documents. The hoist and trolley arrangement shall be as required. Each hoist and trolley shall be manual or electric as indicated in the Contract Documents.

Manual hoists and trolleys shall be furnished with operating chains which shall be welded link type, heavily zinc plated steel. Chain-operated drive wheels shall be provided with a swinging chain guide which will permit rapid handling of the chain without fouling or gagging and will also permit reasonable side pull on the chain. Operating chains shall extend to approximately 3 feet (1 m) above the floor. The maximum chain pull required at the rated capacity shall be 80 pounds (350 N).

2.4.01 Hoists. The hook shall be a slow opening, non-fracturing, forged steel type with a safety latch. The hook shall be mounted on a ball or roller thrust bearing for easy turning.

2.4.02 Manual. Manually operated hoists shall be spur-geared. Each hoist shall be equipped with a self-activating, mechanical load brake which will prevent acceleration of the load when lowering and which will sustain the maximum load at any point. Load brakes shall operate in sealed enclosures.

Load chains shall be heat-treated alloy steel, welded link type, heavily zinc plated. Chain containers shall be provided to receive idle load chain. Antifriction bearings shall be used throughout, and the assembly shall have facilities for proper lubrication.

If the hoist is hook-attached to the trolley, the hoisting assembly shall consist of an upper block housing the spur gearing, load chain guide, and upper sheaves, and shall be equipped with a top hook for attachment directly to the trolley; a load chain equipped with a load hook; and operating chains. The top hook shall be arranged to swivel and shall be of forged steel.

If the hoist is built integrally with the trolley, the hoisting assembly shall consist of the necessary gearing, guides, and sheaves, all built integrally with the trolley; a load chain equipped with a load hook; and operating chains.

2.4.03 Electric. Electric hoists shall consist of a single-speed electric motor, a grooved winding drum, and gearing. Antifriction bearings shall be used throughout. The winding drum shall have machined grooves designed to receive the full run of hoisting cable without overwrapping. The hoists shall be provided with True Vertical

Lift. The ratio between the diameter of the drum and the diameter of the hoisting cable shall be at least 20 to 1. At least two laps of cable shall remain on the drum when the lifting hook is in the lowest position.

Hoist gearing shall be spur or helical type and shall be fully enclosed in an oiltight housing. All bearings shall be antifriction type, with oil lubrication or lifetime grease packing.

The hoist shall be provided with mechanical and electrical load brakes arranged so that the load may be raised or lowered by electric power and automatically sustained at any position of the hook when the power is cut off. The mechanical load brake shall prevent acceleration of the load when lowering and shall completely sustain the load when brought to rest, independent of the electric brake. The electric brake shall be released whenever current is flowing to the hoist motor and shall be automatically activated when the current is shut off or interrupted. The mechanical load brake shall operate in oil in a sealed enclosure.

The hoist shall be provided with adjustable limit switches to stop the hoisting mechanism at the upper and lower limits of hook travel.

The lifting tackle shall consist of a lower block and hook, necessary sheaves, and wire rope, made especially for hoisting service. Wire rope shall be as recommended by the rope manufacturer for use on the specified drum. The lower block shall be of the safety type, with guarded sheaves. The sheaves shall have antifriction or sleeve type bearings.

2.4.04 Trolleys. The trolley frame shall be rigid. The trolley and bridge arrangement shall be as required. For underhung type trolleys, the trolley frame shall be provided with lugs or wrap around side plates on both sides of the bridge. Wheels shall be double flange type for top-running trolleys, and single flange type for underhung trolleys. Wheels shall be made from rolled, forged, or cast steel, machined universal crowned or tapered treads. Wheel bearings shall be permanently shielded, lifetime-lubricated, antifriction type, adequate for radial and end thrust loading.

2.4.05 Manual. The trolley shall be hand geared or push-type.

For hand geared trolleys, drive wheels shall have integrally cut spur gear teeth or machine-cut gears pressed on hubs. Wheel axles shall be of the fixed type, made from high carbon steel, machined and ground to size to receive the wheel bearings. If a hook-attached hoist is specified, the trolley shall be provided with a lug or a crosshead with machined seat to receive the mounting hook of the hoist.

2.4.06 Electric. The trolley drive shall be a sealed worm or spur gear unit, permanently lubricated with an oil bath. Each trolley shall be provided with a brake conforming to the governing standards. Drive wheel treads shall be hardened.

The trolley speed at the rated capacity shall be 40-60 fpm (200-300 mm/s).

2.5 BRIDGES. Each bridge shall be single or double girder type, shall be rigidly supported by end trucks, and shall operate on a running surface. The bridge shall be constructed to accommodate the type of trolley specified. When underhung trolleys are specified, the wearing surface of the bridge's lower flanges shall be either specially fabricated flanges or standard flanges ground smooth.

Steel design and fabrication shall comply with applicable portions of the specifications of the American Institute of Steel Construction. Loadings, impact allowances, and allowable stresses shall be in accordance with the governing standards. Deflection of the main girder shall not exceed 1/800 of the span, with the maximum hoist load at any point.

2.5.01 End Trucks. End trucks, each fabricated from structural steel members, shall be designed to distribute the loading equally to each wheel, shall be securely attached to the beam by welding or with fitted bolts in reamed holes, and shall be provided with heavy gusset plates to ensure adequate rigidity and squareness. Each truck shall have heavy end plates to engage the stops located on the specified running surface. End trucks shall have a wheelbase of approximately 1/7 the bridge span. Underhung end trucks shall be provided with lugs or wrap around side plates on both sides of the track.

The end trucks and wheels shall be designed to operate on the specified running surface, and shall clear all fittings, anchors, and splices located on, or near, that surface.

2.5.02 Wheels. Bridge crane wheels shall be made of rolled, forged, or cast steel, with machined universal crowned or tapered hardened treads, designed to operate on the specified running surface. Drive wheels in each truck shall have integrally cut spur gear teeth, or machine-cut gears pressed on hubs. The other wheels in each truck shall be idlers. Axles may be either rotating or fixed type. Wheel bearings shall be permanently shielded, lifetime-lubricated, antifriction type, adequate for radial and end thrust loading.

For top running bridges, each end truck shall have double flange wheels and one drive wheel. For underhung bridges, each end truck shall have single flange wheels and one pair of drive wheels.

2.5.03 Bridge Drive Mechanism. The bridge shall be either manually or electrically driven. Gearing shall be helical, spur, or herringbone type, made from rolled or cast steel, and shall have machine-cut teeth. All shafts shall be made from alloy steel and shall be heat treated.

2.5.04 Manual. The bridge drive shall consist of a cross shaft connected to the drive wheel(s) of each end truck and a chain operated drive wheel. The cross shaft shall be designed to withstand torsional strain and shall be supported by brackets and self-aligning bearings at intervals sufficient to prevent distortion of the shaft. Bearings shall be lifetime-lubricated, antifriction type.

The drive wheel shall be equipped with a swinging chain guide which will permit rapid handling of the chain without fouling or gagging the wheel and will also permit reasonable side pull on the chain. The operating chain shall be heavily zinc plated and shall extend to approximately 3 feet (1 m) above the floor. The drive chain for the bridge shall be located as indicated in the Contract Documents. The maximum chain pull required at the rated capacity shall be 80 pounds (350 N).

2.5.05 Electric. The bridge drive shall consist of a single speed electric motor, or a specially designed dual speed electric motor, as required, enclosed reduction gearing, and a cross shaft connected to the drive wheel(s) of each end truck. The shaft shall be designed to withstand torsional strain and shall be supported with self-aligning, lifetime-lubricated bearings at intervals sufficient to prevent distortion of the shaft.

The drive motor shall contain a built-in adjustable mechanical brake. The bridge brake shall be solenoid operated, adjustable shoe or disc type, acting directly on the bridge drive motor shaft.

The bridge speed at the rated capacity shall be 50-75 fpm (250-380 mm/s).

2.6 BUMPERS AND STOPS. Bumpers and stops in compliance with the governing standards shall be installed on the bridge, trolley, and the specified running surface. The bumpers and stops shall be located so that no part of the bridge or trolley encroaches on the clearances specified or indicated on the drawings.

2.7 ELECTRICAL.

2.7.01 Motors. Motors shall be high-starting torque, squirrel-cage, totally enclosed type, designed especially for crane and hoist service and suitable for operation on the power supply specified. Motor size and speed shall be adequate to start the fully rated load capacity.

2.7.02 Controllers. Control of all electric hoist, trolley, and bridge motions shall all be from a single pendant push-button station. Controllers shall be of the reversing, magnetic contactor type, with thermal overload protection, and shall be installed at the motor and operated from the pendant station. Bridge and trolley controllers shall be provided with ballast resistance for cushioned starting.

The pendant shall contain a separate push button for each of the following motions: off, on, hoist up and down (when electric hoists are specified), trolley forward and reverse (when electric trolleys are specified), and bridge forward and reverse (when electric bridges are specified). The pendant shall be mounted as indicated in the Contract Documents. Push buttons shall be of the interlocking type to prevent possibility of damage to equipment should two or more buttons be depressed simultaneously. Push buttons shall be provided with a spring return to neutral and shall automatically return to the off position when pressure on the button is released. A control power transformer with one secondary lead fused and the other grounded shall be provided to reduce voltage at the push-button station to a maximum of 120 volts. The pendant control cable shall be heavy-duty type with extra-flexible stranding and neoprene jacket. Support for the pendant station shall be provided by a stainless steel wire rope or chain equipped with a suitable strain-relief clamp for the conductor cable.

2.7.03 Power Feed System. When any part of the crane system is electrically operated, a complete electric power feed system shall be provided. The system shall consist of insulated conductors and insulated collector assemblies with copper-graphite collector shoes, and shall be U-S Safety Trolley's "Span-Guard" or "Duct-O-Bar". The conductors shall be the completely enclosed type. The current and voltage rating of the conductors and collectors shall be not less than 90 amperes continuous duty, 135 amperes intermittent duty.

Stationary conductors shall be installed adjacent to the runway, with supports and brackets as needed. Cross conductors shall be supported by angles across the top of the bridge. Collectors for hoist operation shall be installed on the hoist trolley and wired to the hoist. Conductors and collectors shall be installed in conformity with the recommendations and instructions of the system manufacturer.

The feeder circuit for the crane assembly will be furnished and installed under Master Specification Section 16050, Electrical General Requirements, to the location indicated on the drawings. A suitable surface-mounted junction box, with all hanger brackets and other accessories required for a complete installation, shall be furnished and installed under this section at the location indicated, and the feeder circuit wired in.

2.7.04 Wiring. All insulated wire shall be heat resisting and shall be insulated for 600 volts.

2.8 SHOP PAINTING. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound, as recommended by the manufacturer.

2.9 LUBRICATION. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment by Owner. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

2.10 SAFETY GUARDS. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.11 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 ERECTION. Each crane, hoist, and trolley shall be erected by workers who are regularly engaged in crane erecting and who are acceptable to the crane manufacturer. The orientation of installation of the hoist and trolley on each crane bridge shall be as directed by the Engineer.

3.2 WIRING. All wiring shall be installed in intermediate metal conduit in accordance with the National Electrical Code.

3.3 INSPECTION AND TESTING. After complete assembly and installation, each crane shall be subject to an installation check as specified herein, and an acceptance test. A manufacturer's representative shall be present during all field inspection and testing. The inspection and testing shall verify that each crane has been assembled properly and that all required adjustments have been made.

3.3.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting appurtenances; and has been operated under full load conditions and that it operated satisfactorily.

3.3.02 Acceptance Testing. Each crane shall be subject to operational and rated load testing.

Each crane shall raise, lower, hold in any position, and transport a test load equal to 125 percent of the rated capacity of the crane, with no detrimental effects on the crane. All motions shall be executed satisfactorily. Contractor shall provide the test weights.

The following functions shall be tested:

Hoisting and lowering.

Trolley travel.

Bridge travel.

Limit switches, locking and safety devices.

The trip setting of hoist limit switches shall be determined by tests with an empty hook traveling in increasing speeds up to the maximum speed. The actuating mechanism of the limit switch shall be located to trip the switch, under all conditions, in sufficient time to prevent contact of the hook or hook block with any part of the trolley.

Hoisting and lowering tests will be conducted with 0, 50, 100, and 125 percent of the nominal or rated load.

The rated load test shall consist of the following operations:

The test load shall be lifted a sufficient distance to ensure that the load is supported by the crane and held by the hoist brakes.

The test load shall be transported by means of the trolley for the full length of the bridge.

The test load shall be transported by means of the bridge for the full length of the runway in one direction with the trolley as close to the extreme right-hand end of the crane as practical and in the other direction with the trolley as close to the extreme left-hand end of the crane as practical.

The test load shall be lowered, stopped, and held with the brakes.

Wiring shall be given an insulation resistance test using a 500 volt megger.

Following completion of the tests, each crane shall be inspected by Contractor and the manufacturer's representative, in the presence of Engineer, for misalignment, breakage, and undue wear. All deficiencies shall be corrected by Contractor in a manner acceptable to Engineer.

3.3.03 Test Reports. Field inspection and testing of each crane shall be documented by the crane manufacturer's representative through Contractor, noting the deficiencies and corrections and certifying that each crane is acceptable for operation. Certification of the inspection shall be submitted to Engineer.

End of Section

SECTION 14641

PORTABLE GANTRY CRANES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of portable gantry cranes, complete with jacks, cart kits, hoists and trolleys, and all other accessories necessary for a complete and operating system, as indicated in the Contract Documents.

1.2 GENERAL. Equipment and accessories furnished under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, Engineering data, instructions, recommendations of the equipment manufacturer, and local, state and federal codes, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Governing Standards. Equipment provided under this section shall comply with the applicable requirements of the following:

> Occupational Safety and Health Standards of the U. S. Department of Labor; Subpart N, Materials Handling and Storage.
>
> Monorail Manufacturers Association (MMA) Specifications for Underhung Cranes and Monorail Systems.
>
> Hoist Manufacturer Institute HMI 200, Specifications for Hand Operated Chain Hoists.
>
> ANSI B30, Safety Standards for Cranes, Derricks, Hoists, Hooks, Jacks, and Slings.
>
> MIOSHA Standards

1.2.03 Labels. The portable gantry crane and hoist shall have a conspicuous, easy to read label showing manufacturer's name and rated capacity of equipment. Equipment shall be identified by an equipment tag number. Tag number shall be assigned by Owner.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.6 WARRANTY. The manufacturer shall provide a one (1) year warranty for the portable gantry crane and appurtenant equipment in accordance with Master Specification Section 01170, Warranties and Bonds.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the service conditions as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Loading, impact allowances and allowable stresses shall be in accordance with the governing standards. The lifting frame shall have a safety factor of at least 1.5, and the deflection under design load shall not exceed 1/360 of the span.

The lifting frame, hoist, and trolley shall be designed for the conditions as indicated in the Contract Documents.

2.3 ACCEPTABLE MANUFACTURERS. Each portable gantry crane, hoist, and trolley shall be furnished by Wallace. Equivalent products of other manufacturers regularly engaged in the production of equipment of this type may be furnished subject to acceptance by Engineer.

2.4 PORTABLE LIFTING FRAME. The portable lifting frame shall be of the gantry, A-frame type. The height shall be fully adjustable in 6 inch (150 mm) intervals and shall be locked on each leg by a spring-loaded bolt equipped with a safety notch. Locks shall be designed to allow locking each leg in an unbolted position to facilitate height adjustment. The spread width shall be adjustable with a minimum of six different positions at 6 inch (150 mm) intervals. A cable shall be provided between each set of adjustable legs to prevent overextension. The distance between the A-frames shall be adjustable up to the maximum distance specified.

2.4.01 Monorail. The monorail shall be designed to align with off-center loads to prevent lifting frame and trolley distortion. The monorail shall be suspended from the lifting frame by a minimum of four points at each end of the monorail. A lifting U-bolt shall be provided on top of the monorail at mid-span to facilitate height adjustment.

2.4.02 Casters. Four casters shall be provided, each capable of rotating 360 degrees with a four-position swivel lock. Each caster shall be held to the lifting frame by a bolt secured with a safety chain. The lock on each caster shall prevent rolling and swiveling of the caster when engaged. Each caster shall have a diameter of 6 inches (150 mm).

2.5 HOIST.

2.5.01 Hoisting Assembly. The hoisting assembly shall consist of the necessary gearing, guides, and sheaves, all built integrally with the trolley; a load chain equipped with a load hook; and hand chains. Antifriction bearings shall be used throughout, and the assembly shall have suitable fittings for proper lubrication.

2.5.02 Hooks. The load hook shall be slow opening, nonfracturing, forged steel, and shall be provided with a safety latch. The hooks shall be mounted on antifriction bearings to permit easy turning.

2.5.03 Load Brake. The hoist shall be equipped with a self-activating, mechanical load brake which will prevent acceleration of the load when lowering, and which will sustain the maximum load at any point. Load brakes shall operate in sealed enclosures.

2.5.04 Hoist Chains. Operating chains shall be welded link type, heavily zinc plated. Load chains shall be heat-treated alloy steel. Hand chains shall be steel and shall extend to approximately 3 feet (900 mm) above the floor. Chain containers shall be provided to receive idle load chain.

2.6 TROLLEY. The trolley shall be handgeared type. The trolley shall have a rated capacity equal to or greater than the corresponding hoist capacity.

The trolley frame shall be rigid, shall contain the hoist, and shall be underhung type designed for operation on the specified runway beam. The trolley frame shall be provided with lugs or wrap around side plates on both sides of the track.

Trolley wheels shall be of the single flange type of rolled, forged or cast steel with machined universal crowned or tapered treads. Drive wheels shall have integrally cut spur gear teeth or machine cut gears pressed on hubs.

Wheel axles shall be of the fixed type, made from high carbon steel machined and ground to size to receive the wheel bearings. Wheel bearings shall be permanently shielded, lifetime-lubricated, antifriction type, suitable for radial and end thrusting loading.

The drive wheels of manually operated, hand geared trolleys shall be provided with a swinging chain guide which will permit rapid chain handling without fouling or gagging and also permit reasonable side pull on the chain. Operating chains shall be all steel welded link type, heavily zinc plated. Operating chains shall extend to approximately 3 feet (900 mm) above the floor.

2.7 ACCESSORIES.

2.7.01 Cart. The portable gantry crane shall be provided with a 1 ton (910 kg) capacity cart consisting of two steel bridges. The bridges shall be designed to fit into the lifting frame caster sections to provide a portable cart capable of transporting all of the crane components and equipment. The cart with the disassembled crane components shall be able to pass through a 3 feet (900 mm) wide by 6 feet (1800 mm) high opening.

2.7.02 Jacks. Four steel jacks designed to fit the portable gantry crane shall be furnished. The jacks shall be used to adjust the portable gantry crane height and caster spread.

2.8 SHOP COATINGS. All iron and steel surfaces of the equipment shall be protected with suitable coatings applied in the shop. Coatings shall be suitable for the environment where the equipment will be used. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting.

All coated surfaces shall receive at least three coats of epoxy enamel, at a minimum dry film thickness (DFT) of 5 mils (125 μm) each. The total DFT of the epoxy enamel shall be at least 15 mils (375 μm). An aliphatic polyurethane topcoat shall be applied after complete drying and curing of the epoxy enamel. The aliphatic polyurethane shall be applied in a single coat and shall have a minimum DFT of 2 mils (50 μm).

All coatings shall be continuous and free from gaps, pinholes, thin spots, and other defects. Special attention shall be given to corners, edges, bolts, and weld cleaning to assure adequate coatings in all areas.

Color shall be manufacturer's standard which is acceptable to Owner.

Acceptable coating products shall be as follows:

Epoxy Enamel	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", or Tnemec "Series 69 Hi-Build Epoxoline II".
Aliphatic Polyurethane	Ameron "Amercoat 450HS", Carboline "Carbothane 134HG", or Tnemec "Series 74 Endura-Shield".

2.9 SAFETY GUARDS. All belt or chain drives, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.10 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 ASSEMBLY. The portable gantry crane, complete with accessories, shall be fully assembled, lubricated as needed and placed in proper operating condition to the satisfaction of Engineer.

End of Section

INDEX

DIVISION 15 - MECHANICAL PAGE NO.

VOLUME IV

VOLUME V

SECTION 15005

MECHANICAL DEMOLITION

PART 1 – GENERAL

1.1 SCOPE. Perform all HVAC, demolition required for removal of systems and equipment made obsolete by project as indicated on the drawings and as specified herein.

Work Included:

Non-destructive and selective removal of systems, materials, and equipment for reuse or salvage as directed by the Owner and as requested by the Engineer.

Removal and legal disposal of all debris.

Removal of all obsolete materials and equipment for a clean and finished installation, unless noted otherwise on the drawings.

Removal of existing heating and ventilating (H&V) equipment and piping as shown on contract documents and as required in field if not shown on contract documents.

The existing heating and ventilating (H&V) demolition work shall include demolition of controls, exhaust fans, louvers, ductwork, existing steam/condensate piping as shown on plans and as specified here. This, therefore, will require selective removal/demolition and capping at the mains.

The Contractor shall cap existing piping that is not being reused as shown on plans or as required.

The HVAC Contractor to remove existing thermostats and conduits as required and patch openings. Match finish with existing finish.

The HVAC Contractor shall perform demolition of respective systems and all cutting/patching of holes and restoration of all surfaces (floors, walls, ceilings, roof, etc.) to match with existing adjacent surfaces as clearly as possible as to texture and finish.

The cutting/patching shall be done by craftsman skilled in particular trade affected by demolition.

Insulation or materials shall be identified before attempting any demolition. Contractor shall comply with the requirements of EPA regulations, National Emissions Standards, and the OSHA regulations, as well as applicable State laws and City Codes and Ordinances.

1.2 GENERAL. Drawings and general provisions of the Contract, including General and Special Conditions and Division 1 Specification Sections, apply to this Section.

1.3 JOB CONDITIONS.

1.3.01 Coordination. Adjacent buildings will be required to remain in operation and utility services will be required to be maintained for operations in those buildings.

1.3.02 Phasing. Prior to commencing demolition in any area of the work, notify the Owner/Architect seven days in advance to ensure that no adjacent occupied buildings will be disrupted. All shutdowns, if required, shall be scheduled with the utility companies. Where shutdowns are not permitted during weekdays/working hours, the Contractor shall do such work on the weekends or after working hours. All such costs for premium time shall be included in the bid. Refer to phasing plans in the bidding documents before starting work.

Demolition phasing must be approved by the Owner prior to commencement of the operations.

Removal of debris and construction traffic will be limited to specified areas.

Demolition and installation phasing shall be worked out by the Contractor to maintain existing services to other buildings on site.

1.3.03 Codes. In addition to complying with all pertinent codes and regulations, comply with the requirements of those insurance carriers providing coverage for this work.

1.3.04 Burning. On site burning shall not be permitted.

During the execution of the work, primary consideration shall be given to the protection from damage to the structure, furnishings, finishes, and the like that are not specifically indicated to be removed and disposed.

Provide and maintain temporary partitions or dust barriers adequate to keep dirt, dust, noise, and other particles from being transferred to adjacent areas.

Existing items or surfaces to remain that are damaged as a result of this work shall be refinished, repaired, or replaced to the satisfaction of the Owner at no additional cost.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Patching. All materials used for patching shall be in conformance with the applicable sections of the specifications. Where materials are not specifically described, but require for proper completion of the work, they shall be as selected by the Contractor subject to approval by the Owner.

PART 3 - EXECUTION

3.1 DEMOLITION.

3.1.01 Site Inspection. The drawings do not show all materials or equipment existing on the project that will require demolition.

Before commencing the work of this section, the Contractor shall check with the Owner about materials, and equipment to be removed and those to be preserved. All those items requiring demolition shall be hauled away from site.

3.1.02 Scheduling. Schedule all work with all necessary considerations for public and adjacent areas.

Avoid interference with the use of and passage to and from adjacent areas.

Schedule all work so as not to interfere with nor disrupt Owners continuous operation of other areas of the facility.

All piping/ductwork that are partly removed and are required for making connections to new piping and ductwork shall be temporarily capped until new connections are made.

3.1.03 Abandoned Materials and Equipment. Items so indicated on drawings to be removed and not indicated or specified to be saved or retained shall be demolished, removed, demounted, or disconnected in the best possible manner to ensure that no damage will result to other adjacent items or surface to remain.

3.1.04 Salvage. During removal of items so indicated, caution shall be used to eliminate damage to any equipment having salvage value.

All material being removed shall become the property of the Contractor for disposal unless otherwise noted or directed. Deliver any such item retained by the Owner to any location on the project site as indicated by the project manager.

3.1.05 Disposal and Clean Up. Areas in which demolition and salvage work is being done shall be cleaned daily.

All dirt, dust, debris, unsalvageable and unreusable items and the like shall be totally removed from the project site on a daily basis. Under no circumstances shall such refuse be allowed to collect for longer periods.

Refuse shall not be allowed to block, or otherwise impair circulation in sidewalks or other traffic areas.

End of Section

SECTION 15006

MECHANICAL IDENTIFICATION

PART 1 - GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of mechanical identification materials for the mechanical equipment, piping and ducts as indicated in the contract documents:

Equipment nameplates.

Equipment markers.

Equipment signs.

Access panel and door markers.

Pipe markers.

Duct markers.

Valve tags.

1.2 SUBMITTALS. Submit a shop drawing of each type of product indicated above for engineer's approval.

Submit a typewritten valve schedule for each piping system, reproduced on 8 1/2 inch by 11 inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on tag), location of valve (room or space), and variations for identification (if any). Mark valves which are intended for emergency shut-off and similar special uses, by special "flags", in the schedule margin.

Submit samples of each color, lettering style, and other graphic representation required for each identification material or system. Provide a mock-up type sample installation.

1.3 QUALITY ASSURANCE.

1.3.01 ASME Compliance. Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

PART 2 - PRODUCTS

2.1 EQUIPMENT IDENTIFICATION DEVICES.

2.1.01 Equipment Nameplates. Metal, with data engraved or stamped, for permanent attachment on equipment.

Data:

Manufacturer, product name, model number, and serial number.

Capacity, operating and power characteristics, and essential data.

Labels of tested compliances.

Location:

Accessible and visible.

Fasteners:

As required to mount on equipment.

2.1.02 Equipment Markers. Engraved, color-coded laminated plastic. Include contact-type, permanent adhesive.

Terminology:

Match schedules as closely as possible.

Data:

Name and plan number.

Equipment service.

Design capacity.

Other design parameters such as pressure drop, entering and leaving conditions, and speed.

Size:

2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.

2.1.03 Equipment Signs. ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.

Data:

Instructions for operation of equipment and for safety procedures.

Engraving:

Manufacturer's standard letter style, of sizes and with terms to match equipment identification.

Thickness:

1/8 inch, unless otherwise indicated.

Fasteners:

Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.1.04 Access Panel and Door Markers. 1/16-inch- thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.

Fasteners:

Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.2 PIPING IDENTIFICATION DEVICES.

2.2.01 Manufactured Pipe Markers, General. Preprinted, color-coded, with lettering indicating service, and showing direction of flow.

Colors:

Comply with ASME A13.1, unless otherwise indicated.

Lettering:

Use piping system terms indicated and abbreviate only as necessary for each application length.

Pipes with OD, Including Insulation, Less Than 6 Inches:

Full-band pipe markers extending 360 degrees around pipe at each location.

Pipes with OD, Including Insulation, 6 Inches and Larger:

Either full-band or strip-type pipe markers at least three times letter height and of length required for label.

Arrows:

Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

2.2.02 Pre-tensioned Pipe Markers. Pre-coiled semi-rigid plastic formed to cover full circumference of pipe and to attach to pipe without adhesive.

2.2.03 Shaped Pipe Markers. Preformed semi-rigid plastic formed to partially cover circumference of pipe and to attach to pipe with mechanical fasteners that do not penetrate insulation vapor barrier.

2.2.04 Self-Adhesive Pipe Markers. Plastic with pressure-sensitive, permanent-type, self-adhesive back.

2.2.05 Plastic Tape. Continuously printed, vinyl tape at least 3 mils thick with pressure-sensitive, permanent-type, self-adhesive back.

Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.

Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

2.3 DUCT IDENTIFICATION DEVICES.

2.3.01 Duct Markers. Engraved, color-coded laminated plastic. Include direction and quantity of airflow and duct service (such as supply, return, and exhaust). Include contact-type, permanent adhesive.

2.4 VALVE TAGS.

2.4.01 Valve Tags. Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers, with numbering scheme. Provide 5/32-inch hole for fastener.

Material: 0.032-inch- thick brass.

Valve-Tag Fasteners: Brass wire-link or beaded chain; or S-hook.

2.5 ACCEPTABLE MANUFACTURERS. Identification materials shall be manufactured by All Systems, Inc., Brady (W.H.) Co., Marking Services, Inc., Seton Name Plate Corp., or equal.

PART 3 – EXECUTION

3.1 APPLICATIONS, GENERAL. Products specified are for applications referenced in other Division 15 Sections. If more than single-type material, device, or label is specified for listed applications, selection is installer's option.

3.2 EQUIPMENT IDENTIFICATION.

3.2.01 Equipment Nameplates. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:

Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.

Pumps, compressors, chillers, condensers, and similar motor-driven units.

Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

Fans, blowers, primary balancing dampers, and mixing boxes.

Heating and ventilation central-station and zone-type units.

3.2.02 Equipment Markers. Install equipment markers with permanent adhesive on or near each major item of mechanical equipment. Data required for markers may be included on signs, and markers may be omitted if both are indicated.

Letter Size:

Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

Data:

Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.

Location:

Locate markers where accessible and visible. Include markers for the following general categories of equipment:

Main control and operating valves, including safety devices and hazardous units such as gas outlets.

Meters, gages, thermometers, and similar units.

Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.

Pumps, compressors, chillers, condensers, and similar motor-driven units.

Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

Fans, blowers, primary balancing dampers, and mixing boxes.

Heating and ventilation central-station and zone-type units.

Tanks and pressure vessels.

Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

3.2.03 Equipment Signs. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.

Color:

Identify mechanical equipment with equipment markers in the following color codes:

Green: For cooling equipment and components.

Yellow: For heating equipment and components.

Green and Yellow: For combination cooling and heating equipment and components.

Brown: For energy-reclamation equipment and components.

Letter Size:

Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

Data:

Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.

Include signs for the following general categories of equipment:

Main control and operating valves, including safety devices and hazardous units such as gas outlets.

Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.

Pumps, compressors, chillers, condensers, and similar motor-driven units.

Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

Fans, blowers, primary balancing dampers, and mixing boxes.

Heating and ventilation central-station and zone-type units.

Tanks and pressure vessels.

Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

3.2.04 Access Panel Markers. Install access panel markers with screws on equipment access panels.

3.3 PIPING IDENTIFICATION.

3.3.01 Manufactured Pipe Markers. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

Pipes with OD, Including Insulation, Less Than 6 Inches: Pre-tensioned pipe markers. Use size to ensure a tight fit.

Pipes with OD, Including Insulation, Less Than 6 Inches: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 3/4 inch wide, lapped at least 1-1/2 inches at both ends of pipe marker, and covering full circumference of pipe.

Pipes with OD, Including Insulation, 6 Inches and Larger: Shaped pipe markers. Use size to match pipe and secure with fasteners.

Pipes with OD, Including Insulation, 6 Inches and Larger: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 1-1/2 inches wide, lapped at least 3 inches at both ends of pipe marker, and covering full circumference of pipe.

Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior non-concealed locations as follows:

Near each valve and control device.

Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.

Near penetrations through walls, floors, ceilings, and non-accessible enclosures.

At access doors, manholes, and similar access points that permit view of concealed piping.

Near major equipment items and other points of origination and termination.

Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.

On piping above removable acoustical ceilings. Omit intermediately spaced markers.

3.4 DUCT IDENTIFICATION.

3.4.01 Duct Markers. Install duct markers with permanent adhesive on air ducts in the following color codes:

Color:

Green: For cold-air supply ducts.

Yellow: For hot-air supply ducts.

Blue: For exhaust-, outside-, relief-, return-, and mixed-air ducts.

Letter Size:

Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.5 VALVE-TAG INSTALLATION. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; plumbing fixture supply stops; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

3.5.01 Valve-Tag Application Schedule. Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following:

Valve-Tag Size and Shape:

Cold Water: 1-1/2 inches, round.

Hot Water: 1-1/2 inches, round.

Steam & Condensate: 1-1/2 inches, round.

Valve-Tag Color:

Cold Water: Blue

Hot Water: Red

Letter Color:

Cold Water: Black.

Hot Water: Black.

3.6 ADJUSTING AND CLEANING. Relocate mechanical identification materials and devices that have become visually blocked by other work.

Clean faces of mechanical identification devices and glass frames of valve schedules.

End of Section

SECTION 15010

VALVE INSTALLATION

PART 1 - GENERAL

1.1 SCOPE. This section covers the installation of new valves and actuators purchased by Contractor as part of this Work, or purchased by others under the procurement specifications. The equipment to be furnished by others for installation by Contractor is identified in the applicable valve schedules.

Cleaning, disinfection, pressure and leakage testing, insulation, and pipe supports are covered in other sections.

1.2 GENERAL. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Any valves and actuators that are identified as being provided by others will be furnished complete for installation by Contractor. Technical specifications under which the equipment will be purchased are available.

Contractor shall determine the number of handwheel turns to close each manual valve and shall provide a type 316 stainless steel nameplate, attached to the operator, to indicate the required turns. Contractor shall also submit to Engineer, a table, indicating the number of turns required for each manual valve provided.

1.2.01 Coordination. When manufacturer's field services or installation check services are provided by the equipment manufacturer, Contractor shall coordinate the services with the equipment manufacturer. Contractor shall give Engineer written notice at least 30 days prior to the need for manufacturer's field services.

Submittals for equipment that will be furnished by others under each procurement contract will be furnished to Contractor upon completion of review by Engineer. Contractor shall review equipment submittals and coordinate with the requirements of the Work and the Contract Documents. Contractor accepts sole responsibility for determining and verifying all quantities, dimensions, and field construction criteria.

Flanged connections to valves including the bolts, nuts, and gaskets are covered in the appropriate pipe specification section.

1.3 DELIVERY, STORAGE, AND HANDLING.

1.3.01 Storage. Upon delivery, all equipment and materials shall immediately be stored and protected by Contractor in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, and the manufacturer's instructions until installed in the Work. Stored equipment shall be protected by Contractor against damage and exposure from the elements. At no time shall the equipment be stored on earth or grass surfaces or come into contact with earth or grass. Contractor shall keep the equipment dry at all times.

PART 2 - PRODUCTS

Not Applicable.

PART 3 - EXECUTION

3.1 INSPECTION. All valves and accessories shall be inspected for damage and cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by Contractor. Such material shall be segregated from the clean material and shall be inspected and approved by Owner or his representative before its use.

3.2 INSTALLATION.

3.2.01 General. Valves shall be installed with sufficient clearance for proper operation of any external mechanisms, and with sufficient clearance to dismantle the valve for in-place maintenance. Installation shall be in accordance with the valve manufacturer's recommendations.

Unless otherwise indicated on the drawings, all valves installed in horizontal runs of pipe having centerline elevations 4 feet 6 inches (1.3 m) or less above the finish floor shall be installed with their operating stems vertical. Valves installed in horizontal runs of piping having centerline elevations between 4 feet 6 inches (1.3 m) and 6 feet 9 inches (2 m) above the finish floor shall be installed with their operating stems horizontal. If adjacent piping prohibits this, the stems and operating handwheel shall be installed above the valve horizontal centerline as close to horizontal as possible. Valves installed in vertical runs of pipe shall have their operating stems oriented to facilitate the most practicable operation, as reviewed by Engineer.

3.2.02 Installation Checks. When specified in Master Specification Section 15010, Valve Installation, installation checks will be provided by a manufacturer's representative in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Such services shall be furnished at no charge to Contractor for the extent indicated in the valve procurement sections. Any additional services in connection with the installation the equipment which are required by reason of Contractor's progress shall be paid for by Contractor.

Contractor shall perform no Work related to the installation or operation of materials or equipment furnished by others without direct observation and guidance of the field representative, unless Engineer and manufacturer furnishing such materials concur otherwise.

3.2.03 Butterfly Valves. Butterfly valves shall be installed with the shaft horizontal unless otherwise necessary for proper operation or as acceptable to Engineer.

Whenever an actuator must be removed to permit installation of a valve, the actuator shall be promptly reinstalled and shall be inspected and readjusted by a representative of the valve manufacturer.

3.2.04 Check Valves.

3.2.04.01 Lift Check Valves. Horizontal lift checks shall be installed in a level horizontal position so that the internal parts rise and fall vertically, unless the valve is spring loaded. Angle pattern lift checks shall be installed in vertical pipe with flow upward from beneath the disc.

3.2.04.02 Swing Check Valves. Install valves oriented for the correct flow direction. Only valves designed for vertical installation shall be installed in vertical piping.

3.2.05 Eccentric Plug Valves. Eccentric plug valves shall be installed with the shaft horizontal and the plug in the upper half of the valve body. Valves in wastewater, sludge, or scum lines shall be installed with the seat on the upstream end.

3.2.06 Resilient Seated Gate Valves. Valves shall be handled and installed in accordance with the recommendations set forth in the Appendix to ANSI/AWWA C509 and with the recommendations of the manufacturer.

3.2.07 Double Disc Gate Valves. Valves shall be handled and installed in accordance with the recommendations set forth in the Appendix to AWWA C500 and with the recommendations of the manufacturer.

3.2.08 Air Release and Combination Air Valves. The exhaust from each valve shall be piped to a suitable point acceptable to Engineer. Air release valve exhaust piping leading to a trapped floor drain shall terminate at least 6 inches (150 mm) above the floor.

3.2.09 Valve Boxes. Valve boxes shall be set plumb. Each valve box shall be placed directly over the valve it serves, with the top of the box brought flush with the finished grade. After each valve box is placed in proper position, earth fill shall be placed and thoroughly tamped around the box.

3.2.10 Yard Hydrants. A concrete slab 18 inches (450 mm) square and 4 inches (100 mm) thick shall be provided around the top of each 3/4 inch (19 mm) and 1-1/2 inch (38 mm) yard hydrant. Hydrants shall be installed plumb. Hydrant drainage shall be provided by installing below each hydrant at least 1 cubic foot (0.03 m^3) of gravel or crushed stone.

Each 4 inch (100 mm) yard hydrant shall be set on a concrete foundation at least 18 inches (450 mm) square and 6 inches (150 mm) thick. Each hydrant shall be anchored in place or adequately blocked to prevent the hydrant from blowing off the supply connection. Hydrant drainage shall be provided by installing at least 7 cu. ft (0.20 m^3) of gravel or crushed stone around the hydrant and below the top of the hydrant supply pipe.

An operating wrench shall be provided for each yard hydrant.

3.3 VALVE ACTUATORS. Valve actuators and accessories will be furnished by others and shall be installed in accordance with the equipment manufacturer's recommendations.

3.4 FIELD QUALITY CONTROL.

3.4.01 Field Testing. After installation, all valves 12” and above shall be tested in conjunction with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.4.01.01 Pressure Tests. Pressure testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.4.01.02 Leakage Tests. All valves shall be free from leaks. Each leak that is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor. Leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.5 ADJUSTING. After installation, the opening and closing time shall be adjusted as needed for each pneumatic, hydraulic and electric actuated valve.

End of Section

SECTION 15020

MISCELLANEOUS PIPING AND ACCESSORIES INSTALLATION

PART 1 - GENERAL

1.1 SCOPE. This section covers the installation of miscellaneous piping, cast iron soil pipe, copper tubing, and accessories as indicated on the drawings. Contractor shall furnish all necessary jointing materials, coatings, and accessories that are specified herein.

Pipe supports and anchors shall be furnished by Contractor, and are covered in Master Specification Section 15140, Pipe Supports. Pipe trenching and backfilling are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

1.2 GENERAL.

1.2.01 Coordination. Materials installed under this section shall be installed in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the manufacturer, unless exceptions are noted by Engineer.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Chlorine tank car unloading connection.

Cleaning procedure for metal chlorine piping.

Watertight/dusttight pipe sleeves.

1.3.02 Welder Certification. Prior to the start of the work, Contractor shall submit a list of the welders he proposes using and the type of welding for which each has been qualified. Copy of certification and identification stamp shall be submitted for each welder. Qualification tests may be waived if evidence of prior qualification is deemed suitable by Engineer.

1.3.03 Spool Drawings. Spool drawings indicating the complete line, showing all welded and assembly items, except for insulation shoes or nonstress-relieved lines shall be developed and submitted.

1.4 QUALITY ASSURANCE.

1.4.01 Welding and Brazing Qualifications. All welding and brazing procedures and operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of Section IX of the ASME Code. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.4.02 Tolerances. These tolerances apply to in-line items and connections for other lines.

The general dimension, such as face-to-face, face on end-to-end, face- or end-to center and center-to-center shall be 1/8 inch [3 mm].

The inclination of flange face from true in any direction shall be 3/64 inch per foot [4 mm per meter].

Rotation of flange bolt holes shall not exceed 1/16 inch [1.5 mm].

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

Plastic pipe, tubing, and fittings shall be stored between 40°F and 90°F (4°C and 32°C).

1.5.01 Coated Pipe. Handling methods and equipment used shall prevent damage to the protective coating and shall include the use of end hooks, padded calipers, and nylon or similar fabric slings with spreader bars. Bare cables, chains, or metal bars shall not be used. Coated pipe shall be stored off the ground on wide, padded skids. Plastic-coated pipe shall be covered or otherwise protected from exposure to sunlight.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Pipe, tubing, and fittings covered herein shall be installed in the services indicatedin the Contract Documents.

2.2 MATERIALS.

Solder	Solid wire, ASTM B32, Alloy Grade Sb5, (95-5).
Soldering Flux	Paste type, Fed Spec O-F-506, Type I, Form A.
Brazing Filler Metal	AWS A5.8, BCuP-5; Engelhard "Silvaloy 15", Goldsmith "GB-15", or Handy & Harman "Sil-Fos".
Brazing Flux	Paste type, Fed Spec O-F-499, Type B.
Insulating Fittings	
Threaded	Dielectric steel pipe nipple, ASTM A53, Schedule 40, polypropylene lined, zinc plated; Perfection Corp. "Clearflow Fittings".
Flanged	Epco "Dielectric Flange Unions" or Central Plastics "Insulating Flange Unions".
Pipe Insulation	See Section 15250.
Watertight/Dusttight Pipe Sleeves	O-Z Electrical Manufacturing "Thruwall" and "Floor Seals", or Thunderline "Link-Seals"; with modular rubber sealing elements, nonmetallic pressure plates, and galvanized bolts.
Pipe Sleeve Sealant	Polysulfide or urethane, as specified in the caulking section.
Anti-Seize Thread Lubricant	Jet-Lube "Nikal", John Crane "Thred Gard Nickel", Never-Seez "Pure Nickel Special", or Permatex "Nickel Anti-Seize".
Teflon Thread Sealer	Paste type; Hercules "Real-tuff", John Crane "JC-30", or Permatex "Thread Sealant with Teflon".

Teflon Thread Tape	Hercules "Tape Dope" or John Crane "Thred-Tape".
Solvent Cement	
PVC Systems	ASTM D2564.
CPVC Systems	ASTM F493.
Sodium Hypochlorite, Sodium Hydroxide, and Sodium Bisulfite Service	IPS Corporation "Weld-On 724"
Primer	ASTM F656.
Protective Coatings	
Tape Wrap	ANSI/AWWA C209, except single ply tape thickness shall not be less than 30 mils [760 µm]; Protecto Wrap "200" or Tapecoat "CT".
Primer	As recommended by the tape manufacturer.
Medium Consistency Coal Tar	Carboline "Bitumastic Super Service Black" or Tnemec "46-465 H.B. Tnemecol".
Chlorine Tank Car Unloading Connection	Special flanged hose assembly conforming to materials and details on Drawing No. 135, The Chlorine Institute, Inc.

PART 3 - EXECUTION

3.1 INSPECTION. All piping components shall be inspected for damage and cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and recleaned to the original requirements by Contractor. Such material shall be segregated from the clean material and shall be inspected and approved by Owner or his representative before its use.

3.2 PREPARATION.

3.2.01 Field Measurement. Pipe shall be cut to measurements taken at the site, not from the drawings. All necessary provisions shall be made in laying out piping to allow for expansion and contraction. Piping shall not obstruct openings or passageways. Pipes shall be held free of contact with building construction to avoid transmission of noise resulting from expansion.

3.3 INSTALLATION.

3.3.01 General. All instruments and specialty items shall be installed in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and with sufficient clearance and access for ease of operation and maintenance.

Flat faced wrenches and vises shall be used for copper tubing systems. Pipe wrenches and vises with toothed jaws will damage copper materials and shall not be used. Bends in soft temper tubing shall be shaped with bending tools.

3.3.02 Pipe Sleeves. Piping passing through concrete or masonry shall be installed through sleeves that have been installed before the concrete is placed or when masonry is laid. Pipe sleeves installed through floors with a special finish, such as ceramic or vinyl composition tile, shall be flush with the finished floor surface and shall be provided with nickel or chromium plated floor plates. Unless otherwise indicated on the drawings, in all other locations where pipes pass through floors, pipe sleeves shall project not less than 1 inch (25 mm) nor more than 2 inches [50 mm] above the floor surface, with the projections uniform within each area. In the case of insulated pipes, the insulation shall extend through pipe sleeves. Where the drawings indicate future installation of pipe, sleeves fitted with suitable plastic caps or plugs shall be provided.

Holes drilled with a suitable rotary drill will be considered instead of sleeves for piping which passes through interior walls and through floors with a special finish.

Unless otherwise indicated on the drawings, all pipes passing through walls or slabs which have one side in contact with earth or exposed to the weather shall be sealed watertight with special rubber-gasketed sleeve and joint assemblies, or with sleeves and modular rubber sealing elements.

Piping passing through locations shall be made dusttight and gastight with special rubber-gasketed sleeve and joint assemblies; with sleeves sealed with modular rubber sealing elements; or by caulking with oakum and polysulfide or urethane sealant.

3.3.03 Pipe Joints. Pipe joints shall be carefully and neatly made in accordance with the indicated requirements.

3.3.03.01 Threaded. Pipe threads shall conform to ANSI/ASME B1.20.1, NPT, and shall be fully and cleanly cut with sharp dies. Not more than three threads at each pipe connection shall remain exposed after installation. Ends of pipe shall be reamed after threading and before assembly to remove all burrs.

Threaded joints in plastic piping shall be made up with teflon thread tape applied to all male threads. Threaded joints in stainless steel piping shall be made up with teflon thread sealer and teflon thread tape applied to all male threads.

Threaded joints in steel piping for chlorine service shall be made up with teflon thread tape or litharge and glycerine paste applied to all male threads.

Threaded joints for diesel fuel oil and fuel oil piping shall be seal welded.

At the option of Contractor, threaded joints in other piping may be made up with teflon thread tape, thread sealer, or a suitable joint compound.

Seal welds shall cover all exposed threads. Thread tape and joint compound or sealers shall not be used in threaded joints which are to be seal welded. Seal welding of threaded joints that have failed a pressure test shall not be made until all thread compound and teflon tape have been removed.

3.3.03.02 Compression. Ends of tubing shall be cut square and all burrs shall be removed. The tubing end shall be fully inserted into the compression fitting and the nut shall be tightened not less than 1-1/4 turns and not more than 1-1/2 turns past fingertight, or as recommended by the fitting manufacturer, to produce a leaktight, torque-free connection.

3.3.03.03 Flared. Ends of annealed copper tubing shall be cut square, and all burrs shall be removed prior to flaring. Ends shall be uniformly flared without scratches or grooves. Fittings shall be tightened as needed to produce leaktight connections.

3.3.03.04 Soldered and Brazed. Where solder fittings are specified for lines smaller than 2 inches [50 mm], joints may be soldered or brazed at the option of Contractor. Joints in 2 inch [50 mm] and larger copper tubing shall be brazed. Joints in copper chlorine tubing and refrigerant piping shall be brazed; solder will not be acceptable. Brazing alloy shall contain no tin.

Surfaces to be joined shall be thoroughly cleaned with flint paper and coated with a thin film of flux. At each joint, tubing shall enter to the full depth of the fitting socket.

Care shall be taken to avoid overheating the metal or flux. Each joint shall be uniformly heated to the extent that filler metal will melt on contact. While the joint is still hot, surplus filler metal and flux shall be removed with a rag or brush.

3.3.03.05 Solvent Welded. Solvent welded connections shall only be used for PVC or CPVC pipe. All joint preparation, cutting, and jointing procedures shall comply with the pipe manufacturer's recommendations and ASTM D2855. Pipe ends shall be beveled or chamfered to the dimensions recommended by the manufacturer. Newly assembled joints shall be suitably blocked or restrained to prevent movement during the setting time recommended by the manufacturer. Pressure testing of solvent welded piping systems shall not be performed until the applicable curing time, as set forth in Table X2.1 of ASTM D2855, has elapsed.

3.3.03.06 Epoxy and Adhesive Bonded. Epoxy and adhesive bonded joints shall only be used for FRP pipe. All joint preparation, cutting, and jointing procedures shall comply with the pipe manufacturer's recommendations. Adhesive shall be mixed and applied in accordance with the manufacturer's recommendations. After joining, either the pipe or the fitting shall be rotated approximately one-half turn to uniformly distribute adhesive. A slight fillet of adhesive at the bond line is desirable, but all excess adhesive shall be wiped off immediately. Newly assembled joints shall be suitably blocked or restrained to prevent movement during the curing period recommended by the manufacturer.

3.3.03.07 Heat Fusion Bonded Joints. All joint preparation, cutting, jointing equipment, and jointing procedures shall comply with the pipe manufacturer's recommendations. The heating time, temperature, pressure applied to the joint during bonding, and cooling time shall consistently produce leaktight joints as strong as the pipe being joined.

3.3.03.08 Flanged. Flange bolts shall be tightened sufficiently to slightly compress the gasket and effect a seal, but shall not be torqued less than the minimum value required by the gasket manufacturer. Flange bolts shall not be so tight as to fracture or distort the flanges. A plain washer shall be installed under the head and nut of bolts connecting plastic pipe flanges. Anti-seize thread lubricant shall be applied to the threaded portion of all stainless steel bolts during assembly.

Flange bolt holes shall be oriented as follows, unless otherwise indicated on the spool drawings:

Vertical flange face:	Bolt holes to straddle the vertical centerlines.
Horizontal flange face:	Bolt holes to straddle plant north-south centerlines.

Pipe sealants, thread compounds, or other coatings shall not be applied to flange gaskets unless recommended by the gasket manufacturer for the specified service and approved by Engineer.

Welds at orifice flanges shall have internal surfaces ground smooth to the pipe wall.

Slip-on flanges shall be welded inside and outside. There shall be a distance of approximately 1/16 to 1/8 inch [1.5 to 3 mm] between the edge of the fillet weld and the face of the flange. The seal weld shall be applied so that the flange face shall be free of weld spatter and does not require refacing.

Flat-faced flanges shall be used when mating to Class 125 flanges. Full-face gaskets shall be used with flat-faced flanges and ring gaskets shall be used with raised faced flanges.

Weld neck flanges shall be used with butt-weld fittings. The bore of weld neck flanges shall match the pipe wall thickness.

Insulating joints connecting submerged (buried) piping to exposed piping shall be installed above the maximum water surface elevation and before the first pipe support not having coated anchor bolts or adhesive-bonded concrete anchors. All submerged (buried) metallic piping shall be isolated from the concrete reinforcement. Insulating flanges shall be tested for electrical isolation after installation and bolt-up but prior to introduction of conducting fluid.

3.3.03.09 <u>Welded</u>. Welding shall conform to the specifications and recommendations contained in the ANSI B31.1 Code for Pressure Piping.

Weld cross-sections shall be equal to or greater than the pipe wall thickness. Welds shall be smooth and continuous and shall have interior projections no greater than 1/16-inch [1.5 mm]. Backing strips or rings shall not be used except with specific prior review by Engineer as to use, material, and design. Root gap inserts that are completely melted and consumed in the weld bead are acceptable only when reviewed in advance by Engineer.

Stainless steel welding shall be inert gas tungsten arc (TIG) or the direct current, straight polarity, inert gas metal arc process (MIG).

Carbon steel welding shall be made by the shielded metal arc process.

3.3.03.10 <u>Grooved Couplings</u>. Grooves for grooved couplings shall be cut with a specially designed grooving tool. Grooves cut in steel pipe shall conform to flexible grooving dimensions, as set forth in AWWA C606, and shall be clean and sharp without burrs or check marks.

3.3.03.11 <u>Push-on</u>. Gasket installation and other jointing procedures shall be in accordance with the recommendations of the manufacturer. Each spigot end shall be suitably beveled to facilitate assembly. All joint surfaces shall be lubricated with a heavy vegetable soap solution immediately before the joint is completed. Lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean.

3.3.03.12 Rubber-Gasketed. Rubber-gasketed joints for hub and spigot type cast iron soil pipe shall have plain spigot ends, without beads. Cut ends of all pipe shall be cut square, beveled, and all burrs shall be removed. Spigot ends shall be coated with a lubricant recommended by the gasket manufacturer and fully seated in the gasket. Clamps for hubless cast iron soil pipe shall be installed in accordance with the manufacturer's recommendations.

3.3.03.13 Other Pipe Joints. Coupled joints in tempered glass pipe, plastic joints in vitrified clay pipe, and other proprietary type joints shall be made in accordance with the manufacturer's recommendations and to the satisfaction of Engineer.

3.3.04 Pipe. Pipe shall be installed as specified, as indicated on the drawings, or, in the absence of detail piping arrangement, in a manner acceptable to Engineer.

Piping shall be installed without springing or forcing the pipe in a manner which would induce stresses in the pipe, valves, or connecting equipment.

Piping shall be supported in conformance with Master Specification Section 15140, Pipe Supports.

Piping shall be connected to equipment by flanges or unions as specified in the pipe procurement sections. Piping connecting to equipment shall be supported by a pipe support and not by the equipment.

Water, gas, and air supply piping shall be provided with a shutoff valve and union at each fixture or unit of equipment, whether or not indicated on the drawings, to permit isolation and disconnection of each item without disturbing the remainder of the system. Air supply piping shall be provided with sectionalizing valves and valved air inlet connections as needed for isolation of portions of the system for periodic testing. Gas supply lines to buildings shall be provided with a shutoff valve and union located above grade immediately outside the building. A capped drip leg shall be provided at the bottom of the vertical riser of gas supply piping adjacent to gas-fired appliances.

A union shall be provided within 2 feet [600 mm] of each threaded-end valve unless there are other connections which will permit easy removal of the valve. Unions shall also be provided in piping adjacent to devices or equipment which may require removal in the future and where required by the drawings or the specifications.

All air piping shall be graded to points of drainage collection where drip legs and drain valves shall be provided. Air piping shall be sized for the service conditions, with the indicated minimum sizes:

Service	Minimum Size
Air signal	1/4 inch OD [6 mm OD]
Power air	1/2 inch OD [13 mm OD]
Air supply	1/2 inch OD [13 mm OD]
Bubbler drop pipes	3/4 inch [19 mm]
Buried piping	3/4 inch [19 mm]

Water supply piping within structures shall be arranged, and facilities provided, for complete drainage. All piping serving metering equipment shall be uniformly graded so that air traps are eliminated and complete venting is provided.

All digester gas piping shall be graded to points of drainage collection where drip legs and drip traps shall be provided.

Stuffing box leakage from water sealed pumps shall be piped to the nearest point of drainage collection.

Taps for pressure gauge connections on the suction and discharge of pumping units shall be provided with a nipple and a ball type shutoff valve.

Drilling and tapping of pipe walls for installation of pressure gauges or switches will not be permitted.

In all piping except air and gas piping, insulating fittings shall be provided to prevent contact of dissimilar metals, including but not limited to, contact of copper, brass, or bronze pipe, tubing, fittings, valves, or appurtenances, or stainless steel pipe, tubing, fittings, valves, or appurtenances with iron or steel pipe, fittings, valves, or appurtenances. Insulating fittings shall also be provided to prevent contact of copper, brass, or bronze pipe, tubing, fittings, valves or appurtenances with stainless steel pipe, tubing, fittings, valves, or appurtenances.

Branch connections in horizontal runs of steam, air, and gas piping shall be made from the top of the pipe.

Buried PVC piping shall be "snaked" in the trench and shall be kept as cool as possible during installation. PVC pipe shall be kept shaded and shall be covered with backfill immediately after installation.

All chemical piping shall be installed so that lines are readily accessible for cleaning. Tees shall be provided at regular intervals in all chemical piping except chlorine piping, with extra openings plugged, to facilitate cleaning. Teflon thread tape or teflon thread sealer shall be applied to the threads of the plugs so that they can be easily removed. At each point where hose or reinforced plastic tubing is connected to rigid piping, a quick-disconnect coupling shall be provided.

Anhydrous ammonia, chlorine and sulfur dioxide gas and vent piping shall be installed so that liquid traps are avoided. The open end of each vent line shall elbow down and shall be provided with a corrosion-resistant insect screen.

Double-contained chemical feed piping shall be installed according to the manufacturer's recommendations. Joints shall be solvent cemented. Splitting and rewelding of fittings will not be acceptable. Suitable drains and vents shall be provided to permit complete drainage of both the primary and secondary containment piping. Interstitial supporting devices shall be designed to allow continuous drainage in the annular space to the drain ports. Drain fittings shall be designed to allow a valve attachment to be made so that the secondary containment compartment can be readily drained and manually inspected for leaks.

Polyethylene piping shall be installed in accordance with the manufacturer's recommendations. A continuous 12 AWG THHN insulated copper tracer wire shall be placed 6 inches (150 mm) above all portions of the buried pipe, but no more than 18 inches (450 mm) below the ground surface. Where the pipe extends above grade, a 2 foot (0.6 m) length of wire shall be coiled and attached to the pipe.

Piping adjacent to flow sensors shall be installed in accordance with the requirements of the manufacturer of the flow sensor and commonly accepted design practices of the appropriate straight pipe runs both upstream and downstream.

Drains required for operation are shown on the drawings. However, vents at all high points and drains at all low points in the piping that are required for complete draining for pressure test may not be shown on these drawings. Contractor shall add such items as found to be necessary during detail piping design and/or piping installation.

3.3.05 Reducers. Eccentric reducers shall be installed flat on the bottom for steam, condensate return and digester gas services.

3.3.06 Valves. Prior to soldering or brazing valves, teflon and elastomer seats and seals shall be removed to prevent damage.

Isolation valves provided with equipment and instruments shall be located in a manner which will allow ease of access and removal of the items to be isolated.

3.4 PIPING ASSEMBLY.

3.4.01 General. Contractor shall employ only labor that has been qualified by training and experience to capably perform the specified activities required to accomplish the work in a satisfactory manner.

Contractor shall designate a quality assurance inspector who is acceptable to the Owner to inspect the installation, cleaning, and testing of the piping systems. The inspector shall also be responsible to maintain records for all spools and appurtenances for inspection and approval by the Owner's designated representative.

The specification and qualification of weld joints and welders shall be in accordance with ASME Boiler Pressure Vessel Code, Section IX, Welding and Brazing.

Weld procedure specifications (WPS) and procedure qualification reports (PQR) shall be submitted to Engineer for review and validation of joint design, efficiencies and strength before fabrication begins.

The supervision of quality control and quality assurance programs for shop-fabricated piping and skid-mounted equipment for both direct and sub-contracted work shall be by Contractor.

Inspection techniques and acceptance criteria shall be in accordance with Section VI, Inspection, Examination, and Testing of the Piping Codes and ASME Boiler and Pressure Vessel Code Section V, Nondestructive Examination.

Contractor shall have a quality control/quality assurance program to do the following minimum level of nondestructive examination (NDE) for steam and condensate systems:

100 percent visual examination of welds by a qualified examiner (per B31.1).

20 percent random sampling for material's compliance with fitting, pipe, valves and flange requirements. Materials are considered acceptable if the examiner can visually identify foundry markings or mill marking and the ASTM markings comply with engineering specifications.

10 percent of the flanges will be torqued with a calibrated torque wrench. Acceptance criteria for bolt torque will be identified in the QC Program Manual. Bolts and nuts will be checked for foundry markings and compared to the Specifications.

100 percent of the piping supports that use guides, anchors, spring hangers, and stops will be examined.

Contractor shall have a quality control/quality assurance program to do the following minimum level of nondestructive examination (NDE) for all other systems:

5 percent random sampling of 100 percent radiographic testing (RT) or ultrasonic testing (UT) or in-process visual weld examination.

15 percent random sampling for material's compliance with fitting, pipe, valve and flange requirements. Materials are considered acceptable if the examiner can visually identify the foundry markings or mill marking and the ASTM markings comply with engineering specifications.

10 percent of the flanges will be torqued with a calibrated torque wrench. Bolts and nuts will be checked for foundry markings and compared to the Specifications.

100 percent of the piping supports that use guides, anchors and stops will be examined.

If Contractor has developed alternative techniques or intends to apply alternative methods considered equivalent to those indicated herein, a proposal on such techniques or methods shall be submitted in writing to Engineer for review and approval at least 14 days before intended date of use.

If there is a conflict between the mechanical drawings and piping and instrumentation drawings (P&IDs), the P&ID shall take precedence.

Any deviations from the Specifications and piping locations shown on the Drawings require prior review and approval by Engineer.

Welding shall not begin until weld joint and welder qualification submittals have been reviewed and approved.

3.5 PROTECTIVE COATING. Standard weight black steel pipe in buried locations will have exterior surfaces protected with a shop applied plastic coating.

Extra strong black steel pipe in buried locations shall have exterior surfaces protected as specified herein.

The exterior surfaces of all fittings, couplings, specials, and other portions of buried piping not protected with plastic coating shall be tape-wrapped in the field. All surfaces to be tape-wrapped shall be thoroughly cleaned and primed in accordance with the tape manufacturer's recommendations immediately before wrapping. The tape shall be applied by two-ply (half-lap) wrapping or as needed to provide a total installed tape thickness of at least 60 mils [1.5 mm]. Joints in plastic-coated pipe shall be cleaned, primed, and tape-wrapped after installation.

Joints in galvanized steel piping in underground locations shall be field painted with two coats of coal tar coating.

3.5.01 Inspection. All shop-applied plastic coatings and tape wrap on pipe or fittings shall be inspected for holidays and other defects after receipt of the pipe or fitting on the job and immediately before installation. All field-applied tape wrap on pipe, joints, fittings, and valves shall be inspected for holidays and other defects following completion of wrapping. Inspection of plastic coatings after installation of the pipe or fitting in the trench shall be made where, in the opinion of Engineer, the coating may have been damaged during installation. Holidays and defects disclosed by inspection shall be repaired in accordance with the recommendations of the coating or tape wrap manufacturer, as applicable.

The inspection shall be made using an electrical holiday detector. The detector and inspection procedures shall conform to the requirements of Section 4.4 of ANSI/AWWA C209.

3.6 PRESSURE AND LEAKAGE TESTING. All specified tests shall be made by and at the expense of Contractor in the presence, and to the satisfaction of Engineer. Each piping system shall be tested for at least 1 hour with no loss of pressure. Piping shall be tested at the indicated pressures:

Service	Test Pressure	Test Medium
Water supply	1-1/2 times working pressure but not less than 120 psi [828 kPa]	Water
Gas supply	1-1/2 times working pressure but not less than 60 psi [414 kPa]	Compressed air
Air supply and signal	1-1/2 times working pressure but not less than 50 psi [345 kPa]	Zero humidity air or nitrogen
Liquid chlorine and anhydrous ammonia, chlorine and sulfur dioxide gas pressure piping	300 psi [2068 kPa]	Zero humidity air or nitrogen
Chlorine and sulfur dioxide gas	15 inches [51 kPa] of mercury vacuum	Atmospheric air

vacuum piping		
Other piping	1-1/2 times working pressure but not less than 50 psi [345 kPa]	Suitable fluid or gas; for distilled water piping, distilled water or filtered oil-free compressed air may be used

Compressed air or pressurized gas shall not be used for testing plastic piping unless specifically recommended by the pipe manufacturer.

Leakage may be determined by loss-of-pressure, soap solution, chemical indicator, or positive and accurate method acceptable to Engineer. All fixtures, devices, or accessories which are to be connected to the lines and which would be damaged if subjected to the specified test pressure shall be disconnected and the ends of the branch lines plugged or capped as needed during the testing.

After completion of the specified pressure tests, all anhydrous ammonia, chlorine and sulfur dioxide gas piping shall be tested for leakage using the appropriate gas chemical at operating pressures. Piping shall be thoroughly cleaned and dried before admitting gas chemical into the system. Gas chemical shall be slowly admitted to the piping system.

For chlorine gas piping, leakage shall be checked by waving a swab soaked in aqua ammonia solution near each fitting. Ammonia solution shall not be applied directly to the fittings. Formation of white fumes will indicate the presence of leaks. All chlorine gas shall be purged from the line before leaks are repaired.

Unless otherwise required by the applicable codes, drainage and venting systems shall be water or air tested, as required. For water testing, the drainage and venting system shall be filled with water to the level of the highest vent stack. For air testing, the system shall be charged with air to a minimum pressure of 5 psig [35 kPa]. Openings shall be plugged as necessary for either type of test. To be considered free of leaks, the system shall hold the water or air for 30 minutes without any drop in the water level or air pressure.

All necessary testing equipment and materials, including tools, appliances and devices, shall be furnished and all tests shall be made by and at the expense of Contractor and at the time directed by Engineer.

All joints in piping shall be tight and free of leaks. All joints which are found to leak, by observation or during any specified test, shall be repaired, and the tests repeated.

3.6 CLEANING. The interior of all pipe, valves, and fittings shall be smooth, clean, and free of blisters, loose mill scale, sand, dirt, and other foreign matter when installed. Before being placed in service, the interior of all lines shall be thoroughly cleaned, to the satisfaction of Engineer.

Metal anhydrous ammonia, chlorine and sulfur dioxide piping shall be cleaned as recommended by the gas chemical feed system supplier. All surfaces which may come into contact with gas chemical shall be thoroughly dry and free of oil or grease before being placed in service. The recommended cleaning procedures shall be submitted for review in accordance with Master Specification Section 01080, Project Submittals.

Tin-lined copper tubing for distribution of distilled water shall be flushed and cleaned with distilled water in accordance with the tubing manufacturer's recommendations.

3.7 ACCEPTANCE. Owner reserves the right to have any section of the piping system which he suspects may be faulty cut out of the system by Contractor for inspection and testing. Should the joint prove to be sound, Owner will reimburse Contractor on a time-and-material basis as specified in the Contract. Should the joint prove to be faulty, the destructive test will continue joint by joint in all directions until sound joints are found. Costs for replacement of faulty work and/or materials shall be the responsibility of Contractor.

End of Section

SECTION 15060

MISCELLANEOUS PIPING AND PIPE ASSEMBLIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous piping and pipe assemblies for the services as indicated in the Contract Documents. This section includes the following types of pipe:

Regular Weight Brass Pipe
Extra Strong Brass Pipe
Polyethylene Hose
Tempered Glass Pipe
Nickel Alloy Pipe

Miscellaneous piping shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. Complete specifications, data and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but shall not be limited to, the following:

Chemical resistant waste pipe and fittings.

Hose couplings.

Name of Manufacturer

Type and model

Construction materials, thickness, and finishes,

Pressure and temperature ratings

1.3 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Miscellaneous piping materials shall be as indicated.

Material Classification	BR-1
Regular Weight Brass Pipe	
Pipe	ASTM B43, red brass, seamless, regular weight.
Fittings	ANSI/ASME B16.15, Class 125.
Material Classification	BR-2
Extra Strong Brass Pipe	
Pipe	ASTM B43, red brass, seamless, extra strong.
Fittings	ANSI/ASME B16.15, Class 125.
Material Classification	HS-1
Hose With Insert Type Couplings	
Hose	ID not smaller than nominal size.
	Boston " Crosslinked Polyethylene Hose" or Gates "Renegade", "Mustang 45 HW" or "Stallion" acid-chemical hose. To be selected for resistance to the service chemical.
Couplings	Rigid PVC or other material suitable for service conditions, with band type stainless steel clamps.
Material Classification	HS-2
Hose With Quick Disconnect Couplings	

Hose	ID not smaller than nominal size. Boston " Crosslinked Polyethylene Hose" or Gates "Renegade", "Mustang 45 HW" or "Stallion" acid-chemical hose. To be selected for resistance to the service chemical.
Couplings	OPW "Quick Coupler" or PT Coupling "Quick Connect/Disconnect Coupling"; polypropylene or other material suitable for service conditions.
Material Classification	TG-1
Tempered Glass Pipe	
Pipe	Borosilicate glass, ASTM C 1053. Schott "Kimax", or equal.
Fittings	Borosilicate glass, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard drainline coupling with compression liner, seal ring, and stainless steel band and bolt. Joints shall be "bead-to-bead" or "bead-to-plain end" type.
Material Classification	CRP-1
Carpenter 20-Cb3	
Welded	ASTM B464 - UNS NO8020.
Seamless	ASTM B729 - UNS NO8020.
Fittings	ASTM B462 - UNS NO8020. The use of flanged fittings shall be limited to equipment connections.

2.1.02 Accessories. Accessories for miscellaneous piping systems shall be as indicated.

Unions For Brass pipe	Fed Spec WW-U-516, Class 125.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15061

DUCTILE IRON PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of ductile iron pipe, except ductile iron pipe used for buried water main service. Ductile iron pipe shall be furnished complete with all fittings, jointing materials, pipe hangers and supports, anchors, blocking, encasement, and other appurtenances.

Piping furnished hereunder shall be complete with all joint gaskets, bolts, and nuts required for installation of any valves and equipment furnished by others for installation under this contract.

Pipe hangers and supports are covered in Master Specification Section 15140, Pipe Supports. Pressure and leakage testing is covered in Master Specification Section 15020, Miscellaneous Piping and Accessories Installation. Cleaning and disinfection are covered in Master Specification Section 02675, Disinfection of Water Distribution System. Cast iron soil pipe is covered in Master Specification Section 15069, Cast Iron Soil Pipe and Accessories.

Ductlie iron pipe for buried water main service is covered in Master Specification Section 02620, Water Main Services and Gate Valves. Pipe trenching, bedding, and backfill are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

1.1.02 Pipe Manufacturer’s Experience and Field Services. All ductile iron pipe, fittings, and specials shall be fabricated, lined, and coated by the pipe manufacturer. Minimum required experience qualifications shall include manufacture of a pipeline at least 1 mile (1.6 km) in length, of equal or larger diameter than the pipe to be provided, with joints, lining, and coating suitable for the same or greater pressure rating, which has performed satisfactorily for the past 5 years.

An experienced, competent, and authorized field service representative shall be provided by the pipe manufacturer to perform all pipe manufacturer’s field services specified herein. The field service representative's minimum required experience qualifications shall include 5 years of practical knowledge and experience installing ductile iron pipe with joints, lining, and coating of the pipe to be provided. The pipe manufacturer’s field service representative shall be acceptable to Owner. A resume of the proposed pipe manufacturer’s field service representative shall be submitted for review. The resume shall include the field service representative’s experience record which meets the specified minimum required experience qualifications.

All ductile iron pipe shall be installed in accordance with the pipe manufacturer's recommendations. The pipe manufacturer's field service representative shall visit the site and inspect, check, instruct, guide, and direct Contractor's procedures for pipe handling, laying, and jointing at the start of pipe installation for each crew. The pipe manufacturer's field service representative shall coordinate his services with Contractor.

Each joint, including restrained joints, shall be checked by Contractor as instructed by the pipe manufacturer's field service representative to determine that the joint and the restraints are installed properly.

The pipe manufacturer's field service representative shall furnish to Owner, through Engineer, a written report certifying that Contractor's installation personnel have been properly instructed and have demonstrated the proper pipe handling and installation procedures. The pipe manufacturer's field service representative shall also furnish to Owner, through Engineer, a written report of each site visit.

All costs for these services shall be included in the Contract Price.

1.1.03 Emergency Repair Manual. Contractor shall submit an emergency repair manual prepared and furnished by the pipe manufacturer. The emergency repair manual shall include procedures for handling emergency calls and repairs; a list of stock replacement pipe sections, closures, and other parts needed for emergency repairs; names and emergency telephone numbers of pipe manufacturer's engineering staff and factory-trained field service representatives who can be contacted day or night during an emergency; response and delivery times; and installation instructions for the materials and methods used in making repairs. The pipe manufacturer shall provide emergency assistance that may be required, during the construction and warranty period, at no additional cost to Owner.

1.2 SUBMITTALS. Drawings, details, specifications, and installation schedules covering all ductile iron pipe and accessories shall be submitted in accordance with the procedure set forth in Master Specification Section 01080, Project Submittals. The drawings and data shall include, but shall not be limited to, the following:

Certification by manufacturer for each item furnished in accordance with the ANSI/AWWA Standards.

Certification of gaskets.

Certification of proof-of-design tests for joints.

Certification of proof-of-design tests for welded-on outlets.

Laying schedule complete with an explanation of all abbreviations used in the schedule.

Two samples of the polyethylene encasement, each sample clearly indicating all identification required by the Governing Standard.

Submittal data shall clearly indicate the country of origin of pipe, fittings, restraining devices, and accessories. Certified copies of physical and chemical test results as outlined in AWWA C151 shall be submitted for the materials to be provided.

Contractor shall obtain and submit a written statement from the gasket material manufacturer certifying that the gasket materials are compatible with the joints specified herein and are recommended for the specified field test pressures and service conditions.

1.3 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Pipe, fittings, and accessories shall be handled in a manner that will ensure installation in sound, undamaged condition. Equipment, tools, and methods used in handling and installing pipe and fittings shall not damage the pipe and fittings. Hooks inserted in ends of pipe shall have broad, well-padded contact surfaces. Unpadded hooks, wire brushes or other abrasive tools shall not be permitted to come into contact with polyethylene lining when it is specified.

Contractor furnished pipe and fittings in which the lining has been damaged shall be replaced by and at the expense of Contractor. With the concurrence of Engineer, small and readily accessible damaged areas may be repaired.

If the lining of Owner furnished pipe or fittings is damaged by Contractor during unloading or handling, the damaged pipe or fittings shall be replaced by and at the expense of Contractor. Where the damaged areas are small and readily accessible, Contractor may be permitted to repair the lining.

Contractor shall repair any damage to pipe coatings before the pipe is installed.

PART 2 - PRODUCTS

2.1 PIPE CLASS. The class of ductile iron pipe shall be as indicated in the Ductile Iron Pipe Schedule 15061-S01 or as indicated in the Contract Documents. The specified class includes corrosion allowance and casting allowance.

Pipe wall thickness for grooved and threaded pipe shall be increased if necessary to comply with the following minimum thickness:

Pipe Size		Minimum Class	
Inches	mm	Threaded Ends (1)	Grooved Ends (2)
4-16	100-400	53	53
18	450	53	54
20	500	53	55
24	600	53	56
30-54	750-1400	53	--
60 & 64	1500-1600	350	--

(1) Complies with ANSI/AWWA C115/A21.15 for minimum pipe wall thickness for threaded flanges.

(2) Grooved couplings are cataloged through 24 inch (600 mm); larger sizes require cast-on or threaded-on shoulders.

2.2 MATERIALS. All materials in contact with potable water shall have NSF 61 certification.

Pipe	Ductile iron, ANSI/AWWA C151/A21.51, Table 1 or Table 3.
Gaskets – All Joint Types	Gaskets shall be synthetic rubber. Natural rubber will not be acceptable. For potable water service, gaskets shall be certified as suitable for chlorinated and chloraminated potable water; a certificate of gasket suitability shall be submitted.
Fittings	Ductile iron, ANSI/AWWA C110/A21.1 (except shorter laying lengths will be acceptable for U.S. Pipe), or ANSI/AWWA C153/A21.53, minimum working pressure rating as follows, unless indicated otherwise on the drawings.

Fitting Size in (mm)	Material	Type	Min. Working Pressure Rating, psi (kPa)
4 to 24 (100 to 600)	DI	Mechanical and Push-on joints	350 (2400)
4 to 24 (100 to 600)	DI	Flanged joints	250 (1700)
30 to 48 (750 to 1200)	DI	All joints	250 (1700)
54 to 64 (1350 to 1600)	DI	All joints	150 (1000)

All fittings shall be ductile iron and suitable for a test pressure of 1.5 times rated working pressure without leakage or damage.

Push-on Joints	ANSI/AWWA C111/A21.11.
Restrained Push-on Joints, gaskets with stainless steel gripping segments, as required (4 inch through 12 inch) (100 mm through 300 mm).	US.Pipe "Field Lok Gasket", or American "Fast Grip".
Restrained Push-on Joints, locking wedge type, as required (4 inch through 20 inch) (100 mm through 500 mm).	EBAA Iron "Megalug" Series 1700, without exception.
Restrained Push-on Joints, positive locking segments and/or rings, as required (4 inch through 64 inch) (100 mm through 1600 mm).	American "Flex-Ring," or "Lok-Ring"; Clow "Super-Lock"; U.S. Pipe "TR Flex"; or Griffin "Snap-Lok".
Flanged Joints	ANSI/AWWA C115/A21.5.
Flanges	
Class 250	Ductile iron, flat faced, with ANSI/ASME B16.1, Class 250 diameter and drilling.

All Others	Ductile iron, ANSI/AWWA C115/A21.15.
Flanges	All flanges shall be suitable for test pressure of 1.5 times rated pressure without leakage or damage.
Bolts	ASTM A307, chamfered or rounded ends projecting 1/4 to 1/2 inch (6.3 to 12.7 mm) beyond outer face of nut.
Nuts	ASTM A307, hexagonal, ANSI/ASME B18.2.2, heavy semi-finished pattern.
Gaskets	ASTM D1330, Grade I rubber, full face type, 1/8 inch (3 mm) thick.
Insulated Flanges	
Flanges	As specified herein, except bolt holes shall be enlarged as needed to accept bolt insulating sleeves.
Insulation Kits	As manufactured by Central Plastics or PSI Industries.
Insulating Gaskets	Type E, pyrox 1E glass reinforced epoxy, 1/8 inch (3 mm) thick, with Buna-N sealing element.
Bolt Insulating Sleeves	Mylar, 1/32 inch (0.79 mm) thick.
Insulating Washers	Phenolic laminate, 1/8 inch (3 mm) thick, one for each flange bolt.
Backing Washers	Steel, 1/8 inch (3 mm) thick, two for each flange bolt.
Mechanical Joints	ANSI/AWWA C111/A21.11.
Restrained Mechanical Joints (Factory prepared spigot), as required (4 inch through 48 inch) (100 mm through 1200 mm).	American "MJ coupled Joints", or Griffin "Mech-Lok".

Restrained Mechanical Joints, (field cut spigot), as required (4 inch through 20 inch) (100 mm through 500 mm).	EBAA Iron "Megalug" Series 1100, without exception.
Wall Castings	Mechanical joint with water stop and tapped holes; single casting or fabricated ductile iron. All holes shall be sized in accordance with the details on the drawings and shall be provided with removable plugs.
Mechanical Joints with Tie Rods	See standard details.
Tie Rods	ASTM A307.
Steel Pipe	ASTM A53, standard weight.
Washers	ANSI B18.22.1, plain steel.
Threaded Connections	ANSI/ASME B1.20.1, NPT; provide boss or tapping saddle wherever wall thickness minus the foundry tolerance at the tapped connection is less than that required for 4-thread engagement as set forth in Table A.1, Appendix A, of ANSI/AWWA C151/A21.51.
Mechanical Couplings	
Couplings	Dresser "Style 38," Smith-Blair "441 or 411 Flexible Coupling," or Romac "Style 501"; without pipe stop.
Gaskets	Oil-resistant synthetic rubber.
Grooved Couplings	AWWA C606.
Pipe Ends (rigid joints), as required.	Grooved, with dimensions conforming to AWWA C606, Table 3.
Pipe Ends (flexible joints), as required	Shouldered, with dimensions conforming to AWWA C606, Table 4.

Couplings (non-shouldered pipe)	Grinnell "Figure 7001," or Victaulic "Style 31."
Couplings (shouldered pipe)	Victaulic "Style 41" or "Style 44".
Flanged Coupling Adapters	Smith-Blair "Type 912" or Romac "Style FCA501", with anchor studs for 12 inches (300 mm) and smaller, as required; Smith-Blair "Type 913" or Romac "Style FC400", 14 inches (350 mm) and larger.
Tapping Saddles	Ductile iron, with steel straps and rubber sealing gasket, 250 psi (1700 kPa)) pressure rating.
Shop Coating and Lining	
Cement Mortar Lining	ANSI/AWWA C104/A21.4.
Polyethylene Lining	ASTM D1248, Class C, heat bonded, 40 mil (1000 µm) nominal thickness, except min thickness shall be at least 30 mils (750 µm). Thickness may taper to not less than 10 mils (250 µm))beginning 4 inches (100 mm) from the end of pipe or fitting.
Ceramic Epoxy Lining	Induron "Protecto 401 Ceramic Epoxy".
Calcium Aluminate Lining	La Farge "SewperCoat".
Glass Lining	Two-coat system applied over blast-cleaned surface; ground and finish coats separately fired; finished lining thickness at least 8 mils (200 µm), Mohs' Hardness 5 to 6 density (2500 to 3000 kg/m^3) as determined by ASTM D792; Ceramic Coating "Non-Stick Glass Lining" or Victo "SG-14 Glass Lined Pipe."
Universal Primer	Manufacturer's standard.
Asphaltic Coating	Manufacturer's standard.
Coal Tar Epoxy	Manufacturer's standard.

Liquid Epoxy	ANSI/AWWA C210.
Medium Consistency Coal Tar	Carboline "Bitumastic Super Service Black" or Tnemec "46-465 H.B. Tnemecol."
Polyethylene Encasement	Seamless, ANSI/AWWA C105/A21.5; LLD-8 mil (200 μm) or HDCL-4 mil (100 μm).

2.3 SHOP COATING AND LINING. The interior of all pipe and fittings for water or water treatment service shall be cement mortar lined. The interior of all pipe for gravity sewers shall be lined with the material as specified herein. The interior of all pipe for other services, except air, shall be cement mortar lined. The interior of all air piping shall be unlined and uncoated.

Glass-lined pipe or other lining, as specified, shall be provided for the following wastewater facilities services:

Scum piping.

All sludge piping except piping conveying activated sludge from final settling basins.

Sludge holding tank overflow piping.

Sludge holding tank supernatant drawoff piping.

Where buried or embedded in concrete, glass-lined pipe shall be ductile iron with mechanical or push-on joints; glass-lined pipe installed in interior locations may be flanged ductile iron with flanged cast or ductile iron fittings.

The exterior surfaces of all pipe and fittings which will be exposed in interior locations shall be shop primed. Flange faces shall be coated with a suitable rust-preventive compound. Exterior surfaces of all other pipe and fittings shall be coated with asphaltic coating.

PART 3 - EXECUTION

3.1 INSPECTION. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation; spigot ends shall be examined with particular care. All defective pipe and fittings shall be removed from the site of the work.

3.2 PREPARATION. The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter prior to installation. Before jointing, all joint contact surfaces shall be wire brushed if necessary, wiped clean, and kept clean until jointing is completed.

Precautions shall be taken to prevent foreign material from entering the pipe during installation. Debris, tools, clothing, or other objects shall not be placed in or allowed to enter the pipe.

3.3 CUTTING PIPE. Cutting shall be done in a neat manner, without damage to the pipe or the lining. Cuts shall be smooth, straight, and at right angles to the pipe axis. After cutting, the ends of the pipe shall be dressed with a file or power grinder to remove all roughness and sharp edges. The cut ends of push-on joint pipe shall be suitably beveled.

All field cutting of existing gray cast iron pipe shall be done with mechanical pipe cutters, except where the use of mechanical cutters would be difficult or impracticable.

Ends of ductile iron pipe shall be cut with a portable guillotine saw, abrasive wheel, saw, milling cutter, or oxyacetylene torch. The use of hydraulic squeeze type cutters will not be permitted. Field-cut holes for saddles shall be cut with mechanical cutters; oxyacetylene cutting will not be permitted.

3.4 ALIGNMENT. Piping shall be laid to the lines and grades indicated on the drawings. Pipelines or runs intended to be straight shall be laid straight. Deflections form a straight line or grade shall not exceed the values stipulated in Table 4 or Table 5 of AWWA C600, unless specially designed bells and spigots are provided.

Either shorter pipe sections or fittings shall be installed where needed to conform to the alignment or grade indicated on the drawings.

Batter boards, laser beam equipment, or surveying instruments shall be used to maintain alignment and grade.

If batter boards are used to determine and check pipe subgrades, they shall be erected at intervals of not more than 25 feet (8 m). At least three batter boards shall always be maintained in proper position when trench grading is in progress.

If laser beam equipment is used, periodic elevation measurements shall be made with surveying instruments to verify accuracy of grades. If such measurements indicate thermal deflection of the laser beam due to differences between the ground temperature and the air temperature within the pipe, precautions shall be taken to prevent or minimize further thermal deflections.

3.5 LAYING PIPE. Buried pipe shall be protected from lateral displacement by placing the specified pipe embedment material. Under no circumstances shall pipe be laid in water, and no pipe shall be laid under unsuitable weather or trench conditions.

Whenever pipe laying is stopped, the open end of the pipe shall be sealed with a watertight plug, which will prevent trench water from entering the pipe.

Pipe shall be laid with the bell ends facing the direction of laying, except when reverse laying is specifically authorized by Engineer.

3.6 FIELD JOINTS. Joints in buried locations shall be mechanical or push-on type unless otherwise indicated on the drawings. Bells on wall castings and wall sleeves shall be mechanical joint type, with tapped holes for tie rods or stud bolts. All other joints shall be flanged unless otherwise indicated on the drawings.

Certification of joint design shall be provided in accordance with ANSI/AWWA C111/A21.11-90, Section 4.5, Performance Requirements, as modified herein. The joint test pressure shall be not less than 2 times the working pressure or 1-1/2 times the test pressure of the pipeline, whichever is higher. The same certification and testing shall also be provided for restrained joints. For restrained joints, the piping shall not be blocked to prevent separation and the joint shall not leak or show evidence of failure. It is not necessary that such tests be made on pipe manufactured specifically for this project. Certified reports covering tests made on other pipe of the same size and design as specified herein and manufactured from materials of equivalent type and quality may be accepted as adequate proof of design.

Where acceptable to Engineer, as required, grooved couplings may be used instead of flanges, provided that rigid grooving is used to preclude longitudinal pipe movement and angular deflection at joints. Fittings, valves, and equipment installed using grooved couplings shall be adequately supported and blocked or restrained to prevent rotation.

3.7 MECHANICAL JOINTS. Mechanical joints shall be carefully assembled in accordance with the manufacturer's recommendations. If effective sealing is not obtained, the joint shall be disassembled, thoroughly cleaned, and reassembled. Bolts shall be uniformly tightened to the torque values listed in Appendix A of ANSI/AWWA C111/A21.11. Overtightening of bolts to compensate for poor installation practice will not be permitted.

The holes in mechanical joints with tie rods shall be carefully aligned to permit installation of the tie rods. In flange and mechanical joint pieces, holes in the mechanical joint bells and the flanges shall straddle the top (or side for vertical piping) center line. The top (or side) center line shall be marked on each flange and mechanical joint piece at the foundry.

3.8 <u>PUSH-ON JOINTS</u>. The pipe manufacturer's instructions and recommendations for proper jointing procedures shall be followed. All joint surfaces shall be lubricated with heavy vegetable soap solution immediately before the joint is completed. Lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean. Each spigot end shall be suitably beveled to facilitate assembly.

Pipe ends for restrained joint pipe shall be prepared in accordance with the pipe manufacturer's recommendations.

3.9 <u>FLANGED JOINTS</u>. Pipe shall extend completely through screwed-on flanges. The pipe end and flange face shall be finish machined in a single operation. Flange faces shall be flat and perpendicular to the pipe center line.

When bolting flanged joints, care shall be taken to avoid restraint on the opposite end of the pipe or fitting which would prevent uniform gasket compression or would cause unnecessary stress in the flanges. One flange shall be free to move in any direction while the flange bolts are being tightened. Bolts shall be tightened gradually and at a uniform rate, to ensure uniform compression of the gasket.

Special care shall be taken when connecting piping to any pumping equipment to ensure that piping stresses are not transmitted to the pump flanges. All connecting piping shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before any bolts are installed in the flanges. In addition, pump connection piping shall be free to move parallel to its longitudinal center line while the bolts are being tightened. Each pump shall be leveled, aligned, and wedged into position, which will fit the connecting piping, but shall not be grouted until the initial fitting and alignment of the pipe, so that the pump may be shifted on its foundation if necessary to properly install the connecting piping. Each pump shall, however, be grouted before final bolting of the connecting piping. After final alignment and bolting, the pump connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the pump or opening of the pump connection joints. If any movement is observed, the piping shall be loosened and re-aligned as needed and then the flanges bolted back together. The flange bolts shall then be loosened and the process repeated until no movement is observed.

3.10 <u>FLANGED COUPLING ADAPTERS</u>. Flanged coupling adapters shall be installed in strict accordance with the coupling manufacturer's recommendations. After the pipe is in place and bolted tight, the proper locations of holes for the anchor studs shall be determined and the pipe shall be field-drilled. Holes for anchor studs shall be drilled completely through the pipe wall. Hole diameter shall be not more than 1/8 inch (3 mm) larger than the diameter of the stud projection.

The inner surfaces of couplings shall be prepared for coating in accordance with instructions of the coating manufacturer and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining surfaces, except flange mating surfaces, shall be cleaned and shop primed with universal primer.

3.11 MECHANICAL COUPLINGS. Mechanical couplings shall be carefully installed in accordance with the manufacturer's recommendations. A space of at least 1/4 inch (6 mm), but not more than 1 inch (25 mm), shall be left between the pipe ends. Pipe and coupling surfaces in contact with gaskets shall be clean and free from dirt and other foreign matter during assembly. All assembly bolts shall be uniformly tightened so that the coupling is free from leaks, and all parts of the coupling are square and symmetrical with the pipe. Following installation of the coupling, damaged areas of shop coatings on the pipe and coupling shall be repaired to the satisfaction of Engineer.

The interior surfaces of the middle rings shall be prepared for coating in accordance with instructions of the coating manufacturer and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining components shall be cleaned and shop primed with universal primer.

3.12 GROOVED END JOINTS. Grooved couplings with rigid type grooving shall be installed in accordance with the coupling manufacturer's recommendations. Completed joints shall be rigid and shall not allow angular deflection or longitudinal movement. Except for closure pieces, field grooving of pipe will not be permitted.

Special care shall be taken when connecting to pumping equipment to avoid transmitting pipe stresses to the pump flanges. Piping shall be permanently supported to obtain accurate matching of piping and abutting pump flanges before bolts are installed in the flanges.

3.13 POLYETHYLENE ENCASEMENT. All buried ductile iron pipe, including all straight pipe, bends, tees, adapters, closure pieces, and other fittings or specials, and all valves shall be provided with a minimum of one wrap of polyethylene encasement. Locations where ductile iron pipe shall be double wrapped with polyethylene encasement are indicated in the Contract Documents.

Polyethylene tube protection shall be installed in accordance with AWWA C105, Method A. Preparation of the pipe shall include, but is not limited to, removing lumps of clay, mud, cinders, etc., prior to installation.

Where ductile iron pipe is also embedded or encased in concrete, the polyethylene tube shall be installed over the pipe for 5 feet (1.5 m) either side of each end of the concrete encasement.

The terms "polyethylene tube protection" and "polyethylene encasement" are interchangeable and shall have the same meaning in these Contract Documents.

3.14 OUTLETS. Where a 12 inch (300 mm) or smaller branch outlet is indicated and the diameter of the line pipe is at least twice the diameter of the branch, a tee, a factory welded-on boss, or a tapping saddle will be acceptable.

Where a 4 inch (100 mm) or larger branch outlet is indicated on the drawings and the diameter of the branch pipe for a given diameter of parent pipe is less than equal to the maximum diameter listed herein, a factory welded-on outlet fabricated from centrifugally cast ductile iron pipe will be acceptable.

Parent Pipe Diameter Versus Maximum Branch Pipe
Diameter for Welded-On Outlets

Parent Pipe Dia inches (mm)	Max Branch Pipe Dia inches (mm)	Parent Pipe Dia inches (mm)	Max Branch Pipe Dia inches (mm)
8 ((200))	4 ((100))	30 ((750))	20 ((500))
10 ((250))	6 ((150))	36 ((900))	24 ((600))
12 ((300))	8 (200))	42 (1050))	30 (750))
14 ((350))	8 ((200))	48 (1200))	30 (750))
16 ((400))	10 ((250))	54 ((1350))	30 ((750))
18 ((450))	12 ((300))	60 ((1500))	30 ((750))
20 ((500))	14 ((350))	64 ((1600))	30 ((750))
24 ((600))	16 ((400))		

All welded-on outlets shall be rated for a working pressure of 250 psi (1700 kPa))and shall have a minimum factor of safety of 2.0. The pipe manufacturer shall provide test data and certification of proof of design. It is not necessary that these tests be performed on pipe manufactured specifically for this project. Certified reports covering tests made on other pipe of the same size and design as specified herein and manufactured from materials of equivalent type and quality may be accepted as adequate proof of design. Welded-on outlets may be provided as a radial (tee)

outlet, a tangential outlet, or a lateral outlet fabricated at a specific angle to the parent pipe (in 15° (0.262 rad)) increments between
45° and 90° (0.785 to 1.570 rad)) from the axis of the parent pipe), as indicated on the drawings. The fillet weld dimensions for welded-on outlets shall be as specified herein. Parent pipe and branch pipe shall meet hydrostatic test requirements in accordance with AWWA C151, Sec. 51-9, prior to fabrication.

Welded-on Outlet Fillet Weld Dimensions for Specified
Outlet Configurations

Radial and Lateral Outlets			Tangential Outlets		
Parent Pipe Dia inches (mm)	Branch Pipe Dia inches (mm)	Weld Fillet Size inches (mm)	Parent Pipe Dia inches (mm)	Branch Pipe Dia inches (mm)	Weld Fillet Size inches (mm)
24 (600) and smaller	24 (600) and smaller	1 x 1 (25 x 25)	8-30 (200-750)	24 (600) and smaller	1-1/4 x 1-1/4 (32 x 32)
30-48 (750-1200)	24 (600) and smaller	1-1/4 x 1-1/4 (32 x 32)	36-54 (900-1350)	24 (600) and smaller	1-1/2 x 1-1/2 (38 x 38)
54-64 (1350-1600)	24 (600) and smaller	2-1/4 x 2-1/2 (57 x 64)	60-64 (1500-1600)	24 (600) and smaller	2-1/2 x 2-1/2 (64 x 64)
42-54 (1050-1350)	30 (750)	2-1/2 x 2-1/2 (64 x 64)	42-54 (1050-1350)	30 (750)	2-1/2 x 2-1/2 (64 x 64)
60-64 (1500-1600)	30 (750)	2-3/4 x 2-3/4 (70 x 70)	60-64 (1500-1600)	30 (750)	2-3/4 x 2-3/4 (70 x 70)

All joints on welded-on branch outlets shall be made in accordance with the latest revision of ANSI/AWWA C111/A21.11 and/or ANSI/AWWA C115/A21.15, as applicable. All outlets shall be fabricated from centrifugally cast ductile iron pipe designed in accordance with ANSI/AWWA C150/A21.50 and manufactured and tested in accordance with ANSI/AWWA C151/A21.51. Ni-Rod FC 55® electrodes manufactured by International Nickel Corporation (or an electrode with equivalent properties) shall be used in the manufacture of the fillet welds. Carbon steel electrodes will not be acceptable. Special Thickness Class 53 pipe shall be used for all branch pipe and parent pipe in 4 to 54 inch (100 to 1400 mm) sizes. Pressure Class 350 pipe shall be used for 60 inch and 64 inch (1500 and 1600 mm) parent pipe. After welding, each fabricated outlet shall be subjected to a 15 psi (100 kPa) air test. A soap and water solution shall be applied during the testing procedure to inspect the weld for leakage. Any welds that show air seepage shall be refabricated and retested.

Welded-on outlets shall be fabricated by the pipe manufacturer at its production facilities. Manufacturers of welded-on outlets shall have at least 5 years of satisfactory experience in the manufacture and performance of these products. The manufacturer shall have a documented welding quality assurance system and shall maintain resident quality assurance records based on ANSI/AWS D11.2, the Guide for Welding Iron Castings. The manufacturer shall also maintain appropriate welding procedure specifications (WPS), procedure qualification (PQR), and welder performance qualification test (WPQR) records.

The type of pipe end for the branch outlet shall be as specified or indicated on the drawings. The maximum size and laying length of the welded-on branch outlet shall be as recommended by the pipe manufacturer and shall be acceptable to Engineer for the field conditions and the connecting pipe or valve. Pipe embedment material and trench backfill shall be placed and compacted under and around each side of the outlet to hold the pipe in proper position and alignment during the subsequent pipe jointing, embedment, and backfilling.

At locations acceptable to Engineer, drilling and tapping of the pipe wall for 2 inch (50 mm) and smaller pipe connections will also be acceptable, provided that the wall thickness, minus the casting allowance, at the point of connection equals or exceeds the wall thickness required for 4-thread engagement in accordance with Table A.1, Appendix A of ANSI/AWWA C151/A21.51.

3.15 <u>WALL CASTINGS</u>. Wall castings shall be provided where ductile iron pipes pass through concrete walls, unless otherwise indicated on the drawings.

Where a flange and mechanical joint piece is to connect to a mechanical joint wall casting, the bolt holes in the bell of the wall casting shall straddle the top (or the side for vertical piping) center line of the casting and shall align with the bolt holes in the flange and mechanical joint piece. The top center line shall be marked on the wall casting at the foundry.

3.16 <u>REDUCERS</u>. Reducers shall be eccentric or concentric as indicated on the drawings. Reducers of eccentric pattern shall be installed with the straight side on top, so that no air traps are formed.

3.17 <u>CONNECTIONS WITH EXISTING PIPING</u>. Connections between new work and existing piping shall be made using fittings suitable for the conditions encountered. Each connection with an existing pipe shall be made at a time and under conditions which will least interfere with service to customers, and as authorized by Owner. Facilities shall be provided for proper dewatering and for disposal of all water removed from dewatered lines and excavations without damage to adjacent property.

Special care shall be taken to prevent contamination when dewatering, cutting into, and making connections with existing potable water piping. Trench water, mud, or other contaminating substances shall not be permitted to enter the lines. The interior of all pipe, fittings, and valves installed in such connections shall be thoroughly cleaned and then swabbed with, or dipped in, a 200 mg/L chlorine solution.

3.18 INSULATED FLANGED JOINTS. Insulated flanged joints shall be installed where indicated on the drawings. In addition to one full-faced insulated gasket, each flange insulating assembly shall consist of one full-length sleeve, one insulating washer, and two backing washers for each flange bolt. The insulating gasket ID shall be 1/8 inch (3 mm) less than the ID of the flange in which it is installed. The insulated flanged joint accessories shall be installed in accordance with the instructions and recommendations of the manufacturer.

3.19 CONCRETE ENCASEMENT. Concrete encasement shall be installed where indicated on the drawings. A pipe joint shall be provided within 12 inches (300 mm) of each end of the concrete encasement. Concrete and reinforcing steel shall be as specified in Master Specification Section 03300, Cast-In-Place Concrete and Master Specification Section 03200, Concrete Reinforcement. All pipe to be encased shall be suitably supported and blocked in proper position, and shall be anchored to prevent flotation.

3.20 REACTION ANCHORAGE AND BLOCKING. Concrete blocking shall be installed where indicated on the drawings and shall extend from the fitting to solid, undisturbed earth and shall be installed so that all joints are accessible for repair. The dimensions of concrete reaction blocking shall be as indicated on the drawings. If adequate support against undisturbed ground cannot be obtained, restrained joints shall be installed to provide the necessary support. If the lack of suitable solid vertical excavation face is due to improper trench excavation, restrained joints shall be furnished and installed by and at the expense of Contractor.

Reaction blocking, anchorages, or other supports for fittings installed in fills or other unstable ground, installed above grade, or exposed within structures, shall be provided as required and as indicated on the drawings.

Coatings for appurtenances listed below shall be in accordance with Master Specification Section 09900, Painting, or in accordance with the following paragraph as indicated in the Contract Documents.

All ferrous metal clamps, rods, bolts, and other components of tapping saddles, reaction anchorages, or joint harness, subject to submergence or contact with earth or other fill material and not encased in concrete, shall be protected from corrosion by two coats of medium consistency coal tar applied in the field to clean, dry metal surfaces. The first coat shall be dry and hard before the second coat is applied.

Metal surfaces exposed above grade or within structures shall be given one prime coat and two finish coats of a coating acceptable to Engineer.

3.21 LEAKAGE AND PRESSURE TESTS. Pipe and fittings shall be subjected to a leakage test and a pressure test, as specified herein.

3.21.01 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

Contractor shall provide all necessary pumping equipment; piping connections between the piping and the nearest available source of test water; pressure gauges; and other equipment, materials, and facilities necessary for the tests.

All pipe, fittings, valves, pipe joints, and other materials which are found to be defective shall be removed and replaced with new and acceptable materials, and the affected portion of the piping shall be retested by and at the expense of Contractor.

3.21.02 Visual Leakage Inspection. When a leakage test is not conducted, all joints shall be watertight and free from visible leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.22 CLEANING. The interior of all pipe and fittings shall be kept clean of any foreign matter until the work has been accepted.

3.23 SCHEDULE. See Ductile Iron Pipe Schedule 15061-S01.

End of Section

SECTION 15062

STEEL PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of steel pipe 6 inches (150 mm) in diameter and larger, together with fittings, specials, and appurtenances primarily to be used for plant applications. For steel watermain transmission piping, consult Master Specification Section 02626.

Steel pipe smaller than 6 inches (150 mm) in diameter, light wall steel pipe, miscellaneous small piping, pipe supports, concurrent cathodic protection, pressure and leakage tests, and cleaning and disinfection are covered in other sections.

Pipe trenching, bedding, and backfill are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

The size, service, and locations of steel pipelines, and the pipe material alternatives are as indicated in the Contract Documents, or in the Steel Pipe Schedule 15062-S01.

Steel piping shall be furnished and installed complete with all fittings, specials, jointing materials, appurtenances, and accessories indicated on the drawings or otherwise required for proper installation and functioning of the piping.

Piping furnished hereunder shall be complete with all jointing materials required for installation of any valves and equipment furnished by others for installation under this contract.

1.2 GOVERNING STANDARDS. Except as modified or supplemented herein, all steel pipe, fittings, and specials shall conform to the applicable requirements of the following standards:

ANSI/AWWA Standards	Title
C200	Steel Water Pipe 6 Inches (150 mm) and Larger
C203	Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape - Hot Applied

C205	Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4 Inch and Larger - Shop Applied
C206	Field Welding of Steel Water Pipe
C207	Steel Pipe Flanges for Waterworks Service - Sizes 4 Inches Through 144 Inches (100 mm through 3600 mm)
C208	Dimensions for Steel Water Pipe Fittings.
C209	Cold Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines
C210	Liquid Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines
C214	Tape Coating Systems for the Exterior of Steel Water Pipelines
C602	Cement-Mortar Lining of Water Pipelines in Place
C606	Grooved and Shouldered Type Joints

ANSI Standard

B18.2.1	Square and Hex Bolts and Screws

ANSI/ASME Standards

B1.1	Unified Inch Screw Threads
B18.2.2	Square and Hex Nuts
B36.10	Welded and Seamless Wrought Steel Pipe

1.3 SUBMITTALS. Drawings, specifications, installation schedules, welding procedures and welder qualifications, and other data showing complete details of the fabrication, construction, weld locations, joint details and certification, and installation of pipe, fittings, specials, and connections, together with complete data covering all materials proposed for use, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Submittals shall indicate the ASTM designation for the material from which each class of pipe is fabricated.

In addition to the markings, as specified under the governing standard, Contractor's drawings shall include a complete laying schedule with piece description to show where each numbered pipe, fitting, or special is to be installed. The numbers indicated on the drawings shall correspond with those painted on the pipe.

If the flange gasket materials to be provided are other than those specified herein, Contractor shall obtain and submit a written statement from the gasket material manufacturer certifying that the gasket materials are compatible with the flanged joints specified herein and are suitable for the specified field test pressure.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Pipe, fittings, specials, and appurtenances shall at all times be handled and stored in a manner that will ensure installation in sound, undamaged condition.

PART 2 - PRODUCTS

2.1 BASIS OF DESIGN. Steel pipe, fittings, and specials may be either fabricated or mill type. In either case, all items shall be fabricated to the sizes, dimensions, and shapes indicated on the drawings or specified herein.

The specified size of fabricated pipe, fittings, and specials shall be the nominal inside diameter, in inches (mm), where 12 inches (300 mm) and smaller, and the actual inside diameter of pipe lining or the outside diameter, as specified herein, where 14 inches (350 mm) and larger. Where stab joint pipe is permitted and two or more wall thicknesses are required for pipe of the same size, pipe size may be adjusted slightly to allow the different classes of pipe to be stabbed together.

The specified size of mill pipe, fittings, and specials shall be the nominal pipe size as set forth in ANSI/ASME B36.10.

Pipe design shall be performed by Engineer or the pipe fabricator, as specified herein.

In addition to the pipe markings required by ANSI/AWWA C200, each pipe section, fitting, and special shall be clearly marked to indicate the service, wall thickness, or minimum yield strength of the pipe material.

2.1.01 Pipe Wall Thickness. When pipe design is by Engineer, the minimum wall thickness shall be as indicated in the Steel Pipe Schedule 15062-S01.

When the fabricator is required to design the pipe, the wall thickness shall be determined by the following formula, except that the minimum wall thickness and the maximum diameter to thickness ratio shall be as indicated in the Steel Pipe Schedule 15062-S01. Pipe shall be designed for all conditions indicated in the Steel Pipe Schedule 15062-S01.

$$t = (PD)/(2s),$$

where

t = the pipe wall thickness in inches (mm).

s = the allowable fiber stress in psi, (Pa) which shall not exceed 50 percent of the yield strength of the steel plate at working pressure or 75 percent of the yield strength at shop test pressure.

P = the pipe working pressure or shop test pressure in psi (Pa).

D = the pipe outside diameter, in inches (mm), or straight pipe sections or the larger outside diameter or tapered sections.

2.1.02 Fitting Dimensions. The dimensions of steel pipe fittings shall conform to ANSI/AWWA C208, as specified herein.

2.1.03 Reinforcement of Fittings and Specials. All bends, fittings, branch connections, reducers, and special sections shall be reinforced, or the pipe wall thickness shall be increased, so that the combined stresses due to internal pressure (circumferential and longitudinal) and bending will not exceed 67 percent of the yield strength of the pipe material.

Whether or not indicated on the drawings, reinforcements or additional wall thickness shall be provided as necessary to ensure that the combined stresses do not exceed the specified maximum. Unless otherwise indicated or directed, the internal pressure shall be the specified shop or field test pressure as indicated in the Steel Pipe Schedule 15062-S01 for the piping adjacent to the item in question, and the external load as indicated in the Steel Pipe Schedule 15062-S01 shall be equal to the pipe full of water.

In addition to the above and where in trench, the design of reinforcement or wall thickness shall take into consideration an external load as indicated in the Steel Pipe Schedule 15062-S01.

Wall thicknesses of reducing sections shall be not less than the required thicknesses for the larger ends.

2.1.04 Joints. Acceptable joints of the type indicated on the drawings and as specified herein shall be provided for all pipe installations in the locations indicated or accepted by Engineer. To facilitate installation, additional field-welded or mechanically coupled joints may be provided, but shall be kept to a minimum, and their locations shall be acceptable to Engineer. Field-welded joints shall not be used in pipe smaller than 27 inches (675 mm), except in locations where the interior coating can be satisfactorily repaired and inspected.

2.2 MATERIALS.

Pipe, Fittings, and Specials	ANSI/AWWA C200. All steel shall be fully killed and made to a fine austenitic grain size practice.
Flanged Joints	
Flanges	ANSI/AWWA C207, slip-on, except where otherwise permitted or required.
Dimensions and Drilling	ANSI/AWWA C207, as indicated on the drawings.
Blind Flanges	ANSI/AWWA C207, unless otherwise indicated on the drawings or specified.
Gaskets	ANSI/AWWA C207, full face type, John Crane "Style 999" neoprene, 1/8 inch (3 mm) thick, for field test pressures up to 250 psi (1700 kPa); ring type, John Crane "Style 4160" compressed aramid fiber sheet, 1/16 inch (1.5 mm) thick, for field test pressures above 250 psi (1700 kPa). The products of other manufacturers and other products of the manufacturer named herein will not be acceptable unless a certificate of product suitability is submitted as set forth in the Submittals paragraph herein.

Insulated Flanges

Flanges	As specified herein, except bolt holes shall be enlarged as needed to accept bolt insulating sleeves.
Insulation Kits	As manufactured by Central Plastics or PSI Industries.
Insulating Gaskets	Type E, pyrox 1E glass reinforced epoxy, 1/8 inch (3 mm) thick, with Buna-N sealing element.
Bolt Insulating Sleeves	Mylar, 1/32 inch (0.7 mm) thick.
Insulating Washers	Phenolic laminate, 1/8 inch (3 mm)thick, one for each flange bolt.
Backing Washers	Steel, 1/8 inch (3 mm) thick, two for each flange bolt.

Flange Bolting

Material	ANSI/AWWA C207.
Type	Bolt and nut; bolt-stud and two nuts permitted for 1 inch (25 mm) and larger.
Bolts and Bolt-Studs	
Length	Such that ends project 1/4 to 1/2 inch (6 to 12.7 mm) beyond surface of nuts.
Ends	Chamfered or rounded.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2A fit. Bolt-studs may be threaded full length.
Bolt Head Dimensions	ANSI B18.2.1; regular pattern for square, heavy pattern for hexagonal.
Nuts	Hexagonal.
Dimensions	ANSI/ASME B18.2.2, heavy,

	semifinished pattern.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2B fit.
Stab Joints	Bell-and-spigot, with rubber gasket as sole element depended upon for watertightness.
Bells and Spigots	Rolled groove, Carnegie shape, or fabricated type, as needed or permitted.
Rubber Gaskets	Continuous O-ring; ANSI/AWWA C200, Section 3.6, except basic polymer shall be synthetic rubber. Natural rubber will not be acceptable.
Mechanical Couplings	
Insulating	Baker "Series 216", Dresser "Style 39", or Smith-Blair "416"; without pipe stop.
Reducing	Baker "Series 220", Dresser "Style 62", or Smith-Blair "413" and "415"; without pipe stop.
All Others	Baker "Series 200", Dresser "Style 38", or Smith-Blair "411 Flexible Coupling"; without pipe stop.
Restrained Joints	Of the type indicated on the drawings or as specified herein.
Lugs or Collars	ASTM A283, Grade B or C; or ASTM A36.
Tie Bolts	ASTM A193, Grade B7.
Threading	ANSI/ASME B1.1, Class 2A fit, coarse thread series for 7/8 inch (22 mm) and smaller, and 8-thread series for 1 inch (25 mm) and larger.
Ends	Chamfered or rounded.
Nuts	Hexagonal, ASTM A194, Grade 2H or better.

Threading	As specified for tie bolts, except Class 2B fit.
Dimensions	ANSI/ASME B18.2.2, heavy semifinished pattern.
Flat Washers	Hardened steel, ASTM A325.
Flanged Coupling Adapters	Dresser "Style 128" or Smith-Blair "913"; with anchor studs of sufficient size and number to withstand test pressure.
Grooved Couplings (when joint movement and deflection is not acceptable)	ANSI/AWWA C606; Gustin-Bacon "No. 120 Rigid" or Victaulic "07 Zero-Flex".
Grooved Couplings (when joint movement and deflection is acceptable)	ANSI/AWWA C606; Gustin-Bacon "No. 100 Standard" or Victaulic "Style 22" or "Style 77", as needed.
Small Branch Connections	
Pipe Nipples	Seamless black steel pipe, ASTM A53, standard weight (Schedule 40).
Welding Fittings	
Threaded Outlets	Bonney "Thredolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Welded Outlets	Bonney "Weldolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Coatings and Linings	
Coal Tar Enamel	ANSI/AWWA C203.
Liquid Epoxy	ANSI/AWWA C210.
Tape Coating	ANSI/AWWA C209 and C214.
Cement Mortar	ANSI/AWWA C205 and C602.
Cement	ASTM C150, Type II.
Sand	ANSI/AWWA C205, Section 4.2.3,

	except sand for field-applied lining shall pass a No. 16 (1.18 mm) sieve.
Epoxy Bonding Agent	ASTM C881, Type II, moisture insensitive and suitable for service conditions.
Latex Admixture	Euclid "Euco Flex-Con" or Sika "SikaLatex".
Medium Consistency Coal Tar	Carboline "Bitumastic Super Service Black" or Tnemec "46-465 H.B. Tnemecol".
Bituminous Filler for Wall Fittings	Plastic asphalt roof cement, asbestos-free, ASTM D4586, Type II.
Watertight Pipe Sleeves	Thunderline Corporation "Link-Seal", insulating type with modular rubber sealing elements, nonmetallic pressure plates, and galvanized bolts and nuts.
Anchor Bolts	ASTM A307.

2.3 ENDS OF SECTIONS.

2.3.01 For Field Welding. Ends of pipe, fittings, and specials for joints butt-welded in the field shall have the ends beveled for butt welding in accordance with the governing standards.

Ends of pipe, fittings, and specials for field-welded lap joints shall have both the bell and the spigot expanded by pressing (not rolling) to obtain the required shape and welding tolerances.

2.3.02 For Fitting with Flanges. Ends to be fitted with slip-on flanges shall be prepared to accommodate the flanges in accordance with the governing standards.

2.3.03 For Stab Joints. Stab joints shall be designed so that the gasket will maintain a watertight joint under all conditions of service, including expansion, contraction, and earth settlement. The gasket shall not support the entire weight of the pipe. Spigot ends shall have a groove to retain the gasket. Pipe ends shall be self-centering without the aid of the gasket.

2.3.04 For Mechanical Couplings. Ends to be joined by mechanical couplings shall be plain end type in accordance with the governing standard. In addition, pipe seam welds on ends to be joined by mechanical couplings shall be ground flush to permit slipping the coupling in at least one direction to clear the pipe joint.

2.3.05 For Grooved Couplings. Ends to be joined by grooved couplings shall be of the cut grooved or shouldered type as specified herein, conforming to the governing standard and as recommended by the coupling manufacturer for the size and wall thickness of the pipe, fitting, or special being coupled, and for the maximum test or working pressure to which the couplings will be subjected.

2.3.06 For Flanged Coupling Adapters. Ends to be fitted with flanged coupling adapters shall be plain end type in accordance with the governing standard for mechanical couplings. Welds shall be ground flush to permit installation of the coupling, and holes shall be field drilled at the proper location for anchor studs.

2.3.07 For Connection to Dissimilar Pipe Materials. Steel pipe connections to buried or submerged concrete pipe or cast iron pipe shall be made with insulated flanges.

2.4 SEAMS. Except for seamless mill-type pipe, all piping shall be made from steel plates rolled into cylinders or sections thereof with the longitudinal seams butt-welded, or shall be spirally formed and butt-welded. There shall be not more than two longitudinal seams. Girth seams shall be butt-welded and shall be spaced not closer than 10 feet (3 m) apart except in specials and fittings.

2.5 PIPE LENGTHS. Straight pipe section lengths shall be as specified herein, unless otherwise indicated on the drawings.

All pipe to be connected with mechanical couplings shall be fabricated so that the space between pipe ends within the couplings will not exceed the amount recommended by the coupling manufacturer, but will be at least 1/2 inch (12 mm).

2.6 SMALL BRANCH CONNECTIONS. Branch connections 2-1/2 inches (63 mm) and smaller shall be made with welding fittings with threaded outlets. Where the exact outlet size desired is in doubt, but is known to be less than 1 inch (25 mm), a 1 inch (25 mm) outlet shall be provided and reducing bushings used as needed.

Branch connections sized 3 through 12 inches (75 through 300 mm) shall be made with pipe nipples or with welding fittings with welded outlets. Pipe nipples and welding fittings shall be welded to the pipe shell and reinforced as needed to meet design and testing requirements.

Small branch connections shall be so located that they will not interfere with joints, supports, or other details, and shall be provided with caps or plugs to protect the threads during shipping and handling.

2.7 ACCESS MANHOLES. Access manholes shall be provided in the locations indicated on the drawings. The type of manholes shall also be indicated on the drawings. An access manhole marker post shall be furnished and installed adjacent to each buried access manhole as indicated on the drawings.

2.7.01 Type I Manhole. A Type I manhole shall consist of a 24 inch (600 mm) flanged outlet with a blind flange cover. Covers shall be fabricated from steel plate with thickness as indicated on the drawings, and shall have two handles fabricated from 1 inch (25 mm) diameter rod.

At the option of Contractor and subject to acceptance by Engineer, reinforced or dished covers of lighter weight and equal strength may be provided.

2.7.02 Type 2 Manhole. A Type 2 manhole shall be bolted or hinged type, conforming to Figure 13-26 of AWWA M11 and shall be suitable for a pressure as indicated on the drawings.

> Covers. Manhole covers shall be fabricated from steel plate with thickness as indicated on the drawings.
>
> Reinforcing Pads. Reinforcing pads shall be provided as indicated on the drawings.

2.7.03 Type 3 Manholes. A Type 3 manhole shall provide an elliptical clear opening at least 14 by 18 inches (350 by 450 mm) and shall be of self-sealing construction, with two steel yokes and a lifting handle on the cover. Each cover shall be hinged from the outside and designed to swing in. The manholes shall withstand, without leaking, the test pressure specified for the pipe in which they are to be installed. The design shall be in accordance with the ASME Code for Unfired Pressure Vessels. Access manholes shall be designed and installed so that flow in the pipe is not obstructed.

2.8 DRAINS AND VENTS. Drains and vents shall be provided at the locations and in the sizes indicated on the drawings. Pipe used for drain and vent piping shall be ASTM A53 standard weight, black steel pipe. Drain valves shall be hose valves. Vent valves shall be resilient seat globe valves. Drain and vent valves shall comply with the requirements of Master Specification Section 15100, Miscellaneous Valves.

2.9 FLANGED JOINTS. Flange faces of flanged joints shall be normal to the pipe axis. Angular deflection (layback) of the flange faces shall not exceed the allowable set forth in Section 4.3 of ANSI/AWWA C207. All flanges shall be refaced after welding to the pipe, if necessary to prevent distortion of connecting valve bodies from excessive flange bolt tightening and to prevent leakage at the joint.

Pipe lengths and dimensions and drillings of flanges shall be coordinated with the lengths and flanges for valves, pumps, and other equipment to be installed in the piping. All mating flanges shall have the same diameter and drilling and shall be suitable for the pressures to which they will be subjected.

Flanges shall be of the slip-on type, except that welding-neck or slip-on flanges welded to short lengths of pipe shall be used where installation of flanges in the field is permitted or required.

2.10 STAB JOINTS. Rubber-gasketed bell-and-spigot (stab type) steel pipe shall be furnished where indicated or specified. The design of the rubber-gasketed bell-and-spigot joints shall be subject to review and acceptance by Engineer.

The difference in circumferential measurements between the outside of the spigot end and the inside of the bell shall be not more than 0.12 inch (3 mm). For pipe with a wall thickness greater than 11/32 inch (8.7 mm), and for 60 inch (1500 mm) and larger pipe, a bar type fabricated spigot shall be furnished. Bends in the pipe wall forming each bell shall have a radius of at least 15 times the pipe wall thickness.

Contractor shall obtain from the fabricator and shall submit certification that the pipe joints will withstand working pressures and test pressures equal to those specified, and documentation that joints of the type proposed have performed satisfactorily under similar conditions.

2.11 MECHANICAL COUPLINGS. The middle ring of mechanical couplings shall have a thickness at least equal to the wall thickness specified herein for the size of pipe on which the coupling is to be used. If the manufacturer's standard thickness is less, that thickness may be used unless allowable pressures are exceeded. The length of each middle ring shall be not less than 10 inches (250 mm) for 36 inch (900 mm) and larger pipe and not less than 7 inches (175 mm) for pipe smaller than 36 inches (900 mm).

When required, the middle rings shall be shop galvanized and the remaining components shall be cleaned and shop primed with 2 mils (50 μm) of a universal primer.

When required, middle rings shall be prepared for coating in accordance with the coating manufacturer's instructions and shall then be coated with 5 mils (125 μm) of liquid epoxy in accordance with ANSI/AWWA C210. The remaining components shall be cleaned and shop primed with 2 mils (50 μm) of a universal type primer.

2.12 GROOVED COUPLINGS. Grooved couplings shall be provided where indicated on the drawings and shall be sized for proper installation on the pipe ends provided. The couplings shall have movement and deflection requirements as needed.

After fabrication, all housing clamps forming the coupling shall be cleaned and primed (as specified for the pipe) by the coupling manufacturer.

2.13 RESTRAINED JOINTS. Restrained joints shall be shall be flanged, welded, flanged coupling adapters with anchor studs, or harnessed, as required, and as specified or indicated on the drawings.

Where indicated on the drawings, mechanically coupled, grooved coupling, or stab type joints shall be restrained with harness bolts and lugs or collars. Joint harnesses shall conform to the details indicated on the drawings. Lugs or collars shall be shop welded to the pipe and coated as specified for the adjacent pipe.

2.14 PROTECTIVE COATINGS AND LININGS. All steel pipe, fittings, specials, wall fittings, and accessories shall be lined, coated, or wrapped as specified herein.

2.14.01 Type of Coating and Lining. Surface preparation shall be in accordance with the coating or lining manufacturer's instructions. Types of protective coating and lining shall be as follows:

Exterior Surfaces in Interior Locations	Shop-applied universal primer. Field painting is covered in Master Specification Section 09900,Painting.
Exterior Surfaces Underground, Including those Encased in Concrete	Coal tar enamel, ANSI/AWWA C203, cement mortar, ANSI/AWWA C205, liquid epoxy, ANSI/AWWA C210, or tape coating, ANSI/AWWA C214, as specified herein. The governing standards shall be as modified herein.
Exterior Surfaces in Contact with Potable Water or Submerged in Water Treatment Process Waters	Cement mortar, ANSI/AWWA C205, or liquid epoxy, ANSI/AWWA C210, as specified herein.
Interior Surfaces	Coal tar enamel, ANSI/AWWA C203, cement mortar - shop applied, ANSI/AWWA C205, liquid epoxy, ANSI/AWWA C210, or cement mortar - field applied, ANSI/ AWWA C602, as specified herein. The governing standards shall be as modified herein.
Pipe Joints	

Couplings	Shop coating as specified for each type of coupling. Field coating as specified for ends of sections.
Ends of Sections	As specified herein.
Machined Surfaces	Rust-preventive compound.

2.14.02 Modifications to the Governing Standards.

2.14.02.01 Coal Tar Enamel Coating. Except as modified or supplemented herein, all materials and their application shall be in accordance with ANSI/AWWA C203, and the appendix thereto when specified herein.

Exterior surfaces of all steel pipe, fittings, and specials which are to be installed underground or which are to be encased in concrete shall be blast cleaned, primed, and coated in the shop with hot-applied coal tar enamel followed by a single layer of outerwrap consisting of glass-fiber felt, polyethylene-kraft paper, or polyethylene-elastomer laminate. The outerwrap shall be coated with shop-applied whitewash or a single layer of kraft paper.

The application of coal tar enamel coating materials, including the preparation of surfaces; priming; and lining and coating of the pipe, fittings, and specials, shall be done in the shop by an established pipe lining and coating company acceptable to the manufacturer of the coal tar enamel materials and to Engineer. Exterior coating shall not be applied until after the specified interior cement mortar lining (if required) has been applied and cured. Repairs of any damage to the shop coating and the field coating of ends where coatings have been held back shall be done by experienced and qualified personnel.

The pipe lining and coating company shall submit an affidavit of compliance indicating that all instructions and requirements of the coating materials manufacturer will be followed and that the company is acceptable to the materials manufacturer.

2.14.02.02 Shop-Applied Cement Mortar Lining. Unless otherwise acceptable to Engineer, cement mortar lining for all 36 inch (900 mm) and smaller steel pipe shall be shop applied. For pipe larger than 36 inches (900 mm), the lining shall be shop applied, or Contractor shall have the option of shop or field applied lining as specified herein. Except as modified herein, shop-applied mortar linings shall comply with ANSI/AWWA C205.

Specials. Wire fabric reinforcement shall be used in the lining of fittings and specials in accordance with Section 4.4.5 of ANSI/AWWA C205.

Adjacent to Valves. If the specified nominal pipe size is the actual outside diameter, cement mortar lining installed in steel pipe adjacent to butterfly valves shall be tapered so that the lining material will not interfere with the valve disc during valve operation.

2.14.02.03 Shop-Applied Tape Coat. Except as modified or supplemented herein, shop-applied tape coating shall comply with ANSI/AWWA C214. The tape coating system shall consist of a primer layer, an inner layer of tape for corrosion protection, and two outer layers of tape for mechanical protection. The total thickness of the tape coating system shall be at least 80 mils (2 mm). The outer layer of tape shall be white.

2.15 SHOP INSPECTION AND TESTING. Except as otherwise indicated or acceptable to Engineer, all materials and work shall be inspected and tested by the pipe manufacturer in accordance with ANSI/AWWA C200. All costs in connection with such inspection and testing shall be borne by Contractor.

Copies of all test reports shall be submitted as set forth in Master Specification Section 01080, Project Submittals.

Owner reserves the right to sample and test any pipe after delivery and to reject all pipe represented by any sample which fails to comply with the specified requirements.

2.15.01 Owner's Inspection at the Shop. If Owner elects to inspect any work or materials, as permitted under Section 1.4 of ANSI/AWWA C200, all costs in connection with the services of Owner's inspector will be paid for by Owner. Additional weld test specimens shall be furnished to Owner's inspector for testing by an independent testing laboratory whenever, in the judgment of Owner's inspector, a satisfactory weld is not being made. Test specimens shall also be furnished when Owner's inspector desires. The entire cost of obtaining, inspecting, and testing of such additional specimen plates, welds, or materials will be borne by Owner. If any specimen is found not to conform to the specified requirements, the materials represented by the specimen will be rejected. The expense of all subsequent tests due to failure of original specimens to comply with the specifications shall be the responsibility of Contractor.

Work to be performed by Owner's inspector at the fabricating shop will include checking of flange alignment after welding to the pipe and tolerances of stab joints, when applicable.

In addition to making or witnessing all specified tests and submitting any required reports to Engineer and Owner, Owner's inspector will submit written reports to Contractor concerning all materials rejected, noting the reason for each rejection.

Inspection by Owner's inspector, or failure to provide inspections, shall not relieve Contractor of his responsibility to provide materials and to perform the work in accordance with the Contract Documents.

2.15.02 Welding Procedures, Welder Qualifications, and Testing. When additional welding requirements are required, they shall be as specified in this paragraph.

All welding procedures, welders, welding operators, and tackers shall be qualified in accordance with AWS D1.1 and as defined in ANSI/AWWA C200. All qualifications shall be in accordance with all-position pipe tests as defined in Section 5 of AWS D1.1.

All shop welds on steel pipe and fittings shall be ultrasonically tested by qualified and certified operators employed by the fabricator. Shop ultrasonic weld tests shall be in accordance with Section 9 of API 5L, 37th Edition. All costs for ultrasonic shop testing shall be paid by Contractor. Contractor and Engineer shall each be furnished a copy of all ultrasonic test reports.

Personnel performing visual inspection of welds shall be qualified and currently certified as Certified Welding Inspectors (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing ultrasonic and radiographic tests shall be qualified and certified according to the requirements of SNT-TC-1A.

Nondestructive examination procedures shall be submitted in accordance with Master Specification Section 01080, Project Submittals at the time welding procedures are submitted. Records of inspection, nondestructive examination, and material certification shall be furnished to Engineer.

All costs for inspection of shop welds shall be paid by Contractor.

PART 3 - EXECUTION

3.1 FIELD INSPECTION. All shop-applied exterior coal tar enamel or tape coatings on pipe, fittings, or specials shall be electrically inspected for holidays and other defects, and repaired if necessary. All electrical inspection shall be made in accordance with Section 6 of ANSI/AWWA C203.

Inspection and repair of exterior coatings shall be performed by and at the expense of Contractor, after receipt of the pipe, fittings, or specials on the job and before installation. Electrical inspection of exterior coal tar enamel or tape coatings after installation of the pipe, fitting, or special in the trench shall be made where, in the opinion of Engineer, the coating may have been damaged by handling during installation.

3.2 PROTECTION AND CLEANING. The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted.

Precautions shall be taken to ensure that foreign matter does not enter the pipe during jointing, lining repair, or inspection operations.

3.3 ALIGNMENT AND GRADE. Pipe shall be laid to the lines and grades indicated on the drawings. Pipelines or runs intended to be straight shall be laid straight. Curves in stab joint pipe may be formed by opening the joint. Maximum joint openings and deflections shall be as recommended by the pipe manufacturer. In welded pipe, deflections up to 4-1/2 degrees (0.079 rad) may be made by shop-mitering one end of one pipe. Deflections up to 22-1/2 degrees (0.393 rad) may be made by shop-mitering the ends of two adjacent sections of pipe by equal amounts. Deflections greater than 22-1/2 degrees (0.393 rad) shall be made by use of fabricated bends.

High points which allow air to collect in pipelines will not be permitted unless an air release valve is indicated on the drawings at that location.

When pipelines must be closely controlled, laser beam equipment, surveying instruments, or other suitable means shall be used to maintain alignment and grade. At least one elevation reading shall be taken on each length of pipe. If laser beam equipment is used, periodic elevation measurements shall be made with surveying instruments to verify accuracy of grades. If such measurements indicate thermal deflection of the laser beam due to differences between the ground temperature and the air temperature within the pipe, precautions shall be taken to prevent or minimize further thermal deflections.

3.4 INSTALLATION.

3.4.01 Buried Piping. For buried piping, all trenching, embedment, and backfilling shall conform to Master Specification Section 02221, Trenching, Backfilling, and Compacting and the details indicated on the drawings.

Whenever pipe laying is stopped, the open end of the line shall be sealed with a watertight plug. All water in the trench shall be removed prior to removing the plug.

Pipe embedment and backfilling shall closely follow the installation and jointing of steel pipe in the trench to prevent flotation of the pipe by water and longitudinal movement caused by thermal expansion or contraction of the pipe.

For restrained joint pipe, not more than 160 feet (48 m) of pipe shall ever be exposed ahead of the backfilling in any section of trench. The backfill adjacent to field joints may be temporarily omitted to provide adequate space for field coating the joints. Closure welds on restrained joint pipe shall be made during the cool part of the day.

3.4.02 Out-of-Round Pipe. Pipe which deviates from a true circle by more than 1 percent shall be laid with its larger diameter vertical, or by using struts or jacks on continuous head and sill timbers to correct the vertical diameter where permitted by Engineer. Struts or jacks shall be left in place until the joints at each end have been completed and embedment and backfill for the section have been placed to at least 12 inches (300 mm) above the top of the pipe. Final inspection, repair, and checking of interior lining shall be performed after the struts or jacks have been removed.

3.4.03 Elongating Vertical Diameter. When required, the vertical diameter of all buried pipe with minimum cover depth as required or so indicated on the drawings, shall be elongated (before backfilling of the trench) by an amount equal to 2 percent of the nominal diameter.

The vertical diameter may be elongated by controlled placement of pipe embedment material or by struts or jacks installed between continuous head and sill timbers padded to protect the lining. Struts or jacks shall be left in place until the joints at each end have been completed and the embedment and backfill for the section have been placed to at least 12 inches (300 mm) above the top of the pipe. Final inspection, repair, and checking of interior lining shall be performed after the struts or jacks have been removed.

3.4.04 Pipe Deflection. After completion of backfilling and before acceptance of the Work, all pipe larger than 30 inches (750 mm) in diameter shall be tested for excessive deflection by measuring the actual inside vertical diameter. Deflection measurements will be made by Engineer. Pipe with diametral deflection exceeding 2 percent of the nominal inside diameter shall be uncovered and the bedding and backfill replaced as needed to prevent excessive deflection. After replacing bedding and backfill, the pipe shall be retested.

3.4.05 Flanged Joints. Care shall be taken in bolting flanged joints to avoid restraint on the opposite end of the piece, which would prevent pressure from being evenly and uniformly applied upon the gasket. The pipe or fitting must be free to move in any direction during installation of bolts. Bolts shall be gradually tightened in a crisscross pattern, to ensure a uniform rate of gasket compression around the entire flange.

Special care shall be taken when connecting piping to pumping equipment to ensure that piping stresses are not transmitted to the pump flanges. All connecting piping shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before any bolts are installed in the flanges. In addition, pump connection piping shall be free to move parallel to its longitudinal center line while the bolts are being tightened. Each pump shall be leveled, aligned, and wedged into position which will fit the connecting piping, but shall not be grouted until the initial fitting and alignment of the pipe so that the pump may be shifted on its foundation if necessary to properly install the connecting piping. Each pump shall, however, be grouted before final bolting of the connecting piping. After final alignment and bolting, the pump connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the pump or opening of the pump connection joints. If any movement is observed, the piping shall be loosened and re-aligned as needed and then the flanges bolted back together. The flange bolts then shall be loosened and the process repeated until no movement is observed.

3.4.06 Couplings. Surfaces of pipe ends and couplings in contact with the sealing gasket shall be clean and free from foreign material when the coupling is installed on the pipe. Wrenches used in bolting couplings shall be of a type and size recommended by the coupling manufacturer. All bolts shall be tightened by approximately the same amount, with all parts of the coupling square and symmetrical with the pipe. Following installation, the exterior coating of each coupling shall be touched up or reprimed.

3.4.07 Insulated Flanged Joints. Insulated flanged joints shall be installed where indicated on the drawings. In addition to one full-faced insulating gasket, each flange insulating assembly shall consist of one full-length sleeve, one insulating washer, and two backing washers for each flange bolt. The insulating gasket ID shall be 1/8 inch (3 mm) less than the ID of the flange in which it is installed. The insulated flanged joint accessories shall be installed in accordance with the instructions and recommendations of the manufacturer.

3.4.08 Stab Joints. Gasket installation and other jointing procedures shall conform to the instructions and recommendations of the pipe manufacturer. All joint surfaces shall be lubricated with heavy vegetable soap solution immediately before making the joint. The lubricant shall be suitable for use in potable water, shall be stored in closed containers, and shall be kept clean. Measurements shall be taken at the joints after installation to ensure that the specified clearances have not been exceeded.

3.4.09 Welded Joints. All welds shall be sound and free from embedded scale or slag, shall have tensile strength across the weld not less than that of the thinner of the connected sections, and shall be watertight. Butt welds shall be used for all welded joints in pipe assemblies and in the fabrication of bends and other specials. Field-welded joints, where permitted, shall be either butt-welded or lap-welded.

Field welding of joints shall conform to ANSI/AWWA C206. Single field-welded butt joints with outside backing rings may be used for pipe larger than 27 inches

(675 mm) in diameter. Backing rings will not be permitted for 27 inch (675 mm) and smaller pipe. Butt straps shall be welded on both the inside and outside of the pipe and at each end of the pipe and strap to avoid stress multiplication.

Field-welded lap joints shall have fillet welds both inside and outside to avoid stress multiplication. The outside weld may be a seal weld.

Testing of welded joints shall be standard, or special procedure, as specified herein.

3.4.09.01 Standard Inspection and Testing. When specified herein, standard shop inspection and testing shall be in accordance with the shop inspection and testing provisions herein.

Field weld test specimens shall be furnished to Engineer for testing by an independent testing laboratory whenever, in the judgment of Engineer, a satisfactory weld is not being made. Test specimens shall also be furnished when Engineer desires. All costs for this testing will be paid by Owner.

3.4.09.02 Special Procedure Inspection and Testing. When specified herein, special procedure shop inspection and testing shall be in accordance with the shop inspection and testing provisions specified herein. Field welding procedures, welders, welding operators, and tackers shall be qualified in accordance with AWS D1.1 and as defined in Section 3 of ANSI/AWWA C206 or ANSI/AWWA C200, as applicable. All qualifications shall be in accordance with all-position pipe tests as defined in Section 5 of AWS D1.1.

The welder qualification testing for field welding shall be conducted at the project site. Results of previous qualification tests will not be accepted. Contractor shall provide the services of an independent testing laboratory to perform the welder qualification. Copies of all test data and certifications shall be submitted to Engineer. All costs of welder qualification testing shall be paid by Contractor.

Upon completion of each field-welded joint, the welding operator shall mark his regular identification number and the last two digits of the year the work was completed, or Contractor may have a records system that traces a welder's work. Steel stamping directly on piping will not be permitted unless "low stress" die stamps, such as interrupted dot or round-nose types, are used.

Field welds will be randomly inspected and tested by an independent testing laboratory as directed by Engineer. Field lap welds will be inspected by magnetic particle or dye penetration methods. Field butt welds will be inspected by the radiographic method and in accordance with the acceptance criteria of API 1104. Contractor shall inform Engineer before welded joints are to be backfilled so that the joint may be inspected. Contractor shall assume all costs of exposing joints that were backfilled before inspection.

Personnel performing visual inspection of welds shall be qualified and currently certified as Certified Welding Inspectors (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing nondestructive tests shall be qualified and certified to the requirements of SNT-TC-1A.

Engineer may also order nondestructive testing by an independent testing laboratory in addition to any testing specified herein.

Except as otherwise specified herein, all costs for inspection and testing of field welds by the independent testing laboratory will be paid by Owner. If the weld is defective, the inspection costs shall be paid by Contractor. Defective welds shall be repaired and retested at Contractor's expense.

Test reports of all laboratory tests shall be submitted as provided for in Master Specification Section 01060, Quality Control.

3.4.10 Flanged Coupling Adapters. Flanged coupling adapters shall be provided where indicated on the drawings and shall be installed in accordance with the coupling manufacturer's recommendations. After the pipe is in place and all bolts have been properly tightened, the location of holes for the anchor studs shall be determined and field drilled. Hole diameter shall be not more than 1/8 inch (3 mm) larger than the diameter of the stud projection. Anchor stud holes shall extend completely through the pipe wall and lining material.

The inner surfaces of the coupling shall be prepared for painting in accordance with the paint manufacturer's instructions and shall then be coated with liquid epoxy in accordance with ANSI/AWWA C210. The remaining surfaces, except flange mating surfaces, shall be cleaned and shop primed with a universal primer.

3.5 WALL SLEEVES. Wall sleeves shall be provided where indicated on the drawings and shall be provided where steel pipe passes through concrete or masonry walls, unless otherwise noted. Where harness lugs are attached to wall sleeves, the sleeves shall be carefully aligned to permit installation of the tie rods. In flange and mechanical joint wall sleeves, holes in the mechanical joint bells and flanges shall straddle the top (or side for vertical piping) center line. The top (or side) center line shall be marked on each flange and mechanical joint piece at the fabricating shop.

3.6 PIPE ANCHORS, BLOCKING, ENCASEMENT, HANGERS, AND SUPPORTS. Pipe anchors, blocking, hangers, and supports shall be installed where and as indicated on drawings and shall be fabricated in accordance with Master Specification Section 15140, Pipe Supports and the details indicated on the drawings, and shall be furnished and installed complete with all concrete bases, anchor bolts and nuts, plates, rods, and other accessories required for proper support of the piping. All piping shall be rigidly supported and anchored so that there is no movement or visible sagging between supports. Where the details must be modified to fit the piping and structures, all such modifications shall be subject to acceptance by Engineer. Unless otherwise permitted, lugs for lateral or longitudinal anchorage shall be shop welded to the pipe.

Concrete reaction anchorage, blocking, encasements, and supports shall be provided as indicated on the drawings or as permitted by Engineer. Concrete and reinforcing steel for anchorages, blocking, encasements, and supports shall conform to Master Specification Section 03300, Cast In Place Concrete and Master Specification Section 03200 Concrete Reinforcement. All pipe to be encased shall be suitably supported and blocked in proper position, and shall be anchored to prevent flotation.

3.7 PROTECTIVE COATINGS AND LININGS.

3.7.01 Field Coating and Repair. Entry into the pipe or pipeline for application of interior linings to unlined ends shall be from open ends or through access manholes, except as otherwise permitted by Engineer. Pour holes shall be permitted as specified herein, and shall consist of 4 inch (100 mm) standard weight black steel pipe welded to the pipe to be lined and covered with a bolted blind flange***.***

Field repair of shop-applied exterior coatings and interior linings shall conform to the following:

For Field-Welded Joints

Coal Tar Enamel	Hold back coating and lining 4 inches (100 mm) from joint. Field repair in accordance with ANSI/AWWA C203.
Cement Mortar	Hold back coating and lining 4 inches (100 mm) from joint. Field repair in accordance with Section 4.6 of ANSI/AWWA C205 as modified herein.
Liquid Epoxy	Hold back coating 4 inches (100 mm) from joint. Field repair in accordance with ANSI/AWWA C210.
Tape Coating	Hold back at least 4 inches (100 mm) from joint. Field repair in accordance with ANSI/AWWA C209, except the total applied tape thickness shall be not

	less than 80 mils (2 mm).
For Flanged Joints	Extend lining to ends of pipe. The coating of exterior surfaces is covered in Master Specification Section 09900, Painting.
For Stab Joints	
Coal Tar Enamel	Hold back the coating on spigots and the lining in bells from joints in accordance with ANSI/AWWA C203. Field repair exterior coating with 20 mils (500 µm) of medium consistency coal tar. Repair lining in accordance with ANSI/AWWA C203.
Cement Mortar	Hold back the coating on spigots and the lining in bells from joints as specified for coal tar enamel coatings in ANSI/AWWA C203. Field repair in accordance with Section 4.6 of ANSI/AWWA C205 as modified herein.
Liquid Epoxy	Hold back the coating on spigots and the lining in bells from joints, and field repair in accordance with ANSI/AWWA C210.
Tape Coating	Hold back the coating on spigots as specified for coal tar enamel in ANSI/AWWA C203. Field repair in accordance with ANSI/AWWA C209.
For Mechanically Coupled Joints	
Coal Tar Enamel	Hold back coating 16 inches (400 mm) from joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Lining shall extend to end of pipe. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.

Cement Mortar	Hold back coating 16 inches (400 mm) from joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Lining shall extend to end of pipe. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Liquid Epoxy	Shop coat in accordance with ANSI/AWWA C210. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Tape Coating	Hold back coating 16 inches (400 mm) from joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.

For Grooved Coupled Joints

Coal Tar Enamel	Hold back coating 6 inches (150 mm) at joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Lining shall extend to end of pipe. Field repair exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Cement Mortar	Hold back coating 6 inches (150 mm) at joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with

	ANSI/AWWA C203. Lining shall extend to end of pipe. Field repair exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Liquid Epoxy	Shop coat in accordance with ANSI/AWWA C210. Field repair exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.
Tape Coating	Hold back coating 12 inches (300 mm) at joints; paint exposed surfaces with 2.5 mil (63 µm) dry film thickness of Type B primer in accordance with ANSI/AWWA C203. Field coat exterior surfaces with 20 mil (500 µm) dry film thickness of medium consistency coal tar. Repair of lining at joints not required.

3.7.02 <u>Modifications to the Governing Standards</u>.

3.7.02.01 <u>Field Repair of Shop-Applied Cement Mortar Lining</u>. Field repair of interior joint surfaces shall be done in accordance with Section 4.6.2 of ANSI/AWWA C205, except that an epoxy bonding agent and latex admixture shall be used in conjunction with the sand and cement mortar. The addition of lime or pozzolan will not be permitted.

The exposed steel shall be thoroughly cleaned and all grease shall be removed. A coat of epoxy bonding agent shall be applied over the area to be lined in accordance with the manufacturer's recommendations. A soupy mixture of cement and water shall be applied over the epoxy after it becomes tacky. Cement mortar to which the latex admixture has been added shall then be packed into the area to be patched and screeded off level with the adjacent cement mortar lining. The patched area shall be given an initial floating with a wood float, followed by a steel trowel finish.

Defective or damaged shop-applied cement mortar linings shall be removed, the surfaces cleaned, and the lining repaired as specified above for joint repair.

3.7.02.02 <u>Field-Applied Cement Mortar Lining</u>. Except as modified herein, field-applied mortar linings shall comply with ANSI/AWWA C602.

Specials. Wire fabric reinforcement shall be used in the lining of fittings and specials in conformance with Section 4.4.5 of ANSI/AWWA C205.

Field Repair. Defective or damaged field-applied cement mortar linings shall be removed, the surfaces cleaned, and the lining repaired as specified for shop-applied cement mortar linings.

3.8 CONNECTIONS WITH EXISTING PIPING. Connections between new work and existing piping shall be made with suitable fittings for the conditions encountered. Each connection with an existing pipe shall be made at a time and under conditions which will least interfere with service to customers, and as authorized by Owner.

Facilities shall be provided for dewatering and for disposal of the water removed from the dewatered lines and excavations without damage to adjacent property.

For pipelines which will convey potable water, special care shall be taken to prevent contamination when dewatering, cutting into, and making connections with potable water piping. Trench water, mud, or other contaminating substances shall not be permitted to enter the lines. The interior of all pipe, fittings, and valves installed in such connections shall be thoroughly cleaned and then swabbed with or dipped in a 200 mg/L chlorine solution.

3.9 PROVISIONS FOR CATHODIC PROTECTION. Provisions shall be made for cathodic protection of underground steel pipelines. An insulated type joint shall be provided at each connection to a steel water tank, each branch connection to an existing or future water line, each connection between concrete pipe or ductile iron pipe and steel pipe, each connection through a structure wall, and where indicated on the drawings. An electrical bond shall be provided across all other gasketed pipeline joints. Test lead stations for monitoring electrical currents on the pipeline shall be provided at locations indicated on the drawings.

3.9.01 Insulated Joints. Insulated flange type joints shall be provided where indicated on the drawings or specified. After installation, protective coatings shall be provided around the joint as specified herein.

3.9.02 Electrical Bond Across Rubber-Gasketed Joints. Two electrical bonding cables shall be provided to and across each mechanical coupling and across each rubber-gasketed stab joint. Before the field joint coating is applied to mechanical couplings, two small areas of metal shall be exposed on the pipe surface each side of the coupling, on the middle ring, and on each follower ring. Before the field joint coating is applied to stab joints, two small areas of metal shall be exposed on each side of the joint. Each area shall be thoroughly cleaned, and two cathodic protection cables shall be bonded to the pipe, one on either side of the joint, and to the middle ring and follower rings for mechanically coupled joints. Each cable shall be bonded by the thermite process. The completed connections and exposed metal surfaces shall be coated as specified for field repair of coatings.

3.9.03 Electrical Bond Across Valves and Flanges. Two electrical bonding cables shall be provided across valves and flanged connections other than insulated flanges. The electrical bond shall be provided as specified for bond across rubber-gasketed joints.

3.9.04 Bonding Cables. Bonding cable and test lead wires shall be not less than 6 AWG (16 mm^2), Type CP copper cathodic protection cable, with low density, high molecular weight polyethylene insulation.

3.9.05 Test Lead Stations. Test lead stations shall be provided where specified or indicated. The test lead stations shall be as specified herein. The test lead wires shall be terminated on the ground surface in a standard connection box at a protected location acceptable to Engineer. Standard connection boxes for test lead stations shall be C.P. Test Services "NM-7" plastic terminal boxes, 18 inches (450 mm) long, with 5 inch (125 mm) inside diameter, a locking cast iron lid, a terminal block with seven terminals, and the inscription "CP TEST" cast into its cover.

3.10 LEAKAGE AND PRESSURE TESTS. After installation, steel piping shall be subjected to a leakage and pressure test.

3.10.01 Leakage. All steel piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.10.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.11 DISINFECTION. The steel piping shall be disinfected after installation as specified herein. The disinfection is to be as specified in Master Specification Section 02675, Disinfection of Water Distribution System.

End of Section

SECTION 15063

LIGHT WALL STEEL PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of light wall steel pipe, fittings, specials, and appurtenances.

Miscellaneous small piping and pipe supports are covered in Master Specification Section 15065, Miscellaneous Steel Pipe, Tubing, and Accessories and Master Specification Section 15140, Pipe Supports .

Light wall steel piping shall be furnished and installed complete with all fittings, specials, flanges, couplings, joint harnesses, anchors, anchor bolts, anchor inserts in concrete, expansion anchors, flange gaskets, flange bolts and nuts, pipe supports and hangers, wall fittings, blind flanges, connections, appurtenances, and accessories, as indicated on the drawings, or otherwise specified herein for proper installation and functioning of the piping.

Piping furnished shall be complete with all jointing materials required for installation of any valves and equipment furnished by others for installation under this contract.

1.2 GOVERNING STANDARDS. Except as modified or supplemented herein, all light wall steel pipe, fittings, and specials shall conform to the applicable requirements of the following standards:

ANSI/AWWA Standards	Title
C200	Steel Water Pipe 6 Inches [150 mm] and Larger
C206	Field Welding of Steel Water Pipe
C208	Dimensions for Steel Water Pipe Fittings

1.3 SUBMITTALS. Drawings, specifications, and other data showing complete details of the fabrication, construction, weld locations, and installation of pipe, fittings, specials, and connections, together with complete data covering all materials proposed for use, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

Pipe, fittings, specials, and appurtenances shall at all times be handled and stored in a manner that will ensure installation in sound, undamaged condition. Handling methods and equipment used shall prevent damage to the coating and shall include the use of wide canvas slings and wide padded skids. Bare cables, chains, hooks, metal bars, or narrow skids shall not be used.

All pipes shall be carefully supported during shipment on padded saddles not less than 12 inches (300 mm) wide. Each end of each length of pipe, fitting, or special shall be laterally supported and braced as needed to ensure that it will maintain a true circular shape. Pipe, fittings, and specials shall be separated so that they do not bear against each other, and the whole load shall be securely fastened to prevent movement in transit.

Any pipe section, fitting, or special, which shows dents, kinks, abrupt changes of curvature other than specified, or other injuries, will be rejected. Contractor shall, at his expense, replace or recondition each rejected section. Reconditioning procedures shall be acceptable to Engineer. Coatings removed in reconditioning pipe, fittings, or specials shall be replaced as specified for the original coating.

PART 2 - PRODUCTS

2.1 BASIS OF DESIGN. Light wall steel pipe, fittings, and specials may be either fabricated or mill type. In either case, all items shall be fabricated to the sizes, dimensions, and shapes indicated on the drawings. Elbows shall be long radius, with the centerline to face dimensions equal to 1.5 times the pipe diameter unless otherwise indicated.

The ratio of pipe diameter to wall thickness shall not exceed 200. Unless otherwise indicated in the Light Wall Steel Pipe Schedule 15063-S01, the wall thickness shall be not less than 0.134 inch (10 gage) (3.42 mm).

Specified nominal pipe size for 14 inch (350 mm) and larger pipe, fittings, and specials shall be the actual outside diameter, in inches (mm).

The outside diameter of 12 inch (300 mm) and smaller pipe shall conform to the dimensions set forth in ANSI/ASME B36.10 for standard weight steel pipe.

Bends, fittings, branch connections, and special sections shall be reinforced or shall have their shell thickness increased so that the combined stresses due to internal pressure and bending will not exceed 50 percent of the yield strength of the material. Contractor shall determine and provide reinforcements or additional shell thickness as needed to keep the combined stresses within the specified maximum. Unless otherwise indicated on the drawings or directed, the internal working pressure for design purposes shall be as indicated in the Light Wall Steel Pipe Schedule 15063-S01. The dead load shall be equal to the weight of the pipe.

2.2 MATERIALS. Unless otherwise required by the drawings, field joints shall be either flanged or mechanically coupled.

Pipe	ANSI/AWWA C200, ASTM A139.
Fittings and Specials	ANSI/AWWA C200.
Dimensions	AWWA C208.
Flanged Joints	
Flanges	Flat faced when connecting to flat faced flanges; otherwise, raised face. Steel plate of the following thickness:

Nominal Pipe Size inches [mm]	Flange Thickness inches [mm]
6 [150]	1/4 [6]
8,10 [200, 250]	5/16 [7.8]
12 [300]	3/8 [9.3]
14-20 [350 - 500]	7/16 [10.9]
24 [600]	1/2 [12.7]
30, 36 [750, 900]	5/8 [15.6]
42, 48 [1200]	3/4 [19]

Material	ASTM A36.
Diameter and Drilling	ANSI/ASME B16.1, Class 25.

Flange Bolting

Material	ASTM A307.
Type	Bolt and nut; bolt-stud and two nuts permitted for 1 inch and larger.
Bolts and Bolt-Studs	
Length	Such that ends project 1/4 to 1/2 inch [6 to 12.7 mm] beyond surface of nuts.
Ends	Chamfered or rounded.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2A fit. Bolt-studs may be threaded full length. Studs for tapped holes shall be threaded to match threading in holes.
Bolt Heads	
Shape	Hexagonal or square.
Dimensions	ANSI/ASME B18.2.2; regular pattern for square, heavy pattern for hexagonal.
Nuts	Hexagonal.
Dimensions	ANSI/ASME B18.2.2, heavy, semifinished pattern.
Threading	ANSI/ASME B1.1, coarse thread series, Class 2B fit.

Gaskets

For Aeration/Backwash Air Service

Raised Face Flanges	Non-asbestos inorganic fiber with EPDM binder; dimensions to suit flange contact fact, 1/16 inch [1 mm] minimum thickness for plain finished surfaces, 3/32 inch [2 mm] minimum thickness for serrated surfaces, rated for 275°F [135°C] service; Garlock "IFG 5507".

Flat Faced Flanges	Premium Grade, EPDM, ring type, 1/8 inch (3 mm) thick, rated for 275°F (135°C) service, Garlock "8314".
Insulating Fittings	
Threaded	Dielectric steel pipe nipple, ASTM A53, Schedule 40, polypropylene lined, zinc plated; Perfection Corp. "Clearflow Fittings".
Flanged	Epco "Dielectric Flange Unions" or Central Plastics "Insulating Flange Unions".
Coupled Joints	
Mechanical Couplings	Dresser "Style 38 Light Pattern Couplings" or Smith-Blair "411 Flexible Coupling", without pipe stop. Elastomers for air piping shall be rated at 275°F (135°C).
Joint Harness	
Bolts	ASTM A193, Grade B7, or Ryerson "Stress-Proof". Minimum yield point 100,000 psi (689 Mpa).
Threading	ANSI/ASME B1.1, Class 2A fit, coarse thread series.
Ends	Chamfered or rounded.
Nuts	Hexagonal, ASTM A307.
Threading	As specified for bolts except Class 2B fit.
Dimensions	ANSI/ASME B18.2.2, heavy, semifinished pattern.
Flat Washers	Steel, ANSI B18.22.1.
Grooved Couplings	ANSI/AWWA C606, Gustin-Bacon "Gruvagrip Series 100" or Victaulic "Style 77", as needed.
Small Branch Connections	

Pipe Nipples	Seamless black steel pipe, ASTM A53, standard weight (Schedule 40).
Welding Fittings	
Threaded Outlets	Bonney "Thredolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Welded Outlets	Bonney "Weldolets", Porter "W-S Teelets", or Vogt "Weld Couplets".
Expansion Joints	Mercer "Style 450N" or Redflex "No. J-1", single arch, spool type with elastomeric body rated for 300°F [149°C], split steel retaining rings, and control rods, unless otherwise indicated.
Watertight/Dusttight Pipe Sleeves and Sealing Elements	O-Z Electrical Manufacturing "Thruwall" and Floor Seals",or Thunderline Corporation "Link-Seal", with modular rubber sealing elements with galvanized bolts.
Pipe Sleeve Sealant	Polysulfide or urethane, as specified in Master Specification Section 07600, Caulking and Sealers.
Insulation	
Hot Pipe	ASTM C547, Class 1 (to 450 F), 1 inch (25 mm) thick; glass fiber, one-piece molded with vapor barrier, flame-retardant all service jacket and self-sealing tabs; CertainTeed "500 Snap-On" or Owens-Corning "Fiberglas 25 ASJ/SSL".
Jacket	Aluminum, ASTM B209, Alclad 3004, 0.020 inch (0.051 mm) thick, machine rolled, with asphalt and kraft paper vapor barrier.
Cold Piping	Fed Spec HH-I-573, tubular, closed cell elastomeric, at least 3/4 inch (19 mm) thick.
Fittings, Flanges, and	ASTM C547, Class 1 (to 450°F (232°C)),

Valves	1 inch (25 mm) thick, factory molded glass fiber fitting insulation; CertainTeed "Snap Form" or Poncho "Poncho Preformed".
Anchor Bolts	Carbon steel, as specified in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

2.3 ENDS OF SECTIONS.

2.3.01 For Field Welding. Ends of pipe, fittings, and specials for field butt welding shall be outside beveled to an angle of 35 degrees, plus or minus 2-1/2 degrees, with the plane of the pipe end, with an average flat at the end of the pipe of 1/16 inch (1.5 mm) plus or minus 1/32 inch (0.75 mm).

2.3.02 For Fitting with Flanges. Ends to be fitted with flanges shall have the longitudinal or spiral welds ground flush as needed to accommodate the type of flanges provided.

2.3.03 For Mechanical Couplings. Ends to be joined by mechanical couplings shall be plain end type. In addition, the welds on ends to be joined by couplings without pipe stops shall be ground flush to permit slipping the coupling in at least one direction to clear the pipe joint. Outside diameter and out-of-round tolerances shall be within the limits specified by the coupling manufacturer.

2.3.04 For Grooved Couplings. Ends to be joined by grooved couplings shall be of the roll grooved type as recommended by the coupling manufacturer.

2.4 PIPE LENGTH TOLERANCE. Standard and special sections shall be within 1/8 inch (plus or minus) of the specified or theoretical lengths. All pipe to be connected with mechanical couplings shall be fabricated so that space between pipe ends within the couplings will not exceed the allowable, as recommended by the coupling manufacturer, but will be at least 1/8 inch (3 mm).

2.5 SPECIAL SECTIONS. All fittings and specials shall be provided with ends as specified, and shall be fabricated to the shapes, sizes, and dimensions indicated on the drawings.

2.6 SMALL BRANCH CONNECTIONS. Small branch connections 2 inches and smaller shall be made using welding fittings with threaded outlets. Where there is some doubt as to the exact outlet size required, but it is known that the size will be less than 1 inch, a 1 inch (25 mm) outlet shall be provided, and reducers used as needed.

Branch connections 2-1/2 inches (63 mm) and larger shall be made using pipe nipples or welding fittings. Pipe nipples and welding fittings shall be welded to the pipe shell and reinforced as required to meet design and test requirements.

Small branch connections shall be located so as not to interfere with joints, supports, or other details.

2.7 DRAINS. Drains shall be provided at the locations indicated on the drawings. Drain valves shall be hose gate valves. Drain valves shall comply with the requirements of the Master Specification Section 15100, Miscellaneous Valves.

Pipe used for drain piping shall be standard weight, galvanized steel pipe.

2.8 FIELD JOINTS. Flanged, welded, and mechanically coupled joints shall be provided at the locations indicated on the drawings. To facilitate installation, additional field welded and mechanically coupled joints may be provided when required. These field joints shall be kept to a minimum, and their location shall be acceptable to Engineer.

2.9 FLANGED JOINTS. Flanged joint faces shall be normal to the pipe axis, with a maximum tolerance of 0.005 inch per foot (0.125 mm/300 mm) of flange diameter. Angular deflection (or layback) of the flange face shall not exceed 0.75 degree from a plane surface and shall be uniform within 0.010 inch (2.5 mm). All flanges, after welding to the pipe, shall be measured and shall be refaced, if necessary, to bring them within the specified tolerances.

Contractor shall coordinate diameter and drilling of flanges furnished in the piping with the flanges for any valves, blowers, vacuum pumps, and other equipment to be installed in the piping.

Blind flanges shall conform in diameter, drilling, and thickness to the flanges to which they attach and shall be reinforced as needed to produce an airtight joint.

2.10 MECHANICAL COUPLINGS.

2.10.01 Couplings. Unless otherwise shown on the drawings, the middle ring of each mechanical couplings shall have a thickness at least equal to that specified for the size pipe on which the coupling is to be used and shall be not less than 7 inches (175 mm) long. The pipe stop shall be omitted from the inner surface of the middle rings of all couplings. The couplings shall be cleaned and shop primed with the manufacturer's standard universal primer.

2.10.02 Joint Harnesses. Where noted or indicated on the drawings, mechanically coupled joints shall be restrained with harness bolts and lugs. Joint harnesses shall conform to the details on the drawings. Lugs shall be shop welded to the pipe and coated as specified for the adjacent pipe.

2.10.03 Grooved Couplings. Grooved couplings shall be sized for proper installation on the grooved pipe provided.

After fabrication, all housing clamps forming the coupling shall be cleaned and primed by the coupling manufacturer as specified for the pipe.

2.11 WELDED JOINTS. All welds shall be sound and free from embedded scale or slag, shall have tensile strength across the weld not less than that of the thinner of the connected sections, and shall be airtight. Butt welds shall be used for all welded joints in line pipe assemblies and in the fabrication of bends and other specials. Fillet welds shall be used for flange attachment. Welding of field joints shall conform to ANSI/AWWA C206.

2.12 PIPE SUPPORTS, ANCHORS, AND HANGERS. Pipe supports, anchors, and hangers shall be fabricated in accordance with the requirements of Master Specification Section 15140, Pipe Supports, or the details indicated on the drawings. Pipe supports, anchors, and hangers shall be furnished and installed complete with all concrete bases, anchor bolts and nuts, plates, rods, and other accessories required for proper installation. Where the details must be modified to fit the piping and structures, all such modifications shall be subject to review and acceptance by Engineer. Lugs required for lateral or longitudinal anchorage shall be shop welded to the pipe.

2.13 PIPE SLEEVES. Piping passing through concrete or masonry shall be installed through sleeves installed before the concrete is placed or when masonry is laid. Pipe sleeves installed through floors provided with a special finish, such as ceramic or vinyl-composition tile, shall be flush with the finished floor surface and shall be provided with nickel or chromium plated floor plates. In all other locations where pipes pass through floors, pipe sleeves shall project not less than 1 inch (25 mm) nor more than 2 inches (50 mm) above the floor surface, with the projection uniform in each floor area. In the case of insulated pipes, the insulation shall extend through pipe sleeves. Where the drawings indicate future installation of pipe, sleeves shall be provided and the ends sealed with suitable plastic caps or plugs.

Holes drilled with a suitable rotary drill will be considered in lieu of sleeves for piping which passes through interior walls and through floors having a special finish.

Unless otherwise indicated on the drawings, all pipes passing through walls or slabs which have one side in contact with earth or exposed to the weather shall be sealed watertight with special rubber-gasketed sleeve and joint assemblies or with sleeves and modular rubber sealing elements.

Piping passing through walls and floors shall be made dusttight and gastight when specified herein, with special rubber-gasketed sleeve and joint assemblies, with sleeves sealed with modular rubber sealing elements, or by caulking with oakum and sealing each end with polysulfide or urethane sealant.

2.14 PROTECTIVE COATINGS. All steel pipe, fittings, specials, and wall fittings shall be prepared and prime coated as specified herein.

2.14.01 Type of Coating. The type of protective coating to be used shall be as follows:

Exterior Surfaces in Interior and Exterior Locations. Exterior surfaces, except machined surfaces, of all pipe, fittings, specials, flanges, anchors, and pipe supports exposed in interior locations and in manholes shall be thoroughly blast cleaned and given a coat of universal primer.

Field painting shall be as specified in the Master Specification Section 9900, Painting.

Interior Surfaces. The interior surfaces of all steel pipe, fittings, and specials shall not be coated.

Machined Surfaces. All machined surfaces shall be shop coated with rust-preventive compound.

2.15 INSULATION. The following systems shall be insulated:

Hot piping	Explosed blower discharge piping less than 8 feet (2.4 m) above finished floor or grade.
Cold Piping	Blower suction piping.

2.16 INSPECTION AND TESTING. Inspection and testing by an independent laboratory will not be required at the fabricating or coating shop; however, the pipe manufacturer shall furnish an affidavit of compliance certifying that all materials used and work performed comply with the specified requirements. Seven copies of the affidavit shall be furnished.

PART 3 - EXECUTION

3.1 INSTALLATION. All piping shall be installed in the location and arrangement indicated on the drawings.

Taps for pressure gauge connections on the suction and discharge of blowers shall be provided with a nipple and a ball type shutoff valve.

Drilling and tapping of pipe walls for installation of pressure gauges or switches will not be permitted.

In all piping, insulating fittings shall be provided to prevent contact of dissimilar metals, including but not limited to, contact of copper, brass, or bronze pipe, tubing, fittings, valves, or appurtenances, or stainless steel pipe, tubing, fittings, valves, or appurtenances with iron or steel pipe, fittings, valves, or appurtenances. Insulating fittings shall also be provided to prevent contact of copper, brass, or bronze pipe, tubing, fittings, valves, or appurtenances with stainless steel pipe, tubing, fittings, valves, or appurtenances.

Branch connections in horizontal runs of steam, air, and gas piping shall be made from the top of the pipe.

3.1.01 Concrete. Concrete reaction anchorage and supports shall be provided where and as indicated on the drawings.

3.1.02 Flanged Joints. Care shall be taken in bolting flanged joints so that there is no restraint on the opposite end of the piece which would prevent pressure from being evenly and uniformly applied to the gasket. The pipe or fitting must be free to move in any direction during installation of bolts. Bolts shall be gradually tightened, each in turn, at a uniform rate of gasket compression around the entire flange.

Special care shall be taken when connecting to equipment to ensure that piping stresses are not transmitted to the equipment flanges by the connected piping. All such piping shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before installation of any bolts in those flanges. In addition, equipment connection piping shall be free to move parallel to its longitudinal center line while the bolts are tightened. Equipment shall be leveled, aligned, and wedged in position to fit the connecting piping. Equipment shall not be grouted until the initial fitting and alignment of the pipe so that the equipment may be shifted on its foundation if necessary to properly install the connecting piping. Each piece of equipment shall be grouted before final bolting of the connecting piping. After final alignment and bolting, the equipment connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the equipment or opening of the equipment connection joints.

3.1.03 Couplings. The ends of the pipe on which couplings are to be placed, and the couplings themselves, shall be clean and free from any dirt or foreign material, especially those surfaces of the pipe and coupling that contact the gaskets. Gaskets shall be kept clean with no foreign matter between them and the packing surfaces. Wrenches used in bolting couplings shall be of a type and size recommended by the coupling manufacturer. All bolts shall be tightened approximately the same amount, with all parts of the coupling square and symmetrical with the pipe. After installation, couplings shall be carefully touched up or reprimed.

3.1.04 Insulation. Pipe insulation shall be provided where indicated on the drawing and shall be neatly installed in accordance with the manufacturer's recommendations. Piping shall be clean and dry and shall have been tested, when testing is required, before insulation is applied.

End and longitudinal joints shall be tightly butted and sealed with lap and butt strips of self-sealing jacket material.

Fittings, flanges, and valves shall be insulated with molded insulation and all service, one-piece jackets installed in accordance with the manufacturer's recommendations. Fitting insulation shall overlap adjacent pipe insulation at least 1 inch (25 mm). Valves shall be insulated up to the gland only.

Pipe hangers shall permit insulation to pass through and suitable saddles shall be provided to prevent the weight of the piping from being supported by the insulation.

3.2 CLEANING. All pipelines shall be clean and free of dirt, rocks, debris, or other foreign material of any kind when placed in service.

The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted.

3.3 PRESSURE AND LEAKAGE TESTING. All specified tests shall be made by and at the expense of Contractor in the presence, and to the satisfaction, of Engineer. Each piping system shall be tested for at least 1 hour with no loss of pressure. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation. Air piping shall be tested using compressed air.

Leakage may be determined by loss-of-pressure, soap solution, chemical indicator, or positive and accurate method acceptable to Engineer. All fixtures, devices, or accessories which are to be connected to the lines and which would be damaged if subjected to the specified test pressure shall be disconnected and the ends of the branch lines plugged or capped during the testing.

All necessary testing equipment and materials, including tools, appliances and devices, shall be furnished and all tests shall be made by and at the expense of Contractor and at the time directed by Engineer.

All joints in piping shall be tight and free of leaks. All joints which are found to leak, by observation or during any specified test, shall be repaired, and the tests repeated.

End of Section

SECTION 15064

STAINLESS STEEL PIPE, TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of stainless steel pipe, tubing and accessories for the services as indicated in the Contract Documents. Pipe and tubing shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Flange gaskets.

Insulating couplings.

Pipe sleeves.

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Stainless steel pipe materials shall be as indicated.

Material Classification	SS-1
Schedule 10S Stainless Steel With Buttwelded Fittings	
Pipe	ASTM A312, Grade TP304L
Fittings	ASTM A774, wrought stainless steel, grade equivalent to pipe, with beveled ends and Schedule 10S wall thickness.
Material Classification	SS-2
Schedule 10S Stainless Steel With Flanged Fittings	
Pipe	ASTM A312 or ASTM A778, Grade TP304L or TP316L.
Fittings	ASTM A774, wrought stainless steel, grade equivalent to pipe, with angle face rings and stainless steel backing flanges.
Material Classification	SS-3
Schedule 40S Stainless Steel With Threaded Fittings	
Pipe	ASTM A312, Grade TP304 or TP316.
Fittings	AISI Type 304 or 316 to match pipe, Class 150, dimensions conforming to ANSI/ASME B16.3.

Material Classification	SS-4
Schedule 40S Stainless Steel With Socket Welded Fittings	
Pipe	ASTM A312, Grade TP304L or TP316L.
Fittings	ASTM A182, F304L or F316L to match pipe, and ANSI B16.11, Class 3000.
Material Classification	SS-5
Schedule 40S Stainless Steel With Buttwelded Fittings	
Pipe	ASTM A312, Grade TP304L or TP316L.
Fittings	ASTM A403, WP304L or WP316L to match pipe, and ANSI/ASME B16.9, Schedule 40S.
Material Classification	SS-6
Stainless Steel Tubing With Compression Fittings	
Tubing	ASTM A269, seamless, Grade TP304 or TP316, annealed, max hardness Rockwell B80; with the following min wall thicknesses:

Tube OD inches (mm)	Wall Thickness inches (mm)
1/4 to 3/8 (6 to 9)	0.065 (1.65)
1/2 to 7/8 (13 to 22)	0.083 (2.11)
1 to 2 (25 to 50)	0.109 (2.77)

Fittings	Compression type, AISI Type 316 stainless steel; Crawford "Swagelok", or Parker Hannifin "CPI" or "Ferulok".
Material Classification	SS-7

Schedule 10S Stainless Steel
With Buttwelded Fittings

Pipe	ASTM A312, Grade TP304L.
Buttwelded Fittings	ASTM A403, WP304L, and ANSI B16.9, Schedule 10S.

2.1.02 Accessory Materials. Accessory materials for the stainless steel pipe systems shall be as indicated.

Material Classification SS-1 and SS-2

Backing Flanges: Stainless steel plate, AISI Type 304 or 316 to match fittings, with ANSI/ASME B16.5, Class 150 diameter and drilling; with the following thicknesses:

Nominal Pipe Size inches (mm)	Flange Thickness inches (mm)
1/2-8 (13-200)	1/2 (13)
10-14 (250-350)	5/8 (16)
16-18 (400-450)	3/4 (19)
20-30 (500-750)	1 (25)
36 (900)	1-1/4 (32)

Flange Bolts and Nuts: ASTM A307, galvanized, length such that, after installation, bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of nut.

Flange Gaskets: Flexitalic "Style CG", spiral wound, AISI Type 304 stainless steel, non-asbestos filler, 3/16 inch (5 mm) nominal thickness, with compression ring 1/8 inch (3 mm) thick to match required flange dimensions.

Material Classification SS-7

Flanges	ANSI B16.5, Class150, flat face, AISI Type 304.
Flange Bolts	ASTM A193, AISI Type 304, ANSI B18.2.1 heavy hex head, length such that, after installation, bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of nut.
Nuts	ASTM A194, AISI Type 304, ANSI B18.2.2 heavy hex pattern.
Flange Gaskets	Flexitalic "Style CG", spiral wound, AISI Type 304 stainless steel, non-asbestos filler, 3/16 inch (5 mm) nominal thickness, with compression ring 1/8 inch (3 mm) thick to match required flange dimensions.
Material Classification	SS-3, SS-4, and SS-5
Flanges	ANSI/ASME B16.5, Class 150, flat faced, AISI Type 304, 304L, 316, or 316L, to match piping.
Flange Bolts	ASTM A193, AISI Type 304, ANSI B18.2.1, heavy hex head, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
Flange Nuts	ASTM A194, AISI Type 304, ANSI/ASME B18.2.2, heavy hex pattern.
Flange Gaskets	ASTM D1330, Grade I, red rubber, ring type, 1/8 inch (3 mm) thick.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation .

3.2 LEAKAGE AND PRESSURE TESTS. After installation, stainless steel piping shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All stainless steel piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15065

MISCELLANEOUS STEEL PIPE, TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous steel pipe, tubing and accessories that is less than 24 inches (600 mm) in diameter for the services as specified herein. Pipe and tubing shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Expansion joints.

Flange gaskets.

Glass lined pipe and fittings.

Grooved and mechanical couplings.

Insulating (dielectric) couplings, threaded and flanged.

Name of Manufacturer.

Type and Model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

1.4.01 Coated Pipe. Handling methods and equipment used shall prevent damage to the protective coating and shall include the use of end hooks, padded calipers, and nylon or similar fabric slings with spreader bars. Bare cables, chains, or metal bars shall not be used. Coated pipe shall be stored off the ground on wide, padded skids. Plastic coated pipe shall be covered or otherwise protected from exposure to sunlight.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Miscellaneous steel pipe materials shall be as indicated.

Material Classification	CSG-1
Standard Weight Galvanized Steel With Threaded Cast Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade A or B; or ASTM A106, of equivalent thickness.
Fittings	Threaded type, ANSI/ASME B16.4, Class 125.
Material Classification	CSG-2
Standard Weight Galvanized Steel With Threaded Malleable Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade A or B; or ASTM A106, of equivalent thickness.

Fittings	Threaded type, ANSI/ASME B16.3, Class 150, or Fed Spec WW-P-521, Type II.
Material Classification	CSG-3
Standard Weight Galvanized Steel With Flanged Cast Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade A or B; or ASTM A106, of equivalent thickness.
Fittings	Flanged type, ANSI/ASME B16.1, Class 125.
Material Classification	CS-1
Standard Weight Steel With Threaded Malleable Iron Fittings	
Pipe	ASTM A53, Type E, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI/ASME B16.3, Class 150, or Fed Spec WW-P-521, Type I.
Material Classificaion	CS-2
Standard Weight Steel With Forged Steel Socket Welded Fittings	
Pipe	ASTM A53, Type S, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI B16.11, Class 3000; Bonney, Crane, Ladish, or Vogt.
Material Classification	CS-3
Standard Weight Steel With Buttwelded Fittings	

Pipe	ASTM A53, Type S, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI/ASME B16.9; standard weight.
Material Classification	CS-4
Extra Strong Steel With Forged Steel Threaded Fittings	
Pipe	ASTM A53, Type S, extra strong, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI B16.11, Class 2000 or 3000; Bonney, Crane, Ladish, or Vogt.
Material Classification	CS-5
Extra Strong Steel With Forged Steel Socket Welded Fittings	
Pipe	ASTM A53, Type S, extra strong, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI B16.11, Class 3000; Bonney, Crane, Ladish, or Vogt.
Material Classification	CS-6
Extra Strong Steel With Buttwelded Fittings	
Pipe	ASTM A53, Type E, extra strong, Grade B; or ASTM A106, of equivalent thickness.
Fittings	ANSI/ASME B16.9; extra strong.
Material Classification	CS-7
Standard Weight Steel With Threaded Cast Iron Fittings	

Pipe	ASTM A53, Type S, standard weight, Grade B; or ASTM A106, of equivalent thickness.
Fittings	Threaded type, ANSI/ASME B16.4, Class 125. When used for lime slurry piping service, fittings and flanges for disassembly and cleaning shall be provided only at the locations indicated on the drawings. Changes in alignment at other locations shall be accomplished by bending the pipe. All bends shall have a radius of at least 3 feet [0.9 m].
Material Classification	CS-8
Steel Hydraulic Tubing With Compression Fittings	
Tubing	ASTM A179, seamless, soft annealed, wall thickness as required.
Fittings	Steel, compression type, Crawford "Swagelok" or Parker Hannifin "CPI".
Material Classification	CS-9
PP Lined Steel Pipe	
Pipe and Lining	ASTM F429.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-10
PVD Lined Steel Pipe	
Pipe and Lining	ASTM F491.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-11
FEP Lined Steel Pipe	

Pipe and Lining	ASTM F546.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-12
PTFE Lined Steel Pipe	
Pipe and Lining	ASTM F423.
Fittings	A587, A106 Grade B, or A53.
Material Classification	CS-13
Glass Lined Steel Pipe	
Pipe	Standard weight steel pipe with flanged ends and Ceramic Coating "Non-Stick Glass Lining" or Vitco "SG-14 Glass Lined Pipe".
Fittings	Ductile iron, as specified in Master Specification Section 15061, Ductile Iron Pipe, with Ceramic Coating "Non-Stick Glass Lining" or Vitco "SG-14 Glass Lined Pipe".
Material Classification	CS-14
Double-Wall Secondary Containment Pipe	Perma Pipe/Ricwil Type "Ultra FS".
Carrier Pipe	Black steel pipe, ASTM A53, Type S, Grade B, Schedule 80.
Containment Pipe	Black steel pipe, ASTM A53, Type S, Grade B, Schedule 40 with FRP filament wound outer covering bonded to steel containment pipe, minimum 0.100 inch [2.5 mm] thick.
Fittings	Factory prefabricated, of the same materials and thickness as the specified pipe.

Leak Detection	Stainless steel leak detection guide tube and stainless steel cable pull wire to allow pulling of the leak detection cable into the containment pipe, both during and after piping installation.

2.1.02 Accessory Materials. Accessory materials for the miscellaneous steel pipe and tubing systems shall be as indicated.

Nipples	ASTM A733, seamless, extra strong (Schedule 80); "close" nipples will be permitted only by special authorization in each case.
Unions (Malleable Iron)	Fed Spec WW-U-53l, Class 2; Type B (galvanized) for galvanized pipe or Type A (black) for ungalvanized pipe.
Flanges	
For Standard Weight Pipe	ANSI/ASME B16.5, Class 150, flat faced when connected to flat faced flanges; otherwise, raised face.
For Extra Strong Pipe	
Chemical Gas Piping	ASTM A105, forged steel, tongue and groove flanged union type, with nonmetallic gasket; rated for a working pressure of 1,500 psi [10.3 MPa].
Digester Gas Piping	ANSI/ASME B16.5, Class 150, flat faced.
Other Services	ANSI/ASME B16.5, Class 300, raised face.
For Plastic Lined Pipe	Steel, forged or cast, diameter and drilling in accordance with ANSI/ASME B16.5, Class 150 or 300 as required.
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch [3 to 10 mm] beyond outer face of the nut.

Flange Gaskets

For Aeration/Backwash Air Service

Raised Face Flanges	Non-asbestos inorganic fiber with EPDM binder; dimensions to suit flange contact face, 1/16 inch [1.5 mm] minimum thickness for plain finished surfaces, 3/32 inch [2 mm] minimum thickness for serrated surfaces, rated for 275°F [135°C] service; Garlock "IFG 5507".
Flat Faced Flanges	Premium Grade, EPDM, ring type, 1/8 inch (3 mm) thick, rated for 275°F (135°C) service; Garlock "8314".

For Boiler Exhaust Service	Garlock "Blue-Gard, Style 3000".
For Oil Service	Non-asbestos filler with neoprene or nitrile binder; dimensions to suit flange contact face; 1/16 inch (1.5 mm) minimum thickness for plain finished surfaces, 3/32 inch (2 mm) minimum thickness for serrated surfaces.
For Heating Water Service	Non-asbestos inorganic fiber with nitrile binder; dimensions to suit flange contact face, 1/16 inch (1.5 mm)minimum thickness for plain finished surfaces, 3/32 inch (2 mm) minimum thickness for serrated surfaces; Garlock "IFG 5500".
For Water Service	ASTM D1330, Grade I, red rubber, ring type, 1/8 inch (3 mm) thick.

For Other Services

Flat Faced Flanges	Non-asbestos filler with neoprene or nitrile binder; dimensions to suit flange contact face; 1/16 inch (1.5 mm) minimum thickness for plain finished surfaces, 3/32 inch (2 mm) minimum thickness for serrated surfaces.

Raised Face Flanges	Continuous stainless steel ribbon wound into a spiral with non- asbestos filler between adjacent coils with a carbon steel gauge ring. Compressed gasket thickness shall be 0.095 inch +/- 0.005 inch (2.4 mm +/- 0.13 mm).
Grooved Couplings	
Rigid	AWWA C606; Gustin-Bacon "No. 120 Rigid" or Victaulic "07 Zero-Flex".
Standard	AWWA C606; Gustin-Bacon "No. 100 Standard" or Victaulic "Style 77".
Mechanical Couplings	Dresser "Style 38" or Smith-Blair "Type 411 Flexible Coupling"; without pipe stop.
Expansion Joints	Flexonics "Model H Expansion Compensators" for 3 inch (75 mm) or smaller; Flexonics "Free Flexing Expansion Joints" with flanged ends and stainless steel bellows for 4 inch (100 mm) or larger.
Material Classification	CS-11
Joining	Carrier pipe shall be joined by socket welding. Containment pipe shall be joined by split sleeve of the same diameter as containment pipe with minimum 60 mil (1.5 mm) thick polyethylene jacket.
End Seal	End seals shall be furnished at all terminal ends. The end seal shall be sealed to the containment pipe.
Leak Detection	Microprocessor based monitoring unit, for continuous monitoring by cable of a single line for water and hydrocarbon.
Control Panel	Modified NEMA Type 12 enclosure, with status and alarm data Model "PAL-AT20C". Power supply to the unit will

	be 120 volt, 1 phase, 60 Hz. Unit shall be UL listed with alarm horn and shall locate leaks and not depend on battery back-up functions. System conditions shall be stored in memory in the event of power failure and shall automatically resume monitoring without reset once power is available. Monitoring unit shall be able to differentiate between water left in pipe during installation and an actual growing leak. Panel shall also be able to detect a break in sensor cable and its location.
Cable	Cable shall be located in the interstitial space between the carrier and containment pipe, shall detect both water and hydrocarbon, and shall be capable of being dried in place without being replaced after exposure to any fluid Type "AGW-Gold". Coaxial cable shall interface monitoring control panel with sensor cable by utilizing waterproof junction box for protecting connection.

2.1.03 Coatings and Linings. Standard weight steel pipe in buried locations shall have exterior surfaces protected with a shop applied plastic coating.

Extra strong steel pipe in buried locations shall have exterior surfaces protected with a shop applied plastic coating, a shop applied tape wrap, or will be coated by others in the field.

All surfaces to be tape-wrapped shall be thoroughly cleaned and primed in accordance with the tape manufacturer's recommendations immediately before wrapping. The tape shall be applied by two-ply (half-lap) wrapping or as needed to provide a total installed tape thickness of at least 60 mils (1.5 mm).

Coatings and linings shall be as indicated.

External Coatings

Plastic	Chevron Chemical Co. "Plexco Plexguard Coating" or Encoat/Lukens "Encoat Extruded Coating". The

	products of other manufacturers will not be acceptable.
Tape Wrap	ANSI/AWWA C209, except single ply tape thickness shall not be less than 30 mils (760 µm); Protecto Wrap "200" or Tapecoat "CT".
Internal Linings	
PP Lining	ASTM F492.
PVDF Lining	ASTM F491.
FEP Lining	ASTM F546.
PTFE Lining	ASTM F423.
Glass Lining	Two-coat system applied over blast-cleaned surface; ground and finish coats separately fired; finished lining thickness at least 8 mils (200 µm), Mohs' Hardness 5 to 6, density 2500 to 3000 kg/m^3 as determined by ASTM D792.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation .

3.2 LEAKAGE AND PRESSURE TESTS. After installation, steel piping shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All steel piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15066

FIBERGLASS REINFORCED PLASTIC PIPE

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installation of low pressure fiberglass reinforced plastic pipe for exhaust air systems as indicated in the Contract Documents. Piping shall furnished complete with all fittings, transitions, jointing materials, expansion joints, and other necessary appurtenances.

Pipe supports are covered in Master Specification Section 15140, Pipe Supports. Anchors are covered in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

Pipe trenching, bedding, and backfill are covered in Master Specification Section 02221, Trenching, Backfilling, and Compacting.

1.2 GENERAL.

1.2.01 Coordination. Contractor shall verify that each component of the system furnished is compatible with all other parts of the system, that all piping and materials are appropriate for the expected services, and that all devices necessary for a properly functioning system have been provided.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.2.03 Pipe Identification. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data and catalog cuts, and shop assembled layout drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications shall include, but shall not be limited to, the following:

Pipe

Manufacturer’s name.

Brand designation.

Type of resin.

Pressure, vacuum, and temperature rating of pipe.

Certification of compliance with referenced standards.

Layouts and dimensions of subassemblies to be shipped.

Where the pipe sizes needed for the project are larger than the named manufacturer's standard pipe sizes, the following information shall be submitted for the pipe and fittings that are being provided:

Manufacturer's name.

Certified statement that covers construction and test methods.

Material sources.

Material types.

Average reinforced wall thickness for each pipe size.

Minimum reinforced wall thickness for each pipe size.

Average outside diameter for each pipe size.

Liner material.

Nominal liner thickness for each pipe size.

Expansion Joints

Name of manufacturer.

Type and model.

Materials of construction.

Force required for expansion and contraction.

Contractor shall submit procedures and results of all shop and field testing.

1.4 QUALITY ASSURANCE.

1.4.01 Manufacturer's Field Services. When indicated in the Contract Documents, the pipe manufacturer shall provide hands-on training for the installation contractor's employees in the proper assembly of butt joints. The pipe manufacturer's representative shall be on-site for at least one 8-hour day, during which they shall observe the assembly of at least three butt joints. The pipe manufacturer shall provide hands-on training for the installation contractor's employees in the proper assembly of butt joints. The pipe manufacturer shall submit written certification that the installation contractor's employees have satisfactorily completed all training and instruction and can perform the jointing required for this project in accordance with the pipe manufacturer's recommendations and as specified herein. All field butt joints shall be made by representatives of the pipe manufacturer or by employees of the installation contractor who have been trained and certified by the pipe manufacturer.

All fitters who fabricate and install piping with butt joints shall be qualified for this project. Training and qualification shall be provided by an authorized representative of the pipe manufacturer. Qualified fitters shall carry and have visible at all times a certificate of qualification issued by the pipe manufacturer. Contractor shall arrange the qualifying training.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Pipe and fittings shall be properly supported to avoid damage caused by flexural strains. Pipe and fittings shall not be thrown or dropped.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Fiberglass reinforced pipe will be used in the service conditions as indicated in the Contract Documents.

Pipe and appurtenances used in ventilation exhaust air or odor control systems will be continuously exposed to a humid environment containing hydrogen sulfide gas. Pipe and appurtenances used in emergency gas treatment exhaust systems will be exposed to chlorine gas.

2.2 DESIGN REQUIREMENTS.

2.2.01 Minimum Pipe Wall Stiffness. The minimum pipe wall stiffness, at 5 percent deflection, determined in accordance with ASTM D2412 and Section 3 of AWWA C950, shall be not less than the following:

Nominal Pipe Diameter		Pipe Stiffness	
inches	(mm)	psi	(kPa)
1-8	(25-200)	36	(250)

10	(250)	18	(125)
12-16	(300-400)	9	(62)
18 and larger, buried	(450 and larger, buried)	10 or greater as required	(70)
18 and larger, other locations	(450 and larger, other locations)	5	(35)

2.2.02 Temperature. All pipe, fittings, and appurtenances shall be suitable for the temperature conditions as indicated in the Contract Documents.

2.2 ACCEPTABLE MANUFACTURERS. The fiberglass reinforced plastic pipe, fittings and specials provided under this section shall be from the manufacturer as specified herein without exception.

2.3 MATERIALS.

Epoxy Pipe

Centrifugally Cast, 14 inches (350 mm) and smaller	ASTM D2997, RTRP-21C, centrifugally cast, reinforced epoxy resin pipe with 30 mil (750 µm) liner; Fibercast "Centricast III EP"; without exception.

Filament-Wound

16 inches (400 mm) and smaller	ASTM D2996, RTRP-11FE-111, RTRP-11FF-312, and RTRP-11FQ-311, with at least a 20 mil (500 µm) reinforced liner; Ameron "Bondstrand Series 2000"; Conley "Schedule 20E"; or Smith Fiberglass Products "Green Thread"; without exception.
18 through 20 inches (450 through 500 mm)	ASTM D2310, RTRP-11FQ, with at least a 20 mil (500 µm) reinforced liner; Conley "Schedule 20E"; without exception.

Vinyl Ester Pipe

16 inches (400 mm) and smaller	ASTM D2996, RTRP-12ED-101, RTRP-12EF-311, RTRP-12EQ-311, or RTRP-12EU-311, with vinyl ester resin and at least a 20 mil (500 µm) reinforced liner;

	Ameron "Bondstrand Series 5000"; Conley "Schedule 20V"; Fibercast "F-Chem 1222" or "F-Chem-V"; or Smith Fiberglass Products "Poly Thread"; without exception.
18 inches (450 mm) and larger	ASTM D2310, RTRP-12ED, -11EQ, or -12EU, with vinyl ester resin and at least a 20 mil (500 µm) reinforced liner; Ameron "Bondstran Series 5000"; Conley "Schedule 20V"; Fibercast "F-Chem-V"; or Smith Fiberglass Products "Big Thread LVV"; without exception.
Fittings	Manufacturer's standard, glass fiber reinforced, compatible with the pipe and with chemical resistance equal to or greater than the pipe.
Flanges	ASTM D3982
Flange Bolts or Studs	ASTM A307, Grade B, galvanized or ASTM F593, Type 304 stainless steel as required; length such that, after installation, bolts will project 1/8 to 3/8 inch (3 to 9 mm) beyond the outer face of the nut.
Nuts	ASTM A307, Grade B, galvanized or ASTM F594, Type 304 stainless steel.
Flat Washers	ANSI B18.22.1, plain, galvanized or ANSI B18.22.1, Type 304 stainless steel.
Flange Gaskets	Full face, ASTM D2240, Type A durometer 50-70; at least 1/8 inch (3 mm) thick, neoprene, viton, or nitrile material.
Bell-and-Spigot Joints	Matched tapered bell-and-spigot ends bonded with adhesive.
Butt Joints	Butt and wrap, resin bonded, PS-15, with pressure rating equal to the pipe.
Expansion Joints	As specified herein.
Adhesive	Pipe manufacturer's standard.

All pipe, fittings and appurtenances shall contain ultraviolet (UV) inhibitors. Resins used in the piping system laminates shall have a flame spread rating of 25 or less when tested in accordance with ASTM E84.

2.4 FABRICATION.

2.4.01 Jointing Method. Unless otherwise specified, 14 inch (350 mm) and smaller pipe shall have coupled adhesive bonded joints. Sixteen inch (400 mm) and larger pipe shall have bell-and-spigot or butt joints. Shop fabricated assemblies should be provided to the maximum extent possible, to minimize the number of field joints.

Flanged joints shall be provided at each damper and item of equipment to facilitate disassembly, at each change in material, and where indicated on the drawings. Bolts, nuts, washers, and gaskets shall be provided for all flanged connections in the piping system, including connections to equipment.

Field butt joints shall be located at least 12 inches (300 mm) from any increasing or decreasing cross-section of pipe where the pipe to be jointed has the same diameter.

2.4.02 Butt Joints. Butt joints shall be provided in accordance with the manufacturer's recommendations and as specified herein. Twenty inch (500 mm) and larger pipe shall be overlaid both inside (when accessible) and outside. Eighteen inch (450 mm) and smaller pipe shall be overlaid on the outside only. The minimum width of the overlay shall be as specified in the following table. Inside overlaps shall be made to seal the joint but shall not be considered in meeting the strength requirements.

Pipe Size		Minimum Total Width of Overlay	
Inches	(mm)	Inches	(mm)
18-20	(450-500)	14	(350)
24-36	(600-900)	18	(450)
42-54	(1050-1350)	24	(600)
60-72	(1500-1825)	26	(650)

Finished joints shall be built up in successive layers, shall be as strong as the pieces being joined, and shall be as crevice-free as is commercially practicable, in accordance with ASTM D2563. The width of the first layer shall be at least 4 inches (100 mm). Successive layers shall be increased uniformly to provide the specified minimum total width of overlay which shall be centered on the joint. Crevices between jointed pieces shall be filled with resin, leaving a smooth inner surface. The interior of joints shall also be sealed by covering with not less than 0.1 inch (2 mm) of liner of the same material as the pipe.

2.4.03 Transitions. Fiberglass reinforced plastic transition sections shall be furnished for connecting round pipe to rectangular openings on equipment. Transitions shall have a pressure rating and wall stiffness equal to those of the pipe. Internal lining shall be of the same type of material and thickness as specified for the pipe. Transitions shall have flanged end connections compatible with the connecting pipe and equipment.

2.4.04 Expansion Joints. Expansion joints shall be furnished at the locations indicated on the drawings and at other locations required for proper pipe installation. Expansion joints shall be resistant to ultraviolet light and shall be suitable for the service conditions.

Expansion joints shall be slip-on or flange type. The slip-on type shall be sized to fit tightly on the outside circumference of the pipe and shall be secured in place by adjustable, corrosion-resistant band type clamps. Flange type expansion joints shall have split steel retaining rings and shall have diameter and drilling to match the pipe flanges.

Expansion joints shall be designed to compress 1 inch (25 mm) and to elongate 1 inch (25 mm) with a maximum force to cause movement of 100 lbs (445 N) or less. The joints shall also allow lateral deflections of up to 1 inch (25 mm).

PART 3 - EXECUTION

3.1 INSPECTION. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation. Any pipe that is damaged or shows evidence of contamination shall not be installed in the piping system.

3.2 PREPARATION.

3.2.01 Field Measurement. Pipe shall be cut to measurements taken at the site, not from the drawings. All necessary provisions shall be made in laying out piping to allow for expansion and contraction. Piping shall not obstruct openings or passageways. Pipes shall be held free of contact with building construction to avoid transmission of noise resulting from expansion.

3.3 INSTALLATION. Pipe shall be installed as specified and as indicated on the drawings. All necessary provisions shall be taken in the fabrication and installation of piping to provide for expansion and contraction. Expansion joints shall be installed.

The piping shall be supported as indicated on the drawings and in accordance with the requirements of Master Specification Section 15140, Pipe Supports.

The inside of pipe, fittings, and transitions shall be smooth, clean, and free from blisters, when installed.

3.3.01 Pipe Sleeves. Piping passing through concrete or masonry shall be installed through sleeves installed before the concrete is placed or when masonry is laid.

3.3.02 Pipe Joints. Pipe joints shall be carefully and neatly made in accordance with the following specified requirements.

3.3.02.01 Adhesive Bonded Joints. All joint preparation, cutting, and jointing for adhesive bonded joints shall comply with the pipe manufacturer's recommendations. Adhesive shall be mixed and applied in accordance with the manufacturer's recommendations. Newly assembled joints shall be suitably blocked or restrained to prevent movement during the recommended curing period.

3.3.02.02 Flanged Joints. Flange bolts shall be tightened sufficiently to slightly compress the gasket and make a good seal, but not so tight as to distort the flanges. A flat washer shall be installed under each nut and bolt head.

3.3.02.03 Butt Joints. Butt joints shall be made in accordance with the manufacturer's recommendations and as specified herein.

The inner surface shall be free of cracks and crazing, with a smooth finish, and with an average of not more than two pits per square foot (21 pits per square meter), provided the pits are less than 1/8 inch (3 mm) in diameter, not more than 1/32 inch (0.7 mm) deep, and covered with sufficient resin to avoid exposure of inner surface fabric. Some waviness is permissible as long as the surface is smooth and free of pits. Such surfaces may be reinforced with glass surfacing mat, synthetic fibers, or other suitable material.

3.3.03 Alignment. Piping installed below grade shall be laid to the lines and grades indicated on the drawings. Batter boards, laser beam equipment, or surveying instruments shall be used to maintain alignment and grade.

Batter boards, if used, shall be erected at intervals of not more than 25 feet (7 m). Batter boards shall be used to determine and check pipe subgrades. At least three batter boards shall be maintained in proper position at all times when trench grading is in progress.

If laser beam equipment is used, periodic elevation measurements shall be made with surveying instruments to verify accuracy of grades. If such measurements indicate thermal deflection of the laser beam due to differences between the ground temperature and the air temperature within the pipe, precautions shall be taken to prevent or minimize further thermal deflections.

3.3.04 Laying Pipe. Pipe installed below grade shall be protected from lateral displacement by placing the specified pipe embedment material. Pipe shall not be laid in water or under unsuitable weather or trench conditions.

Pipe laying shall begin at the lowest elevation with bell ends facing the direction of laying, except when reverse laying is permitted by Engineer.

Whenever pipe laying is stopped, the open end of the pipe shall be closed with an end board closely fitting the end of the pipe, to keep sand and earth out of the pipe. The end board shall have several small holes near the center to permit water to enter the pipe and to prevent flotation in the event of flooding of the trench.

3.4 FIELD QUALITY CONTROL.

3.4.01 Butt Joint Procedure Training. When training isindicated in the Contract Documents , the pipe manufacturer shall submit written certification that the installation contractor’s employees have satisfactorily completed all training and instruction and can perform the jointing required for this project in accordance with the pipe manufacturer’s recommendations and as specified herein.

3.4.02 Field Testing. All necessary testing equipment and materials, including tools, appliances, and devices, shall be furnished by Contractor. All tests shall be made by and at the expense of Contractor and at such time as directed by Engineer. All tests shall be conducted in a manner acceptable to Engineer and shall be repeated as many times as necessary to demonstrate compliance with specified requirements. Engineer shall be present during all testing. The piping system shall be tested at 0.75 psi (5 kPa) pressure with air for at least 1 hour, and shall not leak. All joints which are found to leak, by observation or during testing, shall be repaired by Contractor, and tests repeated.

Leakage may be determined by loss of pressure or other method acceptable to Engineer. All equipment or other accessories which would be damaged if subjected to the specified test pressure shall be disconnected, and ends of branch lines plugged or capped, as required, during the testing procedures.

End of Section

SECTION 15067

MISCELLANEOUS PLASTIC PIPE, TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous plastic pipe, tubing and accessories for the services as indicated in the Contract Documents. Pipe and tubing shall be furnished complete with all fittings, flanges, unions, jointing materials and other necessary appurtenances.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all materials provided under this section.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete specifications, data, and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but not be limited to, the following:

Chemical resistant waste pipe and fittings.

Expansion joints.

Flange gaskets.

FRP double wall pipe and fittings.

Gas pipe and fittings.

Pipe sleeves.

Polyethylene pipe and fittings.

Polypropylene pipe and fittings.

PVC pipe and fittings.

CPVC pipe and fittings.

PVDF pipe and fittings

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

Pipe, tubing, and fittings shall be stored between 40°F and 90°F (4°C and 32°C).

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Miscellaneous plastic pipe materials shall be for the services as indicated in Miscellaneous Plastic Pipe, Tubing and Accessories Schedule 15067-S01.

Material Classification	FRP-1
FRP Pipe	
Pipe	ASTM D2996, filament-wound, glass fiber reinforced, vinyl ester resin pipe with 20 mil (500 μm) reinforced resin-rich liner; Fibercast "F-Chem 1222" or Smith Fiberglass Products "Poly Thread".
Fittings and Flanges	Glass fiber reinforced, compatible with the specified pipe, with ratings and chemical resistance equal to or greater than the specified pipe.

Material Classification	PVC-1
Schedule 40 PVC Pipe With Solvent Welded Joints	
Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Fittings	ASTM D2466, Cell Classification 12454-B, bearing NSF seal.
Material Classification	PVC-2
Schedule 80 PVC Pipe With Solvent Welded Joints	
Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Fittings	ASTM D2467, Cell Classification 12454-B, bearing NSF seal.
	Flanges or unions shall be provided where needed to facilitate disassembly of equipment or valves. Flanges or unions shall be joined to the pipe by a solvent weld.
	When acceptable to Engineer, threaded joints may be used instead of solvent welded joints in exposed interior locations for the purpose of facilitating assembly. The use of threaded joints in this system shall be held to a minimum.
Material Classification	PVC-3
Schedule 80 PVC Pipe With Threaded Joints	
Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Fittings	ASTM D2464, Cell Classification 12454-B, bearing NSF seal.

Material Classification	PVC-4
PVC DWV Pipe (Single Wall) With Solvent Welded Joints	
Pipe	ASTM D1785, cell classification 12454-B, bearing NSF seal.
Fittings	ASTM D2665 and ASTM D3311, cell classification 12454-B, bearing NSF seal.
Material Classification	PVC-5
PVC DWV Pipe (Double Wall Containment) With Solvent Welded Joints	
Pipe	Sloan "GSR Contain-it"; with manufacturer's standard spacers, fittings, and suitable chemical service solvent or equal.
Fittings	ASTM D2665 and ASTM D3311, cell classification 12454-B, bearing NSF seal.
Material Classification	PVC-6
PVC Underdrain Pipe and Fittings	
Pipe	ASTM F758, solid or perforated wall, as specified herein, Cell Classification 12454-C or 12364-C, Type PS 46, with solvent welded or elastomeric gasket joints, as specified herein.
Fittings	ASTM D3034, Cell Classification 12454-B or 12454-C, wall thickness SDR 35, with solvent welded or elastomeric gasket joints, as specified herein.
Material Classification	PVC-7

Double-Contained Chemical Feed Pipe	
System	Prefabricated system consisting of primary pipe supported within a Schedule 80 PVC secondary containment housing. Primary pipe material and fittings shall be as specified for single-contained piping for the respective chemical.
Containment Pipe	ASTM D1785, Cell Classification 12454-B, bearing NSF seal.
Interstitial Supporting Devices	Polypropylene spider clips or C-type, within the secondary containment pipe.
Material Classification	CPVC-1
Schedule 80 CPVC Pipe With Solvent Welded Joints	
Pipe	ASTM F441, Schedule 80, Cell Classification 23447-B, bearing NSF seal.
Fittings	ASTM F439, Cell Classification 23447-B, bearing NSF seal.
	Flanges or unions shall be provided where needed to facilitate disassembly of equipment or valves. Flanges or unions shall be joined to the pipe by a solvent weld.
	When acceptable to Engineer, threaded joints may be used instead of solvent welded joints in exposed interior locations for the purpose of facilitating assembly. The use of threaded joints in this system shall be held to a minimum.
Material Classification	PE-1

PE Pipe (4 inch [100 mm] and smaller) With Socket Fusion Fittings	
Pipe	ASTM D3350, Cell Classification PE345434C.
	ASTM D2513, IPS, SDR11; Chevron Chemical Co. "Plexco Yellow-stripe PE3408 Gas Pipe".
Fittings	ASTM D1248, Type III, Class C, Grade P34.
	ASTM D2683, socket type, with wall thickness same as for pipe.
Material Classification	PE-2
PE Pipe (6 inch [150 mm] and larger) With Butt Fusion Fittings	
Pipe	ASTM D3350, Cell Classification PE345434C.
	ASTM D2513, IPS, SDR11; Chevron Chemical Co. "Plexco Yellow-stripe PE3408 Gas Pipe".
Fittings	ASTM D1248, Type III, Class C, Grade P34.
	ASTM D3261, butt heat fusion type, with wall thickness same as for pipe.
Material Classification	PE-3
PE Tubing With Compression Fittings	
Tubing	1/8 through 5/8 inch [3 through 16 mm] OD, 1/16 inch [1 mm] wall thickness, 130°F [54°C] max operating temperature.

Fittings	As recommended by the chlorine feed system manufacturer.
Material Classification	PE-4
PE Pipe	
Pipe	ASTM D3350, Cell Classification PE334434C.
	ASTM F714, DR as specified herein, Phillips "Driscopipe 1000", "Driscopipe 8600", or Plexco "PE 3408", as specified herein.
Fittings	Molded or manufactured from pipe; cell classification of material and pressure rating same as for pipe.
Material Classification	PE-5
Corrugated PE Drainage Tubing and Fittings	AASHTO M252 and ASTM F405, with solid or slotted wall, as specified herein.
Material Classification	PE-6
Polyethylene Tubing and Fittings	1/8 through 3/4 inch [3 through 19 mm] OD, 1/16-inch wall thickness, 130°F maximum operating temperature with compression fittings.
Material Classification	PP-1
Schedule 40 PP Pipe With Socket Fusion Fittings	
Pipe	ASTM D4101, Class 1, virgin, unpigmented homopolymer without additives or UV stabilizer; Enfield or Orion.
	Dimensions in accordance with ASTM D2447.

Fittings	Same material as pipe.
	Socket fusion type compatible with the pipe; Enfield or Orion.
Material Classification	PP-2
PP DWV Pipe With Heat Fused Joints	
Pipe	Schedule 40, ASTM D4101. Orion "Brownline" for standard type or "Blueline" for flame retardant type, Enfield, or R&G Sloan.
Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard heat fused socket joint. Solvent weld joints not permitted.
Material Classification	PP-3
PP DWV Pipe With Mechanical Joints	
Pipe	Schedule 40, ASTM D4101. Orion "Brownline" for standard type or "Blueline" for flame retardant type, Enfield, or R&G Sloan.
Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard.
Material Classification	PVDF-1
PVDF DWV Pipe With Heat Fused Joints	
Pipe	Schedule 40, UL 94-VO, non-combustible. Orion or equal.

Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard heat fused socket joint. Solvent weld joints not permitted.
Material Classification	PVDF-2
PVDF DWV Pipe With Mechanical Joints	
Pipe	Schedule 40, UL 94-VO, non-combustible. Orion or equal.
Fittings	Schedule 40, drainage pattern. Fittings and pipe shall be provided by the same manufacturer.
Joints	Manufacturers' standard.
Material Classification	PVDF-3
Schedule 80 PVDF With Socket Type Heat Fusion Welded Joints	
Pipe	ASTM D3222 for Type 1 homopolymers. Manufactured to wall thicknesses specified in ASTM D1785 for Schedule 80 Pipe.
Fittings	ASTM D2467.
	Flanges or unions shall be provided where needed to facilitate disassembly of equipment or valves. Flanges or unions shall be joined to the pipe by a heat fusion weld.
	When acceptable to the Engineer, threaded joints may be used instead of solvent welded joints for the purpose of facilitating disassembly. The use of threaded joints in this system shall be held to a minimum.

Material Classification	PVDF-4
Schedule 80 PVDF With Threaded Joints	
Pipe	ASTM D3222 for Type 1 homopolymers manufactured to wall thicknesses specified in ASTM D1785 for Schedule 80 Pipe.
Fittings	ASTM D2464.
Material Classification	RPT-1
Reinforced Plastic Tubing	Wire reinforced PVC hose; Cobon Plastics Corp. "Cobovin Type S" or NewAge Industries Inc. "Vardex".

2.1.02 Accessory Materials. Accessory materials for the miscellaneous plastic pipe systems shall be as indicated.

Material Classification	FRP-1
Flanges	Diameter and drilling shall conform to ANSI/ASME B16.5, Class 150.
Flange Bolts and Nuts	ASTM A307, Grade B, galvanized, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
Flat Washers	ANSI B18.22.1, plain, galvanized.
Flange Gaskets	Full face, 1/8 inch (3 mm) thick, chemical-resistant elastomeric material suitable for the specified service.
Expansion Joints	Edlon "Thermo-molded TFE" or Resistoflex "Style R6905" molded expansion joint.
Material Classification	PVC-1 through PVC-7, and PVDF-1 through PVDF-4
Flanges	Diameter and drilling shall conform to

	ANSI/ASME B16.5, Class 150.
	Schedule 80 for DWV systems.
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
	Stainless steel for DWV and sulfuric acid feed systems, galvanized steel for all other systems.
Flat Washers	ANSI B18.22.1, plain.
	Stainless steel for DWV and sulfuric acid feed systems, galvanized steel for all other systems.
Flange Gaskets	Full face, 1/8 inch (3 mm) thick, chemical-resistant elastomeric material suitable for the specified service.
Expansion Joints	Edlon "Thermo-molded TFE" or Resistoflex "Style R6905" molded expansion joint.
Material Classification	CPVC-1
Flanges	Diameter and drilling shall conform to ANSI/ASME B16.5, Class 150.
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut.
	Stainless steel for chemical feed systems, galvanized steel for all other systems.
Flat Washers	ANSI B18.22.1, plain.
	Stainless steel for chemical feed systems, galvanized steel for all other systems.

Flange Gaskets	Full face, 1/8 inch (3 mm) thick, chemical-resistant elastomeric material suitable for the specified service.
Expansion Joints	Edlon "Thermo-molded TFE" or Resistoflex "Style R6905" molded expansion joint.
Material Classification	PE-1 through PE-6
Flanges	Schedule 80 PVC; diameter and drilling shall conform to ANSI/ASME B16.5, Class 150.
Flange Bolts and Nuts	ANSI B18.2.1, ASTM A193, AISI Type 304, heavy hex head, length such that after installation the bolts will project 1/8 to 3/8 inch (3 to 10 mm) beyond outer face of the nut. ASTM A194, AISI Type, ANSI/ASME B18.2.2, heavy hex pattern.
Fittings and Flange Adapters	Molded or manufactured from the pipe; cell classification of material and pressure rating same as for pipe.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation.

3.2 LEAKAGE AND PRESSURE TESTS. After installation, plastic piping shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All plastic piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

3.3 SCHEDULE. See Miscellaneous Plastic Pipe, Tubing and Accessories Schedule 15067-S01.

End of Section

SECTION 15069

CAST IRON SOIL PIPE AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of cast iron soil pipe and accessories for the services as indicated in the Contract Documents. Cast iron soil pipe shall be furnished complete with all fittings and other accessories specified herein.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. Complete specifications, data and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but shall not be limited to, the following:

Gaskets.

Sleeves.

Name of Manufacturer.

Type and Model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.3 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Cast iron soil pipe materials shall be as indicated.

Material Classification	CI - 1
Bell and Spigot	
Pipe and Fittings	Bell and spigot type, ASTM A74.
Jointing Material	Rubber gaskets, ASTM C564.
Material Classification	CI - 2
Hubless	
Pipe and Fittings	Hubless type, CIPSI 301.
Jointing Material	Rubber sleeves, CIPSI 310.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation.
3.2 LEAKAGE AND PRESSURE TESTS. After installation, cast iron soil pipe shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All cast iron soil piping shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15070

COPPER TUBING AND ACCESSORIES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of copper tubing and accessories for the services as indicated in the Contract Documents. Copper tubing shall be furnished complete with all fittings, flanges, unions, and other accessories specified herein.

1.2 SUBMITTALS.

1.2.01 Drawings and Data. Complete specifications, data and catalog cuts or drawings shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Items requiring submittals shall include, but shall not be limited to, the following:

Expansion joints.

Flange gaskets.

Insulating (dielectric) couplings, threaded and flanged.

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Pressure and temperature rating.

Manufacturer shall submit certification that each item furnished is in accordance with the reference standards.

Contractor shall submit procedures and results of all shop and field testing.

1.3 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools. All materials shall be stored in a sheltered location above the ground, separated by type, and shall be supported to prevent sagging or bending.

PART 2 - PRODUCTS

2.1 MATERIALS.

2.1.01 Pipe Materials. Copper tubing materials shall be as indicated.

Material Classification	CU-1
Water Tubing With Flared Fittings	
Tubing	Soft annealed copper tubing, ASTM B88, Type K.
Fittings	Flared, ANSI/ASME B16.26.
Material Classification	CU-2
Water Tubing With Flanged Fittings	
Tubing	Hard drawn copper tubing, ASTM B88, Type L.
Fittings	Flanges, ANSI B16.24, Class 150, cast bronze, brazed joint.
Material Classification	CU-3
Water Tubing With Solder Joints	
Tubing	Hard drawn copper tubing, ASTM B88, Type L.
Fittings	Solder joint, ANSI B16.18, or ANSI/ASME B16.22.
Material Classification	CU-4
Chemical Feed Tubing With Union Fittings	
Tubing	Soft annealed copper tubing, ASTM B88, Type K, cadmium plated for chlorine services.

Fittings	Union type with nonmetallic gasket or chemical lead alloy gasket containing 2-4 percent antimony. Fittings will be brazed to tubing.
Material Classification	CU-5
Instrument Tubing With Compression Fittings	
Tubing	Soft annealed copper tubing, ASTM B280. Dimensions shall be in accordance with ASTM B280.
Fittings	Compression type, brass, Crawford "Swagelok" or Parker Hannifin "CPI".
Material Classification	CU-6
ACR Tubing With Brazed Fittings	
Tubing	Hard drawn ACR copper tubing, ASTM B280. Dimensions shall be in accordance with ASTM B280.
Fittings	Brazed.
Material Classification	CU-7
Copper Hydraulic Tubing With Compression Fittings	
Tubing	ASTM B75, seamless, soft annealed, wall thickness as specified herein.
Fittings	Compression type, brass, Crawford "Swagelok" or Parker Hannifin "CPI".

2.1.02 Accessory Materials. Accessory materials for the copper tubing systems shall be as indicated.

Insulating Fittings

Threaded	Dielectric steel pipe nipple, ASTM A53, Schedule 40, polypropylene-lined, zinc plated; Perfection Corp. "Clearflow Fittings".
Flanged	Epco "Dielectric Flange Unions" or Central Plastics "Insulating Flange Unions".
Flange Bolts and Nuts	ASTM A307, Grade B, length such that, after installation, the bolts will project 1/8 to 3/8 inch (3 to 10 mm beyond outer face of the nut.
Flange Gaskets	ASTM D1330, Grade I, red rubber, ring type, 1/8 inch (3 mm) thick.
Expansion Joints	Tempflex "Model HB Expansion Compensators" with copper tube ends.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories - Installation.

3.2 LEAKAGE AND PRESSURE TESTS. After installation, copper tubing shall be subjected to a leakage and pressure test.

3.2.01 Leakage. All copper tubing shall be watertight and free from leaks. Each leak which is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of Contractor.

3.2.02 Pressure and Leakage Test. Pressure and leakage testing shall be in accordance with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

End of Section

SECTION 15080

ROLLER GATES

PART 1 – GENERAL

1.1 SCOPE**.** This section includes the furnishing, installation, and testing of rising or non-rising stem sluice gates with or without motor operated floor stands and wall thimbles.

The gates shall conform to the current edition of AWWA Standard C-501 except as otherwise specified in the Contract Documents.

The gates shall be designed for indoor or outdoor operation in hazardous or non-hazardous locations in sewage, as scheduled on the Drawings, and may or may not be designed for modulating service.

If the gates shall be equipped with control equipment suitable for remote operation from a remote control panel and/or a remote computer signal, refer to the Master Specifications in Divisions 16 and 17 for installation and connection of controls.

1.2 GENERAL.

1.2.01 Governing Standards.

ANSI A 21.6 (AWWA C106) – Specification for Cast Iron Pipe Centrifugally Cast in Metal Molds for Water and Other Liquids.

ANSI A 21.8 (AWWA C108) Specification for Cast Iron Pipe Centrifugally Cast in Sand Molds for Water and other Liquids.

ANSI A 21.51 (AWWA C151), Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand Lined Molds for Water or Other Liquids.

ANSI B 1.1- Specification for Unified Screw Threads," Course Thread Series, Class 2 Fit, for Tapped Holes.

ANSI B 1.1, "Screw Threads," Course Thread Series, Class 2.

ANSI B 16.1, "Cast Iron Pipe Flanges and Flanged Fittings,' Class 125.

ANSI B 16.2 – Specification for Cast Iron Pipe Flanges and Flanged Fittings," Class 250.

ASTM A126 (American Society for Testing and Materials) – Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings, “Class B”.

ASTM A167 – Specification for Corrosion-Resisting Chromium-Nickel Steel Plate, Sheet and Strips. Grade 3

ASTM A276 – Specification for Cold Finished, Stainless, and Heat Resisting Steel Bars. Type 316.

ASTM A536 – Specification for Ductile Iron Castings,” Grade 70-50-05.

ASTM A653 - Specification for Steel Sheet, Zinc – Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.”
DWSD Specification S-102-1, “Cast Iron Pipe,” revised October 1973.

ASTM B98 – Specification for Copper-Silicon Alloy Rod, Bar, and Shapes.

ASTM B584 – Specification for Copper Alloy Sand Castings for General Applications.

ASTM B21, “Naval Brass Rod, Bar, and Shapes.”

ASTM B144, “High Leaded Tin-Bronze Sand Castings,” Alloy 3A.

ASTM F104, (F112600M7) – Classification System for Nonmetallic Gasket Materials.

AWWA C501 – Cast Iron Sluice Gates.

DWSD Specification S-658-2, “Ductile Iron Pipe, January 1973.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit detailed Shop Drawings showing sluice gate installation dimensions and details and materials of construction of all sluice gate components as called for in Master Specification Section 1180, Submittals. Complete wiring and control diagrams shall be submitted per Master Specification Division 16000, Electrical and Division 12000, Instrumentation and Controls.

1.4 DELIVERY STORAGE AND HANDLING. Sluice gates are provided with locking plates to hold the disc firmly in place in the guides during shipping and installation. Gates can be lifted by a chain or sling through the stem hole in the disc only when locking plates are in place. When lifting gates, take special care to protect machined surfaces and wedges. Locking plates must be removed before opening gate.

Equipment should be stored in a clean, dry area on planks or timbers over an even surface to keep them off the ground and to prevent distortion. Equipment should also be covered to protect seat facings and other machined surfaces from foreign matter. Sluice gates should not be stacked more than three high, and then, only with heavy timber blocking placed between the gates to prevent damage to gates.

To prevent bending when lifting, handling and storing, stems should be supported over their full length. The threaded portion of the stem is protected by a heavy fiber cover, which should not be removed until the stem is ready for installation. Couplings and thrust nuts are shipped in place on the stems and should be removed prior to installation. Stop collars are normally shipped in a bag or box accompanying the floor stands. Operating mechanisms should be handled and treated as precision machinery and protected accordingly.

1.5 WARRANTY. The manufacturer shall furnish to the Owner the warranty as specified in the Master Specification Section 01170, Warranties and Bonds, for the equipment and materials installed under this section of the specifications. Upon receipt of notice from the Owner of failure of any part of the guaranteed materials or equipment during the warranty period, new replacement part or parts shall be furnished and installed promptly by the Contractor at no additional cost to the Owner.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Sluice gates shall be as manufactured by Rodney Hunt Company, Hydro Gate Corporation, Watermain Industries or equal.

2.2 MATERIALS.

2.2.01 Sluice Gate. Sluice gates shall be ductile iron, bronze mounted heavy duty, flanged frame, with or without flush bottom closure as scheduled on the Drawings. Each gate shall be equipped with an adjustable side and top wedge system and designed for a maximum seating or unseating head of 40 (12.2 m) feet of water unless otherwise scheduled on the Drawings.

2.2.02 Wall Thimble. A separate ductile iron wall thimble, Type F, 18 inches (45.7 cm) in depth shall be furnished by the manufacturer for each sluice gate. Thimbles shall be cast in one piece with integral flanged wall ribs and grout holes and shall be of such dimensions and design as approved by the Engineer.

Wall thickness shall not be less than AWWA, Class D; and the flange thickness shall be not less than ANSI, Class 125. The thimble flange faces shall be faced, drilled, and tapped for flange studs as required.

2.2.03 Stem. The top of the stem shall project at least 1 inch (2.54cm) above the operating lift nut when gate is in closed position. The stem diameter shall be selected to limit the l/r ratio between supports to no more than 120, And the Stem couplings, if required, shall be made of bronze and shall be internally threaded and provided with pins of the required size. Note that, the stem shall be made of Type 316 stainless steel and the operating threads shall be Acme Standard or equal accurately rolled or cut in a lathe.

2.2.04 Guides. The sluice gate guides shall be made of ductile iron and shall be of such length that at least one-half the height of the leaf shall be supported by the guides when the gate is in the fully open position. The extension of the gate guides shall be securely anchored to the concrete by means of Type 316 stainless steel anchor bolts, nuts, and pipe spacers. The anchor bolts shall be embedded in the concrete not less than 8 inches (20.3 cm), and the guide slots shall be machined and lined for the full length of the guides with bronze linings. The guide linings shall provide not more than 1/6 inch (1.6 mm) clearance with the tongues on the sides of the leaf. In the case, where the guides are not integrally cast, they shall be doweled and bolted to the gate frame, and the brackets in contact with the wedges on the leaf shall be heavily ribbed to withstand the thrust due to water pressure and wedging action of the leaf wedges, and shall be machined and fitted with bronze wedge facings, which shall be machined on all bearing surfaces to make accurate contact with the wedges.

2.2.05 Stem Guides. Stem guides if required shall be split bronze bushings.
Their brackets shall be made of cast iron with heavily ribbed sections and shall be mounted to the wall with stainless steel anchor bolts and nuts. The distance from the wall to the centerline of the stem shall be readily adjustable. The bushings shall be mounted to the bracket and doweled in such a manner that the stem may be removed without disturbing the alignment of the guide bracket and bushings, where all bolts and nuts shall be made of stainless steel 316, and the bracket and anchor bolts shall be of sufficient strength to withstand all possible stress from operation of the gate.

2.2.06 Wedges. The gate leaves shall be equipped with adjustable bronze wedges of approved design to provide uniform distribution of the seating and unseating pressure. Each leaf shall have machined pads for the wedges. The number, arrangement, location, and method of adjustment of the wedges shall ensure that any leakage occurring shall be 0.1 gallon per minute per linear foot of the surface perimeter. The wedges shall be held in place and adjusted by means of bronze studs, nuts, and washers and shall be machined on all bearing surfaces and shall make accurate contact with the wedge seats attached to the frame.

2.2.07 Gaskets. All gaskets necessary for a complete installation shall be furnished and shall be one piece, where applicable, and shall be 1/16 of an inch (1.6 mm) full face, 3000, manufactured by Garlock or Anchor Packing Superheat 490C, or equal.

2.2.08 Painting. All iron and steel surfaces except machined surfaces, submerged or non-submerged, shall be surface prepared and shop painted as defined in Master Specification Section 09900, Painting, Paragraph 2.2 Materials using National Sanitation Foundation Standard 61 certified products.

2.2.09 Gray and Ductile Gray Cast Iron. All cast iron castings shall be made from cast iron which shall be in conformity with the current ASTM A126, Class B (31,000 psi (213,714 kPa) minimum tensile strength) or equal, and shall be clean, smooth, free from blow or sand holes, porosity, cold shuts, cracks, or other physical defects and shall be tough and close grained. All ductile iron casting shall comply in similar fashion with ASTM A536. Note that, plugging, patching, or welding of defective castings will not be permitted except that minor repairs may be made with prior approval of the Engineer.

2.2.10 Steel. Steel used in the manufacture of the sluice gate and its appurtenances shall be of the best quality open hearth or electric furnace steel having an ultimate tensile strength of not less than 36,000 psi (248,184 kPa), and shall be hot-dipped galvanized after fabrication.

2.2.11 Stainless Steel. The stainless steel for operating stem, bolts, nuts and studs shall be in conformity with the current ASTM A276, Type 316, or approved equal.

2.2.12 Bronze. All bronze parts shall be of uniform composition and quality, shall be free from surface cracks or other defects, and shall conform accurately to the required dimensions, where all defective parts and parts not in conformity with these specifications shall be rejected. The bronze for the stem nut, couplings, thrust nuts, wedges, wedge seats, and gate seats shall be in conformity with the current ASTM B147, Alloy 8B, or approved equal. Seat facing applied by forging shall be in conformity with the current ASTM B21.The bronze for stem guide bushings shall be in conformity with the current ASTM B144, Alloy 3A, or approved equal. Bronze bolts, studs, nuts, anchor bolts, and coupling pins shall be in conformity with the current ASTM B98.

2.2.13 Crank and Hand Wheel – Operated Floor Stands. The geared floor stand shall have a weatherproof, housing, with a bronze operating nut, mounted on a high strength pedestal. Tapered roller bearings shall be located above and below bronze operating nut to support the output thrust of the floor stand. The gearing shall be accurately cut and of proper design to support the load conditions without undue stress. The shaft shall be mounted to provide low friction operation and to resist axial and radial thrusts. Mechanical seals shall be provided around the operating nut and the pinion shaft to prevent lubrication from leaving the unit and moisture from entering the sealed housing. The reduction gear case shall be precision machined and equipped with roller or needle bearings sealed about the reduction shafts. Lubrication fittings shall be provided for all bearings. Crank operated floor stands will be selected so that no more than 40 lb (18.12 Kg) effort shall be needed on the crank to open or close the sluice gate or slide gate. And gear ratio shall be identified by drawings or Engineer. Crank handles and handwheels shall be worked with the direction of rotation to open the valve (usually counterclockwise). Each crank handle or handwheel shall have cast thereon the word "Open" and an arrow indicating the direction to open. The number of turns required to close the gate shall be worked in an appropriate and visible location.

2.2.14 Electric Operators. Electric operators shall be per Master Specification Section 15180, Valve and Gate Actuators.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Installation of the sluice gates, guides, stem supports, and operators shall be in accordance with the manufacturer's detailed instructions.
Prior to the pouring of concrete for the wall containing the sluice gate, the wall thimble shall be accurately placed in the wall forms in accordance with the manufacturer's instruction. Each wall thimble shall be internally braced and bolted to the forms to prevent any distortion during installation operations. Each operator shall be accurately set and plumbed and shall be in proper alignment with the gate and stem before it is installed in place. Operating stems shall be installed in proper alignment and shall not bind in the lift nut or stem guides.

3.2 FIELD QUALITY CONTROL. If inspection or tests disclose defects or non-compliance with the provisions of these specifications, such defects or improperly installed work shall be replaced or adjusted and the tests repeated until compliance with these specifications is obtained.

3.2.01 Field Testing. Following the completion of each roller gate installation, the gate shall be operated through at least two complete open-close cycles, the gate shall be readjusted and re-operated as necessary, and left in a condition acceptable to the Engineer. A field leakage test shall be performed by the Contractor after installation of the gates. Maximum permissible leakage shall be in accordance with AWWA C560. The manufacturer shall be notified of the test in sufficient time to enable him to have a representative present at the test site. After all adjustments have been made and the mechanisms properly lubricated, each gate slide shall be operated through one complete cycle as a final check on proper operation before starting the leakage test.

Complete operation and maintenance requirements shall be including complete manufacturers product data in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals.

3.2.02 Inspection. A representative of the manufacturer shall be present during installation and shall instruct the Contractor's personnel in proper installation procedures and supervise the installation. He shall approve the installation and witness the test.

3.3 MAINTENANCE. Complete training, operation and maintenance requirements shall be provided including complete manufacturers product data in accordance with Master Specification Section 01160, Training and Operations & Maintenance Manuals. The manufacturer's representative shall instruct the Owner's personnel in the proper operation and maintenance of the Sluice Gates.

End of Section

SECTION 15082

CAST-IRON SLIDE GATES

PART 1 – GENERAL

1.1 SCOPE**.** This section includes the furnishing, installation, and testing of rising stem slide gates with or without motor operated floor stands and wall thimbles.

The gates shall conform to the current edition of AWWA Standard C-560 except as otherwise specified in the Contract Documents.

The gates shall be designed for indoor or outdoor operation in hazardous or non-hazardous locations in sewage, as scheduled on the Drawings, and may or may not be designed for modulating service.

If the gates shall be equipped with control equipment suitable for remote operation, Contractor shall conform to the Master Specifications, Divisions 16, Electrical and Division 17, Instrumentation and Controls for installation and connection of the control systems.

1.2 GENERAL.

1.2.01 Governing Standards.

AWWA – American Water Works Associtaion: C560 - Cast-Iron Slide Gates

AWWA/ANSI – American National Standard Institute: C540 - Power Actuating Devices for Valves and Slide Gates

AISI – American Iron and Steel Institute: 1117 - Standard for Resulfured Carbon Steel

AISI – 4140 - Standard for Alloy Steel

AISI – 8620 - Standard for Alloy Steel

ANSI/ASME – American Society of Mechanical Engineers: B16.1 - Standard for Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800

ANSI/ASME: B46.1 - Standard for Surface Textures (Surface Roughness, Waviness, and Lay)

ANSI/ASTM – American Society for Testing and Materials: D471 - Standard Test Method for Rubber Property - Effect of Liquids

ASTM – A36/A36M - Standard Specification for Carbon Structural Steel

ASTM – A48 - Standard Specifications for Gray Iron Castings

ASTM – A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings

ASTM – A276 - Standard Specification for Stainless Steel Bars and Shapes

ASTM – A582/A582M - Standard Specification for Free-Machining Stainless Steel Bars, Hot-Rolled or Cold-Finished

ASTM – B21 - Standard Specification for Naval Brass Rod, Bar, and Shapes

ASTM – B98 - Standard Specification for Copper-Silicon Alloy Rod, Bar, and Shapes

ASTM – B138 - Standard Specification for Manganese Bronze Rod, Bar, and Shapes

ASTM – B139/B139M - Standard Specification for Phosphor Bronze Rod, Bar, and Shapes

ASTM – B148 - Standard Specification for Aluminum-Bronze Sand Castings

ASTM – B505 - Standard Specification for Copper-Base Alloy Continuous Castings

ASTM – B584 - Standard Specification for Copper Alloy Sand Castings for General Applications

ASTM – D1149 - Standard Test Method for Rubber Deterioration-Surface Ozone Cracking in a Chamber

ASTM – D2000 - Standard Classification System for Rubber Products in Automotive Applications

ASTM – F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs

ASTM – F594 - Standard Specification for Stainless Steel Nuts

CDA Copper Alloy Numbers (Note: CA precedes alloy numbers defined by CDA)

SSPC – SP6 - Commercial Blast Cleaning

SSPC – SP10 - Near-White Blast Cleaning

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Submit detailed Shop Drawings showing slide gate installation dimensions and details and materials of construction of all slide gate components as called for in Master Specification, Section 1180, Submittals. Complete wiring and control diagrams shall be submitted in accordance with Master Specification, Division 16000, Electrical and Division 17000, Instrumentation and Controls.

1.4 DELIVERY STORAGE AND HANDLING. Slide gates are provided with locking plates to hold the disc firmly in place in the guides during shipping and installation. Gates can be lifted by a chain or sling through the stem hole in the disc only when locking plates are in place. When lifting gates, take special care to protect machined surfaces and wedges. Locking plates must be removed before opening gate.

Equipment should be stored in a clean, dry area on planks or timbers over an even surface to keep them off the ground and to prevent distortion. Equipment should also be covered to protect seat facings and other machined surfaces from foreign matter. Slide gates should not be stacked more than three high, and then, only with heavy timber blocking placed between the gates to prevent damage to gates.

To prevent bending when lifting, handling and storing, stems should be supported over their full length. The threaded portion of the stem is protected by a heavy fiber cover, which should not be removed until the stem is ready for installation. Couplings and thrust nuts are shipped in place on the stems and should be removed prior to installation. Stop collars are normally shipped in a bag or box accompanying the floor stands. Operating mechanisms should be handled and treated as precision machinery and protected accordingly.

1.5 WARRANTY. The manufacturer shall furnish to the Owner the warranty as specified in the Master Specification Section 01170, Warranties and Bonds, for the equipment and materials installed under this section of the specifications. Upon receipt of notice from the Owner of failure of any part of the guaranteed materials or equipment during the warranty period, new replacement part or parts shall be furnished and installed promptly by the Contractor at no additional cost to the Owner.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Slide gates shall be as manufactured by Rodney Hunt Company, Hydro Gate Corporation, Watermain Industries or equal.

2.2 MATERIALS. Materials shall conform to the following specifications, however, the materials subject to dezincification or dealuminization shall not be used. The manufacturer/supplier shall make a declaration to this effect.

Thimble, frame, guides, slide, stem guides, and gear housing	Cast-iron – ASTM A126, class B; or ASTM A48, class 30.
Yoke and pedestal	Cast-iron – ASTM A126, Class B; or ASTM A48, class 30; or steel - ASTM A36.
Gears	Steel – AISI 8620, AISI 4140, or AISI 1117; bronze – ASTM B148 (CA 952, CA 954, or CA 958), ASTM B584 (CA 865 or CA 867).
Bearings	Bronze – ASTM B148 (CA 954).
Wedges	Bronze – ASTM B584 (CA 836, CA 865, CA 863, or CA 873).
Stem couplings	Bronze – ASTM B584 (CA 865, CA 863, or CA 873 stainless steel - ASTM A582, type 303; or ASTM A276, type 302 or 304.
Thrust nut and gate actuator lift nut	Bronze – ASTM B584 (AC 865, CA 863, or CA 873), ASTM B505 (C95800).
Seating faces and stem guide	Bronze – ASTM B21 (CA 464 or CA 482), ASTM B138 (CA 675), ASTM B98 (CA 651 or CA 655), ASTM B139 (CA 510); or ASTM B584 (CA 836, CA 865, CA 863 or CA 873); stainless steel - ASTM A276, type 302 or 304.
Stem guide bushings	Bronze – ASTM B584 (CA 932 or CA 873), ASTM B98 (CA 651 or CA 655), or ASTM B139 (CA 510).
Stems	Stainless steel ASTM A582, type 303; or ASTM A276, types 302 or 304.
Anchor bolts and fasteners	Stainless steel ASTM F593 or ASTM F594, alloy group 1 or group 2; or bronze - ASTM B98 (CA 651 or CA 655).
Flush-bottom seal	Elastomeric materials - ASTM D2000.
Flush-bottom retainer bar	Cast-iron – ASTM A126, class B; stainless steel - ASTM A276, type 302 or 304; ASTM A582, type 303; bronze - ASTM B98 (CA 651 or CA 655); or ASTM B138 (CA 675).

2.2.01 Slide Gate. Cast iron slide gate shall have frame and slide. The frame and slide shall have embedded bronze seating strips, which shall be pressed together by the attached wedging devices when the gate is closed.

Slide gates shall be cast-iron, bronze mounted heavy duty, flanged frame, with or without flush bottom closure as scheduled on the Drawings. Each gate shall be equipped with an adjustable side and top wedge system and designed for a maximum seating or unseating head of water as scheduled on the Drawings.

The gate slide shall be made of cast iron faces and be of one-piece construction, with strengthening ribs where required; and a reinforced section to receive the seating faces. The slide shall be square or rectangular in shape with integrally cast vertical and horizontal reinforcing ribs. A heavy reinforcing rib along each side shall be provided to ensure rigidity between side wedges. The slide shall be designed to operate under maximum specified differential head with the minimum safety factory of five (5). Guide tongues along each side of the slide shall be machined accurately on contact surfaces. A nut pocket shall be cast on the vertical centerline of the gate and shall be provided with a threaded block for attaching the stem to the slide. Pads for side wedges and top and bottom wedges, when required shall be integrally cast on the slide and machined to receive the adjustable wedges. The maximum allowable clearance between the slide and the slide guide shall be 1/16 in (1.6 mm).

2.2.02 Frame. The gate frame shall be cast iron and be of ample section and cast in one-piece. The frame shall be designed for the seating and unseating head indicated on the drawings with a minimum safety factor of five (5). All surfaces forming joints or bearings shall be machined. The frame shall be machined on the rear face to bolt directly to the machined face of the wall.

2.2.03 Frame Guides. The slide gate guides shall be made of cast iron and bolted to the frame or cast integrally with it. Guides shall be machined on all bearing and contact faces. Guides shall be designed for the design head indicated with a minimum safety factor of five (5). The guides shall be of such length so as to support at least one-half the vertical height of the slide when the slide is in the open position.

The extension of the gate guides shall be securely anchored to the concrete by means of Type 316 stainless steel anchor bolts, nuts, and pipe spacers. The anchor bolts shall be embedded in the concrete not less than 8 inches (20.3 cm), and the guide slots shall be machined and lined for the full length of the guides with bronze linings. In the case, where the guides are not integrally cast, they shall be doweled and bolted to the gate frame, and the brackets in contact with the wedges on the slide shall be heavily ribbed to withstand the thrust due to water pressure and wedging action of the slide wedges, and shall be machined and fitted with bronze wedge facings, which shall be machined on all bearing surfaces to make accurate contact with the wedges. Guide grooves shall be machined on all contact faces.

Overall clearances with slide tongue shall be not more than 1/8 in (3.2 mm). Faces for mounting of wedging devices shall be fully machined. Frames shall be self-contained (S/C) as listed in the “Gate Schedule.”

Round opening gates shall have a circular flange cast as part of the frame for mounting to a wall or pipe flange. All wall thimble-mounted gates shall have a square or rectangular flanged-back frame. The frame shall be fully machined and drilled to match the wall thimble. Gates mounted on pipe flanges shall be furnished with partial drilling per manufacturer’s recommendations.

2.2.04 Yoke. Self-contained gates shall be provided with a cast-iron or structural-steel yoke designed to withstand the thrust of the floorstand or hoist when a 40 lbf (178 N) effort is placed on the handwheel or crank with a safety factor of five (5). The top of the yoke shall be machined to receive the operating mechanism. The pads on the yoke that contact those on the top of the guides shall be machined on contact faces and bolted to the guides.

2.2.05 Wall Thimble. The wall thimble shall be made of cast iron and shall be provided by gate manufacturer. A pipe flange or F-shaped or E-shaped, shall be provided with a suitable end for attaching to the connecting opening as specified on the Gate Schedule. The front or mounting flange, shall be machined and shall be drilled and tapped to the same template used for its particular gate frame. A ring shall be cast on the periphery of the wall thimble to form a water stop and anchor ring in the concrete. Thimbles shall be of such dimensions and design as approved by the Engineer. The gate shall be attached to the wall thimble with bolts or studs to withstand the design forces with a safety factor of five (5). For gate mounting to thimbles, an adequate number of holes shall be provided in the flange on the back of the gate to prevent leakage under the design heads and to resist the shearing action caused by closing and opening forces.

2.2.06 Stem. The top of the stem shall project at least 1 inch (2.54cm) above the operating lift nut when gate is in closed position. Stems shall be manufactured from stainless steel sized to withstand the axial compressive and tensile forces created during gate operation under the specified differential heads and to transmit in compression at least two (2) times the rated output of the lift with a 40 lbf (178 N) effort on the crank or handwheel, or (1.25) times the stall thrust of the electric actuator. Threading on stems shall be rolled with double-lead threads of the Acme type. Cut threads will not be allowed. The contact surfaces of the threads shall have a maximum 16 micro-inch (406 micro-mm) finish. Stem couplings shall have internal threads for transmitting the full thrust of the stem and shall be held in place on the stem with a key, simultaneously engaging the coupling and both stems. The Stem couplings, if required, shall be made of bronze.

2.2.07 Stem Guides. Stem guides shall be fully adjustable, heavy duty castings, with 2 piece cast bronze removable collars. The stem guides shall be properly spaced to support the stem as a long column, with maximum spacing not to exceed a l/r (length/radius of gyration) of 200.

2.2.08 Wedges. The gate slides shall be equipped with adjustable bronze wedges of approved design to provide uniform distribution of the seating and unseating pressure. Each slide shall have machined pads for the wedges. The number, arrangement, location, and method of adjustment of the wedges shall ensure that any leakage occurring shall be 0.1 gallon per minute per linear foot (0.378 L/min per 30.5 cm) of the surface perimeter. The wedges shall be held in place and adjusted by means of bronze studs, nuts, and washers and shall be machined on all bearing surfaces and shall make accurate contact with the wedge seats attached to the frame.

2.2.09 Seals. Resilient seals for flush-bottom gates shall be extruded or molded natural or synthetic rubber. Reclaimed rubber shall not be used. Flush-bottom gates shall be provided with a frame-mounted flush-bottom seal. The solid bulb resilient rubber seal shall be firmly held in place using stainless steel retainers and corrosion-resistant fasteners. The full length of the bottom edge of the slide shall be machined for making uniform contact with the seal when it is mounted on the frame. The differential pressure on the rubber seal shall be variable by adjustment of wedges on the gate. The seal shall be designed to provide for the minimum leakage as specified.

2.2.10 Painting. All iron and steel surfaces except machined surfaces, submerged or non-submerged, shall be surface prepared and shop painted as defined in Master Specification Section 09900, Painting, Paragraph 2.2 Materials using National Sanitation Foundation Standard 61 certified products.

2.2.11 Manual Lifting Devices. The manual lift mechanism shall have either a direct drive handwheel without reduction gearing, or shall be crank-actuated with either single or double-reduction gearing, as necessary to meet lifting capacity required. The lift mechanism shall be sized to permit slide operation with an effort of not more than 40 lbf (178 N) pull on the handwheel/handcrank or 50 lbf-ft (68 N-m) torque on the lift nut or input shaft, depending on the lift type. Maximum pull or torque to start the slide in motion must not exceed one and one-half times this amount. All components of the lift mechanism shall be designed to withstand these input efforts or torque's with a minimum safety factor of five (5). The floor stand shall have a weatherproof, housing, with a bronze-operating nut, mounted on a high strength pedestal. Tapered roller bearings shall be located above and below the flange on the lift bronze operating nut to support the output thrust of the floor stand.
The gearing shall be accurately cut and be of proper design to support the load conditions without undue stress. The shaft shall be mounted to provide low friction operation and to resist axial and radial thrusts.

Mechanical seals shall be provided around the operating nut and the pinion shaft to prevent lubrication from leaving the unit and moisture from entering the sealed housing. The reduction gear case shall be precision machined and equipped with roller or needle bearings sealed about the reduction shafts. Lubrication fittings shall be provided for all bearings. Crank operated floor stands will be selected so that no more than 40 lbf (178 N) effort shall be needed on the crank to open or close the slide gate. Crank handles and handwheels shall be worked with the direction of rotation to open the valve (usually counterclockwise). Each crank handle or handwheel shall have cast there on the word “Open” and an arrow indicating the direction to open. The number of turns required to close the gate shall be worked in an appropriate and visible location.

2.2.12 Electric Operators. Electric operators shall be as per AWWA standard C-540 and Master Specification, Section 15180, Valve and Gate Actuators.

PART 3 – EXECUTION

3.1 INSTALLATION.

3.1.01 Erection. Installation of the slide gates, guides, stem supports, and operators shall be in accordance with the manufacturer’s detailed instructions.
Prior to the pouring of concrete for the wall containing the slide gate, the wall thimble shall be accurately placed in the wall forms in accordance with the manufacturer’s instruction. Each wall thimble shall be internally braced and bolted to the forms to prevent any distortion during installation operations. Each operator shall be accurately set and plumbed and shall be in proper alignment with the gate and stem before it is installed in place. Operating stems shall be installed in proper alignment and shall not bind in the lift nut or stem guides.

3.2 FIELD QUALITY CONTROL. If inspection or tests disclose defects or non-compliance with the provisions of these specifications, such defects or improperly installed work shall be replaced or adjusted and the tests repeated until compliance with these specifications is obtained.

3.2.01 Field Testing. The slide gate shall be tested by being completely operated from open to closed positions in the presence of the Engineer with the head on the gate at maximum elevation as directed by the Engineer. Under these conditions, the gates shall move freely in their guides without binding, and the stems shall be truly vertical with no perceptible side play, and stand shall be tested for mechanical operation. All slide gates shall be tested for leakage. The wedges shall be adjusted to ensure that any leakage, which occurs, does not exceed the amount permitted by AWWA C-501. The Contractor shall make all arrangements; provide all necessary labor, materials, or equipment; and make all adjustments necessary for the performance of operating test which must be conducted in the presence of the Engineer.

3.2.02 Inspection. A representative of the manufacturer shall be present during installation and shall instruct the Contractor's personnel in proper installation procedures and supervise the installation. He shall approve the installation and witness the test.

3.3 MAINTENANCE. Complete training, operation and maintenance requirements shall be provided including complete manufacturers product data in accordance with Master Specification, Section 01160, Training and Operations & Maintenance Manuals. The manufacturer's representative shall instruct the Owner's personnel in the proper operation and maintenance of the Slide Gates.

End of Section

SECTION 15084

STOP LOGS

PART 1 – GENERAL

1.1 SCOPE. This section covers stop logs which shall be furnished complete with guides, seals, relevant hardware and appurtenances.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by the Contractor and subsequently approved by the Engineer. Stop logs shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest products of a manufacturer regularly engaged in the production of stop logs. Each stop log shall be provided with a number plate. Numerals shall be at least 1 inch high and shall be black backed enamel on anodized aluminum plate. The location of number plates and the method of attachment shall be acceptable to the Contractor. The number assigned to each stop log shall be as determined by the Contractor. Log shall be such that the flexural stresses do not exceed 1/5 of ultimate strength or 1/3 of yield strength. Design flexural stress of aluminum shall not exceed 7,000 psi (335 kPa). Log and lifting beam design shall be such that the flexural stresses do not exceed 1/5 of ultimate strength or 1/3 of yield strength. Design flexural stress of aluminum shall not exceed 7,000 psi (335 kPa).

1.3 SUBMITTALS. Complete drawings, construction details, and specifications covering the stop logs and appurtenances shall be submitted in accordance with the submittal section. Each drawing shall be identified with the stop log designation as relevant to the Work.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Provide stop logs and related furnishings as manufactured by Rodney Hunt Company, Fontaine, Waterman, Hydrogate, or approved equal.

2.2 MATERIALS.

Stop Logs	Aluminum B308 6061-T6 or Stainless Steel Type 316L

Lifting Lugs	Aluminum B308 6061-T6 or Stainless Steel Type 316L
Guides	Aluminum B308 6061-T6 or Stainless Steel Type 316L
Seals	
1. Sides	Lip Seal–ASTM D2000, Grade 2BC 615, Extruded Neoprene, Durometer 50
2. Bottom	Flush Lip Seal-ASTM D2000, Grade 2BC 515, Extruded Neoprene, Durometer 50

2.3 FABRICATION. Stop logs shall be of one piece extruded aluminum, or fabricated stainless steel. Stop log panels shall be of height indicated and in height increments set by the manufacturer. Panels made of two or more extrusions shall be securely welded together to form a unit and joints shall be made watertight with neoprene seals or seal welding. All welding shall be in accordance with latest applicable codes of the American Welding Society (D1.2 for aluminum and D1.3 for stainless steel). The stop logs shall be fabricated in separate panels such that the largest panel is no greater than 8 feet (2.4 m) in height. Each panel shall have two stainless steel hooks to engage the lifting device. Adequate drainage and rapid release of air shall be provided for each log. The bottom of the log shall be extruded in a way to accept a specially extruded resilient seal to provide a flush bottom closure. The shape of the lip seal shall provide a seating surface having a minimum width of 1 inch (2.4 cm). The vertical face of the seal shall be in contact with the seating surface of the guide or seal located on the frame to provide a proper seal at the corners. Stop logs shall be of sufficient weight to be submerged under their own weight.

2.4 GUIDES. The guides shall be of extruded aluminum or stainless steel, whichever material is the same as chosen for the logs, and shall be structural shapes or formed plates. The guides shall be designed for maximum rigidity and will be provided with a strap on the back of the guides for the embedded type to lock it into the concrete, or with a side angle for surfacing mounting using anchor bolts. The invert of the frame shall be an angle or channel welded to the lower ends of the guides to form a seating surface for the resilient seal mounted on the stop log.

2.5 SEALS. The seals shall be located along the bottom of the log section, between each stop log panel and along both sides of the log. Seals shall be mechanically attached to the log. Adhesives alone are not an acceptable mounting method. Seals shall be mounted in a manner that allows for easy replacement in the event of damage. Lip type seals shall be attached to the frame to restrict leakage. Under the condition which the log will be subjected to flow in both directions, the log and guide shall be provided with seals in both directions.

2.6 HARDWARE. All necessary attaching bolts and anchor bolts shall be stainless steel and furnished by the stop log manufacturer.

2.7 LIFTING DEVICE. Lifting device shall be suitable for inserting, retrieving and handling stop log panels. One (1) lifting device shall be provided for each stop log width. The lifting device shall be equipped with a suitable eyebolt for crane operation. The device shall be guided by the slot of the guide extrusion, and shall be capable of securing and releasing the stop logs panels with the use of a lanyard from the operating floor. The device shall be furnished with non-metallic wheels to guide the device in the slot. The lifting device may, at the manufacturer's option, be adjustable in widths to accommodate several widths of stop log openings.

2.8 PAINTING. All aluminum in contact with concrete shall have a heavy shop coat of bitumastic paint.

PART 3 – EXECUTION

3.1 INSTALLATION. The installation of all parts shall be done in a workmanlike manner and in accordance with detailed technical installation procedures supplied by the manufacturer.

3.2 TESTING. Upon completion of the installation, the contractor shall be required to make performance tests of the stop logs in the field, under the direction of the Engineer. Tests shall be performed in accordance with the requirements of Master Specification Section 01180, Equipment, Material, Parts and Tools.

3.3 FIELD QUALITY CONTROL. It shall be the Contractor's responsibility to handle, store, and install the stop logs in. strict accordance with manufacturer's drawings and recommendations. All stop logs of the same dimension shall be interchangeable from one slot to another and shall be tested for such interchangeability by actually installing each stop log in each slot in the field. Any maladjustment shall be corrected to the satisfaction of the Engineer.

End of Section

SECTION 15090

ANGLE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated angle valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Nameplates shall have black baked enamel letters at least 3/4 inch (19 mm) high on anodized aluminum plate.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Angle valves shall be suitable for use as throttling valves.

2.1.01 Valves VA-1.

Rating	Class 125
Code	MSS SP-80, Type 1
Body/Bonnet	ASTM B62, bronze, threaded bonnet, threaded packing nut, rising stem
Trim	
Seat	Integral to body
Disc	ASTM B62, bronze
Stem	ASTM B62, bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	-20 to 150°F (-29 to 66°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "504", or approved equal

2.1.02 Valves VA-2.

Rating	Class 150
Code	MSS SP-80, Type 2
Body/Bonnet	ASTM B62, bronze, union bonnet, threaded packing nut, rising stem
Trim	
Seat	Integral to body

Disc	PTFE
Stem	ASTM B62, bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	-20 to 150°F (-29 to 66°C)
Valve Operator	Handwheel
Manufacturers	Stockham "B-222T", Walworth "Fig 3096", or approved equal

2.1.03 Valves VA-3.

Rating	Class 125
Code	MSS SP-85, Type II
Body/Bonnet	ASTM A126, Class B, cast iron, bolted bonnet, OS&Y, rising stem
Trim	
Seat	ASTM B62, bronze, renewable
Disc	ASTM B62, bronze, renewable
Stem	ASTM B16, brass
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Flanged, flat faced
Temperature Limitations	-20 to 150°F (-29 to 66°C)
Valve Operator	Handwheel
Manufacturers	Powell "Fig 1254", or approved equal

2.1.04 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.05 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.06 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.
All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer’s standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1. INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15091

MISCELLANEOUS BALL VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of 4 inch and smaller, manually operated or remote activated, two position (open-close) ball valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

Ball valves larger than 4 inch are covered in Master Specification Section 15103, AWWA Ball Valves.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VB-1.

Rating	500 psi (3.4 MPa]) nonshock cold WOG
Code	MSS SP-110
Type	In-line, two piece, end entry, regular port
Body/Bonnet	ASTM B584–C84400 bronze or ASTM B194, Grade 377, brass
Trim	
Seat	Reinforced Teflon
Ball	Brass, or chrome plated brass
Stem	Brass
Thrust Washer	Reinforced Teflon
Stem Seal	Teflon or Viton
End Connection	Threaded
Temp. Limitations	-20 to 400°F (-29 to 204°C])
Manufacturers	Conbraco Industries "Apollo 70-100 Series"; Powell "Fig 4210T", or approved equal

2.1.02 Valves VB-2.

Rating	800 psi (5.5 MPa) nonshock cold WOG

Code	MSS SP-110
Type	In-line, two piece, end entry, regular port
Body/Bonnet	ASTM A3512-CF8M stainless steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A276-316, stainless steel
Stem	ASTM A276-316, stainless steel
Thrust Washer	Reinforced Teflon
Stem Seal	Teflon or Viton
End Connection	Threaded
Temp. Limitations	-20 to 400°F (-29 to 204°C])
Manufacturers	Conbraco Industries "Apollo 76-100 Series"; Neles-Jamesbury "Series 300", or approved equal

2.1.03 Valves VB-3.

Rating	1000 psi (6.5 MPa) nonshock cold WOG
Code	MSS SP-110, NACE MR-01-75
Type	In-line, three piece, bolted body, regular port
Body/Bonnet	ASTM A351-CF8M, stainless steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A276-316, stainless steel
Stem	ASTM A276-316, stainless steel

Thrust Washer	Reinforced Teflon
Stem Seal	Reinforced Teflon
End Connection	Socketwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Conbraco Industries "Apollo 85-200 Series"; Neles-Jamesbury "Series 4000", or approved equal

2.1.04 Valves VB-4.

Rating	Class 150
Code	MSS SP-72
Type	In-line, split body, full port
Body/Bonnet	ASTM A216-WCB, cast steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A216-WCB, steel, chrome plated
Stem	ASTM A108-CS
Thrust Washer	Reinforced Teflon
Stem Packing	Manufacturer’s standard
End Connection	Flanged, ASME B16.5, Class 150, raised face
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Conbraco Industries "Apollo 88-200 Series", or approved equal

2.1.05 Valves VB-5.

Rating	Class 150
Code	MSS SP-72
Type	In-line, end entry, regular port
Body/Bonnet	ASTM A216-WCB, cast steel
Trim	
Seat	Reinforced Teflon
Ball	ASTM A216-WCB, steel, chrome plated
Stem	ASTM A108-CS
Thrust Washer	Reinforced Teflon
Stem Seal	Manufacturer’s standard
Body Seal	Reinforced Teflon
End Connection	Flanged, ASME B16.5, Class 150, raised face
Temp. Limitations	-20 to 400°F [-29 to 204°C]
Manufacturers	Conbraco Industries "Apollo 88-100 Series"; Neles-Jamesbury "Series 5000"; Powell "Fig 4224T", or approved equal

2.1.06 Valves VB-6.

Rating	800 psi [5.5 MPa] nonshock cold WOG
Code	ASME B16.34
Type	In-line, three piece, bolted body, full port
Body/Bonnet	ASTM A216-WCB, cast steel or ASTM A105, forged steel

Trim	
Seat	Reinforced Teflon
Ball	ASTM A108-CS, chrome plated
Stem	ASTM A108-CS
Thrust Washer	Reinforced Teflon
Stem Seal	Reinforced Teflon
End Connection	Socketwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Conbraco Industries "Apollo 83-200 Series", Contromatics "C-1122-BB-DL", Neles-Jamesbury "4000 Series", or approved equal

2.1.07 Valves VB-7.

Rating	800 psi 95.5 MPa) nonshock cold WOG
Code	ASME B16.34
Type	In-line, three piece, bolted body, regular port
Body/Bonnet	ASTM A105, forged steel or ASTM A216-WCB, cast steel
Trim	
Seat	Reinforced Teflon
Ball	Nickel or hard chrome plated carbon steel
Stem	Nickel or hard chrome plated carbon steel
Thrust Washer	Reinforced Teflon

Stem Seal	Reinforced Teflon
End Connection	Buttwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Contromatics "C-1133-BB-DL", or approved equal

2.1.08 Valves VB-8.

Rating	Class 600
Code	ASME B16.34
Type	In-line, three piece, bolted body, firesafe, regular port
Body/Bonnet	ASTM A105, forged steel
Trim	
Seat	Reinforced Teflon primary, metal secondary
Ball	Stainless steel
Stem	Hard chrome plated carbon steel
Thrust Washer	Reinforced Teflon
Stem Seal	Reinforced Teflon
End Connection	Socketwelded
Temp. Limitations	-20 to 400°F (-29 to 204°C)
Manufacturers	Contromatics "C-1122-BB-FS"; Neles-Jamesbury "4C2236TT-1", or approved equal

2.1.09 Valves VB-9.

Rating	150 psig [1.0 MPa] nonshock cold WOG

Code	MSS SP-122
Type	In-line, true union, full port (Schedule 80)
Body/Bonnet	PVC or CPVC
Trim	
Seat	Teflon
Ball	PVC or CPVC
Stem	PVC or CPVC
Thrust Washer	Teflon
Stem Seal	Viton O-ring
End Connection	Socket
Temp. Limitations	0 to 140°F (-18 to 60°C])
Manufacturers	Nibco "Chemtrol TU Series Tru-Bloc Ball Valve"; Hayward Plastic Products "True Union Ball Valve", or approved equal

2.1.10 Valves VB-10.

Rating	150 psig [1.0 MPa] nonshock cold WOG
Code	MSS SP-122
Type	In-line, true union, full port (Schedule 80)
Body/Bonnet	PVC or CPVC
Trim	
Seat	Teflon
Ball	PVC or CPVC

Stem	PVC or CPVC
Thrust Washer	Teflon
Stem Seal	Viton O-ring
End Connection	Flanged
Temp. Limitations	0 to 140°F (-18 to 60°C)
Manufacturers	Nibco "Chemtrol TU Series Tru-Bloc Ball Valve"; Hayward Plastic Products "True Union Ball Valve", or approved equal

2.1.11 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.12 Rotation. The direction of rotation of the lever or handwheel to open the valve shall be to the left (counterclockwise).

2.1.13 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated	
Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the Miscellaneous Ball Valve Schedule 15091-S01.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as indicated in the Miscellaneous Ball Valve Schedule 15091-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15092

INDUSTRIAL BUTTERFLY VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated two position (open-close) industrial type butterfly valves for low-pressure air service, chemical and odor control service, hot water heating system service, and other applications where AWWA type butterfly valves are not indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Valve discs shall seat at 90 degrees with the pipe axis.

Flanged end valves shall be of the short-body type. Where mechanical joint ends are indicated in the Contract Documents, either mechanical joint or push-on ends conforming to ANSI/AWWA C111/A21.11 will be acceptable. For buried or submerged service, shaft seals shall be O-ring type.

2.1.01 Valves VBF-1.

Rating	Class 150
Code	MSS SP-67
Body	ASTM A395, GR 60/40/18, ductile iron
Trim	
Seat	EPDM
Disc	ASTM B148, Alloy 952, aluminum bronze
Stem	ASTM A276, Grade 316 or 304, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Upper and lower bearings or two upper bearings, bronze or reinforced teflon
Shaft Seal	Synthetic rubber O-rings
End Connection	Wafer
Temperature Limitations	-20° to 250°F (-29° to 121°C)
Manufacturers	Keystone “AR1”, or approved equal

2.1.02 Valves VBF-2.

Rating	Class 150
Code	MSS SP-67
Body	ASTM A395, GR 60/40/18, ductile iron
Trim	
Seat	EPDM
Disc	ASTM B148, Alloy 952, aluminum bronze
Stem	ASTM A276, Grade 316 or 304, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Upper and lower bearings or two upper bearings, bronze or reinforced teflon
Shaft Seal	Synthetic rubber O-rings
End Connection	Lug flanged, ASME B16.5, Class 150 diameter and drilling
Temperature Limitations	-20° to 250°F (-29° to 121°C)
Manufacturers	Keystone “AR2”, or approved equal

2.1.03 Valves VBF-3.

Rating	Class 150
Body	PVC
Trim	
Seat	FPM (Viton) or EPDM
Disc	PVC or polypropylene

Stem	AISI Type 316 stainless steel
Stem Seal	Synthetic O-rings
Shaft Bearings	Upper and lower bearings, reinforced teflon
End Connection	Flanged, ASME B16.5, Class 150 diameter and drilling
Temperature Limitations	40° to 140°F (4° to 60°C)
Manufacturers	Chemtrol “Model B”, or approved equal

2.1.04 Valves VBF-4.

Rating	Class 150
Code	MSS SP-67
Body	ASTM A395 or A536, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM A296, CF8M, stainless steel
Stem	ASTM A296, CF8M, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Acetal
End Connection	Wafer
Temperature Limitations	0° to 212°F (-18° to 100°C)
Manufacturers	ABZ “Figure 090”, or approved equal

2.1.05 Valves VBF-5.

Rating	Class 150

Code	MSS SP-67
Body	ASTM A395 or A536, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM A296, CF8M, stainless steel
Stem	ASTM A296, CF8M, stainless steel
Stem Packing	Buna-N
Shaft Bearings	Acetal
End Connection	Lug flanged, ASME B16.5, Class 150 diameter and drilling
Temperature Limitations	0° to 212°F (-18° to 100°C)
-Manufacturers	ABZ “Figure 090”, or approved equal

2.1.06 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.07 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.08 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials	
Asphalt Varnish	Fed Spec TT-C-494.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.

Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the Industrial Butterfly Valve Schedule 15092-S01.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Torque Tubes. Requirements for torque tubes shall be as indicated in the Industrial Butterfly Valve Schedule 15092-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.06 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15093

CHECK VALVES

PART 1 - GENERAL

1.1. SCOPE. This section covers the furnishing of check valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VC-1.

Rating	Class 150
Code	API-594
Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze
Springs/Hinge Pins/Stops	Stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 150, flat faced flanges
Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A125HZNSF", Stockham "WG-970", Mission "Duo-Chek II Figure 12HMP", Valve and Primer "9000AR1F", or approved equal

2.1.02 Valves VC-2.

Rating	Class 150
Code	API-594

Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze
Springs/Hinge Pins/Stops	Stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 150, flat faced flanges
Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A125HZNSF", Stockham "WG-970", Mission "Duo-Chek II Figure 12HMP", Valve and Primer "9000AR1F", or approved equal

2.1.03 Valves VC-3.

Rating	Class 300
Code	API-594
Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze

Springs/Hinge Pins/Stops	AISI Type 316 stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 300, raised faced flanges
Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A250HZNSR", Stockham "WG-970", Mission "Duo-Chek II Figure 25HMF", Valve and Primer "9200AR1R", or approved equal

2.1.04 Valves VC-4.

Rating	140 psig
Code	API-594
Type	Dual disc wafer
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Seat	Buna-N
Disc	ASTM B148 Alloy 952, aluminum bronze or ductile iron with bronze trim
Springs, Hinge Pins & Stops	AISI Type 316 stainless steel
Bearings	Teflon
End Connection	Plain, installed between ASME B16.5, Class 300, raised faced flanges

Temp. Limitations	-20° to 225°F (-29° to 107°C)
Valve Operator	None
Manufacturers	Marlin "Wafer Check A250HZNSR", Mission "Duo-Chek II Figure 25HMF", Valve and Primer "9200AR1R", or approved equal

2.1.05 Valves VC-5.

Rating	Class 125
Code	MSS SP-71, Type III, AWWA C508
Type	Horizontal swing, bolted bonnet
Body/Bonnet	ASTM A126 Class B cast iron
Trim	
Seat Ring	ASTM B763 Alloy 8440 bronze
Disc	ASTM A126, Class B, cast iron
Hinge Pins	Stainless steel
Bearings	Bronze bushings
Cover Gasket	Manufacturer’s standard
End Connection	Flanged, ASME B16.1, Class 125, flat faced
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	External spring
Manufacturers	American Flow Control "52 SC", M&H "Style 259-02", Mueller "A2600-6-02", or approved equal.

2.1.06 Valves VC-6.

Rating	Class 125

Code	MSS SP-71, Type I
Type	Horizontal swing, bolted bonnet
Body/Bonnet	ASTM A126, Class B, cast iron
Trim	
Seat Ring	Bronze
Disc	Bronze
Hinge Pins	Bronze or brass
Bushings	Bronze
Cover Gasket	Manufacturer’s standard
End Connection	Flanged, ASME B16.1 Class 125, flat faced
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	None
Manufacturers	Milwaukee "F-2974", Stockham "G-931", or approved equal

2.1.07 Valves VC-7.

Rating	Class 125
Code	MSS SP-80, Type III
Type	Horizontal swing, threaded bonnet
Body/Bonnet	ASTM B62 bronze
Trim	
Seat	Bronze, regrinding
Disc	Bronze
Hinge Pins	Manufacturer’s standard

End Connection	Threaded
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	None
Manufacturers	Stockham "B-321", Walworth "Fig 3406", or approved equal

2.1.08 Valves VC-8.

Rating	Class 125
Code	MSS SP-80, Type III
Type	Horizontal swing, threaded bonnet
Body/Bonnet	ASTM B62 bronze
Trim	
Seat	Bronze, regrinding
Disc	Bronze
Hinge Pins	Manufacturer’s standard
End Connection	Soldered
Temp. Limitations	-20° to 212°F (-29° to 100°C)
Valve Operator	None
Manufacturers	Nibco "S-413-B", Walworth "Fig 3046SJ", or approved equal

2.1.09 Valves VC-9.

Rating	Class 125
Code	API-594
Type	Dual disc wafer
Body	ASTM A126, Class B, cast iron

Trim	
Seat	EPDM
Disc	Aluminum
Hinge Pins	Aluminum
Springs	Stainless steel
Bushings	Manufacturer's standard
End Connection	Plain, installed between ASME B16.1, Class 125, flat faced flanges
Temp. Limitations	-20° to 300°F (-29° to 149°C)
Valve Operator	None
Manufacturers	Techno Corporation "Technocheck Silent Seatless Check Valves", Hoffman "Air Check Valves", Lamson "Check Valves", or approved equal

2.1.10 Valves VC-10.

Rating	3000
Type	Poppet
Body	Stainless steel
Trim	
Poppet	Stainless steel
O-ring	Viton
Spring	Stainless steel
End Connection	Threaded
Temp. Limitations	-10 to 375°F [-23 to 191°C]
Valve Operator	None

Manufacturers	Circle Seal "224B" or Nupro "Series C", or approved equal.

2.1.11 Valves VC-11.

Rating	150 psig [1 MPa] nonshock
Type	Ball check, true union
Body	PVC or CPVC
Trim	
Ball	PVC or CPVC
Seat	Viton or EPDM
Seals	Viton or EPDM
End Connection	Socket
Temp. Limitations	0° to 140°F (-18 to 60°C)
Valve Operator	None
Manufacturers	Hayward Plastics Products "Ball Check Valve", Nibco "Chemtrol True Union Ball Check Valve", or approved equal.

2.1.12 Valves VC-12.

Rating	150 psig (1 MPa) nonshock
Type	Ball check, true union
Body/Bonnet	PVC or CPVC
Trim	
Ball	PVC or CPVC
Seat	Viton or EPDM
Seals	Viton or EPDM

End Connection	Flanged, ASME B16.5, Class 150, raised face
Temp. Limitations	0° to 140°F (-18° to 60°C)
Valve Operator	None
Manufacturers	Hayward Plastics Products "Ball Check Valve", Nibco "Chemtrol True Union Ball Check Valve", or approved equal.

2.1.13 <u>Valves VC-13</u>.

Rating	100 psig (690 kPa) nonshock
Type	Diaphragm, two piece
Body	PVC
Trim	
Diaphragm	Buna-N
End Connection	Threaded
Temp. Limitations	0° to 140°F (-18° to 60°C)
Valve Operator	None
Manufacturers	Plast-O-Matic "Series CK Check Valves" or "Series VB Vacuum Breakers", or approved equal

2.1.14 <u>Length Tolerance</u>. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.15 <u>Shop Coatings</u>. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

<u>Coating Materials</u>

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

<u>Surfaces To Be Coated</u>

Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

PART 3 - EXECUTION

3.1 <u>INSTALLATION</u>. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15094

BACKFLOW PREVENTERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of backflow preventers and associated appurtenances.

Piping, pipe supports, insulation, and accessories that are not an integral part of the backflow preventers or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each backflow preventer covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the device in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication and assembly drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications for each unit shall include, but shall not be limited to the following:

Name of manufacturer.

Type and model.

Net weight.

Unit dimensions.

Performance curves indicating flow capacity versus pressure drop.

Manufacturer shall submit certification that each backflow preventer and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of backflow preventer.

Contractor shall submit results of all pressure and leakage testing.

1.3.02 Operation and Maintenance Data and Manuals. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. Backflow preventers shall be designed to meet the requirements as indicated herein and on the backflow preventer scheduleand as indicated in the Contract Documents.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and specific products are listed in the Design and Construction paragraph.

2.3 DESIGN AND CONSTRUCTION. Backflow prevention device type shall be as indicated in the backflow preventer schedule and as indicated in the Contract Documents.

2.3.01 Reduced Pressure Zone Backflow Preventers. Reduced pressure zone (RPZ) backflow preventers shall consist of isolation valves, two independent check valves, and differential relief valve. The assembly shall automatically reduce the pressure in the zone between the check valves. In the event that the reduced pressure is not maintained, the differential relief valve shall open, maintaining the proper zone differential. RPZ backflow preventers shall comply with AWWA C511-92 and ASSE Standard 1013 requirements and shall be suitable for horizontal installation. Each RPZ backflow preventer shall be provided with a relief valve air-gap drain fitting.

RPZ backflow preventers in 2 inch (50 mm) and smaller sizes shall be provided with bronze bodies and with a threaded bronze bodied ball valve on each end of the device. Two inch (50 mm) and smaller RPZ backflow preventers shall be Febco “Model 860”, Cla-Val Company “Model RP6L”, Watts Regulator “Series 909”, or approved equal.

RPZ backflow preventers in 2-1/2 inch (63 mm) and larger sizes shall be provided with ductile iron bodies, epoxy-coated interior and exterior, and a flanged, resilient-seated gate valve on each end of the device. Flange diameter and drilling shall conform to ANSI/ASME B16.1, Class 125. 2-1/2 inch (63 mm) and larger RPZ backflow preventers shall be Febco “Model 860”, Cla-Val Company “Model RP7L”, Watts Regulator Company “Series 909”, or approved equal.

2.3.02 Hose Connection Vacuum Breakers. Hose connection vacuum breakers shall be provided with 3/4 inch (19 mm) hose thread ends, brass or bronze bodies, stainless steel stem, rubber seat, and rubber disc. Hose connection vacuum breakers shall be of tamper-resistant design to prevent removal, and shall comply with ASSE Standard 1011 requirements. Hose connection vacuum breakers shall be Watts Regulator Company “Series 8”, or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15095

SOLENOID VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of solenoid operated valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Solenoid valves shall have packless construction without packing box or sliding seal.

Solenoid coils for ac service shall have voltage and frequency as indicated in the Contract Documents, encapsulated, Class F, for continuous duty at rated voltage plus or minus 10 percent and 40°C ambient, in a NEMA Type 1 or 4 enclosure, as required, with a conduit knockout.

Solenoid coils for dc service shall have dc voltage as indicated in the Contract Documents, Class H, for continuous duty at rated voltage plus or minus 10 percent and 40°C ambient, in a NEMA Type 1 or 4 enclosure as required, with a conduit knockout.

2.1.01 Valves VSOL-1.

Type	2-way, pilot operated
Body/Bonnet	Brass or bronze
Trim	
Seals	Buna-N or teflon
Disc	Buna-N or teflon
Stem	Manufacturer's standard
Bonnet Gasket	Manufacturer's standard
Spring	Manufacturer's standard
End Connection	Threaded
Temp. Limitations	32° to 104°F (0 to 40°C)
Valve Operator	Integral
Manufacturers	ASCO "8210 Series", or approved equal

2.1.02 Valves VSOL-2.

Type	3-way, pilot operated
Body/Bonnet	Brass or bronze
Trim	
Seals	Buna-N or teflon
Disc	Buna-N or teflon
Stem	Manufacturer’s standard
Bonnet Gasket	Manufacturer’s standard
Spring	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	32° to 104°F (0° to 40°C)
Valve Operator	Integral
Manufacturers	ASCO "8316 Series", or approved equal

2.1.03 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.04 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid	Ameron "Amerlock 400 High-Solids

service)	Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 ACCESSORIES.

2.2.01 Manual Operators. Requirements for manual operators, to allow valve operation when electrical power is off, shall be as indicated in the Solenoid Valve Schedule 15095-S01.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15096

GLOBE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated, two position (open-close) globe valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VGL-1.

Rating	Class 200
Code	MSS SP-80
Type	In-line, union or threaded bonnet, rising stem, needle
Body/Bonnet	Bronze or brass
Trim	
Seat	Manufacturer’s standard
Stem	Bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	0° to 400°F (-18° to 204°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "600", Powell "Fig 180", Stockham "B-64", or approved equal.

2.1.02 Valves VGL-2.

Rating	Class 125
Code	MSS SP-80, Type 1

Type	In-line, metal disc, threaded bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Bronze
Stem	Bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	0° to 350°F (-18° to 177°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "502", Stockham "B-16", Walworth "Fig 3058", or approved equal

2.1.03 Valves VGL-3.

Rating	Class 125
Code	MSS SP-80, Type 1
Type	In-line, metal disc, threaded bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Bronze

Stem	Bronze
Bonnet Gasket	Manufacturer's standard
Stem Packing	Manufacturer's standard
End Connection	Soldered
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "1502", Stockham "B-17", or approved equal

2.1.04 Valves VGL-4.

Rating	Class 150
Code	MSS SP-80, Type 2
Type	In-line, composition disc, union bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Teflon
Stem	Bronze
Bonnet Gasket	Manufacturer's standard
Stem Packing	Manufacturer's standard
End Connection	Threaded
Temp. Limitations	0° to 350°F (-18° to 177°C)
Valve Operator	Handwheel

Manufacturers	Milwaukee "590", Stockham "B-22T", Walworth "Fig 3095", or approved equal

2.1.05 Valves VGL-5.

Rating	Class 150
Code	MSS SP-80, Type 2
Type	In-line, composition disc, union bonnet, rising stem
Body/Bonnet	ASTM B62, bronze
Trim	
Seat	Integral to body
Disc	Teflon
Stem	ASTM B62, bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Teflon impregnated
End Connection	Soldered
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "1590", or approved equal

2.1.06 Valves VGL-6.

Rating	Class 150
Code	MSS SP-85, Type I
Type	In-line, bolted bonnet, OS&Y rising stem

Body/Bonnet	ASTM A126 Class B, cast iron
Trim	
Seat Ring	ASTM B62, bronze
Disc	ASTM B62, bronze
Stem	Brass or silicone bronze
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Flanged, ASME B16.1, Class 125, flat faced
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Handwheel
Manufacturers	Milwaukee "F2981", Powell "Fig 1253", Walworth "8096F", or approved equal

2.1.07 Valves VGL-7.

Rating	Class 250
Code	MSS SP-85 Type 1
Type	In-line, single seated, top guided, bolted bonnet
Body/Bonnet	Cast iron
Trim	
Plug	316 stainless steel
Seat Ring	316 stainless steel
Stem	Manufacturer’s standard

Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Threaded
Temp. Limitations	0° to 250°F (-18° to 121°C)
Valve Operator	Electric
Manufacturers	Dezurik “Series 1400”, or approved equal

2.1.08 Valves VGL-8.

Rating	Class 125
Code	MSS SP-85, Type 1
Type	In-line, single seated, cage, bolted bonnet
Body/Bonnet	Cast iron
Trim	
Plug	17-4 PH stainless steel
Seat Ring	17-4 PH stainless steel
Stem	Manufacturer’s standard
Bonnet Gasket	Manufacturer’s standard
Stem Packing	Manufacturer’s standard
End Connection	Flanged, ASME B16.1, Class 125, flat faced
Temp. Limitations	0° to 350°F (-18° to 177°C)
Valve Operator	Electric
Manufacturers	Dezurik “Series 9100”, or approved

equal

2.1.09 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.10 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.11 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Coating Materials	
Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated	
Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged,	Asphalt varnish.

or Installed in Manholes or Valve Vaults	
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coatedwith the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15097

PINCH VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated, two position (open-close) pinch valves for the services indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves. Pinch valves shall be of full body construction, with flexible sleeve liner, and 100 percent port area of the joining pipe at the valve ends. The valve area shall be 100 percent of the full pipe area through the entire length of the valve. All metal parts are to be completely protected from the process fluid by a flexible elastomer liner. Each valve shall be throttled and fully closed with compressed air that constricts the sleeve at the center of the valve. Each valve body shall be drilled and tapped for a pressure connection on top and bottom of the housing.

The elastomer liners shall be manufactured from elastomer with polyester reinforcement ply and with flanges. Metal reinforcements in valves sized 6 inches (150 mm) and larger shall be molded into the liner flanges. The elastomer liner shall be pre-pinched and shall be field replaceable. Two piece liners shall be identical and shall lock into position without separate gaskets or adhesives. The metal body shall consist of two identical halves.

The calculated bursting pressure of the elastomer liner shall be four times the rated working pressure of the valve. The valve shall be able to handle surge pressures of 150 percent of the working line pressure without breakage.

Rating	Class 150
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Liner	Buna-N
End Connection	Flanged, ASME B16.5, Class 150, flat faced
Temp. Limitations	40 to 225°F (4 to 107°C)
Valve Operator	Integral, pneumatic
Manufacturers	Fowler “Delta Series”, or approved equal

2.1.02 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.03 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	
Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15098

PLUG VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manually operated or remote activated, two position (open-close) plug valves for the services as indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections. Valve actuators are covered in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Valves VP-1.

Rating	175 WOG
Code	
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Plug Seal	Hycar
Plug	Bronze or nickel plated cast iron
Stem Seal	Buna
End Connection	Threaded
Temp. Limitations	-20 to 180°F (-29 to 82°C)
Valve Operator	Lever
Manufacturers	Key Port "Fig 425-RS51", or approved equal

2.1.02 Valves VP-2.

Rating	175 WOG
Code	
Body	ASTM A536, GR 65/45/12, ductile iron
Trim	
Plug Seal	Hycar
Plug	Bronze or nickel plated cast iron

Stem Seal	Buna
End Connection	Flanged, ASME B16.1, Class 125
Temp. Limitations	-20 to 180°F (-29 to 82°C)
Valve Operator	Lever
Manufacturers	Key Port “Fig 425-RS51”, or approved equal

2.1.03 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.04 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.05 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces	
Interior Surfaces	Epoxy.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.3 ACCESSORIES.

2.3.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.02 Position Indicators. Requirements for position indicators shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.03 Floor Boxes. Requirements for floor boxes shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.04 Operating Stands. Requirements for operating stands shall be as indicated in Master Specification Section 15180, Valve and Gate Actuators.

2.3.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coatedwith the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15099

PRESSURE REDUCING VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of pressure reducing valves for gas, air, and water service as indicated in the Contract Documents.

Piping, pipe supports, insulation, and accessories which are not an integral part of the valves or are not specified herein are covered in other sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication and assembly drawings, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications for each unit shall include, but shall not be limited to, the following:

Name of manufacturer.

Type and model.

Unit dimensions.

Performance curves indicating flow capacity versus pressure drop.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. Pressure reducing valves shall be designed to meet the requirements as indicated herein and on the Pressure Reducing Value Schedule 15099-S01 and as indicated in the Contract Documents.

Each pressure reducing valve shall be designed to provide tight shutoff under conditions of no flow and shall not "hunt" under ordinary flow conditions. Pressure reducing valves shall be selected and sized as recommended by the valve manufacturer. Valve pressure setpoint shall be adjustable to at least 20 percent above and below the reduced pressure setpoint.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers and specific products are listed in the Construction paragraph.

2.3 MATERIALS. Valve materials shall be as indicated below and in the Construction paragraph.

Shop Coatings

Epoxy Enamel (NSF certified)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", approved equal; immersion service.
Epoxy Enamel (Natural Gas Service)	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series N69 Hi-Build Epoxoline II", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.

2.4 CONSTRUCTION.

2.4.01 Water Service. Pressure reducing valves for water service shall be direct-acting or pilot-operated type as indicated in the Pressure Reducing Valve Schedule.

Direct-acting valves shall be globe type with threaded connections and union assembly. The valves shall be provided with bronze body and cover, stainless steel trim, reinforced neoprene diaphragm, Buna-N disc, and stainless steel strainer. Direct-acting pressure reducing valves shall be Cla-Val “Model 990”, Cash-Acme, Watts, or approved equal.

Pilot-operated valves shall be globe type with flanged ends. The valves shall be provided with epoxy coated ductile iron body, bronze trim, and Buna-N rubber diaphragm and disc. The pilot regulating valve shall be bronze with stainless steel trim. Pilot-operated pressure reducing valves shall be Cla-Val “Model 990”, Cash-Acme, Watts, or approved equal.

When indicated in the schedules, pilot-operated valves shall be equipped with a low flow bypass. The low flow bypass shall consist of a direct-acting pressure reducing valve in parallel with the pilot-operated valve. The valves and required piping assembly shall be factory assembled and shall be Cla-Val “Model 90-48”, or approved equal.

2.4.02 Gas Service. Pressure reducing valves for natural gas and propane gas service shall be suitable for gases with specific gravities of 0.6 and 1.5, respectively. Natural gas and propane gas pressure reducing valves shall be direct-acting type with cast iron or cast steel bodies, threaded ends, aluminum trim, and a nitrile diaphragm and disc. Valves shall be Fisher Controls "S-102/S-201 Series", or approved equal.

Pressure reducing valves for digester gas service shall be suitable for gas with specific gravity of 0.8 to 0.9. Digester gas pressure reducing valves shall be pilot-operated type with stainless steel bodies, stainless steel trim, viton diaphragm, and stainless steel pilot. Valves shall be Fisher Controls "1098-EGR Series", or approved equal.

2.4.03 Air Service. Pressure reducing valves for air service shall have a cast iron or steel body with stainless steel trim and a composition disc. Pressure reducing valves shall be furnished with integral or line mounted inlet filters/strainers and discharge pressure gauges. Valves shall be as manufactured by Fisher Controls; Jordan Valve Div., Richards Industries; O. C. Keckley Co.; Leslie Controls, Inc.; Spirax Sarco, Inc; or approved equal.

2.5 SHOP COATING. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting .

Surfaces to be Coated

Interior Surfaces	
Liquid Service	Epoxy (NSF certified).
Fuel Gas and digester Gas Service	Epoxy.
Exterior Surfaces	Universal primer.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

End of Section

SECTION 15100

MISCELLANEOUS VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of miscellaneous valves as indicated in the Contract Documents. This section includes the following types of valves:

Hose faucets
Wall hydrants
Wall hydrants with vacuum breaker
Yard hydrants
Post type yard hydrants
Curb stops

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment , Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.02 Number Plates. Each valve covered by this section, that has been assigned a number on the drawings, shall be provided with a number plate mounted on or adjacent to the valve in a manner acceptable to Engineer. Number plates shall be aluminum with engraved letters at least 3/4 inch (19 mm) high. Letters shall be painted black after fabrication.

1.3 SUBMITTALS. Complete drawings, details, and specifications, covering the valves and their appurtenances shall be submitted in accordance Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180,Equipment , Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION.

2.1.01 Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch (1.6 mm) of the specified or theoretical length.

2.1.02 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.1.03 Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer’s standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Coating Materials

Asphalt Varnish	Fed Spec TT-C-494.
Epoxy Enamel (for NSF 61 liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces

Interior Surfaces

Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.
Actuators and Accessories	Universal primer.

2.2 HOSE VALVES AND HYDRANTS.

2.2.01 Hose Faucets, VHF-1.

Type	Faucet, threaded bonnet
Body/Bonnet	Brass
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, male NPT x male HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	T-handle
Manufacturers	Chicago Faucets "No. 7T", Tanner "1235", or approved equal

2.2.02 Wall Hydrants, VHF-2.

Type	Freeze proof
Body/Bonnet	Brass or bronze
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, NPT x male HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	Removable key
Manufacturers	Josam "71200", Smith "5610", Wade "W-8604", Woodford "60", Zurn "Z-1315", or approved equal

2.2.03 Wall Hydrants with Vacuum Breaker, VHF-3.

Type	Freeze proof, with vacuum breaker
Body	Brass or bronze
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, NPT x male HPT
Temp. Limitations	32° to 212°F (0° to 100°C)

Valve Operator	Removable key
Manufacturers	Josam "71050", Smith "5609", Wade "W-8620", Woodford "65", Zurn "Z-1310", or approved equal

2.2.04 Yard Hydrants, VHF-4.

Type	Non-freeze, box type
Body	Brass or bronze
Trim	
Seat	Manufacturer’s standard
Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
Box, Cover, Casing	Bronze
End Connection	Threaded, NPT x HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	Removable key
Manufacturers	Josam "Series 71600", Smith "5810/5813", Wade W-8610", Zurn "Z-1360/1365", or approved equal

2.2.05 Post Type Yard Hydrants, VHF-5.

Type	Non-freeze, post type
Body	Brass or bronze
Trim	
Seat	Manufacturer’s standard

Disc	Manufacturer’s standard
Stem	Manufacturer’s standard
Stem Seal	Manufacturer’s standard
End Connection	Threaded, NPT x HPT
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	Removable key
Manufacturers	Josam "Series 71701", Smith "5910/5913", Wade "W-8604", Woodford "60", Zurn "Z-1385/1390", or approved equal

2.3 CURB STOPS.

2.3.01 Curb Stops, VCS-1.

Code	AWWA C800
Type	Straight-through
Body	Brass or bronze
Trim	
Seat	Manufacturer's standard
Plug/Ball	Manufacturer's standard
Stem	Manufacturer's standard
Stem Seal	Manufacturer's standard
End Connection	Threaded
Temp. Limitations	32° to 212°F (0° to 100°C)
Valve Operator	T-handle
Manufacturers	Ford Meter Box "Ford Ball Valve", Hays "Nuseal Curb Stop", Mueller

"Mark II Oriseal", or approved equal

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5 ACCESSORIES.

2.5.01 Extension Stems. Requirements for extension stems and stem guides shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.03 Floor Boxes. Requirements for floor boxes shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.04 Operating Stands. Requirements for operating stands shall be as specified in Master Specification Section 15180,Valve and Gate Actuators.

2.5.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

PART 3 - EXECUTION

3.1 INSTALLATION. Materials furnished under this section will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. When specified herein, an experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section01180, Equipment, Materials, Parts, and Tools and shall revisit the job site as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated, as in accurate alignment, is free from any undue stress imposed by connecting piping and appurtenances, and has been operated under full load conditions and that is operated satisfactory.

3.2 SCHEDULE. See Schedules 15100-S01 and 15100-S02.

End of Section

SECTION 15101

AWWA BUTTERFLY VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of AWWA butterfly valves for cold water service as indicated in the Contract Documents and AWWA Butterfly Valve Schedule 15101-S01. All other butterfly valves are covered in Master Specification Section 15092, Industrial Butterfly Valves.

AWWA butterfly valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all butterfly valves and manual actuators shall conform to the applicable requirements of ANSI/AWWA C504.

1.2.03 Marking. Supplementing the requirements of Section 6.1 of the governing standard, the country of origin of all castings and an identifying serial number shall be stamped on a corrosion-resistant plate attached to the valve body.

1.2.04 Temporary Number Plates. Each butterfly valve shall be tagged or marked in the factory with the identifying number listed in the AWWA Butterfly Valve Schedule 15101-S01.

1.2.05 Permanent Number Plates. All butterfly valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall

be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Certified copies of test results as specified herein by Section 5 of ANSI/AWWA C504, with an affidavit of compliance as indicated in Section 1.7 of C504, shall be submitted to Engineer before the valves are shipped. Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS. Butterfly valves shall be limited to the manufacturers as specified herein. Sizes and styles for the manufacturers shall be limited as indicated, without exception:

Manufacturer	Acceptable Sizes and Styles
Rodney Hunt	All
Val-Matic	All
Milliken	All
DeZurik	All

Pratt	All
M&H	All

2.2 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of butterfly valves shall conform to the requirements of ANSI/AWWA C504.

Acceptable shop coatings are listed in the following table.

Asphalt Varnish	Fed. Spec. TT-C-494.
Epoxy Enamel (NSF certified systems)	Ameron “Amerlock 400 High-Solids Epoxy Coating”, Carboline “Carbogard 891”, Tnemec “Series N140 Pota-Pox Plus”, or approved equal, immersion service.
Epoxy Enamel (non-NSF certified)	Ameron “Amercoat 385 Epoxy”, Carboline “Carbogard 890”, Tnemec “Series 69 Hi-Build Epoxoline II”, or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Bodies. Valves shall be ductile iron, short-body type except where wafer type is specified in the AWWA Butterfly Valve Schedule 15101-S01. The use of a stop or lug cast integrally with or mechanically secured to the body for the purpose of limiting disc travel by means of direct contact or interference with the valve disc (in either the open or closed position) will not be acceptable.

The valve disc shall be a single casting made of ductile iron with a dome shape.

2.3.02 Flanges. Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch (125 μm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.002 inch per foot (0.017 percent) of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2.3.03 Mechanical Joint Ends. Mechanical joint ends shall be either mechanical joint or push-on ends conforming to ANSI/AWWA C111/A21.11.

2.3.04 Valve Shafts. Valve shafts shall be fabricated of AISI Type 17-4PH stainless steel. The use of shafts having a hexagonal cross section will not be acceptable. Shafts shall be provided with a permanent indicating mark to identify disc position when the actuator is removed or reinstalled.

The connection between the shaft and the disc shall be mechanically secured by means of solid, smooth sided, stainless steel or monel taper pins or dowel pins. Each taper pin or dowel pin shall extend through or shall wedge against the side of the shaft and shall be mechanically secured in place. The use of set screws, knurled or fluted dowel pins, expansion pins, roll pins, tension pins, spring pins, or other devices instead of the pins specified herein will not be acceptable.

2.3.05 Valve Seats. Acceptable seating surfaces mating with rubber are AISI Type 316 stainless steel, or monel for all valves; bronze for 20 inch (500 mm) and smaller valves.

Seats shall be located on the valve body or disc as required. Valve seat configurations which rely on the mating pipe flange to hold the seat in position in the valve body will not be acceptable.

The valve seat shall be natural rubber or Buna-N that is certified compliant with NSF 61.

2.3.06 Shaft Seals. The valve shall be provided with a ductile iron stuffing box at the projection of the valve shaft from the valve body. Stuffing boxes for rectangular section packing shall be bushed in an approved manner with bushings made of cast bronze or type 316 stainless steel. Stuffing boxes for “vee” type packing shall be fitted with a cast bronze or type 316 stainless steel bottoming ring.

The stuffing box gland and follower, gland studs and nuts shall be manufactured of cast bronze bronze or type 316 stainless steel. The follower shall be of split construction.

The stuffing box shall be packed with graphited, non-asbestos, rectangular packing or Engineer approved “vee” type packing.

2.3.07 Thrust Bearings. Each valve shall be provided with one or more thrust bearings in accordance with the governing standard. Thrust bearings which are directly exposed to line liquid and which consist of a metal bearing surface in rubbing contact with an opposing metal bearing surface will not be acceptable.

2.3.08 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified herein, as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the AWWA Butterfly Valve Schedule 15101-S01.

All 8 inch (200 mm) and larger valves shall have geared actuators.

If valves with an AWWA class designation higher than indicated in the schedule are furnished, actuator torque capabilities shall be increased accordingly and be acceptable to Engineer.

2.4.01 Actuator Sizing. The valve manufacturer shall size the actuator in accordance with AWWA C504, the operating conditions and requirements indicated in the AWWA Butterfly Valve Schedule 15101-S01, and the valve manufacturer's requirements.

For valves 20 inch (500 mm) and smaller, the actuator torque shall be at least 70 percent of the AWWA C504 Table 4 torque for Class 150B. For valves 24 inch (600 mm) and larger, the actuator torque shall be at least 50 percent of the Table 4 torque for the AWWA class valve being provided.

For valves with actuator torque requirements not indicated shall have an actuator torque based on a maximum differential pressure across the valve equal to the valve class and a maximum velocity through the valve of 16 feet per second (4.9 m/s).

Valves with operating stands shall have actuator torques increased by 25 percent. Actuator torques determined by the above requirements shall be increased by any safety factors required by AWWA C504, paragraphs 3.8.6.1 and 3.8.7 or indicated or specified herein.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces, except finished surfaces, bearing surfaces, and stainless steel components, of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting. Coal tar shall not be an acceptable coating.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy enamel.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	
Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy enamel.

Interior coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy Enamel	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.05 Torque Tubes. Requirements for torque tubes shall be as indicated in the AWWA Butterfly Valve Schedule 15101-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.06 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

2.7 SHOP TESTING. Except as modified herein, AWWA butterfly valves shall be tested in accordance with Section 5 of AWWA C504. Each valve shall be performance tested in accordance with Section 5.2.1 and shall be given a leakage test and a hydrostatic test as described in Sections 5.2.2 and 5.2.3.
Each valve shall be leaktight in both directions when closed by the actuator with the maximum pressure applied to the valve.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.
3.2 SCHEDULE. See the Butterfly Valve Schedule 15101-S01.

End of Section

SECTION 15102

ECCENTRIC PLUG VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of eccentric plug valves as indicated in the Contract Documents and Eccentric Plug Valve Schedule 15102-S01.

Plug valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Marking. Each valve shall be marked with the manufacturer's name, valve size, and pressure rating, and the country of origin of the body casting. All markings shall be cast on the exterior surface of the valve body. An identifying serial number shall be stamped on a corrosion-resistant plate attached to the valve body.

1.2.03 Temporary Number Plates. Each eccentric plug valve shall be tagged or marked in the factory with the identifying number listed in the Eccentric Plug Valve Schedule 15102-S01.

1.2.04 Permanent Number Plates. All plug valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate oras indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance withMaster

Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Certified copies of reports covering proof-of-design testing of valves as set forth in Section 5.2 of ANSI/AWWA C504, with an affidavit of compliance as indicated in Section 1.7 of C504, shall be submitted to Engineer before the valves are shipped. Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS. Eccentric plug valves furnished under this section shall be manufactured by DeZurik, Pratt, Milliken, Val-Matic, Clow, or Victaulic, without exception.

2.2 MATERIALS. Materials used in the manufacture of eccentric plug valves shall be as indicated:

Body	Ductile iron, ASTM A536, Grade 65-45-12.
Plug	Ductile iron, ASTM A536, Grade 65-45-12.
Plug Facing	Neoprene or Buna-N, 70 Type A durometer hardness in accordance with ASTM D2240.
Body Seat	Welded nickel overlay.
Upper and Lower Trunnion Bearings	Sleeve type; type 316 stainless steel or bronze.
Upper Thrust Bearing	TFE, Nylatron, or Delrin.

Stem Seal	V-type packing or U-cups, Buna-N or TFE.

Acceptable shop coatings are listed in the following table. Whenindicated on the Contract Documents, epoxy for liquid service shall be as specified in Master Specification Section 09900, Painting rather than as indicated below.

Asphalt Varnish	Fed Spec TT-C-494.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Epoxy	
For Gas Service	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", Plasite "Plasguard 7122", or approved equal.
For Liquid Service	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Body. The valve port area of each valve shall be at least 80 percent of the cross section of the connecting piping for 20 inch (500 mm) and smaller valves and 70 percent for 24 inch (600 mm) and larger valves. Valves shall provide tight shutoff at the rated pressure from either direction. An adjustable closed position plug stop shall be provided.

Each valve body shall be plainly marked to indicate the seat end. The actual length of 10 inch (250 mm) and smaller valves shall be within plus or minus 1/16 inch (1.6 mm) of the theoretical length. The actual length of 12 inch (300 mm) and larger valves shall be within plus or minus 1/8 inch (3 mm) of the theoretical length.

Valve ends shall be compatible with connecting piping. All valves shall have flanged, grooved or mechanical joint ends as indicated in the Eccentric Plug Valve Schedule 15102-S01. Flange diameter and drilling shall be spot faced and conform to ANSI B16.1, Class 125. Flanges shall be flat faced and finished to true plane surfaces within a tolerance limit of 0.005 inch (0.12 mm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of

0.002 inch per foot (0.16 mm per meter) of flange diameter. The degree of smoothness of the flange faces shall be 125 RMS.

Grooved end dimensions shall conform to AWWA C606, Table 5, for rigid joints. When grooved end valves are to be installed in flanged piping, two flange adapters compatible with the connecting piping shall be provided with each valve. Mechanical joint ends shall conform to ANSI/AWWA C111/A21.11.

Valve bodies shall be rated for a working pressure as indicated on the Eccentric Plug Valve Schedule 15102-S01.

2.3.02 Plug. The plug shall be of one-piece construction and shall have a cylindrical or spherical seating surface eccentrically offset from the center of the plug shaft. The interference between the plug face and the body seat, with the plug in the closed position, shall be externally adjustable in the field with the valve in the line under pressure. Plug surfaces shall be faced with a resilient material.

2.3.03 Seats. Seats shall be cast in the body and shall have raised, welded-in nickel overlay not less than 0.050 inch (1.30 mm) thick on all surfaces in contact with the plug face. The overlay shall be at least 90 percent nickel and have a Brinell hardness of 200 or greater.

2.3.04 Stem Seals. The valve shaft shall be sealed by U-cups or by at least four self-adjusting chevron type packing rings.

2.3.05 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified herein, as specified in Master Specification Section 15180, Valve and Gate Actuators and as indicated in the Eccentric Plug Valve Schedule 15102-S01.

Geared actuators shall be used for manually operated valves in the following applications:

1. For all 4 inch (100 mm) and larger buried valves.

2. For all 8 inch (200 mm) and larger valves.

3. For all 6 inch (150 mm) valves in throttling or free discharge applications.

4. For all 6 inch (150 mm) valves where the unseating pressure exceeds

25 psi (170 kPa).

5. For all chainwheel operated valves.

6. For all valves in gas service.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces, except bearing and finished surfaces and stainless steel components of valves and accessories, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	
For Liquid Service	Epoxy.
For Gas Service	Epoxy.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

When specified herein, interior epoxy coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the Eccentric Plug Valve Schedule 15102-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.05 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

Valve boxes which are to be provided with position indicators shall have top sections and covers designed for proper installation of the position indicator and accessories.

2.7 TESTING. Except as modified herein, eccentric plug valves shall be tested in accordance with Section 5 of AWWA C504. Each valve shall be performance tested in accordance with Section 5.2.1 and shall be given a leakage test and a hydrostatic test as described in Sections 5.2.2 and 5.2.3. The leakage test shall be applied to the seating face of the plug (tending to unseat the plug) at the rated pressure of the valve.

Each valve shall be leaktight in both directions when closed by the actuator with the maximum differential pressure applied to the plug as specified in the Eccentric Plug Valve Schedule 15102-S01.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.2 SCHEDULE. See the Eccentric Plug Valve Schedule 15102-S01.

End of Section

SECTION 15103

AWWA BALL VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of 6 inch (150 mm) and larger AWWA ball valves as indicated in the Contract Documents and AWWA Ball Valve Schedule 15103-S01. Four inch (100 mm) and smaller ball valves are covered in Master Specification Section 15091, Miscellaneous Ball Valves.

AWWA ball valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all ball valves and manual actuators shall conform to the applicable requirements of ANSI/AWWA C507.

1.2.03 Temporary Number Plates. Each ball valve shall be tagged or marked in the factory with the identifying number listed in the AWWA Ball Valve Schedule 15103-S01.

1.2.04 Permanent Number Plates. All ball valves shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall be at least 1 inch [25 mm] high and shall be black baked enamel on anodized aluminum plate or shall be asindicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Certified copies of reports covering proof-of-design testing of valves as set forth in Section 5.2.4.3 of ANSI/AWWA C504, with an affidavit of compliance as indicated in Section 1.3 of C507, shall be submitted to Engineer before the valves are shipped. Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS. Ball valves shall be as manufactured by APCO/Williamette, Valve Technologies, or approved equal.

2.2 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of ball valves shall conform to ANSI/AWWA C507.

Shop Coatings

Epoxy (NSF certified systems.	Ameron "Amerlock 400 High-Solids Epoxy Coating"; Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox plus", or approved equal; immersion service.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Body. Each valve body shall be ductile iron and provided with flanged ends. Flanges shall be flat faced and finished to true plane surfaces within a tolerance of 0.005 inch (0.12 mm). Each flange face shall be perpendicular to the longitudinal axis of the valve, within a maximum angular variation tolerance of 0.002 inch per foot (0.16 mm/m) of flange diameter. Flange faces shall have concentric or spiral serrated finish.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125.

Actual length of valves shall be within plus or minus 1/16 inch (1.6 mm)of the theoretical length.

2.3.02 Ball. Each ball shall be designed so that there will be flow between the ball and body when the ball is in a throttled position and so that substantially all flow is through the ball when in the fully open position.

2.3.03 Seats. The type of seats shall be metal to metal, as specified herein. For metal-to-metal seated valves, a type 316 stainless steel seat shall be provided on the ball and a monel seat on the valve body. The ball shall be fitted with a type 316 stainless steel sleeve and the ball seat shall be attached to this sleeve by a threaded connection. Valve seats shall be located as specified herein. The seats and the type 316 stainless steel sleeve shall be securely anchored in place.

Contact pressure between seats shall not exceed 1,000 psi (6895 kPa) at an unbalanced head equal to the specified working pressure.

2.3.04 Operating Mechanism. Unless otherwise specified, the basic operating mechanism for each valve shall be of the traveling-nut type and shall consist of (1) a traveling crosshead which will move transversely to the valve shaft, (2) a threaded lead screw engaging corresponding threads in the crosshead, which will move the crosshead when turned by the valve drive unit for manual or electric motor operated valves, and a piston rod with the crosshead directly attached thereto for cylinder operated valves, and (3) a rotator lever, linked to the crosshead, which will impart a rotary motion to the valve shaft. Worm gear type operating mechanisms will also be acceptable for electric motor operated valves. The operator shall have manual stops.

2.3.05 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the AWWA Ball Valve Schedule 15103-S01.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy (NSF 61 certified).
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the AWWA Ball Valve Schedule 15103-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the AWWA Ball Valve Schedule 15103-S01, and as specified in Section Master Specification 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the AWWA Ball Valve Schedule 15103-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators

2.7 PROOF-OF-DESIGN TESTING. Except as modified or supplemented herein, ball valves shall be subject to proof-of-design testing in accordance with Section 5.2.4.3 of ANSI/AWWA C504 titled Rubber-Seated Butterfly Valves. Upon completion of the cycle test, seat leakage of metal-seated valves shall not exceed the rate set forth in Section 5.2.2.1 of ANSI/AWWA C507, and resilient-seated valves shall be droptight.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.
3.2 SCHEDULE. See AWWA Ball Valve Schedule 15103-S01.

End of Section

SECTION 15104

RESILIENT-SEATED GATE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of resilient-seated AWWA gate valves for water service as indicated in the Contract Documents and Resilient-Seated Gate Valve Schedule 15104-S01.

Resilient-seated gate valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all resilient-seated gate valves shall conform to the applicable requirements of ANSI/AWWA C509.

1.2.03 Marking. Supplementing the requirements of Section 7.1 of the governing standard, the name of the country where the valve body was manufactured shall be cast on the exterior of the body. The name of the country where the gate was manufactured shall be molded into the resilient seat material.

1.2.04 Temporary Number Plates. Each resilient-seated gate valve shall be tagged or marked in the factory with the identifying number listed in the Resilient Seated Gate Valve Schedule 15104-S01.

1.2.05 Permanent Number Plates. All gate valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall

be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

All valves shall be tested in accordance with Section 6 of ANSI/AWWA C509. Certified copies of the results of all tests, together with an affidavit of compliance as indicated in Section 1.5, shall be submitted to Engineer before the valves are shipped.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of resilient-seated gate valves shall conform to the requirements of ANSI/AWWA C509.

2.1.01 Bronze Components. All bronze valve components in contact with liquid shall contain less than 15 percent zinc. All aluminum bronze components in contact with liquid shall be heat treated in accordance with Section 2.2 of ANSI/AWWA C504 to inhibit dealuminization.

2.1.02 Gaskets. Gaskets shall be free of asbestos and corrosive ingredients.

2.1.03 Shop Coatings.

Asphalt Varnish	Fed Spec TT-C-494.

Epoxy (NSF Certified)	Manufacturer's standard fusion-bonded or liquid epoxy.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.2 VALVE CONSTRUCTION.

2.2.01 Body. Valve shall be fabricated of ductile iron.

2.2.02 Ends. Valve ends shall be compatible with connecting piping and as indicated in the Resilient Seated Gate Valve Schedule 15104-S01. Except as modified or supplemented herein, the ends shall conform to the applicable requirements of ANSI/AWWA C509.

Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch (125 μm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.001 inch per inch (1 μm/mm) of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2.2.03 Stem Seals. Stuffing box stem seals shall be provided for all gate valves with rising stems (outside screw-and-yoke type). O-ring stem seals shall be provided for all buried gate valves, and for all gate valves with non-rising stems. The type of stem shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01.

2.2.04 Rotation. The direction of rotation of the handwheel or the wrench nut to open the valve shall be to the left (counterclockwise).

2.2.05. Shop Coating. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. Except as specified below, the valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be coated as follows:

Interior surfaces	Epoxy (NSF certified)
Exterior surfaces of all other valves.	Universal primer.
Polished or machined surfaces.	Rust-preventive compound.

The protective epoxy coating on the interior surfaces of each valve shall be applied in three coats, with a minimum total dry film thickness of 13 mils (325 μm). Alternatively, the manufacturer's standard coating may be used and the interior surfaces of each valve shall be subjected to a nondestructive holiday test in accordance with ASTM G62, Method A, and shall be electrically void-free.

Interior coatings shall comply with AWWA C550. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils (250 μm) or 13 mils (325 μm)where specified herein.
Universal Primer	3 mils (75 μm)

2.3 VALVE ACTUATORS. Requirements for valve actuators shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4 ACCESSORIES.

2.4.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.02 Floor Boxes. Requirements for floor boxes shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.03 Operating Stands. Requirements for operating stands shall be as indicated in the Resilient Seated Gate Valve Schedule 15104-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.04 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves shall be handled and installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.2. SCHEDULE. See the Resilient-Seated Gate Valve Schedule 15104-S01.

End of Section

SECTION 15105

DOUBLE DISC GATE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of 3 inch (75 mm) and larger double disc, parallel seat gate valves for water service as indicated in the Contract Documents and Double Disc Gate Valve Schedule 15105-S01.

Double disc gate valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production and valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and material furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all double disc gate valves shall conform to the applicable requirements of AWWA C500.

1.2.03 Marking. Supplementing the requirements of Section 6.1 of the governing standard, each gate valve shall be marked with the maximum working pressure for which the valve is designed. In addition, the name of the country where the valve body was manufactured shall be cast on the exterior of the body.

1.2.04 Temporary Number Plates. Each double disc gate valve shall be tagged or marked in the factory with the identifying number listed in the Double Disc Gate Valve Schedule 15105-S01.

1.2.05 Permanent Number Plates. All gate valves, except buried or submerged valves, shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall

be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

Certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components.

All valves shall be tested in accordance with Section 5.2 of AWWA C500. Certified copies of the results of all tests, together with an affidavit of compliance as indicated in Section 1.4, shall be submitted to Engineer before the valves are shipped. Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of double disc gate valves shall conform to the requirements of ANSI/AWWA C500.

2.1.01 Bronze Components. All bronze valve components in contact with liquid shall contain less than 15 percent zinc. All aluminum bronze components in contact with liquid shall be heat treated in accordance with Section 2.2 of ANSI/AWWA C504 to inhibit dealuminization.

2.1.02 Gaskets. Gaskets shall be free of asbestos and corrosive ingredients.

2.1.03 Shop Coatings.

Epoxy Enamel (NSF certified)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal; immersion service.

Epoxy Enamel (non-NSF certified)	Ameron "Amerlock 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.2 VALVE CONSTRUCTION.

2.2.01 Body. Valve shall be fabricated of ductile iron.

2.2.02 Ends. Valve ends shall be compatible with connecting piping and as indicated in the Double Disc Gate Valve Schedule 15105-S01. Except as modified or supplemented herein, the ends shall conform to the applicable requirements of ANSI/AWWA C500.

Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch (125 µm). The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.002 inch per foot (165 µm/m) of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2.2.03 Stem Seals. Stuffing box stem seals shall be provided for all gate valves with rising stems (outside screw-and-yoke type). O-ring stem seals shall be provided for all buried gate valves, and for all gate valves with non-rising stems. The type of stem shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01.

2.2.04 Rotation. The direction of rotation of the handwheel or wrench nut to open the valve shall be to the right (clockwise).

2.2.05 Bypasses. All 16 inch (400 mm) and larger gate valves shall be provided with a bypass and a bypass valve. Bypasses and bypass valves shall comply with Section 3.20 and Table 8 of the governing standard.

2.2.06 Gearing. All 16 inch (400 mm) and larger gate valves shall be provided with gears and gear cases as indicated in the Double Disc Gate Valve Schedule 15105-

S01. Gears and gear cases shall comply with Sections 3.17 and 3.18 and Table 7 of the governing standard.

2.2.07 Internal Rollers and Tracks. All 16 inch (400 mm) and larger valves installed in horizontal piping with the stem oriented horizontally shall be equipped with internal rollers and tracks, as indicated in the Double Disc Gate Valve Schedule 15105-S01.

2.2.08 Shop Coating. All interior and exterior ferrous metal surfaces, except finished surfaces, bearing surfaces, and stainless steel components, of valves and accessories shall be shop painted for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in the Master Specification Section 09900, Painting.

Surfaces shall be coated as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy enamel (NSF certified for potable water service).
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	
Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy enamel.
Actuators and Accessories	Universal primer.

Interior coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness

Epoxy Enamel	10 mils (250 µm)
Universal Primer	3 mils (75 µm)

2.3 VALVE ACTUATORS. Requirements for valve actuators shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4 ACCESSORIES.

2.4.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.02 Floor Boxes. Requirements for floor boxes shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.03 Operating Stands. Requirements for operating stands shall be as indicated in the Double Disc Gate Valve Schedule 15105-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.4.04 Valve Boxes. Requirements for valve boxes shall be as indicated in the DWSD standard details.

All parts of valve boxes, bases, and covers shall be shop coated with the manufacturer's standard coating.

PART 3 - EXECUTION

3.1 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.1.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the job site as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.2 SCHEDULE. See the Double Disc Gate Valve Schedule 15105-S01.

End of Section

SECTION 15106

CONE VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of cone valves for the services indicated in the Contract Documents and Cone Valve Schedule 15106-S01.

Cone valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Temporary Number Plates. Each cone valve shall be tagged or marked in the factory with the identifying number listed in the Cone Valve Schedule 15106-S01.

1.2.03 Permanent Number Plates. All cone valves shall be provided with a permanent number plate. The location of number plates and the method of fastening shall be acceptable to Engineer. Numerals shall be at least 1 inch (25 mm) high and shall be black baked enamel on anodized aluminum plate or as indicated in the Contract Documents.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of all ductile iron valve components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each drawing shall be identified with the valve number or name as specified in this section.

Fluid diagrams for all hydraulic systems shall be submitted. Diagrams shall be drawn using fluid power symbols approved by the American National Standards Institute, Inc., or the manufacturer's standard set of symbols if these symbols adequately and clearly explain the operation of the various components.

In addition, the following drawings shall be submitted before fabrication of the valve control equipment for the pump check valves:

> Curve plotting "Area of Opening in Percent of Full Opening" versus "Plug Rotation in Degrees".
>
> Curve plotting "Area of Opening in Percent of Full Opening" versus "Time of Valve Closure" for normal closing.
>
> Curve plotting "Area of Opening in Percent of Full Opening" versus "Time of Valve Closure" for emergency closing.

When requested by the Engineer, certified copies of physical and chemical test results shall be submitted for the materials of construction of valve components. Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

Contractor shall submit results of all pressure and leakage testing.

PART 2 - PRODUCTS

2.1 <u>ACCEPTABLE PRODUCTS</u>. Cone valves shall be manufactured by Rodney Hunt, American Valve (Pennsylvania), or approved equal.

2.2 <u>MATERIALS</u>. Materials used in the manufacture of the cone valve as furnished, and of all valve accessories, appurtenances, and control equipment and devices, shall be new and the best and most suitable for the purpose intended in each case, the selection of each such material being based on strength, ductility, durability, and other basic properties in accordance with the best current engineering practice. Materials shall conform to the latest applicable standards of the American Society for Testing and Materials.

Materials used in the manufacture of the cone valve shall be as follows:

Body	Ductile iron, ASTM A536 Grade 65-45-12.
Plug	Ductile iron, ASTM A536, Grade 65-45-12.
Body Seats	Monel.
Plug Seats	Monel.
Bearings	Bronze.
Plug Shaft	Stainless steel, AISI Type 17-4PH w/minimum tensile strength of 80,000 psi.
Operating Mechanism	Cast steel, ASTM A27; or ductile iron, ASTM A536.
Shaft Packing	Graphite packing with split lantern ring/gland. Provide special tools necessary for packing replacement.
Shop Coatings	
Epoxy Enamel	NSF certified systems; Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", or Tnemec "Series N140 Pota-Pox Plus"; immersion service.
Universal Primer	Universal Rust-Inhibitive Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 888 Primer," or Tnemec Series N27 S.T. Typoxy.
Rust-Preventive Compound	Houghton "Rust Veto 344".

All materials subject to rubbing contact shall be of different hardness to prevent galling. Difference in hardness between the two surfaces shall be at least 125 Brinell.

2.3 VALVE CONSTRUCTION.

2.3.01 Valve Body. The body of the valve shall be ductile iron and shall have flanged inlet and outlet waterway openings and a flanged opening for insertion or removal of the valve plug.

Both inlet and outlet ends of the valve body shall be provided with seat rings fused into the body metal, with the seat faces raised above adjacent body surfaces by a sufficient amount to assure free operation of the valve plug regardless of any encrustations on interior body surfaces.

Each valve shall be provided with four NPT taps with solid brass plugs, two located on each side of the valve. The size of the taps shall be determined by the Owner based on the size of the valve.

2-3.02 Flanges. The valve shall be provided with end flanges conforming to ANSI/ASME B16.1, Class 250.

Flanges shall be flat faced and finished to true plane surfaces within a tolerance limit of 0.005 inch. Each finished face shall be perpendicular to the longitudinal axis of the valve within a maximum angular variation tolerance of 0.002 inch per foot of flange diameter.

Flanges shall be drilled and spot faced per ANSI B16.1, Class 125. The degree of smoothness of the flange faces shall be 125 RMS.

2-3.03 Plug. The plug shall be in the form of a frustrum of a cone, with a clear circular-section waterway. The plug shall rotate on large diameter end trunnions made of magnesium bronze with a tensile strength of 70,000 psi, and shall be provided with bronze bearing sleeves operating in bronze-bushed bearings in both valve body and valve-head cover. The clearances between bearing sleeves and the bearings shall not exceed 0.008 inches. The maximum allowable unit bearing stress shall not exceed 3,000 psi. The valve operating shaft shall be provided with either a hard bronze sleeve or a chrome overlay where it passes through the valve-head cover stuffing box.

The plug shall be provided with four seat rings fused into the plug metal, one each around the inlet and the outlet plug openings, and the other two placed at right angles thereon so as to cut off the flow when the valve is in a closed position. The plug and seats shall be designed for only an axial motion for unwedging the seated pair of the plug seats from the body seats and of a rotary motion for turning the plug 90 degrees and aligning the second pair of seats in the plug with the body seats, followed only by axial motion during seating. Seats shall not be in contact with any part of the valve at any time during rotation of the plug. Body seats and their mating plug seats shall be machined to close tolerances, so as to fully mate to reduce wear and minimize leakage when the cone pump check valve is fully opened or closed.

The plug seats shall have a minimum thickness of 0.090 inches after fusing and machining.

2.3.04 Valve-Head Cover. The valve shall be provided with a valve-head cover casting which will (a) close the flanged head opening in the valve body, (b) support the outer plug trunnion and attached shaft, and (c) support the valve operating mechanism and mechanism housing. The valve head cover shall be arched in the center to allow water from the packing gland or other external source to drain freely off the valve. The valve-head cover shall make a registered connection with the valve body and shall be provided with a bronze-bushed bearing, shaft stuffing box, split bronze packing gland, suitable graphite packing, and four jacking bolts equally spaced around the perimeter for removal. Head bolts, studs, and nuts shall be of silicon bronze. Reference match marks shall be provided on both body and valve-head cover to ensure proper assembly.

The stuffing box shall have sufficient depth for the graphite packing and to contain a portion of the gland. The packing shall be replaceable without removing the valve actuator. The gland shall be bronze, split, drilled, threaded and pinned. It shall be easily accessible, adjustable via bronze studs and double nuts with one nut being a locking nut. The valve actuator shall not be used to retain the shaft seal.

2.3.05 Operating Mechanisms. The basic valve operating mechanism shall consist of (a) crosshead which will move in a straight line between parallel guide rods transversely to the plug shaft, (b) a piston rod which will transmit an operating force from the drive unit to the crosshead, (c) a lift lever which will impart a rotary motion to the plug shaft. The operating mechanism shall provide for axial adjustment of the plug to compensate for any wear that may develop. The plug operating shaft shall be of sufficient strength to withstand any stresses to which it may be subjected under the most adverse operating conditions. Pipe stops are required in the open position.

Valve operation shall be such that 10 percent opening area of the plug waterway will be obtained when the crosshead travels between 45 and 55 percent of its total linear movement.

Crosshead, lift nut and other parts of the operating mechanism shall be greasable from the outside of the mechanism housing.

The valve operating mechanism shall be totally enclosed in a suitable housing with a removable cover which will permit inspection, adjustment, and repair of the operating mechanism.

2.3.06 Valve Position Indicators. An indicating pointer, attached to a plug shaft extension through and operating over an indicator plate mounted on the operating mechanism housing cover, shall be provided to indicate the position of the plug opening relative to the body seat openings. The indicating pointer shall be both bolted and pinned to the plug shaft extension to ensure alignment.

Indicator plates shall be graduated to show percentages of both projected port area and plug rotation.

2.3.07 Rotation. The direction of rotation of the handwheel to open the valve shall be to the left (counterclockwise).

2.3.08 Valve Base. Cone valves shall be provided with a base or pedestal for support. Cone valves shall be supported upon a steel bearing plate anchored into a concrete support as indicated on the Drawings. Contact surfaces of valve body and bearing plate shall have milled finishes, and the valve shall be free to move upon the bearing plate. Bolting of the valve to base will not be acceptable.

2.4 VALVE ACTUATORS. Requirements for valve actuators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators, and as indicated in the Cone Valve Schedule 15106-S01.

2.5 SHOP COATING. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified in Master Specification Section 09900, Painting.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

Interior coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy Enamel	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.6 ACCESSORIES.

2.6.01 Extension Stems. Requirements for extension stems and stem guides shall be as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.02 Position Indicators. Requirements for position indicators shall be as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.03 Floor Boxes. Requirements for floor boxes shall be as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

2.6.04 Operating Stands. Requirements for operating stands shall be as indicated in the Cone Valve Schedule 15106-S01, and as specified in Master Specification Section 15180, Valve and Gate Actuators.

PART 3 - EXECUTION

3.1 HYDROSTATIC TESTS. Each valve shall be fully assembled in the shop prior to testing. Test heads shall be bolted to each waterway flange and, with the plug in a partially open position, each valve shall be tested hydrostatically at a test pressure equal to 150 psi greater than the valve working pressure. This test pressure shall be maintained for 30 minutes, and the valve shall show no evidence of structural failure, seeps, or leakage at any point.

The valve shall also be tested for leakage, with one test head removed and the plug closed. A test pressure equal to the valve working pressure shall be applied and maintained for 15 minutes, during which time the leakage through the valve shall not exceed 0.15 ounce per minute per inch of valve waterway diameter. The test should then be repeated with the pressure applied to the opposite side of the valve.

After complete assembly, the valve shall be opened and closed at least twice.

Cone valve operator controls shall be shop tested for proper operation prior to shipment.

3-1.01 Witness Testing. Representatives from both the Owner and the Engineer will witness shop tests of all cone valves.

All testing equipment used will be inspected. The Contractor shall notify the Engineer at least 14 days in advance of the time that the shop test will be conducted. All valves to be tested shall be tested during one trip to the factory of a duration acceptable to the Engineer.

3.2 INSTALLATION. Valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until any problems are corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping and appurtenances; and has been operated under full load conditions and that it has operated satisfactorily.

3.3 SCHEDULE. See Cone Valve Schedule 15106-S01.

End of Section

SECTION 15108

AIR RELEASE AND COMBINATION AIR VALVES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of air release and combination air valves as indicated in the Contract Documents and Air Release and Combination Air Valve Schedule 15108-S01.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valves shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Governing Standard. Except as modified or supplemented herein, all valves furnished under this section shall conform to the applicable requirements of AWWA C512.

1.2.03 Permanent Number Plates. Each valve shall be provided with a number plate, with at least 1 inch (25 mm) high black baked enamel numerals on anodized aluminum plate. The location of number plates and the method of attachment shall be acceptable to Engineer.

1.3 SUBMITTALS. Complete assembly drawings, together with detailed specifications and data covering materials used and accessories forming a part of the valves furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.
Manufacturer shall submit certification that each valve and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of valve.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCTS.

Air release valves with operating pressures of 150 psi (1000 kPa) or less shall be Apco/Valve and Primer "No. 200", GA Industries "Figure 920m", Multiplex "Crispin Type N", Val-Matic "No. 38", or approved equal.

Air release valves with operating pressures greater than 150 psi (1000 kPa) shall be Apco/Valve and Primer "No. 200A", GA Industries "Figure 920H", Multiplex "Crispin Type N", Val-Matic "No. 38", or approved equal.

Three inch (75 mm) and smaller combination air valves shall be of the integral type with a valve assembly which functions as both an air and vacuum valve and an air release valve. The valves shall be Apco/Valve and Primer "Single Body Combination Air Valves", Multiplex "Crispin Universal Air Release Valves", Val-Matic "Combination Air Valves", or approved equal.

Four inch (100 mm) and larger combination air valves shall consist of an air and vacuum valve with an externally mounted air release valve. The valves shall be Apco/Valve and Primer "Custom Combination Air Valves", GA Industries "Figure 950 Kinetic Custom Combination Air Valves", Multiplex "Crispin Dual Air Valves", Val-Matic "Dual Body Combination Air Valves", or approved equal.

Three inch (75 mm) and smaller air release and vacuum relief valves for vertical diffusion vane pumps shall be of the kinetic energy type with a valve assembly which functions as both an air release and a vacuum relief valve. The exhaust from the valve shall be provided with a throttling device for field adjusting the air flow rate. The valves shall be Apco/Valve and Primer "Series 140DAT Air Valves for Vertical Turbine Pumps", GA Industries "Figure 933 Kinetic Air/Vacuum Valve", Multiplex "Crispin Deep Well Air Valve", or approved equal. The discharge from the valve shall be provided with a threaded NPT connection.

Four inch (100 mm) and larger air release and vacuum relief valves for vertical diffusion vane pumps shall be of the kinetic energy type with a valve assembly which functions as both an air release and a vacuum relief valve. The valve shall be provided with a surge check valve on the valve inlet. The valves shall be Apco/Valve and Primer "Series 1900 Air Valves for Vertical Turbine Pumps", GA Industries "Figure 931 Slow-Closing Kinetic Air/Vacuum Valve", Multiplex "Crispin Air & Vacuum Valve with Surge Check Valve", or approved equal. The discharge from the valve shall be provided with a flanged connection.

2.2 MATERIALS. Except as modified or supplemented herein, materials of construction shall comply with the governing standard. The use of stressed thermoplastic components will not be acceptable.

Valve Trim	Bronze or type 316 stainless steel.

Float	Type 316 stainless steel.
Shop Coatings	
Epoxy (NSF Certified)	Carboline "Carboguard 891" Tnemec "Series N140 Pota-Pox Plus, or approved equal."
Universal Primer	As recommended by the manufacturer and compatible with the field coating.
Rust-Preventive Compound	As recommended by manufacturer.

2.3 SHOP COATING. All interior and exterior ferrous metal surfaces, except stainless steel components, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the field painting specified inMaster Specification Section 09900, Painting.

Surfaces shall be painted as indicated:

Interior Surfaces	Epoxy.
Exterior Surfaces of All Other Valves	Universal primer.
Polished or Machined Surfaces	Rust-preventive compound.

Interior epoxy coatings shall comply with AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils (250 μm)
Universal Primer	3 mils (75 μm)

2.4 SHUTOFF VALVES. A shutoff valve shall be provided in the piping leading to each air release valve and combination air valve. Each 4 inch (100 mm) and larger combination air valve shall be provided with a shutoff valve between the air and vacuum valve and the air release valve.

PART 3 - EXECUTION

3.1 INSTALLATION. Air release and combination air valves will be installed in accordance with Master Specification Section 15010, Valve Installation.

3.2 SCHEDULE. See Air Release and Combination Air Valve Schedule 15108-S01.

End of Section

SECTION 15130

INDICATING DEVICES

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of line-mounted, local indicating devices and accessories.

Remote indicating devices or transmitters are covered in Master Specification Section 17500, Instrumentation General Requirements. Temperature wells (thermowells) are covered in Master Specification Section 15020, Miscellaneous Piping and Accessories Installation. Devices to be furnished by an equipment supplier, either with an item of equipment or as a component of an equipment package, are covered in the applicable equipment section.

Cleaning, disinfection, pressure and leakage testing, insulation, and pipe supports are covered in other sections.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the Engineer.

1.2.01 Coordination. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all pressure gauges shall conform to the requirements of ANSI/ASME B40.1.

1.2.04 Temporary Number Plates. Each device shall be factory tagged or marked to identify the device by type and number, as indicated.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete drawings or catalog cuts, together with detailed specifications and data covering materials used, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance information shall be supplied. Operation and maintenance manuals shall be submitted in accordance withMaster Specification Section 01160, Training and Operation & Maintenance Manuals.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with therequirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed to meet the specified conditions as indicated in the Contract Documents.

2.2 CONSTRUCTION.

2.2.01 Pressure Indicators. Pressure indicators shall be dial type with rotary geared movement and adjustable pointer.

The dial shall be white background with black markings. The units of measurement shall be indicated on the dial face. Subdivisions of the scale shall conform to the requirements of the governing standard. Pointer travel shall be not less than 200 degrees (3.5 rad) nor more than 270 degrees (4.7 rad) or arc.

Pressure indicators shall be as manufactured by 3D Instruments, or approved equal.

2.2.02 Temperature Indicators.

2.2.02.01 Bi-Metal. Bi-metal temperature indicators shall be hermetically sealed type with external zero adjustment. Indicators shall be furnished with angularly adjustable frame to permit positioning of the dial to accommodate easy viewing.

2.2.02.02 Filled Temperature Indicators. Gas-filled temperature indicators shall be furnished complete with dial indicator, armored capillary tubing and bulb or temperature sensor. Direct mounted indicators shall have an angularly adjustable frame to permit positioning of the dial to accommodate easy viewing.

2.2.03 Sight Flow Indicators. Sight flow indicators shall be provided as indicated in the Contract Documents to provide a visual indication of flow within a pipe. Sight flow indicators shall be of the double window type.

2.2.04 Rotameters. Rotameters (variable area flow meters) shall be provided as indicated in the Contract Documents. Bypass rotameters shall be furnished complete with both a line orifice plate and a range orifice. The range orifice shall be designed to limit flow through the rotameter to within the range of the rotameter.

2.2.05 Orifice Plates and Flanges. Orifice plates shall be ISA standard plates with concentric bore to the nearest 1/8 inch (3 mm) for the flow range specified. Flanges for the orifice plate will be furnished with jackscrews for installing and removing the orifice plate. Tab or coupon shall be provided that indicates the size of the orifice plate.

2.3 ACCESSORIES.

2.3.01 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 INSPECTION. All equipment and accessories shall be inspected for damage and cleanliness before being installed. Any items damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by the Contractor. Such equipment shall be segregated from the undamaged/clean items and shall be inspected and approved by the Owner or his representative before its use.

3.2 INSTALLATION. Equipment and materials furnished under this section shall be installed in proper operating condition in full conformity with Master Specification Section 15020, Miscellaneous Piping and Accessories Installation.

All indicating devices shall be installed so they can be easily read from floor/platform level and are readily accessible for maintenance and service.

3.2.01 Pressure Indicators. All pressure indicators installed in steam and any other elevated temperature service shall be protected with a thermal isolator (pigtail). Angle style pigtails shall be used for gauges connected to vertical surfaces. Straight-style pigtails shall be used for gauges connected to horizontal surfaces. Pigtails are not to be insulated.

An isolation valve shall be installed at each pipe branch to a pressure indictor except where in-line, flow-through diaphragm seal gauge isolators are utilized. The valve shall be suitable for the line pressure and temperature and shall allow removal of the indicator while the monitored line is in operation.

3.2.02 Temperature Indicators. All temperature indicators shall be installed in temperature wells (thermowells). Filled system indicator dials shall be mounted on a column or floor support approximately 5 feet (1.5 m) above the viewing floor level. Spare capillary shall be neatly coiled and tied.

3.2.03 Sight Flow Indicators. Flapper type sight flow indicators in horizontal piping shall be installed with the flapper hinge at the top of the pipe.

3.2.04 Rotameters. Rotameters shall be installed between 3 and 6 feet (0.9 and 1.8 m) above the viewing floor level. Rotameters shall be installed with flow vertical upwards

Isolation valves shall be installed in the rotameter inlet and outlet piping near the orifice flanges for bypass rotameters. The isolation valves shall allow removal of the rotameter while the monitored line remains in operation. Unions or flanges shall be provided within 2 feet (0.6 m) of the rotameter to facilitate removal.

3.2.05 Orifice Plates and Flanges. Orifice flanges in horizontal piping runs shall be installed so that the orifice taps are located on the vertical centerline at the top of the pipe for gas service and on the horizontal centerline for liquid and steam service.

Orifice plates and flanges shall be installed with the minimum upstream and downstream lengths of unobstructed pipe as indicated on the drawings.

End of Section

SECTION 15140

PIPE SUPPORTS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of pipe hangers, brackets, and supports. Pipe supports shall be furnished complete with all necessary inserts, bolts, nuts, rods, washers, and other accessories. This section also covers the spacing of expansion joints in piping systems. Expansion joint products and materials are covered in the respective piping sections.

Concrete and fabricated steel supports shall be as indicated in the Contract Documents.

1.2 GENERAL. In certain locations, pipe supports, anchors, and expansion joints have been indicated on the drawings, but no attempt has been made to indicate every pipe support, anchor, and expansion joint. It shall be Contractor's responsibility to provide a complete system of pipe supports, to provide expansion joints, and to anchor all piping, in accordance with the requirements specified herein. Additional pipe supports may be required adjacent to expansion joints, couplings, or valves.

All piping shall be rigidly supported and anchored so that there is no movement or visible sagging between supports.

Pipe supports and expansion joints are not required in buried piping, but concrete blocking or other suitable anchorage shall be provided as indicated in theContract Documents.

Piping support system components shall comply with specified piping code requirements.

1.2.01 Abbreviations. Reference to standards and organizations in this section shall be as indicated by the following designations.

AISI	American Iron and Steel Institute
ANSI	American National Standards Institute
ASTM	American Society of Testing and Materials
MSS	Manufacturers Standardization Society of Value and Fitting

Industry

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.3 SUBMITTALS. Complete data and catalog cuts or drawings covering fabricated pipe supports, fabricated inserts, and stainless steel, galvanized, and copper- and plastic-coated pipe supports shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

Data shall include a listing of the intended use and general location of each item submitted.

PART 2 - PRODUCTS

2.1 MATERIALS. Unless otherwise indicated, all pipe supports shall comply with ANSI/MSS SP-58 and MSS SP-69. Materials of construction for fabricated steel supports are covered in the structural and miscellaneous metals section. All pipe support materials shall be packaged as necessary to ensure delivery in satisfactory condition.

Unless otherwise specified or indicated on the drawings, pipe supports shall be fabricated of manufacturer's standard materials and provided with manufacturer's standard finish.

Design loads for inserts, brackets, clamps, and other support items shall not exceed the manufacturer's recommended loads.

Pipe supports shall be manufactured for the sizes and types of pipe to which they are applied. Strap hangers will not be acceptable. Threaded rods shall have sufficient threading to permit the maximum adjustment available in the support item. Continuously threaded rod is not acceptable for hanger rods over 12 inches (300 mm) in length.

Unless otherwise acceptable to Engineer, the use of supports which rely on stressed thermoplastic components to support the pipe will not be acceptable.

Contact between dissimilar metals, including contact between stainless steel and carbon steel, shall be prevented. Supports for brass or copper pipe or tubing shall be copper plated. Portions of pipe supports which come into contact with other metals that are dissimilar shall be rubber or vinyl coated.

Stainless steel supports shall be furnished, and shall be AISI Type 304 or 316 stainless steel. Stainless steel supports fabricated by welding shall be AISI Type 304L or 316L.

Hot-dip galvanized supports shall be furnished and shall be in accordance with ASTM A153 and A385.

Pipe support types and application shall comply with Table 1.

PART 3 - EXECUTION

3.1 APPLICATION. Concrete inserts or anchor bolts shall be used to support piping from new cast-in-place concrete. Expansion anchors shall be used to fasten supports to existing concrete and masonry.

Anchorage shall be provided to resist thrust due to temperature changes, changes in diameter or direction, or dead-ending. Anchors shall be located as specified to force expansion and contraction movement to occur at expansion joints, loops, or elbows, and as needed to prevent excessive bending stresses and opening of mechanical couplings. Anchorage for temperature changes shall be centered between elbows and mechanical joints used as expansion joints. Anchorage for bellows type expansion joints may be located adjacent to the joint.

When expansion joints are necessary, pipe guides shall be provided adjacent to bellows type expansion joints. Guides will not be required where mechanical couplings are permitted as expansion joints. Guides shall be located on both sides of expansion joints, except where anchors are adjacent to the joint. Unless otherwise indicated on the drawings, one guide shall be within four pipe diameters from the joint and a second guide within 14 pipe diameters from the first guide. Pipe supports shall allow adequate movement; pipe guides shall not be used for support. Pipe guides shall be provided at locations as recommended by the manufacturer.

Pipe supports for insulated cold piping systems shall be sized for the outside diameter of the insulated pipe, and an insulation protection shield shall be installed between the support and the insulation. Rigid insulation inserts shall be installed between the pipe and the insulation shields for piping larger than 2 inches (50 mm) or when needed to prevent crushing of the insulation. Inserts shall be of the same thickness as the adjacent insulation and shall be vapor sealed.

Insulated hot piping systems shall be supported by clevises, clamps, support saddles, or rollers. Pipe clamps shall be attached directly to the pipe. Support saddles and rollers shall be sized for the outside diameter of the insulated pipe, and an insulation protection saddle shall be installed at the support.

When supports for the FRP piping systems are in contact with less than 180 degrees of the pipe surface or when the width of the support is less than one-third the nominal pipe diameter (4 inches (100 mm] minimum), an FRP or steel saddle, shaped to the outside diameter of the pipe, shall be bonded to at least the bottom 120 degrees of the pipe.

3.2 TYPES OF SUPPORTS. The specific products for pipe supports shall be as indicated in Table 1 for the specified type and size of support.

TABLE 1 - TYPES OF SUPPORTS					
Description and Service				Type	
				MSS SP 69 (Note 1)	Other
Hangers					
	2-1/2 inch (63 mm) and smaller pipe				
		For hot and cold insulating piping

Table 1 Notes:

1. MSS SP-69 supports and hangers are illustrated on Figure 1-15140.
2. Pipe clamps or other devices which rely on the application of a clamping force to the supported pipe in order to maintain the clamp position or location in a prefabricated channel or track will not be acceptable for use with nonmetallic pipe or tubing.

3.3 SUPPORT SPACINGS. Pipe supports and expansion joints shall be spaced in accordance with Tables 2, 3, 4, and 5. The types of pipes to be supported are as indicatbed. Table 2 covers spacings for the standard operating conditions specified for each pipe material. Tables 3 and 4 cover PVC and FRP pipe spacings where operating conditions are in excess of the temperature and specific gravity requirements covered in Table 2. Table 5 covers PVC and FRP pipe which carries air or liquids with a specific gravity other than 1.0.

Table 2 Notes:

1. Unless otherwise acceptable to Engineer, an expansion joint shall be provided in each straight run of pipe having an overall length between loops or bends exceeding the maximum run specified herein.

2. Unless otherwise acceptable to Engineer, the spacing between expansion joints in any straight pipe run shall not exceed the maximum spacing specified herein.

3. Expansion joint fittings are specified in the respective piping procurement sections.

4. At least two properly padded supports for each pipe section.

5. At least one support for each pipe section.

6. Expansion joints shall be mechanical couplings.

7. No expansion joints are required.

8. Supports for 5 and 10 foot (1.5 and 3 m) long pipe sections shall be located within 18 inches (460 mm) of each joint. Supports shall be positioned to maintain the piping alignment and to prevent the piping from sagging.

3.3.01 <u>Temperature Adjustments for PVC Pipe</u>. PVC pipe at a temperature above 100°F (38°C) shall have maximum support spacings in accordance with the following table. For insulated lines, reduce the support spacing to 70 percent of the listed values.

TABLE 3 - MAXIMUM PIPE SUPPORT SPACINGS FOR PVC PIPE AT NON-STANDARD TEMPERATURES

feet (meters)

Nominal Size	Schedule 40		Schedule 80	
inches (mm)	120°F (49°C)	140°F (60°C)	120°F (49°C)	140°F (60°C)

3.3.03 Specific Gravity Adjustments for PVC and FRP Pipe. PVC and FRP pipe shall have the maximum spacing indicated in Tables 2, 3, and 4 adjusted in accordance with the following table when the specific gravity of the liquid is greater than 1.0. Table 5 shall not apply to PVC pipe containing alum solution, caustic soda solution, ferric chloride solution, and hypochlorite solution, as these services are specifically covered in Table 2.

3.4 INSTALLATION.

3.4.01 General. All piping shall be supported in a manner which will prevent undue stress on any valve, fitting, or piece of equipment. In addition, pipe supports shall be provided at changes in direction or elevation, adjacent to flexible couplings, and where otherwise shown. Pipe supports and hangers shall not be installed in equipment access areas.

Where horizontal piping is arranged with two or more parallel lines, trapeze hangers may be used in lieu of individual hangers. Trapeze assembly shall consist of structure attachments as previously specified with rod size dependent upon total weight supported. Spacing of assemblies shall be determined by the minimum pipe size included in the group supported. Trapeze horizontal assemblies shall be structural angle or channel section of sufficient size to prevent measurable sag between rods. All lines shall be attached to the horizontal with intermediate pipe guides and U-bolts or one-hole clamps. Pre-engineered support equipment may be used when selected and installed in accordance with the manufacturer's recommendations.

No copper pipe shall contact a pipe support or hanger of dissimilar metal. Hangers and supports for copper pipe shall be copper-plated, plastic coated, or copper pipe shall be galvanically isolated using Neoprene strips or other material as approved.

No piping shall be supported from the pipe above.

Horizontal piping hanger support rods shall attach to steel beams with center-loading I-clamps, or welded beam clips. Hanger support rods shall attach to concrete slabs or beams with inserts.

Anchorage shall be provided to resist both lateral and longitudinal seismic forces. Seismic forces shall be calculated assuming the pipes are full.

3.4.02 Inserts. Reference building structural concrete drawings for concrete inserts. When not provided as part of the building concrete structure, provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.

Where concrete slabs form finished ceilings, provide inserts flush with the slab surface.

Where inserts are omitted, drill through concrete slab from below and provide thru-bolt with recessed square steel plate and nut recessed into and grouted flush with slab. X-ray locate existing reinforcing rods before drilling.

3.4.03 Pipe Hangers and Supports. Hanger rod sizing for copper pipe and plastic pipe shall be same as for steel pipe. Install hangers to provide a minimum 1/2 inch (13 mm) space between finished covering and adjacent work.

A hanger shall be placed with 18 inches (450 mm) of each horizontal elbow, and on both sides of all piping accessories and valves weighing 20 pounds (9 kg) or more.

Hangers shall have 1-1/2 inches (38 mm) minimum vertical adjustment.

Support horizontal cast iron and no-hub piping systems adjacent to each joint.

Support vertical piping at every floor using riser clamps.

Support riser piping independently or connected horizontal piping.

Hanger and hanger components shall be sized specifically for the pipe size it is to be used on.

3.5 PLACEMENT. Unless closer spacing is indicated on the drawings, the maximum spacing for pipe supports and expansion joints shall be as indicated in Tables 2, 3, 4, and 5.

Rubber hose and flexible tubing shall be provided with continuous angle or channel support.

Unless otherwise indicated on the drawings or acceptable to Engineer, piping shall be supported approximately 1-1/2 inches (38 mm) out from the face of walls and at least 3 inches (75 mm) below ceilings.

End of Section

SECTION 15150

WATER METERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of water meters and associated appurtenances at the locations indicated on the drawings.

Pipe materials, valves, insulation, and pipe supports which are not an integral part of the fixture or piece of equipment and are not specified herein are covered in other Master Specification sections.

1.2 GENERAL.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts. and Tools shall apply to all equipment and materials furnished under this section.

1.2.02 Power Supply. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.03 Number Plates. Each water meter which has been assigned a number on the drawings shall be provided with a number plate mounted on or adjacent to the device in a manner acceptable to the Engineer. Nameplates shall have black baked enamel letters at least 3/4 inch (19 mm) high on anodized aluminum plate. .

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication, assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. The data and specifications to be submitted for each unit shall include, but shall not be limited to, the following:

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Performance curves indicating flow capacity versus pressure drop.

Accuracy.

Pressure and temperature ratings.

Overall dimensions.

Piping connection sizes and locations.

Power requirements.

Net weight.

Wiring diagrams.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance withMaster Specification Section 01160, Training, and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Construction. Water meters shall be constructed in accordance with the following standards:

Displacement Water Meters	AWWA C700
Turbine Water Meters	AWWA C701
Compound Water Meters	AWWA C702
Propeller Water Meters	AWWA C704

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with the requirements of Master Specification Section 01180, Equipment, Materials, Parts. and Tools .

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. Water meters shall be designed and selected to meet the specified conditions as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Water meters shall be designed to meet the performance and design conditions indicated in the Contract Documents, and on the water meter schedule.

Each meter shall measure the actual flow within the accuracy specified over the indicated flow range with a water temperature range of 32°F (0°C) to 120°F (50°C). The accuracy shall be expressed as a percentage of the actual flow and not as a percent of maximum flow.

Meter assemblies shall have performance capabilities of continuous operation up to the rated maximum flows without affecting long-term accuracy or causing any undue component wear. All meter assemblies shall also have a 25 percent flow capacity in excess of the maximum flows as indicated in the Contract Documents for intermittent flow demands.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 DESIGN AND CONSTRUCTION.

2.4.01 Displacement Meters. Displacement meters shall be nutating or oscillating disc type with bronze or synthetic polymer housing as indicated in the schedules, thermoplastic plastic chamber and hard rubber disc. Accuracy shall be ±1.5 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Each meter shall be provided with threaded union type spud end connections.

Meter registers shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Displacement type meters shall be Badger Meter Inc., "Recordall Disc Meter", ABB Water Meters, Inc, or approved equal.

2.4.02. Turbine Meters. Turbine meters shall be moving rotor type with bronze, cast iron, or 316 stainless steel housing as indicated in the schedules, thermoplastic rotor, ceramic bearings, stainless steel straightening vanes, Buna N "O" ring, and Nitrile head gasket. Accuracy shall be ±1.5 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Meters in 2 inch and smaller sizes shall be provided with threaded union type spud end connections. Meters in larger than 2 inch sizes shall be provided with ANSI Class 125 flanged end connections.

Meter registers shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Turbine type meters shall be Badger Meter Inc., "Recordall Turbo Meter", ABB Water Meters, Inc, or approved equal.

2.4.03 Compound Meters. Compound meters shall incorporate a positive displacement chamber for measuring low flows, a turbine chamber for measuring high flows, and a valve for diverting flow to the respective chamber. Compound meters shall be provided with a single housing or may be provided with independent housings factory piped with a single inlet and outlet connection. Meters shall be provided with bronze housings and piping, thermoplastic rotor, valve casing, and disc chamber, and stainless steel straightening vanes. Accuracy shall be ±1.5 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Meters shall be provided with ANSI Class 125 flanged end connections.

Meter registers shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Compound type meters shall be Badger Meter Inc., "Recordall Compound Meter", ABB Water Meters, Inc, or approved equal.

2.4.04 Propeller Meters. Propeller meters shall be rotating propeller type with cast iron housing, copper stabilized polypropylene propeller, graphite/stainless steel propeller bearing, graphite/carbide thrust bearing, and stainless steel straightening vanes. Accuracy shall be ±2 percent over the full meter range. The meter shall be suitable for an operating temperature range of 32°F (0°C) to 120°F (50°C) and a working pressure of 150 psi (1,050 kPa). Meters shall be provided with ANSI Class 125 flanged end connections.

Meter register shall totalize flow through the meter, and shall be equipped with a direct numerical readout and a center-sweep test hand. Meter register and lid shall be constructed of synthetic polymer. Propeller type meters shall be Badger Meter Inc., "Series MFLT Propeller Meter", Sparling Instruments, Inc, or approved equal.

2.5 PAINTING AND COATINGS.

2.5.01 Surface Preparation. All iron and steel surfaces shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint or coating manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.5.02 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Coatings located in water passages shall comply with AWWA requirements for use with potable water and shall be NSF certified. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall conform to the requirements of the Master Specification Section 09900, Painting.

2.6 ELECTRICAL. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 INSTALLATION. Materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Meters shall be installed with the required upstream and downstream straight pipe lengths as recommended by the manufacturer.

3.3 FIELD QUALITY CONTROL.

3.3.01 Installation Check. Unless indicated otherwise, an experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.4 ADJUSTING. Meters shall be calibrated and adjusted according to manufacturer's written instructions after installation. Meter faces shall be adjusted to proper angle for best visibility.

3.5 PROTECTION. Meters and appurtenances shall be protected from damage immediately after installation. Scratched, cracked or broken components shall be replaced. Meters shall not be used during the construction.

3.6 CLEANING. After completion of testing and immediately before the final inspection, meters shall be thoroughly cleaned. Cleaning materials and methods shall be as recommended by the manufacturer.

End of Section

SECTION 15180

VALVE AND GATE ACTUATORS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing of manual and powered valve and gate actuators and accessories.

1.2 GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Valve and gate actuators shall be furnished with all necessary parts and accessories indicated on the drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of actuators.

1.2.01 General Equipment Requirements. The General Equipment Stipulations Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to the equipment and materials furnished under this section.

1.2.02 Governing Standards. Except as modified or supplemented herein, all powered actuators shall conform to applicable requirements of ANSI/AWWA C540.

Except as modified or supplemented herein for butterfly and eccentric plug valves, all manual and cylinder actuators shall conform to the applicable requirements of ANSI/AWWA C504.

Except as modified or supplemented herein for ball valves, all manual actuators shall conform to the applicable requirements of ANSI/AWWA C507.

Except as modified or supplemented herein, all sluice and slide gate, manual actuators shall conform to the applicable requirements of AWWA C501.

1.2.03 Power Supply. Power supply to electric actuators will be as indicated on the valve or gate schedule.

1.2.04 Marking. Each actuator shall be marked with the manufacturer's name, model number, and the country of origin. An identifying serial number shall be stamped on a corrosion-resistant plate attached to the actuator.

1.2.05 Temporary Number Plates. Each actuator shall be factory tagged or marked to identify the actuator and the applicable valve or gate by number or service as indicated in the valve or gate schedule.

1.3 SUBMITTALS. Complete drawings, details, and specifications covering the actuators and their appurtenances shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Submittal drawings shall clearly indicate the country of origin of each actuator and its components.

When requested by Engineer, certified copies of physical and chemical test results shall be submitted for the materials of construction for the actuator components.

The drawings shall include separate wiring diagrams for each electrically operated or controlled actuator and the electrical control equipment. Each actuator drawing shall be identified with the respective valve number or name.

Certified copies of reports covering proof-of-design testing of each electrically operated or controlled actuator, as set forth in Section 6 of ANSI/AWWA C540 together with an affidavit of compliance, as indicated in Section 1.7 of ANSI/AWWA C540 shall be submitted to Engineer before the actuators are shipped.

1.4 DELIVERY, STORAGE, AND SHIPPING. Shipping, handling and storage shall be in accordance with requirements of Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS.

2.1.01 General. Valve and gate actuators and appurtenances shall be designed for the conditions and requirements as indicated in the respective Master Specification valve and gate sections.

Liberal factors of safety shall be used throughout the design, especially in the design of parts subject to intermittent or alternating stresses. In general, working stresses shall not exceed one-third of the yield point or one-fifth of the ultimate strength of each material.

2.1.02 Valve Actuators. Each actuator shall be designed to open or close the valve under all operating conditions. Actuators shall be designed for the maximum pressure differential across the valve and maximum velocities through the valve where indicated in the respective valve and gate section schedules.

Valve actuators shall be provided and adjusted by the valve manufacturer. Actuator mounting arrangements and handwheel or chainwheel positions shall facilitate operation and maintenance and shall be determined by the valve manufacturer unless indicated otherwise on the drawings or directed by Engineer.

2.1.03 Gate Actuators. Actuators, regardless of type, shall be sized to produce the torque or thrust required to operate the applicable gate when the gate is subject to the seating and unseating operating heads as indicated in the respective gate section schedules.

Both the design head and the operating head shall be measured from the surface of the liquid to the center line of the gate.

2.1.04 Limit Switches. When manual or cylinder operated valves or gates require limit switches for instrumentation or controls, the limit switches shall be provided as required in their respective valve and gate schedules.

Each limit switch shall be heavy duty type, with a cast NEMA Type 4 enclosure, a spring return roller lever, and four isolated contacts (two normally open and two normally closed) rated 10 amperes at 120 to 480 volts ac and 5 amperes at 125 volts dc. The switches shall be Allen Bradley "802T" or Square D "9007 Type C".

2.1.05 Sealing. When valves are to be buried, submerged, or installed in vaults, the actuators and accessories shall be sealed to prevent the entrance of water. The design water depth shall be as indicated in the respective schedules but not less than 20 feet (6.1 m).

2.2 MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of actuators shall conform to the requirements of ANSI/AWWA C504 and C540.

2.3 VALVE MANUAL ACTUATORS.

2.3.01 General. Manual actuators of the types listed in the Valve Schedules shall be provided by the valve manufacturer.

All valves, except those which are equipped with power actuators or are designed for automatic operation, shall be provided with manual actuators. Unless otherwise indicated or specified, each geared manual actuator shall be equipped with an operating handwheel.

Unless otherwise required by Owner, the direction of rotation of the wheel, wrench nut, or lever to open the valve shall be to the left (counterclockwise). Each valve body or actuator shall have cast thereon the word "Open" and an arrow indicating the direction to open. The direction of rotation of the wheel or wrench nut to open gate valves shall be to the right (clockwise).

The housing of traveling-nut type actuators shall be fitted with a removable cover which shall permit inspection and maintenance of the operating mechanism without removing the actuator from the valve. Travel limiting devices shall be provided inside the actuator for the open and closed positions. Travel limiting stop nuts or collars installed on the reach rod of traveling-nut type operating mechanisms shall be field adjustable and shall be locked in position by means of a removable roll pin, cotter pin, or other positive locking device. The use of stop nuts or adjustable shaft collars which rely on clamping force or setscrews to prevent rotation of the nut or collar on the reach rod will not be acceptable.

Each valve actuator shall be designed so that shaft seal leakage cannot enter the actuator housing.

Valves for throttling service shall be equipped with an infinitely variable locking device or a totally enclosed gear actuator. Other lever actuators shall be designed so that the valve can be readily locked open, closed, or in at least five intermediate positions.

Geared actuators for plug valves not listed in the Eccentric Plug Valve Schedule shall be rated for a differential pressure across the valve, on the seating side of 100 psi (680 kPa) for 8 inch (200 mm) and smaller valves, 50 psi (340 kPa) for 10 inch (250 mm) and larger valves, and 25 psi (170 kPa) for gas service valves.

Manual actuators shall produce the required torque with a maximum pull of 80 pounds (356 N) on the lever or handwheel. Actuator components shall withstand, without damage, a pull of 200 pounds (890 N) on the handwheel or chainwheel or an input of 300 foot-pounds (407 J) on the operating nut.

2.3.02 Handwheels. Handwheel diameters shall be at least 8 inches (150 mm) but not more than 24 inches (600 mm) for 30 inch (750 mm) and smaller valves and not more than 30 inches (750 mm) for 36 inch (900 mm) and larger valves.

2.3.03 Chainwheels. Unless specifically required to be equipped with other types of actuators in the respective valve schedules, all valves with center lines more than 7'-6" (2.3 m) above the floor shall be provided with chainwheels and operating chains. Each chainwheel operated valve shall be equipped with a chain guide which will permit rapid handling of the operating chain without "gagging" of the wheel and will also permit reasonable side pull on the chain. Suitable extensions shall be provided, if necessary, to prevent interference of the chain with adjacent piping or equipment. Operating chains shall be hot-dip galvanized carbon steel and shall be looped to extend to within 4 feet (1.2 m) of the floor below the valve.

2.3.04 Lever Actuators. Lever actuators shall be designed to produce the specified torque with a maximum pull of 80 pounds (350 N). Levers on valves for throttling service shall have an infinitely variable locking device, and levers for other valves shall be capable of being locked in at least five intermediate positions between fully open and fully closed. In any building or structure containing lever operated valves, at least two operating levers shall be provided for each size and type of lever operated valve.

2.3.05 Chain Levers. Chain lever actuators shall be designed to produce the specified torque with a maximum pull of 80 pounds (350 N) on the chain. Suitable actuator extensions shall be provided, if necessary, to prevent interference of the chain with adjacent piping or equipment. Operating chains shall be hot-dip galvanized carbon steel and shall be looped to extend to within 4 feet (1200 mm) of the floor below the valve.

2.3.06 Wrench Nuts. Wrench nuts shall be provided on all buried valves, on all valves that are to be operated through floor boxes, and where indicated on the drawings. Unless otherwise directed by Owner, all wrench nuts shall comply with Section 3.16 of AWWA C500. At least two operating keys shall be furnished for operation of the wrench nut operated valves.

2.3.07 Operating Stands. Operating stands shall be provided in the locations indicated on the drawings. Operating stands shall support the handwheel approximately 36 inches (900 mm) above the floor. A sleeve made from standard weight galvanized steel pipe shall be provided for the opening in the floor beneath each operating stand. When stems are 10 feet (3 m) or longer, a suitable thrust bearing shall be provided in each operating stand to carry the weight of the extension stem. Operating stands in exterior locations shall be cast iron. Operating stands in interior locations shall be cast iron or fabricated steel as indicated in the Contract Documents.

2.3.08 Wall Brackets. Wall brackets shall be provided to support manual actuators in the locations indicated on the drawings or indicated in the respective gate schedules. The horizontal face of the bracket shall be predrilled to accept the actuator and the stem without modification. The top of the bracket shall extend sufficiently to bear on and transfer thrust loads to the top of the supporting structure.

2.4 GATE MANUAL ACTUATORS.

2.4.01 General. Manual actuators of the types as required for each gate in the Gate Schedules shall be provided by the gate manufacturer.

All bearings and gears shall be totally enclosed in a weathertight housing having a sufficient number of fittings to permit periodic lubrication of all internal moving components without partial or total disassembly of the mechanism. The pinion shaft of crank-operated mechanisms shall be supported by roller bearings or needle bearings.

All manual actuators shall conform to the requirements of Section 3.14 of AWWA C501, or each manual actuator shall be designed to operate the gate when a 40 pound (178 N) effort is applied to the crank or the handwheel and shall be able to withstand, without damage, an effort of 200 pounds (890 N), as required.

When specified, manual actuators for rising stem self-contained gates shall be designed for mounting directly on the frame yoke.

When a portable electric actuator will be furnished, all crank-operated geared manual actuators shall be suitable for operation with the portable electric actuator specified herein. A suitable adapter coupling shall be furnished with each manual actuator when required to couple the portable actuator to the actuator pinion shaft.

2.4.02 Floorstands. Floorstands shall be designed to transfer operating thrusts to the supporting structure. Each floorstand shall be designed to position the crank or the handwheel approximately 36 inches (900 mm) above the frame yoke, supporting surface, or adjacent operating floor or platform.

2.4.03 Wall Brackets. Wall brackets shall be provided to support manual actuators in the locations indicated on the drawings or indicated in the respective gate schedules. The horizontal face of the bracket shall be predrilled to accept the actuator and the stem without modification. The top of the bracket shall extend sufficiently to bear on and transfer thrust loads to the top of the supporting structure.

2.4.04 Dual Actuators. Dual actuators shall be provided for the gates so indicated in the respective gate schedules. Dual actuators shall be interconnected by a cross shaft complete with required couplings so both stems move at the same rate. Each cross shaft shall be protected by a full length removable aluminum or stainless steel cover attached to the yoke beam or actuator.

2.4.05 Remote Actuators. Gates as indicated in the respective gate schedules, to be provided with a remote actuator, shall be operated by a frame-mounted handwheel and chain drive. An extension shaft suitable for connection to the pinion shaft of the benchstand shall be provided complete with a roller chain, shaft couplings, support bearings, and a roller chain sprocket keyed or bolted to the end of the shaft. A handwheel with bearing housing and sprocket shall be bolted to the side frame approximately 48 inches (1200 mm) above the operating floor. Removable aluminum or stainless steel weathertight covers shall be provided to protect the extension shaft, drive chain, and sprockets. Handwheel and sprocket diameters shall be selected to operate the gate under the maximum specified seating pressure with an effort of not more than 40 pounds (178 N) applied to the rim of the handwheel. Handwheels and sprockets shall be able to withstand a 100 pound (445 N) effort without damage.

2.4.06 Stem Covers. Unless otherwise specified, each rising stem manual actuator shall be provided with a stem cover. Stem covers shall conform to Section 3.4 of AWWA C501.

2.4.06.01 Plastic Covers. When specified in the respective gate schedule, stem covers shall be constructed of transparent plastic pipe and shall be furnished with an end cap, condensation vents, and a clear mylar position-indicating marking tape. The marking tape shall be adhesive backed and shall be permanently marked and calibrated in feet and inches [meters and millimeters]. The tape shall be applied to the stem cover after the gate has been installed and shall be so positioned that the height of the slide will be indicated by reference to the top of the stem.

2.4.06.02 Steel Covers. When specified in the respective gate schedule, stem covers shall be constructed from steel pipe and shall be furnished complete with a threaded end cap. All steel components of each cover shall be hot-dip galvanized following fabrication.

2.4.06.03 Slide Position Indicators. Each sluice gate operating mechanism with a steel stem cover shall be furnished with a digital or dial type mechanical position indicator. The indicator mechanism shall be installed inside a weatherproof housing and shall be clearly visible through a transparent, weatherproof window.

2.5 ELECTRIC ACTUATORS.

2.5.01 General. Electric actuators as listed in the Valve and Gate Schedules shall be provided by the valve or gate manufacturer.

Electric actuators for 12 inch (300 mm) and smaller butterfly valves and eccentric plug valves shall be quarter-turn type and shall be Auma "SG05.1" through "SG12.1", EIM Series HQ, Limitorque "QX", or Rotork "IQT", without exception.

All other electric actuators shall be multiturn type and shall be Auma "SA07.2" through "SA48.1", EIM "Series M2CP", Limitorque "L120" with "B320" bevel gearbox operator, or Rotork "IQ3" with "Type MTW" or "Type IWS" worm gear operator, without exception.

Electric actuators produced by other manufacturers are not acceptable.
Each electric actuator shall be furnished complete with a motor, gearing, handwheel, limit switches and torque sensors, lubricants, heating elements, wiring, and terminals. Each actuator shall be constructed as a self-contained unit with a cast

iron, weatherproof, submersible, or explosionproof housing, as specified herein, and shall be integrally assembled on the applicable valve or gate by the valve or gate manufacturer. Housings for quarter-turn actuators may be cast iron or die-cast aluminum alloy.

Actuators for valves and gates shall be designed to cycle the valve or gate from the fully open to the fully closed position or the reverse in approximately 60 seconds or as required.

Actuator motors may be mounted horizontally adjacent or vertically above the reduction gearing. All gearing shall be either oil bath or grease lubricated. When grease lubrication is used, in no case shall motors be mounted vertically below the gearing.

2.5.02 Motors. Motors shall be totally enclosed, high torque design made expressly for valve actuator service, capable of operating the valve under full differential pressure for a complete open-close and reverse cycle of travel at least twice in immediate succession without overheating. Motors shall be designed in accordance with NEMA standards and shall operate successfully at any voltage within 10 percent above or below rated voltage. Motor bearings shall be permanently lubricated.

2.5.03 Power Gearing. Power gearing shall consist of hardened steel spur or helical gears and alloy bronze or hardened steel worm gear, all suitably lubricated, designed for 100 percent overload, and effectively sealed against entrance of foreign matter. Steel gears shall be hardened to at least 350 Brinell. Planetary or cycloidal gearing or aluminum, mild steel, or nonmetallic gears will not be acceptable. Gearing shall be designed to be self-locking so that actuation of a torque switch by a torque overload condition will not allow the actuator to restart until the torque overload has been eliminated. If a secondary gear box is required, it shall be designed to withstand the locked rotor torque of the actuator.

2.5.04 Handwheel Mechanism. The handwheel shall not rotate during motor operation. During handwheel operation the motor shall not affect the actuator operation. The actuator shall be responsive to electrical power and control at all times and, when under electrical control, shall instantly disengage the handwheel. Unless otherwise required by Owner, the handwheel shall rotate counterclockwise to open the valve. An arrow indicating the opening direction and the word "Open" shall be cast on the handwheel. The force required to operate the handwheel shall not exceed 80 pounds (350 N).

2.5.05 Torque Sensing. Torque and thrust loads in both closing and opening directions shall be limited by a torque sensing device. Each torque sensing device shall be provided with an adjustment setting indicator. The adjustment shall permit a variation of approximately 40 percent in torque setting. Switches shall have a rating of not less than 6 amperes at 120 volts ac and 0.5 ampere at 115 volts dc.

2.5.06 Limit Switches. Each electric actuator shall be designed to be readily field adaptable for four limit switch assemblies. Each switch assembly shall consist of at least three separate limit switches, shall be operated by the driving mechanism, and shall be independently adjustable to trip at any point at and between the fully open and fully closed valve positions. All switches shall have an inductive contact rating of not less than 6 amperes at 120 volts ac, 3 amperes at 240 volts ac, 1.5 amperes at 480 volts ac, and 0.5 ampere at 115 volts dc.

Each quarter-turn actuator shall be provided with end-of-travel limit switches in addition to four spdt switches, each independently adjustable at any point of valve travel.

2.5.07 Position Transmitter. When specified, valves shall be provided with an electronic type position transmitter. The transmitter output shall be an isolated 4-20 mA dc capable of driving an external load of 0 to 500 ohms. Accuracy of the transmitted signal shall be plus or minus 2.0 percent of span. Repeatability and hysteresis shall be within 1.0 percent. The transmitter shall transmit to a remote position indicator which is specified in the instrumentation section.

2.5.08 Heating Elements. Space heating elements shall be provided to prevent condensation in the motor and limit switch housing. Heating elements shall be rated 120 volts ac. Heaters shall be continuously energized.

2.5.09 Terminal Facilities. Terminal facilities for connection to motor leads, switches, position transmitter, and heating elements shall be provided in readily accessible terminal compartments. Each terminal compartment shall have at least two openings for external electrical conduits, one sized at least 3/4 inch (19 mm) and the other at least 1-1/4 inches (31 mm). Each terminal compartment shall be large enough to allow easy routing and termination of fifteen 12 AWG (4 mm^2) conductors.

2.5.10 Controller. Each valve shall be furnished with a reversing controller located either inside the actuator housing or mounted on the housing in a NEMA Type 4 or stainless steel enclosure as required. The controller shall be equipped with:

A motor overload protective device in each phase or solid state motor protection.

A space heater element, rated 120 volts ac, sized to be continuously energized for prevention of condensation within the controller enclosure.

A fused control power circuit taken from one power lead on the load side of the breaker and line side of the reversing starter to ground. If power supply is greater than 120 volts ac, a control power transformer with fused secondary, with volt-ampere capacity suitable for starter control plus continuous service to space heater elements in motor housing, limit switch compartment, and controller enclosure.

A terminal block with connectors for all external controls. All leads from the actuator motor and limit switch assembly shall be routed to terminal connections in the controller for external connections to all other control devices.

Reversing controllers shall be both mechanically and electrically interlocked and provided with the necessary direct-operated auxiliary contacts for required interlocking and control.

Valve controllers shall be expressly selected for long life and reliable, low maintenance service under rugged service conditions.

2.5.11 Control Module. Valves listed for modulating service in the Butterfly Valve Schedule shall be provided with a control module for position modulating type service. The control module shall be mounted within the valve actuator limit switch housing. The module shall accept a standard 4-20 mA dc analog input signal with a load impedance of not greater than 400 ohms. The control module shall contain adjustments for span, zero, gain, and deadband.

The actuator shall have a slide-wire type position feedback potentiometer which provides a position feedback signal to the control module.

A "Manual-Automatic" selector switch shall be provided. When specified herein, the actuators shall have "Open-Close" momentary contact push buttons for local electric operation in the manual mode.

2.5.11.01 Control Performance. For any operating torque within the specified range of the valve actuator, the valve and actuator shall perform within these specified limits:

Linearity	Linearity of actual valve position as compared to demand signal shall be within plus or minus 4.0 percent of span over the entire operating range.
Repeatability	For any repeated demand signal to the valve

	actuator, the actual valve position shall be repeated
Deadband	Deadband of the valve actuator shall be adjustable from 1.0 to 10 percent of span.
Hysteresis	For any repeated demand signal to the valve actuator, from either an increasing or a decreasing direction, the actual valve position shall be repeated within 1 degree of valve shaft rotation.

2.6 HYDRAULIC CYLINDER ACTUATORS.

2.6.01 General. Hydraulic cylinder actuators as listed in the Valve or Gate Schedules shall be provided by the valve or gate manufacturer.

2.6.02 Hydraulic Cylinder Actuators. Hydraulic cylinder actuators of the double acting type shall be provided by the valve manufacturer. Cylinders shall be of tie-rod or bolted-flange construction; shall be sized to provide the safety factors stipulated in Table 6 in Section 3.8 of ANSI/AWWA C504; and shall be designed to provide satisfactory operation with either water or oil as required. Operating pressure range shall be as required. Cylinders shall be shop tested at 300 psig [2070 kPa gauge]. Actuators with nonmetallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

The valve actuator mechanism coupled to the cylinder shall be totally enclosed. The cylinder shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rod shall be enclosed in the mechanism housing and shall not be exposed to view.

2.6.03 Control Devices. When specified in the respective valve schedule, a 4-way solenoid valve, with manual actuator when specified herein, shall be provided to control the operation of each hydraulic cylinder operated valve. Each solenoid valve shall be heavy-duty, single solenoid, two-position type rated for a differential operating hydraulic pressure of 125 psig (860 kPa gauge). Each valve shall be designed and constructed for exceptionally long life, with forged brass body; poppet type seats and discs; continuous duty, molded, Class F coil; NEMA Type 4 solenoid enclosure; and 1/2 inch (12.7 mm) threaded conduit connection. Solenoid valves shall be rated for use with a power supply, as specified herein, and shall be ASCO "Model No. 8344G70MO 4-Way Pilot Operated Solenoid Valves" with manual override features as manufactured by Automatic Switch Co.

Each hydraulic connection on each cylinder shall be equipped with an adjustable flow control valve. The flow control valves and connecting piping shall be arranged to permit control of the flow rate of exhaust fluid from the cylinder and to permit the independent adjustment and control of valve opening and closing speeds. Control valves shall be sized so that the time required for the cylinder piston to complete its stroke can be adjusted from 30 to 120 seconds with fluid supply pressure as specified herein. Flow control valves shall be manufactured from brass or stainless steel and shall be Parker Hannifin "Colorflow F Series" or Mead "Dyla-Trol".

An oil reservoir shall be provided in the oil piping connecting the two flow control valves on each oil hydraulic cylinder.

2.7 AIR CYLINDER ACTUATORS.

2.7.01 General. Air cylinder actuators as listed in the Valve or Gate Schedules shall be provided by the valve or gate manufacturer.

2.7.02 Air Cylinder Actuators. Air cylinder actuators of the double acting type shall be provided by the valve manufacturer. Cylinders shall be sized to provide the safety factors stipulated in Table 6 in Section 3.8 of ANSI/AWWA C504, except as specified herein, and shall be designed to provide satisfactory operation using air, or when specified herein, dry, oil-free instrument air at 80 psig (550 kPa gauge) pressure and shall be shop tested at 240 psig (1650 kPa gauge).

Actuators with nonmetallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

The valve actuator mechanism coupled to the cylinder shall be totally enclosed. The cylinder shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rod shall be enclosed in the mechanism housing and shall not be exposed to view.

2.7.03 Control Devices. When specified in the respective valve schedule, a 4-way solenoid valve with manual actuator, when required, shall be provided to control the operation of each air cylinder operated valve. Each solenoid valve shall be heavy-duty, single solenoid, two-position type rated for a differential operating air pressure of 125 psig (860 kPa gauge). Each valve shall be designed and constructed for exceptionally long life, with forged brass body; poppet type seats and discs; continuous duty, molded, Class F coil; NEMA Type 4 solenoid enclosure; and 1/2 inch (12.7 mm) threaded conduit connection. Solenoid valves shall be rated for use with a power supply, as required, and shall be ASCO "Model No. 8344G70MO 4-Way Pilot Operated Solenoid Valves" with manual override features as manufactured by Automatic Switch Co.

Each air connection on each cylinder shall be equipped with an adjustable flow control valve. The flow control valves and connecting piping shall be arranged to permit control of the flow rate of exhaust air from the cylinder and to permit independent adjustment and control of valve opening and closing speeds. Control valves shall be sized so that the time required for the air cylinder piston to complete its stroke is adjustable between 20 and 60 seconds, with an air supply pressure of 80 psig (550 kPa gauge). Flow control valves shall be manufactured from brass or stainless steel and shall be Parker Hannifin "Colorflow F Series" or Mead "Dyla-Trol".

2.7.04 Single Acting-Spring Return Air Cylinder Actuators. When specified in the respective valve schedules, air cylinder actuators of the single acting-spring return type shall be provided by the valve manufacturer. Cylinders shall provide satisfactory operation for air of the specified quality and shall be shop tested at 240 psig (1650 kPa gauge). Actuators with non-metallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

The valve actuator mechanism coupled to the cylinder shall be totally enclosed. The cylinder shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rod shall be enclosed in the mechanism housing and shall not be exposed to view. The actuator shall be configured such that on power failure, the spring shall drive the valve open or closed. Each actuator shall be furnished with a 3-way solenoid valve. A flow control valve shall be furnished and installed in the solenoid valve vent.

2.8 AIR-OIL CYLINDER ACTUATORS.

2.8.01 General. Air-oil cylinder actuators as listed in the Valve or Gate Schedules shall be provided by the valve or gate manufacturer.

2.8.02 Air-Oil Cylinder Actuators. Air-oil cylinder actuators may be of the double acting or opposed cylinder type.

For eccentric plug valves, cylinders shall be of tie-rod or bolted-flange construction and shall be sized to provide the safety factors stipulated in Table 6 in Section 3.8 of ANSI/AWWA C504.

Each cylinder unit shall consist of an air cylinder driving an oil hydraulic cylinder of the same diameter, mounted together as a single assembly. Cylinders shall be of the tie-rod or bolted-flange construction. The air cylinder shall operate the valve, and the oil cylinder shall regulate the opening and closing speeds. Each unit shall be provided with an oil reservoir and two flow control valves on the oil cylinder.

The valve actuator mechanism coupled to the cylinders shall be totally enclosed. The cylinders shall be rigidly secured to the mechanism housing and shall not pivot, rotate, or swing during operation. The cylinder piston rods shall be enclosed in the mechanism housing and shall not be exposed to view.

The air cylinder shall be designed to provide satisfactory operation using air, or when specified herein, dry, oil-free instrument air at 80 psig (550 kPa gauge) pressure. The oil cylinder shall be designed to operate at an internal pressure not to exceed 80 psig (550 kPa gauge).

For AWWA butterfly valves; actuators with nonmetallic cylinders, as manufactured by Chicago Fluid Power, DeZurik, or Pratt, will be acceptable.

2.8.03 Control Devices. When specified in the respective valve schedule, a 4-way solenoid valve shall be provided to control the operation of each air-oil cylinder operated valve. Each solenoid valve shall be heavy-duty, single solenoid, two-position type rated for a differential operating air pressure of 125 psig (860 kPa gauge). Each valve shall be designed and constructed for exceptionally long life, with forged brass body; poppet type seats and discs; continuous duty, molded, Class F coil; NEMA Type 4 solenoid enclosure; and 1/2 inch (12.7 mm) threaded conduit connection. Solenoid valves shall be ASCO "Model No. 8344G70MO 4-Way Pilot Operated Solenoid Valves" with manual override features as manufactured by Automatic Switch Co.

Each oil connection on the oil cylinder shall be equipped with an adjustable flow control valve. The flow control valves and connecting oil piping shall be arranged to permit control of the flow rate of exhaust oil from the cylinder and to permit independent adjustment and control of valve opening and closing speeds. Control valves shall be sized so that the time required for the air cylinder piston to complete its stroke is adjustable between 30 and 300 seconds. Flow control valves shall be manufactured from brass or stainless steel and shall be Parker Hannifin "Colorflow F Series" or Mead "Dyla-Trol". An oil reservoir shall be provided in the oil piping connecting the two flow control valves.

2.9 PORTABLE ELECTRIC ACTUATOR. Contractor shall furnish the number of portable, electric motor driven actuators, as specified herein, with adjustable fabricated steel tripod suitable for operation of all crank-operated gates specified in Master Specification Section 02546, Sluice Gates. When indicated in the Contract Documents the portable electric actuators shall be suitable for operating all existing manual sluice and slide gate actuators.

When indicated in the Contract Documents, the actuator shall be reversible and shall be equipped with an overload release clutch for protection of the operated equipment. The clutch shall be adjustable, spring-loaded, drive-pawl type which releases instantly at a preset, predetermined torque. Disc friction clutches or shear pins will not be acceptable.

The actuator shall be suitable for operation with 120 volt, 60 Hz, single phase power, or as specified herein. A three-conductor, heavy-duty, neoprene jacketed, portable cord, with 12 AWG (4 mm^2) copper conductors and a standard grounding type plug, of a length as specified herein, shall be provided with the actuator.

Coordination of the portable actuator with the all new and existing manual actuators shall be the responsibility of Contractor.

2.10 PORTABLE HYDRAULIC ACTUATOR. Contractor shall furnish the number of portable, hydraulic driven actuators, as indicated in the Contract Documents, suitable for operation of all crank-operated sluice gates specified in Master Specification Section02546, Sluice Gates. When indicated in the Contract Documents the portable hydraulic actuators shall be suitable for operating all existing manual sluice gate actuators.

When indicated in the Contract Documents, the actuator shall be reversible and shall be equipped with an overload release clutch for protection of the operated equipment. The clutch shall be adjustable, spring-loaded, drive-pawl type which releases instantly at a preset, predetermined torque. Disc friction clutches or shear pins will not be acceptable.

The portable hydraulic actuator shall be mounted on a lightweight structural steel frame with two wheels for ease of movement. The unit shall consist of a four-cycle gasoline engine with a recoil starter driving a hydraulic pump. The unit shall include all necessary hoses, a hydraulic motor, oil reservoir and four way valve.

2.11 ACTUATOR ACCESSORIES.

2.11.01 EXTENSION STEMS. Extension stems and stem guides shall be furnished when indicated on the respective valve schedule, indicated on the drawings, or otherwise required for proper valve or gate operation. Extension stems shall be of solid steel and shall be not smaller in diameter than the stem of the valve actuator shaft. Extension stems shall be connected to the actuator with a single Lovejoy "Type D" universal joint with grease-filled protective boot. All stem connections shall be pinned.

At least two stem guides shall be furnished with each extension stem, except for buried valves. Stem guides shall be of cast iron, bronze bushed, and adjustable in two directions. Stem guide spacing shall not exceed 100 times the stem diameter or 10 feet (3 m), whichever is smaller. The top stem guide shall be designed to carry the weight of the extension stem. The extension stem shall be provided with a collar pinned to the stem and bearing against the stem thrust guide.

Extension stems for buried valves actuators shall extend to within 6 inches (150 mm) of the ground surface, shall be centered in the valve box using spacers, and shall be equipped with a wrench nut.

When indicated in the Contract Documents, extension stems for buried valve actuators shall be provided with position indicators.

2.11.02 POSITION INDICATORS. Unless otherwise specified, each valve actuator shall be provided with a position indicator to display the position of the plug or disc relative to the body seat opening.

For quarter turn plug, ball, or cone type valves installed in interior locations, the indicating pointer shall be mounted on the outer end of the valve operating shaft extension and shall operate over an indicating scale on the operating mechanism cover. Where the shaft passes through the cover, a suitable stuffing box or other seal shall be provided to prevent the entrance of water.

Each actuator for butterfly valves, except actuators that are located in manholes, buried, or submerged, shall have a valve disc position indicator mounted on the end of the valve shaft. A disc position indicator shall also be provided on each operating stand or the actuator mounted thereon.

2.11.02.01 Position Indicators for Buried Actuators. When specified in the respective valve schedule, each buried valve actuator shall be equipped with a position indicator. Position indicators shall be Indico "Model 179 Valve Position Indicators" manufactured by the Mills Engineering Company, Needham Heights, Massachusetts, or "Diviner" ground level position indicator manufactured by the Henry Pratt Company, Aurora, Illinois. Each indicator assembly shall be designed for installation on the extension stem connected to the operating stem of the buried actuator mechanism and shall be mounted in the top section of the valve box beneath the valve box cover. Each indicator shall be equipped with a wrench nut. Internal gearing shall be sealed and protected from the elements.

2.11.03 FLOOR BOXES. Openings through concrete slabs provided for key operation of valves shall be provided with a cast iron floor box complete with cover. The floor box shall be of the depth indicated on the drawings. Where the operating nut is in the slab, the stem shall have a guide to maintain the nut in the center of the box; where the nut is below the slab, the opening in the bottom of the box shall accommodate the operating key.

Each floor box and cover shall be shop coated with manufacturer's standard coating.

2.11.04 TORQUE TUBES. Torque tube shall utilize pipe rather than solid shafting between the valve input shaft and the output shaft of the valve floorstand operator. An adjustment of 2 inches shall be provided in the torque tub installation. Torque tube shall be coated with the same material as the submerged valve.

2.12 SHOP COATING. All ferrous metal surfaces, except bearing and finished surfaces and stainless steel components of valve actuators and accessories, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field painting in Master Specification Section 09900, Painting.

The following surfaces shall be painted:

Polished or Machined Surfaces	Rust-preventive compound.
Other Surfaces	Epoxy enamel.
Actuators and Accessories	Universal primer.

PART 3 - EXECUTION

3.1 INSTALLATION. Actuators will be installed on the valves in accordance with Master Specification Section 15010, Valve Installation and Master Specification Section 02546, Sluice Gates.

End of Section

SECTION 15190

NATURAL GAS PIPING

PART 1 - GENERAL

1.1 SCOPE. This Section includes fuel gas piping within the building. Products include the following:

Pipe, tube, fittings, and joining materials.

Protective pipe and fitting coating.

Piping specialties

1.2 PROJECT CONDITIONS.

Gas System Pressure: One pressure range. More than 0.5 psig (3.45 kPa) but not more than 5.0 psig (34.5 kPa).

1.3 SUBMITTALS

1.3.01 Product Data. Submit product data for each type of product indicated.

1.3.02 Shop Drawings. Submit shop drawings for fuel gas piping. Include plans and attachments to other work. Show different pressure zones and indicate pressure for each zone.

1.3.03 Field Quality-Control Test Reports. Submit field quality control test report results.

1.3.04 Operation And Maintenance Data. Submit operation and maintenance data for each type of product indicated.

1.4 QUALITY ASSURANCE.

Electrical Components, Devices, and Accessories. Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

NFPA Standard. Comply with NFPA 54, "National Fuel Gas Code."

1.5 WARRANTY. In the event that the equipment or components fail to perform satisfactorily at any time within the Defects Liability period the Contractor shall replace it with one capable of operating as specified and shall comply with the requirements in Division 1.

The Contractor shall be responsible for all cost incurred in furnishing and installing the replacement equipment.

1.6 SPARE PARTS. Spare parts shall meet the requirements of Sections 01750 and 01760.

PART 2 - PRODUCTS

2.1 MANUFACTURERS. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 PIPING MATERIALS. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

Corrugated, Stainless-Steel Tubing Systems. Comply with AGA LC 1 and include the following:

Tubing: Corrugated stainless steel with plastic jacket or coating.

Fittings: Copper alloy with ends made to fit corrugated tubing. Include ends with threads according to ASME B1.20.1 if connection to threaded pipe or fittings is required.

Striker Plates: Steel, designed to protect tubing from penetrations.

Steel Pipe. ASTM A 53/A 53M; Type E or S; Grade B; Schedule 80; black. Wall thickness of wrought-steel pipe shall comply with ASME B36.10M.

Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, with threaded ends according to ASME B1.20.1.

Steel Threaded Fittings: ASME B16.11, forged steel with threaded ends according to ASME B1.20.1.

Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends according to ASME B1.20.1 or butt-welded joints.

Cast-Iron Flanges and Flanged Fittings: ASME B16.1, Class 125.

Joint Compound and Tape: Suitable for natural gas.

Soft Copper Tube. ASTM B 88, Type L (ASTM B 88M, Type B), annealed temper.

Copper Fittings: ASME B16.22, wrought copper, streamlined pattern.

Brazing Filler Metals: AWS A5.8, Silver Classification BAg-1. Filler metal containing phosphorus is prohibited.

2.3 PROTECTIVE COATING. Furnish pipe and fittings with factory-applied, corrosion-resistant polyethylene coating for use in contact with materials that may corrode the pipe.

2.4 PIPING SPECIALTIES.

Flexible Connectors. ANSI Z21.24, copper alloy.

Quick-Disconnect Devices: ANSI Z21.41, convenience outlets and matching plug connector.

PART 3 - EXECUTION

3.1 PREPARATION. Close equipment shutoff valves before turning off fuel gas to premises or section of piping. Perform leakage test as specified in "Field Quality Control" Article to determine that all equipment is turned off in affected piping section.

3.2 PIPING APPLICATIONS. Use flanges, unions, transition, and special fittings in applications below, unless otherwise indicated.

Fuel Gas Piping, 5 psig (34.5 kPa) or less:

NPS 1/2 (DN 15) and Smaller: NPS 3/4 (DN 20) steel pipe, malleable-iron threaded fittings, and threaded joints, Soft copper tube, copper fittings, and brazed joints and Corrugated, stainless-steel tubing system and threaded joints.

NPS 3/4 and NPS 1 (DN 20 and DN 25): Steel pipe, malleable-iron threaded fittings, and threaded joints, Soft copper tube, copper fittings, and brazed joints, Corrugated, stainless-steel tubing system and threaded joints.

NPS 1-1/4 to NPS 3 (DN 32 to DN 70): Steel pipe, malleable-iron threaded fittings, and threaded joints.

NPS 4 and larger. (DN 100) Steel, malleable-iron threaded fittings and butt-welded joints.

3.3 VALVE APPLICATIONS.

Appliance Shutoff Valves for Pressure 0.5 psig (3.45 kPa) or Less: Appliance connector valve or gas stop.

Appliance Shutoff Valves for Pressure 0.5 to 2 psig (3.45 to 13.8 kPa): Gas stop or gas valve.

Piping Line Valves, NPS 2 (DN 50) and Smaller: Gas valve.

Valves at Service Meter, NPS 2 (DN 50) and Smaller: Gas valve.

3.4 INSTALLATION. Basic piping installation requirements and piping joint construction are specified in Division 15 Section 15051 "Piping- General Requirements."

Install pressure gage, upstream and downstream from each service pressure regulator. Pressure gages are specified in Division 15 Section "Piping Specialties."

Concealed Locations: Except as specified below, install concealed gas piping in airtight conduit constructed of Schedule 40, seamless, black steel pipe with welded joints. Vent conduit to outside and terminate with screened vent cap.

Above-Ceiling Locations: Gas piping without conduit may be installed in accessible spaces, subject to approval of authorities having jurisdiction, whether or not such spaces are used as plenums. Do not locate valves above ceilings.

In Walls: Gas piping with welded joints and protective wrapping specified in Part 2 "Protective Coating" Article may be installed in masonry walls, subject to approval of authorities having jurisdiction.

Underground Locations: Locate buried pipe a maximum depth as required by code to prevent damage. Low points and drip trap legs to be located inside of building.

Prohibited Locations: Do not install gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts.

Drips and Sediment Traps: Install drips at points where condensate may collect. Include outlets of service meters. Locate where readily accessible for cleaning and emptying. Do not install where condensate would be subject to freezing.

Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches (75 mm) long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap.

Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings unless specifically shown to be exposed to view.

Install fuel gas piping at uniform grade of 0.1 percent slope upward toward risers.

Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

Connect branch piping from top or side of horizontal piping.

Install unions in pipes NPS 2 (DN 50) and smaller, adjacent to each valve, at final connection to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

Install corrugated, stainless-steel tubing system according to manufacturer's written instructions. Include striker plates to protect tubing from puncture where tubing is restrained and cannot move.

Install strainer on inlet of each line pressure regulator and automatic and electrically operated valve.

Install pressure gage, upstream and downstream from each line pressure regulator. Pressure gages are specified in Division 15 Section 15120 "Piping Specialties."

Install flanges on valves, specialties, and equipment having NPS 2-1/2 (DN 65) and larger connections.

Install vent piping for gas pressure regulators and gas trains, extend outside building, and vent to atmosphere. Terminate vents with turned-down, reducing-elbow fittings with corrosion-resistant insect screens in large end.

3.5 HANGER AND SUPPORT INSTALLATION. Pipe hanger and support devices are specified in Section 15140 - "Pipe Hangers and Supports."

Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:

NPS 1 (DN 25) and Smaller: Maximum span, 96 inches (2438 mm); minimum rod size, 3/8 inch (10 mm).

NPS 1-1/4 (DN 32): Maximum span, 108 inches (2743 mm); minimum rod size, 3/8 inch (10 mm).

NPS 1-1/2 and NPS 2 (DN 40 and DN 50): Maximum span, 108 inches (2743 mm); minimum rod size, 3/8 inch (10 mm).

NPS 2-1/2 and NPS 4 (DN 80 and DN 100): Maximum span

Install hangers for horizontal corrugated, stainless-steel tubing with the following maximum spacing and minimum rod sizes:

NPS 3/8 and NPS 1/2 (DN 10 and DN 15): Maximum span, 48 inches (1219 mm); minimum rod size, 3/8 inch (10 mm).

NPS 3/4 and NPS 1 (DN 20 and DN 25): Maximum span, 72 inches (1829 mm); minimum rod size, 3/8 inch (10 mm).

Option: Support tubing from structure according to manufacturer's written instructions.

3.6 CONNECTIONS. Install piping adjacent to appliances to allow service and maintenance. Connect piping to appliances using gas with shutoff valves and unions. Install valve upstream from and within 72 inches (1800 mm) of each appliance. Install union downstream from valve.

3.7 FIELD QUALITY CONTROL. Test, inspect, and purge piping according to NFPA 54 and requirements of authorities having jurisdiction. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.

End of Section

SECTION 15200

STEAM AND CONDENSATE PIPING

PART 1 - GENERAL

1.1 SCOPE. this Section covers the installation of Low Pressure steam (less than 15 psig) and condensate steel piping together with fittings, specials and appurtenances for the services as indicated in the contract documents. Pipe and tubing shall be furnished complete with all fittings, flanges, unions and other accessories specified herein.

Pipe supports, anchors and expansion joints shall be furnished by Contractor, and are covered in Master Specifications Section 15140, Pipe Supports.

1.2 PERFORMANCE REQUIREMENTS. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures:

LP Steam Piping: 15 psig

Condensate Piping: Gravity at 250 deg F.

Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.

Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

1.3 SUBMITTALS.

1.3.01 Product Data. For each type of the following:

Pressure-reducing and safety valves.

Steam traps.

Thermostatic air vents and vacuum breakers.

Steam and Condensate piping.

Strainers, fittings, and valves.

1.3.02 Shop Drawings. Submittal of pipe anchors, hangers, pipe, multiple pipes, alignment guides, and expansion joints and loops and their attachment to the building structure. Detail locations of anchors, alignment guides, and expansion joints and loops.

1.3.03 Reports. Field quality-control test reports.

1.3.04 O & M. Operation and maintenance data.

1.4 QUALITY ASSURANCE.

1.4.01 ASME Compliance. Comply with ASME B31.9, "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS.

2.1.01 Steel Pipe. ASTM A 53/A 53M, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.

2.1.02 Cast-Iron Threaded Fittings. ASME B16.4; Classes 125, 150, and 300 as indicated in Part 3 piping applications articles.

2.1.03 Malleable-Iron Threaded Fittings. ASME B16.3; Classes 150 and 300 as indicated in Part 3 piping applications articles.

2.1.04 Malleable-Iron Unions. ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 piping applications articles.

2.1.05 Cast-Iron Threaded Flanges and Flanged Fittings. ASME B16.1, Classes 125 and 250 as indicated in Part 3 piping applications articles; raised ground face, and bolt holes spot faced.

2.1.06 Stainless-Steel Bellows, Flexible Connectors.

Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforced, protective jacket.

End Connections: Threaded or flanged to match equipment connected.

Performance: Capable of 3/4-inch misalignment.

CWP Rating: 150 psig.

Maximum Operating Temperature: 250 deg F.

2.2 JOINING MATERIALS.

2.2.01 Pipe-Flange Gasket Materials. Suitable for chemical and thermal conditions of piping system contents.

ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.

Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

2.2.02 Flange Bolts and Nuts. ASME B18.2.1, carbon steel, unless otherwise indicated.

2.2.03 Solder Filler Metals. ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

2.2.04 Brazing Filler Metals. AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

2.3 DIELECTRIC FITTINGS.

2.3.01 Description. Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

2.3.02 Insulating Material. Suitable for system fluid, pressure, and temperature.

2.3.03 Dielectric Unions.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Capitol Manufacturing Company.
Central Plastics Company.
Hart Industries, International Inc.
Watts Water Technologies, Inc.
Zurn Plumbing Products Group.
Or acceptable equal.

Factory-fabricated union assembly, for 250-psig minimum working pressure at 180 deg F.

2.4 VALVES.

2.1.01 Gate, Globe, Check, Ball, and Butterfly Valves. Comply with requirements specified in Division 15, Valve Sections 15091, 15092, 15093 & 15096.

2.5 STRAINERS.

2.5.01 Y-Pattern Strainers.

Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.

End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.

Strainer Screen: Stainless-steel, 20 mesh strainer, and perforated stainless-steel basket with 50 percent free area.

Tapped blow-off plug.

CWP Rating: 250-psig working steam pressure.

2.6 SAFETY VALVES.

2.6.01 Bronze or Brass Safety Valves.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Armstrong International, Inc.
Kunkle Valve; a Tyco International Ltd. Company.
Spirax Sarco, Inc.
Watts Water Technologies, Inc.
Or acceptable equal.

Disc Material: Forged copper alloy.

End Connections: Threaded inlet and outlet.

Spring: Fully enclosed steel spring with adjustable pressure range and positive shutoff, factory set and sealed.

Pressure Class: 250.

Drip-Pan Elbow: Cast iron and having threaded inlet and outlet with threads complying with ASME B1.20.1.

Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

2.6.02 Cast-Iron Safety Valves.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Armstrong International, Inc.
Kunkle Valve; a Tyco International Ltd. Company.
Spirax Sarco, Inc.
Watts Water Technologies, Inc.
Or acceptable equal.

Disc Material: Forged copper alloy with bronze nozzle.

End Connections: Raised-face flanged inlet and threaded or flanged outlet connections.

Spring: Fully enclosed cadmium-plated steel spring with adjustable pressure range and positive shutoff, factory set and sealed.

Pressure Class: 250.

Drip-Pan Elbow: Cast iron and having threaded inlet, outlet, and drain, with threads complying with ASME B1.20.1.

Exhaust Head: Cast iron and having threaded inlet and drain, with threads complying with ASME B1.20.1.

Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

2.7 PRESSURE-REDUCING VALVES.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Armstrong International, Inc.
Hoffman Specialty; Division of ITT Industries.
Leslie Controls, Inc.
Spence Engineering Company, Inc.
Spirax Sarco, Inc.
Or acceptable equal.

Size, Capacity, and Pressure Rating: Factory set for inlet and outlet pressures indicated.

Description: Pilot-actuated, diaphragm type, with adjustable pressure range and positive shutoff.

Body: Cast iron.

End Connections: Threaded connections for valves NPS 2 and smaller and flanged connections for valves NPS 2-1/2 and larger.

Trim: Hardened stainless steel.

Head and Seat: Replaceable, main head stem guide fitted with flushing and pressure-arresting device cover over pilot diaphragm.

Gaskets: Non-asbestos materials.

2.8 STEAM TRAPS.

2.8.01 Inverted Bucket Traps.

Basis-of-Design Product: Subject to compliance with requirements, provide Armstrong TVS-2011S, stainless steel inverted bucket trap with integral isolation valves, strainer and test valve, or a comparable product by one of the following:

Armstrong International, Inc.
Barnes & Jones, Inc.
Dunham-Bush, Inc.
Hoffman Specialty; Division of ITT Industries.
Spirax Sarco Inc.
Or approved equal

Body and Cap: Stainless steel ASTM A240 Grade 304L.

Connection size: 3/4” NPT

Orifice size: 5/32” NPT

End Connections: Threaded.

Head and Seat: Stainless steel.

Valve Retainer, Lever, and Guide Pin Assembly: Stainless steel.

Bucket: Stainless steel.

Strainer: Integral stainless-steel inlet strainer within the trap body.

Air Vent: Stainless-steel thermostatic vent.

Pressure Rating: 400 psig.

2.9 THERMOSTATIC AIR VENTS AND VACUUM BREAKERS.

2.9.01 Thermostatic Air Vent/Vacuum Breaker.

Basis-of-Design Product: Subject to compliance with requirements, provide Armstrong TVAB-3, stainless steel combination Thermostatic Air Vent/Vacuum Breaker, or a comparable product by one of the following:

Armstrong International, Inc.
Barnes & Jones, Inc.
Dunham-Bush, Inc.
Hoffman Specialty; Division of ITT Industries.
Spirax Sarco, Inc.
Or acceptable equal.

Body: 304-L Stainless steel

End Connections: Threaded 304 stainless steel

Thermostatic Air Vent: 3/4” NPT

Vacuum Breaker: 3/8” NPT

Valve: Stainless steel

Spring: T302 stainless steel

“O” Ring: EPDM
Screen: Stainless steel

Thermostatic Element: Phosphor-bronze bellows in a stainless-steel cage

Vacuum Breaker Body: T303 stainless steel

Maximum Allowable Pressure: 300 psig @ 365°F

Maximum Operating Pressure: 150 psig

Discharge Orifice Size: 3/16”

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS.

3.1.01 Low Pressure Steam Piping. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.1.02 Condensate Piping above Grade. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.1.03 Condensate Piping below Grade. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.2 ANCILLARY PIPING APPLICATIONS

3.2.01 Air-Vent Piping.

Inlet: Same as service where installed.

Outlet: Type K annealed-temper copper tubing with soldered or flared joints.

3.2.02 Vacuum-Breaker Piping: Outlet, same as service where installed.

3.2.03 Safety-Valve-Inlet and -Outlet Piping. Same materials and joining methods as for piping specified for the service in which safety valve is installed.

3.3 VALVE APPLICATIONS. Install shutoff duty valves at branch connections to steam supply mains, at steam supply connections to equipment, and at the outlet of steam traps.

Install safety valves on pressure-reducing stations and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install safety-valve discharge piping, without valves, to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

3.4 PIPING INSTALLATION. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Use indicated piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

Install piping to permit valve servicing.

Install piping free of sags and bends.

Install fittings for changes in direction and branch connections.

Install piping to allow application of insulation.

Select system components with pressure rating equal to or greater than system operating pressure.

Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

Install drains, consisting of a tee fitting, NPS 3/4 full port-ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

Install steam supply piping at a minimum uniform grade of 0.2 percent downward in direction of steam flow.

Install condensate return piping at a minimum uniform grade of 0.4 percent downward in direction of condensate flow.

Reduce pipe sizes using eccentric reducer fitting installed with level side down.

Install branch connections to mains using mechanically formed tee fittings in main pipe, with the branch connected to top of main pipe.

Install valves according to Division 15 Section "Valves."

Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections

of equipment, and elsewhere as indicated.
Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 nipple and full port ball valve in blow-down connection of strainers NPS 2 and larger. Match size of strainer blow-off connection for strainers smaller than NPS 2.

Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 15, “Sections 15065 & 15140."

Identify piping as specified in Division 15, Section 15200 – Mechanical Identification.

Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, and control valves.

On straight runs with no natural drainage points, install drip legs at intervals not exceeding 500 feet, if possible.

Size drip legs same size as main. In steam mains NPS 6 and larger, drip leg size can be reduced, but to no less than NPS 4.

3.5 STEAM-TRAP INSTALLATION. Install steam traps in accessible locations as close as possible to connected equipment.

Install full-port ball valve, strainer, and union upstream from trap; install union, check valve, and full-port ball valve downstream from trap unless otherwise indicated.

3.6 PRESSURE-REDUCING VALVE INSTALLATION. Install pressure-reducing valves in accessible location for maintenance and inspection.

Install bypass piping around pressure-reducing valves, with globe valve equal in size to area of pressure-reducing valve seat ring, unless otherwise indicated.

Install gate valves on both sides of pressure-reducing valves.

Install unions or flanges on both sides of pressure-reducing valves having threaded- or flanged-end connections respectively.

Install pressure gages on low-pressure side of pressure-reducing valves after the bypass connection according to Division 15, “Section 15130."

Install strainers upstream for pressure-reducing valve.

Install safety valve downstream from pressure-reducing valve station.

3.7 SAFETY VALVE INSTALLATION. Install safety valves according to ASME B31.9, "Building Services Piping."

Pipe safety-valve discharge without valves to atmosphere outside the building. Install drip-pan elbow fitting adjacent to safety valve and pipe drain connection to nearest floor drain.

Install exhaust head with drain to waste, on vents equal to or larger than NPS 2-1/2.

3.8 HANGERS AND SUPPORTS. Install hangers and supports according to Division 15 “Section 15140 - Pipe Supports. Comply with requirements below for maximum spacing.

3.9 PIPE JOINT CONSTRUCTION. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems.

Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube ends. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube," using copper-phosphorus brazing filler metal complying with AWS A5.8.

Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

> Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
>
> Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.10 TERMINAL EQUIPMENT CONNECTIONS. Size for supply and return piping connections shall be the same as or larger than equipment connections.

Install traps and control valves in accessible locations close to connected equipment.

Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.

Install vacuum breakers downstream from control valve, close to coil inlet connection.

Install a drip leg at coil outlet.

3.11 FIELD QUALITY CONTROL. Prepare steam and condensate piping according to ASME B31.9, "Building Services Piping," and as follows:

> Leave joints, including welds, un-insulated and exposed for examination during test.
>
> Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
>
> Flush system with clean water. Clean strainers.
>
> Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.

Perform the following tests on steam and condensate piping:

> Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
>
> Subject piping system to hydrostatic test pressure that is not less than 1.5 times the working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength.
>
> After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components and repeat hydrostatic test

until there are no leaks.

Prepare written report of testing.

End of Section

SECTION 15245

VIBRATION ISOLATION

PART 1 - GENERAL

1.1 SCOPE. This Section covers the furnishing and installation of vibration isolation requirements associated with mechanical equipment. Schedules and notes on drawings indicate specific types of isolators required for each equipment.

1.2 GENERAL.

1.2.01 Governing Standards.

ASHRAE (HVACA) – ASHRAE Handbook – HVAC Applications

ASHRAE Refrigeration Handbook

ASTM A 36/A 36 M – Standard Specification for Carbon Structural Steel

1.3 SUBMITTALS.

1.3.01 Shop Drawings. Submit shop drawings for each type of vibration isolator for Engineer's review.

1.3.02 Product Data. Submit product data for vibration isolators indicating the following:

Equipment requiring isolation.

Spring outside diameters.

Free, operating, and solid heights.

1.4 QUALITY ASSURANCE. Isolation materials manufacturer shall be responsible for proper selection of spring rates to accomplish scheduled minimum static deflections, for all spring and pad type isolators, based on weight distribution of equipment requiring isolation.

Refer to Equipment Schedules.

Isolation materials manufacturer shall be responsible for structural design of steel beam bases and concrete inertia bases to support mechanical equipment scheduled to receive supplementary base.

Complete set of reviewed shop drawings of all mechanical equipment to receive vibration isolation devices shall be furnished to vibration isolation materials manufacturer, upon which selection of vibration isolators and design of supplementary bases will be completed.

1.5 WARRANTY. Manufacturer's standard warranty unless noted otherwise.

PART 2 - PRODUCTS

2.1 MANUFACTURED UNITS.

2.1.01 Selection Criteria. Select vibration isolators for actual load imposed, and in accordance with Table, Selection Guide for Vibration Isolation, in the Sound and Vibration Control chapter of the ASHRAE HVACA.

Scheduled or specified static deflection requirements relate to actual static deflection of individual mounts under their particular loads.

Unacceptable vibration isolator mounts include:

> Vibration isolator mounts selected on the basis of cataloged, nominal static, deflection, while ignoring decrease in isolation efficiency due to loadings to less than those of nominal rating.
>
> Isolator mounts loaded in excess of their rated load capacity.
>
> Isolators selected by equally dividing total weight of equipment by proposed number of isolators. Except where supported equipment is symmetrical about its vertical axis.

Isolator springs shall have ratio of horizontal to vertical spring constants of not less than 0.8, be horizontally unrestrained, of diameter not less than 80 percent of height at rated load and allow reserve travel of 50 percent of rated deflection from height at rated load to shorted turns condition.

Elastic limit of springs shall not be exceeded at shorted turns conditions.

Equip isolator mounts having steel springs with means for leveling suspended equipment.

2.1.02 Floor Mounts. Equip with leveling bolts and locknuts.

Select for convenient bolting of base plates to building structure.

2.1.03 Hanger Mounts. Furnish positioning type hanger isolators that allow installation of equipment and piping at a fixed elevation independent of load changes and subsequent transfer of suspension load to springs.

Option, preloaded hanger isolators may be furnished with preloading devices being backed off after installation.

2.1.04 Coating. Dip coat steel elements of outdoor isolators with weather resistant paint.

2.1.05 Equipment Bases and Rails.

Type A, Concrete Inertia Block Mount.

Concrete inertia block base with steel springs mounted in series with ribbed neoprene pads.

Form concrete sub-bases from prefabricated steel pouring form frames with 1 inch by 1 inch by 1/8 inch angle stiffeners crossed in both directions on 9 inch centers and welded to sides of steel frames, templates to fit equipment anchor bolts, outboard height saver brackets, and spring isolators.

Depth of steel frame shall be not less than 1/12 of its longest span, but not less than 8 inches.

Concrete: 4000 psi, reinforcing steel #4 bars, 12 inches on center each way.

Acceptable Manufacturers:

Korfund Dynamics, Type RCPF with WS mounts.

Mason Industries, Type KSL with SLFH mounts.

Kinetics, Model CIB-H with FDS bolt down mounts.

Vibration Eliminator, Type SN with OST or OSK mounts.

Vibration Mountings and Controls, Type SPF with AEH mounts.

Type B, Structural Steel Base Mounting.

Structural steel base with steel springs mounted in series with elastomer pads or mounts.

Acceptable Manufacturers:

Korfund Dynamics, Spring-Isolated Structural Base with Type WS mounts.

Mason Industries, Type MSL with Type SLFH mounts.

Kinetics, Model SFB with FDS bolt down mounts.

Vibration Eliminator, Type OSK with OST or OSK mounts.

Vibration Mountings and Controls, Type WFB with Type AWH mounts.

<u>Type C, Structural Steel Base Mount</u>.

Structural steel base with double deflection neoprene-in-shear mounts.

Acceptable Manufacturers:

Korfund Dynamics, Structural Base with Type F or H mounts.

Mason Industries, Type MND with ND mounts.

Kinetics, Model SFB with Model RD mounts.

Vibration Eliminator, Type C or D.

Vibration Mountings and Controls, Type WFB with Type RD mounts.

2.1.06 <u>Vibration Isolator Mountings</u>.

<u>Type D, Spring Floor Mount</u>.

Individual steel spring mounts supported on elastomer pads.

Acceptable Manufacturers:

Korfund Dynamics, Type WS Bolt Down Design.

Mason Industries, Type SLFH.

Kinetics, Model FDS Bolt Down Mounts.

Vibration Eliminator, Type OST.

Vibration Mountings and Controls, Type AWH.

Type E, Double Spring Floor Mounts with Lift Restraint.

Double, side-by-side spring mounts with lift restraints, and supported on elastomer pads.

Acceptable Manufacturers:

Korfund Dynamics, Type WSCL.

Mason Industries, Type SLR.

Kinetics, Model FLS.

Vibration Eliminator, Type KW.

Vibration Mountings and Controls, Type AWR.

Type F, Neoprene-In-Shear Floor Mount.

Individual double deflection neoprene-in-shear mounts.

Acceptable Manufacturers:

Korfund Dynamics, Type F.

Mason Industries, Type ND.

Kinetics, Model RD.

Vibration Eliminator, No. 140 or No. 240.

Vibration Mountings and Controls, Type RD.

Type G, Neoprene Pad Floor Mount.

Ribbed or waffle pattern neoprene pads, single or multilayered as required for equipment's static deflection.

Acceptable Manufacturers:

Korfund Dynamics, Korpad.

Mason Industries, Type WSW or Super W.

Kinetics,Model NP or NG.

Vibration Eliminator, Type 100N.

Vibration Mountings and Controls, Shear-Flex.

Type H, Combination Spring and Neoprene-In-Shear Hanger Mount.

Hanger isolators with steel springs mounted in series with elastomer elements.

Acceptable Manufacturers:

Korfund Dynamics, Type VSPL.

Mason Industries, Type PC30N.

Kinetics,Model SRHPL.

Vibration Eliminator, Type PCSR.

Vibration Mountings and Controls, Series RSHP.

Type J, Neoprene-in-Shear Hanger Mount.

Hanger isolators with elastomer elements.

Acceptable Manufacturers:

Korfund Dynamics, Type H.

Mason Industries, Type HD.

Kinetics, Model RH.

Vibration Eliminator, C Series.

Vibration Mountings and Controls, Series RHDC.

Type K, Thrust Restraint.

Thrust restraint, having spring with elastomer element mounted in series, housing, rods, brackets, and means for presetting thrust force.

Acceptable Manufacturers:

Korfund Dynamics, Thrust Restraints.

Mason Industries, Type WB.

Kinetics, Thrust Restrainer.

Vibration Eliminator, Thrust Restraints.

Vibration Mountings and Controls, SH-27.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.1 General. Install vibration isolation materials and equipment bases in accordance with manufacturer's written instructions.

Remove debris trapped between equipment bases and floor.

Level mountings so each mount carries assigned load.

Mounts showing evidence of insufficient or excessive loading, buckling, squirming, totally collapsed springs, making permanent contact with _lift or sag restraints, or shorted springs and elastomer elements will not be accepted.

Install hanger type isolators so no shorting will occur via contact between upper and lower hanger rods or via contact between lower hanger rods and isolator boxes.

Locate floor vibration isolator mounts so base plates are supported in horizontal position by floor slabs, beams, or other structural elements.

Isolator placements resulting in overhanging or tilted base plates or in bending stresses in steel plate or bar grate flooring are unacceptable.

Bolt base plates to supporting structure.

Prepare pouring forms of inertia bases for concrete placement in accordance with manufacturer's instructions.

Make provisions for bond breaking between concrete fill and floor structure.

Vibrate concrete in place to ensure uniform filling.

Carefully remove spilled concrete.

Remove shipping bolts and blocks from isolator mounts.

Jack spring leveling bolts to obtain full floating equipment suspension.

Level vibration isolator mounts and bases, to attain fully floating equipment suspension under loading conditions of actual operation and adjust restraints.

Adjust or replace defective elements as required.

After installation of isolation materials and before start-up of equipment, clear debris from areas surrounding and beneath isolated equipment.

No rigid connections between equipment and building structure shall be made that degrades noise and vibration isolation system.
Electrical conduit connections to isolated equipment shall be installed with slack to allow free motion of isolated equipment.

3.2 APPLICATION OF MOUNTING TYPES.

Mountings: Types scheduled on Drawings.

Static deflection requirements: Where not indicated, defined in ASHRAE HVAC Systems and Applications Handbook.

Ductwork located within 50 feet of connections to air handling units: Support with Type H vibration isolators selected for a static deflection of 0.75 inch.

Fans and air handling units: At flexible connections install Type K thrust restraints, where developed aerodynamic thrust exceeds 10 percent of weight, and where fan static pressure exceeds 5 inches water gauge.

End of Section

SECTION 15250

MECHANICAL INSULATION

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of insulation, jackets accessories for mechanical piping, ductwork and equipment. Building insulation materials are specified in other sections. Insulation for mechanical equipment which is to be applied at the factory prior to shipment is specified in the individual equipment sections.

1.2 GENERAL. Materials furnished and installed under this section shall be in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall be responsible for coordinating the installation of insulation with the installation of the piping, ductwork, and equipment to be insulated. The piping, ductwork, and equipment shall be tested and accepted by Engineer before installation of the insulation materials.

Contractor shall verify that each component of the insulation systems is compatible with all other parts of the system; that all insulation materials are appropriate for the intended applications; and that all necessary devices and accessories have been provided.

All insulation of the same class shall be the product of a single manufacturer; however, all the insulation types need not be the products of one manufacturer.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials provided under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL, NFPA, and ASTM safety requirements.

1.2.04 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.05 Surface Burning Characteristics. Insulation, jackets, tapes, and adhesives to be used indoors shall have a composite flame spread rating not to exceed 25 and a composite smoke developed rating of 50 when tested by UL 723, NFPA 255, or ASTM E84. All testing shall be done on materials of the same densities and installed thicknesses as the materials being installed. Insulation materials which have been treated with a flame retardant additive to meet the required flame spread and smoke developed ratings are not acceptable.

1.2.06 Painting and Identification. Field painting and identification shall be as specified inMaster Specification Section 09900, Painting.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. A complete list of materials and catalog cuts, together with detailed specifications, materials performance data, installation instructions, parts, devices, and accessories furnished, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Information shall include certified test results to show compliance with UL, NFPA, and ASTM safety requirements.

1.4 QUALITY ASSURANCE.

1.4.01 Manufacturer Experience. A manufacturer shall have furnished material of the type specified which has been in successful operation for not less than the past 5 years.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance withMaster Specification Section 01180, Equipment, Materials, Parts, and Tools .

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.2 MATERIALS.

2.2.01 Pipe Insulation.

2.2.01.01 Type PMF1 Insulation. Type PMF1 mineral fiber pipe insulation shall be Schuller "Micro-Lok", Knauf "Pipe Insulation" Owens/Corning, or approved equal.

Type PMF1 pipe insulation shall be a one-piece molded glass fiber material with all-purpose jacket. The all-purpose jacket shall be factory-applied, fiberglass reinforced vapor barrier type, with white kraft bonded to aluminum foil and self sealing adhesive lap. The insulation shall be suitable for a temperature range of 0°F to 850°F (-18°C to 454°C), shall have a maximum thermal conductivity (k) of 0.24 BTU in/hr ft^2 °F at 75°F (0.035 W/m °C at 24°C), and shall conform to ASTM C547.

2.2.01.02 Type PMF2 Insulation. Type PMF2 high temperature mineral fiber pipe insulation shall be Fibrex "Epitherm 1200", or approved equal.

Type PMF2 pipe insulation shall be a high temperature, sectional or segmented mineral fiber forms with thermosetting binder suitable for temperatures up to 1200°F (649°C), and shall be provided in multiple layers. Fittings and valves shall be insulated with factory-made molded fiber fittings or built-up sections of pipe covering. The insulation shall conform to ASTM C547.

2.2.01.03 Type PFC1 Insulation. Type PFC1 flexible cellular elastomeric pipe insulation shall be Armstrong "Armaflex", Rubatex "R-180-FS", or approved equal. Flexible cellular polyolefin foam insulation shall be IMCOA "Imcolock" or “Imcoshield", or approved equal.

Type PFC1 pipe insulation shall be one-piece, molded elastomeric or polyolefin foam insulation suitable for a temperature range of -40°F to 210°F (-40°C to 99°C), and shall have a maximum thermal conductivity (k) of 0.28 BTU in/hr ft^2 °F at 75°F (0.040 W/m °C at 24°C). The insulation shall be suitable for exposure to weather and direct sunlight or, where not indicated to be jacketed, shall be given two coats of an ultraviolet-resistant finish recommended by the manufacturer. The insulation shall conform to ASTM C534.

2.2.02 Duct Insulation.

2.2.02.01 Type DMF1 Insulation. Type DMF1 semi-rigid type duct insulation shall be Schuller "800 Series Spin-Glas", Knauf "Insulation Board", Owens/Corning, or approved equal.

Type DMF1 exterior insulation for rectangular ductwork shall be a semirigid, 3 pound per cubic foot (48 kg/m^3) density fiberglass material with a factory-applied all service jacket. The insulation shall conform to ASTM C612.

2.2.02.02 Type DMF2 Insulation. Type DMF2 flexible type duct insulation shall be Schuller "Microlite", Knauf "Duct Wrap", Owens/Corning, or approved equal.

Type DMF2 exterior insulation for round ductwork shall be 1 pound per cubic foot (16 kg/m^3) density flexible fiberglass duct wrap with factory-applied foil-scrim-kraft facing. The insulation shall conform to ASTM C553.

2.2.03 Equipment Insulation.

2.2.03.01 Type EMF1 Insulation. Type EMF1 equipment insulation shall be Schuller "800 Series Spin-Glas", Knauf "Insulation Board", Owens/Corning, or approved equal.

Type EMF1 equipment insulation shall be rigid mineral fiber insulation board with a density of 6 pounds per cubic foot (96 kg/m^3) and a factory-applied foil-scrim-kraft facing. The insulation shall conform to ASTM C612.

2.2.03.02 Type EMF2 Insulation. Type EMF2 equipment insulation shall be Fibrex "Mineral Fiber Blanket", or approved equal.

Type EMF2 equipment insulation shall be high temperature mineral fiber blanket with a thermosetting binder suitable for temperatures up to 1200°F (649°C) and shall have a density of 8 pounds per cubic foot (128 kg/m^3). The insulation shall conform to ASTM C592.

2.3 ACCESSORIES.

2.3.01 PVC Insulation Jackets. PVC insulation jackets for piping systems shall be furnished and installed as specified herein and indicated on the drawings.

All fittings in piping systems insulated with mineral fiber shall be jacketed with a polyvinyl chloride (PVC) jacketing material. Piping systems where indicated to have PVC jackets shall be jacketed with the same PVC jacketing material. Jackets for fittings shall be one piece, factory molded to the contour of the fitting. The PVC jacket and fitting covers shall have a minimum thickness of 0.02 inches (0.51 mm) when installed indoors and 0.03 inches (0.76 mm) when installed outdoors. PVC jacketing shall be Schuller "Zeston 2000 Series", or approved equal.

2.3.02 Aluminum Insulation Jackets. Aluminum insulation jackets for insulated piping systems shall be furnished and installed as required and indicated on the drawings.

Fittings in insulated piping systems and equipment where indicated in the insulation schedule shall be provided with aluminum jackets of the same aluminum jacketing material as the piping systems. The aluminum jacket shall be Alclad 3004, or approved equal complying with ASTM B209. The jacket shall have a nominal thickness as indicated, with an embossed finish. A factory-applied asphalt and kraft paper vapor barrier or polyethylene film and kraft paper vapor barrier shall extend the full width of the jacket.

PART 3 - EXECUTION

3.1 INSTALLATION.

3.1.01 General. Contractor shall install all insulation materials as specified herein for the piping systems, ductwork, and equipment, as required, that are not factory insulated. Insulation materials shall be installed in accordance with the manufacturer's written instructions and recommendations. Surfaces to be insulated shall be cleaned and dried. Insulation shall be kept clean and dry and shall remain in the factory container until it is installed. Packages or factory containers shall bear the manufacturer's stamp or label with the name of the manufacturer and description of materials.

Seams of exposed insulation and jackets shall be in the least visible location.

3.1.02 Piping Insulation.

3.1.02.01 Type PMF1 Insulation. Pipe insulation shall be installed to cover all piping, fittings, and appurtenances. Insulation shall be full length of the factory unit using a single cut piece to complete the run. Abutting cut pieces or scraps shall not be used. End joints and longitudinal seams shall be tightly butted. Insulation for fittings shall be of the same thickness and conductivity as the adjoining pipe insulation.

Insulated piping conveying fluids at lower than ambient temperatures shall be jacketed with a continuous vapor barrier. The insulation shall be continuous through hangers and penetrations, except at firewall penetrations, and shall be sealed with vapor barrier coating. The vapor barrier coating shall be applied at intervals not exceeding 15 feet (4.6 m) for straight runs and not more that 6 inches (150 mm) from fittings. Fibrous insulation laps and butt strips that are not self-sealing shall be secured with adhesive and stapled. Staples and seams shall be coated with vapor barrier material.

On piping 2 inches (50 mm) and larger where the insulation is continuous through the hanger, an insert shall be installed between the support shield and piping. The insert shall be of the same thickness and contour as the adjacent insulation and installed to maintain a continuous vapor barrier through the support. The insert shall be constructed of wood or heavy density insulating material suitable for the system operating temperatures.

3.1.02.02 Type PMF2 Insulation. The insulation shall be installed in layers as required to obtain the specified thickness. Joints and seams between insulation sections or segments shall be tight and shall be staggered between layers. The insulation shall be shall be fastened with stainless steel wire loops on 6 inch

(150 mm) centers embedded into the outer layer. All cracks, voids, and depressions shall be filled with insulating cement suitable for the system operating temperatures. The surfaces to receive outer coverings shall be smooth and uniform. Flanges and expansion joints in exhaust piping shall not be insulated.

3.1.03 Duct Insulation. Insulation for ducts indicated on the drawings as wrapped shall be installed as specified herein and indicated on the drawings. Duct insulation shall be continuous through hangers and penetrations, except firewall penetrations but shall be interrupted at thermometers, controls, damper linkages, flexible connections, access doors, etc., to avoid interference with their functioning and/or replacement. Insulation jackets shall be continuous across seams, reinforcement, and projections.

Insulation on ducts conveying air at temperatures below 60°F (16°C) shall be installed with a continuous vapor barrier seal. Staples and joints shall be sealed with a vapor barrier coating.

3.1.03.01 Type DMF1 Insulation. Type DMF1 semirigid insulation shall be secured to all four sides of the duct with mechanical fasteners, spaced not more than 12 inches (305 mm) apart and not more than 3 inches (76 mm) from the edges of the insulation joints. At least two rows of fasteners shall be provided for each side of 12 inch (305 mm) and larger ducts, and one row for each side of ducts smaller than 12 inches (305 mm). All joints in the insulation shall be sealed with 3 inch (76 mm) wide joint sealing tape or 4 inch (102 mm) wide strips of jacket material secured with adhesive and staples.

3.1.03.02 Type DMF2 Insulation. Type DMF2 flexible insulation shall be installed with waterproof, fire-retardant adhesive. Insulation jackets shall overlap at least 2 inches (51 mm) and shall be secured under the overlap with adhesive and stapled on 4 inch (102 mm) centers.

3.1.04 Equipment Insulation. Insulation for equipment shall be installed as specified herein and indicated on the drawings. Equipment insulation shall be installed and fastened as recommended by the manufacturer.

Equipment insulation shall be installed in as closest contact possible with the equipment surface and shall be secured with studs, pins, clips, adhesives, wires, or bands. Pumps may be insulated by forming a box around the pump housing. Seams shall be sealed with joint sealing tape. A smooth coat of insulation cement shall be applied over the insulation except at removable sections. On equipment with surface temperatures lower than 60°F (16°C), two coats of vapor barrier coating shall be applied.

Equipment insulation shall be applied with interruptions for access to manholes, flanges, and other openings without disturbing the insulation. Boxouts with beveled and sealed edges shall be provided around code stamping symbols and nameplates.

3.1.05 PVC Jacketing. PVC jacketing for piping systems shall be installed as specified herein and indicated on the drawings. End joints and longitudinal seams on piping systems conveying fluids at lower than ambient temperatures shall be vapor-sealed, and covered with vapor-barrier tape to ensure a continuous vapor seal. Fittings shall be insulated with glass fiber material.

3.1.06 Aluminum Jacketing. Aluminum jacketing for piping systems shall be installed as specified herein and indicated on the drawings. Jacketing shall be held in place with stainless steel securing bands uniformly spaced at not more than 18 inches (457 mm) to produce tight joints without "bulging". The jacket shall overlap at least 2 inches (51 mm) at longitudinal and circumferential joints. Joints shall be overlapped and sealed with caulk to prevent moisture penetration, and longitudinal joints shall be placed to shed water. Exposed ends of pipe insulation shall be provided with covers constructed of the same material as the jacketing.

Elbows shall be jacketed with spirally wrapped aluminum strips or individual mitered segments or gores cut to fit the insulation.

3.2 INSULATION SCHEDULE.

INSULATION SCHEDULE				
Service	Size Inches (mm)	Mechanical Insulation		Notes
		Type	Thickness Inches (mm)	
PIPING - INDOOR (CONCEALED OR EXPOSED)				
Chilled Water	All	PMF1	1 (25)	(3)
Compressed Air	All	PMF1	1 (25)	(2)
Condensate Drain	All	PMF1	1 (25)	(4)

Digester Gas	Up to 2 (50) Larger than 2 (50)	PMF1 PMF1	1 (25) 2 (50)	
Engine Exhaust	All	PMF2	Note (8)	
Gaseous Oxygen	All	PFC1	2 (50)	
Heating Water, Steam, and Steam Condensate	Up to 3/4 (20) 1 to 2 (25 to 50) 2.5 to 4 (65-100) 6 & 8 (150-200) 10 (250) & larger	PMF1 PMF1 PMF1 PMF1 PMF1	1-1/2 (40) 1-1/2 (40) 2 (50) 2-1/2 (65) 3 (80)	(3) (3) (3) (3) (3)

Heating Water Pumps	All	EMF1	1-1/2 (40)	

Mechanical Insulation Types: FC - Flexible Cellular
MF - Mineral Fiber

Notes:

(1) PVC jacket.

(2) Aluminum jacket.

(3) PVC jackets shall be provided on exposed portions of insulated piping located less than 8 feet (2.4 m) above finished floor. On all other portions of the insulated piping system PVC jackets shall be provided only for fittings.

(4) Insulation shall be provided for portions of the piping system which pass through space above finished ceilings or is exposed above equipment, electrical panels, or cabinets.

(5) Insulation shall be provided for exposed portions of the piping system located less than 8 feet (2.4 m) above the finished floor or grade.

(6) Insulation shall be provided for outside air plenums and ducts with heating coils which are located upstream of the heating coil or pass through unheated spaces after the heating coil, unless indicated to be internally lined.

(7) Insulation shall be provided for air conditioning supply ducts, air

conditioning return ducts, and dehumidifier reactivation air discharge ducts, unless indicated to be internally lined.

(8) Insulation thickness shall be sufficient to provide a cold face temperature not to exceed 150°F (66°C).

(9) The underside of all roof drains shall be insulated to a 1 foot (300 mm) radius from the center of the drain. All roof drain piping within 4 feet (1.2 m) of the drain shall be insulated.

Unless otherwise indicated in the insulation schedule, all mechanical piping, ductwork, equipment, and accessories with an operating temperature in excess of 140°F (60°C) and below 60°F (15°C) shall be insulated.

End of Section

SECTION 15300

FIRE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of materials, equipment, and appurtenances associated with wet-pipe and dry-pipe fire sprinkler systems. All labor, materials, tools, equipment, service and supervision required to design, install, test, and place the fire sprinkler systems in service shall be provided.

Fire sprinkler systems shall meet the design conditions and features as specified and as indicated on the drawings.

1.2 GENERAL.

1.2.01 Coordination. Piping, equipment, and appurtenances furnished and installed under this section shall be designed, fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations furnished by the manufacturer unless exceptions are noted by Engineer.

Contractor shall verify that each component of the fire sprinkler system is compatible with all other parts of the system; that all piping, equipment, and appurtenances are appropriate for the intended function; and that all devices necessary for a properly functioning system have been provided.

Equipment and appurtenances furnished under this section shall be the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the products of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Contractor shall become familiar with details of the work, shall verify dimensions in the field, and notify Engineer of any discrepancy before performing the work.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with the applicable national, state, and local codes and ordinances, laws, regulations, and NFPA Standards which pertain to such work. In case of a conflict between these specifications and any applicable national, state, or local code, ordinance, law, regulation, or NFPA Standard, the latter shall govern.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete design calculations; assembly, and installation drawings; together with complete engineering data covering the materials used and the parts, devices, and accessories forming a part of the equipment and appurtenances furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

The data and specifications submitted shall include, but not be limited to, the following:

Design Documents

Complete working plans, hydraulic calculations, water supply data, and information required by NFPA Standards.

Equipment, Piping, and Appurtenances

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Capacities.

Pressure and temperature ratings.

Overall dimensions.

Piping connection type, size, and location.

Wiring diagrams.

Pressure loss data.

Net weight.

Test Reports

Test reports and certificates as described in NFPA Standard No 13.

1.3.02 Operation and Maintenance Manuals. Operation and maintenance instructions shall be provided for the equipment and appurtenances furnished under this section.

1.4 QUALITY ASSURANCE. All materials and work shall conform to the requirements of the National Fire Protection Association (NFPA), Factory Mutual (FM), and Underwriters' Laboratories (UL).

Manufacturer's providing equipment and appurtenances shall be listed by product name and manufacturer in the UL Fire Protection Equipment Directory and FM Approval Guide.

Fire sprinkler system materials shall be permanently stamped or labeled with the Listing and Approval Agency's identification.

Materials, installation, inspection, and testing of the fire sprinkler system shall comply with the requirements of the local authorities having jurisdiction and Owner's insurance underwriter.

The sprinkler system drawings and calculations shall be performed by an individual with National Institute for Certification of Engineering Technologies (NICET) III certification and signed and sealed by a registered professional engineer licensed in the state of Michigan.

The fire sprinkler system shall be installed by a firm having previously installed a minimum of five systems similar in size and scope to this project.

1.5 PERFORMANCE AND DESIGN REQUIREMENTS. All piping, equipment, and appurtenances shall be designed to meet the performance and design conditions as specified herein and on the drawings. The system shall be designed as an automatic wet-pipe or automatic dry-pipe sprinkler system as indicated in Schedule 13930-S01. The system type, zoning, hazard classification, sprinkler density, and design area of operation shall be as indicated on the drawings, or on schedules, as indicated.

The design area represents the minimum area to be considered for hydraulic calculations. The system shall be designed to discharge the sprinkler density over the most hydraulically demanding design area. The area required to be sprinkled may be larger than the design area.

Water allowances shall be made for inside or outside hose streams as required. Hose stream flow rates shall be as specified by NFPA Standards.

1.5.01 Flow Test. Sprinkler system design shall be performed using either data from a test performed by Contractor, or data supplied by Engineer.

When indicated, Contractor shall perform a water flow test to verify that adequate pressure is available at the required flow before the system is designed. Water supply information provided on the data sheet is based on estimates and shall be verified by flow test prior to designing the sprinkler system. The verification flow test and data shall be the responsibility of Contractor. If it is not possible to perform a flow test prior to designing the system, the test may be performed later, however, Contractor shall accept responsibility for any modifications required in the event that the flow tests indicate a lower available water supply than that on which the calculations were based.

1.5.02 Pipe Sizing. The sprinkler system shall be hydraulically calculated, and shall include a safety factor as indicated at the required flow.

Pipe and accessory sizes indicated on the drawings are the minimum allowed, and shall be increased if determined necessary by hydraulic calculations. The water velocity in piping systems shall not exceed 20 fps (6.1 m/s) at design flow.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.7 EXTRA MATERIALS. A supply of spare sprinklers shall be provided in accordance with NFPA Standard No 13. The sprinklers shall be stored in a suitable metal container and shall be representative of the number of each type and each temperature rating of the sprinklers installed.

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment identification, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All components of the fire sprinkler system shall be designed to meet the specified conditions indicated in the Contract Documents.

2.2 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as indicated in the respective product description paragraphs.

2.3 MATERIALS. All piping systems and related components shall be rated for at least 175 psig (1207 kPa) working pressure.

2.3.01 Anchor Bolts and Expansion Anchors. All anchor bolts, expansion anchors, nuts and washers shall comply with UL, FM, and NFPA requirements. Powder-driven anchor assemblies shall not be used.

2.3.02 Piping Systems. Piping on the supply side of the backflow prevention device shall be as specified in other sections for potable water use. Piping on the sprinkler side of the backflow prevention device shall be black or galvanized steel pipe as follows:

Standard Weight ASTM A53 with Threaded Malleable or Cast Iron Fittings.

All 2 inch (51 mm) and smaller piping.

Standard Weight ASTM A53 with Flanged Fittings.

All 2-1/2 inch (63 mm) and larger piping.

Standard Weight ASTM A53 with Grooved-End Fittings.

All 2-1/2 inch (63 mm) and larger piping on the sprinkler side of the backflow preventer. (Optional)

Schedule 10 ASTM A135 with Roll-Grooved Fittings.

All 2-1/2 inch (63 mm) and larger piping on the sprinkler side of the backflow preventer. (Optional)

Galvanized steel pipe shall be used for sprinkler piping in the systems and locations as required. Pipe shall be furnished complete with all fittings, jointing materials, supports and anchors, and other accessories required for a complete system.

Plain-end fittings with mechanical devices which grip into the pipe, and saddle type branch fittings shall not be used.

2.3.03 Pipe Supports. Pipe supports shall be suitable for the application, construction, and type and size of pipe used.

"C" type clamps shall be provided with retaining clips and shall not be used for piping larger than 1 inch (25 mm) size.

Galvanized hanger assemblies shall be used for the support of galvanized steel piping systems.

2.3.04 Service Valves. Service valves shall be UL-listed and FM approved, with 175 psig (1207 kPa) non-shock minimum working pressure rating.

2.3.04.01 Gate Valves. Gate valves in 2 inch (51 mm) and smaller sizes shall be cast-bronze with threaded ends, solid wedge disc, outside screw and yoke, and rising stem.

Gate valves in 2-1/2 inch (63 mm) and larger sizes shall be iron body, bronze mounted, with tapered solid wedge disc, outside screw and yoke, and rising stem. Valves shall be provided with replaceable bronze disc facing rings and flanged ends.

Gate valves in 4 inch (102 mm) and larger sizes for use with indicator posts shall be iron body, bronze mounted, with solid wedge disc, non-rising stem, operating nut, replaceable bronze disc facing rings, and bonnet cap for indicator post. Gate valves for use with wall indicator posts shall be provided with flanged ends. Gate valves for use with vertical indicator posts shall be provided with flanged or mechanical joint ends.

Indicator posts shall be wall type or vertical type, as indicated. When indicated, the indicator post shall be provided with a supervisory switch to alarm when the valve is not in the full open position.

Wall type indicator posts shall be with cast-iron body, windows for target plates that indicate valve position, extension rod and coupling, locking device, hand wheel operator, wall flange, and red enamel finish.

Vertical type indicator posts shall be with cast-iron body, ductile iron barrel, windows for target plates that indicate valve position, extension rod and coupling, locking device, operating wrench, and red enamel finish. The indicator post shall be of suitable length for the water main bury depth, with the operating handle located approximately 3 feet (900 mm) above finish grade.

2.3.04.02 Butterfly Valves. Butterfly valves in 3 inch (76 mm) and larger sizes shall be provided with cast iron body, iron or aluminum/bronze disc, BUNA-N or EPDM seat sleeve. Valve body shall be lug or grooved type as determined by the piping system. Butterfly valves shall be provided with an integral indicator to show disc position. The indicator shall include a pre-wired single-circuit supervisory switch rated for 10 amperes ac.

2.3.04.03 Ball Valves. Ball valves in 2 inch (51 mm) and smaller sizes shall be brass ball and body with reinforced Teflon seat and threaded ends.

2.3.04.04 Check Valves. Swing check valves 2-1/2 inch (63 mm) and larger shall be cast-iron body with bolted cap, bronze disc or cast-iron disc with bronze disc ring, and flanged ends.

2.3.05 Specialty Valves. Specialty valves shall be UL-listed and FM approved, with 175 psig (1207 kPa) non-shock minimum working pressure rating.

2.3.05.01 Alarm Check Valve. When an alarm check valve is indicated, it shall be provided with variable pressure trim and standard accessories including pressure gauges; alarm switch with contacts rated for 120 volts, 10 amperes; testing bypass;

drain cup; retarding chamber; and all necessary pipe, fittings, and accessories required for a complete trimming installation in accordance with NFPA No. 13. The valve shall be provided with flanged inlet and outlet, bronze grooved seat with O-ring seals, and single hinge pin and latch design. The alarm switch shall be wired to the fire alarm system.

2.3.05.02 Dry-Pipe Valve. When a dry-pipe valve is indicated, it shall be a latching differential valve and shall be provided with standard accessories including drip check valve; drain cup; reset bar; alarm test shut-off valve; pressure gauges; alarm switch with contacts rated for 120 volts, 10 amperes; testing bypass; and all necessary pipe, fittings, and accessories required for a complete trimming installation in accordance with NFPA No. 13. The valve shall be provided with flanged inlet and outlet, bronze grooved seat with O-ring seals, and single hinge pin and latch design. The alarm switch shall be wired to the fire alarm system.

An accelerator, anti-flood device, and associated trim package shall be provided with each dry-pipe valve.

2.3.05.03 Deluge Valve. The system deluge control valve shall be a listed indicating type valve. The control valve shall be UL listed and Factory Mutual (FM) approved for fire protection installations. The system control valve shall be rated for normal system pressure but in no case less than 175 psi. Acceptable manufacturers shall be Viking, Victaulic or approved equal.

The system valve shall be cast-iron body, hydraulically operated, differential-pressure type. Include bronze seat with O-ring seals, trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, drip cup assembly piped without valves and separate from drain line, fill-line attachment with strainer, and push-rod chamber supply connection.

Water Control Valve: The deluge system shall utilize a 90° pattern or straight type of deluge valve shall be externally resettable by hydraulic means. The deluge valve shall employ a positive vent on the priming line to ensure that the deluge valve will not prematurely reset. The inlet and outlet connections of deluge valve can be flanged by flanged, flanged by grooved or grooved by grooved, respectively. The deluge valve shall be capable of installation in the vertical or horizontal position. The deluge valve shall be UL Listed and Factory Mutual Approved. The deluge valve shall have a working pressure of 250 PSI. The valve trim shall be compatible and shall be installed following the manufacturer's specifications. The Deluge Valve manufacturer shall be Viking E-1 or F-1 series or approved equal.

Water Control Valve Trim: The deluge valve trim shall incorporate a pressure operated relief valve (PORV) of the same manufacturer as the deluge valve, to provide a hydraulic means to positively vent the priming water chamber. All deluge valve trim piping and devices shall be listed for use as deluge system. The deluge valve trim shall be galvanized and rated for 250 PSI working pressure. The Deluge Valve Trim shall be compatible with Viking E-1 or F-1 deluge valve, or approved equal.

Water Control Valve Release Panel: The deluge valve release panel shall be 120 VAC or 220 VAC powered with a 24 hour D/C backup power supply. The deluge valve release panel shall be capable of accepting cross-zoned detection as the means of system release. The deluge valve release control panel shall conform to NFPA 70, NFPA 72 and all other applicable codes. The deluge valve release control panel shall be listed for use with a Viking Model E-1 or F-1 deluge valve. The Deluge Release Panel shall be a Simplex-Grinnell, Viking, or approved equal.

Solenoid Valve: An electric solenoid valve shall be utilized to release the priming chamber water pressure. The solenoid valve shall be 24 VAC and conform to NFPA 70. The Solenoid shall be listed for the use with Viking Model E-1 or F-1deluge valve, or approved equal.

Discharge Devices: Nominal 1/2-inch orifice for “Ordinary” temperature classification rating, unless otherwise indicated or required by application.

Open Sprinklers: UL 199, without heat-responsive element.

Orifice: 1/2-inch, with discharge coefficient K between 5.3 and 5.8.

Orifice: 17/32-inch, with discharge coefficient K between 7.4 and 8.2.

Supplemental Detection System: Electrical devices utilized in the supplemental detection system shall be compatible with the release control panel. Installation of electrical supplemental detection system shall be in accordance with N.F.P.A. 70, NFPA 72 and local installation requirements. The detection system shall be inspected, tested and maintained in accordance with all applicable standards and codes.

System Piping: System piping shall conform to NFPA 13, Standards for Installation of Sprinkler Systems. System piping shall be listed for the maximum system pressure it is to be exposed to. All system piping shall be metallic and shall be protected against corrosion of corrosive exist.

Hangers: Deluge sprinkler system hangers shall conform to NFPA 13, Standards for Installation of Sprinkler Systems. The system piping shall be substantially supported to prevent sway or thrust. The hanging of no-system components from the sprinkler piping shall be strictly prohibited. The use of non-metallic hanger materials shall be prohibited unless expressed otherwise.

Fittings: Pipe fittings installed on the deluge sprinkler system shall be in conformance with NFPA 13, Standards for Installation of Sprinkler Systems. The fittings shall be listed for use at the system pressures to be encountered. Fittings shall be corrosion resistant if they are to be installed in a corrosive atmosphere.

2.3.05.04 Air Maintenance Device. An air maintenance device shall be provided for each dry-pipe system. The air maintenance device shall be furnished as a complete assembly, including pressure regulator, pressure relief valve, strainer, shut-off valves, bypass valve, check valve, restriction device, and associated piping. The pressure reducing valve and pressure relief valve settings shall be suitable for the water system supply pressure.

2.3.05.05 Ball Drip Valves. Ball drip valves shall be automatic drain type, 3/4 inch (19 mm) body size, with spring-loaded ball check device and threaded ends.

2.3.05.06 Backflow Preventer. The sprinkler system backflow preventer shall be a double check, double check detector, reduced pressure principle, or reduced pressure detector type as required. The unit shall be epoxy-coated cast iron, with bronze seat and stainless steel trim. Gate valves with flanged ends, outside screw and yoke, rising stem, and resilient seats shall be factory installed at each end of the unit. Each gate valve shall be provided with a supervisory switch to alarm in the event that the valve is not in the full open position.

Detector type backflow preventers shall have a bypass consisting of a bronze displacement type water meter in series with a bronze backflow preventer with ball valves on the bypass line. The backflow preventer on the bypass line shall be double check or reduced pressure principle type as needed to match the primary unit. Backflow preventers shall be as manufactured by Febco, Watts Industries, Inc., or approved equal.

2.3.06 Automatic Sprinklers. Sprinklers shall be furnished and installed in accordance with their listed spacing limitations. Automatic sprinklers shall be provided with heat responsive elements conforming to UL 199. Sprinkler types and categories shall be as indicated in Schedule 13930-S01 or other location as required. Sprinklers shall be provided with nominal 1/2-inch orifice and 165°F (74°C) temperature rating unless otherwise indicated or required by application. Sprinklers located in the vicinity of heaters shall be provided with intermediate or high temperature ratings as specified by NFPA 13.

Sprinklers shall be furnished and installed with all required escutcheons for a complete installation. Escutcheons shall permit sprinkler head adjustment as needed for a proper installation.

Sprinkler cabinets shall be finished steel with hinged cover, space for minimum of 6 spare sprinklers plus sprinkler wrench, and shall be suitable for wall mounting.

Include number of sprinklers required by NFPA 13 and 1 wrench for sprinklers. A separate cabinet with sprinklers and wrench shall be provided for each style of sprinkler head on this project.

When indicated in Schedule 15300-S01, wire-cage type sprinkler guards shall be provided with fastening device for attaching to sprinkler.

2.3.07 Fire Department Connection. A sprinkler system fire department Siamese connection shall be provided when indicated on drawings. The location of the connection shall be as indicated on the drawings or as approved by Engineer and the local Fire Department. The type of siamese connections shall be wall-type or freestanding type as required.

Wall-type fire department connections shall be flush or a projecting type, as required, with cast-brass body; polished chrome plated finish; NH-standard thread inlets according to NFPA 1963 and matching local fire department threads; and threaded NPS outlet. Connection shall include lugged cap, gasket, and chain; lugged swivel connection and drop clappers for each hose connection inlet; and round wall escutcheon plate with marking "AUTO SPKR". The connection shall be provided with two 2-1/2 inch (65 mm) inlets and one 4 inch (100 mm) back outlet.

Freestanding type fire department connections shall be cast-brass or polished brass, as required, with angle body, polished brass cover sleeve, NH-standard thread inlets according to NFPA 1963 and matching local fire department threads, and threaded NPS outlet. Connection shall include lugged cap, gasket, and chain; lugged swivel connection and drop clappers for each hose connection inlet, and cast brass identification nameplate with marking "AUTO SPKR". The connection shall be provided with two or three 2-1/2 inch (65 mm) inlets and one 4 inch (100 mm) or one 6 inch (150 mm) outlet, as required.

2.3.08 Alarm Devices. Alarm devices shall be provided as indicated. Alarm device type and size shall be as needed to match piping and equipment connections.

Water flow indicators shall be electrical supervision vane type, rated to 250 psig (1724 kPa gauge), and shall comply with UL 346. The indicators shall be furnished with a pipe saddle and cast aluminum housing, and shall be suitable for horizontal or vertical installation. Two spdt circuit switches shall be provided with isolated alarm and auxiliary contacts. Contacts shall be rated for 7 ampere, 125 V ac and 0.25 ampere, 24 V ac. Water flow indicators shall be complete with factory-set, field-adjustable, instantly recycling pneumatic retard element to prevent false signals, and tamper-proof cover that alarms when cover is removed.

Pressure switches shall be electrical supervision type, with spdt contacts, and shall comply with UL 753. The pressure switches shall be designed to signal water flow based on rising pressure.

Supervisory (tamper) switches shall comply with UL 753, and shall be electrical supervision type, with spdt normally closed contacts. The switches shall be designed to signal when the controlled valve is in other than full open position and if switch is removed or dismantled.

The sprinkler water flow alarm shall be water motor or electric type.

Water motor alarms shall be hydraulically operated outdoor alarm type. The water motor alarm shall be provided with an aluminum alloy alarm gong at least 5 inches in diameter, energy-efficient impeller, and bearings which do not require lubrication. A Y-strainer shall be installed in the alarm pipeline. The alarm shall be initiated by flow from the alarm check valve retarding chamber, dry-pipe valve, or deluge valve as required.

Electric water flow alarms shall be outdoor alarm bell type, with an aluminum alloy alarm gong at least 6 inches in diameter. The alarm bell shall be weatherproof, and shall be suitable for a 120 V ac power supply. The alarm shall be initiated by flow through the alarm check valve retarding chamber, dry-pipe valve, deluge valve, or flow switch.

2.3.09 <u>Air Compressor</u>. The system air compressor shall be oil-less, permanently lubricated, direct drive, with filtered air inlet and safety relief valve, and suitable for pipeline mounting. System pressure and compressor capacity shall be as required or as specified by NFPA based on the volume of the system, whichever is more stringent. The compressor motor shall be suitable for the power supply. An individual compressor shall be provided for each dry pipe system.

2.3.10 <u>Pressure Gauges</u>. Pressure gauges shall comply with UL 393, and shall be provided with 3-1/2 inch (89 mm) to 4-1/2 inch (114 mm) diameter dial, and a dial range of 0-250 psig (0-1724 kPa gauge).

2.3.11 <u>Emergency Break Glass Switch</u>. Each break-glass switch for fire sprinkler system shall be furnished with a NEMA enclosure as specified herein with hammer, hammer clip, and chain. Each switch shall be Square D "Type 9001K15", Cutler Hammer 10250T Series, or approved equal, with one normally open and one normally closed contact block, or equal. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position.

2.4 <u>CONSTRUCTION</u>.

2.4.01 <u>Shop Coating</u>. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

PART 3 - EXECUTION

3.1 INSPECTION. Contractor shall field verify all existing conditions prior to designing the system.

3.2 INSTALLATION. Piping, equipment, and appurtenances furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.2.01 Sprinkler Piping and Accessories. Deviations from approved "working plans" for sprinkler piping require recalculation and approval by authority with jurisdiction. Written approval shall be obtained from Engineer prior to deviating from approved "working plans".

Approved fittings shall be used to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes. Unions shall be installed adjacent to each valve in pipes 2 inch (51 mm) and smaller. All piping shall be hidden from view in areas with finished ceilings and other areas, as indicated, unless accepted by Engineer to be exposed.

"Inspector's Test Connections" shall be installed in sprinkler piping, complete with shutoff valve, sized and located according to NFPA 13.

The sprinkler piping shall be installed with drains for complete system drainage. Ball drip valves shall be installed to drain piping between fire department connections and check valves, and where indicated. Route drain to outside the building unless otherwise indicated on the drawings.

The sprinkler head riser drop lengths shall be determined in the field and shall be coordinated with all ductwork, electrical conduit, piping systems, process equipment, and tanks. If the sprinkler system piping is installed before all ductwork or other building system construction is finished and if any sprinkler head risers need to be relocated to meet the code requirements, Contractor shall extend or relocate the risers and sprinkler heads at his expense.

Hanger and support spacing and locations for steel piping joined with grooved mechanical couplings shall be in accordance with the manufacturer's written instructions for rigid systems.

Metal roof decking shall not be used for the support of equipment or piping.

Pressure gauges shall be installed at each sprinkler test connection and at top of each riser. Pressure gauges shall be provided with connections not less than 1/4 inch (7 mm) and with soft metal seated globe valve arranged for draining pipe between gage and valve. Gauges shall be installed to permit removal and shall not be installed where subject to freezing.

All alarm devices shall be connected to the fire alarm, plant control, or other system as required.

When they are specified, the water motor alarm bell or electric alarm bell shall be mounted outside on an exterior wall of the building at a location suitable to Engineer so personnel in the area will notified when an alarm is sounded.

3.2.02 Sprinkler Valves. Fire sprinkler valves shall be installed with all trim, fittings, controls, and specialties according to NFPA 13, manufacturer's written instructions, and the authority having jurisdiction.

Service valves shall be supervised-open, and located to control sources of water supply except from fire department connections. Provide permanently marked identification signs indicating portion of system controlled by each valve.

Alarm check valves shall be installed in the vertical position for proper direction of flow, including bypass check valve and retard chamber drain line connection.

All double-check detector assembly backflow preventers shall be installed with bypass water meter, gate valves on each side of meter, and check valve downstream from the meter.

All reduced pressure detector assembly backflow preventers shall be installed with bypass water meter, gate valves on each side of meter, and reduced pressure backflow preventer downstream from the meter.

3.3 FIELD TESTING. Field testing of the fire sprinkler systems shall conform to the requirements of NFPA 13 "System Acceptance" Chapter and to the requirements of the local Fire Department.

Engineer and a representative of the local Fire Department will witness all tests. Contractor shall arrange the testing schedule with the Fire Department and Engineer; with at least 7 days' advance notice.

Contractor shall replace piping and components that do not pass the test procedures specified, and then retest to demonstrate compliance. The procedure shall be repeated until satisfactory results are obtained at no additional cost to Owner. Three copies of test reports shall be submitted in writing to Engineer and to the Fire Department.

Test certificates shall be executed and submitted prior to final inspection and acceptance in accordance with the requirements of NFPA No. 13. Three copies of each test certificate shall be furnished to Engineer and the Fire Department.

After installation and testing of the fire suppression system, complete drawings, conforming to installation records, including location of sprinkler heads, control valves, water supply connections, and wiring diagrams shall be submitted to Engineer prior to final acceptance.

3.4 <u>ADJUSTING</u>. All alarm devices shall be adjusted for proper operation. All drains shall be checked for proper operation.

3.5 <u>CLEANING</u>. Immediately prior to the final inspection, equipment, piping and appurtenances shall be thoroughly cleaned. Dirt and debris shall be cleaned from sprinklers. Sprinklers having paint other than factory finish shall be replaced with new sprinklers. Cleaning and reuse of painted sprinklers is prohibited.

3.6 <u>FINAL INSPECTION AND ACCEPTANCE</u>. A decision shall be reached during the inspection concerning the resolution of discrepancies and changes as recommended by the authorities having jurisdiction. All work determined to be the responsibility of Contractor, and included within the scope of the specifications, shall be promptly completed at no expense to Owner.

The final acceptance of the fire sprinkler system shall be made after the completion of the corrective work resulting from the final testing and inspection and after receipt of a formal letter of acceptance from the local Fire Department.

End of Section

SECTION 15310

CLEAN AGENT FIRE SUPPRESSION SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of materials, equipment, controls, wiring, and appurtenances associated with the clean agent fire suppression system as indicated herein and on the drawings.

The Work shall include furnishing all labor, materials, tools, equipment, service and supervision required to design, install, test, and place into service the fire suppression system throughout the rooms and buildings as indicated in the Contract Documents.

1.2 GENERAL.

1.2.01 Coordination. Piping, equipment, controls, wiring, and appurtenances furnished under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

Contractor shall verify that each component of the fire suppression system is compatible with all other parts of the system; that all piping, equipment, wiring, and appurtenances are appropriate for the intended function; and that all devices necessary for a properly functioning system have been provided.

Equipment and appurtenances furnished under this section shall be the standard product of the manufacturer. Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Contractor shall become familiar with details of the work, shall verify dimensions in the field, and notify Engineer of any discrepancy before performing the work.

1.2.02. General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with the applicable national, state, and local codes and ordinances, laws, regulations, and National Fire Protection Association (NFPA) Standards which pertain to such work. In case of a conflict between this section and any applicable national, state, or local code, ordinance, law, regulation, or NFPA Standard, the latter shall govern.

NFPA standards to be followed shall include, but not limited to:

NFPA 2001	Clean Agent Fire Extinguishing System
NFPA 70	National Electrical Code
NFPA 72	National Fire Alarm Code

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete assembly and installation drawings, working plans, flow calculations, wiring and schematic diagrams, together with detailed specifications and data covering materials used, parts, devices and other accessories forming a part of the equipment and appurtenances furnished, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Device tag numbers indicated on the contract drawings shall be referenced on the submittals where applicable. The submittal to Engineer shall be made after the local authorities having jurisdiction have approved the design. The data and specifications shall include, but not be limited to, the following:

Design Documents

Complete working plans and flow calculations with information as specified by NFPA Standard No 2001.

Fire Suppression Agent

Complete description of suppression agent including physical characteristics, limitations on use, handling procedures and safety precautions.

Equipment, Piping, and Appurtenances

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Capacities.

Pressure and temperature ratings.

ASTM specification for pipe and fittings.

Overall dimensions.

Pressure loss data

Net weight.

Control, Detection, Alarm, and Actuation System

Name of manufacturer.

Type and model.

Control panel face layout.

Sequence of Operation.

Wiring diagrams.

Power requirements.

Test Reports

Test reports indicating successful completion of tests specified herein and as specified by NFPA Standard No. 2001.

1.3.02 Operation and Maintenance Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE. All materials and work shall conform to the requirements of NFPA and Underwriters' Laboratories (UL), and shall be permanently stamped or labeled with the Listing Agency's identification.

Materials, installation, inspection, and testing of the fire suppression system shall comply with the requirements of the local authorities having jurisdiction and Owner's insurance underwriter.

Materials and equipment shall be the standard products of manufacturers regularly engaged in the production of clean agent fire extinguishing systems. All products shall be new and of the latest manufacture. Equipment shall be supported by a service organization that is, in the opinion of Engineer, reasonably convenient to the site.

The suppression system drawings and calculations shall be performed by an individual who is certified Level II or greater by The National Institute for Certification in Engineering Technologies (NICET) in the subfield of Fire Protection Engineering Technology, Special Hazards System Layout. When indicated, the work shall be supervised and the drawings signed and sealed by a registered professional engineer licensed in the state of Michigan.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The system shall cover only the interior locations of the building as herein specified; and shall be suitable for the building construction type, room temperature range, and contents. The contents and temperature range of the area to be protected shall be as indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The clean agent fire suppression system shall be designed as a single-shot, automatic-manual, total flooding system. The suppression system shall be listed as a pre-engineered system. The system shall be provided with primary suppression agent cylinders in the quantity and location as indicated on the drawings. Reserve cylinders shall be provided as indicated in the Contract Documents.

The fire extinguishing system shall provide a concentration of fire extinguishing agent to create an atmosphere that will not support combustion when discharged in the protected areas. The discharge time for halocarbon agents shall not exceed 10 seconds. The discharge time for inert gas agents shall not exceed 60 seconds. The system design shall include the capacity to automatically maintain the design concentration for a minimum of 10 minutes, or as specified by NFPA, whichever is more stringent. A suitable allowance in agent quantity shall be made for normal leakage of agent from the spaces due to agent expansion.

2.2.01 Elevation. All components of the fire suppression system shall be designed to operate at the elevation indicated in the Contract Documents.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable agents include heptafluoropropane (FM-200) as manufactured by Great Lakes Chemical Corporation, FE-13 as manufactured by DuPont Chemicals, and INERGEN as manufactured by ANSUL Fire Protection, or approved equal.

2.4 CONSTRUCTION.

2.4.01 General. Materials and equipment shall be as specified below and as shown and shall be suitable for the service intended. Materials and equipment shall satisfy the requirements of NFPA 2001. Devices and equipment used for the same or similar services shall be of the same make and type and shall be interchangeable when of the same rating.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

All anchor bolts, expansion anchors, nuts and washers shall comply with UL, FM, and NFPA requirements. Powder-driven anchor assemblies shall not be used.

2.4.03 Piping Systems. Distribution piping shall be black or galvanized steel, either ASTM A53 seamless or electric welded, Grade A or B or ASTM A-106, Grade A, B, or C. Cast-iron pipe, steel pipe conforming to ASTM A 120, or nonmetallic pipe shall not be used. Pipe shall be furnished complete with all fittings, jointing materials, supports and anchors, and other accessories required for a complete system.

2.4.04 Pipe Fittings. Pipe fittings for FM-200 and FE-13 agents shall have a minimum working pressure of 620 psi (4280 kPa). Pipe fittings for INERGEN agent shall have a minimum working pressure downstream of the pressure reducer of 1,000 psi (6900 kPa). Cast iron and Class 150 lb steel fittings shall not be used.

2.4.05 Pipe Supports. Pipe supports shall be suitable for the application, construction, and type and size of pipe involved. "C" type clamps shall not be used for larger than 1 inch (25 mm) diameter piping, and shall be provided with retaining clips. Galvanized hanger assemblies shall be used for the support of galvanized steel piping systems.

2.4.06 Storage Containers. Agent containers shall meet the requirements of NFPA 2001. Containers shall be fitted with a resilient pressure seat type forged brass valve and shall have a threaded steel anti-recoil protective cap for handling and shipment.

Storage containers and any pressurized release containers shall be equipped with pressure switches that shall initiate a supervisory signal when cylinder pressure in a container drops to 90 percent of the system working pressure. A portable direct reading beam scale shall be provided for weighing FM-200 and FE-13 containers in place by loosening cylinder clamps and disconnecting the discharge heads. It shall not be necessary to disconnect any control components. Liquid level indicators may be provided in lieu of the portable direct reading beam scale. The containers shall be arranged to allow a service aisle for cylinder removal and cylinder weighing.

Container racks shall be provided at all installations. Racks shall be designed to rigidly secure all containers in place.

2.4.07 Discharge Valve. Each cylinder shall be fitted with a pressure operated discharge valve. Each valve shall include an integral safety relief device which serves to protect cylinder against excessive internal pressure. The cylinder valve shall have a forged brass body with external connections for actuation devices. Each valve shall be provided with a removable pressure gauge or solenoid valve with gauge for pressure reading. When more than one cylinder is connected to a common manifold, a check valve shall be provided with each cylinder. Check valves that utilize "O" ring seats shall not be used as they can be dislodged during discharge.

2.4.08 Discharge Nozzles. Nozzles shall be supplied in quantities sufficient to properly cover the areas being protected in accordance with NFPA 2001. Nozzles shall be of corrosion resistant construction and shall be designed specifically for clean agent application. Nozzles shall be permanently marked as to type and orifice size.

2.4.09 Caution/Advisory Signs. The fire suppression system contractor shall provide signs as specified by NFPA 2001 and as recommended by the clean agent manufacturer. As a minimum, the following signs shall be provided:

A caution sign on the outside of each exterior door of the protected area. Sign shall be Fike Corporation 02-3646.

A manual discharge sign at the manual discharge station. Sign shall be Fike Corporation 02-3644.

A flashing light sign over each exit from the protected area. Sign shall be Fike Corporation 02-3645.

2.4.10 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of a universal primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall conform to the requirements of Master Specification Section 09900, Painting.

2.4.11 Equipment Bases. Unless otherwise indicated or specified, agent cylinders shall be installed on concrete bases at least 6 inches (150 mm) high.

2.4.12 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.5 CONTROLS.

2.5.01 Control Panel. The clean agent system shall be provided with a single control panel that shall be capable of all functions necessary to operate the system, including detection, actuation, and any auxiliary functions specified herein or otherwise required. The control panel shall be located where indicated on the drawings, and shall be provided with the following:

NEMA 12 enclosure with a hinged and lockable door.

Integral battery standby power supply.

Rechargeable batteries and battery charger.

Audible and visual alarms.

Auxiliary contacts for:

Trouble alarm

System alarm

Pre-discharge alarm

Discharge alarm

Ventilation shutdown

Door closures

0 to 60 second field adjustable time delay.

Container disable switch.

Class A wiring of detection and release circuits.

System inhibit (abort) switch.

Parallel wired agent release modules.

The control panel will be provided with a 120 volt, 60 Hz, single phase power supply.

2.5.02 Detectors. A minimum of two detectors shall be provided in each room. One half of the detectors in the room shall be ionization type, and the remainder shall be of the rate compensation thermal type. The temperature setpoint of thermal type detectors shall be as required, unless otherwise required by application.

2.5.03 Manual Release Switch. The manual release switch shall provide a means to discharge the container, and shall bypass all abort and time delay functions, and shall activate all alarm and shutdown devices the same as if they had been activated automatically. The manual release switch shall be located at the control panel.

2.5.04 Audible and Visual Alarms. Two audible and one visual alarm shall be provided in each protected room. One audible and one visual alarm shall be provided on the exterior of the building at the entrance to each protected room. One audible shall be the horn type, and the other audible alarm shall be the siren type. The visual alarm shall be the strobe type. Alarms located on the exterior of the building shall be suitable for wet locations.

2.5.05 Emergency Break Glass Switch. Each break-glass switch for fire suppression system shall be furnished with a NEMA enclosure as specified herein with hammer, hammer clip, and chain. Each switch shall be Square D "Type 9001K15", Cutler Hammer 10250T Series, or approved equal, with one normally open and one normally closed contact block, or equal. Five spare glass disks shall be furnished for each switch. When the glass disk is broken with the hammer, the button will return to a normal extended position.

PART 3 - EXECUTION

3.1 INSPECTION. Contractor shall field verify all existing conditions prior to submitting a bid proposal.

3.2 INSTALLATION. The installation of the complete clean agent suppression system shall be performed by the system manufacturer or an approved representative of the manufacturer. The fire suppression system shall be installed by a firm having previously installed a minimum of 5 systems similar in size and scope to this project. Personnel involved in the installation of the suppression system shall be fully experienced in installing fire detection and clean agent suppression systems. The installation of the work described herein shall be performed to avoid interference with the structure and all other equipment, wiring, piping, and ductwork located in the spaces.

Piping, wiring, equipment, and appurtenances furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer. The installation shall be in accordance with the NFPA 70, NFPA 72, and NFPA 2001.

All conduit, junction boxes, conduit supports and hangers shall be concealed in finished areas and may be exposed in unfinished areas. Smoke detectors shall not be installed prior to the system programming and test period. If construction is ongoing during this period, measures shall be taken to protect smoke detectors from contamination and physical damage. All fire detection and alarm system devices, control panels and remote annunciators shall be flush mounted when located in finished areas and may be surface mounted when located in unfinished areas.

3.2.01 Wiring. The fire suppression system contractor shall be responsible for the wiring of all devices associated with the clean agent suppression system, including but not limited to, detection devices, actuation devices, and audible and visual alarms. A 120 volt single phase power supply to the suppression system control panel will be provided by others. Wiring from the control panel to any automatic door closers will be provided as indicated in the Contract Documents. Wiring from the control panel to any ventilation systems will be provided as indicated in the Contract Documents. Any automatic door closers will as indicated in the Contract Documents. Wiring shall be in accordance with NFPA 70, NFPA 72, and Master Specification Section 16050, Electrical General Requirements.

3.3 CONTROL. The clean agent suppression system shall be capable of completely automatic operation as described herein and as specified by NFPA.

Upon the activation of the first detector, the following shall occur:

An "ALARM" lamp on the control panel shall be illuminated.

An audible alarm (horn) and visual alarm (strobe) shall be energized in the protected room.

The ventilation system shall shut down.

The door closers shall be activated.

Upon the activation of any second detector, the following shall occur:

A "PRE-DISCHARGE" lamp on the control panel shall be illuminated.

An audible alarm (siren) shall be energized in the protected room.

The agent discharge time delay sequence shall be initiated.

Upon completion of the time delay sequence, the following shall occur:

The extinguishing agent shall be released from the cylinder.

A "SYSTEM DISCHARGE" lamp on the control panel shall be energized.

A visual alarm (strobe) on the exterior of the building shall be energized.

3.4 CLEANING. Immediately prior to the final inspection, equipment, piping controls, and appurtenances shall be thoroughly cleaned. Dirt and debris shall be cleaned from discharge nozzles. Nozzles having paint other than factory finish shall be replaced with new nozzles.

3.5 ACCEPTANCE TESTS.

3.5.01 Tests. The fire suppression system shall be tested for correct operation and function. The tests shall be as specified by the local fire department and the following procedures performed in accordance with NFPA 2001:

Review of mechanical components.

Review of enclosure integrity.

Review of electrical components

Functional testing.

The tests shall be supervised by a competent, factory-trained engineer or technician authorized by the manufacturer of the equipment.

3.5.02 Enclosure Integrity Test. When indicated, an enclosure integrity test shall be performed by Contractor to ensure that the required agent concentration can be maintained. Prior to performing the test, the fire suppression system contractor shall inspect the rooms to be protected, and shall advise Owner in writing of any probable areas where excessive leakage from the space may cause the test to fail. The test shall not be performed until Contractor is advised by Owner to proceed. All test instruments shall have been recently calibrated by an independent testing agency. Contractor shall be responsible for providing all materials and labor required to perform the test. The test shall be repeated until a successful test is obtained. In the event that the test fails due to excessive leakage from the space, Owner shall be advised of the areas needing repair, and Contractor will be reimbursed a predetermined sum for repeating the test.

3.5.03 Test Report. A report of test results shall be submitted prior to final inspection and acceptance. Three copies of the report shall be furnished to Engineer and the Fire Department.

3.5.04 Final Drawings. After installation and testing of the fire suppression system, complete drawings, conforming to installation records, including location of discharge nozzles, controls, and wiring diagrams shall be submitted prior to final acceptance.

3.5.05 Final Inspection. A representative of the local fire department and Engineer will make a final inspection of the Work. At the final inspection a factory trained representative of the manufacturer of the major equipment shall demonstrate that all portions of the fire suppression system functions properly. Contractor shall arrange for the final inspection with the fire department and Engineer.

3.5.06 Final Acceptance. The final acceptance of the fire suppression system as specified shall be made after the completion of the Work resulting from the final inspection and after receipt of a formal letter of acceptance from the local fire department.

Deviations from approved "working drawings" for the suppression system require recalculation and approval by authority with jurisdiction. Written approval shall be obtained from Engineer prior to deviating from approved "working plans."

3.6 OPERATOR INSTRUCTION AND TRAINING. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the suppression system manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as needed.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

End of Section

SECTION 15360

CARBON DIOXIDE FIRE SUPPRESSION SYSTEM

PART 1 - GENERAL

1.1 SCOPE OF WORK. Furnish and install a complete engineered, fixed pipe, automatic total flooding low pressure carbon dioxide fire suppression system for each of the areas indicated on the Drawings.

Each system shall be specifically engineered and installed to protect the hazard. The design and engineering shall include a thorough review of the proposed rooms for anticipated air tightness. If anticipated leakage appears unreasonably high, it shall be called to the attention of the Program Manager immediately for possible corrective action.

Each system shall be designed, installed and tested in conformance with current Standards as stipulated in item 1.05 hereinafter and the requirements of local authorities having jurisdiction and Insurance Underwriters.

All piping, and equipment shown on the Drawings is intended to be approximately correct to scale, but figured dimensions and detailed drawings of the actual equipment furnished shall be followed in every case. The Drawings shall be taken in a sense as diagrammatic. Size of ductwork and piping is shown, but it is not the intent to show every offset or fitting, nor every hanger or support, or structural difficulty that may be encountered. To carry out the intent and purpose of the Drawings all necessary parts to make a complete working system ready for use shall be furnished without extra charge. The Subcontractor shall be responsible to coordinate the system installation and routing with the work of all trades.

1.2 RELATED WORK.

Division 16, Electrical

1.3 ENGINEERING SERVICES. The Subcontractor shall retain the services of a specialty subcontractor to design and install the CO2 system. The specialty subcontractor shall employ a licensed professional engineer (in the State of Michigan) specializing in the design and installation of CO2 fire suppression systems to perform the work. The engineer shall be licensed at the time the work is done. If the state issues discipline specific licenses, the engineer shall be licensed in the applicable discipline. In addition, the engineer shall be experienced in the type of work being provided.

All work is to be done according to the applicable regulations for professional engineers, to include signing, sealing and dating documents. When submittals are required by a professional engineer, in addition to state required signing and sealing, a copy of the current wallet card or wall certificate indicating the date of expiration shall be included with the submittal.

1.4 SUBMITTALS. Submit shop drawings, product data and calculations to the city of Detroit Fire Marshall for approval. Submit proof of approval to the Program Manager.

All submittals shall contain a statement that Section 01080 and all other referenced Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual one for each party involved, and shall be included with every submittal and resubmittal.

In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Subcontractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Subcontractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

1.4.01 Shop Drawings. Submit shop drawings under provision of Section 01080.

Submit shop drawings indicating detailed layout of system, locating each component. Include control diagrams, wiring diagrams, and written sequence of operation.

Detailed layout drawings of piping in mechanical rooms and other congested areas shall be provided. Drawings shall show the locations of piping appurtenances, specialties, and all valve banks.

1.4.02 Product Data. Submit product data under provisions of Section 01080.

Submit product data for each piece of equipment comprising the system including storage unit, control valves, control panels, nozzles, manual releases detectors, alarm bells or horns and enunciators.

1.4.03 Calculations. For local application and total flood hazards, submit design calculation derived from computer programs developed specifically for low pressure CO_2 flow calculations. Analysis shall include calculation to verify system terminal pressures, nozzle flow rate, orifice code number, piping pressure loses, component flow data, and pipe sizes considering actual and equivalent lengths of pipe and elevation changes.

1.4.04 Test Reports. Submit test reports indicating successful completion of test to the Program Manager.

1.4.05 Installation Instructions. Submit manufacturer's installation instruction under provisions of section 01080.

1.4.06 Operating and Maintenance Data.

Operating and Maintenance Manual - Submit to the Program Manager as provided in Section 01160, Operating and Maintenance Manuals. The following information shall be considered a minimum. Where applicable, provide information required for specific pieces of equipment.

Personnel familiar with the operation and maintenance of the specific information shall prepare manuals.

Equipment shall be identified with the Owner's Equipment Numbers and Identification as described in the specifications and as shown on the Drawings.

Provide information in three ring binders. All sheets shall have reinforced punches. Tabbed dividers shall separate all sections. Drawings will be bound in the manual, or contained in envelopes bound into the manual.

Contents - Each volume shall contain the following minimum contents:

Installation including instructions for unpacking, installing, aligning, checking and testing. Foundation data, allowable piping loads, and electrical design shall be included.

Operating Instructions to provide pre-operational checks, start up and shut down, and description of all control modes. Include emergency procedures for all fault conditions and actions to be taken for all alarms. Procedures for long term storage shall be included.

Maintenance shall include preventive, and corrective. Schedules for test of other functions are to be included. Provide a list of tools required to service the equipment. Trouble shooting instructions to include a trouble-shooting guide shall be included.

Spare Parts List

Shop Drawing Data to include performance curves, data sheets, flow diagrams, wiring diagrams, and descriptive drawings.

1.5 REFERENCE STANDARDS.

ANSI/ASME B16.3 – malleable iron threaded fittings Class 300.

ANSI/ASME B16.9 – factory made wrought steel butt welding fittings.

ANSI/ASME B31.1 – power piping.

ANSI/ASME B31.1 – pressure vessels.

ANSI/ASME Section 8 – welding and brazing qualifications.

ANSI/WAS D1.1 – Standard Welding Code.

ANSI/NFPA 12 Carbon Dioxide Extinguishing Systems.

ANSI/NFPA 70 – National Electric Code.

NFPA 72 – National Fire Alarm Code.

ASTM–A53 – pipe, steel, black and hot dipped zinc coated, welded and seamless.

ASTM-A106 – seamless carbon steel pipe for high temperature service.

FM – Factory Mutual Engineering.

NEMA – enclosures for control panels.

IRI – Industrial Risk Insurers.

UL – Underwriters Laboratory.

Codes, Ordinances, Permits and Regulations.

Comply with all the laws, ordinances, codes, rules and regulations of the State or local authorities having jurisdiction over any of the work specified herein, and apply for, and pay for, all necessary permits.

If any part of this Section conflicts with the laws and codes, call it to the Program Manager's attention prior to commencing work. If a conflict exists, follow the more strict code or law as approved by the Program Manager.

All materials and equipment where applicable shall be type listed in current edition of FM approved guide.

Requirements set forth in this Section shall be followed when in excess of the required or minimum regulations.

1.6 QUALITY ASSURANCE. All equipment of a given type included in this Section shall be furnished by or through a single manufacturer or as specified on the schedules

Inspection by the Program Manager or his representative or failure to inspect shall not relieve the Subcontractor of responsibility to provide materials and perform the work in accordance with the documents.

The piping manufacturer shall furnish an affidavit of compliance certifying that all materials used and work performed shall comply with the specified requirements. The Subcontractor shall provide copies of mill test confirming the type of material used in the various components.

The Owner and Program Manager reserve the right to sample and test any materials after delivery and to reject all components represented by a sample that fails to comply with the specified requirements.

An authorized representative of the manufacturer shall perform the initial startup of the equipment. The Owner and Program Manager shall witness startup. The use of local sales representatives to perform this work is not acceptable, unless the manufacturer provides documented evidence that the sales representative has been specifically trained for this work.

All rotating parts of equipment shall be statically and dynamically balanced at the factory.

1.7 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved shop drawings upon delivery.

Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner or Program Manager by the manufacturer.

All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container.

All equipment shipped that is exposed such as on a flat bed truck shall be protected during transit. The equipment shall be protected from moisture, road salt, dirt and stones or other materials thrown up from other vehicles. Electrical components shall be protected as above, but with special attention to moisture. The method of shipment protection shall be defined in the submittals.

Instructions for the servicing and startup of equipment in long term or prolonged storage shall accompany each item.

All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.8 DESIGN CRITERIA. The system shall be designed in accordance with the requirements and recommendations of NFPA standards noted above and shall totally flood the hazard volumes with carbon dioxide. Refer to tables in NFPA 12 for design concentrations or as noted on the fire protection systems schedule. Refer to the architectural drawings to obtain dimensions pertinent to determine the volume of the rooms or spaces to be protected.

The system shall be designed to operate automatically or by manual operation. The release of the agent shall be by an electrical signal from the control panel to the solenoid operated releasing devices.

System design shall provide for fire protection of the local application and/or total flooding type with low pressure CO2 and it covers a purging system utilizing the same low pressure CO2 to suppress or prevent fire. The system shall be fixed installation where equipment is designed and installed to provide fire suppression capability for hazards which most likely be in the form of electric heat buildup that will result in fire or explosion conditions. Total flooding shall be done with a calculated CO2 design concentration, volume of space in abnormal temperatures. All space openings shall be sealed against any air movement. Space shall be tested prior to CO2 activation test. Design, fabrication and installation of system and its components shall be in compliance with requirements and recommendations of ANSI/NFPA-12.

Interface system with plant main security room fire alarm and plant annunciation system. Signals that will be monitored shall consist of:

Any Open Doors (greater than ½ hour) - (Trouble).

Any malfunction in the Detectors/annunciation devices/CO2 local panel/CO2 tank/CO2 pressure system and any of the interposing relays in the building - (Warning).

CO2 ready to discharge after a set time interval (selected by the CO2 vendor) – Alarm).

CO2 activation and Discharge - (Alarm with horn).

Individual alarms shall be included also in the building local panel to provide a warning alarm during a time delay period prior to the automatic discharge of carbon dioxide. Refer to the system design in Part -2.

Refer to the electrical drawings to determine Class I, Divisions I and II, Hazard Classification of each room or space. Provide all system components to comply and be suitable for use with the hazard classification.

1.9 PERFORMANCE REQUIREMENTS.

1.9.01 Activation.

Electric: An alarm condition from any detector or operation of a manual release station (electric) shall start the pre-discharge sequence. At this time the control panel shall activate begin the pre-discharge timer(s), start all audible and visual alarm devices, shutdown exhaust air handling fans, close all dampers, release door holders, shutdown fuel and power to process equipment (if any exist inside the space) and actuate the building fire alarm system. The pre-discharge period shall be of sufficient duration for personnel to evacuate the area. The alarm devices shall continue to operate until the control panel is reset.

Pneumatic: A pneumatic time delay and pneumatic sirens are required for all total flood hazards that are normally occupied. Further, a pneumatic time delay and pneumatic sirens are required for local application systems which serve normally occupied enclosures where the discharge will expose personnel to hazardous concentrations of CO_2. The pneumatic siren(s) shall sound during the evacuation and discharge period.

Mechanical: Each master/selector valve shall be provided with an emergency manual override operator.

1.9.02 Volume. The volume of carbon dioxide for the specified concentrations shall be determined using inside area dimensions. The volume of the room space displaced by the equipment shall not be considered to reduce the requirement of carbon dioxide.

1.9.03 Tank Supervisory Alarms. System control power failure, refrigeration motor power failure and refrigeration alarm power failure shall produce a "trouble" alarm and shall be enunciated at the system control panel.

- and/or -

A refrigeration "high-low" pressure signal shall be activated by a pressure operated switch at the storage tank.

PART 2 - PRODUCTS

2.1 MATERIALS. All materials and equipment shall be new and shall be FM approved or UL listed.

2.2 MANUFACTURERS. Systems shall be as designed and manufactured by:

Kidde Fenwal Inc.

The Ansul Co.

Fire Systems Division of Chemetron Corp.

2.3 SYSTEM COMPONENTS.

2.3.01 Pipe and Piping Specifications. The following specifications set forth minimum standards for installation. If the requirements of local codes or the authority having jurisdiction are more stringent these more stringent requirement shall govern the installation.

2.3.02 Type of pipe.

Piping shall be black or galvanized ASTM grade A53 seamless or Electric welded grade A or B or A106 grade A, B or C.

Installation shall be performed in workmanlike manner according to the highest standards of modern practice.

All pipe and fittings shall be new and of recent manufacture.

All pipes shall be reamed after cutting so that all burrs and sharp edges are removed.

All pipes must be thoroughly cleaned before installation. A wire flue brush should be pulled through the length several times followed by clean cloth rags treated for the purpose. All foreign matter and oil must be removed by this process.

All pipes and fittings installed out of doors or in corrosive areas must be galvanized or treated with a proper protective coating.

Pipe Dope: All screwed pipe shall be coated with Teflon tape or an approved pipe joint compound. When tape or pipe joint compound is used coating of the threads must start at least two threads back from the pipe end.

Welding:

All welding must be performed by a certified welder.

All welded pipe 3/4" and smaller shall be welded using a gas welding or other approved method.

All welds shall be pounded to loosen scale and weld beads and then cleaned of the same.

No backing ring chill rings are permitted.

Welded Pipe Reductions: Reductions in welded pipe shall be by one of the following devices.

Butt weld concentric reducers.

Swaged nipples.

Weld o-lets

Where socket weld fittings are permitted see below, a socket weld reducing coupling can be used only for a one size reduction. All other reductions in socket weld pipe shall be made using the above permitted methods.

When methods B, C, or D are used, it is imperative that these fittings be installed in strict accordance with the manufacturer's installation instructions, in each case they must be installed so as to permit full flow. All entrance holes from the main pipe run to the fitting must be of proper size and free of sharp edges, ridges or burrs.

Threaded Pipe Reductions: Reduction in screwed pipe shall be by means of screwed concentric reducing fittings or swaged nipples. Flush bushings shall not be used. Hex bushings, 3000 lb. forged steel may be used for reduction in one pipe size only.

Flanges and Unions:

No unions over 2" size are permitted.

All flanges must be 300 pounds. ANSI class forged steel.

All weld neck flanges used with schedule 80 pipe must have extra heavy pipe wall bore schedule 80. All weld neck flanges used with schedule 40 pipe must have standard weight pipe wall bore schedule 40.

Where flanged pipe connections are used, they shall be gasketed with 1/16" thick compressed type gasket materials.

High grade steel bolts grade 8 or studs with graded nuts shall be used on all flanged connections. All nuts shall have full engagement on the bolt or stud. Use grade 8 or better.

All connectors, that is, bolts, and nuts shall be torqued to the required number or foot pounds as recommended in the standard piping handbooks. Required torque valves for installation of flanged pressure operated valves shall be the same as the Preferred CO2 Systems installed for the Chlor/Dechlor building of the GLWA WRRF.

Pipe take-Offs: All pipe take offs shall be from the side or bottom of the header. Where a take off involves a reduction of several pipe sizes, a bottom take off should be provided.

2.3.03 Tank Header. The tank header is under continuous pressure and therefore it shall be constructed of schedule 80 black steel pipe with extra heavy welding fittings and ANSI 300 pound class flanges.

The tank header can be fabricated using one of the following procedures or by a combination of these procedures.

By the use of extra heavy butt welding fittings.

By the use of extra heavy weld o-lets or thread-o-lets or equivalent.

All welds must allow full flow. No miter weld fittings shall be used. Backing rings, chill rings shall not be used.

2.3.04 Actuation Line. All piping shall be either1/2", threaded steel pipe or stainless steel tubing.

When pipe is used, the following applies:

The pipe shall be a minimum of schedule 40 and where it is installed outdoors or other corrosive environments, galvanized pipe shall be used. (Industrial Risk Insurers requires all piping to be schedule 40 galvanized or schedule 80 black.)

All threaded pipe connections shall be treated with a suitable pipe sealant (i.e., Swak by Cajun Part No. MS PTS-50: Rector seal or equivalent is acceptable). The use of Teflon tape on actuation line piping is not allowed.

All pipe fittings shall be 300 lb. malleable or ductile iron. A 300 lb. steel union shall be installed near the termination of all piping. The use of 150 lb. fittings is not allowed.

Whenever tubing is used, the following applies:

All steel tubing shall be 1/2" X .035 wall and shall be painted to provide corrosion protection. All tubing installed outdoors or in corrosive atmosphere shall be stainless steel 1/2" X .035.

All tubing fittings shall be of the same material as the tubing and shall be of the compression type. All tubing to pipe fittings shall be treated with a pipe sealant as described in 2.B above.

All tubing shall be properly supported.

A filter supplied by CO2 equipment supplier shall be installed at the actuation line termination into each valve, (as shown on design drawings).

Whenever a hose reel bleeder valve is used, a 1/4" pressure regulator may be installed directly on top of the sub-header piping upstream of the selector valve or bleeder. The location of these regulators shall be as shown on the system design drawings.

The actuation line shall be provided with an approved pressure regulator to maintain 100 PSI pressure on the actuation line.

The actuation line shall be provided with an approved two level supervisory switch to provide notification at the control panel when pressure in the actuation line drops to 90 PSI and 80 PSI respectively.

2.3.05 Master Valve Piping. All piping downstream of master valve between master valve and selector valves or between valve and hose reels shall be either

Schedule 40 black steel pipe welded with welded fittings, or,

Schedule 40 steel pipe with listed grooved type couplings and fittings.

When method (A) is used, the following can be used.

Standard weight socket weld fittings are acceptable with exception that no reducing coupling can be used only for a one size reduction. All other reductions shall be made using a butt welding concentric reducer.

Standard weight butt-welding fittings. Backing rings, (chill rings) shall not be used.

1000 pound forged steel screwed fittings, back welded.

When method (B) is used, the following applies:

Where grooved couplings and fittings are used, they shall be listed/approved for use with low pressure carbon dioxide fire systems.

Pipe preparation must be in strict accordance with the manufacturers recommended procedure. Installation must be exactly as per the manufacturing specifications in all aspects.

Grooved couplings shall be installed so as the allow contraction of the pipe (pipe ends butted together).

Grooved couplings must be approved in advance by the system designer with approval obtained prior to start of design.

2.3.06 Discharge Piping. Piping downstream of selector valves, that is piping which is open to atmosphere, shall be schedule 40. Screwed pipe joints are always permitted and in most installations, approved grooved pipe connections may be used. Grooved fittings must be approved for use with carbon dioxide. Approval of fittings must be sought prior to the start of installation.

Screwed Joints: Threaded pipe fittings shall be class 300 pound malleable iron or ductile iron for pipe through 3" 1000 pound ductile iron forged steel shall be used in all larger sizes.

Grooved Joints:

Where grooved couplings and fittings are used, they shall be listed/approved for use with low pressure carbon dioxide fire systems.

Pipe preparation must be in strict accordance with the manufacturer's recommended procedure. Installation must be exactly as per the manufacturer's specification in all respects.

Grooved couplings shall be installed so as to allow contraction of the pipe (pipe ends butted together).

2.3.07 Pressure Relief Piping and Fittings. Piping to pressure reliefs shall be as specified above for discharge piping. All takeoffs for pressure relief piping shall be from the top of the discharge piping.

2.3.08 Dirt Trap. A dirt trap consisting of a tee with capped nipple shall be installed at the end of each run. The nipple shall be at least 2" long. A longer nipple up to approximately 18" is preferred where space permits.

Note: Dirt traps for schedule 40 welded headers are to be formed by welding a schedule 80 nipple to the end of the line. The schedule 80 nipple is threaded at the open end for connection of a screwed pipe cap.

2.3.09 Underground Piping. Underground piping is to be avoided - if unavoidable, a piping configuration layout for underground piping should be submitted, a layout for underground piping should be submitted for approval to system designer prior to the start of system design. The following general requirements shall apply to underground piping:

Trench depth for underground piping shall be a minimum of 3 feet or below frost line whichever is deeper.

Underground pipe shall be schedule 80 black steel with welded joints as specified for the type of run involved.

A protective, insulate covering will be required of all underground pipe. Approval of system designer is required.

Underground piping shall be welded when possible. The only exception would be in a hazardous location where welding is not permitted. In this case, flanged connection shall be used. All underground pipe joints shall be tested for leaks at 300 PSI before the insulation and protective coating is applied.

2.3.10 Pipe Sleeves. All piping through building walls, partitions, floors slabs, roof slabs and the like, shall be sleeved.

Sleeves shall be schedule 40 pipe at least two sizes larger that the pipe being sleeved. One inch pipe is the minimum size to be used as a sleeve.

Sleeves shall be packed with an approved sealing material so as to be dust light.

Sleeves through floor slabs must extend at least 2 above the floor. A greater extension may be used if required by local building codes.

Sleeves extending through roof slabs must extend above the roof and be flashed in accordance with local building codes.

2.3.11 Expansion Joints. Contraction of steel piping during discharge is based on 1" of contraction per 100 feet of steel pipe.

Allowance must be made for this contraction by using either a joint which permits movement, a piping system which contains natural swing joints, fabricated circular type "U" type bends or, in cases where space is limited, an approved manufactured expansion joint.

In piping which utilized grooved type couplings, these couplings shall be installed to permit contraction of the piping.

In straight runs using welded or screwed joints, an expansion joint must be installed within approximately 100 feet of continuous run and each approximate 100 feet of run thereafter. For runs using grooved pipe, a representative of the manufacturer should be contacted to determine the location and number of expansion joints in long runs.

Pipe anchors shall be capable of with standing any contraction thrusts that may be imposed by the piping while permitting movement intended in the design of the piping system to relieve stress. This will required rigid anchoring of certain points in the piping system while leaving other points of the pipe free to move longitudinally so as to relieve stress.

2.3.12 Inspection for Mechanical Integrity. All testing and inspections shall be done in the presence and under the supervision of the equipment manufacturer's test representative.

All pipe and fittings that are under constant tank pressure ball shall be bubble tight. Bubble tests shall be made using leak-tec, or approved equal, under full tank pressure.

Concealed pipe joints such as those in walls, ceilings, trenches and the like shall be tested at 300 PSI before the joint is concealed.

Pipelines not under constant pressure shall not exhibit any visible or audible leak, but bubble tightness is generally not required.

Under no conditions shall water be used to test piping or other CO2 equipment. Either dry nitrogen or CO2 shall be used for testing.

2.3.13 Painting. nPainting requirements shall be similar to the painting used for the Chlorination/De-chlorination buildings of GLWA WRRF and shall be of the moisture resistant/proof type and suitable for indoor and outdoor use.

2.3.14 Pipe Hangers and Supports. All pipe hangers and supports shall conform to the provisions outlined in ANSI B31.1, latest edition, except as modified and supplemented by this specification. All pipes must be solidly anchored to structural members where longitudinal or lateral movement is possible.

Rigid hangers are required wherever a change of direction or a change in the elevation of the piping system occurs. For long straight runs and as a minimum, every other hanger shall be rigid. All hangers shall be fabricated of steel and installed in a workmanlike manner.

All piping shall be attached to rigid hangers by means of u-bolts locked double nuts. The pipe shall be free to move longitudinally within the u-bolt except where the piping design requires it to be anchored.

Hangers and pipe shall be designed to prevent stress from being induced into piping during the temperature change caused by a system discharge.

All piping supports shall be fabricated and installed so that they will not be disengaged by the movement of supported pipe

Pipe shall not be hung using one pipeline as a support for another.

Piping supports shall be arranged so that no excessive bending stresses are induced into the piping from concentrated loads between supports.

The maximum spacing between pipe supports for screwed or welded pipes is given in table 1 below:

Table #1
Maximum Spacing between Supports for Screwed or Welding Pipe:

Nominal Pipe Size (Inches)	Maximum Span (Feet)
1/4	5
1/2	5
3/4	6
1	7
1 1/4	8
1 1/2	9
2	10
2 1/2	11
3	12
4	14
5	16
6	17
8	19

Maximum spacing between pipe supports is given in table 2 below for systems utilizing the grooved coupling method for system discharge piping.

Table #2
Minimum Spacing between Supports for Pipe with Grooved Joints:

Nominal Pipe Size (Inches)	Maximum Span (Feet)
3/4	7
1	7
1 1/4	7
2	7
3	10
4	10
5	12
6	12

2.4 Carbon Dioxide System Component Requirements. The components of the carbon dioxide systems shall be provided in accordance with the following requirements.

2.4.01 Storage Unit. The storage tank shall be built to ASME standards, and bear the ASME label. It shall be installed for all the electrical buildings specified under item 1.01A with flexible hoses to the CO2 piping system to provide flexibility of movement and protect for any unexpected differential settlement of the concrete pad which may exceed 1.5”. The installation of such hoses shall meet the requirements of NFPA 12.

The storage tank is to have a baked white aluminum housing to protect the insulation and should be riveted and sealed at all joints, to prevent water damage to the insulation.

The storage tank shall be supported by two saddles of heavy steel construction welded and cross braced to the vessel for adequate support.

The storage vessel shall be provided with two top lifting lugs.

Tank pressure gauge shall be 6 inch dial type with a rated accuracy of 1/2 of 1%.

The tank liquid level gauge shall read contents in thousand of pounds of liquid CO2 at 0 degrees Fahrenheit. The gauge divisions shall be in two hundred pound increments.

The liquid level gauge shall be equipped with one set of electrical contacts which may be used to enunciate a low liquid level in the storage unit.

The storage unit shall be equipped with two independent alarm pressure switches for annunciation of high or low tank pressure. These switches shall operate at 315

PSIG and 250 PSIG respectively.

The storage unit shall be equipped with the required ASME safety relief. This relief shall be set at 350 PSIG.

A high pressure bleeder valve set at 330 PSIG shall be included with the storage unit assembly.

•The refrigeration system shall operate on a power supply of 208 or 460 volts, 60Hz. For the power service to the refrigeration system, a disconnect switch shall be provided by the CO2 vendor and shall be installed by the electrical contractor.

2.4.02 Valves. All valves shall meet the requirements set forth in the current edition of the NFPA Standard 12, and shall be F.M. approved for carbon dioxide extinguishing systems.

Tank Shut-Off Valves

A manually operated tank shut-off valve shall be provided. Valves are sized 3" through 8" and shall be equipped with a geared hand wheel operator and carry a 300 pound rating. The flanges mounted either side of the valve must have inside diameter chamfered 1/4" deep 45 degree angle for the valve clearance.

The tank shut-off valve shall be equipped with a DPDT limit switch to permit remote annunciation if the valve is other than fully opened. The contacts shall be provided on the tank shut-off valve to indicate fully closed position.

Master/Selector Valves

Valves in sizes 1/2" to and including 2" shall be ball type approved for low pressure carbon dioxide service. Valves in sizes 3" and larger shall be high performance butterfly style suitable for low pressure carbon dioxide service.

The master valve and selector valve shall not fail open. The master or selector valve shall not open automatically in the event of any electric or pneumatic failure.

Master/selector valves shall be provided with spring return pneumatic actuators. An override device shall be mounted on the valve actuator or within the Automatic Time Delay Cabinet for emergency manual operation.

Isolation Valves

Valves in sizes 1/2" to and including 2" shall be ball type approved for low pressure carbon dioxide service. Valves in sizes 3" and larger shall be high performance butterfly style suitable for low pressure carbon dioxide service.

The isolation valve shall be fitted with an electrical status switch.

The isolation valve shall have device to accommodate a lock.

2.4.03 Actuation Line Supervision. Actuation line serving all master/selector valves shall be supervised.

Actuation line to be provided with a supervisory pressure switch to provide annunciation at 80 PSI.

Actuation line to be provided with a pressure regulator to maintain 100 PSI on the line.

2.4.04 Nozzles. Nozzles shall be supplied in quantities sufficient to properly cover the areas being protected in accordance with NFPA-12.

Nozzles shall be permanently marked as to type and orifice.

2.4.05 Electrical. The electric service to the storage tank shall be provided with a fused disconnect supplied by the CO2 vendor and sized per the electrical requirements of the tank compressor.

CO2 System Control Panel and electrical devices shall be designed to operate on 24 VDC service.

All field electrical devices shall be supervised for electrical integrity.

All master/selector valve solenoid circuits shall incorporate maintenance lock-out switch to disable the solenoid during maintenance.

2.4.06 Control Panel. Provide an AUTOPULSE IQ-636X control panel or equivalent and to be located as shown on the drawings to electrically activate the carbon dioxide system. The control panel shall be modular and serve as many zones as required.

The control panel shall be FM approved for fire alarm and releasing service.

The control panel shall provide visual indication on the panel face for the following:

Each initiating circuit alarm and circuit trouble.

Each carbon dioxide release circuit alarm and circuit trouble.

Primary power source failure for each zone.

The control panel shall operate on the single zone concept. Any single activated detector shall be processed by the control panel as an alarm condition. The discharge circuit shall be energized in the affected area and the red "Release" LED on the panel will illuminate.

Alarm, trouble and AC power failure output contacts for each zone shall actuate the local alarm and common building fire alarm system.

Provide SPDT dry contacts for the following output signals to the Building Fire alarm panel:

General alarm condition, discharge notification.

General trouble condition, operational problem notification.

Loss of primary power source to the control panel.

Discharge disabled mechanically or electrically.

Storage unit refrigeration unit power failure.

Storage tank "high-low" pressure trouble.

The control panel shall have battery backup to support the entire system for 24 hours and then perform an alarm sequence for 10 minutes in the event of a primary power failure, but in no case shall be less than 8 AH. A charger shall be provided to recover the batteries in 48 hours from a fully discharged condition. Standby batteries shall be of the sealed, gel-type or lead calcium type. Batteries shall be supervised and provided a trouble signal upon low voltage, open or shorted cell.

The control panel shall be UL listed, FM approved and comply with the requirements as set forth in NFPA 72.

The control panel shall have Class “B” parallel wiring of the all the detection circuits.

The control panel shall utilize series supervised solenoid devices as the method of discharging the extinguishing agent. The solenoids shall be energized directly from the control panel when system discharge is required. Systems which employ devices external to the control panel to either supervise releasing devices or provide energy for discharge will not be accepted.

The control panel shall be equipped with a supervised service disconnect switch. Operation of this switch shall generate a trouble signal, activate a LED and electrically isolate all releasing devices from receiving a discharge signal. With the switch in the "disconnected" position, it shall be possible to simulate any alarm condition and observe proper operation of all detection and signaling circuits without causing agent discharge.

The control panel shall be equipped with auxiliary relays for shutdown operations. The control panel shall be capable of programming relays independently to operate on either, trouble, alarm, pre discharge, or discharge modes.

The control panel, in addition to its yellow system trouble LED, shall further break down a trouble condition with the use of diagnostic LED's. These LED's shall indicate the following trouble conditions:

Open condition, pressure supervisory circuit (separate diagnostic LED).

Alarm audible circuit reverse polarity, open or short circuit.

Pre discharge/discharge audible circuit reverse polarity, short or open.

Detection circuit (separate LED for each detection circuit).

Releasing circuit open circuit.

Manual release circuit open circuit.

AC power loss.

Ground fault.

System alarm audible circuit reverse polarity, short or open.

Microprocessor failure flashing indicator.

The control panel shall have a common control board, which provides common alarm and trouble indications as well as alarm silence and reset switches. A common Class "B" wired general alarm circuit shall be provided for common area signaling as well as separate form "C" dry contacts for general alarm and trouble. A signal switch shall be provided that will silence all active signals. Silencing of audible alarms shall be controlled by "resound" logic, whereby any subsequent new alarm conditions will reactivate audible circuits. A "lamp test" switch shall be provided which will illuminate all alarm and diagnostic LED's.

Control panel shall have a solid state, high speed switching power supply with 24 VDC output capable of responding instantly to voltage and current surges on the input and output sides to protect the system from malfunction and damage. A supervised battery charging circuit and ground fault sensing circuitry shall be an integral part of the power supply. Battery standby power shall be "on line" such that batteries will supply power to the system in the event of AC power loss without a power transfer relay.

One board shall be provided for each protected area. The unit shall provide Class "A" wired detection and series supervised release circuits, Class "B", different distinct audible and visual indications for alarm, pre- discharge, and discharge conditions. Supervised manual release circuits shall be provided.

Each control panel shall have alarm output contacts (dry) for "system operation" and "system trouble," that shall:

> Be direct hard wired into the HVAC control systems serving the building ventilation shut them down in the event of an alarm.
>
> Be connected to the plant process control system to alert the operators of a problem.
>
> See paragraph 3.03B below.

2.4.07 Alarm Devices. Electrically actuated fire alarm horns and strobe lights shall be furnished and installed. Each fire alarm horn strobe shall be actuated and receive operating power from the control panel. Terminals for this purpose shall be provided in the system control cabinet. Each device shall be approved or listed.

The contractor shall furnish and install adequate fire alarm horns and strobes (orange color) to notify plant personnel located in the protected areas. Additionally, horn/strobes shall be provided outside the entrance(s) to the protected area. The output for the audible and visible devices shall be adequate for the conditions encountered.

2.4.08 Thermal Detectors. Compact, stainless steel cover, hermetically sealed assembly, rate of rise compensating type. The setting shall be in accordance with NFPA 72E recommendations.

2.4.09 Manual Release Stations. The Manual release stations shall be located at major points of egress and as shown on Drawings. The manual release station shall provide a means of manually discharging the automatic fire extinguishing system when used in conjunction with the control panel. The manual release switch shall be the "dual action" type, to prevent accidental operation. The switch shall remain in the operated position until reset.

2.4.10 Tank Final Inspection and Test. After all live testing is done on an area or an electrical room, the tank/s shall be recharged when done at the contractor's/vendor's expense before sign off.

2.5 SYSTEM DESIGN TOTAL FLOODING SYSTEMS. Design of the carbon dioxide system shall be based upon the enclosure being sufficiently tight against agent leakage with all ventilation automatically shut down and/or fire dampers to provide for static air condition upon discharge, or shall be appropriately designed to compensate for openings that cannot be closed. Refer to Paragraph 1.01B above.

All appropriate doors, windows, vents and dampers shall be automatically closed before discharge of carbon dioxide. Devices for this purpose shall include pressure operated trips or switches where appropriate.

Agent quantity calculations shall be determined from dimensions furnished on contract drawings for a design concentration percentage at a minimum anticipated hazard temperature.

Pre discharge alarms and mechanical discharge delays shall be provided. They shall be of sufficient duration to warn personnel of an impending discharge of carbon dioxide and allow for hazard area evacuation and preparation.

Electronic Time (discharge) delays will not be permitted or acceptable.

Warning signs shall be provided at each entrance doors to the buildings. The warning signs shall be 18" high by 30" wide with a baked enamel finish. Lettering shall warn the personnel of the presence of a CO2 fire suppression system.

The minimum discharge period shall be within 1 minute. The discharge period shall be lengthened as appropriate by considerations such as deep seated type fires.

Discharge nozzles, detectors and auxiliary equipment shall be located so as not to interfere with the hazard operation and/or maintenance.

PART 3 - EXECUTION

3.1 INSTALLATION. The Subcontractor shall not install any equipment or materials until the Program Manager and DESIGN SUBCONSULTANT had approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Subcontractor's risk.

Provide all labor and material required to set up, mount and connect all system equipment in accordance with NFPA standards. The system shall be installed in strict accordance with the manufacturer's recommendations.

All piping and fittings shall be thoroughly cleaned as assembled. All welded joints to be pounded to loosen scale and weld beads and then use the following procedure. Pull wire flue brush through each length several times. Pull clean cloth rags (not burlap or similar) treated with carbon tetrachloride, or a solution of 50 percent carbon tetrachloride and 50 percent Stoddard's solvent through each pipe length.

The system shall be wired in accordance with the manufacturers diagrams and requirements and the regulations of the Detroit Fire Department. All wiring shall be installed in conduit.

All wiring shall be in accordance with the NEC and local codes, the NFPA Standards No. 72, 72E, 72G, 72H, or the local authority having jurisdiction.

The Subcontractor shall start up each piece of equipment and system and shall make all adjustments so that the system is placed in proper operating condition.

3.2 INSTRUCTIONS. The system shall include permanent nameplates and instruction plates to identify the system and instruct its use under emergency conditions. In addition, provide three copies of an operation and maintenance manual which shall include system mechanical and electrical drawings, a written description of the system design and operation referenced to the system drawings, technical bulletins describing each piece of equipment in the system and inspection and maintenance directions.

3.3 SEQUENCE OF OPERATION. The system shall be designed and installed such that it is actuated by any one of the detectors located in the substation rooms.

Actuation of any detector or manual station shall:

Provide steady alarm electronic sounder signal associated with the area in which the detector was actuated.

Annunciate to Owner's monitoring equipment at the plant central security room.

Perform necessary control functions such as HVAC equipment shutdown and dampers closure.

Shut down and/or keep all emergency generators from starting.

Close all doors leading into protected area.

Discharge agent.

The system shall be capable of being actuated by manual discharge switches for each protected area. Operation of a manual discharge switch shall cause alarm and shutdown devices to operate the same as if the system had operated automatically and shall cause immediate discharge after the time delay period.

Upon entering the alarm mode, audible indication shall be supplied by the steady sounding of an alarm electronic sounder. This unit shall be polarized for full supervision and UL listed. It shall have an output of 82 to 99 dBA at 24 VDC. The sounder shall be provided with a red finish. All field wiring connections shall be made to terminal strips or wire leads on the device.

3.4 ACCEPTANCE TESTS. Perform a complete approval test in the presence of the Owner's representative and governing authorities.

All test procedures shall be performed in accordance with NFPA 12, Section 1 7.3.

Tests shall demonstrate that the entire system functions as intended. All circuits shall be tested: Automatic discharge, manual discharge equipment shutdown and alarm devices. In addition, supervision of each circuit shall be tested. Each detection device shall be tested according to the manufacturer's recommended procedures and NFPA 72E.

Discharge tests shall be conducted. Tests shall be conducted with the equipment manufacturer or equipment manufacturer's representative in the presence of the Owner's representative. Such tests shall be made only after the control system has tested satisfactorily. Carbon dioxide shall be used as the test agent.

Test containers shall be filled to the designed weight. The amount of gas shall be certified by the Subcontractor.

Provide all necessary test apparatus and instrumentation including gas to be expended.

Gas analyzers capable of automatically monitoring three sampling points simultaneously shall be provided. Concentration measurements shall be recorded every 5 seconds on separate strip charts. Sampling probes shall be placed at three different heights in different sections of the protected area. In no case will a probe be placed higher than the highest anticipated combustible hazard. In large buildings, additional test points may be required. The number of points shall be determined by the Program Manager.

Correct all defects and make additional tests, at no additional cost to the Program Manager or Owner, until the system complies with all contract requirements.
Upon acceptance by the Program Manager and the authority having jurisdiction, the complete system shall be reconditioned, tanks refilled and the system placed in full

operation with proper tags.

As a condition of final acceptance, provide operational training to the Owner's personnel. The training sessions shall include emergency procedures, system control panel operation, trouble procedures and safety requirements. Refer to item 4.03 below.

A maintenance agreement shall be submitted to the Owner for consideration only.

As part of the acceptance test, the contractor shall prepare and submit all the ‘As-built” drawings, and tables to the Program Manager.

PART 4 - SPECIAL REQUIREMENTS

4.1 FACTORY TESTING AND WITNESSING. Factory testing is required on the individual devices and equipment of the complete CO2 system and as specified under this specification. All factory testing documentation and written reports shall be properly dated and made available to the owner representative on site.

At least 2 weeks before the proposed field testing for acceptance of the complete CO2 system, contractor shall notify the engineer of the expected testing date for witnessing. The contractor shall submit a report from the CO2 vendor and equipment manufacturer detailing the proposed performance testing of the system.

4.2 SPARE PARTS AND MAINTENANCE TOOLS. Spare parts, maintenance and tools shall conform to the requirements of specification Section 01180. The CO2 vendor can submit a recommended spare parts list for all equipment supplied to allow DWSD decide and select from the list and also allow the plant to enlarge list if is found necessary to do that.

4.3 TRAINING. The CO2 vendor shall provide a training program to the owner. The program shall include all timing, materials, classes and any required certification for the plant personnel to assume responsibility of maintaining the CO2 system with the help of CO2 specialists.

The CO2 contractor shall present to the owner a document outlining the procedure to incorporate the training indicated in (A) above.

4.4 WARRANTIES. The products shall be warranted against any defects in material or workmanship per Section 01180.

The manufacturer of the equipment shall describe the maintenance to be performed during the warranty period to maintain warranty conditions.
In addition to the above, the following special warranty provisions shall apply:

The Subcontractor shall obtain an extended warranty for 3 years for the equipment furnished under this specification.

The extended warranty shall cover all equipment furnished under this specification from the time it is placed into operation (which can be any time during the construction period) until one year after final acceptance.

The extended warranty can be in the form of:

A maintenance agreement that should be included in this contract shall cover any equipment installations/replacements, repair, recharging system, corrective and preventive maintenance, calibration of gauges and monitoring devices (if any installed in the system) and inspection and testing. In addition to that, the agreement shall allow DWSD to get specs, PMs, and equipment info into their CMMS and get DWSD personnel trained to all of that. In addition to above, the agreement can include an O&M contract in place with the right training, certifications, and licensing to do all of this as recommended by the CO_2 supplier.

End of Section

SECTION 15400

PLUMBING

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of materials, appliances, fixtures, equipment, and appurtenances associated with the plumbing systems as specified herein and as indicated in the Contract Documents. Additional requirements for plumbing systems shall be as indicated in the schedules on the drawings. Suitable connections shall be provided for each fixture, piece of equipment, and appurtenance.

Pipe materials, valves, thermal insulation, and pipe supports which are not an integral part of the fixture or piece of equipment and are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the plumbing system is compatible with all other parts of the system; that all piping, fixtures, and appurtenances are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall conform to the requirements of AGA, ASTM, NFPA, and UL safety requirements.

1.2.04 Power Supply. Power supply to equipment with motors shall be as specified in the schedules. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thicknesses and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All plumbing equipment, piping, and valves denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where required due to excessive length, lettering shall be placed on more than one row and centered.

Number plates shall be in the form of nameplates unless equipment is too small to accommodate the specified nameplate, then tags shall be used. Nameplates shall have black baked enamel letters on anodized aluminum plate. Metal nameplates and tags shall be at least 12 gage (2.66 mm) thickness with engraved or imprinted symbols. Tags shall have smooth edges and shall be a minimum diameter of 1-

1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Plumbing equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080 Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications to be submitted for each unit shall include, but shall not be limited to, the following:

Equipment, Piping Accessories, and Appurtenances

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Capacities.

Pressure and temperature ratings.

Overall dimensions.

Piping connection sizes and locations.

Horsepower (kW).

Power requirements.

Net weight.

Wiring diagrams.

Plumbing Fixtures

Name of manufacturer.

Type and model.

Construction materials, thicknesses, and finishes.

Water consumption data.

Overall dimensions.

Rough-in dimensions.

Piping connection sizes and locations.

Net weight.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated in the Contract Documents.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Qualification. The plumbing system installer shall be licensed as stipulated by the authority having jurisdiction.

1.5.03 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.5.04 Construction. Plumbing fixtures shall be constructed in accordance with the following standards:

Enameled Cast Iron	ANSI/ASME A112.19.1M
Vitreous China	ANSI/ASME A112.19.2M
Stainless Steel	ANSI/ASME A112.19.3M

Enameled Steel	ANSI/ASME A112.19.4M
Emergency/Safety Fixtures	ANSI Z358.1

Electric water coolers shall be UL listed and certified in accordance with the Air Conditioning and Refrigeration Institute (ARI) Standard 1010. All materials in contact with water shall comply with the Safe Drinking Water Act of 1986, and the Lead Contamination Control Act of 1988.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

1.7 EXTRA MATERIALS. Extra materials shall be furnished for each type and size of plumbing fixture or equipment as indicated in the Contract Documents, in the quantities indicated below.

Part	Number Required
Flushometer valve repair kits	1 per 5 fixtures
Tank type water closet ballcocks, flush valves, and floats	1 per 5 fixtures
Water closet seats	1 per 10 fixtures
Faucet washer and O-ring kits	1 per 5 fixtures
Faucet cartridge and O-ring kits	1 per 5 fixtures
Electric water heater elements	1 per heater
Water heater relief valves	1 per heater

Extra materials shall be packaged with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All plumbing fixtures and equipment shall be designed and selected to meet the specified conditions indicated in the Contract Documents.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. All fixtures and equipment shall be designed to meet the performance and design conditions specified herein and indicated on the drawings.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer's layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated on the drawings.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

2.4.02 Surface Preparation. All iron and steel surfaces, except motors and speed reducers, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.03 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Surface finish damaged during installation shall be repaired to the satisfaction of Engineer. Field painting shall conform to the requirements of Master Specification Section 09900, Painting.

2.4.04 Equipment Bases. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.05 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.06 Piping Systems. Unless otherwise specified herein, piping system materials shall conform to Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies and Master Specification Section 15061, Ductile Iron Pipe.

2.4.07 Valves. Unless otherwise specified herein, valves indicated to be a part of the plumbing systems shall conform to the Master Specification Section 15100, Miscellaneous Valves and Master Specification Section 15104, Resilient-Seated Gate Valves.

2.5 WATER SUPPLY PIPING ACCESSORIES.

2.5.01 Water Hammer Arrestors. Water hammer arrestors shall be either bellows or piston type. Bellows type arrestors shall consist of a stainless steel shell, a factory charged and sealed compression chamber, a stainless steel or elastomer bellows, and a stainless steel threaded adapter. Piston type arrestors shall consist of a seamless Type L copper shell, a seamlessly spun and factory charged air chamber, a factory lubricated double or triple O-ring sealed piston, and a threaded copper adapter. Water hammer arrestors shall be tested and certified in accordance with American Society of Sanitary Engineering (ASSE) Standard 1010. Arrestors shall be rated for a maximum working pressure of 350 psig (2400 kPa gauge) and a temperature range of 33° F to 250° F (1° C to 120° C). Water hammer arrestors shall be Smith "Hydrotrol", Josam "75000 Series Absorbotron", Wade "Shokstop", Sioux Chief "Hydra-Rester", or approved equal.

2.5.02 Trap Primers. Trap primer valves shall be flow activated, pressure activated, or tailpiece type as indicated in the Contract Documents.

2.5.02.01 Flow Activated Trap Primers. Flow activated trap primer valves shall be the automatic type activated by water flow in a pipeline. The primer valve shall consist of a bronze body with removable operating parts, an integral vacuum breaker, and a gasketed access cover. Connections shall be 1/2 inch (13 mm) NPT. Trap primer valves shall be tested and certified in accordance with American Society of Sanitary Engineering (ASSE) Standard 1018. Trap primer valves shall be Smith "2699", Josam "Series 88250", Wade "W-2400", or approved equal.

2.5.02.02 Pressure Activated Trap Primers. Pressure activated trap primer valves shall be the automatic type activated by pressure drop in a pipeline. The primer valve shall consist of a brass body with removable operating parts and an integral air gap. A distribution unit shall be provided when a single primer valve serves multiple traps. The trap primer shall be self-adjusting to line pressure and shall not require field adjustment. Connections shall be 1/2 inch (13 mm) NPT. Trap primer valves shall be tested and certified in accordance with American Society of Sanitary Engineering (ASSE) Standard 1018. Trap primer valves shall be Precision Plumbing Products "Prime-Rite PR-500", or approved equal.

2.5.02.03 Tailpiece Trap Primers. Trap primers installed in a flush valve water closet supply or lavatory drain shall consist of a chrome plated brass plumbing fixture tailpiece with a 1/2 inch (13 mm) OD diverter pipe and compression connection for copper tubing.

2.5.02.04 Thermostatic Mixing Valves. Thermostatic mixing valves shall comply with ASSE 1017, shall be bronze or brass body, with stainless steel flow control components, threaded end connections, rotating handle adjustment, lockable setpoint, and hot and cold check stops. Valves shall be suitable for flow ranges and have temperature adjustment ranges as indicated in the schedules. Accuracy shall within 3° F (2° C) of setpoint. Thermostatic mixing valves shall be manufactured by Symmons, Leonard, Powers, or approved equal.

2.6 DRAINAGE AND VENT PIPING ACCESSORIES.

2.6.01 Cleanouts. Cleanouts shall be provided where indicated on the drawings and required by the referenced codes.

Floor cleanouts shall consist of a two piece body, a threaded plug, an adjustable head, and a cover. Cleanouts installed in floors that include a waterproofing membrane shall be provided with a flashing flange and membrane clamp. Cleanouts installed in partition walls shall be provided with an access cover and frame with a securing screw installed over the cleanout plug. Wall cleanouts shall be stainless steel or nickel bronze, as indicated. Cleanouts installed in exposed piping shall consist of a ferrule or threaded adapter and a cast brass or bronze plug installed in a T-pattern, 90 degree drainage fitting.

Cast iron cleanouts shall be manufactured by Smith, Josam, Wade, or approved equal. Polypropylene cleanouts shall be manufactured by Orion, Enfield, or approved equal. PVC cleanouts shall be manufactured by Sioux Chief, or approved equal.

2.6.02 Bell-Up Drains. Unless otherwise indicated, bell-up drains shall consist of a drainage pipe hub extended to 1 inch (25 mm) above the finished floor. For chemical-resistant waste systems, bell-up drains shall consist of a plain end section of pipe, with a coupling extended 1 inch (25 mm) above the finished floor.

2.6.03 Funnel Receptors. Funnel receptors shall consist of cast iron funnels with cast iron dome type bottom strainers. Funnel receptors shall be provided with waterstop flange and threaded or no-hub outlet connections suitable for connection to the waste piping. Funnel receptors connected to chemical resistant waste systems shall be furnished with a factory applied chemical resistant interior coating. Unless otherwise indicated, funnel receptors shall be installed 1 inch (25 mm) above the finished floor.

Funnel receptors shall be Smith “Series 3800”, Josam, Wade, or approved equal.

2.6.04 Floor Drains. Floor drains shall be of the types specified herein and indicated on the drawings. Floor drains shall have a two-piece body, a flashing collar, an adjustable head, and a grate. A trap primer connection shall be provided when indicated on the drawings. Floor drains installed in floors that include a waterproofing membrane shall be provided with a flashing flange and membrane clamp.

Cast-iron floor drains shall be manufactured by Smith, Josam, Wade, or approved equal. Polypropylene floor drains shall be manufactured by Orion, Enfield, or approved equal. PVC loor drains shall be manufactured by Sioux Chief, or approved equal.

2.6.05 Roof Drains and Overflow Roof Drains. Roof drains and overflow roof drains shall be of the types specified herein and indicated on the drawings. Roof drains shall consist of a cast iron dome, a cast iron body, a sump receiver, an integral flange, and an extension for insulation thickness, where applicable. Drains for aggregate-surfaced roofing shall be provided with gravel stops. For other than cast-in-place locations, roof drains shall be provided with underdeck clamps. When indicated on the drawings, overflow roof drains shall be provided with interior extension rings. Roof drains and overflow roof drains shall be manufactured by Smith, Josam, Wade, or approved equal.

2.6.06 Downspout Nozzles. Downspout nozzles shall be cast brass or bronze, and shall be provided with a threaded inlet and a mounting flange. The mounting flange shall be provided with drilled fastening lugs. Downspout nozzles shall be Smith

"Model 1770", Josam, Wade, or approved equal.

2.6.07 Modular Trench Drain System. Modular trench drain systems shall be of the types specified herein and indicated on the drawings. The modular trench drain system shall include pre-sloped channel drain sections, end caps, outlet connections, grating, and all other components and accessories required for a complete installation. Drainage channels and related components shall be constructed of corrosion resistant polymer concrete. The grating shall be suitable for extra heavy traffic. The modular trench drain system shall be manufactured by Smith ACO, ABT Polydrain, or approved equal.

2.6.08 Floor Sinks. Floor sinks shall consist of a cast iron body with acid resistant interior finish, and a nickel-bronze grate. The grate shall be of the type indicated on the drawings shall be easily removable for cleaning. Floor sink grates and outlets shall be sized as indicated on the drawings. Floor sinks shall be manufactured by Smith, Josam, Wade, or approved equal.

2.6.09 Backwater Valves. Backwater valves shall be of the types as specified herein and indicated on the drawings. In-line backwater valves shall be provided with a hinged flapper valve and a bolted top access cover or a knife gate valve as indicated on the drawings. Knife gate valves shall be provided with a bronze gate and removable wheel handle. When indicated on the drawings, the access cover or handwheel operator shall be extended to finish floor or grade.

Terminal backwater valves shall be provided with a hinged flapper valve and an inlet hub connection. The flapper valve shall be factory set to be fully closed in the normal position.

Ball-float backwater valves shall be provided with cast-iron body, removable bronze seat ring, neoprene seat and ball-float. Ball float backwater valves shall be provided with threaded inlet connection and threaded or no-hub outlet connection as appropriate for the piping system.

Cast-iron backwater valves shall be manufactured by Smith, Josam, Wade, or approved equal. PVC backwater valves shall be manufactured by NDS, Plastic Oddities, Inc, or approved equal.

2.6.10 Vent Flashings. Plumbing vent flashings shall be furnished and installed as indicated on the drawings.

2.7 PLUMBING FIXTURES AND ACCESSORIES.

2.7.01 General. Plumbing fixtures shall be provided with all required supports, fasteners, supply and drain fittings, gaskets, and escutcheons required for a complete installation.

2.7.02 Water Closets. Water closets shall be of vitreous china, with an elongated bowl and siphon jet flushing action. The type and water use of water closets shall be as indicated on the drawings. All water closets shall be provided with anchor bolt caps. Flush valve type water closets shall be provided with top spud connections for flushometer valves. Flush tank type water closets shall be provided with factory installed tank liners. Field installed liner kits will not be acceptable. Water closets shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.02.01 Seats. Water closet seats shall be white, solid plastic, contoured, elongated open front type without cover, with concealed check and stainless steel hinges. The seats shall be manufactured by Kohler, American Standard, Eljer, Church, or approved equal.

2.7.02.02 Flush Valves. Flush valves for top spud type water closets shall be exposed type, with a chrome plated brass body, an externally adjustable diaphragm, an angle stop, a renewable valve seat, a tailpiece, a vacuum breaker, a wall flange, a spud nut and flange, and a 1 inch (25 mm) NPT water supply connection. Flush valves shall be Sloan "Royal" Delaney, or approved equal.

2.7.02.03 Supply Set. A supply set consisting of a 1/2 inch (13 mm) NPT brass angle loose key stop valve, a copper supply tube, and an escutcheon plate shall be furnished for each tank type water closet. All supply components shall be polished chrome.

2.7.02.04 Chair Carriers. Wall-mounted water closets shall be provided with adjustable chair carriers. The carriers shall be suitable for the chase depth and piping arrangement and shall consist of a heavy-duty cast iron body, complete with a drainage fitting, pylon feet, a drainage nipple, fitting and fixture gaskets, a positioning frame or template, and mounting hardware. Chair carriers shall be manufactured by Smith, Josam, Wade, or approved equal.

2.7.03 Urinals. Urinals shall be of the type and water use as indicated on the drawings. Urinals shall be of vitreous china, wall mounted, with an elongated rim and washout flushing action, and shall be provided with a top spud connection for a flushometer valve. Urinals shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.03.01 Flush Valves. Flush valves shall be exposed type, of chrome plated brass with an externally adjustable diaphragm, an angle stop, a renewable valve seat, a tailpiece, a vacuum breaker, a wall flange, a spud nut and flange, and a 3/4 inch (19 mm) NPT water supply connections. Flush valves shall supply a maximum of 1.0 gallon (3.8 L) per flush, and shall be Sloan "Royal 186-1", Delaney, or approved equal.

2.7.03.02 Supports. A fixture support system, including support legs, upper and lower bearing plates, and bearing studs shall be provided for urinals mounted on all walls other than masonry. Urinals mounted on masonry walls shall be provided with suitable anchor bolts. Urinal supports shall be manufactured by Smith, Josam, Wade, or approved equal.

2.7.04 Lavatories. Lavatory types, dimensions, and water use shall be as indicated on the drawings. Lavatories shall be of vitreous china, constructed with overflow drains and soap depressions. Countertop lavatories shall be self-rimming, and shall be provided with suitable adhesive and/or fastening clamps. Wall-mounted lavatories shall be drilled for a concealed arm carrier. Faucet drillings shall be 4 inches (100 mm) on center unless otherwise indicated. Lavatories shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.04.01 Faucets and Trim. Lavatory faucets shall be 4 inches (100 mm) on center, of polished chrome, with a vandal-resistant single-lever handle and all-brass or copper waterways. Each faucet shall be provided with a flow restrictor, a cast brass grid strainer or pop-up drain, and a 1-1/4 inch (32 mm) cast brass tailpiece. Supply sets consisting of 1/2 inch (12.5 mm) NPT brass angle loose key stop valves, copper supply tubes, and escutcheon plates shall be furnished for each lavatory faucet. All supply components shall be polished chrome. Where indicated to be ADA-compliant and exposed to human contact, lavatory supplies shall be insulated. Lavatory faucets and supply sets shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.04.02 Traps. Lavatory traps shall be at least 1-1/4 inches (32 mm) in diameter, cast brass with polished chrome finish, with an escutcheon flange and a cleanout plug. Where indicated to be ADA-compliant and if exposed to human contact, lavatory traps shall be offset, insulated type.

When insulation is needed, lavatory supplies and traps may be pre-insulated or furnished with an insulation kit for field installation. Insulating material shall be flame retardant closed cell vinyl. The supply insulating kit shall be snap form type or shall be provided with ties. The trap insulation material shall not require the use of ties or mechanical fasteners to be held in place. Pre-insulated traps and supply insulation kits shall be McGuire Products "ProWrap", or approved equal. Trap and supply insulation kits shall be as manufactured by TRUEBRO Inc, or approved equal.

2.7.04.03 Supports. Wall-hung lavatories shall be provided with a complete fixture support system, including support legs, bearing plates, concealed arms, and anchor bolts. The support legs shall be mounted within the partition wall. For lavatories mounted on masonry walls, support legs may be omitted. Lavatory supports shall be manufactured by Smith, Josam, Wade, or approved equal.

2.7.05 Showers. Shower type, dimensions, and water use shall be as indicated on the drawings.

2.7.05.01 Built-up Shower Stalls. Each built-up shower stall shall be provided with a pressure-balanced single lever mixing valve, a shower head, an arm, and a flange. The shower valve shall include integral service stops and an adjustable stop screw. The shower head shall be of adjustable spray pattern type, with volume control, a swivel ball joint, and an integral flow control device. All exposed components shall be polished chrome.

2.7.05.02 Prefabricated Shower Modules, ADA Compliant. Prefabricated shower modules shall be complete units, and shall meet ADA requirements. Each unit shall consist of a one-piece reinforced acrylic enclosure with stainless steel grab bars on two sides, a folding slatted wood or nylon seat, a 1 inch (25 mm) diameter curtain rod, a 10 ounce/yd^2 (339 g/m^2) shower curtain with hooks, and a 2 inch (51 mm) chrome plated cast brass outlet drain. Each module shall be predrilled for a shower valve, a shower support rod, and a dome light. A pressure-balanced single-lever mixing valve, a hand-held shower head with swivel fitting, a 69 inch (1.7 m) stainless steel flexible hose, a support rod, an in-line vacuum breaker, and a 120 volt dome light shall be provided with each unit. Prefabricated shower modules shall be manufactured by Crane, Kohler, or approved equal.

2.7.05.03 Prefabricated Shower Modules. Prefabricated shower modules shall be provided as complete units. Each unit shall consist of a one-piece reinforced acrylic enclosure with a 1 inch (25 mm) diameter curtain rod, a 10 ounce/yd^2 (339 g/m^2) shower curtain with hooks, and a 2 inch (50 mm) chrome plated cast brass outlet drain. Each module shall be predrilled for a shower valve and dome light. A pressure-balanced single-lever mixing valve and a 120 volt dome light shall be provided with each unit. Prefabricated shower modules shall be manufactured by Crane, Kohler, or approved equal.

2.7.06 Stainless Steel Sinks. Sink dimensions, hole punching, material, metal gage, manufacturer and model shall be as indicated in the schedules.

Stainless steel sinks shall be seamless stainless steel, with smooth radius interior corners. Countertop mounted sinks shall be self-rimming with compartment and faucet deck recessed below the outer edge of the sink. All exposed surfaces of sinks shall be machine polished to a bright finish and the underside shall be fully undercoated. Sinks shall be provided with mounting clips, support legs, and all other hardware as indicated in the schedules. Stainless steel sinks shall be manufactured by Advance Tabco, Elkay, or approved equal.

2.7.06.01 Faucets. Sink faucets shall be polished chrome, with a vandal-resistant single-lever handle. All waterways shall be constructed of brass or copper. Faucets shall be provided with a brass spout, an aerator, and a flow restrictor. Supply sets consisting of 1/2 inch (12.5 mm) NPT brass angle loose key stop valves, copper supply tubes, and escutcheon plates shall be provided. All supply components shall be polished chrome. Sink faucets and supply sets shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.06.02 Drain Assembly. All required drainage accessories, including strainers, tailpieces, and traps, shall be provided. Basket strainers shall be heavy gage stainless steel, with a removable conical strainer plate and a neoprene stopper. Tailpieces shall be chrome plated brass. Sink traps shall be at least 1-1/2 inches (38 mm) in diameter, cast brass, with polished chrome finish, an escutcheon flange, and a cleanout plug.

2.7.07 Mop Sinks and Service Sinks. Mop sink and service sink types, dimensions, manufacturers, and models shall be as indicated in the schedules.

Mop sinks shall be floor mounted, corner type, with a diagonal front, constructed of pearl gray terrazzo. Mop sinks shall be provided with an integral 20 gage (0.91 mm) thick stainless steel threshold cap, a 6 inch (150 mm) drop at threshold, and a shoulder at least 1-1/4 inches (32 mm) wide. A 3 inch (75 mm) cast brass drain and stainless steel strainer, and where indicated, a 20 gage (0.91 mm) thick stainless steel splash panel shall be provided for each sink. Mop sinks shall be manufactured by Stern-Williams, Fiat, or approved equal.

Service sinks shall be wall mounted, and shall consist of a 10 inch (254 mm) deep cast iron bowl coated with acid resistant enamel, a stainless steel rim guard, a plain or drilled back as indicated on the drawings, and a heavy gage metal wall bracket. Service sinks shall be manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.07.01 Faucets. Sink faucets shall be rough plated brass, with lever handles, a threaded spout, a vacuum breaker, a wall brace, and a pail hook. The distance from the wall to the center of the spout outlet shall measure approximately 7-1/2 inches (190 mm). Sink faucets shall be as manufactured by Kohler, American Standard, Eljer, or approved equal.

2.7.07.02 Drain Assembly. Mop sinks shall be provided with a 3 inch (75 mm) cast brass drain and a stainless steel strainer. Service sinks shall be provided with a 3 inch (75 mm) cast iron P-type trap standard, with a stainless steel strainer, a cleanout plug, and a threaded outlet.

2.7.08 Emergency Fixtures. Emergency fixtures, including showers, eye/face washes, and combination shower/eye/face wash units shall be furnished and installed where indicated on the drawings. Emergency eyewash shall meet the ANSI Z358.1 Standard and shall provide a minimum tempered water flow of 0.4 gpm at a minimum of 30 psi. Fixture type, manufacturer, and model shall be as indicated in the schedules. Emergency fixtures shall be manufactured by Haws, Guardian, Encon, or approved equal.

Pedestal eyewash shall have a stainless steel receptor, ABS plastic heads, a stay-open ball valve, a push plate actuator, a chrome plated trap, and a universal emergency sigh. All necessary accessories required for a complete installation shall be provided.

Indoor emergency eyewash fixtures shall be wall mounted with a wall bracket, a stainless steel receptor, ABS plastic heads, a stay-open ball valve, a push plate actuator, a chrome plated trap, and a universal emergency sign. All necessary accessories required for a complete installation shall be provided.

Faucet mounted eyewash shall have a chrome plated brass finish, pull handle with graphics, aerated sprays, and up to 2" thick counter thickness. The unit shall have a dedicated tepid water supply, and shall be manufactured by Speakman, or approved equal.

Indoor ceiling-mounted emergency shower fixtures shall be suitable for vertical supply pipe and flush ceiling mounting, with a pipe support bracket, a chrome plated brass shower head, a stay-open ball valve, a stainless steel pull-rod actuator, and a universal emergency sign. The ball valve shall be located above the ceiling. All necessary piping, support brackets, escutcheons, and accessories required for a complete installation shall be provided.

Combination emergency shower/eye/face wash fixtures shall be pedestal mounted, with a stanchion, a floor flange, a deluge showers, an aerated eye/face wash, an eye/face wash dust cover, stay-open ball valves, interconnecting piping, and a universal emergency sign. The shower shall be stainless steel or ABS plastic with a stainless steel pull rod actuator. The eye/face wash receptor shall be stainless steel with push plate and foot pedal actuators.

Freezeproof emergency eye wash fixtures shall be wall mounted with a wall bracket, a stainless steel receptor, ABS plastic heads, a stay-open ball valve, a push plate actuator, and a universal emergency sign. The ball valve shall be located indoors, with an extension stem extending through the exterior wall to the push plate actuator. All necessary drain and bleed piping, wall sleeves, and accessories required for a complete installation shall be provided.

Freezeproof emergency shower fixtures shall be wall mounted, suitable for a horizontal supply pipe, with a pipe support bracket, a stainless steel or ABS shower head, a stay-open ball valve, and a universal emergency sign. The ball valve shall be located indoors, with an actuator extending through the exterior wall. All drain and bleed piping, wall sleeves, and accessories required for a complete installation shall be provided.

Freezeproof combination emergency shower/eyewash fixtures shall be pedestal mounted, with a stanchion, a floor flange, a deluge shower, an aerated eye/face washes, freezeproof stay-open valves, interconnecting piping, and a universal emergency sign. The shower and eye/face wash shall be stainless steel or ABS plastic with a stainless steel actuator. The entire unit shall be provided with self-regulating heating cable and shall be insulated with polyethylene foam insulation. The insulation shall be provided with a removable, UV resistant, ABS plastic jacket with gasketing and removable fasteners. Electric heating cable shall be suitable for the outdoor temperature and power supply indicated on the drawings.

An audible and visual alarm system shall be provided when indicated on the drawings. The alarm system shall activate based on water flow when either the emergency shower or eyewash fixture is operated. The water flow switch shall be provided with double-pole double-throw contacts rated 5 amperes at 125 volts, suitable for remote alarm annunciation. The audible alarm shall provide an intermittent signal rated at 90 dB at 10 feet. The alarm light shall be amber, flashing type. The alarm system shall be pre-wired and shall be furnished with all necessary junction boxes, conduit, wire, and accessories for a complete installation. The alarm system shall be suitable for a 120 volt power supply.

2.7.09 Wash Fountains. Wash fountain type, size, and finish shall be as indicated in the schedules. Wash fountains shall be precast terrazzo with a 9 inch (229 mm) deep bowl, a pedestal support, and stainless steel scuff plates and panels, and shall be suitable for wall or floor type water and waste connections, and a rear or centrally rising vent. Wash fountains shall be complete with a polished chrome liquid or powdered soap dispenser, a thermostatic mixing valve, combination stop/strainer check valves, and all other components required for proper operation. A foot, hand, or infrared control system shall be provided as indicated on the drawings. Infrared control systems shall include transformers as needed for operation on a 120 volt power supply. Wash fountains shall be manufactured by Bradley Corporation, or approved equal.

2.7.10 Electric Water Coolers. Electric water cooler type, capacity, manufacturer, and model shall be as indicated in the schedules. Water coolers shall be wall mounted, mechanically refrigerated type, and shall deliver 50°F (10°C) water at the specified rate, based on 80°F (27°C) inlet water temperature and a room temperature of 90°F (32°C). The water coolers shall consist of a heavy gage steel cabinet, an insulated cooling tank, a stainless steel receptor, copper water lines, a water pressure regulating valve, an adjustable thermostat, and a 3-wire power cord with a polarized plug. The refrigeration unit shall consist of a hermetically sealed spring mounted compressor and an air-cooled condenser. Electric water coolers shall be suitable for a 120 volt, 60 Hz, single phase power supply, shall be UL and ARI listed, and shall be manufactured by Elkay, Oasis, Halsey Taylor, or approved equal.

2.7.11 Food Waste Disposers. Food waste disposer motor size, power supply, and model shall be as indicated on the drawings. Disposers shall consist of stainless steel grinding chamber, grinding elements, impellers, and stopper. Disposers shall be provided with permanently lubricated bearings, a motor overload protector, a tailpiece, a 5 foot (1.5 m) 3-wire power cord with a polarized plug, and a service wrench. Disposers shall be UL listed and shall be manufactured by In-Sink-Erator, or approved equal.

2.8 PLUMBING EQUIPMENT.

2.8.01 General. Plumbing equipment shall be provided with all supports, fasteners, fittings, and escutcheons required for a complete installation.

2.8.02 Water Heaters and Accessories. Water heaters shall be furnished and installed where indicated on the drawings. Heater type, storage capacity, recovery rate, energy input, power supply requirements, manufacturer, and model shall be as indicated in the schedules.

2.8.02.01 Commercial Grade Electric Storage Water Heaters. Electric storage water heaters shall be commercial type, with a glass-lined tank and one or more heating elements. The heater shall be provided with a cold water inlet tube, a magnesium anode, polyurethane foam insulation, a drain valve, and adjustable thermostats. Heating elements shall be immersion type, incoloy sheathed, low or medium watt density, and shall be field replaceable. Heater tanks shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). Heater tanks larger than 70 gallons (265 L) shall be provided with an inspection port. Each heater shall be equipped with an ASME rated pressure-temperature relief valve of suitable capacity. Heaters shall be UL and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. Electric storage water heaters shall be manufactured by State Industries Inc., A. O. Smith, Lockinvar, or approved equal.

2.8.02.02 Industrial Grade Electric Storage Water Heaters. Electric storage water heaters shall be industrial type, with a nickel-lined tank and one or more heating elements. Heaters shall be provided with a cold water inlet tube, high density fiberglass insulation, a drain valve, and adjustable thermostats. Heating elements shall be immersion type, incoloy sheathed, low or medium watt density, and shall be field replaceable. Heater tank shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). The heater tanks shall be provided with an inspection port at least 12 inches (300 mm) in diameter. An ASME rated pressure-temperature relief valve of suitable capacity shall be provided with each heater. Heater shall be UL and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. The electric storage water heaters shall be manufactured by PVI Industries Inc, or approved equal.

2.8.02.03 Electric Instantaneous Water Heaters. Instantaneous water heaters shall be tankless type and shall heat water on demand as determined by an integral flow switch. Heaters shall be suitable for operating water pressures of 25 to 150 psig (14 to 1034 kPa gauge), and shall be provided with compression type tubing connections. Heater elements shall be constructed of stainless steel or glass reinforced plastic, and shall be replaceable. If required by applicable codes, each heater shall be provided with a temperature and pressure relief valve. Heaters shall be provided with thermostatic control. Electric instantaneous water heaters shall be UL listed and shall be manufactured by Chronomite Laboratories Inc., Eemax, or approved equal.

2.8.02.04 Commercial Grade Gas Fired Water Heaters. Gas fired water heaters shall be commercial, storage type, with a glass-lined tank and a natural or propane gas burner as indicated on the drawings. Heaters shall be provided with a cold water inlet tube, a magnesium anode, high density fiberglass insulation, a drain valve, a flue damper, and an adjustable thermostat. The heater burner shall be atmospheric type, constructed of aluminized steel, and shall be suitable for a minimum gas supply pressure as indicated on the drawings. The burner shall be provided with a gas pressure regulator, a manual reset safety shutoff, and an intermittent electronic ignition control system. Burner operation shall be interlocked with the flue damper to prevent burner and pilot ignition until the flue damper is proven open. Heater tanks shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). Heater tanks larger than 70 gallons (265 L) shall be provided with an inspection port. An ASME rated pressure-temperature relief valve of suitable capacity shall be provided with each heater. Heaters shall be UL, AGA, and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. Gas fired storage water heaters shall be manufactured by State Industries, A. O. Smith, Lockinvar, or approved equal.

2.8.02.05 Industrial Grade Gas Fired Water Heaters. Gas fired water heaters shall be industrial, storage type, with a nickel-lined tank and a natural or propane gas burner as indicated on the drawings. Heaters shall be provided with a cold water inlet tube, a magnesium anode, high density fiberglass insulation, a drain valve, and an adjustable thermostat. The heater burner shall be forced draft type constructed of cast aluminum, and shall be suitable for a minimum gas supply pressure as indicated on the drawings. The burner shall be provided with a gas pressure regulator, an automatically reset safety shutoff device, and an intermittent electronic ignition control system. The burner combustion chamber shall be submerged, utilizing a minimum of two passes. Heater tank shall be ASME stamped for a working pressure of at least 125 psig (862 kPa gauge). The heater tanks shall be provided with an inspection port at least 12 inches (300 mm) in diameter. An ASME rated pressure-temperature relief valve of suitable capacity shall be provided with each heater. Heaters shall be UL, AGA, and NSF listed, and shall meet ASHRAE Standard 90.1 for energy efficiency. Gas fired storage water heaters shall be manufactured by PVI Industries, Inc, or approved equal.

2.8.02.06 Water Heater Flues. A complete flue system shall be provided for each gas fired water heater. Unless otherwise required to maintain the listing of the heater, water heaters utilizing atmospheric burners or fan assisted heaters which operate under a negative flue pressure shall be provided with a Type 'B' flue system. Water heaters utilizing forced draft burners which pressurize the flue shall be provided with a pressurized flue system. Flues shall be as specified in Master Specification Section 15500, Heating, Ventilating and Air Conditioning.

2.8.02.07 <u>Circulating Pump</u>. A circulating pump shall be furnished and installed where indicated on the drawings. Pump capacity, power requirements, manufacturer, and model shall be as indicated on the drawings.

The circulating pump shall be an in-line unit with a bronze body, bronze fitted, mechanical seals, a stainless steel or ceramic shaft, and at least 1/2 inch (13 mm) NPT connections. The circulating pump shall be controlled by a 7-day time clock provided with the pump. The time clock shall be suitable for a 120 volt single phase power supply, and shall have contacts rated for 10 amperes ac. The circulating pump shall be manufactured by Bell & Gossett, Thrush, Taco, or approved equal.

2.8.02.08 <u>Thermometers</u>. Thermometers shall be Weksler Instruments "Adjust Angle", Ashcroft "Series EI Everyangle", or approved equal.

Thermometers shall be bimetal type and shall have a dial at least 4-1/2 inch (114 mm) diameter, with black markings on a white background. Pointer travel shall span not less than 200 degrees nor more than 270 degrees. Each thermometer shall have a stainless steel case, bezel, fittings, and stem and shall be hermetically sealed, with external pointer adjustment and an acrylic or shatterproof glass window.

Each indicator shall be furnished with an angularly adjustable frame for convenient viewing. Unless otherwise indicated, thermometer range shall be 0 to 200°F (-10 to 110°C).

Each thermometer shall be furnished with a stainless steel thermowell for installation in the piping systems. The thermowells shall have 3/4 inch (20 mm) NPT thread mounts, a minimum pressure rating of 250 psig (1725 kPa gauge), and a nominal 4 inch (100 mm) insertion length.

2.8.03 <u>Neutralization Tanks</u>. Neutralization tanks shall be furnished and installed where indicated on the drawings. Tank volume, connection sizes, manufacturer, and model shall be as indicated in the schedules.

Neutralization tanks shall be of heavy-duty construction, rotomolded in one piece from polyethylene resins and equipped with a bolt-down cover of the same material, fastened with stainless steel bolts and washers. Inlet, outlet, and vent fittings molded from the same resins as the tank shall be triple-welded to the tank body at the locations indicated on the drawings. A full diameter flanged extension constructed of the same material as the tank shall be provided where required to raise the access cover to at or just below the floor level as indicated on the drawings. The tank shall be filled with hard limestone or marble chunks, 2 to 3 inches (50 to 75 mm) in diameter to the level recommended by the manufacturer. Neutralization tanks shall be manufactured by Enfield, Orion, Town & Country Plastic, Inc, or approved equal.

2.8.04 Hose Reels. Hose reels shall be furnished and installed at the locations indicated on the drawings. Hose reel type, capacity, manufacturer, and model shall be as indicated in the schedules.

Each hose reel shall be provided complete with a hose storage drum, a handle crank winding mechanism, a spring-actuated pin lock, and a heavy duty frame suitable for anchoring to concrete or masonry wall or floor supports. When indicated on the drawings, hose reels shall be provided with a water supply swivel joint rated at 600 psig (4,130 kPa gauge). The hose storage drum shall be provided with a brass male hose adapter suitable for use with the specified hose. The hose reels shall be manufactured by Hannay, or approved equal.

2.8.05 Hoses. Hoses shall be furnished at the locations indicated on the drawings. Hose type, diameter, manufacturer, and model shall be as indicated in the schedules.

Unless otherwise indicated, each hose shall be provided with one male swivel type brass hose connector, one female brass hose connector, and one regulating wash-up spray nozzle. Spray nozzles in 1 inch (25 mm) and 1-1/2 inch (38 mm) sizes shall be Potter-Roemer Inc. "Series 2970" with a cast brass body, a rubber bumper, and a female hose thread, or approved equal.

Type 1 hoses shall be non-collapsible, suitable for water service and shall be rated for 150 psig (1030 kPa gauge) working pressure. The hose shall consist of 1-1/2 inch (38 mm) ID heavy-duty ethylene, propylene diene (EPDM) rubber tubing with synthetic, high tensile textile cord reinforcement and an EPDM cover. Type 1 hoses shall be Gates Rubber Company "Dolphin", or approved equal.

Type 2 hoses shall be non-collapsible, suitable for water service and shall be rated for 130 psig (900 kPa gauge) working pressure. The hose shall consist of 3/4 inch (19 mm) or 1 inch (25 mm) ID heavy-duty ethylene, propylene diene (EPDM) rubber tubing with synthetic, high tensile textile cord reinforcement and an EPDM cover. Type 2 hoses shall be Gates Rubber Company "Industrial Wearmaster", or approved equal.

Type 3 hoses shall be non-collapsible, suitable for hot water service and shall be rated for 200 psig (1380 kPa gauge) working pressure. The hose shall consist of 1 inch ID heavy-duty ethylene, propylene diene (EPDM) rubber tubing with synthetic, high tensile textile cord reinforcement and an EPDM cover. The hose shall have an integrated nozzle. The hose end opposite the nozzle shall be furnished with a female thread brass hose connector with swivel. Type 3 hoses shall be Gates Rubber Company "113S", or approved equal.

Type 4 hoses shall be suitable for lay flat water discharge service and shall be rated for 75 psig (500 kPa gauge) working pressure. The hose shall be 1-1/2 inch (38 mm) ID with a heavy-duty polyvinyl chloride (PVC) body and synthetic, high tensile textile cord reinforcement. Type 4 hoses shall be Gates Rubber Company "Masterflex 500", or approved equal.

2.8.06 Oil Interceptor. An oil interceptor shall be furnished and installed where indicated on the drawings. Interceptor capacities, connections, manufacturer, and model shall be as indicated in the schedules.

The oil interceptor shall be of cast iron with an acid resisting coating inside and outside, an adjustable gravity drawoff, a trap with cleanout, 4 inch (102 mm) inlet and outlet connections, vent connections, a removable baffle and sediment bucket, an internal air relief/flow control fitting with access box, and a gasketed cast iron scoriated cover with one bolt securing T-handle. A suitable steel extension shall be provided to raise the access cover to the floor level. The interceptor shall bear the Plumbing and Drainage Institute (PDI) seal of approval and shall be manufactured by Smith, Josam, Wade, or approved equal.

2.8.07 Flammable Waste Interceptor. A flammable waste interceptor suitable for containing oil and other flammable liquids shall be furnished and installed where indicated on the drawings.

The flammable waste interceptor shall consist of a steel or cast iron shell at least 3/16 inch (5 mm) thick, a 4 inch (100 mm) inlet and outlet, and 3 inch (75 mm) vent connections located as indicated on the drawings and as stipulated by the authority having jurisdiction. Steel interceptors shall be coated inside and outside with two coats of black asphaltum.

The interceptor shall maintain a liquid depth of at least 36 inches (0.9 m), and shall have a liquid retention volume of at least 35 cubic feet (1 cubic meter). The inlet piping shall terminate with a 90 degree elbow to 3 inches (75 mm) below the liquid level. The discharge piping shall consist of a 90 degree elbow and pipe terminating 18 inches (450 mm) below the liquid level.

A suitable steel or cast iron extension shall be provided to raise the access cover to the floor level, and a gasketed vaportight steel or cast iron access cover with lifting rings shall also be provided. The cover shall be at least 24 inches (600 mm) in diameter and shall be suitable for a live load of at least 150 psf (7.2 kPa).

2.8.08 Expansion Tanks. Expansion tanks shall be furnished and installed where indicated on the drawings. Tank capacities, connections, manufacturer, and model shall be as indicated in the schedules.

Expansion tanks shall be welded steel diaphragm type, ASME tested and stamped for a working pressure of 125 psig (862 kPa gauge), with a flexible diaphragm and a charging valve. Floor-mounted tanks shall be provided with a suitable mounting base. The tanks shall be suitable for use with potable water and shall be factory pre-charged to the indicated pressure. Expansion tanks shall be manufactured by Amtrol, or approved equal.

2.8.09 Water Storage Tank. The water storage tank shall have the capacity and dimensions as indicated in the schedules. The tank shall be welded steel, glass or thermosetting polymer lined, suitable for use with potable water, and shall be ASME stamped for a working pressure of 125 psig (862 kPa gauge). The tank shall be provided with legs for vertical mounting, a magnesium anode, threaded connections for 2 inch (50 mm) water inlet and outlet, a 1 inch (25 mm) relief valve, and a 3/4 inch (20 mm) drain valve. The outlet and relief valve connections shall be located near the top of the tank; the inlet and drain valve connections shall be located at the bottom of the tank. An ASME rated pressure-temperature relief valve and drain valve shall be provided with the tank. The exterior of the tank shall be thoroughly cleaned, primed, and finished with baked enamel. The water storage tank shall be manufactured by A. O. Smith, PVI, or approved equal.

2.8.10 Automatic Water Softener Unit. An automatic water softener unit shall be furnished and installed where indicated on the drawings. Softener capacities, connections, manufacturer, and model shall be as indicated in the schedules.

The automatic water softener unit shall be furnished with resin tank(s), a brine tank, resin, an electric control system, and all other accessories and appurtenances required for a complete automatic system. The water softening unit shall be manufactured by Culligan, Bruner, or approved equal.

2.8.10.01 Construction. The water softener shall be a factory-assembled, pressure-type consisting of a single unit with resin tank(s) and one brine tank.

Resin tanks shall be constructed of plastic, fiberglass reinforced plastic, or steel with plastic internal liner, and shall be designed for a working pressure of 100 psig (690 kPa gauge). The resin tanks shall be provided with a distribution pipe system to evenly distribute water flow across the media bed and ensure maximum water softening capacity.
The brine tank shall be constructed of high density polyethylene and shall be provided with a cover, a brine fill/discharge valve, an overflow connection, pipe fittings, and required accessories.

2.8.10.02 Media. The softening media shall be high-capacity, sulfonated polystyrene resin that is stable over the entire pH range with good resistance to bead fracture from attrition or shock. The resin shall have a capacity of 30,000 grains of calcium carbonate hardness per cubic foot (66.6 g/L) of resin when regenerated with 15 lbs (6.8 kg) of salt.

2.8.10.03 Controls. The water softening unit shall be provided with a factory installed, automatic, electrically operated control system as indicated on the drawings.

Timer based control systems shall consist of an electric timer which shall initiate regeneration cycles at adjustable time periods.

Timer and flow based control systems shall consist of an electric timer in conjunction with a manually adjustable totalizing flow meter. The system shall initiate regeneration cycles based on water volume or fixed time periods.

Sensor based control systems shall be the solid-state sensor type which initiates regeneration cycles based on sensing water hardness.

Softening units with two resin tanks shall automatically alternate to the standby resin tank at the time of regeneration and shall operate that tank until either the timer or the flow meter senses regeneration of that unit.

All controls shall be capable of manual adjustment and operation. All controls shall be suitable for operation on a 120 volt single phase power supply.

2.9. COLOR Vitreous china, cast iron, enameled steel, and acrylic plumbing fixtures shall be white unless otherwise indicated. Other plumbing fixtures shall be the manufacturers standard color. Plumbing equipment shall have the manufacturer's standard color and finish unless otherwise indicated in the schedules.

2.10 ELECTRICAL. Motor starters and controls shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with prewired integral starters. Disconnects for equipment shall be furnished and installed under Master Specification Section 16050, Electrical General Requirements, except where specified with integral disconnects. All electrical controls shall have enclosures suitable for the environment and NEMA rating as indicated on the electrical drawings for wiring in conduit. Equipment installed outdoors shall have NEMA Type 4 enclosures. Prewired electric motors installed in packaged equipment are not required to have clamp type grounding terminals in the conduit box or oversized conduit boxes.

PART 3 - EXECUTION

3.1 INSPECTION. Equipment installed in existing facilities with limited access shall be suitable for being installed through available openings. Contractor shall field verify existing opening dimensions and other provisions for installation prior to submittal of bids.

3.2 PREPARATION.

3.2.01 Surface Preparation. All surfaces to be field painted shall be dry and free of dirt, dust, sand, grit mud, oil, grease, rust, loose mill scale, or other objectionable substances, and shall meet the recommendations of the paint manufacturer for surface preparation. Cleaning and painting operations shall be performed in a manner which will prevent dust or other contaminants from getting on freshly painted surfaces. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss of previously painted surfaces shall be dulled if necessary for proper adhesion of top coats.

3.3 INSTALLATION. Piping, fixtures, equipment, and materials furnished under this section shall be installed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Unless otherwise indicated, sleeves shall be provided for all pipe penetrations through concrete and masonry walls. Sleeves and sealing requirements shall be as indicated in Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies and as indicated on the drawings. Piping penetrations through fire-rated floors and walls shall be provided with fire-rated sleeves, sealants, and devices as necessary to maintain the rating of the assembly.

Not all required reducing fittings and unions are indicated. Additional fittings and unions shall be provided as needed to connect all equipment and appurtenances.

Insulating fittings shall be provided to prevent the contact of dissimilar metals in piping systems as specified Master Specification Section 15065, Miscellaneous Steel Pipe, Tubing and Accessories.

Fuel gas pressure regulator vents and fuel train vent valves shall be piped to the exterior of the building.

Piping shall not be routed over or in front of electrical switchboards or panels unless acceptable to Engineer.

3.3.01 Water Supply Piping and Accessories. Water hammer arresters shall be provided in the hot and cold water supply piping at all quick closing valves, at solenoid valves, and at plumbing fixtures. When not indicated on the drawings, arresters shall be located and sized by Contractor in accordance with PDI Standard No. WH201. Contractor shall submit arrester location and sizing plans to Engineer for approval prior to installation. Where possible, water hammer arresters shall be installed in an accessible location.

Water supply piping to hose faucets and hose valves shall be secured with a pipe support within 6 inches (150 mm) of the fixture.

3.3.02 Drainage and Vent Piping and Accessories. Unless otherwise indicated or required by code, horizontal sanitary drainage piping 3 inches (75 mm) in diameter or smaller shall be installed at a uniform slope of 1/4 inch per foot (2 percent); horizontal sanitary drainage piping larger than 3 inches (75 mm) in diameter shall be installed at a uniform slope of 1/8 inch per foot (3 mm/300 mm); horizontal storm drainage piping shall be installed at a uniform slope of 1/8 inch per foot (3 mm/300 mm).

All cast iron, polypropylene, and PVC sanitary and storm drainage piping which is buried beneath floors shall be encased in at least 6 inches (150 mm) of concrete when required. A joint shall be provided in the piping within 12 inches (300 mm) of each end of the encasement.

Drainage fittings shall be installed to convey flow in the piping in the intended direction. To the extent possible, changes in direction shall be made by sweep type fittings. Quarter-bends and sanitary tee fittings shall not be installed for vertical to horizontal or horizontal to horizontal changes of direction.

Plumbing vents through roofs shall be located at least 12 inches (300 mm) from a parapet or from the intersection of a cant with the roof deck, and shall be installed with watertight flashings. Plumbing vents shall be located no closer to operable windows or air intakes than is allowed by the applicable code.

Vents connecting to horizontal sanitary piping shall connect above the centerline of the piping and shall rise at an angle of not less than 45 degrees from the horizontal to a point at least 6 inches (150 mm) above the flood level rim of the fixture served before offsetting horizontally.

Floor drains shall be adjusted to the correct elevation for proper drainage. Floor cleanouts shall be installed flush with the finished floor. Heads of fastening screws shall be flush with the cover or grate surface.

Cleanouts on sanitary and storm piping inside structures shall be located where indicated on the drawings. Additional cleanouts shall be provided where required by the applicable code or authority having jurisdiction. Cleanouts located in sanitary and storm drain risers shall be located 12 inches (300 mm) above the finished floor.

Unless otherwise indicated, floor cleanout size shall equal the line size for 4 inch (100 mm) and smaller drainage piping, and 4 inches (100 mm) in diameter for drains larger than 4 inch (100 mm). Proper clearance shall be provided for access to cleanouts.

Floor drains, trench drains, floor sinks, and bell-up drains indicated to be equipped with traps shall be provided with deep seal "P" traps located as close to the drain as possible.

Roof drains shall be set at the proper level for flashing and drainage and shall be securely attached to the roof decks to prevent movement. Overflow roof drain dams or standpipes shall be set at an elevation 2 inches (50 mm) above the low point of the roof.

3.3.03 Plumbing Fixtures and Accessories. Plumbing fixtures shall be set level and plumb, and shall be securely attached to the floor or wall. Unless otherwise indicated on the drawings, each fixture shall be mounted at the height recommended by the manufacturer. Where required to be in compliance with ADA, fixtures shall be mounted at the heights established by the Federal Government.

Fixtures shall be sealed to the floor or wall with a sealant as specified in Master Specification Section 07600, Caulking and Sealers. The color of sealant shall match the color of the fixture.

Fixture traps shall be easily removable for servicing and cleaning. Escutcheons shall be placed at all locations where fixture supply or drain piping penetrates walls, floors, or ceilings.

Water piping at stop valves, shower heads, and flush valves shall be rigidly secured to blocking. Drop-ear elbows shall be used whenever possible. All water supply piping shall be cleaned and flushed before the plumbing fixtures are installed.

3.3.04 Plumbing Equipment. Plumbing equipment shall be installed in accordance with the manufacturer's recommendations. Adequate clearance shall be provided for access to all components which may require adjustment, servicing, or replacement.

Water heaters shall be installed in accordance with AGA, NSF, NFPA, and UL requirements. Storage type water heaters shall be cleaned and flushed before being connected to the potable water system. Water heater relief valves shall be piped to the nearest drain or as indicated on the drawings, and shall terminate the appropriate air gap distance above the drain.

3.4 FIELD QUALITY CONTROL.

3.4.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

All costs for these services shall be included in the Contract Price.

3.4.02 Startup and Testing. Field performance tests shall be conducted to demonstrate that each system is functioning as specified and to the satisfaction of Engineer.

Field performance testing of the plumbing piping systems shall conform to Master Specification Section 15060, Miscellaneous Piping and Pipe Assemblies.

If inspection or tests indicate defects, the defective work or material shall be replaced, and inspection and tests repeated. All repairs to piping shall be made with new materials. Caulking of threaded joints or holes will not be acceptable.

3.5 ADJUSTING. All flush valves and other devices shall be adjusted for proper flow and quiet operation. Faucet and supply assemblies shall be adjusted or repaired to eliminate leaks. All drains shall be checked for proper operation.

3.6 PROTECTION. Plumbing fixtures, equipment, and appurtenances shall be protected from damage immediately after installation. Plumbing fixtures shall not be used during the construction.

3.7 CLEANING. After completion of testing and immediately before the final inspection, plumbing fixtures, equipment, piping, and appurtenances shall be thoroughly cleaned. Cleaning materials and methods shall be as recommended by the manufacturer. All faucet aerators shall be removed, cleaned, and reinserted.

Any stoppage, discoloration, or other damage to parts of the building, its finish, or furnishings shall be repaired at no additional cost to Owner.

3.8 DISINFECTION. Before the potable water system is placed in operation, it shall be disinfected in accordance with the requirements of the local authority having jurisdiction. In the absence of local requirements, the following disinfection method shall be used:

1. The system shall be purged with clean potable water until all dirt and other substances are flushed from the system.

2. The system shall be filled with a water/chlorine solution containing at least 50 parts per million (50 mg/L) of available chlorine and allowed to stand for 24 hours; or the system shall be filled with a water/chlorine solution containing at least 200 parts per million (200 mg/L) of available chlorine and allowed to stand for 3 hours.

3. The system shall be purged with clean potable water until the chlorine is flushed from the system.

4. The procedure shall be repeated if a bacterial examination indicates that contamination remains present in the system.

3.9 OPERATOR INSTRUCTION AND TRAINING. After completion of the field testing, operator instruction and training on equipment and system operation shall be provided. The training should provide a complete overview of all equipment, testing, adjusting, operation, and maintenance procedures. The training shall take the form of classroom instruction and shall cover:

Documentation in the final Operation and Maintenance Manuals.

Use the Operation and Maintenance Manuals.

Equipment and system startup and shutdown.

System operation procedures for all modes of operation.

Procedures for dealing with abnormal conditions and emergency situations for which there is a specified system response.

The training shall take the form of classroom sessions at the project site conducted by the equipment manufacturer representatives who are knowledgeable and familiar with the project. Hands-on instruction and training will be conducted so that actual operation and maintenance of the equipment and systems can be performed by Owner upon completion of the training. The length of the operator instruction and training shall be as indicated.

At least two weeks prior to the proposed date for the operator instruction and training session, Contractor shall notify Engineer and shall submit an outline for the proposed operator instruction and training session. The proposed outline shall be approved before any training is conducted.

End of Section

SECTION 15430

BACK FLOW PREVENTERS

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installing of backflow preventers and associated appurtenances.

1.2 RELATED DOCUMENTS. Drawings and general provisions of the Contract, including Division 1 Specification Section, apply to this Section.

1.3 SUBMITALS.

1.3.01 Drawings and Data. Complete fabrication and assembly drawings, together with detail specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Mater Specification Section 01080, The data and specifications for each unit shall include, but shall not be limited to the following:

Name of Manufacturer.

Type and model.

Net weight.

Unit dimensions.

Performance curves indicating flow capacity versus pressure drop.

Manufacturer shall submit certification that each backflow preventer and all appurtenances furnished is in accordance with the reference standards. Submit pressure, vacuum and temperature ratings of backflow preventer.

Contractor shall submit results of all pressure and leakage testing.

Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manual shall be submitted in accordance with Master Specification section 01160, Training and Operation Manuals.

PART 2 - PRODUCTS

2.1 BACKFLOW PREVENTERS*.* Shall be Febco-860, Watts Regulator Company–909, or as approved.

Provide an air gap fitting between relief valve outlet and drain line. Provide all required drain piping and fittings from the relief valve outlet to the nearest floor drain or other approved outlet.

2.1.01 Reduced Pressure Backflow Preventers. AWWA/ANSI C511; ductile iron body, epoxy coated interior and exterior, and flagged resilient seated gate valve on each end of the device. Flange diameter and drilling shall confirm to ANSI/ ASTM B16.1, Class 125.

2.1.02 Double Check Valve Assemblies. ANSI/ASSE 1012; bronze body with corrosion- resistant internal parts and stainless steel springs; and two independently operating check valves.

PART 3 – EXECUTION

3.1 INSTALLATION. Install in accordance with manufacturer's instructions.

Pipe relief from backflow preventer to nearest drain.

End of Section

SECTION 15480

GENERAL SERVICE COMPRESSED AIR PIPING

PART 1 - GENERAL

1.1 SCOPE. This section covers general service compressed air piping to be installed in the Rack and Grit building indicated in the Contract Documents.

1.2 SUMMARY. This Section includes piping and related specialties for general-service compressed-air systems operating at 100 psig (1380 kPa) and less.

1.3 RELATED SECTIONS. Related Sections include the following:

Division 15 Section 15130- “Indicating Devices” for thermometers and pressure gages.

Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.3 DEFINITIONS.

ABS: Acrylonitrile-butadiene-styrene plastic.

CR: Chlorosulfonated polyethylene synthetic rubber.

EPDM: Ethylene-propylene-diene terpolymer rubber.

FPM: Vinylidene fluoride-hexafluoropropylene copolymer rubber.

HDPE: High-density polyethylene plastic.

Low-Pressure Compressed-Air Piping: System of compressed-air piping and specialties operating at pressures of 125 psig (860 kPa) and less.

1.4 SUBMITTALS. All submittals required in this section shall be provided in accordance with Master Specification Section 01080, Project Submittals, unless otherwise indicated.

1.4.01 Product Data. Submit product data for the following:

Pipes, tubes, and fittings.

Flexible pipe connectors.

Safety valves.

Pressure regulators.

Filters.

Automatic drain valves.

Hose couplings.

Hose assemblies.

1.4.02 Coordination Drawings. For general-service compressed-air systems. Include relationship to other services that serve same work area.

1.4.03 Brazing Certificates. As required by ASME Boiler and Pressure Vessel Code, Section IX, or AWS B2.2.

1.4.04 Welding Certificates. As required by ASME Boiler and Pressure Vessel Code, Section IX.

1.4.05 Field quality-control test reports. Submit reports with results of field quality-control tests.

1.5 QUALITY ASSURANCE.

1.5.01 Brazing. Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications," or AWS B2.2, "Standard for Brazing Procedure and Performance Qualification."

1.5.02 Welding. Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

1.5.03 Standards. Comply with the following:

ASME B31.1, "Power Piping," for high-pressure compressed-air piping.

ASME B31.9, "Building Services Piping," for low-pressure compressed-air piping.

PART 2 - PRODUCTS

2.1 MANUFACTURERS. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection.

2.1.01 Available Manufacturers. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

2.2 PIPING MATERIALS. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.3 PIPES, TUBES, AND FITTINGS.

2.3.01 Schedule 80, Steel Pipe. ASTM A 53/A 53M, Type E or S, Grade A or B, black or hot dip, zinc coated. Provide Type S, Grade B, and hot-dip zinc-coated pipe options if indicated.

2.3.01.01 Steel Nipples. ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106, Schedule 80, galvanized seamless steel pipe. Include ends matching joining method.

2.3.01.02 Malleable-Iron Fittings. ASME B16.3, Class 150 , threaded. Provide Class 300 and galvanized finish if indicated.

2.3.01.03 Malleable-Iron Unions. ASME B16.39, Class 150 , threaded. Provide Class 300 if indicated.

2.3.01.04 Steel-Piping Grooved-End Fittings. ASTM A 47/A 47M, malleable-iron casting; ASTM A 106, steel pipe; or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe; and made by keyed-coupling manufacturer. Provide galvanized finish if indicated. Available Manufacturers:

Central Sprinkler Co.; Central Grooved Piping Products.

Grinnell Corp.

Star Pipe Products, Inc.; Star Fittings Div.

Victaulic Corp. of America.

Ward Manufacturing, Inc.

2.3.02 Transition Couplings for Metal Piping. Metal coupling or other manufactured fitting same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

2.3.03 Flexible Pipe Connectors. Corrugated tubing with wire-braid covering. Available Manufacturers:

ANAMET Inc.

Flex-Hose Co., Inc.

Flexicraft Industries.

Hyspan Precision Products, Inc.

Mercer Rubber Co.

Metraflex, Inc.

Proco Products, Inc.

Unaflex, Inc.

2.3.04 Stainless-Steel-Hose/Steel Pipe Flexible Pipe Connectors. Corrugated-stainless-steel tubing with stainless-steel wire-braid covering and ends welded to inner tubing.

Working-Pressure Rating: 200 psig (1380 kPa) minimum.

End Connections NPS 2 (DN 50) and Smaller: Threaded steel pipe nipple.

End Connections NPS 2-1/2 (DN 65) and Larger: Flanged steel nipple.

Refer to Division 15 Section 15019 "Exposed Piping Installation" for joining materials not in this Section.

2.4 VALVES.

2.4.01 General-Duty Valves. Refer to Division 15 following sections:

Section 15091, "Miscellaneous Ball Valves" "Valves"

Section 15093, "Check Valves"

Section 15096, "Globe Valves"

Section 15100, "Miscellaneous Valves"

2.5 SPECIALTIES.

2.5.01 Safety Valves. ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," construction; National Board certified, labeled, and factory sealed; constructed of bronze body with poppet safety valve for compressed-air service.

Pressure settings to be higher than discharge pressure and same or lower than receiver pressure rating.

2.5.02 Air-Main Pressure Regulators. Bronze body, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 250-psig (1725-kPa) inlet pressure, unless otherwise indicated.

Type: Pilot operated.

2.5.03 Air-Line Pressure Regulators. Aluminum alloy or plastic body, diaphragm operated, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 100-psig minimum inlet pressure, unless otherwise indicated.

2.5.04 Mechanical Filters. Two-stage, mechanical-separation-type, air-line filters in sizes and ratings indicated. Equip with deflector plates, resin-impregnated-ribbon-type filters with edge filtration, and drain cock.

2.5.05 Automatic Drain Valves. Corrosion-resistant metal body and internal parts, rated for 100-psig (1380-kPa) minimum working pressure, capable of automatic discharge of collected condensate.

2.5.06 Hose Couplings. Shall be Chicago Fitting type. Assembly with locking-mechanism feature for connection and disconnection of compressed-air hose.

Available Manufacturers:

Aeroquip Corporation.

Bowes Manufacturing, Inc.

Parker Hannifin Corporation; Fluid Connectors Group; Quick Coupling Div.

Rectus GMBH; Parker Div.

Schrader-Bridgeport; Amflo Div.

Schrader-Bridgeport/Standard Thomson.

Snap-Tite, Inc.

TOMCO Products Inc.

Tuthill Corporation; Hansen Coupling Div.

2.5.07 Hose Assemblies. Compatible hose, clamps, couplings, and splicers suitable for compressed-air service, of nominal diameter indicated, and rated for 200-psig (2070-kPa minimum working pressure, unless otherwise indicated.

Hose: Reinforced single wire-braid, CR-covered hose for compressed-air service.

Hose Clamps: Stainless-steel clamps or bands.

Hose Couplings: Two-piece, straight-through, threaded brass or stainless-steel O-ring or gasket-seal swivel coupling with serrated ends for connecting two sections of hose.

Hose Splicers: One-piece, straight-through brass or stainless-steel fitting with serrated ends for connecting two sections of hose.

2.6 IDENTIFICATION. Refer to Division 15 Section 15825 "Mechanical Identification" for identification of piping, valves, gages, and specialties.

PART 3 - EXECUTION

3.1 PREPARATION.

3.1.01 Interruption of Existing Compressed-Air Service. Do not interrupt compressed-air service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary compressed-air service according to requirements indicated:

Notify Owner not less than 25 days in advance of proposed interruption of compressed-air service.

Do not proceed with interruption of compressed-air service without Owner's written permission.

3.2 PIPING APPLICATIONS. Install nipples, flanges, unions, transition and special fittings, and valves with pressure ratings same as or higher than system pressure rating used in applications below, unless otherwise indicated.

3.2.01 Joining of Dissimilar Metal Piping. Use dielectric fittings. Refer to Division 15 Section 15019 "Exposed Piping Installations" for dielectric fitting types.

NPS 2 (DN 50) and Smaller: Dielectric unions.

NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Dielectric flanges.

3.2.02 Specialty and Equipment Flanged Connections. Use cast-copper-alloy companion flange with gasket and brazed joint for connection to copper tube.

3.2.03 General-Service Compressed-Air Piping Between Air Compressors And Air Receivers. Use metal general-service compressed-air piping between air compressors and air receivers. Use of plastic piping for this application is prohibited.

3.2.04 Low-Pressure Compressed-Air Piping between Air Compressors and Receivers. Use any of the following piping materials for each size range:

NPS 2 (DN 50) and Smaller: Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

3.2.05 Low-Pressure Compressed-Air Distribution Piping. Use any of the following piping materials for each size range:

NPS 2 (DN 50) and Smaller: Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

3.2.06 Receivers. Use the following piping materials for each size range:

NPS 2 (DN 50) and Smaller. Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

NPS 2-1/2 to NPS 4 (DN 65 to DN 100). Schedule 80, black-steel pipe; threaded malleable-iron fittings; and threaded joints.

3.3 VALVE APPLICATIONS.

3.3.01 General-Duty Valves. Refer to Division 15 Section 15010 "Valve Installation" for metal general-duty valves. Use metal valves, unless otherwise indicated.

3.3.01.01 Metal General-Duty Valves. Use valve types specified in the schedule of valves in Division 15 Section 15010 "Valve Installation" according to the following:

Low-Pressure Compressed Air: Valve types specified for low-pressure compressed air.

Equipment Isolation NPS 2 (DN 50) and Smaller: Safety-exhaust copper-alloy ball valve with exhaust vent and pressure rating at least as great as piping system operating pressure.

Grooved-end valves may be used with grooved-end piping and grooved joints.

3.4 PIPING INSTALLATION. Refer to Division 15 Section 15019 "Exposed Piping Installation” for basic piping installation.

Install air and drain piping with 1 percent slope downward in direction of airflow.

Install eccentric reducers where piping is reduced in direction of flow, with bottoms of both pipes and reducer fitting flush.

Install branch connections to compressed-air mains from top of main. Provide drain leg and drain trap at end of each main and branch and at low points.

Install flexible pipe connector on each connection to air compressors.

Install thermometer and pressure gage on discharge piping from each air compressor and on each receiver; install according to Division 15 Section 15130 "Indicating Devices."

Install pipe expansion joints and anchors according to Division 15 Section 15019 "Exposed Piping Installation."

3.5 VALVE INSTALLATION. Refer to Division 15 Section 15019 "Exposed Piping Installation" for basic piping and valve installation.

Install metal general-duty valves according to Division 15 Section 15010 "Valve Installation."

Install plastic valves according to plastic piping manufacturer's written instructions.

Install shutoff valve at each connection to and from general-service compressed-air specialties, equipment, and accessories. Install strainer if indicated.

Install check valves to maintain correct direction of fluid flow to and from compressed-air piping specialties and equipment.

Install safety valves on receivers in quantity and size to relieve at least the capacity of connected air compressors.

Install automatic drain valves on intercoolers, aftercoolers, receivers, and dryers. Discharge condensate over nearest floor drain.

Install safety valves where recommended by specialty manufacturers.

3.6 JOINT CONSTRUCTION. Refer to Division 15 Section 15019 "Exposed Piping Installation" for basic piping joint construction.

Pressure-Seal Joints. Select correct type of O-ring seals. Make joints with fitting manufacturer's tools and according to fitting manufacturer's written instructions.

Grooved Joints. Select correct type of gasket. Assemble joints with keyed-coupling housing, gasket, lubricant, and bolts according to coupling manufacturer's written instructions. Do not apply lubricant to pre-lubricated gaskets.

Copper Tubing Joints. Join copper tubing with brazed joints. Use silver-composition or copper-phosphorus-composition filler metal and comply with CDA's "Copper Tube Handbook," Section VII, "Brazed Joints."

Dissimilar Metal Piping Material Joints. Use dielectric fittings.

3.7 HANGER AND SUPPORT INSTALLATION. Refer to Division 15 Section 15140 "Pipe Supports" for pipe hanger and support devices. Install the following:

Vertical Piping: MSS Type 8 or 42, clamps.

Individual, Straight, Horizontal Piping Runs: According to the following:
100 Feet (30 m) and Less: MSS Type 1, adjustable, steel, clevis hangers.

Longer Than 100 Feet (30 m): MSS Type 43, adjustable, roller hangers.

Longer Than 100 Feet (30 m), if Indicated: MSS Type 49, spring cushion rolls.

Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.

Base of Vertical Piping: MSS Type 52, spring hangers.

Install supports according to Division 15 Section 15140 "Pipe Supports."
Support horizontal piping within 12 inches (300 mm) of each fitting and coupling.

Support vertical piping and tubing at base and at each floor.

Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch (10-mm) minimum rods.

Install hangers for Schedule 80, steel piping with the following maximum horizontal spacing and minimum rod diameters:

NPS 1/4 to NPS 1/2 (DN 8 to DN 15): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.

NPS 3/4 to NPS 1-1/4 (DN 20 to DN 32): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.

NPS 1-1/2 (DN 40): 12 feet (3.7 m) with 3/8-inch (10-mm) rod.

NPS 2 (DN 50): 13 feet (4 m) with 3/8-inch (10-mm) rod.

NPS 2-1/2 (DN 65): 14 feet (4.3 m) with 1/2-inch (13-mm) rod.

NPS 3 (DN 80): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.

NPS 3-1/2 (DN 90): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.

NPS 4 (DN 100): 17 feet (5.2 m) with 5/8-inch (16-mm) rod.

Install supports for vertical, Schedule 80, steel piping every 15 feet (4.6 m).

NPS 3-1/2 (DN 90): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.

NPS 4 (DN 100): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.

NPS 3 (DN 80): 68 inches (1730 mm) with 1/2-inch (13-mm) rod.

NPS 4 (DN 100): 76 inches (1900 mm) with 1/2-inch (13-mm) rod.

All Sizes: Install continuous support for piping with compressed air at normal operating temperature above 100 deg F (38 deg C)

NPS 1/2 (DN 15): 30 inches (760 mm) with 3/8-inch (10-mm) rod.

NPS 3/4 (DN 20): 36 inches (910 mm) with 3/8-inch (10-mm) rod.

NPS 1 (DN 25): 40 inches (1015 mm) with 3/8-inch (10-mm) rod.

NPS 1-1/4 (DN 32): 43 inches (1090 mm) with 3/8-inch (10-mm) rod.

NPS 1-1/2 (DN 40): 49 inches (1245 mm) with 3/8-inch (10-mm) rod.

NPS 2 (DN 50): 55 inches (1400 mm) with 3/8-inch (10-mm) rod.

NPS 3 and NPS 4 (DN 80 and DN 100): 96 inches (2440 mm) with 1/2-inch (13-mm) rod.

3.8 CONNECTIONS. Drawings indicate general arrangement of piping, fittings, and specialties.

Install piping adjacent to specialties and equipment to allow service and maintenance.

Connect piping to air compressors, accessories, and specialties with shutoff valve and union or flanged connection.

3.9 LABELING AND IDENTIFICATION. Install identifying labels and devices for general-service compressed-air piping systems. Refer to Division 15 Section 15825 "Mechanical Identification" for labeling and identification materials.

3.10 FIELD QUALITY CONTROL. Perform the following field tests and inspections and prepare test reports:

Test and adjust piping safety controls. Replace damaged and malfunctioning safety controls.

Piping Leak Tests: Test new and modified parts of existing piping. Cap and fill general-service compressed-air piping with oil-free dry air or gaseous nitrogen to pressure of 50 psig (345 kPa) above system operating pressure, but not less than 150 psig (1035 kPa). Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours with no drop in pressure.

Repair leaks and retest until no leaks exist.

Report results in writing.

End of Section

SECTION 15482

LABORATORY COMPRESSED AIR SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers laboratory compressed air systems to be installed in the locations indicated in the Contract Documents.

The compressed air package shall include a compressor, an electric drive motor, a motor starter, belts, sheaves, safety guards, receiver, air dryer, controls, traps, valves, piping, baseplate, and all accessories and appurtenances specified, indicated on the drawings, or otherwise required for a complete, properly operating installation.

All required interconnecting air piping and valves between package components shall be provided under this section.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Components of the compressed air equipment package shall be the latest standard products of manufacturers who regularly produce equipment of this type.

All components of the compressed air equipment package shall be shop assembled on a common baseplate. The arrangement shall permit access from the front and ends of the package for maintenance of components.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Power Supply. Power supply to the compressors will be 480 volts, 60 Hz, 3 phase. Power supply to the dryer will be 120 volts, 60 Hz, single phase.

1.3 SUBMITTALS. Complete assembly and installation drawings, together with detailed specifications and data covering all equipment and accessories furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Electrical schematics, wiring diagrams, and panel layout drawings for compressor controls shall be included. Data and specifications for each unit shall include, but shall not be limited to, the following:

Baseplate

Overall dimensions.

Number, size, and location of structural members.

Thickness of top plate.

Number, size, and location of grout openings.

Drawings indicating pipe routing, traps, and valve locations.

Compressor

Manufacturer.

Type and model.

Piston speed.

Dimensions.

Weight, including motor.

Performance data at variable discharge pressures.

Bearing data.

Motors

Manufacturer.

Type and model.

Horsepower (kW) rating and service factor.

Temperature rating.

Full load rotative speed.

Type of bearings and lubrication.

Full load current.

Locked rotor current.

Efficiency at nameplate rating and at operating point.

Power factor at nameplate rating.

Receiver

Capacity.

Pressure rating.

Dimensions.

Connection sizes and locations.

Verification of ASME Code stamp.

Air Dryer

Manufacturer.

Model.

Performance data.

Pressure drop.

1.4 OPERATION AND MAINTENANCE MANUALS. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.6 SPARE PARTS. The following spare parts shall be furnished for each compressed air equipment package:

Part Description	Number Required
Intake air filter elements	2

V-belts	2 matched sets
Inlet valve assembly	1
Inlet valve springs	1 set
Discharge valve assembly	1
Discharge valve springs	1 set
Piston rings	1 set for each size piston

Spare parts shall be suitably packaged in accordance Master Specification Section 01180, Equipment, Materials, Parts, and Tools. Spare parts shall be delivered to Owner as directed.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The system shall supply compressed air to laboratory outlets only. The air shall be dry and oil free.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The performance and design requirements shall be as indicated.

The approximate elevation of the site will be as indicated on the drawings. All equipment furnished shall be designed to meet all specified conditions and to operate satisfactorily at this elevation.

2.3 CONSTRUCTION.

2.3.01 Compressors. The compressors shall be single or two-stage as indicated, air-cooled reciprocating type and shall deliver oil-free air. Pistons shall be fabricated from materials which do not require oil lubrication. Cylinders and crankcases shall be of cast iron construction. Piston rings shall be teflon. Compressor cylinder valves shall be of the finger, channel, leaf, or ring type and shall be fabricated from corrosion-resistant materials suitable for nonlubricated service. Cylinders and cylinder heads shall be designed so that the compressor sheave provides all required external forced air circulation. The compressors shall be constructed with a distance piece between the compression cylinder and the crankcase lubricant system. The distance piece shall consist of an atmospheric chamber arranged to drain back into the crankcase. Portions of the piston rod in contact with the lower seal shall not enter the upper seal area. A collar shall be provided on the piston rod to prevent oil from traveling along the rod. Piston rod packing shall be teflon or carbon, nonlubricated type.

Each crankshaft shall be cradle-mounted with antifriction roller or ball type main bearings. Connecting rod bearings shall be steel backed, babbitt-lined, insert type plain bearings. Connecting rod and crankshaft bearings shall be lubricated by a force feed positive lubrication system. A lubrication system pressure gauge, of the compressor manufacturer's standard size and range, shall be furnished with each compressor.

Each compressor shall be driven by an electric motor connected to the compressor through a V-belt drive.

2.3.02 Package Receiver. The receiver shall be of all welded construction with semi-ellipsoidal heads and leg supports for vertical mounting on the common baseplate. The receiver shall be designed and constructed in accordance with the ASME Code for Unfired Pressure Vessels and shall bear the code stamp.

The receiver shall be provided with piping connections for inlet, outlet, drain, safety valve, compressor control, receiver vent, and cleanout opening. The receiver shall be hot-dip galvanized and shall have an automatic float-operated condensate drain trap.

2.3.03 Air Dryer. The air dryer shall be of the air-cooled noncycling refrigerant type and shall produce a 33 to 39°F (1 to 4°C) pressure dew point at the heat exchanger exit when operating continuously at the design conditions. The air dryer shall be Hankison Refrigifilter "Model 8025", or approved equal.

The dryer shall consist of a heat exchanger, separators, hermetically sealed refrigeration unit, and self-regulating hot gas bypass valve. The dryer shall be completed with "On-Off" manual motor switch, running light, evaporator performance gauge, intake air thermometer, and automatic float-operated condensate drain trap. The dryer shall include a condenser, integral moisture separator, and a cartridge filter of the acetate fiber type, completely enclosed in an ASME pressure vessel and designed for a pressure of 150 psi (1035 kPa).

2.3.04 Piping. All interconnecting piping and tubing between components of the equipment package shall be shop installed.

Piping from the compressor discharge to the receiver shall be sized not less than the compressor discharge connection size and shall be ASTM A53, seamless, Grade B, Schedule 40 black steel pipe with ANSI B16.11, Class 3000, forged steel socket-welding fittings, or Schedule 80 black steel pipe with Class 3000 forged steel threaded fittings. "Close" nipples will not be acceptable.

Pneumatic control and instrument tubing connected directly to the compressor shall be ASTM A269, Type 304 or 316 stainless steel tubing with Parker Hannifin "CPI", Crawford "Swagelok", or approved equal, Type 316 stainless steel compression fittings. Tubing shall be not less than 1/4 inch (25 mm) OD with a wall thickness of 0.028 inch (0.71 mm).

Piping between the package receiver and the air dryer shall be ASTM B88, Type K, hard drawn copper tubing with ANSI B16.18 or B16.22 solder-joint fittings.

All piping and tubing shall be run in vertical and horizontal planes and shall not contact the baseplate. Piping shall be arranged to ensure that undue stresses from thermal expansion are not transmitted to equipment components. All control and instrument tubing shall be continuously supported.

Compressor discharge piping shall be sloped to drain to the receiver and shall include a drip trap to prevent condensate in the discharge piping from draining back to the compressor.

Drainlines from each compressor, air dryer, and receiver shall be piped to the edge of the baseplate. Receiver and air dryer drainlines shall be combined downstream of the traps.

2.3.05 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) opening galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized. All safety guards in outdoor locations shall be designed to prevent the entrance of rain and dripping water.

2.3.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of the equipment by Owner. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

2.3.07 Equipment Bases. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes.

The baseplate shall be constructed of heavy steel plate and structural members and shall be designed for not measurable deflection with the equipment mounted thereon and the baseplate supported around its perimeter. The base shall be designed so that all equipment bolted to it can be removed without access to the underside of the plate and with a flat top surface for ease of cleaning. Structural stiffeners shall be located under the compressors at the compressor anchor points. A drip lip will not be required.

2.3.08 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion
Anchors, unless otherwise indicated on the drawings.

2.3.09 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.3.10 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for coating as recommended by the paint manufacturer for the intended service, and then shop coated with one or more coats of the specified primer.

Machined and polished surfaces shall be coated with rust-preventive compound as recommended by the manufacturer.

All iron and steel surfaces, except galvanized surfaces and stainless steel, shall be thoroughly cleaned, sanded, and shop primed with one or more coats of universal primer, followed by two or more finish coats of epoxy enamel.

Galvanized surfaces shall be prepared for coating in accordance with the instructions of the primer manufacturer. Galvanized surfaces shall be shop primed with two or more coats of universal primer, followed by two or more finish coats of epoxy enamel.

Stainless steel, nonferrous metallic, and nonmetallic surfaces shall not be coated.

Epoxy enamel products for NSF certified systems shall be Ameron "Amerlock 400 High Solids Epoxy Coating", Carboline "Carboguard 891", Tnemec "Series N140 Pota-Pox Plus", or approved equal. Where NSF certification is not required, the epoxy enamel products shall be Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", Tnemec "Series 69 Hi-Build Epoxoline II", or approved equal.

The total paint dry film thickness, including prime coat and finish coats, shall be not less than 5 mils (125 µm). The color shall be safety green in accordance with ANSI Z53.1.

One quart of finish paint shall be provided with the equipment package for field touchup coating.

2.4 ACCESSORIES. Each compressed air equipment package shall be furnished with the following accessory equipment.

2.4.01 Valves.

2.4.01.01 Safety Valves. Safety valves with manual lifting levers shall be installed in the compressor discharge piping and on the receiver as indicated on the drawings. Valves in the compressor discharge piping shall be capable of protecting the compressors from damage when operating against a closed discharge valve and shall be suitable for the maximum compressor discharge air temperature.

The safety valve on the receiver shall be capable of protecting the receiver from excessive pressure.

2.4.01.02 Discharge Check Valves. A line-mounted check valve shall be provided in the discharge piping leading from the compressor. The check valves shall be sized in accordance with the manufacturer's recommendations and shall be suitable for service with reciprocating compressors at the maximum compressor discharge air temperature.

Check valves shall be disc and spring type, designed for installation in the discharge piping from reciprocating compressors, and shall be Hoerbiger "Compact-A-Check" valves, or approved equal. Combination unloading devices/check valves will not be acceptable.

2.4.01.03 Shutoff Valves. All shutoff valves shall be ball valves. Valves in steel piping shall have carbon steel bodies, chrome plated or stainless steel balls, and reinforced teflon seals and seats. Shutoff valves in stainless steel tubing shall be Type 316 stainless steel balls and reinforced teflon seals and seats. Valves in copper tubing shall have bronze bodies; chrome plated, stainless steel, or bronze balls; and reinforced teflon seals and seats. Valves in the compressor discharge piping shall be suitable for the maximum compressor discharge air temperatures.

2.4.01.04 Receiver Vent Valve. A globe type vent valve with bronze body and brass stem shall be provided on the each receiver.

2.4.02 Belts and Sheaves. All required belts and sheaves shall be furnished. Belts and sheaves shall be of the heavy-duty "V" type. Belts for each compressor shall be matched sets.

2.4.03 Intake Filter Silencers. Each compressor shall be provided with a bottom outlet, dry type intake filter silencer supported by the suction pipe and close-coupled to the compressor intake connection. Intake filter silencers shall have an outer cover and a replaceable filter element. Silencers shall be constructed of steel and shall be sized in accordance with the recommendations of the manufacturer. Sound attenuation shall be not less than 20 dB at 1,000 Hz; particle arrestance shall be not less than 99 percent at 25 micron size, and 70 percent at 5 micron size.

2.4.04 Pressure Gauges. Each pressure gauge shall have a phenol case, adjustable pointer, and stainless steel rotary geared movement. Each gauge shall be accurate to within 2 percent of full scale. Gauges shall have a minimum dial size of 4-1/2 inches (115 mm) and a range equal to approximately twice the normal operating pressure at the point of installation. The units of measurement shall be indicated on the dial face.

Panel-mounted gauges shall have a 1/4 inch (6 mm) NPT connection. All other gauges shall have a 1/2 inch (12.7 mm) NPT connection. All gauges shall be provided with a ball valve.

2.4.05 Pressure Switches. Each pressure switch shall have spdt contacts rated 10 amperes at 120 volts ac and shall be completed with shutoff valve. Pressure switches mounted inside the control panel shall have NEMA Type 1 housings.

2.4.06 Thermometers. Thermometers shall be of the remote reading mercury or gas actuated dial type. Thermometers shall have a minimum dial size of 4-1/2 inches (115 mm) and an adjustable pointer, and shall be accurate within 1 percent of full scale. Thermometers shall be furnished complete with a uniformly graduated dial indicator, armored capillary tube, bulb or temperature sensor, and thermowell. Thermometer ranges shall be such that the normal operating reading will be near the midpoint of the range. The units of measurement shall be indicated on the dial face. Spare capillary length shall be neatly coiled and tied.

Air piping shall be increased in size at the thermowell location so that the area between the well and the pipe is not less than the cross-sectional area of the original size piping. The entire sensitive length of the temperature sensor shall be installed within the airflow stream.

2.4.07 Temperature Switches. Temperature switches shall be remote bulb type with spdt contacts rated 10 amperes at 120 volts ac. Temperature switches shall have NEMA Type 1 housings, stainless steel thermowell assemblies, and armored capillaries. Capillary length shall be sufficient for mounting the switch inside the control panel. Spare capillary length shall be neatly coiled and tied.

Air piping shall be increased in size at the thermowell location so that the area between the well and the pipe is not less than the cross-sectional area of the original size piping. The entire sensitive length of the temperature sensor shall be installed within the airflow stream.

2.5 CONTROL EQUIPMENT. All control equipment for the compressor shall be furnished as necessary for a complete installation requiring only field connection of the remote alarm, and electrical power supply supplies. Equipment shall include all control switches, pressure switches, timing relays, auxiliary relays, unloaders, circuit breaker combination magnetic motor starter and other accessories required for control of the compressor. The starter shall include a thermal-magnetic circuit breaker with external operating handle and a control transformer with a 120 volt secondary, one secondary lead fused and the other grounded. Starter overload (one per phase) shall be matched to motor current and shall be provided with a "Reset" push button.

All control equipment for the compressor package, except for the high discharge temperature switches and loading controls, for the compressor, shall be housed in a control panel of NEMA Type 12 construction, mounted on the package.

All system wiring shall be shop installed to terminal blocks in the control panel. Wiring from the panel to system components shall be completely enclosed in liquid-tight flexible conduit.

All pneumatic tubing shall be shop installed to bulkhead fittings at the control panel. All field connections shall be made to the fittings at the panel.

2.5.01 Control Panel. The control panel shall be fabricated from 14 USS gage or heavier steel and shall be equipped with an approximately full-size gasketed door with chromium plated or stainless steel three-point latch and hinges. A screened vent shall be provided in the bottom of the control panel. All control devices shall be rigidly mounted within the enclosure except for breaker handles, selector switches, push buttons, and indicating lights, which shall be mounted on the panel door.

Numbered terminal blocks in the control panel and identical terminal blocks at the equipment shall be provided for those items needing field wiring between the control panel and the compressed air equipment. All items at the compressors shall be wired to terminal blocks.

Numbered bulkhead fittings at the control panel, corresponding to identical numbers at the equipment, shall be provided for all pneumatic tubing requiring field connections between the control panel and equipment. Internal panel tubing shall be run in horizontal and vertical planes and shall be rigidly supported to withstand handling and shipping without damage. Compression type bulkhead fittings shall be provided through the panel for all connections.

Internal panel wiring shall be neatly bundled and tied and shall be identified with suitable wire markers. Terminal blocks for external connections shall be furnished complete with marking strips, coves, and pressure connectors. A terminal shall be provided for each conductor or external circuits. All wiring shall be grouped or cabled and securely attached to the panel. Clearance for field wiring shall be provided between the terminal strips and base.

All panel equipment, wiring, and tubing shall be shop installed.

2.5.02 Compressor Control. The compressed air package shall be furnished with a control system which shall start and stop the compressors as necessary. The control system shall unload the compressors on shutdown and while coming up to speed during startup. Unloading shall be accomplished by inlet valve control.

Each compressor shall be provided with a control switch with "Lead-Off-Lag" positions. Two pressure switches with separately adjustable settings shall be furnished for the compressor, one for "Lead" and one for "Lag" control.

The control system shall start and stop the compressors at the following pressures:

Lead compressor start pressure, psig (kPa gauge)	90 (620)
Lag compressors start pressure, psig (kPa gauge)	100 (690)
Compressors stop pressure, psig (kPa gauge)	120 (830)

2.5.03 Protection Controls. A protection control system shall be provided for each compressor. The control system shall stop the compressor on high discharge air temperature.

2.5.04 Miscellaneous Controls. A dial type thermometer shall be furnished for the compressor air discharge. A package receiver pressure gauge and the compressor air discharge thermometers shall be mounted on a wing projection on top of the control panel.

White indicating lights shall be provided on the control panel to indicate the following alarm conditions:

Compressor motor overload.

High compressor discharge air temperature.

Low receiver pressure.

Indicating lights shall be heavy-duty, oiltight, semiflush type with escutcheon plates to identify the malfunction. A mechanical latching relay circuit with a common "Reset" push button shall be provided so that the alarm lights remain on until manually reset. The latching relays shall have a contact rated 10 amperes at 120 volts, which closes on alarm. An alarm light "Test" push button shall also be provided on the front of the control panel to test the lights simultaneously without actuating the remote alarm.

A normally open contact, which close under alarm conditions, shall be provided for remote alarm. The contact shall close when any alarm occurs. Contact shall be rated 10 amperes at 120 volts, 60 Hz, single phase.

The pressure switch for low receiver pressure shall have adjustable contacts set to close when the receiver pressure falls to 80 psig (550 kPa gauge).

The compressor shall be provided with an elapsed time hour meter mounted on the front of the control panel.

2.6 ELECTRIC MOTORS. Each motor shall be complete with an adjustable baseplate for mounting on the common baseplate. Motors shall be rated at 460 volts, 60 Hz, 3 phase.

Each V-belt drive shall include a sliding base or other suitable tension adjustment. V-belt drives shall have a service factor of at least 1.6 at maximum speed based on the nameplate horsepower (kW) of the drive motor. Drive units shall be designed for 24 hour continuous service.

2.7 SHOP TEST. Prior to shipment, the compressor and dryer shall be operated to check alignment; faulty equipment and controls; proper wiring; leaks in piping, seals, or wells; and proper operation of the safety and operating controls. Compressor pressure controls shall be adjusted to the specified pressures. Defective equipment and controls disclosed by such tests shall be replaced and the package placed in the satisfactory operating conditions before shipping. A statement from the package supplier certifying that the specified shop test has been performed shall be submitted to Engineer prior to shipment.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

End of Section

SECTION 15484

LABORATORY VACUUM SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers vacuum equipment serving the laboratory area, including the equipment, piping, valves, fittings, gauges, bases, anchor bolts, and other accessories and appurtenances required for a complete unit.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools, shall apply to all equipment furnished under this section.

1.2.02 Power Supply. The power supply to the equipment shall be as indicated.

1.2.03 Mechanical Identification.

1.2.03.01 Number Plates. Equipment specified herein shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Nameplates shall have black baked enamel letters on anodized aluminum plate. Number plate symbols and numbers shall be capitalized block letters with a minimum height of 3/4 inch (19 mm). Number plate height shall be twice the letter height. Number plates shall be at least 12 gage (2.66 mm) thickness. Number plates shall be installed with corrosion-resistant mechanical fasteners.

1.2.03.02 Equipment Plates. Equipment specified herein shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3 SUBMITTALS. Complete schematic and wiring diagrams, assembly and installation drawings, together with detailed specifications and data covering material used, power drive assembly, motors, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN REQUIREMENTS. Performance and design requirements shall be as indicated.

The approximate elevation of the site will be as indicated on the drawings. All equipment furnished shall be designed to meet all specified conditions and to operate satisfactorily at this elevation.

2.2 CONSTRUCTION. The vacuum system shall include, but shall not be limited to, simplex or duplex vacuum pumps as required, vacuum receiver tank, oil reclaimer, combination motor starters, control switches, piping, check valves, gauges and miscellaneous accessories to make a complete packaged unit.

2.2.01 Vacuum Pumps. Each pump shall be air-cooled, lubricated, rotary vane type and shall be driven by an electric motor mounted on the same base as the pump. The pumps and motors shall be factory mounted, wired, and piped on a horizontal receiver tank. The vacuum pumps shall be designed or equipped with a discharge exhaust filter or muffler to minimize discharge of oil to the atmosphere.

2.2.02 Receiver Tank. The receiver tank shall be horizontal type, of welded construction, with semi-ellipsoidal heads and with leg supports suitable for mounting on a concrete base. The tank shall be designed and constructed in accordance with the ASME Code for Unfired Pressure Vessels, shall bear the Code stamp, and the exterior shall be primed and painted with the manufacturers standard process. The tank shall have all necessary openings for inlet, discharge, drain, and gauge piping connections. A drain pipe and shutoff valve shall be provided on the bottom of the tank.

Rubber-in-shear vibration isolators shall be provided for mounting the tank to a concrete base.

2.2.03 Accessories. The unit shall be factory furnished with a vacuum gauge and vacuum switches piped to the tank. Additional vacuum system valves and miscellaneous piping and accessories shall be provided by Contractor as indicated on the drawings.

2.2.04 Controls. The vacuum pump unit shall be provided with a factory wired and installed control panel. The panel shall be rated NEMA Type 1 and shall include motor starters, vacuum switches, alternator, transformer, "TEST-OFF-AUTO" selector switches for each pump, and motor overload reset pushbuttons. The motor starters shall be combination magnetic motor starters with a magnetic motor circuit protector. Overloads shall be matched to the motors. Vacuum switches shall have a cut-out range of 5 to 25 inches Hg (16.9 to 84.6 kPa), and an adjustable differential of 4 to 12 inches Hg (13.5 to 40.6 kPa). Vacuum switch contacts shall be rated for 10 amperes at 120 volts ac.

2.2.05 Sequence of Operation. When the selector switches are placed in the "AUTO" position, the vacuum switches and alternator shall control vacuum pump operation in a start-stop or lead-lag manner, as required.

For start-stop pumps, upon a decrease in vacuum, the pump shall be energized. When the "Pump OFF" vacuum setpoint is reached, the pump shall be de-energized. Initial vacuum switch setpoints shall be as indicated in the following list:

Pump "ON"	17 inches Hg (57.5 kPa)
Pump "OFF"	21 inches Hg (71.1 kPa)

For lead-lag pumps, upon a decrease in vacuum, the lead pump shall be energized. If the vacuum continues to decrease, the lag pump shall also be energized. The lead and lag pumps shall be alternated on each cycle. Initial vacuum switch setpoints shall be as indicated below:

Lead pump "ON"	17 inches Hg (57.5 kPa)
Lag pump "ON"	15 inches Hg (50.8 kPa)
Pumps "OFF"	21 inches Hg (71.1 kPa)

2.2.06 Safety Guards. All belt or chain drives, fan blades, couplings, and other moving or rotating parts shall be covered on all sides by a safety guard. Safety guards shall be fabricated from 16 USS gage (1.52 mm) thick or thicker galvanized or aluminum-clad sheet steel or from 1/2 inch (12.7 mm) mesh galvanized expanded metal. Each guard shall be designed for easy installation and removal. All necessary supports and accessories shall be provided for each guard. Supports and accessories, including bolts, shall be galvanized.

2.2.07 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of the equipment by Owner. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

2.2.08 Equipment Bases. Unless otherwise indicated or specified, all equipment shall be installed on concrete bases at least 6 inches (150 mm) high. Cast iron or welded steel baseplates shall be provided for pumps, compressors, and other equipment. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components, and adequate grout holes. Baseplates for pumps shall have a means for collecting leakage and a threaded drain connection.

2.2.09 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.2.10 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.2.11 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

Baseplates shall be anchored to the concrete base with suitable anchor bolts and the space beneath filled with grout.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.3 CLEANING AND ADJUSTING. Upon completion of the work, all parts of the installation shall be thoroughly cleaned. All equipment, pipe, valves, and fittings shall be thoroughly washed to remove grease, metal cuttings, and dirt particles. Any stoppage or other damage caused by Contractor's failure to clean the piping system properly shall be repaired by Contractor without additional cost to Owner.

End of Section

SECTION 15486

DISTILLED WATER SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers distilled water systems, including required equipment, piping, valves, fittings, gauges, bases, anchor bolts, and other accessories and appurtenances required for a complete unit. The equipment shall be installed in the laboratory as indicated on the drawings.

The distribution piping, recirculation piping, and isolating valves shall be in accordance with the piping and valve sections.

1.2 GENERAL. Equipment furnished under this section shall be fabricated and assembled in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1.2.01 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment furnished under this section.

1.2.02 Power Supply. Except as otherwise specified, power supply to the equipment will be 480 volts, 60 Hz, 3 phase.

1.3 SUBMITTALS. Complete schematic and wiring diagrams, assembly and installation drawings, together with detailed specifications and data covering material used, power drive assembly, parts, devices, and other accessories forming a part of the equipment furnished, shall be submitted in accordance Master Specification Section 01080, Equipment, Project Submittals.

1.4 OPERATION AND MAINTENANCE DATA AND MANUALS. Adequate operation and maintenance information shall be supplied. The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered. Operation and maintenance manuals shall be submitted in accordance with Master Specification Section 01060, Training and Operation & Maintenance Manuals.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping, handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

PART 2 - PRODUCTS

2.1 CONSTRUCTION. Each distilled water system shall consist of one pretreatment filter, one water still, one storage tank, one circulation/distribution pump, post treatment filters, piping, and accessories normally included as part of a laboratory distilled water system.

2.1.01 Water Still. The unit shall be a classic tin lined copper and bronze still with low water cutoff, double wall evaporator, vented condenser, and a vapor baffle for pyrogen removal. The water still shall produce 5 gallons per hour (5.3 ml/s) distilled water with a minimum resistivity of 3000 Ω-m and shall be Barnstead "Model A 1015-D", or approved equal. The still shall have a fully automatic control system with an adjustable drain timer cycler. Control system shall be Barnstead "Model G2110", or approved equal. The still shall be mounted on a floorstand in the location indicated on the drawings. The still shall operate on 240 volts, 60 Hz, single phase. The solid-state low water cutoff box shall be provided with a separate 120 volt supply. Solid-state low water cutoff box shall supply power to open and close both inlet and outlet solenoid valves, shall provide terminal connections for both valves, LWCO probe, direct acting level monitor, and contactor controls. Reverse acting level monitor shall be powered from the recirculation pump motor starter CPT. The motor starter shall be provided under Master Specification Section 16050, Electrical General Requirements. Contactor for still, solid-state LWCO box, direct and reverse acting level monitors, inlet and outlet solenoid valves, and LWCO probe shall be provided by equipment manufacturer.

2.1.02 Storage Tank. The storage tank shall be copper with tin coating, 100 gallon (379 L) capacity and shall be Barnstead "Model No. B3047", or approved equal. The tank shall be provided with gauge glass, removable cover, tin-coated, draw off faucet, water inlet connection, water outlet connection, drain, pump suction connection, water seal, recirculation return connection, high and low level monitors, "Model H4005" ultraviolet lamp, low water cutoff, and "Model H3111" vent guard. The ultraviolet lamp shall be the immersion type and shall fit inside a transparent inert sheath. The lamp shall be provided with 10 "Model O4141" replacement bulbs. The tank shall be mounted on a floorstand at the location indicated on the drawings. The floorstand shall be fabricated of steel angle iron and shall be Barnstead "Model No. H1003", or approved equal.

2.1.03 Distribution/Recirculation Pump. The distribution/recirculation pump shall be 1-1/2 hp (1.12 kW), 3,450 rpm, horizontal centrifugal and shall be Barnstead Size DD Pump, "Catalog No. H1140", or approved equal, less the bypass piping. The pump shall pump to the distribution line which shall be piped back to the storage tank from the end of the distribution circuit. Pump housing and all wetted parts shall be AISI type 316 stainless steel. The pump shall be sealed with a teflon gasket, Viton O-ring and a John Crane Type 21 Viton/carbon/ceramic mechanical seal, or approved equal. The pump shall operate on 460 volts ac, 60 Hz, 3 phase. The pump shall be driven by a heavy-duty, totally enclosed, split case induction motor with ball bearing shaft supports. Included leads shall be contained in a junction box for connection to the power supply and to a low water cutoff located on the storage tank. Motor starter shall be furnished under Master Specification Section 16050, Electrical General Requirements.

2.1.04 Post Filters. Analytical grade post filters shall be installed at the locations indicated on the drawings. Each filter shall have a remote above counter mounted microprocessor controlled purity monitor and a remote above counter dispenser and shall be Barnstead "Model D4741", or approved equal with a "Model D5025" Type 1 cartridge kit, or approved equal.

Bioresearch grade, pyrogen free, post filters shall be installed at the locations indicated on the drawings. Each filter shall have a remote, above-counter mounted microprocessor controlled purity monitor and a remote above counter dispenser and shall be Barnstead "Model D4751", or approved equal with a "Model D5025" Type 1 cartridge kit, or approved equal.

2.1.05 Accessories. All accessories and appurtenances required to complete the installation of the distilled water package including all pipe, fittings, valves, cocks, gauges, and other accessories and appurtenances required to provide a workable and satisfactory installation shall be as manufactured or as recommended by the Barnstead Company, or approved equal.

2.1.06 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors.

2.1.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.1.08 Shop Coating. All iron and steel surfaces of the equipment shall be protected with suitable protective coatings applied in the shop. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Field painting shall be indicated in Master Specification Section 09900, Painting.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of a universal primer.

Machined, polished, and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

3.2 FIELD QUALITY CONTROL.

3.2.01 Installation Check. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated under full load conditions and that it operated satisfactorily.

3.3 CLEANING AND ADJUSTING. Upon completion of the work, all parts of the installation shall be thoroughly cleaned. All equipment, pipe, valves, and fittings shall be thoroughly washed to remove grease, metal cuttings, and dirt particles.

End of Section

SECTION 15487

FUEL DISPENSING SYSTEMS

PART 1 - GENERAL

1.1 SCOPE. This section covers furnishing and installation of fuel dispensing systems an indicated in the Contract Documents.

The fuel shall be for use in service vehicles. The fuel dispensing system shall be furnished and installed in the location and arrangement indicated on the drawings and as required, complete with fuel dispensers and all other accessories necessary for a complete and properly operating installation.

1.2 GENERAL. All equipment for this section shall be furnished by or through a single manufacturer who shall be responsible for the design, coordination, and proper installation and operation of the entire system.

Equipment furnished under this section shall be fabricated and installed in full conformity with Drawings, Specifications, engineering data, instructions, and recommendations of the manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, materials, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Contractor shall properly coordinate the work between the Suppliers of equipment to be used with or connected to the storage tank to ensure that all required provisions for mounting the accessories are included.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Contractor shall, at his own expense, arrange for and obtain all necessary permits, inspections, and approval by the proper authorities in local jurisdiction of such work.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service form other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representative shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to the equipment furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations which pertain to such work. In case of a conflict between these Specifications and any state law or municipal ordinance, the latter shall govern.

All work shall comply with Underwriters' Laboratories (UL) safety requirements.

Equipment furnished under this section shall comply with the applicable requirements of the following:

> ASTM A283 "Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes, and Bars," or ASTM A569 "Steel, Carbon, Hot-Rolled Sheet and Strip, Commercial Quality."
>
> American Petroleum Institute.
>
> National Fire Protection Association.
>
> Applicable local regulations and ordinances.

1.2.03 Power Supply. Power supply to equipment with motors shall be as indicated on the Contract Documents. Power supply for controls shall be as required, unless otherwise required for a properly operating system.

1.2.05 Labels. Each dispenser shall have a conspicuous, easy-to read label showing the manufacturer's name and the rated capacity.

1.2.06 Metal Thickness. Gages specified herein refer to US Standard gage.

1.3 SUBMITTALS.

1.3.01 Drawings and Data. Complete fabrication, assembly, and installation drawings, together with detailed specifications and data covering materials used, parts, devices, and other accessories forming a part of the tank and fuel dispensing facilities furnished, shall be submitted in accordance withMaster Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable.

Drawings shall include electrical connection diagrams and schematics identifying all items requiring electrical control or power in the operation of each electrically operated motor driven pump, and complete details and information on the power feed system.

The data shall also indicate the sizes of all major components and full information and details concerning field assembly and installation.

The manufacturer's standard calibration charts shall be submitted.

1.3.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in Master Specification Section 01060, Training, Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4 QUALITY ASSURANCE.

1.4.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.4.02 Contractor's Qualification. When indicated on the Contract Documents, Contractor shall submit qualifications to do the work.

1.5 DELIVERY, STORAGE, AND HANDLING. Shipping ,handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools.

The tank and component parts shall be adequately protected during all transportation, loading and unloading, storage, installation, and subsequent construction activities. All nozzles shall be properly protected at all times and shall be plugged to prevent contamination of the tank interior. Repairs of minor damage, including scratches and abrasions, may be made where permitted by the Engineer in the manner recommended by the manufacturer. If a tank is damaged beyond reasonable repair, in the opinion of Engineer, it will be rejected and shall be replaced by Contractor with an undamaged unit.

At no time shall a tank be dropped or rolled. All lifting shall be done using the lifting lugs or suitable slings.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. The fuel dispensing system shall be suitable for the conditions specified and the locations indicated on the drawings.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. The fuel dispensing system shall be designed to supply diesel fuel or unleaded gasoline, as indicated, for refueling vehicles. The system shall be designed as a one or two hose, one or two product, as indicated in the Contract Documents.

2.3 FUEL DISPENSER. The dispenser shall be of the number of hose and product as indicated. Registers shall read on the front of dispenser with 99.9 gallon delivery register and 99,999.9 gallon nonreset totalizer. Meters shall be neutating disc-type with a calibration screw. The dispenser shall be equipped with strainer, replaceable cartridge filter, pump, electrical junction box, 1-1/2 inch suction, float chamber to prevent meter register from operating when tank is empty, and shall bear UL listing. Cabinet finish shall be baked red enamel. The pumped product shall be identified by means of a decal, painted sign, or other label. The dispenser shall be as manufactured by Fill-Rite or approved equal.

All nozzles shall be shockproof, self-closing and automatic type permitting at least three positions of the hold-open clip and shall meet all requirements required by the U.S. Environmental Protection Agency. All hose shall be 1 inch diameter, 12 feet in length, and shall be suitable for direct sunlight and air temperatures up to 100 F. Hose retrieving devices and swivels shall be installed with all hoses.

Pulsers and detect wires shall be factor installed for each hose in each dispenser, suitable to the fuel management system control console.

Fuel dispensers shall be factory wired such that they require only the specified power supply for proper operation.

2.4 FUEL DISPENSER ACCESSORIES. The accessories for each fuel dispenser shall be provided as indicated on the drawings and specified herein.

2.4.01 Pressure Regulating Valves. The inlet pipe on each dispenser shall be equipped with a 1-1/2 inch pressure regulator valve, Tokheim "Model 52", or approved equal. The pressure regulator valve shall be mounted so that the valve and inlet piping are rigidly set in position and shall be furnished with a safety shear section.

2.5 Fuel Management System. A cardless, keyless fuel management system shall be provided, installed, and placed in roper working order. Fuel management system shall be as manufactured by Fill-Rite or approved equal, shall be compatible with the dispensers provided, and with suitable relay for the pump motor. The system shall feature two wire communication, vehicle identification number entry keypad, and data retrieval by remote printer readout.

Fuel management system shall be ETL listed and consist of all items required for proper operation as specified and shall meet all local, state, and national code requirements.

The system shall provide control and access to each fueling dispenser and to store and print out, upon demand, specified data relevant to the fueling transaction. Access to the system shall be through the weatherproof terminal keypad. The terminal shall be mounted on a contractor-supplied pedestal with all required junction boxes and terminal connection clearly marked with correct wiring identification. The fuel management system supplier shall provide all wiring between the fuel management system and fuel dispensers.

The fuel management system shall control all dispensers, each with number of hoses as indicated. User access to obtain fuel shall be gained once the vehicle identification number has been manually entered onto the terminal keypad. The terminal keypad shall also incorporate battery backup to retain information in memory, in the event of a power failure or system shutoff, display operating instructions, and an RS485 port with converter cable for data retrieval.

The fuel management system shall not permit additional fueling transactions once the memory is full. The fuel management system shall be suitable for future upgrading for fleet management to be 100 percent compatible with IBM personal computer.

A parallel port Epson "Model LX300", or approved equal shall be provided to provide a hard copy audit trail of the transactions. The printer shall be located in the building. Sufficient length of interconnecting cable shall be provided to connect the terminal keypad to the printer.

Print out of the fueling transactions shall include, but not to be limited to the following items:

Vehicle Identification Number.

Transaction Termination Code.

Transaction Date.

Transaction Time.

Hose Number.

Total Volume dispensed.

Pulsers and detect wires shall be provided on dispensers. Conduits shall be provided for power and detect wires. Pulser lines may not be run in the same conduit as power lines.

System manufacturer shall warrant the system against defective materials or workmanship for two years from date of startup by factory trained personnel.

Contractor shall provide system startup and operator instruction by factory trained personnel for one day after notification that the system is in pace and ready to operate at no charge to Owner.

System to include locking emergency stop switch shall be provided to shut of the power to the dispensers in the event of an emergency.

2.6 SPECIAL TOOLS AND ACCESSORIES. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

PART 3 - EXECUTION

3.1 INSTALLATION. Each dispenser and accessories shall be installed in accordance with the manufacturer's instructions, specifications, and drawings.

Each dispenser and accessories shall be installed on a concrete base as indicated on the drawings.

Each dispenser shall be mounted securely on a steel pump spill containment box cast in the concrete base. The pump spill containment box shall be provided with opining and an adjustable shear clamp for the inlet pipe. The pump box shall be AMFAB, shall be suitable for the dispenser, and shall be of ample size to contain spillage when maintenance is required on the pump and for piping and electrical connections.

Fuel management system terminal shall be mounted on templates with all conduits running inside template and terminal mounting pole.

3.2 INSTALLATION CHECK. An experienced, competent, and authorized representative of the manufacturer shall visit the Work and inspect, check, adjust if necessary, and approve the equipment installation. The representative shall be present when the equipment is placed in operation in accordance with Master Specification Section 01180, Equipment, Materials, Parts, and Tools, and shall revisit the jobsite as often as necessary until all trouble is corrected and the equipment installation and operation are satisfactory in the opinion of Engineer.

The manufacturer's representative shall furnish a written report certifying that the equipment has been properly installed and lubricated; is in accurate alignment; is free from any undue stress imposed by connecting appurtenances; and has been operated under full load conditions and that it operated satisfactorily.

3.3 FIELD TESTING. All testing required by governing standards shall be performed.

End of Section

SECTION 15490

HVAC GENERAL PROVISIONS

PART 1 - GENERAL

1.1 SCOPE. These Sections and Drawings cover(s) the general requirements of the HVAC work to be performed and shall not void any of the requirements specified under the General Conditions or General Requirements.

Heating Equipment

Flue Stacks, Breechings and Vents

Air Handling Units

Centrifugal Fans

Ductwork and Accessories

Electric Automatic Temperature Control System

HVAC Systems Testing, Adjusting and Balancing

The requirements specified herein shall be modified only if specified otherwise for a particular application in other Divisions. Work to be included under the "Scope of Work" of each HVAC Section listed above shall include all labor, material, equipment, tools and services necessary to furnish, deliver, unload, install, test and place in satisfactory operation the equipment, services and systems as called for under each HVAC Section including any incidental work not shown, or not specified but which can reasonably be inferred as belonging to the various systems and necessary in good practice to provide a complete and satisfactory operating system.

This HVAC specification is incomplete without the information contained on the Drawings and in the Schedules.

Description of the work included in each Section is not intended to in any way limit the above broad statement, but is intended as a more specific mention of the most important items included therein.

Without limiting the scope of work as shown on the Drawings and required in this Section the following specific mention of items of included work is made.

The scope of work shall include: fans, air handlers, make up air units, air-conditioning units, roof mounted units, duct work by material, thermal insulation by system, acoustical insulation by system, piping by system, sting and balancing, space heaters, ductwork accessories, louvers and dampers, automatic controls by type. In addition any item that could be considered unusual shall be included.

The contractor shall coordinate with the equipment manufacturers control and field installation items furnished. The contractor shall field install and wire furnished loose by the equipment manufacturer.

All ductwork, piping, and equipment shown on the Drawings is intended to be approximately correct to scale, but figured dimensions and detailed drawings of the actual equipment furnished shall be followed in every case. The Drawings shall be taken in a sense as diagrammatic. Size of ductwork and piping are shown, but it is not the intent to show every offset or fitting, nor every hanger or support, or structural difficulty that may be encountered. To carry out the intent and purpose of the drawings all necessary parts to make a complete working system ready for use shall be furnished without extra charge. The Contractor shall be responsible to coordinate the system installation and routing with the work of all trades.

1.2 RELATED REQUIREMENTS. Cutting coving and patching, except for items specified herein, is included in Division 1. Temporary heating, electric power and lighting is included in Division 1. Trenching, excavation and backfill except for items specified herein, is included in Division 2. Concrete work except for furnishing of required anchor bolts, sleeves and templates, which shall be furnished with equipment, is included in Division 3. Flashing and counter flashing, except for items specified herein is included in Division 7. Painting except for factory finished equipment, shop painting and identification labeling is included in Division 9. Miscellaneous metal for supplementary steel required for hangers, equipment supports, anchors and guides, which shall be furnished with equipment, is included in Division 15. Exterior louvers including installations are included in Division 10. Plumbing except water and drains in connections to HVAC equipment is included in other Sections of this Division. Electrical field power wiring except for field wiring for automatic temperature controls as specified and as shown on the HVAC Drawings is included in Division 16.

1.3 SUBMITTALS. Submit, in accordance with Section 01080, all shop drawings specified in the individual Sections. Submittals shall include the following:

Catalog data for all motors to include operating efficiency.

Catalog data on vibration isolator, including operating efficiency and layout diagram that locate the isolates on the equipment by model number. Catalog data on bearings and confirmation of bearing life for the service specified.
Information on coatings as specified in the coating section.

Shop Drawing Data to include performance curves, data sheets, flow diagrams, wiring diagrams, and descriptive drawings.

In general, corrections or comments or lack thereof, made relative to submittals during review shall not relieve the Contractor from compliance with the requirements of the drawings and specifications. Submittals are for review of general conformance with the design concepts of the project and general compliance with the contract documents. The Contractor is responsible for the final design conforming and correlating all quantities and dimensions, selecting fabrication processes and techniques of construction, coordinating the work of all trades, and performing the work in a safe and satisfactory manner.

For units that will be shipped exposed, provide a description of the protective packaging that will be used during transit

All submittals shall contain a statement that Section 15501 and all other referenced Sections have been read and complied with. The certification statement shall be made by all of the following that are applicable; the Contractor, sub-contractor and the vendor. The statement shall be an individual statement for each party involved, and shall be included with every submittal and resubmittal.

1.3.01 Operation and Maintenance Data and Manuals. Submit to the Engineer as provided in Section 01160, Operating and Maintenance Manuals. The following information shall be considered a minimum. Where applicable, provide information required for specific pieces of equipment.

Contents - Each volume shall contain the following minimum contents:

Operating Instructions to provide pre-operational checks, start up and shut down, and description of all control modes. Include emergency procedures for all fault conditions and actions to be taken for all alarms. Procedures for long term storage shall be included.

Maintenance shall include preventive, and corrective. Schedules for test of other functions are to be included. Provide a list of tools required to service the equipment. Trouble shooting instructions to include a trouble-shooting guide shall be included.

Provide information in three ring binders. All sheets shall have reinforced punches. Tabbed dividers shall separate all sections. Drawings will be bound in the manual, or contained in envelopes bound into the manual. Personnel familiar with the operation and maintenance of the specific information shall prepare manuals.

Equipment shall be identified with the Engineers Equipment Numbers and Identification as shown in the Schedules and on the Drawings.

Installation including instructions for unpacking, installing, aligning, checking and testing. Foundation data, allowable piping loads, and electrical design shall be included.

1.4 REFERENCE STANDARDS. The latest published issue of Standards or Recommendations of the following listed Societies, Associations or Institutes in effect 3 months prior to the date of this Contract are part of this Section. These shall be considered as minimum requirements. Specific requirements of this Section and/or Drawings shall have precedence. In case of conflict between published requirements, the Engineer shall determine which is to be followed.

Abbreviation and the title of Federal, State and industry standards, technical societies, associations and institutes and other organizations used are as follows:

AABC - Associated Air Balance Council

ACGIH - American Conference of Governmental Industrial Hygienists

ADC - Air Diffusion Council

ABMA - American Bearing Manufacturers Association

AMCA - Air Movement and Control Association ANSI - American National Standards Institute ARI - Air-Conditioning and Refrigeration Institute ASHRAE - American Society of Heating, Refrigerating and Air-Conditioning Engineers

ASME - American Society of Mechanical Engineers

ASTM - American Society for Testing and Materials

CTI - Cooling Tower Institute

FM - Factory Mutual Engineering and Research Corp. IBR - Institute of Boiler and Radiator Manufacturers
1IEEE - Institute of Electrical and Electronics Engineers NIST - National Institute of Standards and Technology NEBB - National Environmental Balancing Bureau
NEC - National Electrical Code

NEMA - National Electrical Manufacturers Association

NFPA - National Fire Protection Association

OSHA - Occupational Safety and Health Administration

SMACNA - Sheet Metal and Air Conditioning Contractors National Association

UL - Underwriters Laboratories

1.5 QUALITY ASSURANCE. All equipment of a given type included in this Section shall be furnished by or through a single manufacturer or as specified on the schedules
Inspection by the Engineer's representative or failure to inspect shall not relieve the Contractor of responsibility to provide materials and perform the work in accordance with the documents.

1.6 DELIVERY, STORAGE AND HANDLING. All materials shall be inspected for size, quality and quantity against approved shop drawings upon delivery.

Delivery schedule of all equipment shall be coordinated with the Contractor. Equipment ready for shipment prior to the agreed on shipping date shall be stored without cost to the Owner by the manufacturer.

All materials shall be suitably packed for shipment and long term storage. Each package shall be labeled to indicate the project and the contents of each package. Where applicable, equipment numbers shall be marked on the container.

All equipment shipped that is exposed such as on a flat bed truck shall be protected during transit. The equipment shall be protected from moisture, road salt, dirt and stones or other materials thrown up from other vehicles. Electrical components shall be protected as above, but with special attention to moisture. The method of shipment protection shall be defined in the submittals.

Instructions for the servicing and startup of equipment in long term or prolonged storage shall accompany each item.

All materials shall be stored in a covered dry location off of the ground. When required to protect the materials they shall be stored in a temperature-controlled location.

1.7 DEFINITIONS. Particular terminology used under this Division is defined as follows: Air Conditioning - Environmental control of temperature, humidity, cleanliness and air circulation, including the cooling of an enclosed space.

Air Conditioner or Air Conditioning Unit – One or more field-erected or factory-made assemblies, which includes the refrigeration compressor-condenser assembly, for the handling and control of air temperature, humidity, and cleanliness used for cooling.

Fan-Unit - Any unit or assembly containing a fan, motor and drive.

Temperature Controller - Any device which is used to modulate the automatic temperature control system by a change in temperature at the location of the controller.

Explosion Proof - Any equipment or device, which is called to be explosion proof, shall be certified as explosion proof as a complete unit.

1.8 COORDINATION. The Drawings indicate the extent and general arrangement of the systems. If any departures from the Drawings or specifications are deemed necessary, details of such departures and the reasons therefore shall be submitted as soon as practical for review. No such departures shall be made without the prior written concurrence of the Engineer. The Contractor shall coordinate the location and placement of all concrete inserts and welding attachments with the structural engineer. The Contractor shall assume full responsibility for coordination of the HVAC systems, including; scheduling, and verification that all structures, ducts, piping and the mounting of equipment are compatible.

1.9 ENGINEERING SERVICES. When engineering services are specified to be provided by the Contractor, the Contractor shall retain a licensed professional engineer to perform the services. The engineer shall be licensed at the time the work is done and in the State in which the project is located. If the State issues discipline specific licenses, the engineer shall be licensed in the applicable discipline. In addition, the engineer shall be experienced in the type of work being provided.

All work is to be done according to the applicable regulations for professional engineers, to include signing, sealing and dating documents. When submittals are required by a professional engineer, in addition to state required signing and sealing, a copy of the current wallet card or wall certificate indicating the date of expiration shall be included with the submittal.

1.10 ELECTRIC MOTORS. Electric motors in NEMA frame sizes shall conform to the requirements in Section 16150, unless otherwise specified herein.

Clean Dry Areas ODP

Outdoors TEFC

Process Areas

NOT Div. 1 or 2 TEFC

Div. 1 or 2 Explosion Proof.

The motor manufacturer shall confirm that motors used to power equipment are provided with bearings that will provide a bearing life equal to the driven equipment or better. Confirmation shall be included with shop drawing submittal.
Motors will be selected to be non-overloading over the entire operating range of the equipment. A safety factor of 25 percent will be added to all motors up to and including 50 horsepower. A safety factor of 15 percent will be added to all motors over 50 horsepower. Motors indicated in the schedules are to be considered a minimum. The schedule sizing is not to limit compliance with the above requirements.

1.11 SPARE PARTS. Spare parts shall include all special items on the manufacturer's standard list of spare parts In addition to special items, the following spare parts shall be provided:

Furnish all special tools required for normal operation and proper servicing of the equipment.

Spare parts shall include all items on the manufacturer's standard list of spare parts and the following for each unit:

One complete set of drive belts for each piece of belt driven equipment

Pack spare parts in containers suitable for extended storage without deterioration of the parts. Containers shall be clearly labeled designating contents, pieces of equipment for which intended and equipment identification numbers.

Spare parts shall meet the requirements of Sections 01180.

1.12 WARRANTY. In the event that the equipment or components fail to perform satisfactorily at any time within the Defects Liability Period, the Contractor shall replace it with one capable of operating as specified, and shall comply with the requirements in Division 1. The Contractor shall be responsible for all cost incurred in furnishing and installing the replacement equipment.

PART 2 - PRODUCTS

2.1 ELECTRICAL EQUIPMENT. Certain items of electrical equipment which are furnished under this Section shall meet the requirements specified in Division 16:

Disconnect switches, motor starters and combination motor starters (starters with disconnecting means and short circuit protection) shall be as specified in Section 16050.

Cord-connected controls for hazardous areas shall be provided with intrinsically safe relays, which shall be as specified in Section 16050.

Raceways, boxes and fittings shall be as specified in Section 16050. Wires and cables shall be as specified in Section 16050.
Electrical enclosures and panels, to include automatic temperature control panels and components shall be suitable for the environment and electrical classification for the space they are located in. The type of enclosure for the various spaces shall be as specified in Division 16. Refer to the electrical drawings for the space classifications.

Where location designations are not shown on the HVAC Drawings refer to the Electrical Drawings

2.2 EQUIPMENT VIBRATION ISOLATORS AND MOUNTINGS. Unless otherwise specified in this Division all machinery or vibrating mechanical equipment shall be isolated from the building structure by vibration isolators with a minimum deflection as specified. Operating equipment that can transmit objectionable vibration and noise must be installed with special types of vibration isolators such as flexible connectors to ductwork, piping and wiring. In more critical areas and under particular conditions, additional vibration isolators shall be installed as specified in other related Sections in this Division, or in specific equipment schedules.

All equipment shall be provided with attachment points for floor or suspended mounting that will safely transmit all loads to the supports.

The vibration isolator manufacturer shall be responsible for the proper selection of vibration isolators suitable for the particular application. Selection of the vibration isolator shall include the following factors:

Equipment Weight

Equipment operating frequencies

Type of building support structure

Vibration isolators shall be furnished with the equipment.

All floor mounted vibration isolators shall be bolted to the floor or framing on which they rest. Bolts shall be arranged to prevent transmission of vibration through the bolts.
All isolation devices for a single piece of equipment shall be selected for a uniform static deflection according to distribution of weight in the equipment.

All pieces of equipment that have a variation in weight during operation or maintenance such as, but not limited to, cooling towers and hoppers, shall have built-in vertical limit restraints to limit motion to a maximum of 1/4-in.

Isolators exposed to the weather, in rooms classified on electrical drawings as damp, wet, or corrosive or where called for on the Drawings shall be provided with corrosion protection. Steel parts other than springs shall be galvanized. Parts subject to wear, rubbing, shall be non-corrosive material such as rubber or stainless steel. Springs and hardware shall be cadmium plated or otherwise provided with an approved coating.

After installation of equipment, isolators shall be adjusted for proper loading and distribution of weight.

Types - The following types of vibration isolators may be used.

Isolation Types for Floor Mounting

Single elastomer-in-shear isolators, molded mound shaped element designed for 1/4-in deflection under the imposed static load. Double elastomer-in-shear isolators shall be two such elements assembled in series or a molded element designed to provide 1/2-in deflection under the imposed static load. Elastomer-in-shear isolators shall be properly housed to prevent bulging and shall be provided with adequate facilities for bolting to equipment and floor slab.

Spring isolators shall be free standing and laterally stable and shall be equipped with acoustical-friction pads, leveling bolts and bolt holes for anchoring to floor slab. Springs shall have a minimum ratio of outside diameter to operating spring height of 0.8 and an additional travel to solid equal to 50 percent of the specified deflection. Where housed springs are specified or required, provide units with telescoping cast iron or steel housing, containing one or more springs, complete with resilient alignment insert and a minimum of 1/4-in thick rubber or neoprene sound deadening pad bonded to the base of housing.

Heavy load pads shall be 1-1/4-in thick and shall consist of a high load capacity elastomer pad and sandwiched between two 1/8-in thick steel load distribution plates capable of supporting loads up to 250 psi. For large pad area, steel plates of suitable thickness shall be provided to distribute the load.

Light load pads shall be neoprene corrugated single, laminated double or laminated with 1/2-in thick fine granular composition cork sandwiched between two 1/4-in layers of corrugated, oil resistant neoprene. Pads shall be capable of loading to 50 psi.

Isolation for Suspension

Isolation hangers for suspension of equipment and piping shall have a single element of elastomer for 1/4-in deflection, a double or a single molded element of 1/2-in deflection, a single spring element with an elastomer grommet for up to 3/4-in deflection and a combination of an elastomer and spring elements in series for 1-in deflection and up contained within a structural rigid one piece steel hanger box. Springs shall have a minimum ratio of outside diameter to operating spring height of 0.8 and an additional travel to solid equal to 50 percent of the specified deflection.

The neoprene element shall have a bushing to prevent hanger rod contact with the housing box. The lower rod shall be free to swing in a 30 degree arc without touching the spring or the housing.

Rails and Bases - Rails and bases shall be of the following types based on the equipment and deflection required.

Rubber in shear type shall be steel rails running the full length of the supported equipment and extending under any overhang to counteract cantilever effects. The rails shall incorporate single or double deflection elastomer-in-shear fastened in place and a continuous steel floor bearing plate running the full length of each rail. The rails shall be drilled and tapped to accept the supported equipment and shall serve as a template.

Steel spring type shall be steel rails running the full length of the supported equipment and extending under any overhang to counteract cantilever effects. The rails shall consist of structural members supported by individual free standing springs. The rails shall be drilled to accept the supported equipment and shall serve as a template.

Fans and their driving motors shall be mounted on structural steel channel members forming a rigid base. A common member, parallel to the V-belt drive, shall run the full length of the fan and motor and shall be of sufficient rigidity to resist the bending stress of belt pull. The structural steel base shall incorporate single or double deflection elastomer-in-shear elements or free standing springs located for proper weight distribution. The base shall be drilled and tapped to accept the fan and motor and shall serve as a template. Integral motor slide rails shall be provided and welded in place.

Unless specifically noted in other Sections or on specific equipment schedules, all equipment will be provided with vibration isolation as defined by the following table:

Type of Equipment	Vibration Isolation Type	Minimum Deflection for Slab on Grade Inches	Minimum Deflection for up to 20-ft floor span inches	Minimum Deflection for 20-ft to 30-ft Floor Span Inches	Minimum Deflection for 30-ft to 40-ft Floor Span Inches
Axial & Cabinet Fans					
22-in dia. and less	Rubber	0.25	--	--	--
22-in dia. and less	Spring	--	0.75	0.75	0.75
Over 22-in dia. Over 2-in S.P.	Spring	0.75	1.75	1.75	2.50

Type of Equipment	Vibration Isolation Type	Minimum Deflection for Slab on Grade Inches	Minimum Deflection for up to 20-ft floor span inches	Minimum Deflection for 20-ft to 30-ft Floor Span Inches	Minimum Deflection for 30-ft to 40-ft Floor Span Inches
Centrifugal Fan					
22-in dia. and less	Rubber	0.25	--	--	--
22-in dia. and less	Spring	--	0.75	0.75	1.75
24-in dia. and greater					
40 HP and less	Spring	0.75	0.75	0.75	1.75
50 HP and greater	Spring	1.00	1.75	1.75	2.50
Condensing Units					
	Rubber	0.25	--	--	--

	Spring	--	0.75	1.75	1.75
Air Handling Units					
10 HP and less	Spring	0.75	0.75	0.75	0.75
15 HP and greater	Spring	0.75	1.75	1.75	1.75

Isolation for Piping

Flexible piping for systems with operating temperatures over 200 degrees F shall be flexible annular corrugated stainless steel hose. The hose shall be provided with an external stainless steel braid to minimize elongation under pressure. Hoses 2-1/2-in and smaller shall be threaded and hoses 3-in and larger shall be flanged. The manufacturer shall confirm the suitability of the flexible piping for the temperature and pressure of the systems.

Flexible piping for systems with operating temperatures 200 degrees F and less shall be spherical EPDM connections. Connections shall have multiple plies of corded fabric reinforcing. Connection shall be rated for 150 psi at 220 degrees F. For equipment with connections from 2-1/2 to 12-in, 90 degree bend connections can be used. Straight connections shall be double sphere and bend connections shall be single sphere. Provide control cables to prevent excessive elongation on straight connection where required. The manufacturer shall confirm the suitability of the connections for the temperature, pressure, and pipe contents for the systems.

Rigidly Mounted Equipment

When equipment doesn't require vibration isolation, it shall be firmly attached to the building structure. Bolts and support structure shall include allowances for seismic loads as required by the applicable building codes to include shear and moment loads.

2.3 BEARINGS. Grease lubricated bearings (except where driven by motors smaller than 1/2 Hp) shall be equipped with Zerk lubrication fittings and with provision for automatic relief of lubricant pressure away from fan wheel or pump seal. The latter may be accomplished by either built-in relief devices or automatic ball-and-spring relief fittings at the bottom of the bearing housing.

Pressure relieves shall be located outside of the units and shall be visible from maintenance locations. Lubrication fittings shall be located to be easily accessible from maintenance or operating levels. Where necessary, extension tubes shall be provided to bring the service fitting to an accessible location and the relief visible from the same location.

Bearings for all equipment in the schedule below shall have heavy-duty grease lubricated ball or roller bearings. Bearings shall have ample thrust provision to prevent end play during the normal life of the bearing. Unless specifically noted otherwise, all fans and pumps shall have bearings for both the equipment and motors with the following ABMA L-10 life.

Fans over 3000 cfm – 40,000 hours.

Continuous duty fans with motors over 25 horse power 100,000 hours.

For systems with bearings requiring L-10 lives of 100,000 hours or greater, the equipment supplier shall provide calculations for both the equipment bearings and the motor bearings to confirm the bearing selections. For belt drives, the calculations shall include the effect of the sheave size, number of belts, the sheave location on the shaft, and the location of the motor to the driven sheave.

The equipment manufacturer shall provide confirmation of the required life based on the actual drive components. For motors 50 horsepower and greater, the bearing life calculations for both the equipment bearings and the motor bearings shall be provided.

2.4 <u>FLAME AND SMOKE RATINGS</u>. All materials, including adhesives, surface coatings, sealers, assemblies of several materials, insulation, jacketing, finish, etc, shall have flame spread ratings not over 25 (fire resistive) and smoke development ratings not over 50 and fuel contributed rating not over 50, as established by tests conducted in accordance with the Federal Standard 00136B, National Bureau of Standards Radiant Energy Fire Test and the National Fire Code of the NFPA.

These requirements shall apply to all circumstances whether the materials are field applied or have been applied by a manufacturer in his/her shop, or elsewhere, prior to delivery to the project for installation.

2.5 <u>V-BELT DRIVE</u>. V-belt drives shall consist of the driver and driven sheaves and one or multiple matched V-belts. Drives furnished to transmit less than 3/4 Hp may be a single groove, single belt type. Drives to transmit 3/4 Hp or more shall consist of at least two belts. Belts smaller than "A" cross-section shall not be used.

Each sheave shall be grooved to match the belt selection, bored and keyed to fit the receiving shaft, and grooves shall be in parallel planes exactly perpendicular to the bore for the full 360 degrees. Sheaves shall have keys and setscrews. Sheave material may be cast iron.

The drive shall be sized 1.5 times the motor nameplate rating and also shall have ample strength to start the driven equipment by full voltage across-the-line motor starting.

Where variable speed drive is specified, the drive sheave shall be of the variable pitch type which will provide a 5 percent speed variation of the driven equipment at the nominal rated speed. However, the higher speed side shall not cause the driven equipment to draw more than full nameplate rating horsepower from the driver.

2.6 NOISE CRITERIA. The selection of fans, air handling equipment, air conditioners, heating ventilating and air conditioning machinery and mechanical equipment and the installation of the system components such as duct work and piping shall be such as not to exceed to maximum permissible noise for non-equipment spaces as defined in Table 2, Design Guidelines for HVAC System Noise in Unoccupied Spaces contained in the 2003 edition of the ASHRAE Application Handbook. Under no conditions shall the noise created by equipment exceed the levels of permissible noise exposures of occupational areas as established by the OSHA and other Federal, State and local safety and health standards, codes and ordinances.

The equipment supplier shall provide actual data for the equipment submitted. If the space does not meet the required criteria, and the noise level of the equipment is found to be the cause, the equipment supplier shall be responsible for the modifications required to correct the condition.

PART 3 – EXECUTION

3.1 INSTALLATION. The Contractor shall start up each piece of equipment and system and shall make all adjustments so that the system is placed in proper operating condition.

The Contractor shall not install any equipment or materials until the Owner and Engineer have approved all submittals. If any equipment or materials are installed prior to approval of the submittals, it shall be at the Contractor's risk.

3.2 CLEANING AND DISINFECTION. All piping, ductwork and equipment shall be left in a thoroughly cleaned condition. All piping shall be thoroughly flushed to remove all foreign materials prior to any cleaning procedure. All strainer baskets shall be removed, cleaned and reinstalled at the completion of the cleaning operation and also at the completion of all system and equipment final tests. All flushing and cleaning shall be to the satisfaction of the Engineer. Furnish, install and remove all temporary piping and equipment used in the cleaning and flushing operations. Cleaning and flushing shall be performed as specified in other Sections.

3.3 TESTS AND BALANCING. General - Balance and test all systems. Test the work as required by the Engineer during the progress of the work to demonstrate the strength durability and fitness of the installation. Furnish all instruments, ladders, lubricants, test equipment and personnel required for the tests; including manufacturer's representatives for testing and start-up of all supplied equipment.

Balancing and testing shall be performed as specified in other Sections. Before testing and balancing, all systems shall be cleaned and disinfected as specified. Four copies of records of all tests, measurements, settings of throttling devices and nameplate data shall be presented to the Engineer.

Final Tests - Tests of all systems shall be carried out as required by the Engineer prior to final acceptance of the systems for the purpose of demonstrating satisfactory functional and operating efficiency as well as adjustment. During this period, the setting of all automatic controls shall be checked and sufficient measurements taken to ensure that conditions are correct and that capacities are adequate to meet the specified requirements. Provide competent personnel to conduct all tests. Systems will not be considered complete until all tests have been concluded to the satisfaction of the Engineer and all other parties having jurisdiction. In event of leakage or defects, tests must be repeated until all faults are corrected. All tests shall be performed in the presence of the Engineer. The general operating tests shall be performed under as near design conditions as possible.

Testing and balancing of all heating, ventilating and air conditioning air and water systems shall be performed by an AABC or NEBB certified agency, which is independent of all suppliers and installers on the particular job. All testing, adjusting and balancing shall be done under the supervision of a qualified heating, ventilating, and air conditioning Engineer employed by the air balance and testing agency. Reporting forms for testing and balancing shall be as recommended by the AABC or the NEBB.

3.4 START-UP AND TEMPORARY OPERATION. Properly maintain and service all equipment and systems until the particular equipment or the system has been accepted by the Owner.

This maintenance shall include compliance with the manufacturers operating and maintenance instructions as well as periodic checking and cleaning of the strainers and filters and the lubrication of moving parts and all required adjustments.

Records of all maintenance and lubrication work performed on Owner or Contractor furnished equipment shall be maintained at the construction or installation site and shall be available at all times for a review by the Owner or Engineer. At the request of the Owner or Engineer copies of these records shall be submitted to the Owner for information and/or review.

3.5 PAINTING AND COATINGS. Unless otherwise specified, all machinery and factory finished equipment such as fans, air handling units, air conditioning units, and other items of manufacture shall be hot dipped galvanized or will have a factory applied finish, color as standard with the manufacturer. Components fabricated from stainless steel do not require a coating finish unless otherwise specified. All tanks, supporting steel, hangers, rods and all other uncoated or non-galvanized steel other than standard piping and fittings shall have a shop coat consisting of a suitable primer and finish coat. If not factory applied, the prime coat shall be as specified in Division 9. All items not factory or shop primed prior to installation shall be suitably cleaned of rust and mill scale by wire brushing, sanding, or other means and prime painted, immediately after installation.

The Contractor shall be responsible for the repair of all defects, blemishes, holidays and the like apparent in manufactures coatings and shall ensure that the materials used for such repair shall match and be compatible with the manufacturer's standard color, coatings and practices. Surfaces to be repaired or recoated are to be prepared as recommended by the paint or coating supplier. Care shall be taken not to paint over nameplates.

Furnish touch up paint for the various types of equipment furnished and deliver unopened paint to the Owner at completion of the project. The amount of touch-up paint supplied shall be sufficient to cover 15 percent of the applicable painted surfaces or one pint, whichever is greater.

Where specified, or called for on the following schedule, special corrosion resistant/protective coatings shall be provided. Whenever a protective coating is specified, the equipment shall be coated both inside and out. Whenever necessary to provide full coverage of the equipment, the equipment shall be completely disassembled to allow proper preparation and coating application. Any component that would block the coating process shall be removed. Equipment provided with gaskets or liners shall be coated before the application of the gasketing or liner. The equipment Vendor shall test rotating equipment after coating to confirm dynamic balance. If work needs to be done to correct the equipment balance, the integrity of the coating must be corrected after such work.

Ductwork connections to units that require corrosion resistant coatings shall be made with flanges. Flanges shall be factory drilled before coating. Resilient washers suitable for the environment shall be used to protect the coating from the bolts in the flange. The use of self-tapping screws or other fastening methods that will damage the coating are not acceptable.

All items to be provided with a protective coating shall have the following data on the coating included with the unit submittal. Submittal shall include vendor data sheets on the specific coating being used, corrosion resistance data sheets, detailed application data sheets to include surface preparation procedures. For baked coatings submit a letter from the coating manufacturer, that the company doing the actual coating operation is an approved coating company. When an equipment supplier provides the coating, the information shall be supplied by the coating manufacturers.

Coating shall be factory applied by the equipment manufacturer/supplier. If this is not possible, coating shall be applied by a specialty shop under contract to the equipment manufacturer/ supplier. After coating application is completed, the equipment manufacturer/supplier shall test the equipment and certify system operation prior to releasing the equipment to the job site.

Any holidays, runs, sags, blisters, or inclusions in the coating are unacceptable and will be corrected. With the approval of the Engineer, small areas no more than 4-in by 4-in may be corrected in the field. Larger faults shall be returned to the coater to be repaired. The faulty material shall be removed by sanding and in the case of blisters, the edges feathered. The material used for recoating shall be manufactured by the same manufacturer as the original coating and shall be suitable for field repairs. The touch up material shall have the same corrosion resistance as the original coating, and if the original coating required an ultraviolet protection, the same protection will be provided as part of the repair. The final mil thickness of the repaired coating shall be equal to the originally specified thickness. Where baked coatings have been damaged, the repair shall be made with heat applied to the repaired surface to cure the coating. After curing a solvent test as recommended by the manufacturer shall be used to confirm that the coating is cured.

3.6 BALANCE OF ROTATING EQUIPMENT. All machines shall be balanced both statically and dynamically by the manufacturer within the limits of best commercial practices. The term machine, as used above, is to be considered as any piece of equipment which contains rotating components. All machines furnished shall have operating speed not exceeding 80 percent of the first critical speed.

End of Section

SECTION 15500

HEATING, VENTILATING AND AIR CONDITIONING

PART 1 - GENERAL

1.1 SCOPE. This section covers the furnishing and installation of heating, ventilating, and air conditioning (HVAC) equipment, coils, fans, ductwork, duct mounted devices, and appurtenances associated with the HVAC systems.

Schedules on drawings and notes indicate specific HVAC equipment required for the project.

Piping, pipe supports, valves, and accessories which are not an integral part of the equipment or are not specified herein are covered in other sections.

1.2 GENERAL. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by Engineer.

1.2.01 Coordination. Contractor shall verify that each component of the system is compatible with all other parts of the system; that all piping, ductwork, materials, fans, pumps, and motor sizes are appropriate; and that all devices necessary for a properly functioning system have been provided.

Where two or more units of the same class of equipment are required, they shall be the product of a single manufacturer; however, all the component parts of the system need not be the products of one manufacturer.

Each manufacturer of major equipment shall have a local service center, or with written consent of Engineer, shall be able to provide service from other locations within 24 hours. The service center shall be equipped and staffed to service the system and shall maintain a local parts supply. Information on equipment manufacturers' representatives shall be included with the submittals.

Where several manufacturers' names have been listed in this section as possible suppliers, only the products of the first manufacturer listed have been checked for size, functions, and features.

1.2.02 General Equipment Requirements. The General Equipment Stipulations in Master Specification Section 01180, Equipment, Materials, Parts, and Tools shall apply to all equipment and materials furnished under this section.

1.2.03 Governing Standards. Except as modified or supplemented herein, all work covered by this section shall be performed in accordance with all applicable municipal codes and ordinances, laws, and regulations. In case of a conflict between this section and any state law or local ordinance, the latter shall govern.

All work shall comply with UL safety requirements.

The refrigerant systems shall be constructed in accordance with ASHRAE Standard 15. Refrigeration system equipment shall have a minimum efficiency of not less than specified in the latest edition of ASHRAE 90.1, unless otherwise indicated on the drawings.

Capacity ratings for packaged air conditioning units and packaged heat pumps with capacities less than 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 210/240. For packaged air conditioning units over 135,000 BTUH (39 kW) the capacity ratings shall be in accordance with ARI Standard 360. Capacity ratings for packaged heat pumps with capacities over 135,000 BTUH (39 kW) shall be in accordance with ARI Standard 340.

Flue piping and fittings shall be factory built, laboratory tested, listed by Underwriters' Laboratories, and shall comply with NFPA 211.

Electric heating coils shall comply with the current National Electrical Code.

Direct fired makeup air units shall be independently certified to meet ANSI Z83.4.

Fans shall be rated in accordance with AMCA standards, shall be licensed to bear the AMCA Certified Rating Label unless otherwise indicated in the Fan Schedule on the drawings, and shall be UL listed.

1.2.04 Power Supply. Power supply to equipment with motors shall be as indicated in schedules on the drawings. Power supply for controls shall be 120 volts, 60 Hz, single phase unless otherwise required for a properly operating system.

1.2.05 Metal Thickness. Metal thickness and gages specified herein are minimum requirements. Gages refer to US Standard gage.

1.2.06 Lubrication. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during startup or shutdown and shall not waste lubricants.

Lubricants of the types recommended by the equipment manufacturer shall be provided in sufficient quantities to fill all lubricant reservoirs and to replace all consumption during testing, startup, and operation prior to acceptance of equipment. Unless otherwise specified or permitted, the use of synthetic lubricants will not be acceptable.

Lubrication facilities shall be convenient and accessible. Oil drains and fill openings shall be easily accessible from the normal operating area or platform. Drains shall allow for convenient collection of waste oil in containers from the normal operating area or platform without removing the unit from its normal installed position.

1.3 MECHANICAL IDENTIFICATION.

1.3.01 Number Plates. All equipment, piping, valves, ductwork, panels, and control equipment denoted on the drawings by a symbol and an identifying number shall be provided with an identifying number plate. The identifying text shall be identical to the symbols indicated herein or on the drawings and shall be located in a conspicuous place. Number plate symbols and numbers shall be capitalized block letters with a minimum height as indicted below.

Item Identified	Letter Height, inches (mm)
Major Equipment	3/4 (19)
Minor Equipment	1/2 (13)
Control Panels	3/16 (5)

Number plate height shall be twice the letter height. Number plate length shall be as needed, with suitable margins all around. Lettering shall be placed in one row where practicable; however, where necessary due to excessive length, lettering shall be placed on more than one row and centered.

Nameplates shall have black baked enamel letters on anodized aluminum plate. Letters shall be 3/4 inch (19mm) high for section identity and 1/8 inch (3 mm) high for other information Nameplates and tags shall be at least 12 gage (2.66 mm) thickness. Tags shall have smooth edges and shall be a minimum diameter of 1-1/2 inches (38 mm). Tags shall be installed with corrosion-resistant chains or straps. Nameplates shall be installed with corrosion-resistant mechanical fasteners.

1.3.02 Equipment Plates. Mechanical equipment shall be identified with engraved or stamped equipment plates securely affixed to the equipment in an accessible and visible location. Equipment plates shall be in addition to the number plates specified in the preceding paragraph. Equipment plates shall indicate the manufacturer's name, address, product name, catalog number, serial number, capacity, operating and power characteristics, labels of tested compliances, and any other pertinent design data. Equipment plates listing the distributing agent only will not be acceptable.

1.3.03 Piping. Piping identification shall be as specified in Master Specification Section 09900, Painting.

1.3.04 Valves. Valves that have been assigned an identification number shall be identified with tags.

1.3.05 Ductwork. As required, ductwork shall be identified with nameplates as specified herein, or stenciled painting as specified in Master Specification Section 09900, Painting. Ductwork shall be identified with the equipment number and area served, direction of airflow, and service (supply, return, mixed, exhaust, and outside air). The identification shall be located at equipment, at each side of structure or enclosure penetrations, and at each obstruction.

1.4 SUBMITTALS.

1.4.01 Drawings and Data. Complete assembly and installation drawings, and wiring and schematic diagrams, together with detailed specifications and data covering materials, parts, devices, and accessories forming a part of the equipment furnished, shall be submitted in accordance with Master Specification Section 01080, Project Submittals. Device tag numbers indicated on the drawings shall be referenced on the wiring and schematic diagrams where applicable. The data and specifications for each unit shall include, but shall not be limited to, the following:

Packaged Air Conditioning Units/Packaged Heat Pumps

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Locations and sizes of field connections.

Certified performance data and ratings.

Capacity at specified conditions.

Overall dimensions and required clearances.

Wiring diagrams with field and factory wiring clearly identified and electrical requirements.

Net weight and load distribution.

Information on local equipment manufacturers' representatives.

Makeup Air Units

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Burner or heating coil capacities.

Filter velocities.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least 5 different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Multiline wiring diagrams clearly indicating factory installed and field installed wiring with all terminals identified.

Fans

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Overall dimensions and required clearances.

Net weight and load distribution.

Performance curves with the specified operating point clearly identified for each unit, type, and model, with capacity in cubic feet per minute (m^3/s) as the abscissa and brake horsepower, static pressure, and efficiency as the ordinate. The fan curves shall include a family of curves for at least 3 different rotative speeds on a single chart.

Certified AMCA standard test code sound power output data for the fan outlet and casing when operating at the specified volume flow rate. Sound data shall list dB re 10^{-12} watts in each octave band, with midrange frequencies starting at 63 Hz and ending at 8,000 Hz.

Schematic control wiring diagrams showing multiline wiring for the unit and all interconnecting devices. Wiring diagrams shall be detailed to the degree required for field construction, with all terminals identified.

Equipment

Name of manufacturer.

Type and model.

Construction materials, thickness, and finishes.

Manufacturer's performance data.

Overall dimensions and required clearances.

Net weight and load distribution.

Wiring diagrams.

Sheet Metal Fabrication Drawings

Duct layout drawings indicating shop fabricated sections and dimensions.

Pressure and seal classifications.

Access panel and door construction, sizes, and locations.

Duct sealant, adhesive, gasket, and tape information.

Coatings.

Ductwork materials.

Coatings

Name of manufacturer.

Coating type.

Chemical resistance data.

Temperature range data.

Surface preparation and application data.

Film thickness per coat.

Drying and curing time.

Color.

Equipment Motors

Name of Manufacturer.

Type and Model.

Horsepower (kW) rating and service factor.

Temperature rise and insulation rating.

Full load rotative speed.

Type of bearings and method of lubrication.

Net weight.

Overall dimensions.

Efficiency at full, 3/4, and 1/2 loads.

Full load current and power factor.

Locked rotor current.

Temperature Controls

Published descriptive data on each item of equipment and accessories, indicating all specific characteristics and options and identified with the designation used herein and on the drawings.

Schematic control diagrams giving specific data on all settings, ranges, actions, adjustments, and normal positions. Although schematic, these diagrams shall, as closely as possible, represent the actual system with all significant equipment and devices identified and located relative to each other. These diagrams shall also show detailed multiline wiring and instrument piping with all terminals and ports accurately identified. The wiring diagrams shall show the internal connections of the temperature control panels and all field wiring to equipment remote from the control panels, including wiring to Owner-furnished equipment. The wiring diagrams shall be complete, showing all connections necessary to place the temperature control systems in operation. Wiring diagrams shall be detailed to the degree necessary for field construction and shall include all related wiring.

Control valve schedule with each valve identified by the designations used herein and on the drawings and cross-referenced to the manufacturer's equipment data sheet or bulletin. The schedule shall also list complete sizing data for each valve, giving design flow and temperature or pressure, actual pressure drop, normal position, fluid, actual close-off rating, actual capacity index, and any other pertinent data.

Sequence of operation for each system corresponding to the control schematics.

Detailed panel construction drawings, including description of all materials and finishes, complete internal wiring and piping schematics, panel face layout, and complete data on all mounted components.

Space thermostat schedule indicating the types of covers and means of adjustment for each space.

Conduit and wire types.

Number Plates

A listing of equipment to receive number plates.

1.4.02 Operation and Maintenance Data and Manuals. Operation and maintenance manuals shall be supplied, and shall be submitted in accordance with Master Specification Section 01160, Training and Operation & Maintenance Manuals. Equipment designations used shall correspond to those indicated on the drawings.

Operation and maintenance manuals shall include the following:

Equipment function, normal operating characteristics, and limiting conditions.

Assembly, installation, alignment, adjustment, and checking instructions.

Operating instructions for startup, routine and normal operation, regulation and control, shutdown, and emergency conditions.

Lubrication and maintenance instructions.

Guide to troubleshooting.

Parts lists and predicted life of parts subject to wear.

Outline, cross-section, and assembly drawings; engineering data; and wiring diagrams.

Test data and performance curves, where applicable.

A listing of all filter locations, types, sizes, and quantities associated with each piece of equipment.

The operation and maintenance manuals shall be in addition to any instructions or parts lists packed with or attached to the equipment when delivered.

1.4.03 Samples. Samples of protective coatings for equipment shall be submitted to Engineer for approval. The samples shall be at least 3 inches by 3 inches (75mm by 75mm) in size, and shall be submitted in accordance with Master Specification Section 01080, Project Submittals.

1.5 QUALITY ASSURANCE.

1.5.01 Welding Qualifications. All welding procedures and welding operators shall be qualified by an independent testing laboratory in accordance with the applicable provisions of AWS Standard Qualification Procedures. All procedure and operator qualifications shall be in written form and subject to Engineer's review. Accurate records of operator and procedure qualifications shall be maintained by Contractor and made available to Engineer upon request.

1.5.02 Manufacturer's Experience. Unless the equipment manufacturer is specifically named in this section, the manufacturer shall have furnished equipment of the type and size specified which has been in successful operation for not less than the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING. Shipping handling and storage shall be in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools.

1.7 EXTRA MATERIALS. Extra materials for one complete change of lubricating oil and two sets of filters shall be furnished for the equipment.

Extra materials shall be packaged in accordance with Master Specification Section 01180, Equipment, Materials, Parts and Tools, with labels indicating the contents of each package. Each label shall indicate manufacturer's name, equipment name, equipment designation, part nomenclature, part number, address of nearest distributor, and current list price. Extra materials shall be delivered to Owner as directed.

Extra materials subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS. All equipment shall be designed and selected to meet the specified conditions.

2.2 PERFORMANCE AND DESIGN REQUIREMENTS. Equipment and coil capacities shall be as indicated on the schedules.

Gas fired equipment shall be suitable for operation with a natural gas or propane inlet pressure range as required.

Each fan's operating selection point on the fan curves shall be selected to the right of the peak pressure/efficiency point and below the lowest point along the fan curve, to the left of the peak pressure/efficiency point.

2.2.01 Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. Contractor shall review the contract drawings, the manufacturer’s layout drawings, and installation requirements and shall make any modifications required for proper installation subject to acceptance by Engineer.

2.2.02 Elevation. Equipment shall be designed to operate at the elevation as indicated.

2.3 ACCEPTABLE MANUFACTURERS. Acceptable manufacturers shall be as listed in the respective product description paragraphs.

2.4 MANUFACTURE AND FABRICATION.

2.4.01 Welding. All welds shall be continuous (seal type) on submerged or partially submerged components.

2.4.02 Anchor Bolts and Expansion Anchors. Anchor bolts, expansion anchors, nuts, and washers shall be as indicated in Master Specification Section 05550, Anchor Bolts and Expansion Anchors, unless otherwise indicated on the drawings.

2.4.03 Edge Grinding. Sharp corners of cut or sheared edges which will be submerged in operation shall be dulled by at least one pass of a power grinder to improve paint adherence.

2.4.04 Surface Preparation. All iron and steel surfaces, except motors, shall be shop cleaned by sandblasting or equivalent, in strict conformance with the paint manufacturer's recommendations. All mill scale, rust, and contaminants shall be removed before shop primer is applied.

2.4.05 Shop Coating. All steel and iron surfaces shall be protected by suitable coatings applied in the shop. Surfaces which will be inaccessible after assembly shall be protected for the life of the equipment. Coatings shall be suitable for the environment where the equipment is installed. Exposed surfaces shall be finished, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. Electric motors, speed reducers, starters, and other self-contained or enclosed components shall be shop primed or finished with an oil-resistant enamel or universal type primer suitable for top coating in the field with a universal primer and aliphatic polyurethane system. Heated surfaces shall be painted with heat resistant paint.

Surfaces to be coated after installation shall be prepared for painting as recommended by the paint manufacturer for the intended service, and then shop painted with one or more coats of the specified primer. Field painting shall be indicated in Master Specification Section 09900, Painting.

Machined, polished and nonferrous surfaces which are not to be painted shall be coated with rust-preventive compound as recommended by the manufacturer.

2.4.06 Equipment Bases. Unless otherwise indicated or specified, all floor and grade mounted equipment will be installed on concrete bases at least 6 inches (150 mm) high. Each unit and its drive assembly shall be supported on a single baseplate of neat design. Baseplates shall have pads for anchoring all components. Baseplates will be anchored to the concrete base with suitable anchor bolts.

2.4.07 Special Tools and Accessories. Equipment requiring periodic repair and adjustment shall be furnished complete with all special tools, instruments, and accessories required for proper maintenance. Equipment requiring special devices for lifting or handling shall be furnished complete with those devices.

2.4.08 Flue Systems. Flues shall be provided for all equipment that exhausts combustible material. Drain tee caps, stack caps, storm collars, and equipment connection kits shall be provided. The systems shall be designed to compensate for all flue gas-induced thermal expansions. Flue system materials and construction shall be in accordance with the vented equipment manufacturer's recommendations and instructions.

2.4.08.01 Factory Built Flues. Flue systems for gravity vented equipment and vertically vented unit heaters listed for use with "Type B" gas vents shall be Selkirk Metalbestos, "Type B" gas vents, Metal-Fab, or approved equal. The flue systems for power vented equipment shall be Selkirk Metalbestos "Type PS" gas vent, Metal-Fab "Model PIC", or approved equal.

The flue pipe and fittings for vertically power vented unit heaters requiring a 5 inch (125 mm) or smaller flue and gravity vented equipment shall be a "Type B" gas vent. The flue shall be of double wall construction, with a 0.25 inch (6 mm) air space between the walls. The inner gas-carrying pipe shall be constructed of at least 0.012 inch (0.3 mm) aluminum and the outer jacket of at least 0.018 inch (0.5 mm) galvanized steel. The materials and construction of the modular sections shall meet the terms of the product's UL listing.
